TABLE OF CONTENTS

Part Three - The Eastern European Countries

A NOTE ON THE AUTHORS AND THE EDITORS

MIKHAIL ANTONOV is professor of law and teaches at the law school at the Higher School of Economics of the Russian National Research University. He also is executive editor of the *Rossiiskii ezhegodnik teorii prava*. His research interests focus on the Russian philosophy of law and on contemporary legal theory. His main publications in recent years include, among others, *History of the Russian Legal Thought* (HSE, 2012, in Russian) and *Law and Society in the Conception of Georges Gurvitch* (HSE, 2013, in Russian).

ANDRÉ-JEAN ARNAUD, 1936-2015, was research director emeritus at the National Centre for Scientific Research and the Centre for the Theory of Law of the University of Paris Ouest Nanterre–La Défense and director of the European Network on Law and Society (RED&S-FMSH, Paris). Among his publications are *Critique de la Raison Juridique* (LGDJ-Lextenso, vol. 1, 1981; vol. 2, 2003); *Entre modernité et mondialisation* (LGDJ, 2004); and "The Twenty-Year Trans-Planetary Journey of a Legal Sociologist," in *Law and Inter-Systemic Communication: Understanding "Structural Coupling*," ed. A. Febbrajo and G. Harste (Ashgate, 2013).

JOSÉ MANUEL AROSO LINHARES is associate professor of legal theory and philosophy of law at the Coimbra University School of Law (Portugal). His current research interests include the theory of evidence, narrative rationality, intercultural dialogue, precedent, and law as an autonomous practical-cultural project. He is vice president of the Associação Portuguesa de Teoria do Direito, Filosofia do Direito e Filosofia Social (Portuguese Association for the Theory and Philosophy of Law and for Social Philosophy), which is the Portuguese section of the International Association for Legal and Social Philosophy (IVR). He has published several monographs, including *Habermas e a universalidade do direito* (Coimbra, 1989) and *Entre a narrativa pós-moderna da juridicidade e o tratamento narrativo da diferença ou a prova como um exercício de passagem nos limites da juridicidade* (Coimbra, 2001). He has also written several articles, including "Dekonstruktion als philosophische (gegenphilosophische) Reflexion über das Recht: Betrachtungen zu Derrida," *Archiv für Rechts- und Sozialphilosophie* (2007); "Evidence (or Proof?) as Law's Gaping Wound: A Persistent False Aporia?" *Boletim da Faculdade de Direito* (2012); "Law's Cultural Project and the Claim to Universality or the Equivocalities of a Familiar Debate," *International Journal for the Semiotics of Law* (2012); "Law in/as Literature as an Alternative Humanistic Discourse," in *Le-*

gal Rules, Moral Norms and Democratic Principles, ed. B. Wojciechowski et al. (Frankfurt, 2013); and "Phronêsis und Tertialität: Die Behandlung des Neuen als Kern des 'geworfenen Entwurfs' des Rechts," in *Von der Spezifikation zum Schluss: Rhetorisches, topisches und plausibles Schließen in Normen- und Regelsystemen,* ed. L. Philipps and R. Z. Bengez (Nomos Verlag, 2013).

MANUEL ATIENZA is professor of legal philosophy at the University of Alicante, Spain. He is the director of *Doxa*, an international journal of legal philosophy published since 1984, and is former vice president of the International Association for Legal and Social Philosophy (IVR). Among his recent books are *El Derecho como argumentación* (Ariel, 2006); *Curso de argumentación jurídica* (Trotta, 2013); and *Podemos hacer más: Otra forma de pensar el Derecho* (Pasos Perdidos, 2013).

CARLA HENRIETE BEVILACQUA PICCOLO is a lawyer in São Paulo. She holds a master's degree in philosophy of law from the University of São Paulo, with a dissertation titled "Morality and the Concept of Law in H. L. A. Hart."

UTA BINDREITER is associate professor of jurisprudence at the Faculty of Law of Lund University in Sweden. She is the author of *Why Grundnorm? A Treatise on the Implications of Kelsen's Doctrine* (Kluwer Law International, 2002). She is also the Swedish translator of the second edition (1960) of *Hans Kelsen, Reine Rechtslehre* (Thales, 2008). In June 2012, she was appointed international correspondent for the Nordic countries by the Hans Kelsen Institute in Vienna.

VIHREN BOUZOV is professor of legal philosophy and the logic of the social sciences at the St. Cyril and St. Methodius University in Veliko Turnovo, Bulgaria. He is the author of *Rationality, Decisions, and Norms in the Globalization Era: Essays in Practical Logic* (IVIS, 2011). His essay "Rationality, Decision, and Choice" has been published in the *Boston Studies in the Philosophy of Science* (2003), and he has written on legal philosophy, political decision theory, and the philosophy of politics, with publications in Austria, Poland, Romania, the Czech Republic, and Serbia.

ALEXANDER BRÖSTL is professor of legal theory at the law school of the Pavol Jozef Šafárik University in Košice. In the past he has also served as the school's dean and as the university's vice president. His writings include *The Rule of Law / Rechtsstaat: Concepts, Theories, and Principles* (Medes, 1995);

History of Political and Legal Thought (Iura Edition, 1999); *Frontisterion* (Kalligram, 2009); and "The Slovak Republic," in *Constitutional Law of the EU Member States*, ed. L. Besselink et al. (Kluwer, 2014); and he is the main author of *Revolution und Recht* (Peter Lang, 2000); *Constitutional Law of the Slovak Republic* (Aleš Čeněk, 2013); and *Theory of Law* (Aleš Čeněk, 2013). From 1999 to 2011, he sat on the executive committee of the International Association for Legal and Social Philosophy (IVR) and is serving as president of the IVR's Slovak section.

PIERRE BRUNET is professor of public law at the Université Paris Ouest Nanterre; director of the Centre de Théorie et Analyse du Droit (Centre for the Theory and Analysis of Law), Unité Mixte de Recherché (UMR), Centre National de la Recherche Scientifique (CNRS) 7074; and a junior member of the Institut Universitaire de France (French University Institute, 2009, legal theory chair). He is the author of *Vouloir pour la nation* (LGDJ, 2004) and *Sulla Rappresentanza* (Mucchi, 2012). With Federico Arena he has also edited *Questions contemporaines de théorie analytique du droit* (Marcial Pons, 2011), and with Pierre Bonin and Soazick Kerneis he has edited *Formes et doctrines de l'état* (Dalloz, 2015).

AGOSTINO CARRINO is professor of public law at the Federico II University of Naples. He is the author of *Stato e filosofia nel marxismo occidentale* (Jovene, 1981); *L'irrazionale nel concetto: Comunità e diritto in Emil Lask* (ESI, 1983); *L'ordine delle norme: Stato e diritto in Kelsen* (ESI, 1984; translated into German); *Ideologia e coscienza: Critical Legal Studies* (ESI, 1992); "Law and social theory in Emil Lask," in *Rechtsnorm und Rechtswirklichkeit: Festschrift für Werner Krawietz zum 60. Geburtstag*, ed. W. Krawietz et al. (Duncker & Humblot, 1993); *Sovranità e Costituzione nella crisi dello Stato moderno* (Giappichelli, 1998); "Reflections on Legal Science, Law and Power," in *Normativity and Norms: Critical Perspectives on Kelsenian Themes*, ed. S. Paulson and B. Litschewski Paulson (Oxford University Press, 1998); *Democrazia e governo del futuro* (Edizioni Lavoro, 2000); *Oltre l'Occidente: Critica della Costituzione europea* (Dedalo, 2005); *Rechtsstaat und Demokratie in der Verfassung von Liechentstein* (Giappichelli, 2008); *Das Recht zwischen Reinheit und Realität: Hermann Cohen und die philosophischen Grundlagen der Rechtslehre Kelsens* (Nomos Verlag, 2011); *La giustizia come conflitto* (Mimesis, 2011); *La dottrina dello Stato e la sua crisi* (Mucchi, 2014); and *Il problema della sovranità nell'età della globalizzazione* (Rubbettino, 2014). He has given lectures and taught courses as an invited professor at several foreign universities: Humboldt-Universität zu-Berlin, Vienna, Würzburg, Saarbrücken, Hamburg, Barcelona, Basel, Paris Panthéon-Assas, Paris Ouest, Warsaw, Washington University, and Colorado College. He has edited the Italian edition of works by Hans Kelsen,

Carl Schmitt, C. B. Macpherson, Günther Winkler, Horst Dreier, Hasso Hofmann, and Michael Oakeshott. He is also general editor of the series *Jus publicum europaeum* (Giappichelli) and coeditor of the journal *Lo Stato* (Mucchi).

VERONIQUE CHAMPEIL-DESPLATS is professor of public law at the Université Paris Ouest Nanterre. She is the author of *Norberto Bobbio: Pourquoi la démocratie?* (Michel Houdiard éditeur, 2008) and *Méthodologies du droit et des sciences du droit* (Dalloz, 2014). She is the translator of Riccardo Guastini, *Leçons de théorie constitutionnelle* (Dalloz, collection Rivages du droit, 2010). She is the director of CREDOF, short for Centre de recherches et d'études sur les droits fondamentaux (Centre for Research on Fundamental Rights), which is a research team of Unité Mixte de Recherché (UMR) 7074, and of the Centre de Théorie et Analyse du Droit (Centre for the Theory and Analysis of Law). She is also director of the *Revue des Droits de l'Homme*.

JOSÉ DE SOUSA E BRITO is justice emeritus of the Portuguese Constitutional Court in Lisbon and professor at Universidade Nova, also in Lisbon. He is a former visiting professor at the University of Munich, president of the European Consortium of Church and State Research, and president of the International Society for Utilitarian Studies; since 2008, he has been serving as president of the Portuguese Society for Legal Theory, Philosophy of Law, and Social Philosophy. He has published in English, German, French, Italian, and Portuguese on ethics, philosophy of law, criminal law, constitutional law, and canon law. He has published recently *False e vere alternative nella teoria della giustizia: Lezioni napoletane di filosofia del diritto* (Editoriale Scientifica, 2011).

SVEIN ENG is professor of philosophy of law at the University of Oslo. He is the author of *Analysis of Dis/agreement—with Particular Reference to Law and Legal Theory* (Kluwer, 2003; 1st ed. 1998, in Norwegian) and *Rettsfilosofi* (Universitetsforlaget, 2007). He has published extensively on justification, practical reason, and normativity; and most recently, in 2014, he published three studies in *Ratio Juris* on the question of justifying the choice of a mode of justification in the work of Rawls and Kant. He is a member of the Norwegian Academy of Science and Letters.

CARLA FARALLI is professor of legal philosophy and applied ethics at the Bologna University School of Law. Her main research interests include the history of legal philosophy in the 19th and 20th centuries—with a focus on legal positivism and legal realism in Scandinavia, the United States, and Italy—and the contemporary legal debate on gender studies, bioethics, and Law and Literature. She is director of CIRSFID (an interdepartmental research centre of

the University of Bologna specializing in the history and philosophy of law and in computer science and law), as well as editor-in-chief of *Ratio Juris*, President of the Italian Society for Legal Philosophy, and member of the Bologna Academy of Sciences.

TOMASZ GIZBERT-STUDNICKI is professor of law, head of the Jagiellonian University Department of Legal Theory in Kraków. He is a former member of the executive committee of the International Association for Legal and Social Philosophy (IVR). He has worked on the problems relating to the language of law and to legal interpretation and argumentation. He has written two books in Polish and numerous papers in Polish, English, and German. He currently leads a team working on a research project titled "The Limits of Analytical Jurisprudence" and funded by the Polish National Science Centre.

JEAN-LOUIS HALPERIN is professor of law at the École Normale Supérieure in Paris. As a legal historian, he is the author of *L'Impossible Code civil* (PUF, 1992); *Histoire des droits en Europe* (Flammarion, 2004); *Profils des mondialisations du droit* (Dalloz, 2009); and *Five Legal Revolutions since the 17th century* (Springer, 2014).

JASMINKA HASANBEGOVIĆ is professor of legal theory and philosophy of law at the Belgrade University School of Law. Her main research interests include legal reasoning, the history of ideas, human rights, and constitutional theory. She has published four books and nearly a hundred articles, some of them in English, French, German, and Italian. In writing these works she has conducted research at the Centre de Philosophie du Droit de l'Université Libre in Brussels, the *Rechtsfakultät* of the Johannes Gutenberg Universität in Mainz, and the Institut für Rechtsphilosophie of the Ludwig-Maximilians-Universität in Munich and elsewhere. She was co-editor of *Arhiv za pravne i društvene nauke* and *Annals of the Faculty of Law in Belgrade*, sat and sits on the advisory boards of the *Croatian Critical Law Review* and the *Slovenian Law Review*, respectively.

CARLOS MIGUEL HERRERA is professor of law at the University of Cergy-Pontoise and director of the Center of Philosophy of Law and Political Philosophy (CPJP). He is the author of several books, including *Théorie juridique et politique chez Hans Kelsen* (Paris, 1997); *Derecho y socialismo en el pensamiento jurídico* (Universidad Externado de Colombia, 2002); *Droit et gauche* (Presses de l'Université Laval, 2003); *La philosophie du droit de Hans Kelsen* (Presses de l'Université Laval, 2004); *Les droits sociaux* (Presses Universitaires de France, 2009); and *A politica dos juristas: Direito, liberalismo e socialismo*

em Weimar (Alameda, 2012). He is also an honorary member of the Institut Universitaire de France (French University Institute).

MARK VAN HOECKE is research professor of legal theory and comparative law at Ghent University. He is the author of *De Interpretatievrijheid van de rechter* (Kluwer Rechtswetenschappen, 1979) and *Law as Communication* (Hart, 2004). He is the editor of *Methodologies of Legal Research: Which Kind of Method for What Kind of Discipline?* (Hart Publishing, 2011). He has co-edited *Objectivity in Law and Legal Reasoning* (Hart Publishing, 2013). He has served as co-president of the European Academy of Legal Theory since its founding in 1989.

HASSO HOFMANN is professor emeritus of constitutional law and legal philosophy at Humboldt University in Berlin. He is author of *Legitimität gegen Legalität: Der Weg der politischen Philosophie Carl Schmitts* (Duncker & Humblot, 2010); *Repräsentation: Studien zur Wort- und Begriffsgeschichte von der Antike bis ins 19. Jahrhundert* (Duncker & Humblot, 2003); and *Einführung in die Rechts- und Staatsphilosophie* (Wissenschaftliche Buchgesellschaft, 2011). He is a fellow of the Bavarian Academy and of the Berlin-Brandenburgische Akademie der Wissenschaften and a former fellow of the Centre for Advanced Study in Berlin and of the Carl Friedrich von Siemens Foundation in Munich. In 2001, he received a *honoris causa* doctorate from the Goethe University in Frankfurt.

ADRIAN-PAUL ILIESCU is professor of political philosophy and philosophy of law at the Bucharest University, Faculty of Philosophy, as well as director of the Centre of Research on Intergenerational Justice, Social Responsibility, and Sustainability (DIRESS). His interests include social justice, Rawls ("Rawls's Encapsulation of Justice," Institut für die Wissenschaften vom Menschen, *Working Papers*, 1999), and equality, as well as Ludwig Wittgenstein's philosophy, publishing *Wittgenstein: Why Philosophy Is Bound to Err* (Peter Lang Publishing House, 2000).

FEDERICO LIJOI is adjunct professor of philosophy of law at Sapienza University of Rome. He is the author of *La positività del diritto: Saggio su Hans Kelsen* (Aracne, 2011) and *Scienza giuridica, democrazia e diritto: Interpretazioni costituzionali in Austria dall'Impero alla Repubblica* (Aracne, 2012). He is also translator and editor of Hans Kelsen, *Scienza giuridica e diritto* (Giappichelli, 2008) and of Hans Kelsen, *Una nuova scienza politica* (Giappichelli, 2010).

SUSANNA LINDROOS-HOVINHEIMO is docent in jurisprudence at the University of Helsinki. In 2011, she defended her doctoral thesis in legal theory at the same university. She is the author of *Justice and the Ethics of Legal Interpretation* (Routledge, 2012) and numerous articles on legal philosophy and jurisprudence. She has worked as lecturer in jurisprudence at the University of Helsinki and as lecturer in law at Queen Mary University of London. She has also been trained as a judge at the District Court of Vantaa.

LUÍS A. MALHEIRO MENESES DO VALE is teaching assistant at the Coimbra University School of Law (FDUC) in Portugal. He is a founding member of the Portuguese Association for the Theory and Philosophy of Law and for Social Philosophy; an associate member of the Centre for Biomedical Law at the FDUC; an associate member of the Portuguese Society of Rhetoric; a member of the advisory board of Eurofacts; a collaborator of the Centre for EU Law of the University of Minho; and a collaborator of the Juridical Institute of the FDUC. He has been researching, lecturing, and publishing in legal and political philosophy, constitutional theory, and public and social law (mainly health care) and has authored studies such as "Ética do Discurso e Informação Societária," in I *Congresso Direito das Sociedades em Revista*, ed. R. Pinto Duarte et al. (Almedina, 2011); "O Realismo Normativista de Enrico Pattaro: Subsídios para uma análise," in Ars iudicandi: *Estudos em Homenagem ao Doutor Castanheira Neves* (Coimbra, 2008); and "Access to Healthcare between Rationing and Responsiveness: Problem(s) and Meaning(s)," *Lex Medicinae* (2012).

ERIC MILLARD is professor of public law at the Centre de Théorie et Analyse du Droit (Centre for the Theory and Analysis of Law) at the University of Nanterre. He is an honorary member of the Institut Universitaire de France and serves as vice president of the International Association for Legal and Social Philosophy (IVR). He is the author of *Famille et droit Public* (LGDJ, 1996) and *Théorie générale du droit* (Dalloz, 2006). He is also a member of the advisory boards of *Politiques sociales et familiales* (Paris), *Ius Gentium* (Baltimore), *Archiv für Rechts- und Sozialphilosophie* (IVR Stuttgart), *Revus* (Ljubljana), *Droit et Société* (Paris), *Revista da Faculdade de Direito de Vitória* (Brazil), *Jurisprudence Revue Critique* (Paris), *Revue des Droits de l'Homme* (Nanterre), *Teoria Politica* (Turin), *Lo Stato* (Rome), and *Auctoritas* (Paris).

IVAN L. PADJEN is professor of law and senior fellow in political science at the University of Rijeka Faculty of Law, in Croatia. He has written in the following areas and subjects: theory of law and state, methodology of legal and social research, public law and political institutions, property rights, and

rights of expression (religious law, academic law, public media law). He has published in English in *Synthesis Philosophica*, the *Dalhousie Law Journal*, the *Croatian Critical Law Review*, and *Rechtstheorie*.

HENRIK PALMER OLSEN is professor of jurisprudence at the Centre for Excellence for International Courts (iCourts) at the Copenhagen University School of Law. He is the author of *Law in Its Own Right* (Hart, 1999) and *Architectures of Justice* (Ashgate, 2007), both coauthored with Stuart Toddington. He is currently the principal investigator on a research project titled "From Dogma to Data: Exploring How Case Law Evolves," funded by the independent Danish research council. He has directed the school's doctoral programme from 2009 to 2013 and as of June 2014 is the school's acting head of research.

ENRICO PATTARO was born in Rome on April 8, 1941. He has taught philosophy of law and legal informatics at the Bologna University Faculty of Law, serving as dean from 1977 to 1979. He is now professor emeritus at the University of Bologna. His fields of research are legal philosophy, the history of ideas, and legal informatics. He has published fifteen books and more than two hundred articles. Of these he likes to recall "Validità o verificabilità del diritto?," *Rivista trimestrale di diritto e procedura civile* (1966) and *The Law and the Right: A Reappraisal of the Reality That Ought to Be* (Springer, 2005). His achievements include founding CIRFID (Centre for Research in Legal Philosophy and Legal Computer Science) in 1986, and *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law* (Oxford, UK) in 1987, as well as conceiving and designing the present multi-author *Treatise of Legal Philosophy and General Jurisprudence* in the late 1990s, realizing it in twelve volumes published by Springer from 2005 to 2016. He has served as president (1995-1999), and is now honorary president, of the International Association for the Philosophy of Law and for Social Philosophy (IVR).

MARIJAN PAVČNIK is professor of theory and philosophy of law and the state at the Ljubljana University School of Law in Slovenia. He is the author of *Juristisches Verstehen und Entscheiden* (Springer, 1993); *Teorija prava / Legal Theory* (GV Založba, 2011); *Auf dem Weg zum Maß des Rechts* (Franz Steiner Verlag, 2011); and *Argumentacija v pravu / Argumentation in Law*, (GV Založba, 2013). He is also the editor of Leonid Pitamic, *Na robovih čiste teorije prava / An den Grenzen der Reinen Rechtslehre* (Slovenian Academy of Sciences and Arts, 2005) and of the book series *Pravna obzorja / Legal Horizons* (since 1994). In 2001, he received the Zois Prize for scholarly achievements. He is a member of the Slovenian Academy of Sciences and Arts, of the Academy of Europe, and of the international board of the Hans Kelsen Institute in Vienna.

KRZYSZTOF PŁESZKA is professor of law in the department of legal theory at the Jagiellonian University in Kraków. His research is devoted to investigating problems relating to legal system, the theory of legal interpretation and argumentation, and the theory of legislation. He is currently conducting research under a project called "Limits of Analytical Jurisprudence," funded by the Polish National Science Centre. He has written three books in Polish and numerous papers in Polish, German, and English.

RONALDO PORTO MACEDO JR is full professor at the São Paulo University School of Law and at the Getulio Vargas School of Law. He is the author of *Contratos relacionais e defesa do consumidor* (RT, 2006); *Carl Schmitt e a fundamentação do direito* (Saraiva, 2011); *Curso de filosofia política* (Atlas, 2008); *Direito e interpretação. Racionalidades e instituições* (Saraiva, 2011); *Do xadrez à cortesia: Dworkin e a teoria do direito contemporânea* (Saraiva, 2013); and *Ensaios de teoria do Dìdireito* (Saraiva, 2013).

BENJAMÍN RIVAYA is professor of philosophy of law at the University of Oviedo in Spain. He is the author of *Filosofía del Derecho y primer franquismo* (1998); *Derecho y cine en 100 películas: Una guía básica* (2004), with Pablo de Cima; *El materialismo jurídico: La presunta teoría jurídica de Marvin Harris* (2007); *Una historia de la filosofía del Derecho española del siglo XX* (2010); and *Un vademécum judicial: Cine para jueces* (2012).

CORRADO ROVERSI is currently a lecturer at the Bologna University School of Law, where he teaches legal philosophy. He has given talks and presented papers at several international workshops and conferences. Among his publications are *Pragmatica delle regole costitutive* (GEDIT, 2007); *Costituire: Uno studio di ontologia giuridica* (Giappichelli, 2012); "Conceptualizing Institutions," *Phenomenology and the Cognitive Sciences* (2013); "On Constitutive Normativity," in *New Essays on the Normativity of Law*, ed. G. Pavlakos and S. Bertea (Hart Publishing, 2011); "Acceptance Is Not Enough, but Texts Alone Achieve Nothing: A Critique of Two Conceptions of Institutional Ontology," *Rechtstheorie* (2012), and "Conceptualizing Institutions," *Phenomenology and the Cognitive Sciences* (2013).

ANTONINO SCALONE is associate professor of public law at the University of Padua. His publications include *Rappresentanza politica e rappresentanza degli interessi* (Franco Angeli, 1996); *Una battaglia contro gli spettri: Diritto e politica nella* reine Rechtslehre *di Hans Kelsen, 1905–1934* (Giappichelli, 2008); and *L'ordine precario: Unità politica e pluralità nella* Staatslehre *novecentesca da Carl Schmitt a Joseph H. Kaiser* (Polimetrica International, 2011).

ALESSANDRO SERPE is professor of philosophy of law at the D'Annunzio University of Chieti and Pescara in Italy. He is the author of *Realismo nordico e diritto umani: Le "avventure" del realismo nella cultura filosofico-giuridica norvegese* (Naples, 2008) and of *The Doubting Philosopher: Norberto Bobbio; Outlines of his Legal Philosophy within Italian Legal Culture* (Oslo University, 2008), also translated into Italian and Spanish.

ELENA SIMINA TANASESCU is professor of constitutional law in the law department of Bucharest University and director of the Centre for Constitutional Law and Political Institutions. She is coeditor of *Constitutia României– comentariu pe articole* (C. H. Beck, 2008) and coauthor of "Analogical Reasoning and a Dialectical Instrument," in *The Use of Foreign Precedents by Constitutional Judges*, ed. T. Gropi and M.-C. Ponthoreau (Hart Publishing, 2013).

ANA MARGARIDA SIMÕES GAUDÊNCIO is a teaching assistant at the Coimbra University School of Law and a founding member of the Portuguese Association for Theory and Philosophy of Law and for Social Philosophy (the Portuguese section of the International Association for Legal and Social Philosophy, or IVR). Her main research areas are legal philosophy and legal theory. She has published several articles, including "From Centrifugal Teleology to Centripetal Axiology(?): (In)adequacy of the Movement of Law to the Velocity of Praxis," *Boletim da Faculdade de Direito da Universidade de Coimbra* (2012), and has also published *Entre o centro e periferia: A perspectivação ideológico-política da dogmática jurídica e da decisão judicial no Critical Legal Studies Movement* (Lumen Juris, 2013).

AREND SOETEMAN is emeritus professor of jurisprudence and legal philosophy at the Vrije Universiteit in Amsterdam. He is the author of *Logic in Law* (Kluwer Academic Publishers, 1989) and *Machtig Recht* (Samson H. D. Tjeenk Willink, 1986). He has edited *Pluralism and Law* (Kluwer Academic Publishers, 2001). He is a former member and vice president of the executive committee of the International Association for Legal and Social Philosophy (IVR) and organised the 20th IVR World Congress in Amsterdam in 2001. He is a member of the Royal Netherlands Academy of Arts and Sciences and secretary for the humanities and social sciences of the Royal Holland Society of Sciences and Humanities.

CONSTANTIN STAMATIS is professor of philosophy of law and legal reasoning at Aristotle University in Thessaloniki. He is the author of *Argumenter en droit: Une théorie critique de l'argumentation juridique* (Publisud, 1995). His major works in Greek are *Justification of Legal Judgments* (2009) and *A Critical Theory of Justice* (2011).

GIULIANA STELLA is professor of doctrine of the state in the law department of Federico II University in Naples. She is the author of *I giuristi di Husserl: L'interpretazione fenomenologica del diritto* (Giuffrè, 1990); "Hans Kelsen and Edmund Husserl," in *Hans Kelsen's Legal Theory: A Diachronic Point of View*, ed. L. Gianformaggio (Giappichelli, 1990); "Norme e realtà: Oltre il normativismo kelseniano," in *Sistemi normativi statici e dinamici: Analisi di una tipologia kelseniana*, ed. L. Gianformaggio (Giappichelli, 1991); *Stato e scienza: I fondamenti epistemologici della dottrina pura del diritto* (Edizioni Scientifiche Italiane, 1997); "Die utopische 'Uchronie' der Menschenrechte," in *Staat und Recht: Festschrift für Günther Winkler*, ed. H. Haller et al. (Springer, 1997); and *Sovranità e diritti: La dottrina dello Stato da Jellinek a Schmitt* (Giappichelli, 2013). She has edited the Italian translations of works by Hugo Krabbe and Carl Schmitt.

CSABA VARGA is professor emeritus at the Pázmány Péter Catholic University, founder of its Institute for Legal Philosophy, and research professor emeritus at the Institute for Legal Studies of the Hungarian Academy of Sciences. He is the author of *Codification as a Socio-Historical Phenomenon* (1991); *The Place of Law in Lukács's World Concept* (1985); *Theory of the Judicial Process* (1995); *Transition to Rule of Law* (1995); *The Paradigms of Legal Thinking* (1999); and *Transition? To Rule of Law?* (2012). His papers are collected in *Law and Philosophy* (1994); *Comparative Legal Cultures* (2012); *Theory of Law* (2012); and *Contemporary Legal Philosophising* (2013). He has been awarded the Széchenyi Prize, the highest recognition available for scholarly achievement in Hungary.

RODOLFO VAZQUEZ CARDOZO is a philosopher and jurist born in Buenos Aires, Argentina, but Mexican by nationality. He is a professor and a researcher at the Autonomous Technological Institute of Mexico (ITAM). He is a former member of the National System of Researchers (SNI, level 3), the Mexican Academy of Sciences (AMC), and the College of Bioethics AC. Among his publications are *Las fronteras morales del derecho* (Fontamara, 2009) and *Liberalismo, estado de derecho y minorías* (Paidós-UNAM, 2001).

JAN WOLEŃSKI is professor emeritus of philosophy at the Jagiellonian University in Kraków and professor of the University of Information Technology in Rzeszów. He is also a member of Polish Academy of Science, the Polish Academy of Arts and Sciences, the International Institute of Philosophy, and the Academia Europea. His research areas include philosophical logic, epistemology, the history of logic, and legal philosophy. He has published thirty books in Polish, English, French, Russian, Romanian, and Spanish, as well as more than one thousand papers in all fields of philosophy.

GENERAL EDITOR'S PREFACE

In 1995, a world congress for the philosophy of law was held in Bologna, and it turned out to be very successful. Attending the event were more than 700 participants, and among the speakers were Norberto Bobbio, Ronald Dworkin, Jürgen Habermas, and Amartya Sen. A good deal of meeting and greeting took place on that occasion—much of it fleeting, to be sure, but important to me nonetheless—and an interesting encounter was that with Hendrik Van Leusen, who approached me on behalf of the publishing house Kluwer and asked me what Kluwer could do so that I might turn over to it a journal I had founded in 1987 under the title *Ratio Juris: An International Journal of Jurisprudence and Philosophy of Law*. I replied that the bond sealed with the Oxonian publisher Basil Blackwell was as strong as ever: For no reason, therefore, was I going to break up it. So Mr. Van Leusen asked me whether by any chance there was any other project I might have been contemplating in the philosophy of law which Kluwer could be interested in. I answered that I would have given that proposition some thought, but in fact some thinking had already been going on in my mind, with an idea I had already put on the drawing board, though I hadn't proposed it to any publisher yet: It was a project for a multivolume treatise of legal philosophy containing both a theoretical part and a historical one, and it was this project that after the congress I submitted to Hendrik Van Leusen. It drew serious interest from Kluwer. A number of meetings ensued, among them with Alexander Schimmelpenninck. And thus began the *Treatise* adventure, in which I involved several scholars, especially Michael Lobban, Fred D. Miller Jr., Aleksander Peczenik, Gerald J. Postema, Patrick Riley, Hubert Rottleuthner, and Roger A. Shiner: We met quite a number of times (holding seminars as well as dedicated meetings), and these scholars would go on to become the authors and editors of several of the volumes that make up the *Treatise*. It was a rewarding intellectual experience that I fondly go back to now that the *Treatise* has come to completion, after a demanding ten-year endeavour that has led to twelve volumes.

In 2005, Corrado Roversi was the assistant editor of Volume 1 of the *Treatise*, which I authored. Now we are coeditors of the present Volume 12, which concludes the *Treatise*.

Corrado Roversi has since 2005 established a scholarly reputation in Italy and abroad for his fine work in legal ontology. As coeditor of Volume 12, he has coordinated not only the editorial team in Bologna but also the sixty-three authors who from every part of the world have taken part in its realization.

And the two tomes of Volume 12 would not have seen the light of day had it not been for the work he devoted to it.

So thank you Corrado, and welcome among us. I am quite happy to devote to you these very words that Norberto Bobbio so graciously wrote to me in 1966.

Enrico Pattaro

PREFACE BY THE EDITORS OF VOLUME 12

With this Volume 12 (published in two tomes), this *Treatise of Legal Philosophy and General Jurisprudence* reaches completion.

The first five volumes are devoted to theoretical problems: Volume 1, by Enrico Pattaro, thrashes out the crucial problem of the distinction between the law and the right, taking a few historical detours of considerable length along the way; Volume 2, by Hubert Rottleuthner, takes on the problem of the foundations of law; Volume 3, by Roger A. Shiner, addresses that of the sources of law; Volume 4, by Aleksander Peczenik, that of legal doctrine as a source of law and as mode of knowing the law; and Volume 5, by Giovanni Sartor, turns to legal reasoning within the context of a cognitive approach to law.

The next seven volumes are instead historical and have been framed in light of a broad distinction between the philosophy of law done by philosophers, on the one hand, and that done by jurists, on the other.[1] Volumes 6 and 10 are devoted to the philosophers' philosophy of law: Volume 6, edited by Fred D. Miller, Jr., and Carrie-Ann Biondi, discusses the philosophers' philosophy of law from the ancient Greeks to the Scholastics, and Volume 10, by Patrick Riley, covers the philosophers' philosophy of law from the 17th century to our days. Volume 7, edited by Andrea Padovani and Peter G. Stein, looks at the jurists' philosophy of law (as we have termed it) from Rome to the 17th century.

With the 17th century, and in particular with the advent of the modern school of natural law, the picture grows more complex. Next to the philosophers' philosophy of law (the kind found in Aristotle, Saint Augustine, Kant, and Hegel, for example) and the jurists' philosophy of law (like that of Ulpian, Accursius, Domat, and Gény), we set the *legal* philosophers' philosophy of law, or what might be called philosophy of law par excellence. In fact, prior to the modern era there was no distinct discipline that could be called legal philosophy. It was only in the modern age that thinkers began to view themselves as legal philosophers, and for a long time the consensus was that the philosophy of law par excellence was the rationalist school of natural law, which is traditionally made to begin with Grotius (1583–1645), and which was developed in the 17th century and firmed up in its Enlightenment form in the 18th century: It is this school that produced the first philosophy of law to have been considered the first classic instance of what we are here calling the legal philosophers' philosophy of law. The second classic example of a legal philosophers'

[1] The distinction between the philosophers' philosophy of law and the jurists' philosophy of law is by Norberto Bobbio.

philosophy of law in the history of legal thought was, ironically, German legal positivism, which proclaimed the end of the legal philosophers' philosophy of law as embodied in the rationalist natural law theory of the 17th and 18th centuries and replaced it with the *allgemeine Rechtslehre*, that is, with the general doctrine, or theory, of law.

Of course, the threefold distinction among the philosophers' philosophy of law, the jurists' philosophy of law, and the legal philosophers' philosophy of law only expresses broad groupings across all historical volumes and involves a good deal of simplification.[2]

Volume 8 of this *Treatise*, by Michael Lobban, surveys the philosophy of law in the common law world from 1600 to 1900, discussing not only the jurists' philosophy of law but also the legal philosophers' philosophy of law (as we have termed it). In Volume 9—edited by Damiano Canale, Paolo Grossi, and Hasso Hofmann, and devoted to legal philosophy in the civil law world from 1600 to 1900—the reader will find some chapters mostly concerned with the jurists' philosophy of law and others mostly concerned with the legal philosophers' philosophy of law. Volume 11, by Gerald Postema, and the present Volume 12 are both devoted to the philosophy of law in the 20th century, the former covering the common law world and the latter, in two tomes, the civil law world.

* * *

The reason for the imbalance between Volumes 11 and 12 of the *Treatise*, the latter being much longer that the former, is that, unlike the civil law world, the common law world *is* in effect a single world as concerns legal philosophy in the countries taken into account—a single broad context comprising a range of countries that all speak the same language, English, and share the same background culture, in such a way that even the debate in legal philosophy in this world can be considered internally borderless. The civil law world, by contrast, cannot be described as unitary. In fact, far from forming a cohesive mass across time and space, the civil law countries taken into account (those of continental Europe and Latin America) rather look like a patchwork of fragments that over the course of the 20th century cannot even be said to make up something like a single mosaic. Especially as concerns the civil law countries of continental Europe, the 20th century has been a "short" one, as Eric Hobsbawm has described it, considering that its shaping moments spanned from 1914 to 1991: An extremely complex and chaotic century, in that these countries have been a theatre of two world wars and home to terrible dictatorships which, over and above that, have sponsored their own philosophies, not to mention that the

[2] Further details on the organization of this *Treatise* can be found in Volume 6, pp. XVI–XVII, and Volume 9, pp. XV–XVII.

same countries have in the same period been welded together and dismembered, and then reassembled and broken up again.

The civil law countries we are treating in this volume are thirty-one, considering the map after the dissolution of the USSR: Argentina, Austria, Belgium, Brazil, Bulgaria, Chile, Colombia, Croatia, the Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Italy, Mexico, the Netherlands, Norway, Peru, Poland, Portugal, Romania, Russia, Serbia, Slovakia, Slovenia, Spain, Sweden, Uruguay, and Venezuela. What is more, these civil law countries do not all share a single language: The languages spoken in them are twenty. For these reasons, while it has been possible for Volume 11, on legal philosophy in the common law world, to be entrusted to a single author—someone who, needless to say, had to be possessed of great mastery and learning, and for this we turned to Gerald Postema—a treatment of legal philosophy in the civil law world proved to be an endeavour for which we instead had to rely on the expertise of a wide range of contributors, both to achieve completeness and to reflect the language and culture distinctive to each of the countries considered.

The contributors to this volume are sixty-three. It should be borne in mind, in this respect, that under the *Treatise* rules, all contributors had to be native speakers of the languages spoken in the countries they were writing about, or at least they had to be so proficient in those languages as to be able to master the works in their original language. And, after all, English, the lingua franca chosen for the *Treatise*, is not spoken in any of the civil law countries here considered.[3] Moreover, these countries are marked not only by linguistic differences but also by significant cultural ones, some of them contingent on whether or not the philosophy of law itself figures as an academic subject at university. For this reason we have thought it best to give all contributors the greatest freedom and responsibility in selecting the thinkers they would discuss, as well as their number, and also in framing an approach to the legal philosophy they would canvass and the amount they would cover in the countries assigned to them (a task that also meant providing the bibliography with English translations of each of the foreign titles cited in the text). Also, although in several cases we have worked closely with the authors on the English in which their manuscripts were written, so as to make the language as clear as possible, responsibility for the English translations ultimately rests with the authors themselves.

We initially considered the idea of presenting 20th-century legal philosophy in civil law countries in a crosswise fashion, as it were, that is, by orientation of thought. This idea turned out to be impracticable, however, because that would have required, for each current, either a single author capable of proficiently handling its complex development across many different civil law

[3] A different matter is, of course, Scotland. By the same token, it bears recalling that this *Treatise* does not include the Asian and African countries within its purview.

countries or a working group proper, a team of specialists who could work seamlessly together toward that same result. The first strategy turned out to be impossible, and the second one too, or at least it proved to be very difficult. For that reason we ultimately decided to organize the discussion by country, presenting for each of them the entire history of its legal philosophy, with all of the currents of thought that have had a role in it over the course of the 20th century. The outcome of this work, organized geographically, so to speak, is laid out in the first tome of the volume. In order to offset this choice, we also decided to bring out a second tome that in a monographic fashion, beyond the geographical boundaries and fragmentation of the civil law world, would present the three main currents of thought in legal philosophy, namely, natural law theory, legal positivism, and legal realism, along with a theme in legal philosophy that has turned out to be central in the 20th century (particularly in its second half), namely, legal reasoning, ranging from the application of hermeneutics and logic to law to the other significant developments in the theory of legal argumentation.

* * *

German thought in the second half of the 19th and the first half of the 20th century is the source of most of the philosophies developed in the civil law countries under consideration. In that crucible some ambitious speculative philosophical projects were forged, pursuing which thinkers of great prestige and erudition limned out their visions in bold concepts, engaging with one another in the common horizon of philosophy of the spirit, within which these thinkers each sought in their own way to arrive at definitive truths. We are mainly thinking here of neo-Kantianism, neo-Hegelianism, and phenomenology, in its different inflections. So, too, in the same German-speaking countries, in the first half of the 20th century, there also flourished logical empiricism or neoempiricism (pursued in Vienna and Berlin), psychoanalysis, and the logistic normativism pursued in Brno and Vienna. So-called Nazi philosophy has rightly been condemned in the court of history.

Owing to the outsize importance the philosophical developments in German-speaking countries have had in the civil law world, the first part in the first tome of Volume 12 has been given over precisely to German-language legal philosophy (ten chapters overall). We then followed a geographical criterion, looking as well to bring out some cultural contiguities, so the second part of the same tome treats the philosophy of law in the southern European countries and in France. The third part covers the countries of eastern Europe and the fourth those of northern Europe. Finally, we devoted the fifth part to the legal philosophy of the Latin American countries.

It was important for us in this project to cover as much ground as possible. For this reason we have chosen to cast a wide net, gathering all the information

we could from the various recesses of this scattered and fragmentary world, rather than following an already scripted "story" or path, precisely because no such unitary path exists. In this way we hope to have done the best service possible to scholars interested in the historical development of legal philosophy in the civil law countries of Europe and Latin America. Some difficult choices had to be made in deciding whom to include and whom to exclude, and in the end we came up with this criterion: We would only include thinkers who can be described as legal philosophers or legal theorists in a strict sense (at least as concerns a significant part of their work). For this reason, we have decided not to discuss cross-cutting figures, an example being Michel Foucault. In this respect, Volume 12 certainly hews to the same line as Volume 11 (this can be appreciated by looking at Gerald Postema's preface to that volume).

* * *

A great deal of effort has gone into the design and realization of the two tomes making up this Volume 12 of the *Treatise*, and there are many people we would like to thank for the precious help they have offered. They include Carla Faralli, director of CIRSFID (the Interdepartmental Centre for Research in the History, Sociology, and Philosophy of Law and in Computer Science and Law, based at the University of Bologna), who in that role has always encouraged and supported our work; Neil Olivier of Springer, for his help and patience in taking the project through its various stages, starting from the preliminary discussions we had in 2007 at the congress held that year in Cracow by the International Association for Legal and Social Philosophy (IVR); Gerald Postema, who as associate editor of the *Treatise* has contributed his outstanding scholarship; Sandra Tugnoli, without whose help Enrico Pattaro would not have been able to keep working from home; Antonino Rotolo, who as assistant editor of the *Treatise* has offered his experience in making several crucial editorial choices; Erica Calardo, Francesca Faenza, Migle Laukyte, and Nicoletta Bersier, who have served as assistant editors for this volume and without whom it simply would not have seen the light of day; and our English editor, Filippo Valente, for helping to make much of the text more readable (Chapter 10 of Tome 1 has been copyedited by Alexa Nieschlag). Finally, our gratitude goes to all the authors who agreed to contribute to this project, and who have continued to work closely with us over the years.

The German-Speaking Countries

PREMISE

by Agostino Carrino and Hasso Hofmann

The year 1945 not only carries political symbolic significance in regard to the clash between Western democracies and some totalitarian states—for that was the year in which the Nazi regime fell in Germany—but also marks a watershed in the cultural history of 20th-century Europe, separating two clearly distinguished eras: The first of these was what might be called the era of ideologies, after which there came a progressive disenchantment with totalizing narratives, a process that—at the end of the short 20th century, as Eric Hobsbawm has called it—eventuated in the demise of ideologies, giving place to the so-called post-ideological age.

This distinction offers a useful interpretive tool, and it also explains why our reconstruction and exposition of German-language legal philosophy looks quite uneven between the first and the second part, the first covering the authors and theories from 1900 and 1945, the second the authors and theories after 1945.

Indeed, legal philosophy is a genuine expression of a nation's cultural mood, and as such it also reflects its socio-political reality. One can thus appreciate why legal thought in Germany and Austria from 1900 to 1945 should have wound up absorbing and making manifest its underlying reality, and with it the conflicting ideologies—as well as the competing *Weltanschauungen*, or worldviews, when they existed—that can be seen at work in the broadly "cultural" positions taken.

Until 1945, Europe, and in particular Germany, was a theatre of conflicts the nature of which was precisely ideological. These conflicts manifested themselves through a multiplicity of positions, schools, and thinkers, but it has proved impossible to cover them exhaustively in the first part of our exposition, despite the many pages devoted to them, because the scientific thought and legal philosophy produced in that period makes up a unique landscape in European history, owing to the sheer number of conceptions, attitudes, and nuances. A case in point is neo-Kantianism: Only superficially can this movement be divided into two camps—the Marburg and Baden schools (with Cohen, Natorp, and Cassirer, on the one hand, and Rickert, Windelband, and Lask, on the other)—since neo-Kantians in legal philosophy were a motley lot, and they often staked out opposite positions. But the same goes for neo-Hegelianism—whose "official" embodiment in Binder and Larenz was preceded by a variety of singular proto-neo-Hegelian trends (witness Kohler and Berolzheimer)—not to mention legal phenomenology, with its various flavours; the Vienna school of law, where Kelsen's critical positivism lives alongside Verdross's natural-law theory; the conflicting types of

Marxism; and, finally, the different forms of irrationalism, decisionism, and institutionalism.

That explains why the two parts of the exposition are so lopsided, the first (spanning from Chapter 1 to 9) being much longer than the second (developed in Chapter 10): They reflect the difference between the era of clashing worldviews and the subsequent era marked by historico-cultural transformations that can be described as somehow evolutive and not easy to pin down in any definite manner. Indeed, after 1945, the problem of legal philosophy was framed on the basis of different paradigms and perspectives: In the rebirth of natural-law theory, the problem was how to arrive at the ontological foundation of law; in language analysis, it was to "purify" law of its metaphysical nonsense; on the hermeneutical approach, it was to investigate law as a bearer of meaning; and, finally, there emerged the problem of investigating law as a tool for transforming society or as a phenomenon in a process of universalization. These are all currents of thought that after 1945 came in *succession*, rather than standing in direct contrast to one another, as had been happening until 1945, when they were engaged in an ideological struggle for political power. (One need only think here of the "struggle for Weimar" driving the various methodological controversies of the 1920s.)

The point, to be sure, is not to judge which of the two eras is preferable. But it will be noted that, for all the virtues of the post-ideological world—its having secured peace and greater wealth and tranquillity, for example—it has not managed to recreate the multiformity, richness, and polemical zest of legal philosophy from Stammler to Larenz. For this reason, too, the discussion devoted to legal philosophy in the second half of the 20th century is more linear, for it can reconstruct an evolution of attitudes and perspectives that form a sequence, and not just in a temporal sense, either.

It also bears mentioning, however, that while the greater theoretical linearity of post-war philosophy—from natural-law theory to the theory of topics, from the analysis of language to the theory of rights—has made it possible to offer a shorter reconstruction, the first part of the exposition, though quite longer, has significantly had to leave out some important authors, from Moór to Baumgarten and Marck. For this we ask for the reader's forgiveness.

Introduction

PHILOSOPHY OF LAW AND CONCEPTIONS OF THE WORLD

by Agostino Carrino

The fundamental question that was being asked among jurists at the dawn of the 20th century in Europe, especially in Germany, was the following: "Is philosophical speculation on law legitimate?" Or, stated otherwise: "Is the philosophy of law possible?" At the close of a century in which history lay at the centre of academic interest, the predominant form of legal positivism seemed to still be denying this possibility, the idea that it was possible to rationally discuss questions of knowledge, being, and values: "At the law schools," Luis Recaséns Siches observed, "a proper phobia set in against the study of the theory of knowledge or of metaphysics, against any endeavour that was not concerned with positive law, whether currently or historically in force. Nothing was recognized as scientific outside the consideration of social facts, of what came from present or past experience. Anything departing from that was qualified by jurists as sterile or as brazen charlatanism" (Recasens Siches 1928, 4; my translation).[1] This, however, was a form of legal positivism in decline, which not incidentally would soon thereafter be displaced by the so-called critical positivism of Hans Kelsen.

However, whatever the origin may be, the parameters of the problem that emerged in German legal consciousness were still those of the relation between the is (*Sein*) and the ought (*Sollen*), between fact and value, and so between reality and idea, accompanied by a whole series of oppositions that follow logically and develop on different levels. This is exemplified in the oppositions between nature and culture (Rickert), nature and spirit (Dilthey), *Kultur* and *Zivilisation* (Spengler), and society and community (Tönnies).

Nineteenth-century positivism "solved" this problem simply by effacing one of the two terms, essentially the *Sollen*, thus limiting every possible discourse to the empirical datum, to the reality of things, whether the discourse is one of naturalism or historicism. The philosophy of law was thereby denied as a legitimate undertaking, and was immediately identified with the deprecated natural law theory.[2] Neither Savigny's historical school nor Hegel's idealism,

[1] A typical representative of this conception of legal thought was Karl Bergbohm (1973).

[2] "Legal science is a positive science of law and therefore it has to begin with what is existent, not with the ought: this was the fundamental creed of this epoch. All the law is positive law, law which changes in history: therefore also all the legal concepts are relative and conditioned: this was its second dominating creed" (Wielikowski 1914, 11; my translation). See also Hohenhauer 1928–1929.

with their internal dialectic, were to be accorded a distinctively philosophical role; philosophy in general, and the philosophy of law in particular, were subordinated to the primacy of the empirical and positive sciences. In the decoupling of reason and history, what remained was only a history without reason, inasmuch as reason, the *Sollen*, became just a pale and impotent product of thought, devoid of any effect. The empirical, the phenomenon, fell within the exclusive purview of the theoretical. The birth of legal philosophy would take on the peculiar meaning of a leap beyond the idea that philosophy represents a world superseded by the West's civil and scientific evolution.

Until Emil Lask's *Rechtsphilosophie* (1905), German legal literature had in the main committed itself to either empiricism or historicism, both of which had become restrictive, even though they had taken different inflections, in the form of a general empirical theory (Bergbohm, Bierling, Merkel), in the form of legal psychology (Zitelmann, Wundt) and in the form of ethnological jurisprudence (Bachofen, Post, Leist), and also as shallow sociologism (Schäffle, Gumplowicz). As Luis Recaséns Siches observed, these trends "corresponded with the concerns that legal philosophy gave rise to in that epoch, seeking to replace that discipline with writings of a purely historical, empirical, and deductive cast" (Recaséns Siches 1928, 4; my translation). While this was a development within the academic arena, these forms of legal writing were explicit reflections of tendencies inherent in the spirit of the time, grappling with a now-radical crisis in values, a crisis affecting the traditional categories that had formed the European consciousness. Emblematic in this regard was Friedrich Nietzsche's particular form of aphoristic thought. Nietzsche was the decisive author in this phase of European culture, an author whose thought has not always been grasped in its depth and substantive structure, and who has indeed very often been misconstrued or misused. At any rate, the slow rebirth of legal philosophy, and indeed of philosophy tout court, in the second half of the 19th century, became, in many respects, an epoch-making event, to the extent that it was bound up with the solutions that culture in general would forge (or would try to forge) in response to this experience of crisis in Europe and the West. It is this experience which, in the adoption of distinct and opposing vocations, positions, and worldviews, led to an internal fragmentation of philosophy. In this way, even the positivist tendency did not vanish but reemerged in new forms in the work of the neo-Kantian jurists (I am thinking of Radbruch), and then in the so-called critical positivism of the *reine Rechtslehre* and in the sociology of law, itself essentially understood as a type of legal philosophy. Nor can we underplay the philosophical fragmentation that emerged from the question of method (*Methodenstreit*), a question that would give rise to a number of theories of the state politically oriented in different and often opposite directions. Hence, the criticism of the neo-Kantian legal-philosophical currents articulated by neo-Hegelianism, on the one hand, and by phenomenology, on the other, also became a clash of *Weltanschauungen*. The enduring effect of this

interconnection remains evident in contemporary German legal philosophy precisely on account of the link it managed to establish and maintain with political values, with the fundamentally political and moral choices and decisions that humans in modernity are called on to make. It is always possible to interpret a legal-philosophical current as the expression of a position taken in the actual world. Even those doctrines, like Kelsen's "pure" theory of law, that would like to establish an apolitical, value-neutral science, purporting, in this manner, to follow Max Weber's orientation, are nonetheless the expression of a particular political and moral choice made between conflicting worldviews.

In fact, Kelsen's "pure" system is to be set in contrast to the "impure" ones of his antagonists—from Erich Kaufmann to Smend and Schmitt, from Heller to Triepel, von Ferneck, and many others,[3] especially the sociologists of law: Kornfeld,[4] Ehrlich, and Kantorowicz—and yet it is through this very comparison that the pure theory of law and the state clearly reveals its ideological foundation, a neoliberal one at the time of his *Hauptprobleme*,[5] and a social-democratic one during the first Austrian republic (especially under the influence of Karl Renner, among others).

What emerges in the rebirth of legal philosophy—a rebirth sparked by *Rechtsphilosophie* (1905), this little gem by Emil Lask—is the realization that without a worldview there can be no legal or political thought, that our choice among conflicting values is part and parcel of modern historical time, a necessary consequence.

It is precisely the different worldviews that determine the parameters of the problem of choosing a method in legal science, a problem that can be reframed in terms of a basic dilemma: Is it the method that determines the object of scientific knowledge, or is it the object that conditions and determines the method of science? Or, stated otherwise: Can there be a single method in the sciences of the spirit (and so also in jurisprudence), or is it necessary to rely on a plurality of methods in order to grasp the object in its concrete reality? The problem of the method thus emerged as *the* central problem in the theoretical debate in Mittel-European culture in the decades straddling the 19th and 20th centuries: Can there be a science of the spirit endowed with

[3] On some of the critics of the pure theory of law, see Korb 2010.

[4] For a comparison of Kornfeld's sociology of law with Kelsen's first *opus magnum*, see the interesting considerations that Rudolf von Laun makes in his book review of that work by Kelsen (Laun 1911); see also Kornfeld 1912a.

[5] Writes Kelsen: "Since the results of my investigations coincide here with many results of the old liberal theory of the state, I could never gainsay anyone who should see in my work a symptom of that neoliberalism which in recent times seems to be everywhere on the rise" (my translation). The German original: "Da sich dabei meine Resultate mit manchen der älteren liberalen Staatstheorie berühren, so möchte ich mich auch keineswegs dagegen verwahren, wenn man etwa in meiner Arbeit ein Symptom jenes Neoliberalismus erblicken sollte, der sich in jüngster Zeit allenthalben vorzubereiten scheint" (Kelsen 1911, XI, n. 5).

the same "objective" power of knowledge as that afforded by the natural sciences? This is a question in response to which the reaction against the uncritical positivism of the 19th century offered substantially different answers: Hans Kelsen sought to elevate jurisprudence to the rank of an authentic science, championing the idea of a method proper to law, namely, the formal, normative, logicizing method. By contrast, those who subscribed to the neo-Kantianism of Windelband, Rickert, and Lask, as well as those who instead advocated a return to metaphysics in matters of law and politics (as in the example of Erich Kaufmann),[6] underscored the urgent need for a method originating in concrete life, in social and historical reality, rather than in the abstract exigencies of formal reason. This debate was rooted in express and discrepant worldviews, each of which ultimately entailed a moral choice, and for this reason, they remained irreconcilable. This is clearly apparent in the problem of the relation between the individual and society: For Kant—who was the point of departure for this philosophical rebirth—society is a derived entity arising out of an agreement made among individuals, and it is therefore without its own foundation. Society is always to be understood, logically, as dependent on individuals considered in their plurality. The social contract is the necessary limitation that individual reason imposes on itself collectively in order to prevent the pursuit of individual interest from entailing the possibility of individual annihilation. The logical *prius* in Kant always rests with the individual. However, in the late 19th and early 20th centuries, European intellectual culture, and in particular the German-speaking one, emphatically posed the problem of the legitimacy of an investigation into society as an autonomous object of reflection. (The question whether society was still to be conceived in an individualistic sense or as a "community" was another problem still.)

This irreconcilability among worldviews now gave rise to a question: Should we operate *within* the contrast or should we go *beyond* it? The problem at this point became strictly philosophical: Relativism or absolutism? Authors such as Hans Kelsen and Gustav Radbruch were avowedly relativist: Both of them were, after all, mindful of Max Weber's teaching. And no doubt relativism—especially to the extent that it operates as the theoretical form of political pluralism—cannot but serve as the point of departure for any reflection on the world and on life, and so on that part of life and experience which is law. It is my conviction, then, that relativism forms the necessary background to contemporary philosophy: as its point of departure, certainly, but *not as its point of arrival*. The modern consciousness is certainly that of one who doubts, but action presupposes a choice, and every choice presupposes a conviction: It thereby entails a decision, and that takes us outside the realm of doubt, and so of relativism, even though doubt and relativism cannot fail to come back immediately after each decision, if we are to maintain philosophy's critical outlook.

[6] See E. Kaufmann 1960 and Lepsius 1994, 334ff.

The debate that in the German-speaking world in the early decades of the 20th century involved thought in general, but especially legal-political thought, remains of contemporary relevance, for we are still engaged in this discussion, even though relativism seems to have been supplanted by a more marked nihilism, by what is called a philosophy of the "postmodern." This is precisely the point where the properly philosophical task of thought comes into play, in that thought is entrusted with rising above the deceptive contingency of the moment and bringing to light possibilities the ordinary eye cannot see; the clash among worldviews has not been exhausted but has only fallen into a slumber, for there is no historical time that can escape the moment of decision and the morally driven taking of positions, and this also holds for the sceptical and disenchanted time of the "postmodern."

Neo-Kantianism can be given credit for having brought philosophy back to the forefront of the debate on knowledge; by the same token, it has the merit of having raised, in one way or another, the problem of the concrete contents of social experience (and so also of the experience of the law), but it also has the demerit of having been unable, on the basis of its own methodological preconditions, of satisfying the quest to understand such contents, that is, to give them a foundation grounded in knowledge and rationality.

The problem of method would thus move to the centre of the philosophical debate. The process was, in truth, initiated by Lask (1905), but it continued with Adolf Reinach and Gerhardt Husserl, with Julius Binder's criticism of Stammler's "social idealism" (Binder 1915), and later with Erich Kaufmann's critique of neo-Kantian philosophy of law and with the return to a Hegelianism no longer conceived as the mere form of positivism (as it still was by Josef Kohler) but as a substantive legal-philosophical position that turns on its head the relation between logic and matter, form and content, *ought* and *is*, with outcomes which sometimes turned out to be philosophically reasonable (with the neo-Hegelianism advanced by Kaufmann, Binder, and Larenz) or which proved to be dialectically original (as in the concrete conception of the legal system developed by Carl Schmitt, with a significant appropriation of Hegel). These approaches were also accompanied by the rapid rise, especially in the late 1920s and early 1930s, of a legal irrationalism proper which discards the dialectic between the primacy of form versus that of matter, and which in its place ushers in the primacy of mere intuition, of a worldview as an instinctual choice, along with the primacy of will and, in politics, as we know, of free will understood as the exercise of discretionary power. In this sense, neo-Hegelianism positioned itself not only as an alternative to neo-Kantianism but also as a companion to it—at first a concealed one, then a manifest one, and finally a dialectic opposite—always breathing new life into the problem of matter and content vis-à-vis form and logic.

It was Julius Binder who, following Lask, emphasized the abiding lack of originality in the philosophy of law at the beginning of the 20th century, while also indicating that the methodological movement itself was bound to force

the philosophy of law to rethink itself beyond just heeding its methodological "impulse." "And in point of fact," as Binder remarked in 1926, "if Lask were to report today on the current state of legal philosophy, he would certainly find that from the turn of the century onward the discipline has gone through a positive change, for it has abandoned its original unsystematic condition and dogmatic rigidity and has managed not to be consumed by idealistic reminiscences, fully consciously rising to its methodological task and growing into a theory of the science of the state" (Binder 1926b; my translation).

For Binder and the other Hegelians, as well as for the phenomenologists, the great merit of neo-Kantianism is that of having disposed of the various nonphilosophical currents that had been dominant in Europe in the second half of the 19th century: positivism, empiricism, naturalism, historicism, and psychologism. Philosophy neither is nor can be the overarching unitary form of various specialist forms of knowledge: It can only be knowledge in itself, that is, a logico-transcendental critique of knowledge. And yet, as Binder also emphasized, while to "separate the objects of knowledge into form and matter, into intellect and sensibility, into a logico-conditioning element and a conditioned nonlogical one can be hailed as an achievement," it is just as true that this separation placed a dangerous limitation on the concept and tasks of philosophy. Philosophy became a doctrine of formal conditions, of the validity of the presuppositions underpinning the single sciences, and it thus renounced its claim to what it once had been, namely, a science of actual contents (ibid.). Not every system of law was changeful, perpetually in becoming. And so, already in the late 19th century, when natural law theory purported to find a material content of law and of legal norms that would forever be valid, Bierling responded by laying the basis for what he would describe as a theory of legal principles, a theory distinct from the philosophy of law understood as framed by the complex of problems "that reveal the place and the meaning that pertain to the law within the overall order of the world" (Bierling 1975, 13; my translation). The point of the theory of legal principles was not to derive legal content by working from reason, from human nature: Its task was exclusively to grasp in a logically unitary way the necessary conditions for any possible system of law, and to contrapose to the empirical legal sciences the conditions so obtained, understood as formal legal concepts (ibid., 1–16). So the effort, as early as the end of the 19th century, was to arrive at a concept of law that does not amount to a mere abstraction from legal facts but has a logical valence of its own: Much earlier than Kelsen, and indeed Stammler, the quest was on for a "pure" concept of law. To this end it proved necessary to abandon the domain of empirical inquiry, the historical given, and move into that of logical theory; we can see this, for example, in W. Schuppe (1883, 349) and then in Bergbohm,[7] who drew

[7] Writes Bergbohm (1973, 73): "Only one conceptual definition can be the right one, encompassing all the real laws of all times; in fact, the formal concept of law is only one" (my trans-

more directly on Bierling; indeed, Bierling marks "a turning point in the history of legal philosophy," a turning point on the path toward Stammler and then toward Hans Kelsen's "pure theory of law."

Hence, in conclusion, if we abstract from the more specific positions taken by the single authors who have contributed to the philosophy of law in the German-speaking world, this philosophy becomes clear evidence of a clash of concepts. This clash is to be understood as a clash among different conceptions of life and of the world, this with its necessary corollary, namely, that even scientific concepts are mutable: These concepts need to change in accordance with perspective from which the central cultural problems arising in each different epoch are thematized. In this regard, Rickert and Weber were more perceptive than others in holding that science advances by actively relinquishing its old paradigms,[8] and this encompasses the cultural sciences, including history, of course, but also the science of law. Both forms of science, as even Kelsen would indicate, concern themselves with values—but with values that can be either objective or subjective, with remarkably different consequences depending on whether objectivity is ascribed to individual values or to values proper to the collectivity, to the "social" dimension. Value was understood by Windelband as individual in nature (in conformity with the subjectivist revolution of Christianity); however, science was still underpinned by the need to seek objectivity. This was the source from which would emerge the various currents of German legal philosophy in the first half of the 20th century. From this source, some currents were led to accentuate individuality over objectivity; others, in contrast, were led to assert collectivity over subjectivity, in a rich and fruitful dialectical crucible involving schools, theories, and personalities that constitute the unique and unrepeatable character of this philosophy of law in the intellectual history of contemporary Europe.

lation). The German original: "Nur eine Begriffsbestimmung kann die richtige, alle wirklichen Rechte aller Zeiten und Völker umschließende sein, denn der formelle Rechtsbegriff ist selber nur einer."

[8] "Conceptual schemes in the cultural sciences have their moments of youth, maturity, and decline, their phases of dawn, day, and dusk" (Oakes 1988, 37).

Chapter 1

THE REBIRTH OF LEGAL PHILOSOPHY WITHIN THE FRAME OF NEO-KANTIANISM

by Agostino Carrino

1.1. Neo-Kantianism of the Baden School as a Philosophy of Values: Windelband, Rickert, and Lask

The neo-Kantianism of the Baden School, the so-called "philosophy of values," was largely influential in legal philosophy. This school did not confine itself to offering a logical explanation of the way thought proceeds, nor did it seek to posit moral rules derived from reason. As von Rintelen has observed, "its chief endeavor was to pervade the whole of cultural life, and it is [...] indebted to Kant's 'practical reason'" (Rintelen 1970, 21). The reality forming the object of thought (rather than just the reality *produced* by thought) does not result from any logicizing activity, for it can be observed to contain alogical, irrational elements, so that we have to do here, properly speaking, with a philosophy of culture.

The school's founder, Wilhelm Windelband (1848–1915), could not content himself with interpreting Kant: He wanted to go beyond Kant. Doing so meant applying the transcendental method not just to the world of nature but to that of culture. In this way, however, the Kantian method proved to be no longer adequate. The best-known work by Heinrich Rickert (1863–1936), a pupil of Windelband, is devoted to just this question, illustrating the "limits" (*Grenzen*) of the method of the natural sciences, whose concepts cannot explain, for example, the moral imperative of justice or the meaning and value of cultural creations in art, religion, and poetry, where what counts is the individuality of creation, not the generalization of a law of nature. The method of scientific positivism is only suited to the reality of nature, where the concepts we work with are general: It cannot work where the core element lies instead in the individuality of the real, and where this real, unlike the real of the natural world, carries some meaning. If we consider the real from the standpoint of what is general, it becomes nature, whereas if we consider it "with regard to the particular and the individual" (Rickert 1962, 133),[1] it becomes history. However, in Rickert (whose position, not incidentally, is in any event neo-Kantian) Dilthey's "sciences of the spirit" (*Geisteswissenschaften*) become "sciences of culture," for we are not looking at an ontological distinction, as in Dil-

[1] The German original: "Die Wirklichkeit wird Natur, wenn wir sie betrachten mit Rücksicht auf das Allgemeine, sie wird Geschichte, wenn wir sie betrachten mit Rücksicht auf das Besondere und Individuelle" (Rickert 1915, 55).

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_1

they, but at a methodological one: The sciences of culture are sciences whose object is a "senseful" reality. The "spirit" of Dilthey's *Geisteswissenschaften* appeared too ambiguous to Rickert, bordering on the psychologistic approaches concealed in the term *spirit*.

Reality is only one and is something empirical: It becomes "culture" if brought into relation to value. This at once explains the criticism the neo-Kantianism of the Baden school would receive from Hans Kelsen, for whom law is not in the least empirical but is purely normative, a concept (the normative) that in Rickert's philosophy is, once again, always homologous with that of value, which cannot in itself form an object of scientific knowledge, except insofar as a value "attaches" to something empirical, including to the phenomenon we call law. Whereas naturalistic knowledge must be generalizing, and its concepts as general as possible, our knowledge of culture (of that real to which a value "attaches") must avail itself of "individualizing" concepts, because in the world of culture the more a concept is abstract, the farther it will be from reality. Obviously, the value relation must be clearly distinguished from evaluation: "However, individualizing representation can be called *scientific* only if it is governed by *general* or cultural values. Where these generally accepted values are not present, objects possess scientific significance solely as exemplifications of specific or generic types" (Rickert 1915, 130; my translation).[2]

It is toward the value of truth that practical activity must steer, but the relation between truth and practice would not find a uniform interpretation, especially as concerns Rickert and Emil Lask. Indeed, for Rickert truth has its source in logical thought, whereas in Lask value inheres in practice itself: This imparts a relativity to practice, a relativity that brings Lask into connection with Nietzsche, in contrast to neo-Kantianism, which on the whole belongs

> to that direction of German philosophy which, in reaction to Nietzsche, sharply rejects the relativization, transformation and variability of the values of life. The goal of these (neo-Kantian) philosophers is to establish philosophical truths and norms which possess the character of unconditionality and universal validity; for according to them, only when this is achieved philosophy can be called a science. (Rintelen 1970, 25)

In this sense, Rickert can be distinguished both from Lask and from Windelband, in that Lask's focus was on universal validity, whereas Windelband was better equipped to understand the meaning of the individuality of cultural phenomena, distinguishing the nomothetic method, proper to the natural sciences, from the ideographic method, proper to the cultural sciences as sciences concerned with individuality.

[2] The German original: "Wissenschaftlich aber kann die individualisierende Darstellung nur genannt werden, wenn es allgemeine Werte oder Kulturwerte sind, die sie leiten. Wo diese allgemeinen Werten fehlen, haben die Objekte nur als Gattungsexemplare eine wissenschaftliche Bedeutung."

Emil Lask (1875–1915)—"the keenest of the neo-Kantians" (Lukács 1967, 323; my translation)—was the first who, with his call for concreteness ("Drang nach Konkretion": Lukács 1918, 350) grasped the function that conceptions of the world and practical-personal decision play even in logic (Bloch 1968, 154), in such a way that his thought, even though it proceeds from Windelband's and Rickert's philosophy of values, can comfortably be situated among the currents of life philosophy that flourished at the turn of the century. Among the thinkers who stimulated Lask's philosophizing, S. Marck (1929, 39) mentions three: Dilthey, Bergson, and Simmel.

In philosophy, Lask anticipated Nicolai Hartmann's ontology (and not just that, if we consider his influence on Heidegger: see Demmerling 1992, 241ff.), for example, and on Lukács (Rosshoff 1975), and in legal philosophy Lask anticipated conceptions such as Georges Gurvitch's and Gustav Radbruch's (Carrino 1983, 108ff., 137ff.). This set Lask in contrast to the general positions advanced by Rickert, whose "Pathos der Pathoslosigkeit"—as Rickert himself called it, making it a distinctive trait of all great philosophers (Rickert 1921, 155)—could thus be interpreted by Hans Welzel, for example, as a expression of absolute value-neutrality, and hence as an expression of the late-liberal mode of thinking, geared toward a neutral-agnostic foundation of the idea of the state (Welzel 1935, 52–3). As Welzel wrote, "the idea of a method that determines the object, an idea that became a dogma in late-liberal science, especially of criminal law, is nothing but an emanation of the scientistic attitude that substitutes 'methodologically formed' concepts for the ontic element" (ibid., 50; my translation).[3] This conception, however, is distinctive to Cohen's neo-Kantianism and can hardly be ascribed *in toto* to Rickert's philosophy or to southwest German neo-Kantianism in general.

Lask's philosophy, marked by a basic Platonic and Neoplatonic bent, cannot be made to fall squarely within neo-Kantianism, whether it be the Baden or the Marburg variety. There is a basic doubleness with which his philosophy is imbued, for on the one hand he tends toward "things themselves," in accordance with an ontologically oriented mode of thought, while on the other hand he cannot do without the gnosiological positions of a mode of thought at once aprioristic and to some extent subjectivistic. For Rickert (at least until 1909–1910) the alogical element rests with givenness, as such undifferentiated, which only by logical form can be constituted in its particularity; for Lask, by contrast, the primary element in the relation between form and material (he

[3] Here, too, we must recall the judgment expressed in E. Kaufmann 1921, 244: "The theory of knowledge without a concept of the truth, psychology without the soul, the science of law without the idea of law, *Gesinnungsethik* without morality, the science of the spirit without any feeling for the concrete world of the moral feelings: These are the children of this time. [...] Neo-Kantianism thus unwittingly turned into the contrary of what it wanted to be: The immediate precursor of that *Spengler-Stimmung* that has no confidence in itself, of the most recent disease of the people's soul robbed of all metaphysics of the mind" (my translation).

calls this element "autarchic": Sommerhäuser 1965, 104ff.) is to be found in material. In this way, Lask restored the rightful claims of history over against those of reason, but this without ever neglecting the inescapable presence of categorial forms, that is, of reason, in the process of knowledge. Lask's logic retains the concept of value found in Rickert's neo-Kantianism, but only to the extent that value is thought contemporaneously with a practical behaviour of the acting subject, and so with a position taken, a choice made between conflicting values, a concrete decision.

Lask's conception of irrationality assumes a significant role in his thought. The irrational—that which is totally devoid of validity and meaning—is identified in the first place with the material element of our knowledge of being, with the sensible and intuitive, with the *prote ule* ("original matter"): "Nothing do we know about nature other than that therein lies what is devoid of meaning, what is isolated and dead" (Lask 1923–1924, 263; my translation). In the second place, from a theoretical point of view, the irrational is identified with the alogical or nontheoretical. Finally, the irrational is content without form, the "logically naked:" Logical nudity—an essential part of which lies precisely in the multiplicity of human beings—"points to a situation or, more precisely, to the lack of any situation in which something bears a relation to logical form" (Lask 1911, 74; my translation). Logical nudity thus constitutes the absence of any relation to logical form; this means that the formal logical moment is exclusively tasked with a "clarifying mission" with respect to the condition of logical nudity, because "the distance between form and content remains insurmountable" (ibid., 75; my translation).

1.2. The Neo-Kantianism of the Marburg School: Cohen, Natorp, Cassirer

The neo-Kantian current which originated with Hermann Cohen (1842–1918), and in which we also find Paul Natorp and Ernst Cassirer, is the one whose influence on legal philosophy was greater, both for the better—having influenced the best-known legal philosopher of the 20th century, Hans Kelsen—and for the worse, having sparked bitter criticism for its formalism and abstractness. Indeed, what for this philosophical current lies at the centre of reflection is the question of method. Philosophy essentially amounts to methodology, so much so that Natorp styled himself a "pan-methodist": "Philosophy," he said, "is method, nothing but method." It is method that determines the object of philosophy, and mathematical method, in particular, stands as the clearest symbol of scientificity as such.

The neo-Kantianism that developed out of Marburg squarely upends the usual way of looking at the world, just as it overturns the philosophy of experience propounded by someone like Dilthey. Indeed, what for this current comes first is not the world of concrete experience but that of thought. The Marburg circle represented in this sense the opposite of every form of realism:

It is reality that "must" adapt to thought, rather than ideas to reality. Marburg neo-Kantianism thus carries to an extreme the tendency proper to idealist philosophy, for which everything depends on (or "must" depend on) the logical characteristics of the method by which knowledge is attained.

Cohen is certainly the most significant exponent of the neo-Kantian movement, and there is no doubt that in the then-current antiphilosophical climate of triumphant positivism his philosophy constituted an attempt to redeem philosophical reflection as an autonomous activity which can be valued in its own right: As Dussort has observed, his work "advanced the cause of philosophy at a time when the very idea of philosophy seemed to have been all but disqualified" (Dussort 1963, 23; my translation). To be sure, some have sought to reduce Cohen's work to a "return to Kant,"[4] or even to a Kantian philological exegesis, pure and simple, and some still view it that way, but certainly his philosophical attempt goes well beyond that, all the more so if we consider Cassirer's 1922 remark that modern logic has remained, like that of Plato, "a logic of scientific knowledge, and in particular a logic of the mathematical science of nature. Hermann Cohen has the lasting merit of having been the first to surefootedly point out this line of development, and to have held it up to the brighter light of historical and systematic knowledge" (Cassirer 1983, 4; my translation). And very recently some have unhesitatingly laid out their heartfelt belief that in neo-Kantianism, and especially in Cohen's approach to it, "lies the most significant expression of western European thought," to the extent that its underlying idea, the idea of humanity, constitutes "the irrefutable and undeniable truth that finds its realization in epistemology, ethics, and aesthetics" (Kluback 1987, VII).

Unlike Kant, whose concept of knowledge rested on a synthesis between the intellect and sensibility, between categorial forms and content deriving from our experience of the physical world, Cohen took knowledge to be synonymous with the idea of primevalness, or of the origin in a formal-mathematical sense: "Thought is thinking of the origin" (Cohen 1977, 36; my translation).

The problem of the origin or wellspring—the *Ursprung*—draws us right into the core problem of Cohen's philosophy. If thought is the origin, then it must be the "foundation," the *only* possible foundation:

> Nothing at the origin can be given. The principle is the foundation in a strictly literal sense. The foundation must necessarily become the origin. If thought should discover being anywhere other than in the origin, this being can really have no foundation other than that which thought is capable of giving it. Only as the origin's thought does pure thought become real. (Ibid.; my translation)

Being is for Cohen the being of thought, and consequently thought, as the thought of being, is "the thought of knowledge" (ibid., 15; my translation).

[4] On the multiple "returns to Kant," see Dussort 1963, 29–59.

The purity which Cohen speaks of—and which, along with Husserl, exerted much influence on certain legal philosophers, and in particular on a jurist like Hans Kelsen—is none other than the absolute formalism of mathematics, that is, the formalism of an autonomous legality (Winter 1980, 191). And it is paradoxically this concept of *Reinheit* that makes Cohen's idealism a "true realism" (Lewkowitz 1974, 119; my translation),[5] which constitutes the logic of pure knowledge as the "system's foundation" (Cohen 1977, 601; my translation),[6] as "a transcendental methodology of the mathematical science of nature" (Winter 1980, 191; my translation).

The presupposition of philosophy is found by Cohen to lie in the *Faktum* of science, understood as the science of nature, a science whose organ is mathematics.

For Cohen, "things" themselves are a mere "prejudice" by comparison with the originalness of thought and its "mode of knowledge":

> Purity [...] seeks to clarify not things but our scientific knowledge. Only in this way can things themselves be ascertained. Things are only *apparently* given: It is only purity that brings them into the daylight; only in the early-morning light of the problem and the theme do things appear as given. (Cohen 1981, 93; my translation)

Cohen carried on Kant's work by searching for the value and gist of criticism and locating it in the idea of system. In fact, in the age of positivism, with the accompanying centrality and expansiveness of science, to take up the whole range of problems associated with Kant was, for Cohen, to turn to the problem of science, the problem of a unitary scientific method (Klein 1976, 25ff.). Science, method, unity, and system: These are some of the fundamental and inspiring concepts that inform the whole of Cohen's work, whose cornerstone lies in the principle under which "substance" is resolved into a functional "relation," into sheer dynamicity, continuous action.

1.3. Rudolf Stammler's Social Idealism

Rudolf Stammler (1856–1938) was certainly in his time, in the late 19th century and the early part of the 20th century, the most debated and controversial legal philosopher before Kelsen (Somló, 1917, 45, n. 2). He was the first to bring Kantian transcendentalism to bear on legal philosophy (not without feeling in certain respects the influence of historical materialism, even as this current's economistic monocausality needed to be superseded). His thought can be defined as social idealism, to the extent that he postulated the existence of

[5] On the religious meaning of the concept of *Reinheit* (purity) in Cohen, see Löwith 1987, 329.

[6] Writes Cohen: "The system's unity requires a central point in the foundation of logic. This methodological centre lies in the idea of hypothesis, an idea I have developed into judgment and logic of the origin" (ibid.; my translation).

natural rights having variable content. This social ideal is the idea of "a community of human beings who freely want" (Stammler 1926, 141; my translation), a community in which we each share the objectively right or legitimate (*berechtigten*) purposes of others; it is what regulates our being socially bound to one another and our cooperative action, and if we are subject to the law we must necessarily acquiesce in such regulation to the extent that we each decide free of any subjective basis of action. This social idealism of Stammler's is a form of natural law, and what makes it so—despite its being undoubtedly quite modernized when compared with classic natural law or with the Enlightenment's rational natural law—is that natural law always figures as that legal content which can orient the matter found perpetually in process of becoming in social life, in the "economy," aligning such matter with the community's ultimate purpose, and so with social life in agreement with the laws. But what does the "justness" of a positive legal norm depend on? Stammler believes it depends on our ability to critically assess and decide which positive legal norms, in any set of empirically given conditions, actually serve the ultimate purposes recognized to be generally valid for social life. *Contra* Bergbohm, on the hunt for natural law in every nook and cranny of legal science, Stammler refused to get caught up in the purely semantic debate on what law "actually" is and whether this name ought to be reserved for positive law: "This debate can reasonably only be about the question of whether next to the law positively in force there can also be an evaluation (*Erwägung*) concerning law as it ought to be and toward which positive law should orient itself as an admissible and possible avenue" (Stammler 1896, 172ff.; my translation). Accompanying empirical law on every cultural level is thus an ideal of how such law ought to be, and this ideal—always in flux— advances closer and closer before the legislator, pressing the claim that is needs to be realized. Stammler no longer conceives reason and history as set in eternal contraposition to each other, in a struggle to achieve exclusive dominance to the exclusion of everything else, but as two factors both worthy of being considered and defended. Reason becomes form; history becomes content; or, more to the point, reason becomes the form of norms, and history their factual content.

Natural law does not stand in opposition to positive law but rather enters into a relation of possibility with it; it is not a suprahistorical law but a claim arising out of society, a claim by virtue of which the legislator becomes one entrusted with answering the people's needs in every phase of their cultural evolution. The criterion of natural law may be relative and historically conditioned, to be sure, but it is a formal criterion nonetheless, insofar as justice is for Stammler the outcome of a logical operation that must harmoniously coordinate the various elements which make up the life of the law. As Stammler comments:

> We are not after a *perfect* legal content, nor, in any way, are we after an *ideal* law. Far be it from us to lay down a system of unconditionally just legal provisions sitting next to or on top of the law

that conditionally transforms itself. The *pure* theory of law we want to lay out is by and large exclusively concerned neither with the particularities of a legal content nor with legal norms or legal institutes filled with some content, but *with the universally valid type and mode of legal thought*. (Stammler 1911, 33; my translation)[7]

We can see why Kelsen should have made out Stammler to be a precursor of the pure theory of law, an expression that, after all, turns up in Stammler's 1911 *Theorie der Rechtswissenschaft* (Theory of legal science) before it prominently figures in Kelsen's work. Still, even in Stammler, the criterion's historicity paved the way for an opening to the need for a material discourse on law and justice. This form of natural law thus escapes *ab origine* the traditional criticisms levelled at natural law: It does so inasmuch as this criterion is relative, historical; or rather, it is the criterion of reason itself which dwells in history and in the becoming, and which accordingly does not make any pretence to absoluteness but rather dialectically confronts the legislator so that the norms of positive law may as far as possible answer and correspond to the historical needs of the "economy." Methodologically, Stammler's Kantianism clearly reveals itself to be in essence wholly individualistic as concerns its concept of a community, a concept that does not stand in contradiction to individual morality but rather, in some way, *issues* from it, to the extent that, as Wielikowski observed at the time, society is conceived by Stammler as "something derived or secondary, an emanation" (Wielikowski 1914, 72; my translation): The primary logical givenness rests with the individual, and only out of the relationships among individuals does something like a "society" arise. On close inspection, the humanity that Kant speaks of always comes down to the abstract value of the human person—a historically decisive value, to be sure, but abstract nonetheless, in the final analysis. Stammler drives to extremes Kant's possible "communitarianism" and his "idea of community," an idea whose dominant factor, as Lask observed, lies in

that same idea on which basis individualistic legal philosophy all through time has invoked the contract, understood as a meeting of the minds among morally autonomous individuals, elevating it to the status of the only principle by which to legitimize social institutions. Stammler emphatically points up the peculiar empirical makeup of what is social, but this peculiarity in no way corresponds to any peculiar makeup of value. (Lask 1905, 285; my translation)

Even if Stammler—contrary to the interpretation that Binder gave to his philosophy of law—pretended to a certain originality with respect to Kantian and

[7] The German original: "Wir suchen nicht nach einem *vollkommenen* Rechtsinhalte und fragen keineswegs nach einem *idealen* Recht. Es liegt uns ferne, ein System von Rechtsbestimmungen, die unbedingt richtig wären, neben oder über dem bedingt gewordenen Rechte aufzustellen. Es handelt sich bei der *reinen* Rechtslehre, die wir ausführen wollen, überhaupt nicht um die Besonderheiten eines Rechtsinhaltes, gar nicht um stofflich gefüllte Rechtsnormen oder Rechtsinstitute, sondern *um die allgemeingültige Art und Weise des juristischen Denkens*."

neo-Kantian currents, laying claim to a purported "Socratism" of his own, there is no denying that his philosophy of law is in many ways neo-Kantian, in certain respects not independent of Paul Natorp's philosophy, and that in any event it, too, along with the legal philosophy of such other jurists as Jellinek, anticipated the methodical "purism" that would soon thereafter be embraced by legal science. Such methodical purism, however, served a broader purpose in Stammler than it would in Kelsen: Whereas Kelsen would construe it as the "purity" of the method that pretends to know the "positive" law, Stammler with fewer contradictions stuck to a view of it as a logical procedure which in any event never departs from the experience of the law itself, and which is tasked with bringing to fruition the relation between natural law and positive law. This was not a prejudicial natural law but a constant aspiration:

> The law is an attempt beholden [*Zwangsversuch*] to what is right [*zum Richtigen*]. This quality is inherent in all the specific norms a legal system will posit: It is a quality inseparably bound up with such a system, despite the fact that it may on occasion be obscured and disavowed, and no matter how many gross mistakes may still linger as to what is right [*Richtige*]. (Stammler 1928a, 154; my translation)

As is widely known, Kant's Copernican revolution consisted in conceiving the object of knowledge not as something "given" to consciousness but as an *a priori* synthesis combining the senses, on the one hand, and forms, or categories, on the other. Now, it is clear how Stammler, as early as in *Wirtschaft und Recht* (The economy and law: Stammler 1896), rested his entire inquiry on the separation of form and matter, a separation which in later works evolved into the distinction between conditioning form and conditioned matter, and which is considered a legacy of Kantian criticism. Indeed, what it is to pose the problem of the formal conditions of any legal knowledge is essentially to translate into legal terms the problem that Kant posed with respect to our knowledge of the science of nature. Even Kelsen, in his 1920 foreword to his *Problem der Souveränität* (The problem of sovereignty), recognized the "great credit" that Stammler deserves for having fruitfully brought Kant's transcendental method to bear on the philosophy of law. Stammler sought to clarify the fundamental law by which social life is underpinned: This he did by outlining the determining categories of the legal world. Indeed, he set out to identify the pure concept of law which precedes *any* concrete experience of the law. This universally valid concept of law was identified by him with the concept of an autonomous, inviolable, binding will. Law is not a phenomenon external to consciousness; nor is it something substantial, a force, a power, a spiritual thing; nor is it a product or part of our will: It is rather will itself in its universal validity, independently of whatever contents are willed (Stammler 1911, 113).

In this way Stammler rooted out the old antiphilosophical conceptions of 19th-century positivism, but in point of fact this pure—i.e., formal or categorial—concept of law cannot really be pure, or only formal: It is rather a univer-

sal empirical concept. And so, even in Stammler, the question "What is law?" is answered by way of an induction. As Julius Binder observed in his criticism of Stammler,

> every act of willing resides in the sphere of the factual: Willing is an empirical fact, a psychological process. It can thus be narrowly or broadly conceptualized, but the concept assigned to it cannot be described as "pure," that is, free from empirical content, which is changeful. This will is thus defined proceeding from such content, but it cannot be thought of as an *a priori* form of any legal content whatsoever, for it, too, is content, and if the concept is accurately determined, it will define some legal content. In a word, if the legal norms of natural law are valid, they are so only as concerns the positive law. (Binder 1915, 34; my translation)

Indeed, what can be observed to happen when the transcendental method is applied to the sciences of the spirit is that we wind up introducing a misunderstanding with portentous consequences in many ways unfortunate: Kantian criticism is limited to the natural sciences, and its application to the social world carries with it the risk of a crass naturalism, a risk whose tentacles even catch hold of Stammler, despite the effort that in *Wirtschaft und Recht* he devoted to fighting naturalism in the social sciences. Legal science is a practical science, however loose this definition may be, and this makes it subject to a "law-likeness" that cannot be other than the law-like behaviour of nature. What matters in the phenomena of the social world is the sense of the givens that present themselves to the intellect, and this is especially true of law and politics, with respect to which there is no proper role for the categories the intellect relies on in gaining a knowledge of nature, for these categories (magnitude, causality, substance, and the like) are limited to the mathematical science of nature. For Stammler there is "form" on the one hand (that is, reason) and matter on the other (that is, history); and form does not change with the different contents, the former being *a priori* and the latter *a posteriori*. And yet it is clear that these contents—which for Stammler are wide-ranging and many, responding to the legal ideals espoused by different nations over time—cannot really be devoid of any influence on form. Still, it must be that we can work out in a different way the relation between formal categories and contents, for it is clear that immutable and suprahistorical forms can take any content subject only to the condition of their having no influence or relevance. But then it was Stammler himself who set out to bring history back into contact with reason. So, if on the one hand his work marks a watershed in the late 19th and early 20th century, introducing a revolution proper in legal philosophy (which in large part sought to fulfil the jurists' dream of elevating law to the status of the foremost social science, dominating all the others), on the other hand, no matter how praiseworthy his attempt may be, it must essentially be considered a failed enterprise: As Max Weber has shown in his criticism of Stammler (Weber 1977) this is due in the first place to Stammler's confusion between facts and values, between *is* and *ought*, a distinction that Stammler failed to main-

tain owing to the spirit that informs his legal methodology, a spirit that can somehow be described as all-embracing. Standing opposite to this analysis was the criticism that Hermann Cohen himself had devoted to Stammler and to the *Theorie des richtigen Rechts* (Theory of just law): In *Ethik des reinen Willens* (Ethics of the pure will) Cohen had faulted Stammler for having *separated* law and morals (Cohen 1904–1907, 214, 72) observing that moral willing and legal willing run on two separate, albeit parallel, tracks in Stammler, to the extent that morality deals with an *inner* willing and law with an *outer* one, with the consequence that morality falls outside the sphere of what is social.

For the reasons discussed, Stammler's philosophy of law is essentially a wavering philosophy, and it is not incidental in this regard that whereas Cohen's neo-Kantianism would be branded by National Socialism as Jewish, Stammler's philosophy of law would become an object of criticism, but never with a view to disqualifying it altogether. Karl Larenz, for example, would judge it "a precursor of a German legal philosophy" (Larenz 1938a, 269; my translation). Likewise, C. A. Emge, in the obituary he devoted to Stammler in 1938, noted that Stammler had taken part in a conference in the presence of Dr. Frank, minister of justice under Hitler (Emge 1938, 335). And E. B. von Oppen would comment that Stammler's *Lehre vom richtigen Rechts*, so unsparingly criticized by Cohen, could be interpreted as consistent with the worldview of National Socialism (Oppen 1935–1936, 271ff.).

1.4. Emil Lask's Philosophy of Law

Despite the recognized importance of Emil Lask's (1875–1915) *Rechtsphilosophie* (Philosophy of law), the text is essentially ambiguous. Indeed, it can be read as a reflection on the legal problems that had come to the fore with Windelband's *Wertphilosophie*, especially as concerns the problem of method; but it can equally be read against the backdrop of Edmund Husserl's *Logische Untersuchungen*, Ferdinand Tönnies's sociology, Simmel's relativism, and Hermann Cohen's social ethics; and certainly it can also be read through Lask's effort to elaborate a philosophical system of his own that would move beyond Kant, from which it follows that the text can also be read in light of Lask's later writings on philosophical logic (dating to 1911 and 1912) and his posthumous fragments edited 1923 by Eugen Herrige. *Rechtsphilosophie*, written for a *Festschrift* devoted to Kuno Fischer, the historian of philosophy, is the only text that Lask ever devoted to problems in legal philosophy, and yet it exerted a remarkable influence on the German jurists and theorists of the early 20th century, notably on Gustav Radbruch, but also more broadly on the exponents of the very antiformalist movement that followed the predominance of the neo-Kantian schools. It is significant in this regard that in his harsh *Kritik der neukantischen Rechtsphilosophie* (Critique of neo-Kantian legal philosophy) of 1921, Erich Kaufmann was firm in sparing Lask from

the charge of having jumped on the formalist bandwagon of legal neo-Kantianism. In *Rechtsphilosophie*, Lask proposes to analyze the method of legal philosophy and legal science, meaning that he sought to identify the place these disciplines occupy within the broader frame of the cultural sciences, understood on the model of Rickert's and Windelband's neo-Kantianism as sciences concerned with bringing cultural realities into relation with values in accordance with a method that would also distinguish Max Weber's interpretive sociology.

The critical theory of values, which makes up the basic framework of Lask's thought, conceives empirical reality as a single type of reality, thus making a clear departure from the natural law approach. Values are supraempirical with respect to this single reality: They do not inhere in it, nor can they be deduced from it, in the manner of the historicist method, but are derived from a purely intellectual operation on reality. And because the intellect can operate only through categories, it follows that the typical values, that is, the different "types of values," turn out to be a fundamental question for the philosophy of law.

As a theory of typical values, the philosophy of law makes possible two modes of operating on formal value: Either absolute values can be systematized without stepping outside the realm of values or, as happens in politics, we can take the concrete realizations of individual value into account by drawing a distinction between the value of the person (personalism, connected with the liberal worldview) and the value of the community (transpersonalism, connected with the socialist worldview), a distinction taken up and developed in particular by Gustav Radbruch.

Apart from legal philosophy in the strict sense, as a method for analyzing the *value* of law, legal science (a discipline somehow subordinate to legal philosophy) takes on the cast of a cultural science, the upshot of the theoretical relation between reality and meaning. (The object of legal science so conceived, as a cultural science, is the same as that of legal philosophy, except that in this case it does not bear an immediate relation to values.) In a broad sense, legal science can approach law from two standpoints, looking at it as either a "living social process," a real cultural factor, or as a complex of mere ideal meanings investigated through the lens of their dogmatic content. The first approach leads to a social *theory of law*, the second to legal science, which despite its specialist character likewise pursues the task of bringing the content of legal norms into relation with cultural meanings of value and purpose. "The law in a social sense exerts validity as a real cultural factor; the law in a juridical sense is valid as a complex of purely valid meanings" (Lask 1905, 302; my translation).

In this sense, Lask's position proved influential on teleologically and antiformalistically oriented criminal legal science (Baratta 1963) especially in the matter of value, of legal goods, of the aims of protection in criminal law, and of

the necessary relation between a norm's formal abstractness and the legal system's teleological concreteness. As the study of legal meanings, legal science is not only concerned with the systematic connections obtaining among the contents of legal norms—the object of a dogmatics of law—but is also engaged in working out on a theoretical plane the relations that hold between legal meanings and the law's prelegal substratum, between abstract forms and the concrete realities of culture and of everyday life within a community (with its specific constructions of value and form), between scientific and prescientific conceptualization (logic is not extraneous to the object, to the external world, but somehow resides *within* matter itself, within the object).[8] Reason lies not only in the world of the categories but also in the historical world, thus making each givenness the content of a form that in turn becomes the content of another categorial form. By comparison with extreme formalist views, Lask's *Rechtsphilosophie* can be said to have struck a middle ground and offered an opening to the new conceptions of legal philosophy that would emerge in the 20th century. To be sure, his philosophy of law did find itself attuned to a "normativist" line of thought whose clearest expression in this phase was Hermann Cohen's social philosophy, but in no way can it be ascribed to any radical formalist tendency, such as Kelsen's. Indeed, for Lask the teleological element cannot be expunged from legal science, and it is precisely this moment that reveals the impossibility of reducing the objectivity of law to an interlacing of pure logico-formal relations independent of history.

For Lask, inherent in law itself is a "conceptualizing spirit," a logical moment of high technical perfection. Laws, provisions, and rulings are for him mere "clues" to what the law is, which engages in the reality outside itself by devising concepts so complete that science can distinguish itself from it only "to the extent that it presents itself as the simple outgrowth of the formative process originating with the law" (Lask 1905, 316; my translation). Clearly, this logical element never comes in a pure form but always "interlocks with the practical element" (ibid.; my translation). Now, it is precisely this relation between the logical element and life, between law and life, that imposes some clearly defined limits on any extension of logical formalism, and these limits can be known only by maintaining a constant connection between methodology and epistemology, and so only if the concept of reality worked out within the theory of knowledge becomes the fixed point "exclusively starting from which the single strata of conceptualization—overlapping strata, one might say—can univocally be evaluated according to the different distances that separate them from their common basis in reality" (ibid.; my translation).

[8] "Unlike the empiricists, Lask held that logic is necessary for access to the external world, but unlike the rationalists he held that logic could serve as such a path only if it were itself located in the external world. Logic could never coincide with consciousness" (Motzkin 1989, 178; my translation).

Lask's legal philosophy, revolving around the idea of "objective value," presupposes a close connection between law and politcs. Lask does not abandon the value of Kantian personalism but considers it necessarily projected in the direction of social value. This idea evinces the presence of a clear legal-political Hegelianism in Lask's thought. It is no accident that the problem of concrete value appears to him to have been "the central problem of Hegel's system" (ibid., 287; my translation).

1.5. Ethics and the Science of Law in Hermann Cohen

In Cohen's logic, a significant role in "translating" theoretical thought into practical thought is played by the concept of totality, or *Allheit*. In fact, it appears to Cohen that, instead of *overcoming* moral relativism, the concept of *Gemeinschaft* actually *grounds* such relativism, insofar as, in his view, it is precisely "on the basis of this concept" that the community expresses a "relativity" (Cohen 1904–1907, 227; my translation). The community represents a mere majority, as against the *Genossenschaft* (Lewkowitz 1974, 123–25) to which instead the positive meaning of the *Allheit* does correspond. The idea that embedded in the community is something "absolute" (Cohen 1904–1907, 227) is for Cohen simply an illusion, perhaps influenced by religious tradition (Martinetti 1972, 164, 166, 175).

Cohen's "totality" can thus be distinguished from Tönnies's *Gemeinschaft* by virtue of its making no reference at all to any content or to anything "out there" in the natural world. "As an independent unit," Lask observed, Cohen's totality "detaches itself from its discrete real basis, which splits up into sensible individualities." Indeed, "in a thoroughly Hegelian manner," Cohen goes so far as to consider how all particularities ought to be subjected to the "state's coercive unity" (Lask 1923, 304; my translation). Hebraism's legalistic influence comes through in the deeply moral sense with which Cohen imbues the law: "It is in the laws," Lask comments, "that the moral actions of the state itself become complete, and the laws, in their sanctity and absolute universality, must be valid as irreplaceable concepts guiding the self-consciousness of pure willing. The law's formalism becomes in Cohen a symptom of its absolute adherence to values, of its purity, of its apriorism" (ibid., 304; my translation). Cohen's ethics can be construed as a fairly robust attempt to methodologically turn teleologically oriented legal science on its head by outlining a pure legal method, free from any psychological or sociological commixture. The principled separation between the is and the ought, between natural causality and ideal normativity (Cohen 1904–1907, 12ff., 27ff.) was intended to make possible a purely normative consideration of law, a scientific knowledge of norms independent of the overall process through which they are in effect issued, applied, and systematically connected (Wielikowski 1914, 124).

The law is a semi-closed system of formal meanings of values, a system admitting of no reference to any factual vital realities. Jurisprudence can in this sense be described as "the mathematics of the sciences of the spirit" (Cohen 1904–1907, 66; my translation)[9] the model on which to rest the objectivity of moral values. The central task of ethics is to discover the concept of man in its individuality. This concept, then, cannot be psychological or even anthropological, for these other concepts pertain to the individual and not to the universal. Nor can it be a sociological concept, for this is no more than the sum total of all individualities. Having ruled out sociology, psychology, and anthropology, Cohen turns to the science of law in the effort to capture this concept of man in its universality, and more specifically he turns to the construction that jurisprudence makes of the legal person by seizing on a purely formal concept of will.[10]

Indeed, the concept of a legal person means that this will of plural persons "does not become binding as a fragmented will," for "in this will, and in it alone, the pure unity of the will, and hence the legal concept of a person, attains its exact validity" (Cohen 1904–1907, 230; my translation). But it is not just through the concept of a legal person that Cohen builds his science founded on a "science" of law, on the *Faktum* of legal science. In this discipline he also finds a whole series of methodological approaches and insights that become fundamental to his construction of pure moral value. Therein he finds, in particular, the concept of juristic action (*Rechtshandlung*) and, specifically, the unity of juristic action. At several places (ibid., 63–78, 175), Cohen can be found to so understand the deep ("tiefgreifende") (Wielikowski 1914, 126) meaning the concept of juristic action has for an ethics of pure will. This concept of unity is what makes it so that ethics should contain "no objects or things; only action constitutes here the problem of content and of the object" (Cohen 1904–1907, 177, my translation; cf. Figal 1987, 173).

The idea of the state, understood as *Allheit*, constitutes the "apotheosis" of the unity of totality (Cohen 1904–1907, 212);[11] compared to every historically given and describable state, the state which lies in the rule of law stands as an idea "acting as 'a moral concept that guides self-consciousness'" (Figal 1987, 175; my translation). With Cohen, the law no longer appears as a system of concepts and of representations of given things or realities; the law becomes a

[9] "The science of law is analogous to mathematics. It can be defined as the mathematics of the spiritual (or human) sciences, and above all as the mathematics of ethics" (Cohen, 1904–1907, 66; my translation).

[10] On the concept of a legal person in Cohen, see Cohen 1904–1907, 212–40.

[11] As Cohen writes, "there can be no individual in an ethical sense without juridical communion" (Cohen 1904–1907, 214; my translation). "But the highest legal order is given by the state, which is none other than the complex of the norms that regulate relations among individuals in their totality (*Allheit*). The idea of the state is ascribed to a single entity that acts juridically as an ethical individual, that is, an entity whose lawmaking is driven by the guiding concept of a 'totalitarian' corporative political constitution" (Winter 1980, 327; my translation).

system of absolutely new entities, of new value-meanings that are neither realities nor abstractions. Ethics stands to legal science as logic does to mathematics and to the science of nature. Just as logic finds the presupposition of the natural sciences in pure knowledge, so ethics finds the presupposition of legal science in the concept of a pure will: "Ethics must find its completion in the philosophy of law" (Cohen 1904–1907, 227; my translation). "Ethics can be mastered only through legal science, in which it is rooted (ibid., 229) insofar as the material of legal science is the peculiar object of ethics" (ibid., 132; my translation). Action is to be construed as the carrying out of a will that only in legal science is considered to be neither a natural fact nor a psychological one (ibid., 105). Pure will does not depend on an object external to it: It is will in itself, constituting the *subject* behind pure will no less than it *constitutes* its object (ibid., 261). The concept of a moral subject is bodied forth in the concept of a legal person, and the concept of self-consciousness in the state takes shape as a "unity between the willing subject and the willed object" (ibid., 245; my translation). The pure will is concretized in its acts, and the state concretizes its self-consciousness in legislation: The state's will reveals itself in the laws, through which it is known. The state's self-consciousness is consequently concretized and developed in the laws, which stand as its actions. The pure willing of morals, a will that "has become objective by virtue of its being embodied in the state, is understood by Cohen to consist in the is of the ought" (Hohenhauer 1928, 315; my translation).

That, essentially, is the transcendental method which would also attract another Jewish liberal formed by Enlightenment ideals, namely, Kelsen, though the method distinguishes itself from the Kantian model by virtue of its calling into question Kant's dualism between sensibility and the intellect. For Cohen—and this would later become a key point in Kelsen's theory—universal, valid knowledge can be had only if the object of knowledge is determined by thought itself, by the transcendental method, or only if it arises out of thought in accordance with its own functions: "To find it legitimate or possible to give thought something which has not arisen out of thought itself is to fall into error, an error nurtured by the prejudice inherent in the word *given*" (Cohen 1977, 81; my translation). Cohen was attempting a systematic justification of the thesis that a continuity exists between the logical world and the moral one,[12] this for the purpose of treating ethics in a scientific fashion. But the attempt essentially came to nothing, for two reasons, the first being that there simply is no rigorously scientific treatment of ethics, and the second that, once we align ourselves with Kant in considering ethics a new kind of reality (the *is*

[12] Formally, Lübbe (1958, 338) observes, "Cohen grounds his practical philosophy in a precise analogy to his theoretical philosophy: Just as the latter proceeds from the *Faktum* of the exact natural sciences, so the former proceeds from the *Faktum* of the science of the spirit and of the state, so as to discover in this science the principles and basic categories of ethico-political life in society" (my translation).

of the ought), we will be hard put to it to explain how two specifically different realities (the logical world and the moral one) can be subjected to the same scientific method. Cohen attempted to extend the principles and method of theoretical reason to the sphere of moral freedom, but he neglected to consider that every cultural phenomenon—and so also the legal phenomenon—lies in an entirely peculiar tract of experience, for it belongs not with the experience of the physical world but with the world of freedom: "Our experience of the law is indubitably a form of practical experience, and it is therefore a mistake to apply to it the principles of theoretical reason, which are only valid for theoretical experience" (Opocher 1965, 88; my translation). The task of the pure will, therefore, can only be thought of as endless. In other words, Cohen's *Sollen* is a moral duty, not a legal one, and it cannot really be "positive." The justice that legally regulated action connects to finds its source not in a determinate political will but in religion, and specifically in Jewish religion and theology. The idea of justice as understood by Cohen "is theological and transcends the sphere of law even if conceived starting from this sphere" (Figal 1987, 182; my translation).

1.6. Ethics and Law in Paul Natorp (*by Federico Lijoi*)

Paul Natorp (1854–1924) can be grouped with Cohen and Cassirer among the main exponents of Marburg neo-Kantianism.[13] Natorp's objective was to reformulate the rigid contraposition between rational forms of thought and their becoming outwardly concrete in life, such that the rational and the irrational "do not coincide in any absolute way: They neither remain rigidly extraneous to each other nor resolve themselves into each other but both live only in eternal compenetration" (Natorp 1923, 182; my translation).[14] The unlimited and ongoing process innerving the constitution of objectivity is described by Natorp as a tension between a subjective pole (individuality, concreteness) and an objective one (legality, form), where the two endpoints operate as *correlates* and can be defined as "the inbound and outbound direction of the one process through which consciousness develops" (Natorp 1912, 70; my translation).[15]

This very "korrelativer Monismus" (correlative monism: ibid., 152) by which the method is underpinned represents the theoretical substrate on which Natorp rests his arguments in *Recht und Sittlichkeit* (Law and morality: Natorp 1913) an article he wrote in 1913 to settle the regrettable controversy that had arisen between Hermann Cohen and Rudolf Stammler.[16]

[13] On this point, see Holzhey 1986, 1–39, 308–36, and Cassirer 1925, 273–98.

[14] This is a point clearly made as well in Cassirer 1925, 290.

[15] On this point, see also Holzhey 1986, 334.

[16] On the personal consequences of the dispute, see Holzhey 1986, 36, 48, and C. Müller 1994, 12ff.

The occasion for the dispute came when Stammler, in his 1911 *Theorie der Rechtswissenschaft* (Theory of legal science), addressed the relation between law and morals with a view to setting out a *difference* between them (Stammler 1911). In reality, the academic squabble between the two philosophers had been smouldering for several years. Indeed, Cohen had praised the first edition of *Wirtschaft und Recht* (The economy and law: Stammler 1896)—where law was defined as the "Form des sozialen Lebens" (the form assumed by social life) and social life was explicitly recognized as enjoying a logical primacy over abstraction, embodied by the individual considered as an isolate (ibid., 125ff., 83ff.; my translation)—but then, when Stammler's *Lehre von dem richtigen Rechte* (The doctrine of just law: Stammler 1926) came out in 1902, Cohen gave the work a sound drubbing. The main reason for this falling out between the two scholars lay in Stammler's attempt to find in positive law not only the criterion of the law's logical coherence but also that of its justice (ibid., 50; Winter 1980, 21–4). In *Ethik des reinen Willens* (Ethics of the pure will: Cohen 1904–1907), Cohen would comment that "there is absolutely no legitimate basis for the idea [...] of aligning the law with justice without unequivocally seeking and laying the foundation for such justice in ethics" (Cohen 1904–1907, 214; my translation).[17] Indeed, because ethics proceeds from the scientific fact of legal science (ibid., 67, 299, 647) it cannot exist except as will concretized into law (into *action*), and so it is only in a context of intersubjective regulation that ethics can exist. The target of Cohen's objection was Kant's distinction between morals as the *internal* sphere of the moral law (*Gesinnungsethik*) and law as the *external* sphere of coercion, a critique clearly modelled after Hegel's idea of the morality of the state (Winter 1980, 26, 231; Holzhey 1986, 321–2). Only in the moral totality (*Allheit*) represented by the state's legal personality can the individual find full moral accomplishment. The distance between Cohen and Stammler was finally sealed in *Theorie der Rechtswissenschaft*, where Stammler sought to found a philosophy of law in the manner of a "reine Rechtslehre" (Stammler 1911, 3), that is, a philosophy no longer tied to any *Sozialphilosophie*, and Cohen took this to unequivocally signify a further separation between legal science and ethics (C. Müller 1994, 140–3, 152–4; Wielikowski 1914, 26ff.). Evidence of this lay, for example, in the fact that Stammler's theory of the *Rechtsidee* (the idea of law) was entirely derived from the concept of science as a coherent system unifying the multiplicity given in experience ("Idee der Harmonie") (Stammler 1911, 441) while there was nothing specifically ethical about it.

What Natorp sought to do in *Recht und Sittlichkeit*, then, was to mediate, or find some middle ground, between Cohen's monism and Stammler's dual-

[17] In Stammler 1911 and 1928b, 188 n. 6, Cohen's criticism would be described as a mere "*Mißverständnis*" (misunderstanding). On this point, see also the exchange between Natorp and Stammler, now in Holzhey 1986, 91, 107, 110.

ism (Natorp 1913, 21). Law and morals, in Natorp's view, do not constitute two distinct forms of legality but correspond to a "Zweiseitigkeit der Betrachtung" (to two sides of the same consideration: ibid., 12). The distinction between the autonomy of morals and the heteronomy of law, however, does not entail a reciprocal *indifference* between the two forms of obligation; this distinction, on the contrary, is seen as the condition on account of which their domains overlap (ibid., 15).[18] The crux of the controversy, in other words, lay in the fact that, for Natorp, neither Cohen nor Stammler had adequately understood the nature of the *formale Unterscheidung*, or formal distinction, between the method of legal science and that of ethics. The former method does away with the individual point of view by diluting it into the *Gesamtheit* (or totality) of consociation (ibid., 35, 54);[19] the second method, at fault for having yielded to the "point of view of mere classification" (ibid., 52; my translation), instead unjustifiably distinguishes the external sphere (law) from the internal one (morality) (ibid., 39). Indeed, for Natorp, "intention and action can be decoupled and set in contraposition only in the sense that legal evaluation in the first place judges *action*, and only in relation to action does it judge intention, whereas moral evaluation in the first place assays *intention*, and only in relation to intention does it judge action" (ibid., 53; my translation). There emerges, then, the image of the *Zentrum* and the *Peripherie* (the centre and the periphery), "the inbound and the outbound direction," expressing that "correlative monism" that informs Natorp's mediation (ibid., 21, 54–5, 68). Rigorously expressed in *Recht und Sittlichkeit*, then, is the need to understand that the legal method and the ethical are indispensable moments of a synthetic relationship, two complementary approaches to a unified legal philosophy.[20]

1.7. Ernst Cassirer and Natural Law

Ernst Cassirer (1874–1945) contributed in important ways to German legal philosophy with his influential 1910 book *Substanzbegriff und Funktionsbegriff* (Cassirer 1910; translated as *Substance and Function*: Cassirer 1923), after which time he proceeds along peculiar paths, on the one hand taking up the history of philosophy, and on the other attempting a philosophical reconstruc-

[18] This is a point clearly made by Cassirer: "They are not in any way reducible to each other; rather, precisely by virtue of that essential distinction they find themselves in a correlation so close that neither would be comprehensible without the other" (Cassirer 1925, 283; my translation).

[19] On the relation between the individual and the community, see also Natorp 1909, 124.

[20] Natorp's essay also discusses other aspects of the debate between Cohen and Stammler, among which the criticism that Natorp himself (Natorp 1913, 26–8, 30–1) directs at Cohen, accusing him of having logicized ethics, thus doing away with the historicity of law, along with the basic correlation between the categorial and the historical method (the former making a *constitutive* use of categories, the latter a *regulative* one). On this and other matters, see C. Müller 1994, 160–78.

tion of myth and of symbolic forms. His last work, posthumously published in the United States in 1945, would accordingly be devoted to the "myth of the state."

But Cassirer has also given us an important reflection on the meaning of natural law in the cultural history of the West, and it is on this reflection that I should like to focus here for its significance. The occasion for it was a conference held in 1932 at Hamburg's *Juristische Gesellschaft*, where Cassirer delivered a lecture under the title *Vom Wesen und Werden des Naturrechts* (On the being and becoming of natural law: Cassirer 1932–1934). Cassirer had just published his seminal book *Die Philosophie der Aufklärung* (The philosophy of the Enlightenment: Cassirer 1932), and in the lecture he proceeded from an idea he took from Leibniz, but which had been anticipated by Grotius and would then be taken up, after Cassirer, by neo-Kantian philosophers of law like Kelsen: The idea was that of a close relation between jurisprudence and logic, between law and mathematics. Wrote Leibniz:

> The science of law is part of those sciences that depend not on experience but on definitions, not on facts but on purely logical demonstrations; it thus belongs to those sciences that concern themselves not so much with matters of fact as with matters of validity. (Mollat 1893, 22; my translation)

But is that really how things stand? Is it really possible to conceive a law which does not live in the concreteness of human experience, and which accordingly will not countenance any "befouling" admixture, so to speak, with the contradictions of life? To what extent is justice possible as a dimension of existence? Cassirer also asks himself:

> What use can we make of the claimed self-evidence of certain initial legal propositions, what use is the deductive procedure and rigorous demonstration of the other, derived norms, if none of these purely formal determinations is ever certain to find empirical material to which to apply and in which to be realized? (Cassirer 1932–1934, 2; my translation).

Indeed, as a deep and insightful historian of modern philosophical thought, Cassirer subtly grasped the specificity of an analogy, that between mathematics and law, an analogy to be understood as a *pars pro toto*, in the sense that mathematics serves here a specific function, that of reason as a whole. "This sort of metaphor was recurrent in the 17th and 18th centuries, during which time mathematics was always regarded as the 'pride of human reason' and so as its prototype" (ibid., 6; my translation). In the manner of Hermann Cohen, Cassirer set up the problem of the origin as the authentic problem of natural law in the 17th and 18th centuries: "The intent was to bring to light the original source from which positive legal sentences come and from which they continuously receive new nourishment" (ibid., 7; my translation). Human reason is from this point of view productive, precisely because the origin of law lies in reason and cannot be found anywhere but in reason. There are universally

valid norms analogous to those of mathematics in the sense that reason lies at the origin of both the impulse toward knowledge and the impulse toward orderly life organized on the basis of justice.

To the extent that law finds its foundation in reason and in the exigencies of reason, Cassirer declares himself to be not so much a champion of natural law as a close observer of the fact that even in the world of the positive law, of the state's enacted laws, not only is there recourse to natural law, that is, to the unwritten laws, but such recourse is even intensified during the years he is writing. Cassirer points out in this regard some of the work done by Erich Kaufmann and Gerhard Anschütz: In the latter half of the 1920s, in what was then only the latest "revival" of natural law, they underscored, among other things, that the idea of natural law as an awareness of a higher system superior to the written laws was "something eternal and inevitable."[21]

Natural law, however, is not understood by Cassirer as an expression of abstract reason. Quite the contrary: For one thing, he underscores the anthropological peculiarity of humans as subjects of law, that is, as the only animals capable of making promises (the reference is to Nietzsche);[22] and, for another thing, as a historian of philosophy, he throws into relief how those who advocated natural law in the 17th and 18th centuries were never mere theoreticians of mathematical or legal formulas but were men engaged in the moral and political struggles of their time. As Cassirer writes, natural law theory "has in no phase of its development amounted only to extraneous speculation, far-removed from the world: It has never just been abstract theory" (Cassirer 1932–1934, 20; my translation). So, for example, for Grotius "there is no break between theory and practice, between life and doctrine. He wants to teach that which he has lived and live that which he has taught" (ibid., 19; my translation).

For Cassirer, natural law does not express an otherworldly claim, but on the contrary springs from the needs of humans as beings historically determined on the basis of what reason demands. The mathematicization of law—an endeavour that Kelsen, for example, was devoting himself to precisely in that stretch of time—is none other than a way to assert the claims of rationality: It certainly cannot be understood as a translation of abstract formulas into

[21] That is from Kaufmann's speech at a conference the German constitutionalists held in Münster in 1926 on Article 109 of the Weimar Constitution: "We generally fail to appreciate," Kaufmann writes, "how little our legal decisions, even in codified areas of the law, are based on written legal norms expressly formulated by the legislator. The bulk of these decisions, quite often those that determine the final outcome, are ones we draw not from written legal norms but directly from principles of justice that in each area of the law are determined by current ideas of legitimacy espoused by the community in which we live [...]. The state does not make law; it enacts statutes: The state and the statutes are both subordinate to the law" (quoted in Cassirer 1932–1934, 24; my translation). On Erich Kaufmann's philosophy of law, see Section 5.1 in this tome.

[22] Writes Cassirer: "In the ability to rise to the pure idea of law and of legal obligation, as well as in the ability to honour a previous commitment, therefore lies the true origin and the foundation of any specifically human community" (Cassirer 1932–1934, 18; my translation).

concrete forms.[23] Specifically, natural law seeks to counteract the irrationality of arbitrary will, be it that of God or that of the Leviathan state. As Aristotle had taught, it is not possible, in matters of morals and law, to reach the certainty of mathematics and geometric axioms.

The reference made to the natural law theorists of the 17th and 18th centuries is not, of course, just a side note. The point, rather, was to highlight the distinctly political meaning of philosophical stances, and that precisely at a time when democracy appeared to be under threat. In contrast to legal formalism, reaffirmed by authors like Kelsen, natural law thus proved valuable as an ally in a political struggle, for it gave access to a world, the world of supralegal legitimacy, that can open our eyes to the values and norms of justice present in the empirical world. Cassirer's essay on natural law in this sense bears a connection to other articles he wrote in defence of republican democracy (Cassirer 1929). Even though Cassirer was not a legal philosopher by profession, his philosophy, with its shift away from gnosiology and its increasing concern with issues relating to culture and symbolic forms, can be ascribed to that strand of neo-Kantianism which offered itself as a philosophy of culture and whose highest exponent was Gustav Radbruch.

This, in certain respects, appears to be borne out in the posthumously published work of 1945, where Cassirer casts his lot with logico-rational thought, but does so recognizing the constant presence of myth in the affairs of the political world: "It is beyond the power of philosophy to destroy the political myths." Cassirer comments in his conclusions: "A myth is in a sense invulnerable. It is something that surpasses the capabilities of philosophy. In a certain sense, myth is invulnerable. It is impervious to rational arguments; it cannot be refuted by syllogisms. But philosophy can do us another important service. It can make us understand the adversary" (Cassirer 1946, 296).

1.8. Law and Worldviews: Gustav Radbruch's Three-Dimensional Conception of Law

Gustav Radbruch (1878–1949), drawing on Lask's *Rechtsphilosophie*, conceives legal philosophy as an endeavour devoted to "the consideration of the value of law." "Legal philosophy is concerned not with the law in force but with the law that ought to be in force, not with positive law but with just law, not with the law but with the value, meaning, and purpose of law, that is, with justice" (Radbruch 1993, 22; my translation).[24] A value judgment, however,

[23] "Indeed, mathematics and law, regardless of any distinction between them and of the distance between their thematic areas, are manifestations of a single fundamental force testifying to the autonomy and spontaneity of the spirit" (Cassirer 1932–1934, 14; my translation).

[24] The German original: "Und die Rechtsphilosophie insbesondere handelt nicht von dem Rechte, das gilt, sondern von demjenigen, welches gelten sollte, nicht vom positiven, sondern

cannot be a judgment concerned with knowledge in the classic sense: A value judgment is in the first place a personal declaration of faith, which makes Radbruch's legal philosophy declaredly sceptical and relativistic. Radbruch rejects natural law as that conception that purports to "find in human reason legal norms ready for use, which norms, owing to their universally human source, would then have to claim to be everywhere valid in the same way at all times" (ibid., 23; my translation). Radbruch also rejects legal positivism as "indifferent to values" (ibid., 31; my translation), but in its place he offers up a conception of law still based on positive law, or rather, on legalistic law, on the distinction between is and ought, embracing a conception whose attitude to values remains essentially relativistic. He rejects the positions espoused by the free law movement centred around the judge's discretion (a freedom of decision constrained within limits), arguing that the judge is instead "bound by a professional obligation to bring to bear the law's will to be valid; judges ought therefore to sacrifice their legal sentiment to the law's coercive system; they should only ask what is the applicable law, never whether such law is also just" (Radbruch 1987, 315; my translation).[25]

Radbruch's relativism seeks to have legal philosophy contribute to determining the contents of just law as historically determined in a given political community:

> The method expounded here is called relativism because it takes up the task of determining the justness of all value judgments only in relation to a determinate supreme value judgment, only within the framework of a determinate conception of value and of the world, but the method is not concerned with determining the justice of this supreme value judgment itself, of this conception of the world and of values. Such relativism, however, belongs to theoretical reason, not to practical reason. It means that we renounce any attempt at a scientific foundation on which to rest the taking of definitive positions—not that we renounce the taking of positions as such. (Ibid., 235; my translation)[26]

Legal philosophy is thus a tool designed to train politically engaged subjects to advance proposals having valid content. Legal philosophy does not directly choose among competing worldviews but lays the groundwork for each per-

vom richtigen Rechte, nicht vom Recht, sondern vom Wert, vom Sinn, vom Zweck des Rechts—von der Gerechtigkeit."

[25] The German original: "Für den Richter ist es Berufspflicht, den Geltungswillen des Gesetzes zur Geltung zu bringen, das eigene Rechtsgefühl dem autoritativen Rechtsbefehl zu opfern, nur zu fragen was Rechtens ist, und niemals, ob es auch gerecht sei."

[26] The German original: "Die hier dargelegte Methode nennt sich Relativismus, weil sie die Richtigkeit jedes Werturteils nur in Beziehung zu einem bestimmten obersten Werturteil, nur im Rahmen einer bestimmten Wert- und Weltanschauung, nicht aber die Richtigkeit dieses Werturteils, dieser Wert- und Weltanschauung selbst festzustellen sich zur Aufgabe macht. Der Relativismus gehört aber der theoretischen, nicht der praktischen Vernunft an. Er bedeutet Verzicht auf die wissenschaftliche Begründung letzter Stellungnahmen, nicht Verzicht auf die Stellungnahme selbst." See also Radbruch 1990.

son's choice. For this reason, as much as legal philosophy may be relativist, it is built upon concepts that constitute true knowledge and not just a declaration of faith. Radbruch recognizes that, while values are many, their meaning can be known, but when it comes to choosing between conflicting values and worldviews, the decision comes down to a personal choice: It is subjective.

What is law for Radbruch? To begin with, he rejects the inductive method for arriving at a definition of law. To identify the law by working from individual legal phenomena (such as theft, homicide, and usucaption), Radbruch writes, is to already possess the concept of law, which therefore proves to be an *a priori* concept rather than a derived one. The *a priori* is not a temporal relationship but a logical one. Certainly, the *a priori* concept of law can be identified only starting from experience, but it cannot be founded and justified on that basis.

> If we ascribe the *a priori* to the concept of law, we must thereby set up a transcendental logical or gnosiological relation between the concept of law and the individual legal phenomena. Indeed, the law does not become such by virtue of the possibility for the single legal phenomena to make their way into it [*ihm einordnen*]; on the contrary, the single legal phenomena are such because encompassed by the concept of law. (Radbruch 1993, 49; my translation)[27]

Law does not belong to the realm of nature, or to that of values, or to that of religion. It rather falls within the realm of culture:

> The concept of law, for its part, does not indicate any structure of value, because just law and unjust law both fall within that concept. [...] Law is whatever has been set up with a legal purpose, but there is no need for it to actually achieve that purpose. [...] Law is the successful attempt, but also the failed attempt, to be just (*richtiges*) law: Law is the formation of being that serves as a substrate or theatre for legal value, for the idea of law. [...] The concept of law is rigorously separated from the concept of just law, and yet only through this latter concept can the concept of law be achieved. (Ibid., 54; my translation)

The object of legal science is for Radbruch an imperative will and not, as in Kelsen, a normative duty: Legal science is for him a cultural science, not a normative one, a science in which values stand in contraposition to one another, with the consequence that the value judgment with which (positive) law can be criticized will always be a relative judgment. And so we can well understand how, from the *Grundzüge* (Radbruch 1993) onward, Radbruch should equate legal philosophy with a political doctrine of parties, and how he himself should have come to be a prominent figure in the political life of the Weimar Republic, taking a stand in favour of social democracy.

[27] The German original: "[...] wenn wir dem Rechtsbegriff Apriorität zusprechen es soll damit vielmehr ein transzendentallogisches, erkenntnistheoretisches Verhältnis des Rechtsbegriffs zu den einzelnen Rechtserscheinungen gekennzeichnet werden, daß der Rechtsbegriff eben nicht ein gewöhnlicher Allgemeinbegriff ist. Denn das Recht ist nicht deshalb Recht, weil die einzelnen Rechtserscheinungen sich ihm einordnen lassen, vielmehr sind umgekehrt die Rechtserscheinungen nur deshalb 'Rechts'erscheinungen, weil der Begriff des Rechts sie umfaßt."

We can also understand why authors influenced by Kelsen, and Kelsen himself, should have criticized Radbruch's legal philosophy as a theory akin to the politics of law rather than being an outright philosophy of law. The problem lies in the question of value: Must value—even when considered as the method of the "value relation"—have no traffic with the law and with its scientific study, or should it be drawn into the fold of the law? For Radbruch value lies within law. Legal philosophy is for Radbruch a science of experience, a science concerned with the question of value in law.

Halfway between the realm of the *Sollen* and that of the *Sein*, which must be kept distinct, lies the "third" realm of culture, a reality connected with values, and so a cultural fact onto which the value of justice is projected. But for Radbruch law is not just the stage on which the drama of justice is played out; the law, on his political conception of law, is also a tool serving a range of purposes sorted into three classes: they may be individual or collective, or they may be devoted to the completion of work. Decision determines the individual's position in the arena of legal philosophy as well as in that of politics, such that we can envision three conceptions each of which combines a conception of law, one of politics, and one of life. We thus get individualism (centred around individual freedom), supraindividualism (recognizing the primacy of the nation or the centrality of power), and transpersonalism (built on the idea of culture), the last of which being the one that Radbruch puts forward as his own. Marking out the individualist conception (classic liberalism) is the contract; the supraindividual one, organicism; and the cultural one, the edifice, in the sense that the members of society are engaged in a common effort to build their own culture.

Radbruch's legal philosophy owes a big debt to his political conception. Indeed, the primacy he ascribes to the "social" element, where transpersonalist culture thrives, shapes the conception he develops to account for the state's legal form. Radbruch's socialism is a liberal socialism, on which the formal guarantees of the rule of law (of the *Rechtsstaat*) are valid both for the bourgeoise and the working class: "Only legal formalism can protect the oppressed class from the arbitrary acts of a legislative and a judicial function controlled by its class antagonist" (Radbruch 1929, 480; my translation).[28] As has been commented (Poscher 2000, 195), this is another reason why Radbruch does not concern himself with judging "eternal" law, deemed unknowable, but only judges the law in force.

It is form that endows the certainty of law with substance. Indeed, form is not just an element in the liberal and bourgeois vision of the law but is the third element in Radbruch's conception of law as the manifestation of the *Sollen*, along with the element of justice as equality and that of purpose. In this

[28] This is a position close to that of the "Austro-Marxist" Karl Renner: cf. Section 7.2.1 in this tome.

way, law takes on a social dimension, one that also depends on the transformations which take place in the socioeconomic structure. Radbruch thus supersedes Marxist socialism, specifically by restoring the form impressed by the state, conceived not as an enemy of the working class but, on the contrary, as a tool of liberation, as Lassalle had previously claimed in the 19th century *contra* Marx.

Indeed, what best characterizes Radbruch's thought is the following remark: "All the great political transformations have been preceded or accompanied by the philosophy of law. At the outset there was the philosophy of law; at the end, revolution" (Radbruch 1987, 233; my translation).[29] It is indeed difficult to understand (or even criticize) Radbruch's legal philosophy without bearing clearly in mind the link he sets up between the problem of legal philosophy at large and the political conception of the world, a conception to which he in fact ascribes a primacy. As has been observed, Radbruch's legal philosophical doctrine of political parties is "not an analysis of the role that political parties play in democracy; rather, the parties are for him in the first place the sociologically understandable materialization of his legal philosophical system of the conceptions of justice" (Poscher 2000, 195, n. 147; my translation). Radbruch thinks in legal philosophical terms, conjuring up a legal philosophy relativized to the political parties, to a "qualitative" conception on which the ideas for which the parties act as a conduit emerge in the political dialectic even by means of the interests behind those ideas. As much as this may appear paradoxical to those who understand philosophy as an enterprise solely concerned with the quest for the truth, what we are looking at is, on the contrary, a way of "doing philosophy" fully cognizant of the limits that any human undertaking comes up against, including in the quest for truth. In politics, however, if pluralistic democracy is valuable, equally worthy, indeed necessary, is the quest for political unity and the attainment of a unified political will with which the state must act in grappling with the big issues of great consequence. Where this approach comes up short (an approach that separates Radbruch from the theories of democracy developed by authors like Kelsen and Richard Thoma) is in the fact that Radbruch's relativistic "legal philosophical" account of the state remains such throughout the course of his theoretical investigations, from beginning to end. His legal philosophy always translates into the idea of the "rule of political parties," one that ultimately imperils democracy itself and its founding value of the ongoing quest for truth.

[29] The German original: "Alle großen politischen Wandlungen waren von der Rechtsphilosophie vorbereitet oder begleitet. Am Anfang stand die Rechtsphilosophie, am Ende die Revolution."

1.9. Sovereignty and Legal Consciousness in Leonard Nelson's Legal Philosophy

Leonard Nelson (1882–1927)—perhaps popularly known for having been among the first authors to use the term *nihilism* in law, in his criticism of Julius Binder (Nelson 1917, 179ff.)—made interesting contributions to the philosophy of law, but only by derivation from his philosophical thought, with its focus on logic, mathematics, and ethics (and some echoes in pedagogy). Not incidentally, Kelsen thought that Nelson's greatest achievement, specifically in his book on international law titled *Die Rechtswissenschaft ohne Recht* (Legal science without law: Nelson 1917), consisted in "holding legal science up to the mirror of philosophy, that is, the mirror of pure knowledge" (Kelsen 1920a, 189; my translation).

Leonard Nelson's legal philosophy can be described as a neo-Kantianism moderately bent toward natural law. Nelson understands there to be meta-legal criteria of justice that not only influence lawmaking but must also be taken into account by the judge and jurist in interpreting the rules of positive law. These criteria are neither absolute nor objective, for they depend on our "intuition" of what is just and what is unjust—and as much as this intuition may be subjective, it cannot but guide both our action and our evaluation of others. It is in particular the individual's level of education and cultural background that, in Nelson's view, determines the degree of "justness" ascribable to the criteria by which we evaluate the existent: "The justness of a legal decision," Nelson writes, "depends on the judger's education [*Bildung*]" (Nelson 1913, 19; my translation).

For Nelson, law is "natural" in the sense of its being necessary. Humans do not live in a state of nature, but always in a civil or juridical state corresponding to their nature. In self-determination and "self-making" lies the objective that humans pursue as rational beings, and their rationality makes them beings necessarily oriented toward the juridical state, in that they have a "right" to their self-determination. The law presupposes a "basic norm," one whose content can change but whose form cannot: Nelson calls this norm the *Rechtsgesetz* (juridical rule), describing it as the law that secures for everyone an equal right to accomplish the task of the individual's self-determination.

Positive law thus appears not to stand in opposition to "natural law" but to be *functional* to it. For this reason the latter is no less necessary than the former, and so likewise necessary is the force of the state as that body which is to guarantee the application of the positive law. The law is not something that can be discussed; it is a fact: It can be studied and analyzed but never challenged or confuted. In this sense, legal science turns out to be a sociology of law, in that positive law is historically conditioned and so appears as something relative. For Nelson, from an historical point of view, the fundamental concept is not so much that of unconditional freedom as that of equality.

The state understood as a legal institution becomes the fundamental tool with which to body forth the basic legal norm, the "juridical law." Public officials must be adequately cultured and knowledgeable, because only education can guarantee that their will is not arbitrarily exercised but is instead directed toward achieving the juridical purpose of self-determination. For Nelson, law is not valid unless it is *recognized* as being valid, but this recognition cannot be empirical. It must instead be predicated as something objective, as it were: It must be inferred from a balance struck among the interests at play; law is recognized as being valid only if it serves the purpose of self-determination. Those who interpret the law can therefore in a sense be said to become arbiters of the objectivity of the law's recognition as valid law, and it will be for them to decide whether the law's *de facto* condition is a *de jure* condition proper.

Nelson faces the same problem here that comes up with every neo-Kantian philosopher, namely: Once we assume a distinction between a norm and its content, in what way can a point of contact be found? How can form and content be reconciled? In Stammler, this reconciliation had failed by reason of the very premises of his thought, even though he did try to find some mediation between form and content; in Nelson, the same error is repeated. In upholding the necessity of the positive law, of the state, and of coercive force, he justified these elements on an empirical basis, by adducing the realistic necessity to which the moral idealist must yield (Eicher 1953, 133ff.): He certainly did not deduce these things in a necessary way from neo-Kantian logical premises. The state as conceived by Nelson is an entity that must necessarily limit individual liberty so as to guarantee the juridical condition of self-determination (and in this respect his outlook is Kantian indeed), and this necessity—as evident as it is empirical—affects the very formality which frames his conception of law. The state is not the system of norms it is in Kelsen but is an actual power-wielding organization: As such it devotes itself to certain concrete tasks and to a final purpose, which is to enable individuals to attain greater consciousness. One could even speak here of an ethical state, understood as a state subject to the rule of law, one that must perfect itself under the guiding principle of the sovereignty of law itself, although this is a conception that had been anticipated by the Dutch jurist Hugo Krabbe.

The sovereignty of law entails in Nelson a nonempirical idea of law, because sovereignty is understood by him not as the highest *power* (the powers that be) but as the highest *authority*. As authority, sovereign law is law that is valid because endowed with authority, which is what makes it sovereign. Nelson believes that our effort should be to understand the role the concrete powers of government play in achieving the purpose of the individual's self-determination, which powers are not in the least negative but have a dignity of their own insofar as they form a coercive organization geared toward the fulfilment of the supreme duty, that of making it possible for every individual to pursue their "authentic interest," consisting in self-education. This concept of

education in a higher sense—a Platonic sense, might I say—clearly leads him to imagine a state governed by the "savants," for only in this way will it be possible to avoid the slippery slope toward an arbitrary power, that is a power by people not enough educated—however much this is a risk that Nelson seems to in any event accept as a "realistic" possibility (Nelson 1932).

The sovereignty of law entails a rejection of the classic concept of sovereignty, thereby also entailing a conception of international law, a conception grounded on the one hand in our legal consciousness, magnified from the sphere of the state to that of the international community, and on the other in a coercive organization of the law even on an international level. In reality, the question of legal consciousness, not to be confused with a psychological theory of law such as Sturm's (1910),[30] forms the fulcrum of the legal philosophy developed by Nelson, who borrowed the concept into law by drawing on Fries's work, which Nelson himself had contributed to rediscovering, especially as concerns Fries's mathematical logic. In law, however, one can clearly appreciate the risk of falling into a utopian conception of the reality of law and the state (and that goes double for international law). And, indeed, Nelson's legal philosophy cannot in the least be said to have resisted the lure of such utopian detours, mounting on top of Kant's construction much more than Kant would have recognized as his own. Not incidentally, the coercive element necessarily finds its way back into Nelson's construction unaccompanied by the limits and guarantees meant to ensure that we can exercise our liberties in concrete terms: We have thus landed a long ways from a universal duty of self-determination and self-education. Indeed, when it comes to committing to a political vision, Nelson rejects democracy and invokes a "Führer" capable of enforcing the law: "Nelson thus falls into open contradiction by postulating the fundamental tenet of equal freedom as the supreme rule to be followed in personal conduct as well as in the organization of society, only to deny this postulate in deciding how this ideal ought to be politically imposed" (Meyer 1994, 314; my translation).

Nelson's legal philosophy falls squarely within the natural law tradition: The synthetic principle underpinning his material doctrine of law—the principle under which justice *is* law—makes his whole system a pure form of natural law (however moderate it may be), in that Nelson in effect grounds law in ethics and metaphysics, deducing it therefrom, that is, from something that in any event lies *beyond* law. Legal science thus winds up being itself a derived science, as part of another science, such as ethics. In this way we can understand why Nelson, despite some good insights, never occupied more than a marginal place

[30] On Sturm, see Wielikowski 1914, 103ff., discussing as well other authors who can in some way be described as Kantian, but who have nonetheless placed the psychological element at the foundation of law. Among them are Berolzheimer (1904–1907) and Kuhlenbeck (1907) and especially the Russian theorist Petrażycki (1907b). On Petrażycki see Section 16.2 in this tome and Chapter 18 in Tome 2 of this volume.

as a legal philosopher in the neo-Kantian debate of the period, mainly concerned with the bases on which to make possible an authentic *science* of law.

1.10. Fritz Münch's and Max Ernst Mayer's Philosophy of Culture

1.10.1. The Philosophy of Culture

Among the most significant aspects of neo-Kantian philosophy of law is its distinction between the *concept* and the *idea* of law, the first coping with a scientifical problem of legal knowledge (*Rechtswissenschaft*), the latter with the problem of justice (*Rechtsphilosophie*), a distinction that would make it possible for some neo-Kantian jurists to shift emphasis to the idea of law, thus paving the way for legal idealism and in particular for neo-Hegelianism, this in a fairly linear way, even though it was a complex passage involving several interlocking components.

But even working within the framework of neo-Kantianism and its distinction between the idea and the concept of law, some jurists underscore that to define the concept of law, however fundamental the concept may be, is to *limit* the law, insofar as the law is never just a conceptual abstraction but is also part of the social reality. An endeavour to lay out the formal structure of the legal system would necessarily still leave room for a different sort of inquiry, not a conceptual one but a sociology of law exposed to the risk of falling captive to a method proper to the natural sciences. The outcome was a contraposition between dogmatic jurisprudence and the social theory of law. As Müller-Eisert observed, this "ultimately led, in legal methodology, to those conflicts which in the general theory of science arose out of the separation of the sciences into the natural sciences, on the one hand, and the spiritual sciences, on the other" (Müller-Eisert 1917, 3; my translation).

The pressing need to grasp the "totality" of the legal phenomenon appeared to pose a conundrum for anyone boxed into either of the two modes in which to consider the law, namely, the conceptual mode and the empirical one. The idea that this conflict could be solved, so as to encompass the legal phenomenon in its full complexity, appeared feasible to some if the problem was attacked by viewing the law as part of the cultural world: This meant working out a legal philosophy as a philosophy of culture, on an understanding of this latter philosophy as a platform for moving beyond the opposition between the natural and the spiritual sciences. Clearly, the source to look to for inspiration in this endeavour was Heinrich Rickert, the author of a famous book on the natural sciences and the cultural sciences (Rickert 1915; see also 1907).

Nature, as is known, comprises all that is independent of value, whereas culture does just the opposite, for it bears a relation to values. A philosophy of law framed as a philosophy of culture must accordingly presuppose, at one and the same time, a universally valid system of values and a concept of law

capable of accounting for the meaning the empirical sciences of law ascribe to that concept. We can go back to Müller-Eisert here, who frames the idea as follows: "The philosophy of law seeks to [...] establish a connection between, on the one hand, the different general moments contained in the empirical concept of law and, on the other, the universal problems relative to the question of values and of conceptions of the world" (Müller-Eisert 1917, 8; my translation). The philosophy of law certainly presupposes the value inherent in a single individual, but only insofar as each such individual exists not in isolation but as a being networked with others. It would thus be a mistake to equate culture with the community, a concept which at that very time was just beginning to flourish as a sociological construct: Culture is rather to be understood as the complex of relations and interactions among individuals, and its point is not to enable some to exercise power over others but to bring into existence a power that everyone can share in as an inherently valuable and meaningful being set in a "totality" that itself is inherently valuable and meaningful.

The philosophy of law is concerned with law as an absolute value, but underlying this value, and acting as a material substrate, is the effective *reality* of law, forming the object of the empirical science of law. This effective reality is something the philosophy of law cannot neglect. Indeed, its task is precisely to foster a general appreciation of the empirical reality of law. But this means that the philosophy of law takes for its object of study *both* the absolute value inherent in the law *and* its empirical substrate such as it concretely unfolds in the differentiation of humanity into groups, each of them espousing a variety of values (moral, religious, linguistic, and so forth)—each of them, in other words, embodying a specific historically determined culture.

In each of these groups, be it a tribe, a clan, or a state in the modern sense, it is possible to neglect single individuals and their psychical movements, but then the individuals themselves, as components of a culture that makes the idea of value understandable and concrete, needs a series of moments that dynamically construct the group's unity and makes everyone aware of their individual role within the group. The determination of this relational unity of individuals within the group is a function of law, which therefore acts not only as a cultural phenomenon but also as a basic condition failing which no people or nation could have a culture. In this sense, empirically existing law contains value elements of its own, closely bound up with the practical realization of law itself. Every legal system—in fulfilling its function of unifying the group (within a nation, a city, or a nation-state)—is always grounded in a predominant, foundational value which determines the cultural type distinctive to that specific legal order. Law thus necessarily acts as a cultural force, and in this sense can be an object of inquiry that would typically fall within the scope of a cultural science, but without this ever entailing that it cannot form an object of inquiry for a natural science, too, precisely because coexisting in the law are elements of a "spiritual" nature alongside elements of an empirical one.

This moving beyond the old paradigm also entails that science and politics, however much distinct, nonetheless come to find themselves in a relation of mutual influence. And certainly this means that science can have an influence on politics, this to the extent that politics, in a given culture, sets about the task of realizing those values that philosophy has singled out and determined to be absolute. It is a practical task that we are dealing with, for it consists in modifying and correcting a nation's concrete juridical structure: "What the philosophical consideration [of law] singles out as valuable, politics postulates for the concrete present" (ibid., 37; my translation).

Making the law a cultural phenomenon also serves the function, among others, of justifying the philosophy of law as a discipline we must necessarily turn to if we are to gain knowledge of the cultural purposes of law. Law in this way acquires a clear sense as an institution at once positive and normative, in this latter mode of existence serving to criticize the existent. Gysin observed that the cultural philosophy of law, which is grounded in neo-Kantianism, "founds law as a means to the ends of culture. The cultural philosophy of law considers the law through the unity given by a cultural nexus of purpose" (Gysin 1929, 16; my translation). But I would not agree with the next thing Gysin says, namely, that "the idea [*Gedanke*] of law is simply absorbed into the unity of the idea [*Gedanke*] of culture" (ibid.; my translation). The problem here is that Gysin, in taking a critical stance to the cultural philosophy of law, fails to grasp the broader political substance of the philosophy of culture, for he confines himself to drawing a distinction between law, grounded in obligatoriness, and the community as a complex of values tied to the individual. Indeed, Gysin seems not to appreciate that law and culture (the latter understood in its complexity as a phenomenon at once moral, economic, artistic, and so forth) both exist not *in vacuo* but in connection with certain worldviews. Indeed, whereas value is individual, and so cannot be an object of legal obligation, each worldview understands culture as a complex phenomenon, and here, contrary to what Gysin thinks, there is no reason why law should necessarily be "subordinated" to culture, in the sense of its being "derived" from culture (just as culture isn't necessarily "derived" from law). Gysin comments that juridical value cannot be the basis on which law is founded; but in reality the effort in the philosophy of culture is not to found the law on some value but to grasp law in its historicity as shaped by the prevalent worldviews. Writes Gysin:

> Indeed, the essence of the principle of law lies in the fact that law cannot be derived from values, but also in the fact that law, under this principle, is none other than a *relation among values* in the human community. Law does not itself *create* cultural values but does give them an ordering as the supreme law of human coexistence. The law, proceeding from the principle of the predominant value, ponders on this basis how to divide the spheres within which individuals engage in social interaction and interdependence; in this way the respect these spheres compel is raised to the status of an obligation, and the law thus qualifies them as *juridical* spheres. (Ibid., 46)

The problem here is that no exponent of the philosophy of culture ever claimed that the law *creates* cultural values or that law and culture coalesce into any "unity."[31] Rather, the philosophy of culture can ultimately be analyzed as an approach concerned not so much with morals as with the method of law, on the one hand, and politics, on the other. As a philosophy of worldviews, the philosophy of culture takes a historicist approach. And this can easily appreciated from the works of its two most outspoken exponents, namely, Fritz Münch (1890–1970) and Max Ernst Mayer (1875–1923).

1.10.2. Fritz Münch

Münch's thought forms part of the larger neo-Kantian philosophy of values, a philosophy envisioning the world of culture as a world in which values are invoked of necessity because essential to culture itself. However, the values ascribed to facts are themselves historical, being gradually fashioned by accretion through a deeper and deeper gaining of historical consciousness.

The law is for Münch a preeminently cultural phenomenon, by which he means that its definition is predicated on the idea of law, understood not as an immutable entity but as the historically wrought outgrowth of the aspirations, efforts, and aims of those who participate in the sphere we call culture. What culture depends on the degree to which the historical consciousness has matured and is therefore always changing. It is clearly a relativistic conception that underpins Münch's thought, but at the same time he also tries to temper this relativism by identifying a shared telos in our actions as agents, which actions may be historically conditioned but are nonetheless driven by an objective system of absolute values.

For Münch the problem of the relation between law and culture covers a wide range of related and indeed coinciding problems, such as the relation between law and justice, law and power, the person and the populace, and the individual and the community, as well as the problem of the meaning of the concepts of reason, humanity, civilization, nation, and race, among others.

The concept of culture, as was previously observed, is closely bound up with that of history: "Culture, in its most pregnant sense, along with everything it encompasses, is a social forming into shape, and more to the point a historical one. It is impossible—without peering into the 'essence' of history, from a view affording at least some degree of comprehensiveness—to get to

[31] The German original: "So muss es sich denn alle Kultur der menschlichen Gemeinschaft gefallen lassen, dass sie einem Kulturrecht und einer Rechtskultur unterworfen wird. Nur in der Verwirklichung dieses Kulturrechts können die Anforderungen des Kulturgewissens und des Rechtsgewissens zur Einheit von Recht und Kultur vereinigt werden, zu jener Einheit, in der man die höchste Sozialidee, das Ziel der menschlichen Gesellschaft, den diesseitigen Zweck ihrer Geschichte erblicken kann."

the 'essence' of culture" (Münch 1918, 3; my translation). History is to be understood here as historical *action*, not as historical "happening": Only through a consciousness of action gauged to measuring criteria is culture possible. And these criteria against which to measure action are the ideas that regulate action, which cannot just be concerned with the present but must also look to tradition. Culture in this sense configures itself as a "traditional forming into shape bearing a connection to ideas [*ideenbezogene Traditionsgestaltung*]" (ibid., 7; my translation), the place where the concrete ideal holds together a community's past and future, whereas culture statically construed only refers to a given society in the present moment.

The view of culture underpinning Münch's approach looks like an idea of organization and order, an ideal project needing to be politically structured. Münch believes that ideas do not actualize on their own, and for this reason a close link is needed between the populace (the masses), on the one hand, and the ruler (the Führer), on the other. "The ruler and the populace cannot do without each other: The populace without a ruler is blind to values; a ruler without the people is powerless" (ibid., 12; my translation).[32] But this should not be taken to mean that the populace is for Münch an autonomous entity, for it is made of individuals, who alone can be holders and bearers of the ideas which thrive in the culture, and it is to individuals that law refers as a cultural organization or institution.

So the law is or strives to be "an ordering of community life in its mutual relations" (ibid., 15; my translation), distinguishing itself from those normative phenomena that have to do with the interiority of individuals (with their ethicalness, morals, religion, and so on). Law is a phenomenon predicated on power, and what genetically matters is not the ideality of law but its positivity, namely, its being able to exert force. But the moment power as such brings its own force to bear, it becomes law, and in carrying out its external regulative activity, it turns from a phenomenon predicated on power into a phenomenon predicated on values.

Culture is reason concretized into historically given institutions, and law is thus necessarily governed by its own logic. This is not a formal abstract logic, however, but a conceptual one "managed," as it were, by theoretical jurists. Law thus forms part of a broader system, at once differentiated and harmonious, in that none of its parts can overpower the others: "The overall idea of culture, however, cannot be an idea whereby the logic of one sphere of sense seizes hold of another, but can only be an idea designating a harmonious synthesis of the different spheres into a unitary system of ideas where the process of cultural differentiation finds its ideal point of convergence" (ibid., 38; my translation).

[32] Cf. ibid, 14: "The material principles of the constitution of culture are ideas; their enactors are men of ideas."

This notion of cultural unity is central to Münch's philosophy of law, for he uses it to found the difference among the single, historically and nationally determined cultural units. The distinguishing feature of the philosophy of culture lies in its proceeding not from the abstract but from the concrete, not from the universal but from the individual. A consciousness of the national culture does not entail that no value is to be ascribed to the consciousness of humanity, but this latter consciousness is a result of there being a consciousness of the unity of the national community.

The makeup of law is *teleologically* dependent on the sense of culture in general. For this reason the philosophy of culture rejects legal positivism as a misconceived attempt to found law on law itself: If the positing of law entails a relation with a community's unitary cultural dimension, that is, with the concrete purposes this community sets out for itself, the law cannot be devoid of moral import. The idea of law is a value in itself, but this idea is "a member of the system of ideas and must therefore place its own logic at the service of culture as a whole" (ibid., 14; my translation). There is no such thing as free law (see Münch 1914) or natural law, but neither can there be a "cultural law" as such, existing apart from the complex of ideas that make up a culture. A law or a ruling can be described as equitable (fair) only if it corresponds to the concrete sense of the cultural area to be regulated, and only if it looks to the unity of culture. Law must exist through a matching relation between form and content, between the idea and its material.

Not that Münch fails to appreciate the possibility and the fact of contradiction between historically conditioned values and those which find themselves ordered into a system, but history is for him the path leading from culture to reason, and therein is revealed the Hegelian vocation of the philosophy of culture, for which reason this philosophy can be viewed as marking the passage from neo-Kantianism to neo-Hegelianism.

1.10.3. Max Ernst Mayer's Philosophy of Law

Max Ernst Mayer deserves mention in the theory and philosophy of law essentially as the author of two works (apart from some writings he devoted to the subject of criminal law), namely, *Rechtsnormen und Kulturnormen* (Legal norms and cultural norms: M. E. Mayer 1903, also translated into Spanish and published in Chile in 2000) and *Rechtsphilosophie* (Legal philosophy: M. E. Mayer 1922).

Mayer's philosophy of law contains elements of both neo-Kantianism (and in fact his early works were written under the guidance of authors with neo-Kantian leanings) and neo-Hegelianism, though he does develop both currents in his own peculiar way.

In *Rechtsnormen und Kulturnormen* he frames the philosophy of law as a branch of philosophy, which in turn is understood by him as driven by two

main lines of inquiry, aimed on the one hand at finding the ultimate foundation—in light of the distinction between reality and value (metaphysics)—and on the other at determining the ultimate values (ethics).

In his second book, the philosophy of law is accordingly and explicitly set up as the study of the concept and the idea of law. The concept of law must inevitably be framed by appealing to reality such as it is causally determined, since the law is bound up with concrete human experience and so with the world of cause and effect, which is something apart from the world of values and of evaluation concerned with objects (whether real or ideal). Apperceptions and meanings thus come into focus as the aspects of the reality of law that a philosopher of law is called on to investigate. In this sense, Mayer understands himself as carrying Hegel's philosophy forward: "The whole of reality," he writes, "is either spirit or reason—Hegel's doctrine is idealism. Thinking and being are identical—Hegel's doctrine is the philosophy of identity. [...] Since logic is now the doctrine of concepts, the evolution of concepts coincides with the whole of reality" (M. E. Mayer 1922, 12; my translation).

Mayer seems not to realize, however, that the identity so stipulated between thought and being precludes him from philosophically conceiving reality and value as two distinct, albeit connected, worlds—as is called for under the distinction he himself set forth at the outset. It is therefore in an uncritical fashion that Mayer takes up Hegelianism, climbing aboard the bandwagon of popular platitude in his understanding of Hegel: What is real is rational; what is rational is real (ibid., 90). At a time when it was the norm to keep the *Sein* separate from the *Sollen*, Mayer appears to miss that law must be an object of evaluation, however much no longer an evaluation made from the perspective of natural law. If reality and value coincided, then positive law would be inherently just, and Mayer's original distinction between reality and value would shed its objective or critical import in a philosophical analysis of law.

Mayer appears to hover between two opposite worldviews, the Hegelian one and the neo-Kantian one, but as Julius Moór observed, "a dualistic mode of consideration conforming to the neo-Kantian conception cannot be reconciled with a Hegelian philosophy of identity" (Moór 1923–1924, 93; my translation).

Law is for Mayer a set of norms backed by a threat of sanction, and so the law is understood by him to presuppose the state as a power capable of enforcing those sanctions. Legal norms strictly understood are accordingly the norms posited by the state—"the law in a strict sense presupposes a state and in the final analysis is guaranteed by force" (M. E. Mayer 1922, 53; my translation)—but Mayer cannot distinguish the one from the other (legal norms from the force by which they are guaranteed), and for this reason he ends up saying that the state is in itself the legal system already.

In Mayer's view, law consists of norms coupled with action, values coupled with causality. Norms therefore always turn into action, and actions always

presuppose norms, and so the Hegelian identity always comes back with every one of Mayer's distinctions. By recognizing the *Sein* and the *Sollen* as being interlaced, Mayer's Hegelian philosophy might have offered an answer to Kelsen's logistic normativism, were it not that Mayer fails to work out the antinomies in which he finds himself entangled.

The same goes for his theory of values. He starts out from the distinction between absolute and relative values, and on this basis undertakes to ground a "critically relativistic" theory distinct from Gustav Radbruch's sceptical relativism (M. E. Mayer 1922, 70ff.), but even here he does no more than set out a dependence of values on a people's culture as a historically determined outcome. Mayer believes there to exist beyond history, and so beyond the relativity of values, a supreme value that he locates in the idea of humanity itself: "The idea of humanity," he writes, "outstrips relative validities, giving rise to a supra-relative validity" (ibid., 69; my translation)[33] a validity that drives the evolution of culture. At the core of this idea lies the need to "regard every man as a man" (ibid., 31; my translation).[34] "Humanity teaches and calls for the idea of man in himself" (ibid., 88; my translation), and in fact humanity, in Mayer's view, should be regarded not as a legal "ideal" but rather as the idea of law itself (ibid., 89). And in this way—relying on the idea of humanity—he believes he can also resolve the antinomy between personalism and transpersonalism.

This approach, not free of contradiction, leads to a metaphysics of law, and indeed to a *Christian* metaphysics of law: "It was the doctrine of morality and religion, and Christianity in particular, that posited humanity as the aim of the ethical will" (ibid., 92; my translation).

[33] The German original: "Die Idee der Humanität wächst über relative Geltungen hinaus, also in überrelative Geltung hinein."

[34] The German original: "Ihr Wesen ist, jeden Menschen als Menschen gelten zu lassen."

Chapter 2

LOGISTIC NORMATIVISM: THE *WIENER RECHTSTHEORETISCHE SCHULE*

by Agostino Carrino

2.1. Precursors of the Pure Theory of Law: František Weyr

2.1.1. Introductory Remarks

As much as František (Franz) Weyr (1879–1951) may be widely acknowledged to be an exponent of the *reine Rechtslehre* (the Czech version of it, known as the *Brünner Schule*),[1] an early article he wrote in 1908—three years before Kelsen's *Hauptprobleme der Staatsrechtslehre*—can easily be described as setting out in outline some of the fundamental legal-philosophical positions of what in the 1910s and 1920s would come to be known as the budding Austrian school of law, the school responsible for most widely known form of "pure theory of law." Weyr specifically founded the Brünn school of jurisprudence, which was cast in the same mould as the school in Vienna, in that they both looked to the philosophy of Kant, drawing from it the dualism of is and ought, of knowing and willing, and extracting on that basis the consequence that the law needs to be analysed *structurally*, not functionally. The exponents of this school of thought wrote in both Czech and German, and for a deeper understanding of it one can turn to two of those exponents who rose to prominence in the latter half of the 20th century, namely, Vladimir Kubeš and Ota Weinberger. Here we will of course confine ourselves to Weyr's legal-philosophical positions and will distil them from his German writings, but these form an adequate enough basis on which to characterize his thought. Also worthy of note are the considerations Weyr made on the question of nationality and the minorities, but that discussion would cause us to drift off-topic and so will not be taken up.

2.1.2. The Law as a Unitary System

What makes Weyr a precursor of Kelsen's pure theory of law is in the first place his endeavour to seek out the foundation of the legal system as a unitary system. The idea of a unitary legal system is precisely the subject of Weyr's first significant article, his 1908 *Zum Problem eines einheitlichen Rechtssys-*

[1] On Weyr and the other thinkers in this school, especially Karel Engliš and Jaroslav Kallab, see Kubeš 1980, 9–32, and Weinberger 1980a, 33–49; cf. Kubeš 1978, 137–49. Cf. also Section 18.3.1 in this tome.

DOI 10.1007/978-94-007-1479-3_2

tems (On the problem of a unified legal system: Weyr 1908b). The essence of Weyr's critical method lies in something that Kelsen would later also take up, namely, the attempt to expose and move beyond the pseudo-dualisms of traditional legal science, this proceeding from a recognition that jurists need to cast off the sense of inferiority they are seized by when their method of inquiry is brought into comparison with the scientific method of the natural sciences.

At the heart of Weyr's article lies his criticism of the dualism between *subjektives Recht* and *objektives Recht* (right and law), whose origin he traces to the historical development that brought about the "transformation of the idea of the state" (ibid., 536; my translation), a transformation on account of which the original meta-juridical dualism morphed into a juridical one. Whether this and other dualisms can be resolved, says Weyr, depends on the method the jurists use in their research: It depends on their ability to reject bad methods from the outset, for these methods have caused legal science to unravel, first at the hands of the medieval glossators, then the natural lawyers, then the historicists, and finally the sociologists (see Wyer 1931, 372–3). However, it was still an open question for Weyr whether jurisprudence was to be made into a science proper by "borrowing" the (causal) method of the natural sciences, as was being advocated at the time by jurists like Max von Seydel (1873)[2] and as would subsequently also be urged in different ways, at least through a criticism of Kelsen and Weyr himself, by a range of legal sociologists who included Karl Georg Wurzel,[3] Ignatz Kornfeld, and Eugen Ehrlich.[4] In fact, the problem for Weyr was precisely that of figuring out what the proper method of legal science was supposed to be. This, he thought, "despite its apparent simplicity," was up there among "the most intractable fundamental problems of scientific knowledge" (Weyr 1908b, 542; my translation).

In *prefiguring* Kelsen, this 1908 article also prefigured the need to move *away* from Kelsen, to the extent that, in Weyr's view, legal science depends for its normativity not only on its method but also on its subject matter: "Every scientific method," Weyr comments, "depends on the nature of its object, and nothing is more difficult than to clearly identify and delimit what a given science is to have as its object" (ibid., 542; my translation). In this "precritical" phase, Weyr was still not as rigid as Kelsen would be, but in truth Weyr was never bound to go too far in that direction to begin with, despite his meth-

[2] On Seydel, see M. Becker 2009.

[3] Karl Georg Wurzel is a forgotten sociologist today, but in the early 20th century he was influential even in the United States, where he was translated and quoted (see J. Frank 1970, 245ff.). His main work of sociology, *Die Sozialdynamik des Rechts* (The social dynamics of law) dates to 1924 and came out in a second edition edited by Günther Winkler along with the 1904 book, *Das juristische Denken* (Legal thought: Wurzel 1991a). On Wurzel see Section 3.4 in this tome.

[4] On. Kornfeld and Ehrlich, see Sections 3.2 and 3.3 in this tome.

odological concerns. This is probably due in part to the different "mode" of critical idealism he espoused by comparison with Kelsen: Whereas the decisive influence on Kelsen, at least in an initial phase, seemed to be that of Kant as filtered through Hermann Cohen, the essential inspiration for Weyr was the philosophy of Arthur Schopenhauer.

Weyr was well aware that the sciences bear a kinship relation by virtue of some understreams (some more subterranean than others) and that a jurist cannot refrain from also taking a sociological or a psychological interest in the law. Even so, he was also quite clear that it is fundamentally important to identify a specific method for jurisprudence different from the methods in use in the other sciences. If I am to get to the essence of the state as my specific object of study, I certainly will not go about my research in the manner of a geologist studying the strata of the earth's crust. But then, what *is* the method of legal science? Weyr appears to assert the need for a "pure science of law" understood as a "science of abstract norms and concepts."

2.1.3. Validity and Causality

The distinction is very clear to Weyr between propositions of validity, distinctive to legal science, and those of the natural sciences: the former are concerned with matters of propositional truth, which in the case of mathematics involve unquestionable truths, this in contrast to the propositions of legal science, which are not amenable to demonstration in the manner of mathematical theorems.

> If, therefore, I take the concept of sovereignty and define it (with Jellinek) as a juridical person's exclusive capacity for self-determination, I am thereby presenting a legal construction whose "justness" [*Richtigkeit*] I cannot properly demonstrate (as I could, say, the Pythagorean theorem), for no such construction can be false in the same sense in which the proposition "2 + 2 = 5" can be shown to be false. (Weyr 1908b, 545; my translation)

What distinguishes Weyr from Kelsen here is that sovereignty is understood by Weyr as something we can ascribe to more than one concept, whereas Kelsen understands it as something which can only represent the positivity of the legal system.

Legal science, however, is also conceived by Weyr as a "constructive" science. Is that to be understood in the sense of the logical method used, for example, by Hermann Cohen, the leading exponent of the Marburg neo-Kantian school? Is law "constructed" or "constituted" by the corresponding method, according to the view Kelsen would later espouse, at least in his European period? This much is suggested by Rosin in his account of the way Weyr understands the cooperatives recognized under German law (*Genossenschaften*): It was Weyr's argument, in this regard, that the jurist "does not walk into the workshop to find two objects [*Gegenstände*] fully realized, typical and con-

crete, sitting there on the workbench, but rather creates [*schafft*] or constructs [*konstruiert*] the two types through a free conceptual construction" (ibid., 549; my translation). Jurists, for Weyr, are therefore free to create their own objects of scientific consideration, exactly as in Kelsen, but whereas Weyr takes this to mean that there can be more than one "constructed" object, so long as they each express a unitary conception of law as a unitary system, Kelsen understands law as invariably and exclusively consisting in that which the only possible legal science (a normative science) constructs in its process toward knowledge. In truth, even Kelsen, like Weyr before him, thought that the legal system constructed and constituted by the legal scientist depends on the scientific observer, and in particular on that observer's *personality* (says Weyr) or on the *kind* of scientific observer involved (in Kelsen's conception): In this way one observer, driven by an imperialist outlook, constructs a universal legal system centred on his own state, whereas another, espousing a pacifist worldview, constructs a universal system centred on the idea of a *civitas maxima*.

Even in Weyr (and so before Kelsen) the state is never something having physical existence amenable to direct observation but is rather an artificial expression (*Kunstausdruck*) signifying "a series of jural and social relationships" (Weyr 1908b, 551; my translation). Nothing exists for a jurist except what jurists themselves have conceptually "constructed." The jurist's method is not and cannot be an inductive method: "Jurists have nothing before them that they can inductively study or analyze" (ibid., 552–3; my translation). As Kelsen would later comment, a jurist is concerned with juridical forms, just as a painter is concerned with aesthetic form and not with brushes and palettes. From this tenet follows the criticism that in the same article Weyr directs at all those jurists who have in various ways upheld the division of law into "private law" and "public law" (the latter clearly to be understood in the sense of the *öffentliches Recht* rather than in that of the *Staatsrecht*), a charge laid against a whole range of theorists, from those who defended an organicist conception of the state (most notably Otto von Gierke and Hugo Preuss) to Julius Stahl, Rosin, Otto Mayer, Jellinek, and Bernatzik, not to speak of authors like Bornhak and especially Gumplowicz, the latter of whom denies the juridical nature of the state, on the view of the state as an entirely sociological phenomenon, and so an object of study falling within the exclusive domain of a sociological science, and in this sense they are taken to task for behaving like professors of theology teaching atheism or teachers of mathematics denying the Pythagorean theorem (ibid., 567).

2.1.4. The Autonomy of Legal Science

That Weyr's 1908 article anticipated the conception Kelsen would expound in his first major work, the 1911 *Hauptprobleme*, can be appreciated from Weyr's discussion of that work in a 1914 article titled *Über zwei Hauptpunkte*

der Kelsenschen Staatsrechtslehre (On two main points of Kelsen's theory of public law: Weyr 1974a). Here Weyr underscores Kelsen's effort to identify the autonomy of jurisprudence and the jurist as a distinct type whose work is independent of the sociologist's, the psychologist's, the politician's, and so forth—a point he would reiterate in a 1931 contribution to the *Festschrift Kelsen* (Weyr 1931b). Jurisprudence is made to rest on foundations of its own, recognizing the need for it to have its own method of knowledge, and for jurists not to shunt this method aside once they appreciate its specificity. Therein lies, in Weyr's assessment, the greatest achievement of Kelsen's *Hauptprobleme*, characterized by Weyr as no less than a "Critique of Juridical Reason." A thing, be it real or ideal, can be an object of consideration from several points of view, but once I commit to a given point of view (Weyr makes the example of the unity of an apple considered from a mathematical point of view), I cannot hope to expand my knowledge from that point of view by bringing a different point of view to bear on the same object (an apple considered from an economic point of view), for in that case I would end up not with a deeper knowledge of the object but with an intellectual and cognitive confusion. That, according to Weyr, is the predicament of many jurists who set out to gain an "enriched" knowledge of law by resorting to sociology and to its methods: What they achieve in that way is not a keener understanding of their object of study but a confusion between two sorts of knowledge, the moment they invoke the primacy of "content" and of the laws of evolution. Writes Weyr:

> For a true jurist—by which term I mean someone having a specifically juridical mode of thinking, coupled with a corresponding métier—the sociological deductions of the current legal sociologists cannot be worthwhile in any other sense than that which the deductions of the earlier natural-law theorists can be found to have. (Weyr 1974a, 461; my translation)

And so Kelsen's approach strikes him as an "unerhörtes Novum" (an unprecedented novelty: ibid., 460), that is, as an absolute novelty in the landscape of legal science, clearing away all those unfounded ambitions to get jurisprudence to do more than it can and ought to achieve. For legal science does not concern itself with particular purposes or with so-called laws of evolution.

2.1.5. Public Law and Private Law

Weyr underscores how—as concerns what is perhaps the greatest breakthrough of Kelsen's thought, namely, its having resolved all pseudo-dualisms, and in particular that between "public" and private law[5]—he had previously

[5] "There is no legal basis for drawing a distinction between so-called public law and so-called private law; only from a historical and psychological point of view can the distinction be explained, but there is no longer any justification for it today" (Weyr 1974a, 461; my translation).

himself laid the groundwork for finding a way out of that entanglement. More to the point, Weyr underscores the conservative nature of that distinction, a distinction that retains an "absolutistic element" in framing the relation between public power—a power above the law—and those subject to that power. The *whole* of the law is grounded in the state: The law is all *Staatsrecht*. "Indeed, this mysterious conceit of 'public' law is designed in the first place to retain certain elements of force [*Gewaltfaktor*] that can be brought to bear on other subjects under the law" (ibid., 464; my translation).

Weyr's rejection of the dualism between public and private law is closely bound up with his upholding the view of the exclusivity and unity of the legal method,[6] a feature by virtue of which the object of legal concepts can only be an ideal object, and so a unitary legal system with "noetic boundaries" (ibid., 465; my translation) overstepping which would lead to a methodological eclecticism that would cause us to lose sight of the very object of legal science, namely, the law as the abstraction and basis on which legal rights and obligations can be ascribed to individuals. It follows that concepts must themselves be "constructed" in such a way that through a *tertium comparationis*—a benchmark against which to compare different concepts (here those of public law and private law)—the dualisms between these concepts can be traced to the unity of a properly scientific concept (the law of the state as *the whole of the law*: Weyr 1974c). Weyr draws a distinction between "ancient" philosophy of law, solely concerned with the contents of law, and the "new" philosophy of law, which instead approaches its object scientifically and therefore sets itself up as a formal philosophy of law, capable of moving beyond all pseudo-dualisms by emplacing them into the unity of the legal system and of its formal (and hence general) concept as reconstructed by the *reine Rechtslehre* (ibid., 553). "Thus, for example, it will first of all be necessary to find the universal concept of law (understood as the object of legal knowledge), and only then will it be possible to inquire whether there can be found within this concept any 'differences' on which basis to distinguish subconcepts" (ibid., 554; my translation). The differences internal to law are for Weyr only "relative," in that

> a ruling, an administrative act, and a private contract each appear as a "legal norm," just like a law or an enacted measure, or like any other expression of a legal duty, relatively more general (and hence more abstract) than such a duty, and whose status as a legal norm is beyond doubt even from the standpoint of traditional legal scholarship. (Ibid.; my translation)

[6] "In any event, the similarity or dissimilarity between different systems of domestic law can be large or small, but they always find a logical and necessary counterpart in the unity of method that alone can make possible a scientific knowledge of any system of law, whichever it may be" (Weyr 1927–1928, 215–6; my translation). The French original: "En tout cas, la diversité ou la ressemblance des différents droits nationaux puissant-elles être grandes ou petites, toujours est-il qu'elles trouvent une contre-partie logique et nécessaire dans l'unité de la méthode qui, seule, rend possible une connaissance scientifique de n'importe quel système de droit."

And from that standpoint, Weyr argues, we have to recognize that a judge's ruling, a law enacted by a parliament, an administrative act, and a contract all enjoy the same legal status, in that they all count as norms. The *tertium comparationis* that in this process should make it possible to move beyond the dualisms lies in the concept of the creation of law (*Normsetzung*). The overarching concept, however, is not empty, as the theorists of the "living law" would have it, but is more general and comprehensive than the concepts it comprises: It is so as the concept of law is to court procedure, as court procedure is to German statutory law, and so on.

2.1.6. The Hierarchical Structure of the Legal System and the "Metanormative"

Likewise, this normative method can solve the contrast, only an apparent one, between general laws and particular laws, between abstract law and concrete norms (an individual administrative act or a judge's ruling). This much, says Weyr, has been shown by the hierarchical conception of the legal system developed by Adolf Merkl (1836–1896), to which Weyr devotes a reconstructive article (Weyr 1927–1928) where Merkl's normativist method is traced to Weyr's own previous work, positing the concept of the state's law as the means through which to work out the contrast between *subjektives Recht* and *objektives Recht* (rights and law). There is no qualitative difference between a ruling, an act of Parliament, an administrative act, and a private contract:

> What has prevented traditional legal scholarship from appreciating this analogy is its understanding of a private contract as an act in the law that in combination with a norm (for example, a prescription in the civil law) gives rise to an obligation or right [*subjektives Recht*]. (Ibid., 222; my translation)

Among the precursors of Merkl's *Stufenbaulehre* mentioned by Weyr are O. Bülow, A. Haenel, and, clearly, Bierling, but Weyr also mentions himself, taking credit for having seen before Merkl the hierarchical structure of the legal system (ibid., 223).[7] Merkl's hierarchical structure, however, overturns the normativist approach of Kelsen's *Hauptprobleme* by opening the unitary legal system to the "metanormative":

> Just as the most immanent science of nature (physics) shows an unremitting propensity for metaphysical problems, so even the most positivistic theory of law shows a propensity for the metanormative. This propensity can be observed in the pure theory of law in the overall shift from its original purely *static* point of view (where the central problem is *Quid juris?*) to a dynamic point of view, from which even the flux of norms in becoming—their arising, changing, and lapsing—can form an object of legal knowledge and thus be normatively conceived, which may not be the case *all* the time, to be sure, but for the most part it is. (Weyr 1931b, 371; my translation)

[7] Weyr refers to page 13 of his book on the foundations of legal philosophy that he had written in 1929 in Czech, *Zaklady filosofie právní* (Foundations of legal philosophy: Weyr 1980a, 113).

And what is this becoming of norms—the changing course of the legal system, of *particular* legal systems: the Czech system, the Austrian, the French—if not the application of norms in the concreteness of the social? Now, since a norm, "valid" though it may be, is meant to be effective, that is, concretely applied, the enforcement of a norm, as Weyr comments, is realized through a "process of the external world," and the question *Quid juris?* cannot be answered on purely normative grounds, so much so that Weyr—rejecting Kelsen's conception of primary norms as norms backed by sanctions—even tries to build the concept of obligation itself into the legal system: "The concept of enforcement, then, only lives on the outskirts of a normative-immanent consideration if the content of the norm to be enforced (i.e., an obligation) at the same time entails the creation of a new norm, namely, a secondary norm" (Weinberger 1980a, 40; my translation). But the need for a norm to be enforced or made concrete in the hierarchical and dynamic system represented by a legal order (for example, the need to pay back a loan) means that "the tension between the world such as it is and the world as it ought to be, as judged in light of a certain norm, has been dissolved" (Weyr 1980c, 145; my translation).

2.1.7. Sein *and* Sollen

That the separation between the *Sein* and the *Sollen* can entail an undue isolation of jurisprudence, and even a de facto weakening of its explicative power, has been underscored by several authors, so much so that Weyr himself is keen to assert the relativity of the monistic method. This is regarded by him as the only method capable of conferring a scientific status on jurisprudence, by placing jurisprudence on the same level with the natural sciences, despite the objections raised not only by natural scientists but also by jurists themselves, many of whom envisioned a content of jurisprudential laws as absolute and timeless as that of the natural sciences. But the challenge for Weyr was to have *two* sciences with equal dignity, bearing in mind that, while legal norms, as *artificial* entities, are changeable and do not last forever, that should not affect their quality, namely, their validity (*Geltung*).

If the two sciences are to adhere to Kant's method and to a critical idealism accepting the unknowability of the "thing in itself," they must both presuppose a basic methodological premises: the *is* for the natural sciences, the *ought* for the normative ones. But in reality, Weyr argues, the *is* is not extraneous to the normative sciences, either, in that both are underpinned by the is understood as the "givenness" (*Gegebensein*) of its object of knowledge. On the other hand, Weyr comments, this givenness of the object of knowledge "is problematic for natural and normative science alike, and so it certainly won't be possible on this basis to assert the primacy of one over the other" (Weyr 1974b, 539; my translation). But Weyr was also a good enough practical jurist to appreciate that the dualism propounded in the theory of method must

in some way be tempered by the jurist's concrete experience. This, as we saw, is especially true where the normative method lets go of the idea of a static method and turns to the dynamicity incident to the production of law. It is no accident that Weyr's previously mentioned article on the *Stufenbau* has a passage revealing that this precursor of Kelsen, whom Kelsen undoubtedly held in great esteem, nonetheless did not refrain from drawing different, if not divergent, conclusions from those of Kelsen. Let us therefore look at this passage in its entirety:

> If we take into account that the normative mode of consideration, despite its independence from the causal method of the natural sciences, logically requires and presupposes this point of view as a methodological or noetic integration (or opposition)—for only in this way can we arrive at Kant's well-known noetic dualism—and if we take into account that this dualism necessarily presupposes a certain divergence of content between the existing world and the world of duty (the *Sollen*) (for if they corresponded in every single respect, duty would lose its typical meaning), then we would be looking at the idea that the enforcement or fulfilment of a norm would normatively at the same time entail its extinction, except that in this case the norm would be extinguished not by its creators (as by issuing other norms in derogation of the existing one) but by those who are subject to it. [...] If the enforcement or fulfilment of a norm can be construed as its extinction, it would mean that the contents of the existing world of the is find themselves in greater proximity to those of the world of the ought, and specifically this would happen in the manner in which, according to the norm's fulfilment (enforcement), the existing world appears as it must appear in the sense of the fulfilled norm. (Weyr 1980c, 145–6; my translation)

The world of law is therefore a world of procedures, of processes through which what is becomes what ought to be. Weyr makes this into a distinctive feature of the legal system, failing to see that even the natural world is a world of processes. He should therefore have paid greater attention to the role of the will as an element characteristic of legal procedures and specifically of normative production by a norm-crafter (*Normerzeuger*). Not that he completely overlooks to do this, but he confines himself to marking the difference between the world of natural causes and that of norm-making through the will of a legislator, setting up a hierarchy between the level of normative production and that of normative fulfilment, in turn set up on two levels: that of mere decision as distinguished from that of knowledge or judgment.

Weyr in this way goes back to defending Kelsen. He does so in responding to a critical comment on the pure theory of law put forward by W. Jöckel (Weyr 1931a, 458ff.). Weyr in certain respects formalizes the pure theory of law even more emphatically in responding to Jöckel's criticism of Kelsen: What sense could there be to criticizing mathematics on the ground that it concerns itself with numbers rather than with concrete quantities, without considering that these quantities are identified by those very numbers understood as general and abstract entities. We certainly cannot replace the exact science of mathematics with the natural sciences just because the former does not describe any specific contents: this circle, that triangle, and so on. In the

same way, there is no way, proceeding from "the thesis of the pure theory of law as a formal (i.e., exact) science of legal form, to have any experience of the content of concrete legal systems" (Weyr 1931b, 374; my translation).

2.1.8. Teleology

As we take into account the similarities between Weyr and Kelsen, however, we should not forget that Weyr does not confine himself to setting the normative sciences in contraposition to the causal sciences, for in the normative sciences he introduces a *teleological* aspect, which Kelsen, in his *Hauptprobleme*, understands to be just another part of the causal conception. Whereas for Weyr a norm is not an expression of logic, for Kelsen, at least in his European period, legal normativity inevitably contains a logicistic element that marks the specificity of legal science. As much as Weyr may underscore the need for a distinctly legal method, as well as for a distinct method of legal conceptualization, it is still the case that whereas for Kelsen there is no law outside legal science—and so the concept of a legal norm is equated with that of a normative legal science that "produces," "constitutes," or creates its object as a logically coherent entity—for Weyr the standpoint of the knowing subject is different from that of the object to be known: The two are "correlative" (ibid., 370) entities, to be sure, but for that very reason they cannot be the same thing; indeed, there is an essential distinction between them.

On closer inspection, Weyr's philosophy of law reveals, aside from the analogies just considered, greater theoretical flexibility when compared with Kelsen's philosophy of law, that is, greater attention paid to the life of the law as experienced by jurists and lawyers on a practical level. Weyr thus draws a distinction between norms and imperatives, while recognizing that in practice a norm can act, and does act, as an imperative having the *motivating* power to *causally* move individuals to action (Weyr 1980b, 58). And indeed the legal philosophy advanced by Weyr and by other exponents of this school never fails to pay close attention to the law in practice, especially as concerns the civil law and, with Weyr, administrative law as well. Precisely in discussing Merkl's account of the legal system's stepwise structure, Weyr defends this thesis by applying his *tertium comparationis* criterion: If lawmaking, administration, and judicature find themselves on the same plane, it is because this *tertium comparationis* is none other than "the quality common to these three functions and to their results; they are all norm-creating activities, and norms are their uniform product" (Weyr 1927–1928, 225; my translation). The problem is how to conceive administration as a norm-creating function (like the legislative and judicial functions). Not incidentally, when it comes to the hierarchy of norms, Weyr is prompted to clarify this concept by reference to those who produce norms, and so by reference to their will, thus framing the question not in terms of primary and secondary norms themselves (the former more

general, like the statutes; the latter more specific, like court rulings and administrative acts) but by speaking of the *Normerzeuger*, meaning the *producers* of primary and secondary norms (the legislator in the first case, the judge in the second) (Weyr 1980c, 139ff.).

2.1.9. The Practice and Theory of Law

Although Weyr, like Merkl and so also Kelsen, holds that a concrete norm is contained in a general one, he understands such a concrete norm to be so contained only in a "latent state," by which is meant that in order for a norm to become real, there always needs to be a concrete authority that will carry the general norm into execution: a judge or an administrative official (Weyr 1927–1928, 227). This interest in the concrete that distinguishes Weyr's philosophy of law is certainly reflected in the essay he wrote on the occasion marking Kelsen's fiftieth birthday, where he turns to the relation between the pure theory of law and administrative law. But even in the earlier article previously discussed, offering a criticism of the dualism between public and private law, Weyr's rejection of this dualism is never divorced from an appreciation that practice will follow its course even independently of theoretical speculation, and that the distinction between public and private law exists as a matter of fact, as evidenced in the different ways in which jurists in practice behave in taking into account the status of organizations, business entities, persons, and so on. The whole of our current government apparatus, Weyr comments, "is completely based on the dualist principle" (Weyr 1908b, 574; my translation). At the same time, Weyr envisions for legal science the task of showing to those who deal with the law on a practical level, and in particular to the legislators, that for reasons at once scientific and practical, modern law under the rule of law needs to move beyond that dualism, and where law and administrative justice are concerned, this move makes it necessary to confer on the citizen bringing a lawsuit against an administrative agency an equal status with the state itself, or at least that is a move making it necessary to part with the idea of the state as an entity more valuable than the citizen (the classic view of the "surplus value" of the state vis-à-vis the citizen). A legal dispute in administrative law is no different from one in civil law. The idea that a difference might exist is claimed by Weyr to be ultimately in large part "rooted in psychology" (ibid., 577; my translation). Nor, in closing, does Weyr shy away from sharing some political reflections on the modern welfare state grounded in the rule of law, a state where the bifurcation between private and public law appears to have lost its raison d'être in a legal system increasingly moving toward a unitary makeup, precisely for reasons in part political, and this too is a point where Weyr parts ways with Kelsen. Not incidentally, law does not, for Weyr, "dissolve" into the state, but the state is a normative entity from which legal norms issue:

> By *legal norm* is meant all those norms whose normative subject we consider to be the unitary subject we call the state. The set of these norms—whose cohesive element lies in the identity of this normative entity—is a unitary system of norms, namely, the legal system. (Weyr 1980a, 41; my translation)

So, if on the one hand Weyr, in his article on administrative law and the pure theory of law, reiterates the meta-legality of many theses, arguing that administrative jurists are among those jurists with the greatest exposure to the non-normative, non-legal justification of norms, on the other hand he does not appear to reduce the state directly to the legal system, with respect to which the state is both "maker" (of the norms making up the legal system) and "owner." To claim that the state "makes" law means logically to envision a distinction between law and the state, a distinction that Kelsen, by contrast, would account to be illogical, on the view that the state is none other than the personification of the legal system.

At the same time, however, Weyr underscores that the rule of law entails a series of legal relationships among legal persons excluding the idea of the state as inherently more valuable than (or as having a "surplus value" over) its "partners," who in the eyes of the kind of the administrative law then in force were deemed mere "subjects." These considerations are only apparently political, for as Weyr conceives them, they are internal to the scientific enterprise of jurisprudence. Indeed, the normative sciences are understood by Weyr to have the same scientific standing as the natural sciences (Weyr 1974b, 541), this to the extent that their "constructive method" is "legal in the proper sense of the term" (Weyr 1908b, 580; my translation). More than that, the relation between a norm's validity (*Geltung*) and its efficaciousness (enforceability) is much closer in Weyr than in Kelsen, not only in Kelsen's 1911 *Hauptprobleme* but also in his subsequent writings, which in Weyr's estimation reflect the influence of Sander and Merkl and were thus more cognizant of the socio-empirical nature of law:

> The knowing subject in the normative sphere (the human intellect) choosing among countless legal systems (legal orders) will typically choose as objects of knowledge those whose representations are as a rule effective as motivations acting on the human intellect or, in other words, those that present a "useful scheme by which to interpret and evaluate human beings. (Ibid., 541; my translation)

Validity is for Weyr a meta-normative construct, in the sense that the givenness of a valid norm or of validity "transcends" the method of knowledge proper to legal science, just as in Kant the givenness of the object of the method proper to the empirical sciences transcends that method.

2.1.10. On the Concept of Sovereignty

Perhaps nowhere are the differences and similarities between the Brünn school and the Vienna school of "pure" legal science more subtle than in the

concept of sovereignty: Kelsen uncompromisingly rejects the concept of sovereignty and seeks to undo its "dogma," but Weyr is less categorical. For on the one hand he agrees with Kelsen that sovereignty is not something we can ascribe to a real power, whether it be the state itself or the power of the state, but on the other hand sovereignty does not simply resolve itself into an ideology or something to be rooted out. Sovereignty for Weyr does exist, and it lies in the sovereignty of the legal system itself, a view that seems closer to Hugo Krabbe's than to that of Kelsen, who is known for the claim that sovereignty must be "radically removed" (Kelsen 1920a, 320). Of course, this sovereignty envisioned by Weyr is a formal concept:

> The understanding of the concept of sovereignty being presented here is of course fundamentally different from the customary ways of understanding the same concept: The concept does not contain "power" as a characteristic, and so does not contain the concepts of supreme and unlimited power, either, but simply expresses a formal principle of normative knowledge. This concept is an abstraction similar to that of a "normative subject," which likewise does not represent an element of the external world, and so no qualities may be ascribed to it that can only partake of reality (as is the case, for example, with power, that is, physical efficaciousness). (Weyr 1980d, 61–2; my translation)

But if sovereignty is a formal concept and a quality of the legal order, it cannot take up any content whatsoever, for among its contents there must necessarily also be a specific one: that which makes it possible for the order to set forth "the conditions under which a norm figures as an element of the normative system" (ibid., 60, my translation). Now, because this feature characterizes heteronomous systems, and the legal system is such a system, this necessarily means that the unity of the legal system presupposes a content (a content of its norms) that establishes the legality of norms, namely, their belonging to the legal system. So, as much as the law may be a system of abstract and formal norms, these norms presuppose some content that regulates the life of the legal system.

Now, it is true that for Weyr the formal criterion served the purpose of reducing each legal system to unity, and that this applies not only to "composite" systems (such as a federal state) but also to unitary ones. But as a quality of the legal system, sovereignty is also understood by him as a concept at once static and dynamic. The latter aspect comes through if we consider a legal system in its concrete existence: A legal system so considered can only be dynamic, by virtue of its regulating its own change. But then, precisely in this way, despite the reiterated normativity of the system, the law winds up embodying voluntaristic elements (the will ascribable to one agent or another) that pull the world of pure *Sollen* back into the reality of being, the *Sein*. Whether we are dealing with a composite (federal) system or a unitary one, the system will always have to have unity in order to be valid, that is, all of its parts (the states forming a federation, but also all the other bodies having secondary normative

competence, such as the municipalities and the ministries) need to be reducible to a single legal person, which in this case would be the central state. But this reduction to unity and, vice versa, the delegation of competences from the centre to the periphery, always implies a decision-making moment somewhere down the line, and so a plurality of agents. This plurality of agents, despite Weyr's normative formalism, always comes with a string of sociopolitical characteristics, in that the norm produced by the normative agent delegated by the sovereign legal order is part of the class (*Tatbestand*) "to which the legal order ascribes the birth of legal obligations, in just the same way as the birth, death, or killing of a man are classes of acts from which certain obligations spring on the basis of the legal system" (ibid., 66; my translation). What counts as scientifically relevant is, for Weyr, the legal order as a unitary system, but equally relevant are all the normatively subjective agents (*Normsubjekte*) absent which there would be no production of norms. And so, considering that sovereignty is itself hierarchically ordered, at every level of partial sovereignty there operate agents who produce norms.

The foregoing interpretation of Weyr's philosophy of law highlights a possibility that Weyr himself was aware of, so much so that on the same page he takes care to point out that his theory is to be set against those views which confuse the legal concepts (the legally relevant classes of acts and facts) with the legal order itself, in that the component entities forming the legal order are found to have some sort of superordination to other legal persons. But this very egalitarian concern—this liberal defence of the equal standing of private citizens vis-à-vis the government bodies tasked with making administrative law[8]—is a double-edged sword, for on the one hand it does bespeak the liberal cast of Weyr's political philosophy, but on the other it acts as just another reminder of the antinomy inherent in a normativist philosophy of law that fails to be such all the way through (an objection that with equal force applies to Kelsen's own pure theory of law). Not incidentally, as was previously pointed out, the later Weyr was very much drawn to a "triadic" theory of law, that of Karel Engliš (1880–1961), who espoused a threefold approach to the knowledge of law based on the three criteria of causality, normativity, and teleology.

[8] "Administrative acts are considered a type of unilateral 'legal transaction,' which this theory [criticized by Weyr] sees as an autonomous source of rights and legal obligations. In a theory so conceived a confusion is made between the legal order and its legal concepts (*Tatbestande*)—with which the legal order as the only source of the whole of law, that is, as the source of rights, connects the birth of 'legal relations'—and in this way the whole systematic makeup of the legal order is destroyed. Indeed, to make one example, it would be impossible on that theory to speak of the unity of the legal system—understood as the unity of the whole of law—because the law is to be found in a whole series of legal concepts, such as those of contract, birth, death, bureaucratic decision, and the like" (Weyr 1980d, 67; my translation).

2.2. Precursors of the Pure Theory of Law: Hugo Krabbe (*by Giuliana Stella*)

Hugo Krabbe (1857–1936) gained widespread recognition and a devout following in his day, this owing to his innovative approach and to the originality of his works, which fit squarely into the broad contemporary landscape of German-language jurisprudence, but which pay equal attention to, and draw inspiration from, the thinkers who were paving the way for the great epistemological turn of the late 19th century: It is this new paradigm that would eventuate in the so-called Pure theory of law developed by Kelsen, a thinker that Krabbe is in fact considered to have anticipated. Krabbe's theory carries import in legal philosophy and public law alike, since his writings belong in an area of study, the theory of the state (*Staatslehre*), that at the time was considered a fundamental subject of law: These writings are specifically devoted to the relation between law and the state.

As we will see, Krabbe's ideas were seminal for the legal disciplines, and for the General theory of law (*Allgemeine Rechtslehre*) in particular, and three are the main works in which these ideas are expounded. The first of these (Krabbe 1906) frontally took on the question of the sovereignty of law: It was published in Dutch and immediately translated into German under the title *Die Lehre der Rechtssouveränität* (The theory of legal sovereignty: Krabbe 1906). According to Krabbe's own account, this work found its natural development, about a decade later, in his second important book, which in German is titled *Die moderne Staatsidee* (The modern idea of the state: Krabbe 1919). In the preface to the second edition—an expanded edition published directly in German in 1919—Krabbe informs us that the main body of the work consists of the book published under the same title in 1915, and substantially completed before the start of World War I. The 1919 work adds to the 1915 edition by bringing in a 1917 essay titled *Het Rechtsgezag*. This enrichment makes the 1919 German edition of *Die moderne Staatsidee* the core of Krabbe's legal speculation and scholarly production. It was Krabbe himself, after all, who pointed out that, whereas in his first major work, the 1906 *Die Lehre der Rechtssouveränität*, he was mainly concerned with criticizing the theory of the state's sovereignty on its merits, this second work instead sought to explain in the positive the principles framing the opposite theory, that of the sovereignty of law, and thus sought to flesh out the modern idea of the state. There is also a more concise, but no less coherent, version of this theory in which he offers a historical and speculative reconstruction of the modern idea of the state: It was published in French in 1926 (Krabbe 1926), and the basis for it is a course he taught at The Hague Academy of International Law. It, too, testifies to the wide currency enjoyed by Krabbe's theory. And finally there is the 1930 *Kritische Darstellung der Staatslehre* (Critical presentation of the doctrine of the state: Krabbe 1930), in which the conception expounded in the preceding works is bolstered by way of further theoretical backing and historical reconstruction.

As the titles of Krabbe's works indicate, and as a deeper analysis of their content makes even clearer, the central concern of his research is to move beyond an obsolete understanding of the state by laying out a conception that replaces the idea of dominion (*Herrschaft*) with that of law. However, it would be remiss not to point out the role played in the first half of the 20th century by the developing idea of international law, for this idea also plays a role in situating Krabbe's theory. These very theoretical interests are, after all, the ones we also find in the theorist who did more than anyone else to shape the legal landscape of the 20th century, namely, Hans Kelsen, and as was previously mentioned, it is precisely in Krabbe that Kelsen finds an important precursor. Very early on in Kelsen's production we find the very themes that Krabbe had previously turned to, specifically those revolving around the whole question of the nexus between law and the state and between municipal and international law—in a word, the question of sovereignty.

It bears pointing out in this connection that in 1920, after the publication of Krabbe's first two major works, Kelsen came out with a book that clearly identified the problem of sovereignty in its very title, *Das Problem der Souveränität und die Theorie des Völkerrechts* (The problem of sovereignty and the theory of international law: Kelsen 1920a), while the subtitle, qualifying the work as a *Beitrag zu einer reinen Rechtslehre*, a "contribution to a pure theory of law," and so as an essential stepping stone on the way to Kelsen's complete theoretical project, bespeaks Kelsen's complete affinity with Krabbe in establishing the importance of the close relation between a certain conception of international law and the idea of sovereignty.

If Krabbe is not widely recognized today, that is precisely because his theory found itself "enfolded into" into that of Kelsen, who in superseding Krabbe's theory and expanding it so as to adjust it to his own conception, wound up consigning it to oblivion. Krabbe is reckoned among Kelsen's so-called precursors, and once Kelsen came into his own as a character much more prolific and enterprising than the comparatively tempered, moderate professor from the University of Leiden,[9] Krabbe wound up being sidelined, despite the critical acclaim he had initially received. One need only consider in this regard the negligible role, if that, which Krabbe has in the work of Schmitt and Koellreutter,[10] not to mention that even in the French-speaking area, where his work also gained notoriety early on, his innovative theory of sovereignty would soon be overshadowed by Léon Duguit's more fully devel-

[9] Krabbe was professor of *Staatsrecht* (public law) at the University of Groningen and Leiden. He also served as president of the Netherlandish Society of Legal Philosophy, founded in 1919 and based in Leiden.

[10] There is a short but interesting passage on Krabbe in Schmitt 1922. Krabbe is conspicuously absent in Koellreutter 1933, where the reader will instead find discussions of Kelsen and Heller.

oped theory,[11] similar to the ones advanced by Krabbe and Kelsen, but certainly more up to date and closer to the kind of discourse engaged in by the jurists, especially those who took a sociological interest in law.

Krabbe's method consists in the first place in situating the idea of the state in a historical context. This is an idea he came to by reconstructing the main stages in the discipline devoted to its study, the *Staatslehre*, and coupling this development to a concept viewed as having primacy, that of sovereignty. He specifically traces out the history of the "modern" idea of the state, setting out to find the origin of this idea and pin down the moment of its birth. This idea thoroughly rejects an interpretation of sovereignty as simply related to the state, since to a modern state belongs a sovereignty understood as the sovereignty of law.

The turning point in the history of the idea of the state from the Greeks to modernity is located by Krabbe in the 16th century, when Thomas More set out the view that culture, not power, ought to be the aim of the state (the latter aim having been conceived from the outset as consubstantial with the state). In More's *Utopia* there emerges the idea that the state can organize society on the basis of an ideal model. But it is with Grotius that we find an appreciation of law as having a role that prefigures the idea of the sovereignty of law. There is indeed in his theory the primacy of a *coetus perfectus*, the bearer of sovereignty. And, finally, it is in Rousseau's philosophy that Krabbe sees the birth of the modern idea of the state as an entity bound up with the law. Krabbe is thinking here of Rousseau's concept of the general will and of the "impersonal" power of law. But he wonders what might have been the nature of the law Rousseau had in mind; and seeing that Rousseau, and even more so Grotius, still reasoned in terms of the natural law, he instead assigned that role to the positive law, arguing that by positing the sovereignty of natural law we would have advanced only partway toward the authentically modern idea of the state: Sovereignty belongs not to "natural" but to positive law. It is the sovereignty of *positive* law, then, which lies at the core of Krabbe's theory.

The historical process just outlined would eventually lead to the *Rechtsstaat*—the German rendering of the rule-of-law state—but since law never ceases to improve itself, Krabbe considers this to be only one of several evolutionary stages. And indeed Krabbe notes that in Kant, himself among the pioneers of the rule-of-law state, the law and the state still give place to a dualism. We have to wait until Stahl before we are shown the way to their identification.

[11] Duguit denied both the personality and the sovereignty of the state, in so doing looking to Kelsen, despite the different working assumptions from which the two authors start and the different conclusions they arrive at. But Duguit also pursued (without laying too much emphasis on) Krabbe's idea of the primacy of law over the state, regarded by Duguit as no more than an instrument.

The sovereignty of law therefore appears in Krabbe as the outgrowth of a long journey that began with the birth of the state: At the outset, the state had to be identified with a power, and specifically with a *personalized* power, but it then became a force through a succession of "depersonalizing" stages, and only in this way would it be possible to achieve an objectivization of power, and so a modern sovereignty, namely, the sovereignty of law. This is where international law takes on a preeminent role, for just as the state based on the monarch's power gave way to the state based on the power of the legal system—where no one, not even the monarch, is above the law—in the same way the individual legal order, like a river opening into the sea, opens into the international, or *inter gentes*, legal order, or, as Krabbe liked to call this cultural legal project, a supranational order, that is, an order lying beyond the nation.

We should now be in a position to appreciate not only the sense in which the Dutch jurist Krabbe is considered a precursor of Kelsen, but also the extent to which Kelsen's criticisms of Krabbe were founded. Kelsen's theory of sovereignty is expounded in his previously mentioned treatise of 1920, *Das Problem der Souveränität*, where Kelsen recognizes Krabbe's work as a "masterly critique of the German theory of public law" (Kelsen 1920a, 23; my translation), and he even adopts many of his predecessor's positions, but he winds up rejecting the theory even so. Its main error lies in its allegedly personifying the state, in its reifying the state as a person "in flesh and blood." But the truth is that Krabbe sets up an alternative between the law's personal power and its impersonal power, and as concerns personal power, he never reaches the point of "reifying" the state. Instead, he appropriately speaks of concrete men, such as a king, or a "college of men," stating that this is only a stage through which historically given societies go, a stage where material sovereignty based on authority gradually gives way to spiritual sovereignty based on law. Kelsen thus sets up a straw man, criticising a position that Krabbe never put forward.

In fact, on reading Krabbe's 1906 work, one can only come away startled by the points of overlap between the two jurists. Apart from the use of the expression "pure theory," there are more-substantive questions treating which Kelsen would later take a view strikingly similar to that of Krabbe: the idea that private citizens and the state stand on an equal footing, the nondistinction between public and private law (Krabbe 1906, 37),[12] and the rejection of the dogma of the will as a source of law. The will, however, is replaced by Krabbe with what he calls the "legal sentiment," a rather peculiar component of his theory of sovereignty, and here we do have a position quite unlike anything Kelsen might have taken up.[13] In terms that Kelsen would later adopt,

[12] Kelsen (1920a, 126ff.) recognized Krabbe as having anticipated his rejection of the dualism between public and private law.

[13] The question of legal "sentiment" or "consciousness" would deserve a closer investigation

Krabbe (1906, 43; cf. Kelsen 1911, 268ff.; 1913–1914, 53ff.) denies that the state enjoys any "surplus value" (*Mehrwert*), and he instead makes the case for a distinction between the stage where power rests with personal law and the stage where it is impersonal law that gains preeminence: This, he argues, comes about through the evolution of the human spirit—or, stated otherwise, in terms that Kelsen's epistemological framework inherits from Ernst Cassirer (Kelsen 1981, chap. 4)—it is something we witness in the passage from substance to function, from concrete to abstract. Anticipating Kelsen's normativism, Krabbe puts forward an argument as follows:

> The theory of the state's sovereignty rests on the idea that power is rooted in a personal right to rule. The theory of the sovereignty of law rests on the idea of an impersonal power, the power distinctive to norms precisely insofar as they are legal norms. The latter theory is the outgrowth of a superior culture and presupposes a capacity for abstract thinking. (Krabbe 1906, 47; my translation)

And in the same vein: "Law, meaning positive law, amenable to coercive enforcement, as the case may be, [...] appears before us as a set of norms" (ibid., 151; my translation). Precisely in the shift from the power wielded by a person to the power inherent in norms Krabbe locates the great revolution of modernity: "If we now ask which great thought [...] has come out victorious, we can answer that a *spiritual power* has taken the place of a *personal power*. We no longer live under the rule of persons but under the rule of norms, of these spiritual forces" (Krabbe 1919, 9; my translation).

The two authors diverge, on the other hand, when it comes to offering an actual definition of the rule-of-law state, the *Rechtsstaat*. Indeed, Krabbe held that the sovereignty of law describes this as a specific kind of state, the historically given entity which is the constitutional state, and thinks it possible to proceed on this very basis in moving by degrees beyond the dualism between the state and the law; Kelsen, by contrast, posited from the outset an absolute identity between law and the state, such that any kind of state is ipso facto a rule-of-law state. To this end—and, as Schmitt commented,[14] proceeding on an overtly ideological basis—Kelsen sets out to "blot out" sovereignty *tout court* (cf. Kelsen 1920a, 320). Perhaps this is where the comparison between the two

because it connects to Krabbe's idea that the achievement of a mature legal civilization is inevitably bound up with the cultural growth of men, who in his view have accordingly progressed through several historical stages of legal consciousness. That is how an initial prevailing idea of sovereignty tied to power, or empire, morphed into an increasingly expanded idea of supranational sovereignty not bounded by any given territory. It is therefore not possible, in light of this development, to account for Krabbe's theory by setting it in contrast to legal positivism, a view he instead always defended.

[14] Kelsen's rejection of the concept of sovereignty is denounced by Schmitt as none other than the outcome of the liberal ideology critical of the state. This is an outlook that according to Schmitt (1922, 29) Kelsen shares with Krabbe.

authors shows Krabbe to be the more practical-minded and empirical jurist,[15] with a sense for the historical datum,[16] a choice that Kelsen, in pursuit of a supposed "universality" of the concepts of legal science (ibid., 26), most resolutely criticizes.

In addition, Krabbe, looking to specifically clinch the link between legality and civilization, cannot countenance the idea that there is any sovereignty of law to be found in a theocratic organization of power: Such sovereignty can only be found where the development of culture has given rise to a proper consciousness,[17] one through which we come to recognize the direct obligatoriness deriving from what is no longer tied to any concrete personality but instead is binding precisely in virtue of its impersonality. The rule of law in Krabbe is tantamount to the impersonality of law, or, better yet, to the direct obligatoriness owed to the law's impersonality, but where *impersonality* means not "abstract" but "the impersonal legal order." This impersonality therefore does not rule out that the law, like the state when it exercised absolute sovereignty, bears a connection to power:[18] What happened, quite simply, is that power shifted from one holder to another. The power of the state and that of law are not fictive but real. If we observe them in their historical development, we will see that they initially coexisted, and then this phase ushered in a second one where the law and the state gained equal standing, once a model was identified corresponding precisely to the rule-of-law state.

Krabbe analysed the concrete legal structures of some European countries, through the eyes of a positivist jurist as well as through those of a legal philosopher, drawing the consequence that a substantive difference had devel-

[15] Specifically, it is Krabbe's intent to argue for his theory of sovereignty by connecting it to a discussion on the question of validity and obligation. See Krabbe 1919, 75.

[16] As evidence of that claim, one might recall the important role that Krabbe recognizes for the historical school of law.

[17] Law lives in the legal consciousness, and that view is closely bound up with the idea of the sovereignty of law: It is the legal consciousness of individuals and of peoples that confers vigour and force on the law—described by Krabbe (1926, 574) as the "new prince"—and on the multiple forms through which law manifests itself, including those of the federal state and the federation of states and, in descending order, of the county, the municipality, and so on. This is where Schmitt's interpretation comes in, which in Krabbe's consciousness approach sees a reiteration of H. Preuss and O. von Gierke's doctrine of the corporative state (see Schmitt 1922, 31). Also centred on the consonance between Krabbe's doctrine and that of Preuss and on the incongruence of Krabbe's doctrine with that of Kelsen is the interpretation of Krabbe offered by Hennis (2003, 24–8).

[18] The impersonality of power—which Krabbe defends tooth and nail, having first outlined its historical development—is a view that attracts Schmitt's firmest criticism, on the reasoning that the "anti-personalist" approach neglects law's indispensable logical decision-making moment, which in Schmitt's view cannot be resolved into a content-based deductivism: "Every concrete legal decision," says Schmitt, "contains a moment of indifference to content, in that a legal conclusion cannot be fully deduced from its premises, and yet the need for a decision remains an inherently determinative moment" (Schmitt 1922, 36; my translation).

oped between two situations: On the one hand was a complete *Gewaltseinheit*, which had grown to maturity in Great Britain, the Netherlands, and France, and on the other was an outworn model based on a dualism of powers and still present in Germany (Krabbe 1906, 68). The shift from personal to impersonal power is inherent in the evolution of civilization, and the historically decisive moment along the path so reconstructed came with the Glorious Revolution of 1689, starting from which the impersonal power of law gradually gained ground on the personal power of the king,[19] in a process driven by an awareness of the risk the state poses to liberty (cf. Krabbe 1919, 27).

The resolving monism Krabbe offers in response to the problem of the relation between law and the state is used by him to also solve the contradiction inherent in those conceptions that do not rule out the possibility of there being multiple "political entities" to which the principle of sovereignty applies, even though this principle is by definition absolute and exclusive. Under the monist theory—which by convention is attributed to Kelsen,[20] but which was first set out by Krabbe (ibid., 308)—the state's law merges with international law. Then, too, it is significant that Kelsen should again draw on Krabbe in criticizing the theory of the social contract as the foundation for the legitimacy of the people's sovereignty,[21] for this is a theory Krabbe specifically rejected as too indistinct, in that it cannot be identified with the personal power of command-giving, but neither can it be identified with the law's impersonal power (cf. Krabbe 1906, 149). The essential point, for Krabbe, is that there can be sovereignty even without a concrete subjectivity: without a person or body collegiate. This theory of the sovereignty of law carries clear political implications, for it ties in with the idea of the universality of the international legal order rooted in Wolff's ideal of the *civitas maxima*. The theory, in other words, comes with a political project which consists in designing a "supranational" order, an order which governs a community encompassing several states, and which for this reason is held up as more valuable than national law.

[19] "Since the 1689 revolution [...] there persists the attempt to eliminate personal power and make completely dominant the exclusive power that Parliament could have expressed by virtue of its being an organ of law. By accomplishing that objective, law acquired impersonal validity, and it can be said of England that it realized the doctrine of the sovereignty of law" (Krabbe 1906, 67; my translation).

[20] Like Kelsen, Krabbe also sees in the evolution of international law the makings of a "universal state." Nussbaum writes that "Krabbe does not just subscribe to the monistic theory—he even argues for the supremacy of international law, which he terms 'supranational law' and characterizes as having something of a messianic streak" (Nussbaum 1960, 309; my translation).

[21] Krabbe (1919, 45), in his own turn, would later look to Kelsen's *Hauptprobleme der Staatsrechtslehre* to find further backing for the view contrary to the social contract and to the theory of recognition (by the people) as the foundation for the legitimacy of law.

2.3. Hans Kelsen's Normativist Logicism (from 1911 to 1934)

2.3.1. Substance and Function in Kelsen's Philosophy of Law

The concept of function expresses the particularity of modern times in a special way which distinguishes modernity from premodern times. Which is to say that modernity is marked by its lack of any "centre." Where everything is a function, a relation, everything is interconnected, in the sense that *everything* is a centre, and so *nothing* is. Premodern times, for example, are without exception acquainted with the "sovereign" in a personal sense.

With the breakup of the medieval *Respublica Christiana*, this figure is replaced by a new one, that of the modern sovereign, of Hobbes's "mortal God." This figure in truth contains the germ of a process of self-dissolution that gradually leads to a loss of legitimacy, to the disappearance of the sovereign as a person in flesh and blood, to the advent (at first) of the fiction of the state as a person in a legal-dogmatic sense, and finally to the melting of this person into the universal sovereignty of the impersonal and abstract norm. It was Hans Kelsen's (1888–1973) legal philosophy that grasped this process of transfiguration from concrete to formal sovereignty.[22] This happened in what in my view stands as Kelsen's most significant work, *Das Problem der Souveränität* (The problem of sovereignty: Kelsen 1920a) whereas the classic systematization of this development is set down on an epistemological level, as is known, in Ernst Cassirer's 1910 *Substanzbegriff und Funktionsbegriff* (The concept of substance and the concept of function: Cassirer 1910), an essential text in understanding the history of modern philosophy, and also, where we are concerned, in explaining the *reine Rechtslehre* as a legal philosophy suited to the theoretical developments of modernity and of his new model of pluralist society (see Carrino 1998 and van Ooyen 2003, 2010).

The opposition between the concept of substance and that of function plays a key role in the effort by which Kelsen, throughout his theoretical production, goes about criticizing the various forms of ideology, so much so that his thought often appears to morph, and in fact does morph, into a proper anti-ideological ideology. In no author more than in Kelsen (see Topitsch 1964, 19ff.) do we find such a strenuous criticism of ideology and of the "ideological" imagery par excellence, that of religion: He closely parses the "canonical" texts of ideologism, from the straightforwardly religious ones to the politico-metaphysical ones, all of them dismantled because devoid of any coherence, guilty as charged before the tribunal of the logico-deductive rigour of scientific criticism (see Kelsen 2011).

This proper *jeu de massacre* naturally takes on different inflections at different places, and it cannot always hit the mark, owing in part to a preconceived intellectual mindset hostile to the symbolic discourse proper to religion and metaphysics (a hidebound mindset still savouring of 19th-century positiv-

[22] On Kelsen, see also Sections 8.3 and 8.4 in Tome 2 of this volume.

ism, despite Kelsen's description of his own approach as "*critical* positivism"). And as it turns out, it is in some of Kelsen's lesser-known texts that this criticism appears at its best. To be sure, these texts may not be the canonical ones that define Kelsen at his most familiar, but they are nonetheless essential, in my view, in laying the groundwork for an understanding of his theoretico-political project, by which is meant his turning the law to ethico-political ends. An example is to be found in *The Soul and the Law*, a 1936 article published in French (Kelsen 1936) and translated into English in the *Review of Religion* (Kelsen 1937), an article that anticipates the better-known *Society and Nature* (Kelsen 1943). Here the concept of the soul emblematically fills the role of the concept of substance and signifies everything that falls within the range of mythology, archaism, magic, primitive totemism, and the like, whereas the concept of law stands for form, in the sense of what is relational, referring to the logical interlacing of functional propositions of a scientific cast, scientific because hypothetical and probabilistic. "The soul" and "the law" are thus to be read as "substance *versus* function," or again as "magic *versus* science," along with other like contrasts, all of which must be read as stages in a process where every last theological vestige is to be effaced from life, and above all from science: from science in general, and specifically, as far as Kelsen is concerned, from political and legal science.

If we are to understand Kelsen's theoretical project—which indirectly is also his political project—we will have to take into account the question of how Kelsen goes about overcoming the dualist theology of good versus bad, of "true being" versus appearance. For it is around this central problem that Kelsen builds all his arguments: This is the backdrop against which we are to view all his works, the focal point being the criticism that Kelsen devotes to Plato, and we can see this reflected in Kelsen's criticism of human faith in the immortality of the soul, in the existence of something independent from the natural individual and from the complexes which make up the individual's psychophysical interrelatedness. Kelsen's arguments, in other words, are aimed at what scientific criticism identifies as a simple hypostatized "double" of the individual. Someone reading Kelsen's studies on Plato, a philosopher who accompanied Kelsen basically throughout his life (Kelsen 1985), cannot help but notice that Kelsen always goes back to the question of the soul and its immortality—and so, mind you, the question of the soul which metaphysics speaks of—a litmus test he uses to determine all ideological-metaphysical and archaic conceptions of life. The question of the soul served as a starting point from which to work in developing other questions, the ones more closely connected to the pure theory of law, especially when it comes to the doctrine of the "double truth," criticized as irreconcilable with the modern, scientific vision of the world and of life. The question of the "soul" and that of the "double truth"[23] interlock to

[23] The psyche as a "double" of the person had previously been investigated by Rhode (1925,

make up the supporting structure of Kelsen's opposition to ideology, indeed of *all* ideologies. His criticism even targets what he calls the "superstition" deeply rooted in the human psyche, and tied to atavistic impulses of fear and survival, and hence bound up with a matter as primal as anyone may possess.

In this sense, Kelsen was not taking aim at an ideological superfetation or accretion, a historically settled "superstructural" belief; he was rather concerned to debunk a lingering magical vision of life that survives in each person, a vision that in reality amounts to a social ideology: "Faith in the soul is in the first place an ideology of retribution, and as such a tool of justice" (Kelsen 1985, 248; my translation). In Plato, as well as in general, this faith is connected with the problem of good and evil, with ethics (ibid., 272, 280) and with the need for justice, something that in a conversation with Günther Winkler in the early 1960s he described as the "opium of the people." We are thus dealing with the fantasies of single human beings who continue to imagine their immortal "souls," something against which, in a sort of "initiation to modern science," Kelsen sets his own profoundly laic and secular vision of life. It is not religion as the opium of the people that Kelsen criticises, but the individual as an "opium buyer," who fails to see the only possible truth in the universe, the veridicality that (in a Kantian manner) the new science *produces*. The term *soul* effects a hypostatization beneath which are concealed political postulates: It is the germ that spawns all illusory beliefs, such as that in the existence of God or in justice. "In Plato, the primacy of justice over truth, of ethics over our knowledge of reality, is deeply connected with his doctrine of the double truth. If it is the good that "brings forth the truth," then only the good can be true, and so the good must necessarily also be true" (ibid., 204; my translation). In metaphysics we proceed not from the process for gaining knowledge of the truth but from an abstract emotive postulate, from a subjective need, even though we cannot avoid shifting toward that level of reality and concreteness which, from a scientifically correct perspective, ought to be the point of departure and of arrival.

For Kelsen, for example, the problem of justice is simply a misconceived problem, for it concerns individual convictions and the rules of the individual's *autonomous* action, not the *heteronomous* structure of law. Law and justice are problems that fall under two different headings, the former being a matter of social technique and the latter a matter of individual morality. "The eternal question of justice," Kelsen writes, "seems to be one of these genuine problems whose solution does not consist in a correct answer but in correcting the question; that is to say, in substituting for one question another, allegedly a more precise one. The resigned wisdom: man can never find the truth but may learn to ask better questions, holds for the problem of justice more than for any other one" (Kelsen 1947, 390).

7). Kelsen (1985, 10) in any event also highlights how in Plato, next to the purely ethical concept of the soul there sometimes appears a naturalistic-psychological concept.

The presupposition behind this framing of the problem lies in an assumption of value relativism, a theme developing which Kelsen certainly bears Max Weber in mind. If we had to choose between liberty and equality, for example, there would be no way for us to rationally decide which of these two values is objectively superior to the other, for any such decision would depend on each person's internal psychical motivations. Any attempt on our part to justify a choice among subjective values by invoking an objectively valid rule of justice will amount to no more than the expression of a psychical need. Justice is "an irrational ideal," "a euphemistic paraphrase of the painful fact that justice is an ideal inaccessible to rational cognition" (ibid., 397). Even so, it is a historically demonstrated symptomatic fact that whenever an ideal of justice comes into contact with social reality, it undergoes a peculiar metamorphosis that turns it into an ideal of peace, which too may not amount to justice, but at least it amounts of a *species* of justice. Positive law is in effect "a social order the purpose of which is to guarantee peace among the individuals subject to that order" (ibid., 397–8) an order that transforms the ideal of an *extra nos* absolute justice into the inherently relative justice proper to legality, to a compliance with positive legal norms: "It is 'just' for a legal rule to be actually applied in all cases where, according to its content, this rule should be applied. It is 'unjust' for it to be applied in one case and not in another similar case" (ibid., 398).

So if we were to construe Kelsen's theory of law and the state as a neutral, unqualifiedly agnostic theory—even in the phase where this theory moved closest to the empirical currents (in Kelsen's American period)—this would mean that as a matter of principle we have deprived ourselves of a full understanding of that theory, deliberately choosing not to take into account its complex and multiform ideal valence. Such a misconstrual is a risk attendant on our neglecting to fully consider that the *reine Rechtslehre*'s neo-Kantian foundation can be used as a sort of toolkit for moral evaluation; and it is also a risk we incur by failing to grasp the logical necessity to historically revisit Kelsen's theory, in that we have taken Kelsen too seriously, so to speak, when he describes his endeavour and purposes as purely scientific, descriptive, and non-evaluative; or we have sought at all costs to make his theory into a *solely* ideological depiction of this or that political conception (as a rule, and not incidentally, a *liberal* conception). This twofold error has prevented us from grasping the profound meaning of Kelsen's project, its strong historico-theoretical relevance, almost as if to suggest that a theory's historical situatedness or its (indirectly) moral import somehow acts to undermine its theoretical value.

The pure theory of law is a relativistic theory, to be sure, but it does not resolve itself into an absolute scepsis. Kelsen's relativism is itself relative, in that it presupposes an all-embracing value, that of tolerance. In Kelsen, tolerance is not an exclusively political value but rather functions as the necessary condition for any attempt at political liberation: It is the trait that binds science as the process of self-determination of reason with politics as the process through

which to found a universal order of peace and rationalize human existence. Tolerance thus means rationalization and, consequently, formalism. And so, Kelsen's highly disparaged and criticized formalism is not so "empty," after all, as this formalism itself pretends to be: On the contrary, precisely on account of its "emptiness," it is charged with material meanings and with the potential for political projects. Coming to the forefront *in* and *through* this formalism is the global project that secularized modern humanity has for a rationalistic foundation of society so as to be free from all metaphysical, transcendent assumptions. In Kelsen's pure theory of law (which must be construed not only as a general theory of law, a theory of the state, but also as a legal and political philosophy), we find in certain respects the most coherent place for an earthbound rationalization of vital processes. Kelsen figures as the knight spearheading the effort to blot out all mythological, metaphysical, and mystical residues; he symbolizes the horror of all that is elementary, irrational, and "primitive."

In secularization, on the one hand, and in the bursting onto the European scene (and especially onto the Mittel-European scene) of a Jewish spirit fully suspicious of all that is not pure spirit, or interiority, or an awareness of pain and defectiveness, on the other, we have two hermeneutical lenses through which to read the recent history of Europe that show themselves to be especially fruitful in working toward an understanding of Kelsen, who certainly did have a part in that history. His theory—which it would be a mistake to regard as just legal or political, for it is also a moral philosophy—thus lends itself to a critical and cognizant understanding of the complex spiritual coordinates of the time of crisis and of the devaluation of all values (*Entwertung aller Werte*), presenting itself as a critical scientific and speculative self-reflection, a radical one capable of rising to the challenge posed by the dissolution of any organic communitarian bond in the traditional sense and by the emerging concern with the *value* of what is normative, of that which *ought to be*.

The basic elements of Kelsen's conceptual toolkit—order (system), norm, duty, and spirit (in the Freudian sense of the term)—are not neutral concepts, purely and naively formal in the sense of a technico-scientific categorial apparatus indifferent to the deep motivations, conscious or otherwise, of those who use them. The ambiguity of Kelsen's project—which all told builds a model for a legal-political order designed to promote a certain kind of politics and of law—is owed to this terminological ambivalence, which invokes layers of much deeper meaningfulness than that of the general theoretical conceptual apparatus. Kelsen was a full participant in the spiritual turmoil that marked the great Vienna of the early 20th century and in the crisis of the Mittel-European world—a world importantly shaped by the Jewish intelligentsia—and there is no doubt that his cultural roots hark back to a legacy that can only be understood by virtue of his being tied to the Jewish community (by a bond that only grew stronger the more it was rejected), and it is quite significant that this community was "founded" *ab origine* on the lack of any foundation,

on the destiny of nomadism and of exile (it is only in 1906 that Kelsen "converted" to Christianity, for reasons of expediency). These roots

> reached back to the archaic-religious conception of the law understood as the transcendence of the Word over deeds, that is, over human vicissitudes and the convulsions of history; the transcendence of rules over history; of form over facts; of the ought over the mobility, instability, and insecurity that distinguishes the conflictual and contradictory reality of the is; [...] the transcendence of order over disorder. (Frosini 1988b, 52; my translation)

Only on this hermeneutical foundation, and from this perspective, is it possible to grasp the authentic meaning of the view that equates God with nature and the state with pure normativity, with a functional relation, with formal-legalistic abstractness. The desubstantivization of the state that Kelsen effects by making the state into a legal form that comes back together only in the universal totality of the *civitas maxima* is a move whose meaning can be grasped only as an attempt to rationalize the basic existential question facing modern humanity deprived of the "gift of meaning," the question of how to overcome the sense of guilt and remove it, with the accompanying anxiety, leading the world from chaos to the cosmos. Anxiety provides the essential key for the hermeneutics of modern culture, but anxiety is itself a religious, theological concept. In rabbinic culture (cf. Rubenstein 1968), for example, anxiety is the original productive sign of religious practices, of symbolic rites, and of knowledge. And it is not incidental that anxiety should at the same time constitute the core of Freud's psychoanalytic theory—the last chapter in the comments to the Talmud, as Kafka characterized that theory—and Kelsen not only kept up personal relations with Freud but also adopted important elements of his theory (Losano 1981).

The rejection of any organic substantive conception was taking on a strong political flavour in a reactionary sense at that time, but the thrust of this rejection in Kelsen lay in his attempt to radically dismantle all mythological thought by seizing on the tools made available by the rationalistic and formalistic critique of knowledge, as well as on the advances made in anthropology, ethnology, and especially psychoanalysis. Freud's effort was to trace the vestiges of mythological thought in modern man, and in a similar vein Kelsen saw this thought as a brake on the emancipative movement of the spiritual sciences, where hypostatization—coupled with an insufficiently autonomous role recognized for the notion of function understood as constitutive of the dignity of the modern scientific enterprise—continues to hamstring humans in their endeavour to free themselves from the primitivism of miracles, as well as from the metaphysical character of their hypostatizing and substantivizing "full of mystery" (Kelsen 1920b, 424; my translation)—irrational and logically tenuous like Hegel's objective spirit (Kelsen 1922a, 133) (even though, as we will see, Kelsen would end up drawing on Hegel's critique of subjectivism)—and from the communistic millenarianism propounded by Marx, Engels, and Lenin (Kelsen 1920b, 424).

Kelsen's theory of law as a system that coerces human behaviour lays its foundation on an atomistic conception of society as an entity that only exists through its psychophysical singularities, which alone represent social reality, the matter-of-fact basis of sociological causal knowledge. The normative-functional conception of the state is possible only against the background of a specific conception of the world and of life that has interiorized the dematerialization of all supraindividual figures, first among which that of God. One can appreciate, from this perspective, why Kelsen should have regarded Freud's work as "invaluable." True, Kelsen judged this work to be only "preliminary" in moving toward the definitive abatement of "metaphysical dualism," but Freud's psychological analysis did nonetheless appear to him to have dissolved the archaic metaphysical dualism of the double truth, having resolved the "hypostatizations—armed with all the magic of centuries-old words: *God*, *society*, *state*—into individual psychological elements" (Kelsen 1922a, 134; my translation).[24]

The doctrine of the double truth entails a double morality: an empirical one and an authentic, metaphysical one coinciding with true being. But we must be careful here, for even at this early stage Kelsen's critique of metaphysics in pursuit of a despiritualizing realism begins to reveal his basic project. And far from assuming a sceptical cast, this project is deeply morally committed. Kelsen's peculiarity and originality consist precisely in his effort to promote a peaceful coexistence—just, good, moral—through a critique aimed at every ideology of justice, goodness, and the like. And so, while Kelsen does demythologize absolute values in such a way as to come to a relativistic view, this is nonetheless a *moral* view,[25] and in fact he proceeds in an attempt to ground morality itself—a "weak" morality, so to speak—in the truth of modern science.

Programmatically ruling out as a matter of principle any hypostatization that should duplicate the object of scientific knowledge—an object conceived as a single, unitary entity—Kelsen *from the start* relativizes absolute values into

[24] Just as in Freud's view the psychological premise of communism "is an untenable illusion," in that by abolishing private property "we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest one (Freud 1930, 83–4), so Kelsen argues that "faith in the possibility of a tight-knit community [...] rests either on ignorance of human nature or on faith in the possibility of a radical change. *Man*—this is the material out of which even the house of a future social arrangement ought to be built (Kelsen 1965a, 93).

[25] It has been observed that Kelsen—and with him other early relativists like Radbruch—proceeds "from the view that it is impossible to determine which of various moral conceptions is superior to or better than the others [...] to the conclusion that we would do well to respect all opinions, and should thus realize freedom, democracy, and toleration." So both Kelsen and the others "arrive at an outcome essentially [...] contrary to the subjectivist premises of their thought, for they wind up in effect positing some values as superior to others, and these higher values—those of freedom and toleration—are ones that can be characterized precisely as [...] objective and absolute" (Cattaneo 1962, 43; my translation).

relative values: The state is in the first place desubstantivized, "formalized," and resolved into the pure relations of the legal norm, and justice is reduced to the positive law. The modern theory of the state appears to him to be still imbued with metaphysical dualism, seized by the idea of soul or that of substance: It is thus still caught in the grip of that "mythological conception of the world" that "'behind' the multiple sensible manifestations of nature conjures up a multiplicity of deities imagined to be the causes of natural phenomena" (Kelsen 1981, 9; my translation). The state is not a "substance" apart from the law—much less a substance *superior* to the law (as the organicist authoritarian currents and theories of law would have it)—but is rather "the expression of the systematic unity of law" (ibid., 12; my translation) an "ideal creation" (ibid., 14; my translation) of knowing thought.

When we work with two different systems (God as distinguished from the world, the state as distinguished from law, justice as distinguished from law), the one and the other hypostatizing different expressions of the same reality, and so when we work on the basis of a double truth, it means we are working with the mental reservation that if the rules of law should get in the way of special interests, then we can invoke *the other* system, *the other* "truth," so as to advance those interests and impose them:

> We can thus resort to the metalegal system and hold up as valid an "act of the state" that no legal norm would allow us to relate to the unity of the legal system, an act which "lies outside the law," and which is therefore legally void, a personal arbitrary act, or even a crime for which a punishment is provided. In a sense, then, this act can be ascribed not to the subject who materially carried it out but to a subject conceived of as standing "behind" this person, and so to a systematic unity. The system of the "state," which when the occasion arises stands in for the inconvenient system of the "law," comes onto the scene under the name of "politics." (Ibid.; my translation)

Of course, Kelsen's criticism of ideology can hold up only on condition of holding on to a basic presupposition behind every one of his arguments, the idea that not only is there a science of nature whose assertions are true, but also that this science of nature constitutes a value. This presupposition cannot be demonstrated, to be sure, but neither can the contrary assumption, that is, we cannot demonstrate natural science to be a nonvalue (this, among other reasons, because it clearly is not). In Kelsen, all values are thus made to stand on the same plane: The value of positive law cannot substantially be distinguished from that of justice, or the value of morality from that of logic. Where value is concerned, we always find ourselves operating within the sphere of validity (*Geltung*) as distinguished from that of being. That law and justice or logic and morals are different things from stones and stars, from the passions and the instincts, appears to Kelsen to be a self-evident proposition. But how to distinguish the value of law from the value closest to it, that of justice, considering that we do, after all, have to distinguish the two? Kelsen is not a crass positivist. Quite the contrary, he is a critical one, especially in his

European period: He is a critical idealist in the Kantian sense of the term, where Kantianism is itself two-sided, however, for on the one hand it does not stray too far from a certain positivist conception, but at the same time it takes on an ethical orientation. In this way, values are typified: The value of law is a "type" different from that of justice, just as this latter type of value distinguishes itself from that of logic or that of aesthetics. Values are relativized in virtue of their being placed before one another by thought in its search for knowledge. One might say that the totality of the world of values is broken up into a plurality of typical values that thought can only grasp precisely in their typicality. The criterion for this typicality, however, lies in the exclusivity by which each *type* of value is distinguished: The value of law excludes that of justice, such that we can have a positive science of law—a science of law proper, which only on that account can be considered positive—only to the extent that in analyzing the type "law," we cease to inquire into the value of justice and instead deliberately and as a matter of principle rule out any question about the justice of law, about the law of the law, or about "just" law. In this conscious turning away from classic systematizations, from totalities of thought, from all-embracing accounts lies Kelsen's legal positivism and the very positivity of law, which as such appears as the product of scientific thought, with its penchant for analyzing, dividing, and breaking apart what formerly stood as the universality of things, the totality of the world, including the world of values and their hierarchy.

This analytical method is the functional method, which, however, we cannot inquire into any further. This method appears as the mark, the "stigma," of modern civilization, which in effect has carried through—or rather, *is* carrying through—the project of seizing the world. For Kelsen, the truth of this method is given by its very being here, by its effective potency in its unfolding.

It is clear, then, that Kelsen adheres to a scientistic ideology, however much a refined one. He wants a "science of the spirit," but always on the basis and the presupposition of the sciences of nature, because that is where the functional method (as a method through which "substances" are dissolved) has revealed its capacities and potency. Not incidentally, Cassirer's book is a philosophical analysis of *natural* science, not of the spiritual sciences. Philosophy can thus present itself as the mathematics of the natural sciences, and Kelsen accordingly wants to construct a philosophy of law understood as a mathematics of the legal sciences, that is, of the various areas of positive law, where legal science can be described as pure in the sense that it, too, has dissolved the concept of substance. Whether such a project is at all possible is not a question on which we can enter here, apart from observing that the world of the spirit is something other than the world of nature—it is so precisely for Kelsen, too—such that this attempt to carry the function of mathematics over to the world of nature cannot but give rise to questions, precisely the sorts of questions that should in general come up in an attempt to apply the presuppositions of

Hans Kelsen (1881–1973)

Kant's *Critique of Pure Reason* to the world of liberty. But what matters is that Kelsen did in fact make such attempts, and that he did so specifically with a view to doing science: not so much the kind of science that will answer the intellectual curiosities of the learned as the kind that will liberate humans by making them more aware of the relativity of all things, or rather, of all things apart from the advancement of science itself.

Science and politics, science and the world, science and people are all different things to Kelsen. The world, politics, and humans all belong with the irrational, with that which cannot be formalized, the contradictory. In fact, worse than that, everything here falls under the dominance of the primitive instincts, their originary form lying in religion as a social ideological structure. God and the state thus reveal a singular homogeneity, in that they both act as instrumental depictions serving to harness the instinct toward subjection, an instinct having two contradictory drives, one toward our own subjection and the other toward that of others:

> If we take religion in its historical embodiment, there has never been a believer content to be alone with his God; we have always subjected ourselves to a God so as to subject *others* to this God. And the greater this subordination, the more fanatic our religious self-alienation, the stronger the exaltation of humanity, the more unbounded will be our impulse to dominate others in the name of divinity, the more triumphant will be the victory of this divinity, for it is only through victory that a warrior of faith can identify with his divinity. (Kelsen 2010, 143)

And so theology and legal science, the concept of god and that of the state, do exhibit "a perfect parallelism of logical structure," a parallelism that "manifests itself through an astonishing identity" between two sets of problems and solutions: those set out in taking on the question of the relationship between, on the one hand, God and the world and, on the other, the state and law (Kelsen 1981, 9). It is on this basis that Kelsen dissolves the state into law, just as modern science has dissolved God into nature and its laws.

Religion is the primary social ideology, masquerading—in the etymological sense of the term—the impulse toward dominion: "Irrationalism is the autocracy that seeks to bring under subjection not only thought but also the will of the subjects" (Kelsen 1985, 375; my translation). Religion, the state, the nation "are specific ideologies that rise above the structure of real facts. [...] If the masks come off, the drama loses its authentic sense; if we proceed independently of the masks, we will forgo precisely that specific interpretation exclusively into which things like society and religion resolve themselves!" (Kelsen 2010, 144; my translation). Inevitably, for Kelsen, every metaphysics of justice contains contradictions: Every metaphysical (i.e., religious) doctrine proceeds from the absoluteness of value, only to ultimately find itself compelled to relativize it. Indeed, the objective is always the real, or what is positive, the social world, and so if value is to have any effect in this world, it must lose its absoluteness. We can see this in Plato's metaphysical doctrine, for example,

but also in Aristotle's rationalistic doctrine, where Kelsen points out as "highly characteristic" the fact that Aristotle's attempt "to rationalize the idea of justice as the idea of equality, which originally is an emotional ideal, finally results in replacing the idea of justice by the idea of truth" (Kelsen 1947, 409; my translation).

Kelsen's legal positivism reaches the same conclusion as natural law theory, in both of the main forms taken by this ideology of justice, the metaphysico-religious form (with Plato, as well as with Jesus and especially the Apostle Paul) and the rationalistic one (with Aristotle). Which is to say that in either case, justice is ultimately equated with legality, being located in a compliance with the rules of the state: "Justice is the order of the state" (ibid., 408; my translation). But while natural law ideology is forced to metamorphosize its basic postulates, Kelsen remains from the outset coherent with his postulate of the value of veridicality, so that he does not have to forsake the scientific method in order to press the exigencies of a possible, however relative, justice. Even more relevant than this difference, however, is that, unlike Kelsen's critical legal positivism (or "critical idealism"), the ideology of justice *justifies* existing power: This contrasts with the pure theory of law, which can also *criticize* power.[26] Natural law is almost invariably conservative, acting as a "scientific" legitimation of power; the pure theory is reformist, open to social transformation and to the protection of individual freedoms, an extolment of law as something other than politics, even though it may bear a relation to politics. From this perspective, Kelsen's legal positivism could thus be made to fall within so-called political legal positivism, even more than within the methodological variety of legal positivism.

Law, and modern law in particular, is for Kelsen a value, a value at once political and moral: From a political point of view, the value of law lies in *democracy*, and specifically in democratic pluralism; from an ethical point of view, in *tolerance*. Kelsen's doctrine is positivist in that it rejects as logically incoherent any discourse about justice. But the import of this rejection is not just scientific: It is also moral and political. For Kelsen, the ideology of justice winds up excluding the pluralism of democracy, of a "legal order" that approaches the ideal state,[27] in favour of a hypostatized dualism that beclouds the reality of dominion and the predominance of primitive-archaic and substantialist my-

[26] Writes Kelsen in 1929: "If there is a place where we can operate outside the sphere of power, that place is science. And that holds as well for the science of power, which thus coincides with the pure theory of law and the state" (Kelsen 1929a, 1726; my translation).

[27] Here Kelsen brings in Plato, depicting him as the quintessential exponent of an antidemocratic and metaphysical conception of the state, in this finding himself very much in sympathy with the well-known interpretation of Plato offered by Karl Popper. Indeed, on this view, Plato so despises democracy that he could never bring himself around to the idea "that power in such a state, as in other nonideal states, can be brought even comparatively close to the ideal through a legal system" (Kelsen 1985, 373; my translation).

thology. As Ota Weinberger has observed, Kelsen's relativism does not in the end entail a negation of values but

> is simply a matter of regarding them as decisions, as something that cannot be demonstrated in purely cognitive fashion. Kelsen's pure positivism and his relativist theory of value are not unrealistic and neutral in their pragmatic consequences; they lead, rather, to a critique of ideology, to an understanding of value pluralism, to the postulate of tolerance, to a pluralistic democracy based on the free play of ideas in the self-correcting dialectic of clashing opinions within the field of legal development. They do this, however, without the fiction that in the process we shall simply apprehend "correct" law that has somehow been previously given. (Weinberger 1973, XXV–XXVI)

As Weinberger goes on to say, Kelsen's entire work and attitude are "imbued, therefore, with a high moral tone, in keeping with the modern spirit, which is sustained equally by the idea of democratic freedoms and by creative responsibility and the will to betterment" (ibid.).[28]

2.3.2. The Problem of Legal Science in Kelsen's Pure Theory of Law

2.3.2.1. The Disavowal

Kelsen's scholarly writing spanned from 1905, with a book on Dante Alighieri, to 1968, with an article in reply to Karl Leiminger (Kelsen 1968a). This is quite a long period, and it did make for more than one "conversion," providing several occasions for Kelsen to distance himself from some of the theses framing his own system, a system that must in effect be historicized and contextualized in grasping its meaning, which as we saw is not devoid of a political and even a moral dimension. However, one must disagree with those who depict Kelsen's pure theory of law as a work in progress, linearly evolving along a path of greater and greater perfection, so much so that, despite Kelsen's own interpretation of himself, his theoretical discourse is historically and politically situated. As has been observed by one of his most recent and best commentators, Robert Christian van Ooyen, Kelsen's legal philosophy and theory of the state are to be interpreted as making up a specifically political theory of pluralist democracy, a theory of this society's constitution (Ooyen 2003, 70).[29] We thus have to do with a theory that expresses its own time. Indeed, it expresses the substantial criticalness of its own time, a time marked by deep transformations—social, ideal, cultural, economic, and scientific.

It is precisely the question of science, of the "scientificity" of the propositions by which each discipline expresses its knowledge, that lies at the origin of

[28] See also, at greater length, Carrino 1987.

[29] I should mention, however, that this way of interpreting Kelsen's theory was previously offered in Italian in a book on Kelsen I myself wrote in 1984: See Carrino 1992.

Kelsen's *reine Rechtslehre* (from here on out the RRL). Indeed, it is this question that shapes the features and peculiarities of the RRL, which as we saw is structured around the concept of function (and of relation) as an idea proper to modern science. Kelsen's problem is that of founding jurisprudence as an authentic science having the power of knowledge. It is doubtless a range of methods that Kelsen relies on in outlining the characteristics of this science of law and in determining its limits (in the Kantian sense of what it is that knowledge can do and what it cannot do): He proceeded from the distinction between the is and the ought, still statically conditioned in the work he submitted for his habilitation, *Hauptprobleme der Staatsrechtslehre*; he then drew on Hermann Cohen's neo-Kantian philosophy and subsequently introduced in his system, at that stage still a purely normative one, the dynamic elements—namely, the production of norms (Sander and Merkl)—that would lead to the contradictions and antinomies which beset the pure theory of law as a whole.

The basic tenets of Kelsen's thought, such as he himself presents them in a somehow apodictic way, are as follows.

(*a*) Law is a phenomenon pertaining to the world of the *Sollen*, and it must therefore be clearly distinguished from everything having to do with facts, with what is empirical, the *Sein*.

(*b*) Law is an order of norms resting on a *Grundnorm*, a basic norm which is not positive but is presupposed, a hypothesis of reason in its quest for knowledge.

(*c*) Law as a legal system is hierarchically structured beginning from the basic norm (the *Grundnorm*, also referred to as *Urnorm* in Kelsen's early writings) and ending with the mere application of the judge's rulings on the part of the officials. For Kelsen, law is thus built on the idea of the penalty, revolving around the penalty, so much so that he defines the legal norm as follows: If A, then B ought to (*soll*) follow, where A is an illicit fact and B its normative consequence, namely, the penalty.

(*d*) Kelsen was interested in founding this legal science as an authentically normative science, and to this end, in the early decades of this activity, he stages an all-out attack against natural law theory, and even more so against the sociology of law, the science that was just then emerging with such authors as Kantorowicz and Wurzel, and above all Eugen Ehrlich (see Chapter 3 in this tome).

(*e*) In order to make legal science a science whose object consists in norms—meaning the enacted rules of positive law, in that the RRL seeks a positivist science—Kelsen needed to clear away from his field of vision anything having to do with power, force, and so with the state in its traditional acceptation. To this end he identified the state with law (but not the other way around, mind you—not law with the state). The state is always equated with the rule of law: It is a state made up of norms, the norms of the law. The unity of the state is only a way to represent the unity of the legal system. Only in this system do we find unity and coherence, in contrast to the reality of society,

which is the arena of conflict and contradiction; and a state conceived as an organic or concrete "entity"—the manifestation of power, the expression of this society—is a contradiction in itself, for it would be a place of separation, not of unity. Only the legal system, as a system of norms, can express this unity.

(*f*) The idea of the state as a normative system entails a clear rejection of the classic conception of the sovereignty of the state. Sovereignty is for Kelsen an archaic myth, something that legal science must free itself of. Sovereignty expresses a "substantialist" conception, which Kelsen found to have been eclipsed by the relativist worldview (relativist in a gnosiological sense, but also in a political one). The whole law is a single, unitary entity from the standpoint of knowing reason. This means that Kelsen rejects dualist conceptions of the relationship between domestic and international law. The only possible distinction is that between the primacy of domestic law as against the primacy of international law. But this is understood by Kelsen as a subjective choice dictated by political motivations. Those who uphold the primacy of domestic law (all legal systems in the world are no more than "parts" of a state's internal law) do so pursuing an imperialist programme in politics; those who instead uphold the primacy of international law, of the *civitas maxima*, do so as pacifists. And this choice is in truth anything but "free," in that those who advocate the primacy of the state's internal law thereby also position themselves against modern science and its advances—in effect espousing, as we saw, the idea of substance against the properly scientific idea of function.

(*g*) Kelsen is known as the creator of Europe's first constitutional court, the one set up with the Austrian constitution of 1920, and according to René Marcic (1966, 481ff.) this is where the RRL's authentic sense is to be located. This may be somewhat of a far-fetched interpretation, to be sure, but certainly in the central role played by the judge as a technician lies the fundamental point of the RRL correctly interpreted as a political theory of modern legal democracy.

(*h*) As mentioned at point (*e*) above, law is for Kelsen a single, unitary system. From here we get not only his identification of law and the state but also the supersession of all the traditional "dualisms" of legal dogmatics: those between public and private law, law and rights, legal person and natural person.

Those are the essential ideas, the building blocks, of the RRL. However, we will not take them up individually here, nor could we. I am rather interested in highlighting the RRL's broad presuppositions, those which Kelsen thought should lie at the foundation of a scientific theory of law, but which we will show here to be contradictory. This is discussed with respect to the basic norm in my treatment of Alfred Verdross and with respect to the hierarchical structure of the legal system in my treatment of its essential theorist, Alfred J. Merkl (see Sections 2.4.1 and 2.4.2).

It is useful, in view of the aims we have set out, to take things from a turning point, one that in truth marks a veritable abjuration in Kelsen's thought.

The occasion for it was a conference that took place among jurists in Salzburg in 1962. Here Kelsen gave a presentation published in 1963 under the title *Die Grundlage der Naturrechtslehre* (The foundations of the doctrine of natural-law: Kelsen 1963), with which his RRL officially moved into its last phase, indeed a phase that in certain respects marks a complete reversal from Kelsen's own early statements of his theory. These early statements were still influenced by neo-Kantianism,[30] with the various inflections it took—though it is especially the logicism of Marburg neo-Kantianism (Cohen, Natorp, and Cassirer) that Kelsen took up, giving it a formalistic bent—and this was entirely in keeping with Kelsen's Austrian and European period, with its historico-political as well as conceptual vicissitudes. This was the period that spanned from the doctoral dissertation on Dante's conception of the state and on electoral law, continuing through the habilitation study (Kelsen 1911), and ending with the works he produced in the 1930s and early 1940s.

In the 1963 article—as well as in a number of other ones which followed immediately thereafter and were then worked into the posthumous *Allgemeine Theorie der Normen* of 1979 (see Kelsen 1964, 1968b, 1968c, 1968d) norms are no longer depicted as autonomous and independent. "A norm is a norm," Kelsen once remarked in a debate held in Berkeley with Hart (cf. Postema 2011, Hart 1983), thus clearly situating norms in a world different from, and indeed opposite to, that of the is and of facts,[31] namely, in the world of the ought, the *Sollen*. But now, in 1963, we no longer have such a clear-cut statement of the nature of norms, which appear as no more than a shell for empirical reality: as *the necessary form of a willing will*. The meaning of a norm no longer lies in its being a norm—an expression of the world of the *Sollen* understood as a primitive category, the most fundamental mode of consciousness—but in the fact that with absolute necessity the norm adheres to the underlying act of will, which is an empirical act. The norm is now for Kelsen only the sense ascribable to an act of will directed at the behaviour of others. "There is no duty, that is, no norm, without a will, a will whose sense lies precisely in such duty" (Kelsen 1968b, 1473; my translation). And in this way legal science underwent a transformation with Kelsen at Berkeley: The discipline originated

[30] The commentator who first saw a neo-Kantian element in Kelsen's thought, and in particular in the *Hauptprobleme der Staatsrechtslehre*, was O. Ewald, who saw his work as an effort, "undertaken with rigour and logical energy, to bring transcendentalism to bear on the philosophy of law" (Ewald 1912, 397). On neo-Kantianism see Chapter 1 in this tome. On Kelsen and neo-kantianism see also Chapter 8 in Tome 2 of this volume.

[31] Here Kelsen refers to "the fact that the essence of the whole of law, like that of all norms, lies in the conceptual conflict between is and ought; the fact that law and norms alike would simply be meaningless if they coincided with the is, with actual reality; and so the fact that in knowing the law we must necessarily look at something other than actual reality: We must look at that which actual reality ought to aim for even if it may not do so, and so not at the is but at that in light of which the is must be interpreted and assessed" (Kelsen 1914, 236; my translation).

in Vienna as a purely normative science—a set of logical deductions, an entirely formal enterprise, separate from any consideration of the will of those who issue norms and those who fall subject to them—and then became a science of the sense of will, still officially a "normative" science, but only in the sense of its aiming at a knowledge of that which the is (*Wollen*) means. This conception now prevailed in the later Kelsen along with the parallel and connected conception of the basic norm (or *Grundnorm*) as a "fiction" (Kelsen 1964; my translation)[32] no longer understood as a hypothesis of knowing thought and as the origin of the knowing subject's ability to "gain possession" of the object of knowledge in virtue of the *method* of knowledge. But the point is that this is the exact opposite of the conception which prevailed (however much not exclusively) in the theory Kelsen was carrying forward in the 1910s and 1920s.

The task of jurisprudence in the first phase of Kelsen's thought is solely that of describing legal norms by abstracting from any psychologistic or voluntaristic element. The legal will is not a psychological fact or reality but a figure, a construction of legal thought: an imputation (or *Zurechnung*), which would later, not incidentally, become an ascription (or *Zuschreibung*), but which in any event lies in the nexus resulting from the connection that legal norms effect by linking subjects to external actions. There is neither causality nor teleology in the world of law, but only normativity in the sense of an imputation. The "person" in law is always something entirely distinct from the "person" in the real world, meaning the social world, with the psychological processes we each undergo in society and the real acts we do. *Contra* Zitelmann and Binding, Kelsen seeks to demonstrate that their concept of a "psychological" will always and exclusively refers to what in reality is a *juridical* will, a *purely* juridical will. Law is concerned not with action or with its causes or motives, but with the duty to act in one way or another. Never can the legal proposition through which the state's "will" gains validity be a command or an imperative, because the state's real domination over its "subjects" is something extraneous to the world of law, of norms, of the *Sollen*. In the *Hauptprobleme*, the state still figures as a "legal person," but here Kelsen is already laying the groundwork for his later identification of the state with the norms that make up the

[32] "Befuddling" is how the new concept of the basic norm as a fiction is described by J. Behrend, for whom "this new conception of Kelsen's clearly contradicts the thesis explicitly upheld and reiterated especially in the *Reine Rechtslehre* [...] that the basic norm is a norm presupposed in thought and not a norm resting on a fictitious act of will," a thesis that strikes Behrend as "as much better suited to Kelsen's overall theoretical system" (Behrend 1977, 80–1; my translation). Indeed, what distinguishes the *Reine Rechtslehre* is precisely its clear and unequivocal denial that the transcendental, as a metaphysical or theological mode of speculation, can be a basis on which to derive the validity of law; so from this perspective, if we are to understand the positive law, which the *Reine Rechtslehre* sets out to know, it would be much more coherent to relate that law to the basic norm as a hypothetical presupposition than to move in the opposite direction and seek to explain the validity of the positive law by relating that law to a fictitious act of will used as a logical expedient." Cf. Carrino 2011.

legal order, and so for his definition of the state as a *Rechtsstaat* in a logico-formal sense.

Initially Kelsen proceeded from a neo-Kantian conception driven to extremes, a conception that owes a debt to Hermann Cohen, but also to Simmel and Windelband,[33] and on this conception the method *creates* the object of its investigation: It "produces" this object in thought, and thought structures the object's coherence. Another point of contrast is that for the early Kelsen, legal knowledge creates its object as an object of knowledge, and in this way this object, namely, law, is produced as something necessarily coherent, as a non-contradictory or senseful (*sinnvoll*) order of norms; and so in the early Kelsen, it is a logical impossibility for norms that gives rise to conflict (see Bulygin 1983, 25ff., and Kelsen and Klug 1981). But for the later Kelsen (1963, 120), these very conflicts became nothing short of a frequent reality: "If in obeying or applying each of the two norms, the other one is (possibly or necessarily) violated," then there will be a conflict of norms (Kelsen 1968c, 1438). "A conflict of norms is undesirable, to be sure, but it is nonetheless possible, and it often occurs" (ibid., 1439). And as to the point that concerns us specifically: "Legal science is incompetent to resolve normative conflicts" (ibid., 1443). Although we should not immediately draw from these remarks, as has often been done, the conclusion that the later Kelsen "recognizes the failure of his project to construct a systematic theory of law" (Calsamiglia 1977, 122–3; my translation), there is no doubt that here, in this conversion and "abjuration," new possibilities open up for a deeper interpretation of Kelsen's original project.

The turnabout is explicitly acknowledged in the 1963 article just quoted, specifically as concerns Kelsen's best-known theory, that of the basic norm (or *Grundnorm*) which lies at the basis of the legal system:

> In my earlier writings I have spoken of norms that do not consist in the sense of an act of will. Unfortunately, however, I must now confess that I can no longer uphold this doctrine: I have had to abandon it. It has been anything but easy for me to let go of the doctrine I have defended for decades. There can be no norms that are merely thought, that is, norms that only exist as the sense of an act of *thought*, and not as the sense of an act of *will*. (Kelsen 1963, 119–20; my translation)

[33] The relation between Kelsen and Windelband has not received much study, to be sure, but an influence seems apparent nonetheless, to the extent that Kelsen's idea of the system's logical coherence may owe something to Windelband and to his distinction between logic and empiricism: "Indeed, as a theory of correct thinking," Windelband wrote, logic "must set out some norms for empirical thought, and the meaning, foundation, and original validity of these norms must be absolutely independent of the possibility of human error on the part of individuals whose empirical representations sometimes follow these norms and sometimes violate them" (Windelband 1912, 15). But then Kelsen appears to have interpreted Windelband's neo-Kantian philosophy unilaterally, in that Windelband saw logical forms as structurally connected with the existent despite their independence, whereas Kelsen took the view that thought, in its endeavour to know the law, proceeds independently of the contents of forms in giving these contents a logical ordering within the system.

It also significant, for someone who had hitherto been of neo-Kantian persuasion, to reject (explicitly at this point) the Kantian account of practical reason, an account which Kant is thought to have taken directly from Thomas Aquinas, and which appears to Kelsen as an evident "theological," and hence unscientific, foundation. As Kelsen remarks:

> It is disconcerting to acknowledge this fact, but it is an acknowledgment I have not come to with ease. And if I have reached this point, imposing this recognition on myself, Sirs you can believe me that I have done so only after the most mature reflection, because this in large part contradicts precisely what I myself have maintained for decades. (Ibid., 121; my translation)

The later Kelsen disavowed "in large part" his doctrine such as it had been elaborated and defended for decades, beginning with the *Hauptprobleme* (but only to a certain extent, since in this work law is still *statically* conditioned, and not yet considered as a dynamic system) and continuing until the first edition of the *Reine Rechtslehre* (1934).

But it is significant that Kelsen's position in the 1960s represents a return to a certain neo-Kantianism which, though it proceeded from the distinction between *Sein* and *Sollen*, never stopped short at drawing a line of separation between the two worlds. An example can be found in Rudolf Stammler himself (see Section 1.3 in this tome): A neo-Kantian philosopher whom Kelsen had certainly criticized—albeit also considering him a precursor of the "pure" theory of law—Stammler interpreted the law as a mode of willing, thus envisaging a connection between norms and the will, a connection that appears to be not unlike the one the later Kelsen espoused. Thus, Stammler wrote in his 1911 *Theorie der Rechtswissenschaft:*

> If someone raises a *legal* claim, they are not assuming something to be true, but rather want something; if they issue a legal proposition, they are not stating a fact of experience but are pursuing some ends; and in the case where we are considering the content of a legal order, we see not the physical phenomena of nature but a content of human willing. (Stammler 1911, 69; my translation)

But ends, or willing, are precisely what Kelsen, in this initial phase of the RRL, wants to keep outside and far-removed from the legal phenomenon and from the science of law, a science exclusively understood as "a geometry of the total legal phenomenon" (Kelsen 1911, 93; my translation).

2.3.2.2. The Irrationalism Marking the Second Phase of the RRL

Without a doubt the most significant consequence of Kelsen's abandonment of his former views is his irrationalism (Weinberger 1981a, 36ff.; 1981b, 487ff.; 1986, 187–9), which now takes the place of the old normative logicism aiming at a "logic of *sense*" in the manner of Edmund Husserl (F. Kaufmann 1922a, 240ff.); but no less important is the vanishing of the uncompromising

separation—a logical one, but carrying ontological overtones—between the is and the ought (Kubeš 1980a, 165). "There can be no imperative without an emperor," Kelsen now affirms (Kelsen 1963, 119; my translation). "There can be no norm without an authority that posits norms" (Kelsen 1968d, 1461; my translation).[34] A norm is what authority wants; this is an empirical authority—it certainly cannot be identified with the knowing scientist who in the act of knowing brings the object of knowledge into being as a coherent object, a unitary, noncontradictory, and hence "pure" object—and authority posits norms *insofar as* and *because* it wills them (that is, insofar as and because willing is *being*). The RRL's initial formalistic logicism, which here comes into contact with the realistic and pragmatic mentality of American legal thought, disappears in order to conjure up a freshly minted "pure theory of law," and hence in order to make way for a straightforwardly voluntaristic conception of the problem of law and of our knowledge of the legal phenomenon. The criticism that in the *Hauptprobleme* Kelsen devoted to the dogma of the will and to Jhering now only appears as a faint recollection.

Indeed, in an effort to overcome the obstacle posed by the logical difficulty of a connection between form and content, norms and facts, validity and effectivity, Kelsen now introduces the concept of a "modally indifferent substrate" (Kelsen 1979, 44ff.; my translation), an example being the phrase "shutting the door," understood as the modally neutral propositional content underlying the declarative sentence "The door is shut" and the imperative one "The door must stay shut." But if this concept is to serve the heuristic role envisioned for it, Kelsen must abandon the idea he formerly espoused of an insurmountable opposition between the is and the ought, an opposition that Kelsen initially held up as the "metalogical principle of every dualistic conception of the world" (Kelsen 1968e, 959; my translation). What appears indefensible in the later Kelsen is not the concept of a modally indifferent substrate (Eikema Hommes 1984, 158)[35] but the very cornerstone of the RRL in its classic form: the uncompromising dualism between the *Sein* and the *Sollen*, a dualism that had led Kelsen to positively affirm he was not a monist: "Ich bin kein Monist" (Kelsen 1911, VI). Certainly, this dualism would not only be formally upheld but also historically investigated; even so, it would no longer have the meaning of a separation between two equally "real" worlds, namely, the empirical world of nature, on the one hand, and the world of value, validity, the spirit, on the other: It would only stand as an antimetaphysical statement of principle. For

[34] On the norm as the meaning of an act of will in Kelsen's *Allgemeine Theorie der Normen* (1979), see Weinberger 1981a, 36ff. On Kelsen's posthumously published work, see Kubeš 1980a, 165, in which he sees the endpoint of a "tragic development" that has always brought Kelsen closer to the Uppsala school (Hägerström, Lundstedt, Olivecrona) and to Alf Ross. Cf. Opalek 1980. On the Uppsala School and Ross see Chapters 13 through 16 in Tome 2 of this volume.

[35] Here, in discussing the idea of a "modally indifferent substrate," Achterberg (1984, 450–2) speaks of "bridges" between the is and the ought.

the later Kelsen the separation must be maintained because any attempt to overcome it would mean abandoning "the field of empirical reality, and in particular the field of empirical acts of will," having recourse to a "transcendent, metaphysical field that makes possible a willing which at the same time exists as *thinking*, an ought which at the same time exists as *being*. [...] This is the ascent of man toward God, the ascent of science or philosophy toward theology" (Kelsen 1963, 121; my translation).

In all these articles of the 1960s, jurisprudence certainly remains a science of the spirit, a normative science, and its propositions accordingly present themselves as normative (*Soll-Sätze*) (cf. Vernengo 1986, 99–108) in that they purport to "describe" norms. But the meaning of a norm—a norm is actually *identified* with its meaning: A norm does not "have" a meaning; it *is* meaning—is no longer the meaning that can only be produced by the judgments constitutive of legal science. It is rather the meaning (the norm) that necessarily adheres to the fact, to being, to willing. Meaning is connected to being, to the fact of willing: "A duty must necessarily [*muss*] be the correlate of an act of willing" (Kelsen 1963, 122; my translation). What must (normatively, juridically) be known is no longer the *Sinn*—a norm's meaning as such, its *logical* meaning—but the content of an empirical act of willing, a content that in some way is expressed (Walter 1983, 192).

When the RRL was in its first phase it instead entailed a clear separation among judgments of knowledge: On the one hand are value (ought) judgments (*Sollurteilen*); on the other, empirical judgments (*Seinurteilen*), their classification depending on the orientation or intentionality proper to them. Kelsen drew, among others, on Johann Friedrich Herbart, who in his *Allgemeine Metaphysik* (General metaphysics)—Kelsen writes in his 1916 essay on legal science—"was even more coherent and true to principle than Kant in setting out the opposition between the is and the ought," basing this fundamental dualism on an original reflection," and constituting it "in the full diversity of directions in which the eye can cast its glance" (Kelsen 1968f, 37; my translation). In the logico-formal antagonism between the is and the ought lies the very presupposition of any classification of the sciences, a question that, as is known, was very much debated in Germany in the late 19th and early 20th centuries.

Under this originary formalism of the RRL, in its Austrian phase, the ought gains an autonomous existence: It is not "the ought of the is" (the meaning of an act of will) but "*the is of the ought*," the ideal *is* of an ought (a norm) or value, so much so that, as Kelsen commented, there would be no difference if "instead of speaking of the ought we spoke of a 'pure' [nonempirical] will" (Kelsen 1920a, 9; my translation): Legal knowledge "relates to law as an *exclusive* system, a closed one, as a world unto itself" (ibid., 14, my translation; Kelsen 1925, 105, 123) severed in knowledge from the world of facts, "like an *ideal order*, like a system of norms, and so like an ideality" (Kelsen 1920a, 11; my translation). The object of legal science is never a fact, not even indirect-

ly, but only a complex of pure meanings, such that on these premises Kelsen could even charge the neo-Kantian Emil Lask with failing, in his legal philosophy, to proceed coherently with his own logico-philosophical approach, instead proceeding from an "erroneous conception of legal positivism" (Kelsen 1968f, 73; my translation), a conception on which value somehow lies "alongside" the real, the fact, the is, the will, rather than being constructed in the process of knowledge as a world in itself" (ibid., 67, 74; my translation).[36] This is a criticism of Lask that would recoil upon Kelsen in the attack the latter's pupil Fritz Sander would stage against Kelsen, by resorting precisely to Lask's philosophy.

The pure essence of the ought defines the object, the *only* object, of the science of law, a normative science of meaning understood as something just contemplated in the mind, and in this sense pure, ideal, eidetic. Knowledge produces the meaning of norms, constituting their sense, such that every content, every sociological, political, or psychological reality, as well as every relation established with reality (Larenz 1931, 25), is completely excluded from the normative mode of consideration. Positive law as an "objective," preconceptual givenness, independent from the knowledge-making moment of legal science, law understood as a fact or empirical reality, a product of history and of the social conflict among values, charged with ideal, often ideological meanings, cannot logically play any role in such a conception of legal knowledge. The logical arcanum of that way of doing science is the pure eidetic *Wesensschau* (the intuition of essences),[37] a concept indicating forms which constitute other forms (even if this happens from the start in a way that contradicts Kant's distinction between *reflexio* and constitution: Kant 1963, 267ff.),[38] or categories that impress themselves on other categories, or forms of forms, rather than descriptions or explanations of facts or of acts of will, however much qualified as norms. As Kelsen writes, "although the legal order postulates a human will, it is not *the same thing* as this will, which may be lacking without thereby undermining the existence, i.e., the validity, of the legal order" (Kelsen 1968f, 92; my translation). Kelsen's logical normativism is from this point of view profoundly ahistorical (Carrino 1997, 811–8).

The legal order as a social reality, "as a state or process of social life," is irrelevant to the normative knowledge of law. The "existence" of law thus turns

[36] As G. Hohenhauer rightly pointed out, "the norms of positive law cannot have anything in common with the norm as a Kantian *a priori* construct" (Hohenhauer (1928, 328; my translation). On Lask, see also Section 1.4 in Tome 1 of this volume and Section 1.1.3.2 in Tome 2 of this volume.

[37] On the analogies and differences between the RRL and the phenomenological method developed by F. Kaufmann and Schreier, see Voegelin 1925, 86ff. On the phenomenological approach in general, see Dobretsberger 1927, 246–58; Bobbio 1934b; Stella 1990. Cf. also Chapter 4 in Tome 1 of this volume, Sections 4.4 and 4.5 in particular.

[38] On the problem of the relation between constitutive and reflexive judgments in legal science, see Sander 1923c, 143ff.

out to be an ideal quality: It is pure validity (*Geltung*), never an empirical or historical effectivity. The efficacy of law is so to speak the *proteron pros emas*, not the "objective," or logico-formal, prius. For example, there could be no Pythagorean theorem for us unless there were people *thinking* the same theorem, but its *validity* is independent of any act of thought (such an act functions as the *conditio sine qua non* of validity, not as its *conditio per quam*): Validity "finds its specific foundation [...] in a first axiom. So even the coercive order singled out as the 'state' does not in any way find the foundation of its validity in the reality of volitions and in the actions which have contained that order" (Kelsen 1922b, 93; my translation). The ought is validity (*Geltung*), inherent in which are (objective) value judgments understood as straightforward judgments of knowledge. Kelsen thus ponders the question, "Can a judgment be anything but a value judgment?" (Kelsen 1968f, 78; my translation). The sphere of the ought is the sphere of what is not conditioned by facts (historical, economic, political, religious facts, and the like), and norms understood as the meaning carried by an act of will certainly cannot be taken into consideration by legal science as a science of purely *ideal* meanings. Validity is an idea, a quality of the knowing intellect, and as such is not amenable to empirical verification; legal science is a knowledge of ideal meanings, of pure forms that logically ignore their "content," such as this content is historically determined. The RRL is the pure doctrine of a logically pure object (Kelsen 1922b, 80–1), in that we are dealing with an object "produced" by either of the two basic directions in which the knowing intellect may cast its glance. The RRL thus appears as a form of the law of reason (Holzhey 1984, 100), of the law of *knowing* reason. The first phase in Kelsen's thought stands in opposition to the last one, even though, in reality, each of the phases in the RRL's transformation is replete with contradictions.

2.3.2.3. The Aporias in the RRL

If, as Kant thought, it is in the very essence of critical thought that it should transcend the historical and the factual, substituting the order of facts with that of validity and law; if "law cannot in any way be a phenomenon, for its concept lies instead in the intellect" (Kant 1781, A44; my translation),[39] then there are two unavoidable lines of development for an authentically pure theory of law—i.e., a *critical* theory, and hence a theory "inherent in which is the philosophy of law" (Kelsen 1920a, VI; my translation)[40]—and so also a theory

[39] The German original reads "denn das Recht kann gar nicht erscheinen, sondern sein Begriff liegt im Verstande."

[40] Indeed, Kelsen (1925, VI) has always claimed credit for having brought "the province of legal science [...] closer to the fertile centre of all knowledge, namely, philosophy." On this aspect of Kelsen's doctrine, see Jöckel 1930, 2.

which can take into account the "limits to which positivism in the knowledge of law can be pushed," and which accordingly rejects as a matter of principle the "uncritical dogmatism" whereby a system of positive law is possible "without presuppositions" (ibid., VIII; my translation): On the one hand, a theory so described could not but develop into a form of critical idealism;[41] on the other hand, as was earlier underscored, it was bound to eventuate in a sort of formal or logico-transcendental "natural law theory." (This latter result is something that Kelsen obviously resisted, in his effort to always clarify his theory and positions as positivist, however much within the limits he himself recognized.) Whence the contradictions that accompanied the RRL throughout the arc of its development: too imbued with critical idealism to be purely positivist; but too positivist, on the other hand,[42] to be an authentically critical theory of law (see Martyniak 1937, 188; Kimmel 1961, 298; and Schild 1975, 70ff.).[43] Despite the theses Renato Treves defended in the 1930s in his article on the philosophical foundations of the pure theory of law, this is anything but a unitary theory: It is actually an antinomic theory (Carrino 2011). The philosophical "foundations" on which rests the work of Kelsen, Kant, Cohen, Vaihinger, Mach, and Cassirer, and also, i.e., Windelband and Simmel, make their way into the pure theory without really amalgamating, and so without giving place to a new unity, but rather engendering antinomies even with respect to the distinguishing features of Kelsen's thought, such as the basic norm and the distinction between the is and the ought. As has been rightly observed, "Kelsen's theory of law thus stands in contradiction to its own philosophical principles. Kelsen failed as a jurist to carry out in a rigorous and coherent way the projects he had laid out as a philosopher" (Martyniak 1937, 188; my translation). Critical idealism and positivism are plied together without finding any

[41] Perhaps the first commentator to have underscored Kelsen's constructivist idealism was one of his Viennese teachers, Friedrich Tezner, for whom the construction Kelsen lays out in the *Hauptprobleme* proceeds from the idea of the rule of law, though this is only one of the forms historically taken by the state in general. In this way, Tezner (1912, 338) argues, Kelsen can be said to abandon legal positivism and to wind up in the natural law theory he so despised.

[42] "If Kelsen had stayed true to his method, the RRL would have morphed into the most consummate idealism" (Calsamiglia 1977, 147; my translation). On the "formal natural law" ascribable to Kelsen's doctrine, which "unwittingly" ushers in "his archenemy, making it impossible to temporalize a given normative order," see once more Ross 1929, 260ff. Clearly, this opposition between idealism and positivism harboured within the RRL only concerns a *philosophical* idealism and a *legal* positivism. Even in his epistemological foundations, Kelsen walks a thin line between idealism and positivism: This can be appreciated in his drawing on the method of "purity" and on Hermann Cohen's and Ernst Cassirer's neo-Kantian apriorism, while at the same time looking to (*a*) Mach's *Denkökonomie*—it is Pitamic (1919, 1974) who spotted the *Denkökonomie* in the RRL's philosophical foundations—and to (*b*) Vaihinger's as-if (*Als-ob*) philosophy, both of which certainly stand in contrast to neo-Kantian transcendentalism (cf. Jöckel 1939, 87). On Pitamic, see Pavčnik 2011, 269ff., and Section 20.3.3 in this tome.

[43] As Wielinger (1977, 374) underscores, Kelsen has in any event always been careful to distinguish his own position from traditional philosophical positivism.

unity. Perhaps from a philosophical point of view it would be even better to speak of criticism and pragmatism, two strands that Kelsen failed to combine into a fecund synthesis. It is no accident that in 1930 Alfred Verdross should have invited Kelsen to rid himself of his neo-Kantian baggage so as to arrive at an "objective" (*gegenständliche*) philosophy (Verdross 2010, 1069).

This aporia of the RRL is in truth unsolvable. Even if the nomodynamic principle of the legal system, a principle introduced by Merkl and taken up by Kelsen (1923c, XII–XVI),[44] appears designed to overcome the RRL's contradictions in its passage from a *static* view of the legal system to a *dynamic* one, the moment the "positivity" of law is made to "effectively consist in this dynamic principle," in such a way that "the whole contraposition between natural law and positive law can in a certain sense be cast as a contraposition between a static system of norms and a dynamic one" (Kelsen 1968h, 293; my translation), when it comes time to effect a synthesis through which to make the system coherent, this contraposition in truth can only be worked out as an exercise in witchcraft, resolving itself, here as elsewhere, into a *great mystery*. Indeed, as has been observed by one of Kelsen's keenest commentators, the Hungarian legal philosopher Julius Moór, "a purely normative consideration should not concern itself at all with the problem of the *making* of law, for it should take the view that law cannot be made but only *known*. But in this way the view embraced is that of natural-law theory" (Moór 1931, 68; my translation).[45] Even at that time Fritz Sander, a regrettably forgotten author, had correctly argued that the normative consideration of law was in itself "statically conditioned" (Sander 1923c, 6; my translation). From a logical point of view, the purely normative consideration and tiered construction of the legal system contradict each other: "It is baffling," Moór went on to write, "that Adolf Merkl, who of all the people who defend the purely normative conception, does so even more unilaterally than Kelsen, should have been the first to

[44] There is nonetheless in this text a significant passage where Kelsen argues that "the idea of a meta-legal nature of the production of law," an idea introduced in the 1911 edition, is not "completely wrong": "The error of the *Hauprobleme* only consists in their introducing that idea too early. If the law can normalize its own production, in the sense of its perfecting itself, and if in this self-determination of the process through which the law is produced we want to see an essential characteristic of law, then we certainly cannot overlook that the *logically* primary legal norm cannot itself come under the purview of a higher rule of law by which its production is determined: We cannot overlook that the *basic norm* comes into play as the supreme rule of legal production, the rule that grounds the unity of the overall legal system within which the other norms are set into place. The basic norm must therefore as such be presupposed and not taken as posited in conformity with the law. Its place must, in other words, be seen as a fact that lies outside the legal system" (Kelsen 1923c, XIV–XV; my translation).

[45] As Kühne (1984, 195–6) has observed, if the RRL is understood to observe a static principle, it would have to be described not as a *general* theory of law, but as a theory distinctive to a *specific* legal system: It would have to state what the content of the law "in force" can be. On Moór see also Section 19.3.1 in this tome.

emphatically underscore this necessity for a dynamic consideration of law, a necessity that contradicts the normative consideration itself" (Moór 1931, 80; my translation). Even before Moór, this same observation had been made by S. Marck, that the principle that according to the tiered-construction theory governs the legal system and the application of law "is not of a logical kind but is rather determined by considerations of conformity to the purpose" (Marck 1925, 41; my translation) the system itself is intended to serve. The neo-Hegelian scholar Karl Larenz also made the same point: "This 'tiered-construction theory' can hardly be reconciled with a conception on which law is realized not through acts of will but through acts of knowledge. Therein lies a contradiction with the fundamental ideas underpinning Kelsen's theory of knowledge" (Larenz 1931, 27, my translation; cf. Aufricht 1974, 76–8, and Larenz 1933a, 68–103).

And indeed, it is not hard to appreciate why from a logical point of view it is only a static understanding, and not a dynamic one, that can result from a purely normative knowledge of law, the only kind of knowledge on which basis, as Kelsen would have it, it is possible to build a science of law. To see this, we need only consider that if the positive law is normatively considered, it can only appear as a prepackaged ordering of legal norms ordered within a fixed and self-enclosed system. As Moór observes, "the dogmatic science of law abstracts completely from the causal moment of temporal transformation: This science regards the positive law as having frozen at a given historical moment, *sub specie puncti temporis*, thereby taking a static consideration of the positive law" (Moór 1931, 80; my translation). In a normative sense, if we are to take normativism seriously, law can be considered only as being "immutable from its inception, eternal and timeless" (ibid., 63–4; my translation).[46] Indeed, from a strict and coherently normativist perspective, the legal system can only be *deduced* from a normative knowledge of law, and the perspective, in Kelsen's own words, accordingly presents itself as "a *normative* and *deductive* science of values, in the manner of ethics and logic," thus positioning itself as an "evaluating" science (Kelsen 1915, 839–40). In this way, the RRL's purely formal approach makes jurisprudence a "geometry" of the total legal phenomenon, and legal dogmatics an analogue of mathematics, however much belatedly with respect to the pluralism of non-Euclidean geometries (Walz 1930, 50); but by the same token—a consideration that holds so much the more if we take account of the theory of the basic norm as a foundational and Archimedean point of the normative legal system—the deductivist structure is such that the approach

[46] There is certainly no accident about the pointed irony that comes through in W. Jöckel's comment that "with the aid of Kelsen's basic norm, it would be possible to regard as law in force from the beginning of this century any legal system set decades, even centuries in the past, conceivably going back to Justinian's Roman law or to Hammurabi's Babylonian *Landrecht* or to the legal system of some German statelet" (Jöckel 1930, 117; my translation).

cannot but resolve itself into a transcription of what Leibniz wrote, this time with the coherence proper to a natural-law conception. Writes Leibniz,

> and from every definition one can draw certain consequences, by using the incontestable rules of logic; and this is precisely what one does in building the necessary and demonstrative sciences which depend not at all on facts, but solely on reason, such as logic, metaphysics, arithmetic, geometry, the science of motion, and the science of right as well; which are not at all founded on experiences and facts, and serve rather to give reasons for facts and to control them in advance; *which would* [also] *happen with respect to right, if there were no law in the world*. (Leibniz 1988, 50)

To this must be added that the very theory of the hierarchical construction of the legal system—a construction that moves from the basic norm to the general rules to the judge's rulings to the acts through which such rulings are enforced—has been interpreted as a secularization of politico-theological postulates: It is a proper "irony of fate," W. Krawietz comments, that Kelsen should have introduced this "Trojan horse of natural law" into his legal-positivist system, with "the idea of a hierarchy of laws immanent in every system of law" (Krawietz 1984a, 256, 261; my translation).[47]

When Kelsen was in his first American period, he was instead already clearly inclined toward the neoempirical criterion of demarcation between science and metaphysics. Just as for Moritz Schlick (1938, 93; my translation), for example, "every proposition is meaningful insofar as it is verifiable, asserting only that which can be verified, and nothing else besides,"[48] so for Kelsen the propositions through which the law is known can be ascribed to science, rather than to metaphysics, only to the extent that they refer to "a positive order evidenced by objectively determinable acts" (Kelsen 1945, 13). On this approach, already seeking to be "radically realistic and empirical" (ibid.), normative jurisprudence is no longer set up as a complex of value judgments but as one of "judgments about reality" (Kelsen 1957a, 351ff.; 1957b, 295ff.), and as such, it runs "parallel to the empirical science of nature" as "an analytical description of positive law" (Kelsen 1945, 163), the only possible nonevaluative description of the only possible "value" that can be objectively known insofar as it is amenable to factual verification in empirical experience. Indeed, only because we are dealing with judgments about reality is an experimental verification possible.

In this phase Kelsen can be described as (on the whole) neoempiricist, just as in the period from 1911 to 1935 he can be described as (on the whole) neo-Kantian. For the empirical Kelsen, no judgment of knowledge can be a plain logical judgment about value, because as he himself writes, "value judg-

[47] One who argued for the essentiality of the hierarchical structure of every legal system is A. Merkl (1923, 210).

[48] But it was Reichenbach who had the strongest influence on Kelsen in this period. See Bagolini 1983, 112ff., and 1984, 230ff., arguing that in the RRL imputation is identical with causality.

ments [...] cannot be verified by facts, as can statements about reality" (Kelsen 1957b, 295) and what in this area governs is subjectivism, which builds hypostatized ideal models generally for the sole purpose of serving specific political ideologies: No element of truth can be a basis on which to resolve a conflict among moral judgments. But we also have ought judgments, that is, judgments relative to the world of positive law, and which carry logical force serving as a basis of knowledge: These are the judgments of the science of law, and their status as judgments of knowledge is owed to their being objectively verifiable, as is the case with any other area of the empirical sciences. Kelsen thus abandons the opposition between nature and spirit, underscoring the actual, empirical reality of law.

Clearly, given that background, legal science is no longer legitimized in "producing" its own object, because precisely that which is given in itself must constitute the empirical basis on which scientific assertions can be verified. That in this period Kelsen, unlike what the classic RRL maintained, understands legal science as incapable of producing its own object of knowledge, by constituting this object through its method, thereby excluding every other type of that same object, is something that can easily be gathered from this passage:

> The law may be the object of different sciences; the Pure Theory of Law has never claimed to be the only possible or legitimate science of law. Sociology of law and history of law are others. They, together with the structural analysis of law, are necessary for a complete understanding of the complex phenomenon of law. (Ibid., 294)

One need only read Kelsen's polemic with Ehrlich (or the articles he wrote taking aim at Kantorowicz and even Max Weber) to appreciate the extent to which these positions depart from the ones Kelsen originally held. Unlike what he emphatically argued in the *Allgemeine Staatslehre* (Kelsen 1925, 6–7, 15–20), the RRL no longer stands as the methodological *prius* in any reflection on the law, but is only one of a range of possible sciences of the legal phenomenon, all of them legitimate.

The method of knowledge no longer *determines* the object but "is *determined* by its object" (Kelsen 1953, 143; my translation), which winds up constructing the very concept of law, a concept that now—if it is to give any knowledge of law—must take shape as an abstraction made from facts. Initially, on the contrary, as in the stance taken against Ehrlich, Kelsen adamantly stressed the point not only that "the law is an idea having no perceptible content," thus setting law in contraposition to fact," but also that the concept of law can never be "an abstraction from facts" (Kelsen 1915, 855; my translation). And so for this early Kelsen it would be nothing short of a "contradiction" to espouse a sociological concept of law (or of the state, which Kelsen equates with the law), even as an ancillary concept intended to support the

normative one, because there is no way for us to think the specific legal, normative unit we call "state" unless we exclusively and foundationally commit to a purely legal, purely normative, mode of consideration:

> Only the erroneous opinion that sociology can fundamentally take the same object as normative jurisprudence, namely, law, leads to the idea of an autonomous *sociology of law*. But the *legal norm*, this specific object of legal science, is not cut out for a sociology concerned with being. A sociological concept of law is impossible, no less so than a mathematical concept of the biological process or a moral concept of gravity. (Ibid., 875–6; my translation)

So Kelsen's philosophy of law appears not so much as a philosophy *in progress*—such is the view taken by its staunch supporters (and by Kelsen himself, in a reply to a critical commentary)[49]—as an inherently *contradictory* philosophy. The contradictions of the "pure theory of law" should not be considered from a historical angle exclusively, however, but should also be considered synchronically, because we are dealing with a theory that, despite its dismissal of history in the name of logic and reason, has a specific historical origin that explains its meaning and importance, while also explaining the internal antinomies themselves. The RRL, in other words, is an "Austrian" theory of law, a theory that owes a lot to the composite makeup of the Austro-Hungarian monarchy, torn between a plural society and a unitary legal-political order. Then, too, as Adolf J. Merkl has rightly pointed out, "due consideration has yet to be given to the fact that in large part what prompted the RRL's birth were the historical upheavals of World War I, which set up the conditions under which ephemeral legal forms came to be equated with imperious political exigencies and supreme moral values" (Merkl 1961, 295; my translation).

2.3.2.4. What Is the RRL Good For?

The RRL's inherent, historically determined contradiction springs from an effort to ground jurisprudence as a spiritual science, but relying on means and concepts derived from *natural* science. For although these derived concepts would be interpreted in different ways, the idea of natural science always stood in the background, understood—consciously or otherwise—as an authentic science and model for every kind of inquiry, again in line with the outlook of the time.

The two highest concepts in natural science were formalism and abstractness, analogized to what in modern social science are commodities, and in particular the quintessentially abstract commodity, money. Kelsen now offered to bring these concepts to bear on the theory of law and the state, a theory under-

[49] See Hofmann 1977, 30, commenting that "one is not licensed to expound by theory on the basis of a piece that has become obsolete: This must be done keeping to the second edition of the *Reine Rechtslehre*" (my translation).

stood not as an empirical (historical or sociological) science but as a spiritual one: a spiritual science embedded in a worldview set against all mystical-organicistic or communitarian-concrete visions in the traditional sense.

For this science of the spirit, such as Kelsen sought to found it, the state is the form of social coexistence: It is that "how," that complex of norms or rules that constitute the value, the spiritual makeup of the human world, something that no scientifico-naturalistic conception can grasp: "It has been from the outset a failed enterprise to define the state *materially*, by looking at its content, at the purposes pursued in the form of the state. Indeed, the state is a form of social unity: It is not a content!" (Kelsen 1915, 867; my translation). And against Jhering's teleological conception of law and the state, Kelsen writes in the *Hauptprobleme*:

> Certainly, the law and the legal order have a purpose (such as to set up and maintain the conditions for order and peace). However, the state, as far as this purpose is concerned, comes into play not as a subject but as an object, that is, as a *means*. The state and the legal order are not the means through which to pursue the end which has been singled out; the subjects who pursue that purpose are, however, the single human beings in their *social* community, namely, society (as opposed to their community as a state). That the jurist considers the state and the legal system a "means" is only an expression of the *formal* character of jurisprudence. The concept of a means belongs to the category of form in opposition to that of purpose, which is ascribed to content as a material moment. And that not the state but society should count as the subject of a purpose therefore corresponds to that generally accepted categorization according to which these two concepts, under the heading of the opposition between form and content, are related to that conception on which society appears as a *form* of organization of society. (Kelsen 1911, 208–9; my translation)

And in a polemic against Rickert's (and Weber's) concept of value relation (*Wertbeziehung*), Kelsen underscores the following point:

> Reality and ideality cannot in any way be linked to a single concept, nor can they in any science be understood from the same point of view: Reality results from a mode of consideration essentially unlike that of ideality. A content only presents itself either in the form through which *being* is known or in that through which the ought is known. In the former case a content presents itself as an actual reality; in the latter, as a value. Along the path of completely different ways of seeking knowledge, the given becomes either reality or value. (Kelsen 1968f, 46; my translation, italics added)

We can see here the attempt to unambiguously separate the "spiritual content" from the corresponding psychical acts, the latter understood as moments of the is, and this clearly brings to light the influence exerted on Kelsen's thought by Edmund Husserl's phenomenology and Georg Simmel's methodology, the only thinker who, working from a social-philosophical perspective, managed to avoid confusing form with content, the is with the ought. Indeed, as Kelsen argues, Simmel does not concern himself with the material elements of the social process: "He does not go looking for any law of nature with which to ex-

plain the social process, but only seeks to offer a theory of the *forms* of social relations" (Kelsen 1915, 229; my translation).[50]

In this way, however, the logical, if not logicizing, formalization of the legal phenomenon—a formalization set in motion by Paul Laband[51] and driven to extremes by Kelsen, with his effort to *morally neutralize* the legal system at its highest rungs (see Merkl 1961, 300–1)—took on a specific *political* meaning: The underlying idea, very much in keeping with the overall trend of the modern age, was to "weaken" power as such by giving it a formal-normative rationalization, while at the same time fashioning anew the *aims* of power—which by now had become secularized and "logicized"—so as to reorganize the social world, a world making it possible to body forth the modern ambition to systematize the irrational within a logico-formal framework,[52] and to embrace a radically demythicized form of existence and lifestyles where the spirit (understood as the intellect) commands nature. Kelsen thus rejected the "primitive" conception, which cannot seize the specific reality of "sense" as a social phenomenon, and for which the *specific* forms of spiritual being are nonbeing, a mere appearance, the vestige of a magical conception of existence. As has been commented,

> in essence, Kelsen is just concerned with explaining that there is no unconditional necessity to "exclude" the spheres of sense and of spiritual being from the complex of social reality, that the pretence made by a spiritual being and by a particular "legal reality" can only be understood as the result of a hypothetical judgment in which it is determined that if we are to treat the law as the object of any particular science, then we will have to take up a particular sphere of ought. (H. Mayer 1937, 28; my translation)

[50] In this regard, however, it would be remiss to gloss over the observation that "Kelsen completely overlooks that this is a separation Simmel wants to achieve for *all* the objects of *all* the sciences. This applies to law and religion, and no less to the *science of nature*, so Simmel's reasoning, which for Kelsen is decisive, is not something invoking which Kelsen is thereby authorized to speak of a realm of the spirit as against the realm of nature, for we simply have to do with the separation of psychology from all the other sciences" (Roffenstein 1924–1925, 546; my translation).

[51] Here is how Laband explains the endeavour: "The scientific task of dogmatics applied to a given positive law is to construct legal concepts, to subsume legal maxims under more-general concepts, while also deducing from these concepts the conclusions that derive from them. This [...] is a purely logical activity of thought. For this task there is no other means than logic; logic cannot in any way be replaced in working to accomplish this end; no historical, political, or philosophical consideration […] can have any bearing on the dogmatics of concrete legal material, and all too often considerations of this kind only serve to mask the lack of constructive work" (Laband 1895, vol. 1, X; my translation). Cf. Friedrich 1997, 235ff.

[52] As O. K. Flechtheim has observed, "Kelsen's idea of order, an idea even more formal than Kant's, is intertwined with a logico-formal systematization of the irrational" (Flechtheim 1963, 6; my translation). It is Flechtheim's view that "Kelsen's claim to coherence rests entirely on the essence of our classical logic, which in turn depends on the structure of our thought and language" (ibid., 42; my translation), and for this reason Kelsen appears incapable of adapting to logical structures different from those of the classical tradition.

The RRL's universalism rests on the principle of the unity of reason.[53] It thus

> seeks to subject the spheres of ideality and reality alike. The RRL's universalism is nothing but the legal manifestation of universalism tout court; it is, in other words, the manifestation of a metalegal principle, a principle acting *a priori* in the field of law. (Fraenkel 1937, 294–5)

We can apply here to Kelsen what has been said of Kant (definitely a reference point for Kelsen, however much in several respects a problematic one): "Kant's whole effort has been to replace the state of nature with a legal state in which war will yield to procedure and victory to an adjudicative ruling" (La Croix 1966, 12; my translation).

In this sense, Kelsen's criticism of early liberalism is to be interpreted as an *immanent* criticism, like the criticism a neoliberal would make of historically eclipsed forms of the classical liberal ideal. Kelsen's legal-political liberalism is closely wedded to the criticism—a criticism he wants to be "scientifically" grounded"—of the facticity of law, that is, the criticism of the identification between the state and power (an identification that conceals ideological aims): "The state must be either power or law: It could not be both at the same time. Precisely because the contents of positive legal norms are the outcome of conflicting interests, Kelsen refuses to recognize them as categorical and confines himself to looking for these norms' logical structure" (Kraft-Fuchs 1931, 408; my translation).[54] We will never be able to fully grasp at once the greatness and misery of the RRL if we are unwilling to accept that the scientistic component and the ideological-moral component are one and the same thing in Kelsen. The RRL is a relativistic yet moral theory,[55] this because the two moral values laid at the foundation of the theory are liberty and tolerance. Indeed, the theory stands on the basic premise of the rejection of violence—the ideal espoused by the cultured liberal bourgeoisie—for it is by insulating the legal phenomenon from power (the is, or facticity) that the theory hopes to secure both its own "purity" (or "scientificity") and the possibility of marrying science with political ideology, the former neutral and "nonevaluative," the latter liberal: "The elimination of power from law is done in full theoretical consciousness. Kelsen does want this outcome. Unlike what is the case with other types of positivism, the ideological scientistic component does not resolve itself out into an absolutization of facticity but, on the contrary, into its absolute negation" (Fechner 1969, 107; my translation).

Kelsen thinks he can use the constructivist method of neo-Kantianism, especially that of Hermann Cohen, but he completely overlooks the problems of

[53] Undoubtedly, Kelsen also comes under the spell of current philosophical trends, especially the movement for the unity of science. See Jabloner and Stadler 2001.

[54] On Margit Kraft-Fuchs (1902–1994), a disciple of Kelsen and a critic of Schmitt, see Stolleis 2008.

[55] On the RRL's basic norm as a "moral maxim," see Priester 1984, 228–30.

Cohen's philosophy, which takes a fundamentally ethicist angle, even though it does so through a "pure will"; nor does Kelsen consider that even in the broader ambit of neo-Kantianism the *Sollen* always bears a connection to the is. We should mention in this regard the other main exponent of Marburg neo-Kantianism, Paul Natorp, for whom

> in any assertion of duty there is already inevitably posited an is, this in three respects. In the first place, a duty is asserted only against the background of an is: We form judgments about that which *is* in evaluating whether or not it ought to be, or we form judgments about that which *is not* in evaluating whether or not it ought not to be. In the second place, duty itself expresses the need for an is or a non-is: It therefore to that extent presupposes the sense of the is qua is if it is to be understood. And in the third place, that something ought to be or not be is a judgment made by evaluating its being or not being. (Natorp 1911, 32; my translation)

2.3.2.5. A Pessimistic Anthropology

Kelsen's half century of work on the separation between the is and the ought, on the hierarchical structure of the legal system, on the norm as a hypothetical objective judgment, on the identity of state and law, and on the *Grundnorm* seem to essentially point to the thesis of the relativity of law and the state. Law is for Kelsen a value, but in its content it is a relative value, not an absolute one: It is not *etwas heiliges*, as it had been for Hegel, but only an ideology through which humans undertake to realize particular interests. These interests may be of various kinds, to be sure, but they are always underpinned by a historically and anthropologically unvarying fact: the distinction between those who command and those whose are commanded, between the rulers and the ruled. Kelsen's anthropology is of a fundamentally pessimistic kind: "It is inevitable for there to be a difference between individual will—the point of departure in setting out the necessity for liberty—and the apparatus of the state, which stands as an extraneous will in contraposition to the individual" (Kelsen 1929b, 11; my translation). The very idea of a supersession or an extinction of the state, of all coercive systems, thus takes on "a utopian character": It "ignores the aggressive drive inherent in man" (Kelsen 2000a, 241). Law and the state, in their normative identification, thus function as the specific form that seeks, constitutes, and guarantees social peace in the conflictive social world of facts and in the uneliminable tension among concrete individuals, among their conflicting material interests: "Social reality," Kelsen writes, "does indeed come down to power and command" (Kelsen 1968g, 1759; my translation).

While, on the one hand, this means that for Kelsen law appears to dwell entirely in the world of validity, of the ought, of value, and not in that of facts, of socio-empirical reality, we should not take this to mean, on the other hand, that between the two worlds thus set in contraposition there cannot somewhere be a liaison, a line of communication, or translation tools—all con-

duits without which, it needs be said, it wouldn't even make sense to raise the problem of the law as "positive" law. Behind the positive law lies, for Kelsen, something that goes beyond law, a metalegal element. This element, however, is to be found neither in eternal law nor in some absolute value of material justice, but only in what is ordinarily understood as power, as *Herrschaft und Führerschaft*:

> The problem of natural law is the perennial problem of what lies underneath the positive law. And I fear that those who are still seeking an answer will find neither the absolute truth of a metaphysics nor the absolute justice of natural law. Those who lift that veil without closing their eyes will see the intent, wide-eyed stare of the Gorgon's head of power. (Kelsen 1927, 55; my translation)

What, after all, is that coercion which contradictorily makes its way into the concept of law, if not the primitive fact of power? As has been correctly observed, "a sociological positivism works here as a theory in a complementary role to the Marburg brand of neo-Kantianism, so as to secure a place for the law ahead of other systems of duty" (Meyer-Hesemann 1984, 77; my translation). Although the legal system outlined by Kelsen does constitute a *normative* system grounded in the pure *Sollen*, it also works itself out, under the influence of Merkl's and Sander's theories of law, as a system of qualifications issued by hierarchically arranged organs of power. In other words, the system may set itself up as a pyramid of norms, but it equally does so as a "cascade of powers," of *political* powers. The very the faculty to initiate a coercive process against anyone who should "violate" a "right"—a faculty the legal system recognizes for the subject—is none other than power itself, however partial it may be (just as the person, the subject, is himself or herself a "partial legal system"). As Kelsen writes, "this power of the subject is a political power, a public function par excellence." And so the "specifically 'political' element is none other than the element of coercion" (Kelsen 2000a, 248).

As can be appreciated, the RRL's contradiction is something the theory carries with it in every phase of its evolution. It is known how prominently the concepts of sanction (punishment) and coercion figure in the RRL. Yet these are facts, not values. The central role played by the sanctioning moment is the necessary outcome of an attempt Kelsen makes to overcome the aporias attendant on the Kantian approach to the knowledge of law, an approach that makes it impossible to mark out the legal "ought" within the world of the *Sollen*. Recourse to effectivity—understood both as the *conditio sine qua non* of the legal system's validity and as an ascription of legal validity to the individual norm, in the form of a judicial decision—is supposed to guarantee the knowability of the object we call law, the scientificity of the legal scientist's endeavour to gain knowledge of the law. Yet effectivity, or the fact of power, is never a duty, a value, a norm, a spiritual content but rather an *is*, a fact. This means that Kelsen's realism contradicts his "critical idealism" on a fundamen-

tal point. Indeed, although he may seek to ground jurisprudence as a spiritual science, his attempt turns out to be exclusively based on the methodological tools of natural science. As W. Schild has observed, herein lies the "tragic" element in Kelsen, an element present from the very outset, from his—contradictorily—Kantian phase, for Kelsen fails to do away with natural-law theory without lapsing into a form of legal positivism he himself took exception to as a dogmatics devoid of any presuppositions. Kelsen's criticism of ideology may just prove to be, at bottom, the hideout sought by a disillusioned theorist who sees moving in, closer and closer, the spectre of law as power, as fact. It is a spectre he is after all very much familiar with, one he cannot keep at bay if not in theoretical postulates (still neo-Kantian) that cannot be made to square with his otherwise realist and positivist approach, precisely because—once forced to shut out the authentically philosophical approaches—his ideal of scientificity, of objective knowledge, nudges him closer and closer to facts, to the is, to that reality which the natural sciences know casually and which they really do make into an object of science (by gaining possession of the object): "The greater the element of power," Schild comments, "the more legal science resembles a natural science. The scientificity of the legal scientist's activity, and hence the 'purity' of that activity, depends on how close it comes to power" (Schild 1975, 187). The ideological criticism of this power—something amenable to objective knowledge—is tasked with salvaging the nonevaluative scientificity of the legal scientist, who must refuse to serve the prince. Certainly a commendable aim, but it does nothing to ground science as a science proper, or the law as law.

2.3.2.6. The Basic Norm: Critical Idealism or Critical Positivism?

Julius Moór has underscored that there is only one reason why the RRL does not in the end itself translate into a theory of natural law: It is that, as was previously pointed out, the RRL "cannot adhere to a strictly normative consideration" of law (Moór 1931, 68; my translation). Among the pillars of Kelsen's thought is the idea of the basic norm (*Grundnorm*), a norm that, in Kelsen's own definition of it, is valid "in just the same way as a norm of natural law." But as much as Kelsen may say it is not up to legal science to answer "the eternal quest for justice on the part of humanity," it is doubtless that there is no *lapsus calami* in the contention he offers on the same page with the statement that "critical positivism, which does not need to be more papist than the pope, can itself claim [along with natural-law theory] to have grasped the essence of justice by way of the basic norm, which sets up the positive law as a noncontradictory system, and this is especially true considering that critical positivism, through this basic norm, understands the positive law as a system of peace" (Kelsen 1968h, 295, 343; my translation). And in a later article on the metamorphoses of the idea of justice, he explicitly states that a legal system guar-

antees peace to the extent that, in the unitary world of norms, it leads to compromise and makes it possible to overcome conflicting interests (Kelsen 1947, 397), all claims that, non incidentally, have been found to be "of an evaluative and preceptive nature—neither analytical nor empirico-descriptive" (Bagolini 1968, 404; my translation).

The basic norm—a concept that Kelsen significantly held on to, never wanting to abandon it, however much it may be amenable to different interpretations—in any way does not represent the legal system's foundation of "validity" or that of "effectivity." It rather serves as the foundation of the law's *rational* knowability: Any discussion about the foundation of validity must be limited to the problem of the distinction between the system of natural norms as against that of positive norms. We thus have to equate rationality with sovereignty: It is certainly a discussion which appears not to break beyond the boundaries of a theory of legal knowledge, but which can also be translated into an *ideology*. What it means to equate the system's "logical peace" with sovereignty is that a legal system must be coherent, or rational, and that it can be rational only as a system of peace: Peace and the "rule of law," law and scientific legality, reason and formal democracy are couplets each of which looks to and entails the others in a series of homologies carrying strong politico-ideological meanings. The RRL is not only knowledge but also evaluation and prescription: It is a "jusrationalism," that is, a logical-formal theory of natural law, on the one hand, and a political theory of pluralist democracy, on the other. In this way, as Ebenstein has observed, "the ideal of justice is reduced to that of the unity of the legal system: The logical ideal replaces the moral one. In this transubstantiation of the system's idea of logical peace into the moral peace of society, Kelsen's logicizing of the ideal of justice finds its culmination and conclusion" (Ebenstein 1969, 92; my translation).

The basic norm theorized by the RRL is intended to make comprehensible—as a meaningful, rationally interpretable complex—the legal material that has been posited by enactment. Not incidentally, as Kelsen writes, the judgment whether a state is democratic or autocratic "is a matter exclusively for the knowledge of law" (Kelsen 1923b, 164; my translation). The basic norm is entrusted with grounding a coherent, "meaningful" system (Kelsen 1968h, 295) by way of logical knowledge, with making "unitarily" comprehensible "the material offered by experience" (Kelsen 1968i, 258; my translation). We can understand in light of these remarks how Kelsen, as early as in his *Hauptprobleme*, should have claimed it to be a distinctive feature of jurisprudence that "even a norm brought into existence in a way contrary to law can be a legal norm, or that, in other words, we cannot include the condition of a norm's coming into existence in framing the concept of law" (Kelsen 1911, 411; my translation). Which is to say: We cannot concern ourselves with the irrational fact of power in the rational *Sollen* of law, the "incomprehensible mystery" of how an ought can be destroyed by an is, or how an is can turn into an ought"

(ibid., 314; my translation). The basic norm (which Kelsen also qualifies as original, or primary: *Ursprungsnorm*) serves the function of translating into a purely formal language without content the claims of natural law: It weakens these claims and deprives them of substance, or, in other words, taking up a judgment by the young Lukács, it strips those claims of all content: "Of the tenets of natural law the only one to survive was the ideal of the unbroken continuity of the formal system of law" (Lukács 1971, 108).

It is the basic norm that establishes the legal system as a *possible* system of law while also establishing the difference between the system of natural law and that of positive law. As formally normative and hence logically deduced systems, the last two stand on the same conceptual footing. In this sense the *Grundnorm* functions as the original, rationalistic—i.e., basic or "fundamental"—presupposition, for it serves to make jurists aware of what they do when, "in assuming a conception of their object," "they confine themselves to the positive law" and "reject any notion of a law of nature" (Kelsen 1968i, 254; my translation). That legal practitioners should in their activity confine themselves to the "positive" law means that they only take account of this law in its original, ideal validity, such that what really matters, as far as this basic norm is concerned, is not the question of the source of the content of the positive law, whatever this content may be, but only the question of its possible foundation, which can only be that of reason, because only abstract reason is formal and hence capable of seizing that object as a formal and abstract object and so as an object of science: "This sets legal positivism apart from the theory of natural law" (ibid., 255; my translation). It is therefore clear, however, that this legal positivism is itself only a "natural-law theory devoid of content," but a theory that, as has been observed, the practitioners and technicians who are engaged in working with the law proper particularly appreciate as a "sublimation of dogmatics" (Leoni 1980, 187; my translation).

The distinction between a material theory of natural law and a formal one lies, according to Kelsen, in the fact that the former relates law to a vague and ambiguous concept of justice, a concept determined on the basis of the social groups' contrasting interests, and the latter, by contrast, sees in the law alone a "relative justice" (Kelsen 2000b, 24), albeit in a primary way, or an order of peace, and so a value as a point of equilibrium for social conflicts: "The critique of knowledge, therefore, is not meant to autonomously determine the concept of law, but only tries to hold up law itself as an ultimate value" (Dobretsberger 1931, 7; my translation). With Kelsen, a material theory of natural law geared to the problem of social conflict or the problem of the dominant power (the problem of counteracting or merely justifying such power) is replaced by a legal positivism whose strict boundaries make it into a solely logical and formal, and hence rational, theory of natural law, which precisely for this reason can handle the peculiar dominion of the abstract, of formalism, that marks the age of the bureaucratization and the formal impersonality of

legal power: This formal or "logicizing" theory of natural law no longer requires the legal order to rest on a moral foundation, metahistorical and otherworldly—for in the age of the *Entwertung* any such foundation is bound to appear as no more than a lie—but rather asks that the legal system, the system of positive norms, be "at least devoid of contradictions and feasible" (ibid., 8; my translation). In the final analysis, as Arthur Kaufmann has observed, "Kelsen's *Sollen* is a moral category" (A. Kaufmann 1985, 110; my translation).

2.3.2.7. Formal Logical Natural-Law Theory and Pacifism

The rational theory of natural law, or formal logical natural-law theory: This designation can have any precise meaning only if we understand that the jurist makes the background assumption of order and peace as values. It does not matter that this be a "just peace," for "peace stands as a value" in any event (Bobbio 1955, 48; my translation). Peace and order—the law as an "order for peace"—are in fact "justice" per se,[56] for they counteract the chaos of nature: The law is "a value in itself" (ibid., 151; my translation), for as an ordered system it achieves peace. The jurist normatively presupposes peace in the sense of a moral-political reference point, the meaning of a certain way of understanding the law, as a compromise against the background of conflict, as a means for settling conflicts; the jurist presupposes the search for a state of peace where science can progress and develop in its drive to dominate nature, or that which is extraneous to the spirit and is in becoming—the drive to proceed fully certain of its own autonomy. For the "positivist" Kelsen "order is a concern even more important than the concern with the justice of the legal system, inasmuch as [...] order is a presupposition of a just legal system" (Kriele 1966, 427; my translation). To trace one rule's validity to that of a higher rule is to set up a guarantee with which to guard to some extent against the arbitrary use of power: The law in Kelsen's sense "presupposes at least a value, that of order, of a peaceful, well-ordered society" (Bindschedler 1960, 71–2, 76; my translation).

In this sense the logicizing constructions of Kelsen's legal system wind up looking like projects for new worlds within which to design different such systems, "creations conceived without any regard for the real or received meaning of certain legal concepts," instead conceived "exclusively according to a logical conformity to the purpose." And so, one cannot fail to see in the RRL a logicistic natural-law theory, or even "a cognitivist metaethics producing a self-styled scientific theory of values" (Pattaro 1982; my translation).

The feature of the RRL that makes it like a natural-law theory, in the formal logical sense of the term, comes through clearly in the monism Kelsen upholds

[56] Kelsen asserts that the purpose of every social order, and in particular of the legal order, lies in peace, justice, and law-abidingness, which amounts to peace guaranteed by law (Kelsen 1941, 72).

for the international legal system, conceived as a unitary whole resting on a formal logical foundation (the presupposition for knowing the legal system), and no one can deny here that this characteristic brings the conception within the realm of natural law. Writes Kelsen: "To the extent that this 'natural law' foundation confines itself, as a legal hypothesis, to making a legal system possible among coordinated peoples, a system that perfects itself through the enactment of positive norms filling the system with content, even the legal system of a single state—understood as a sovereign state—cannot be devoid of such a natural-law foundation" (Kelsen 1920a, 252–3; my translation). That is all the more so if we take into account this statement by Felix Ermacora: "Corresponding to Hans Kelsen's critical legal positivism, reaching its apex with the formal basic norm, is a material basic norm Kelsen identifies as consisting in the rule of law and democracy" (Ermacora 1983, 29, my translation; see also H. Dreier 1986, 282ff.; Ooyen 2003, Vinx 2007).

In Kelsen, then, rationalistic science, the typical expression of modern science, is not indifferent to an ideological and moral choice in favour of democracy, understood as democracy in the practical sense of a feasible and hence representative parliamentary democracy: It might even be said that science is in a sense identified with democracy as a form of power based on relativism. Indeed, part of "the vital principle of every democracy" lies in the "freedom of science," such that democracy (formal and representative) no longer appears as a political form among others but as the basic, material norm of the RRL's legal system as a whole, and also as an expression of the knowledge-making instinct, the political form of reason in which we can recognize a certain psychological type—the one built on the modern crisis of the foundations, of the grand metaphysical narrations—with "a strong inclination toward feelings of guilt," and a "comparatively weak sense of self" (Kelsen 1968l, 1930; my translation).

Whether this conception really founds a purely rationalistic society and does not instead configure a project for a new community grounded not in tradition and the roots of being but on abstract thought, on modern scientific reason as a will to power, is a question we need not concern ourselves with here. What instead cannot go unmentioned is a perceptive criticism that Erich Kaufmann made of Kelsen's *Problem der Souveränität*, where the formalistic and rationalistic concept of parliamentary democracy is inflected and concretized by conceiving a *civitas maxima* reminiscent of Christian Wolff, a "universal state as a universal organization" (Kelsen 1920a, 320; my translation). What Kelsen had declared to be the exclusively gnosiological function of the pure ought is thus upended to embrace a concept of universal spatial validity: "This universal spatial validity, which is still above all abstract, then morphs into the concrete totality of the world's universality, or at least it projects itself into the sociological 'reality' of a world organization" (E. Kaufmann 1960, 194; my translation).

2.3.2.8. Kelsen and Hegel

The foregoing observation by Erich Kaufmann is apropos because it enables us to work into a discussion of Kelsen's legal philosophy an objection made against the RRL by legal scholars like Alf Ross, who argues that "if Kelsen's system is to be able to reconstruct its own concept of law, it will have to forsake its critical foundation and instead look for a basis in Hegel's metaphysics" (Ross 1946, 44), in the sense that sociological reality would be forged as a synthesis of reality and validity, is and ought, or, stated otherwise, in the sense that description would also become prescription, and judgments about "the reality of law"—judgments of validity, of *Sollgeltung*—would become value judgments (*Werturteil*), and vice versa. And certainly it seems that only in this way can we understand how the concept of obligatoriness should have collapsed into that of binding force, into a norm's "specific existence," into the objective validity of a legal system thus furnished with a "metaphysical attribute." This legal validity, as has been observed, has always made possible interpretations belonging to a specific tradition in axiological thought, a tradition in which obedience to norms is predicated on a specific quality of norms, namely, their being *objectively valid*.

Indeed, in Kelsen's view the legal system is already in itself a value, logically so, in a way not too distant from Hegel's idealist conception (this convergence may seem quite paradoxical, to be sure, but it has already been observed by Pitamic as far as Fichte, for example, is concerned). As has been observed, it may well be that behind the thesis of the obligatoriness of norms *qua* norms, of norms insofar as they make up a system understood as the normative *primum*, lies "the great shadow of Hegel. Indeed, why should we accept the legal system's obligatoriness, *sic et simpliciter*, [...] if not because, precisely as Hegel thought, the system is the legal form of that living ethical reality which is a people constituted as a state?" (Cotta 1981, 44; my translation). A distinction may be pointed out, however, in that the specifically Hegelian concept of the ethical state is replaced by Kelsen with that abstract scientific reason which through the basic norm becomes a universal state (*civitas maxima*), a unitary legal system of the world, power as law and law as power.

It is in the 1925 *Allgemeine Staatslehre* that this marriage with Hegel assumes some striking forms. Here the primacy of the international order as the *civitas maxima* is grounded in the "spirit of the world" (*Weltgeist*), in "universal reason" (*Weltvernunft*) as contrasted with the "ephemeral and provisional phenomenal forms" given by individuals "who know and want." Individuals are only "emanations" of "supreme universal reason": They are "part of the world's universal spirit," "the fiefdom of the single and sovereign universal *I*" (Kelsen 1925, 131; my translation). And then, again, in 1926 Kelsen writes: "Hegel and his disciples, imperialists of every nationality, are unquestionably representatives of an objectivist or universalist philosophy. But this universal-

ism, as is known, stops at the state. It is in a radically individualist way that these representatives construe the relation between the state (understood as an individual) and humanity" (Kelsen 1926b, 231; my translation). Kelsen thus underscores the contradiction, in Hegelian philosophy, between metaphysical universalism and politico-legal individualism.

A rational knowledge of the legal phenomenon, a science of law, can be achieved only on the basis of an objectivist *Weltanschauung* which grounds the validity of partial legal systems in the "totality" of the single, sovereign *civitas maxima* of the international legal system, and for which the empirical individual, as part of nature, is no more than "mere appearance" (*bloßer Schein*). (Totality so conceived is what Hermann Cohen would call *Allheit*, setting this concept in contrast to the purely organicistic and substantivist concept of the *Gemeinschaft*.)

The subjectivist conception—imperialist in politics—which in contraposition to "the state as a subject sets the rest of the legal world as an object, and which through the theory of recognition dissolves this object as a function of the subject," denies "the world of value, and specifically the rule of law, understood as universal law, that is, as the universal state," and by reducing everything to the world of nature, of facts, of power, it ultimately leads "to a negation of law in general, and so of legal knowledge, of the science of law" (Kelsen 1925, 131–2; my translation). Indeed, this tendency leads to a negation of the very idea of law and "to an affirmation of the viewpoint of mere power."

In this way, with this antirelativistic concretization of Kelsen's theory,[57] the politico-ideological essence of the RRL's method is identified, and it is not incidental that it should even have been possible to describe this as "a sociological theory of law in a normative guise" (R. Dreier 1981c, 225; my translation). The RRL is a political theory of law no less than it is a legal theory of the state, a theory whose arcanum lies in the idea, in the baked-in value of a universal peace (an idea that in the later Kelsen would be replaced by that of *international security*)—the idea of a universal state governed by reason and science, a state that Kelsen wants make rationally, i.e., logically, possible, and hence scientifically knowable, and vice versa. As Kelsen writes:

> The Pure Theory of Law relativizes the State. And by recognizing the state as an intermediate level of the law, the Pure Theory discerns that a continuous sequence of legal structures, gradually merging into one another, leads from the universal legal community of international law, encompassing all states, to the legal communities incorporated into the state. (Kelsen 1992, 124)

The theory in this way "facilitates development that has been stunted by mistaken notion, development in terms of legal policy […]; it may be said that the

[57] It was observed by M. Kraft-Fuchs in this regard that "Kelsen's relativism applies to the content of law but not to its form. Because the pure theory of law is a theory of forms, its results remain resistant to this relativism" (Kraft-Fuchs 1931, 409–10; my translation).

Pure Theory of Law, because it secures the cognitive unity of all law by relativizing the concept of the state, creates a presupposition not without significance for the organisational unity of a centralized system of world law" (ibid., 124–5). Here we have a late-Enlightenment legal utopia that with the tools of the abstract, formal reasoning of modern, relativistic science seeks to eschew the burden of any content-rich, substantivist utopia.

In the identification between state and law, conceiving the state as a normative legal system, lies *the conditio sine qua non* for the rational, legal, and scientific foundation, and so for the real possibility, of the Wolffian *civitas maxima* as a democratic order embodying the "rule of law" (for Kelsen every state is a *Rechtsstaat*). As W. Bauer has observed,

> Kelsen's idealistic cosmopolitanism is an Enlightenment legacy for the realization of the postulate of humanity in a universal community of peace. Universal morality, universal law, and the universal state constitute a unity. In the boldness of the attempt to take up the classic 18th-century idea of harmony in its purest form and transplant it into the 20th century lies Kelsen's skill and his illusion. But as something that rests on a faith in a universal morality, the *civitas maxima* itself forms part of an idea of progress rooted in natural-law theory. (W. Bauer 1968, 113)

As Erich Kaufmann has observed, we are always looking at "the same port through which passes the history of the rationalistic metaphysics of progress, and which elevates pure 'concepts' to the status of metaphysical powerhouses with empirical realities and effects" (E. Kaufmann 1960, 195; my translation).

2.3.2.9. Kelsen's Theory of Law as a Logic of Law

We have thus far considered the outlines of Kelsen's philosophy of law as a scientific methodology of law. What, then, is the law in Kelsen's general theory? According to Kelsen, as we have seen, the jurist is concerned not with facts but with norms: "The law which constitutes the object (or product) of such a legal science could never be 'positive'" (Kelsen 1920a, 89; my translation) in the sense of its belonging with the world of facts. Kelsen thus occupies himself exclusively with legal norms in their *epoché* with respect to their effective reality, and jurisprudence, as a science of the spirit, is never a science of facts but a normative science, not a science of the is but a science of the ought: a science of the value of law or, more to the point, a science concerned with the is of the ought (Kelsen 1922b, 76; 1925, 45).

Like mathematics, jurisprudence is for Kelsen a *formal* science: It develops formal concepts axiomatized and deduced from first principles or formal postulates, such that law is never, in its essence, "anything real" (Kelsen 1968m, 1238, my translation; cf. Carrino 2011). This amounts to driving out of the "specifically legal" field of inquiry all questions relating to the *purpose* of law. Legal concepts are formal categories, and jurisprudence has to do only with "the *form* of a phenomenon." The material content of this phenomenon is to

be investigated and known (to the extent that it can be known) in history, sociology, and psychology (which Kelsen understands as a truly complementary science, serving only to integrate the normative science of law).

Kelsen postulates a purely formal method founded on the specifically legal criterion of imputation (*Zurechnung*), a device that produces and constitutes a peculiar object of its own: "There is, then, no methodological difference between science and law" (Clavreul 1978, 268; my translation), in the sense that, in Kelsen's view, law itself builds its structure on the constitutive rationality of the normative sentence (the *Soll-Satz*), that is, on the truth-producing force of the statements made by those who detain knowledge, a force which can therefore determine what Kelsen accounts to be the two fundamental aspects of law, namely, its *coherence* and its *unity*.

According to an emanatistic logic tracing its roots to Hegel and Cohen alike, the pure normative sentence actually produces, or delivers, the "truth" of individual freedom. Individual freedom therefore does not *precede* individual *Zurechnung* but is rather the result of such imputability. It is not that a person is legally a subject—i.e., someone to whom something may be imputed—because of that person's natural freedom; rather, a person is a "subject" and is free because, and to the extent that, something can be imputed to that person in the unvarying areas of the ideal-typical construction understood as a hypothetical, formal-logical construction. Which is to say that persons are free insofar as they are each themselves a "norm" (and this is where Hold von Ferneck's criticism comes in: von Ferneck 1926; see Section 2.5.3.). In this way norms are addressed not to the *Sein* but to each individual's *Sollen*: "The theory of norms," Kelsen writes, "cannot explain the real phenomena of the life of law. The law is not only incapable of providing such explanations but should not even be in the business of doing so [...], precisely because the theory of norms is concerned with seizing, not the world of the is, of reality, but only a world of duty, of ideality" (Kelsen 1912, 608; my translation).

Because of the stand the RRL takes against any form of psychologism and sociologism, the theory must certainly be defined as a logic of law. The theory was hatched in a time of crisis, and if we now trace its historical origin, looking at the political and cultural conditions under the Danubian monarchy (A. Fuchs 1984; Goller 1997), we cannot fail to see the doctrine's theoretical limitations, and so also its criticality. But in reality every historical time is a time of crisis. And in that respect, as we consider Kelsen's effort to work out a "pure" theory—free from any commixture with what is psychological, sociological, and political, a theory capable of grappling with the needs and conditions of a time of crisis, a time that has always been our *own* time as well—we must come to the conclusion that there is a specific topicality about his theory, not quite as a *science* of law but as a *philosophy* of law, precisely to the extent that the RRL can be valued as a logicistic theory of law, and hence a theory as such needing to be integrated into a broader vision and thus superseded. The RRL's

topicality lies, so to speak, in its being both an end and a beginning. The theory logically shows that the legal system's basic norm cannot be posited through some authority's act of will. As Marcic has commented, the RRL "works itself out as a logic of law; anyone expecting anything more of it would be doing do in vain" (Marcic 1961, 411; my translation).

2.3.2.10. Between Purity and Reality: The Theory of Legal Interpretation in the RRL

No discussion of Kelsen's pure theory of law can be complete without briefly considering the theory of legal interpretation. It is no accident that the problem of interpretation should not have come up in any complete form in Kelsen's theory until the 1930s: One would be hard put to it to find this problem being taken up in any complete form in his earlier writings, and in particular in the *Hauptprobleme*, whose static conception of the law still compelled him to imagine the judge as something of an "automaton,"[58] a mere applier of the general law. Indeed, it was Adolf J. Merkl who forced Kelsen to take up the problem of interpretation, even if as early as the late 1800s this problem—that of the judge's interpretation of norms—had become a contentious, widely debated issue, especially among the legal thinkers of the so-called free law movement (*Freirechtsbewegung*), for whom the judge was deemed to be in a way a *maker* of law, not just a plain "applier" of it.[59] This theory seems to be the one to have had a greater hold on Kelsen himself, who revisited it and brought it into this system under the guise of so-called authentic interpretation.

In traditional legal dogmatics, authentic interpretation is understood to be that which a law's own author gives in clarifying its sense or in pointing out the "correct" interpretation, or both. As a rule, then, the author of an authentic interpretation is the lawmaker, the one who in the modern state is entrusted with *making* the laws. For Kelsen, by contrast, it is never the lawmaker who "authentically" interprets the laws (the lawmaker can only "make" the laws as a subject "authorized" to do so by a higher norm): This is rather a task left to the judge. But what to make of this odd about-face in Kelsen's approach? Let us backtrack a little and have a look at Merkl's article on interpretation:

> As is widely known, practice *does not come to an end* with the interpretation of law. Practice needs a complete individualization of the general norm; interpretation may not always achieve this purpose, but it often reaches a point where different solutions become available, all of them equally possible on the logical plane; this consequently makes necessary a subjective volitional function (as against a merely knowledge-gaining one) that can be guided by sheer discretion no less than by nonlegal reasons, such as opportunity, fairness, justice, and suchlike. (Merkl 1993a, 71; my translation)

[58] This is so in the manner—whether real or presumed—of 19th-century legal science. On this point, see Ogorek 1986.

[59] On the free law movement, see Riebschläger 1968.

And that lays the groundwork for the distinction Kelsen would later draw between the *scientific* interpretation of law (by the legal scientist) and its *authentic* interpretation (the one found in the judge's decision, or ruling). And even Merkl had underscored that "any practice which should overstep the boundaries of legal interpretation does not thereby necessarily become disrespectful of the law" (ibid.; my translation).

Now, there is no doubt that the problem of interpretation did not make its way into the RRL as a topic of reflection until the idea of the *Stufenbau* was introduced into the system (the idea of the system as a multilevel construction). Besides, it is Kelsen himself who observed as much when he remarked that "the legal system's stepwise construction" entails "consequences of great moment for the problem of interpretation" (Kelsen 1934b, 90; 1968n, 1363; cf. Wielinger 1990, 107ff.). And these are consequences that reveal precisely the contradiction between the static system of law (the original one as set out in the *Hauptprobleme*) and the dynamic, hierarchical system (such as it comes out once Merkl's and Sander's ideas are introduced into the system). The problem, in other words, is the one that confronts us once a system we want to be coherent, the outcome of the method of knowledge, is viewed in light of the role played by volition in the concrete and empirical making of norms—precisely that volition which in the *Hauptprobleme* Kelsen had sought to expunge from a "purely scientific" consideration of law.

In this way, Kelsen proves to be coherent with some of the premises of this thought but incoherent with others. The idea of authentic interpretation as the moment when the general and abstract legal norm is "concretized," or individualized, presupposes that the judge's decision is not *determined* by the general norm but rather introduces into the system a strong volitional element, one that breaks up the legal system's deductive structure and turns the normative system on its head by making it into a *sociological* system, as Ralf Dreier (1981d, 225) has in fact argued. Legal knowledge (*Rechtserkenntnis*) gives judicial decision a picture of possibilities deduced from the system and from the general and abstract norm, and from among these possibilities the judge can choose:

> If by *interpretation* is meant a determination made in knowing the sense of the object to be interpreted, then legal interpretation can only consist in the outcome of what is done in ascertaining the framework set up by the legal system to be interpreted, and with that, in a knowledge of greater possibilities afforded within this framework. (Kelsen 1960, 349; my translation)

And so there can be no "compulsory" solution, as it were, for the only activity that can be engaged in is that of determining the general framework of interpretive possibilities (Ringhofer 1971, 204ff.).

But the problem is that this twofold activity—knowledge-making on the one hand, decision-making on the other—can only unfold within the intellect of the same person, the judge. From which it follows that what in fact prevails is always the decision, which perhaps in this case cannot be said to "arise out

of nothing," as it does in Schmitt, but in any event presupposes an evaluative activity, one that certainly cannot be necessarily objective. Here Kelsen shows himself to be coherent with the anti-ideological attitude he takes in his thought. The law such as it springs from the judge's final decision is the outcome of a taking of positions, of choices to espouse certain values while rejecting others, of power relations, and even of a "relation with power." This ultimately brings to light the specifically ideological character of law, in the sense that all norms fall within a world other than the world of the is—they form part of the world of *Geltung*, of duty—but also in the sense that norms, as ideological constructions, are incapable of representing that specific reality which is society as a world torn apart by conflict among opposing interests. To what extent has Kelsen succeeded in reconciling a vision of legal science as the "pure science" of a "pure object" (pure because produced by the method of knowledge) with a political interest in criticizing ideologies in the name of the principle of democratic pluralism? This is a question that must remain open to future reflection.

2.4. The Vienna School of Law: Merkl and Verdross

2.4.1. Adolf J. Merkl and the Hierarchical Construction of Law

Unlike Kelsen, whose legal science declaredly proceeded from an attempt to elaborate a philosophy of law—or rather, from the need to methodologically work together philosophy and law—Adolf J. Merkl (1890–1970), who himself contributed in an essential way to a "pure theory of law," always worked within the bounds of legal dogmatics, at most taking up the outlying question of morality in relation to legal norms, a relation experienced in the first place as an expression of personal choice.

And so Merkl never did give us any specific philosophy of law. Yet his contribution to the *reine Rechtslehre* did prove to be decisive, since the conception of law as a system—and in particular as a hierarchically organized system (the so-called *Stufenbau*)—traces back precisely to him. In combination with Sander's concept of dynamicity, the idea of a tiered, hierarchical ordering of the legal system wrests Kelsen's theory from its static condition and plunges it into the realm of normative production. But the consequences, in truth, would turn out to be contradictory, in that pure normativity logically presupposes a static vision of the law, whereas production calls into play precisely that phenomenon of the world of the is—empirical willing—which Kelsen (at least in the first decades of his scientifical career) always sought to expunge from the system so as to build an authentic science of law understood as a "normative" science of legal "forms."

The legal order is no longer a coherently organized complex of norms; quite the contrary, it is a system of *acts*: acts that *produce* norms and ones that *apply* them. For this reason Merkl, in one of his best-known articles, could speak of

a "double face of law" (Merkl 1993b, 227ff.; my translation) in that law is at once produced and applied. Each act of production entails an application of the norm being produced, just as each application presupposes a normative production: "The process by which law is applied runs parallel to the process by which law is *produced*, such that with each new act of normative application a new norm is produced" (Merkl 1993c, 477; my translation).[60] Merkl's normativism lies in the fact that each act of legal production is recognized as legal by virtue of a higher norm, and that is what enables Merkl to conceive the legal system, even in its new form, as something normative—something that accordingly presupposes a *Sollen*, in the manner of Kelsen—and not as just a complex of purely factual referents. Still, the voluntaristic, and hence empirical, element in the system for producing and applying the law is constantly reaffirmed by Merkl in the ways that most singularly distinguish legal dogmatics, especially in the area of administrative law. Thus, for example, as far as the question of discretionary power is concerned, we read in his 1927 *Allgemeines Verwaltungsrecht* (General administrative law): "A comparatively abstract act serving as a rule for producing a relatively concrete act cannot determine the latter in its every respect but can only offer a component in the process toward the rule's concretization, and it must necessarily make way for another component, namely, the competent organ's discretion in bringing the concretizing act into being" (Merkl 1927, 142; my translation).[61] There is a legal system that exists as an objective entity, but there is also a subjectivity through which norms are created. Which is to say that the legal system is contemporaneously made up of autonomous determinants and heteronomous ones: On the one hand are the existing rules of law; on the other, the (comparatively) subjective acts through which those rules are applied.

The will thus figures as an essential component in the process by which law properly so called is produced. However, the normative dimension that Merkl picked up from Kelsen loops back into the system, as it were, conferring on it a peculiar characteristic, one that we could describe as the self-production of law. Indeed, like Kelsen, Merkl subscribes to the idea of a *Grundnorm* lying at the basis of the system, a norm that can "close off" the system. As a "closed" system, the legal order consequently becomes self-productive. Writes Merkl:

> The mentioned production relation that holds between every conditioning legal phenomenon and every legal phenomenon conditioned by it clarifies the expression "(stepwise) self-produc-

[60] The German original: "Der Prozeß der Rechtsanwendung läuft dem Prozeß der Rechtserzeugung parallel, und zwar derart, daß mittels jedes normativen Aktes der Rechtsanwendung ein neuer Rechtssatz (oder ein Komplex von Rechtssätzen) erzeugt wird."

[61] The German original: "Ein relativer abstrakter Akt, der als Erzeugungsregel eines relativ konkreten Aktes dient, kann diesen nicht zur Gänze determinieren, sondern kann nur eine Komponente des Konkretisierungsprozesses abgebe und muß einer anderen Komponente Raum geben: dem Ermessen des zum Konkretisierungsakt zuständigen Organs."

tion of law." This expression does not express a belief in the ability of the system to work miracles, a belief that in lieu of human activity productive of law posits some sort of legal *deus ex machina*. The scientific notion of the law's self-production rests on the experiential fact that the legal system is made up of two parts, each having its own, separate content: On the one hand are the rules of human behaviour; on the other, the rules that regulate the introduction and form, namely, the production, of those rules of behaviour. And that, more simply stated, corresponds to the difference between formal law and substantive law. (Merkl 1993c, 475; my translation)

Merkl proceeded by underscoring the important role played, on the one hand, by the "logical completeness" of the legal order understood as a normative system (this is the tribute he pays to Kelsen's "normativism") and, on the other hand, by the necessary presence of rules for the production of rules, in such a way that without the former rules the law would be something static, an idea contrary to the reality of things, in that "law entails the *life* of law, thereby entailing movement;" law "is an essentially dynamic system" (ibid.; my translation).

Merkl's way of looking at law is thus attentive to the reality of things, and so to the life of law. But how to describe this if not as a legal-empirical approach, one that as such distinguishes itself from Kelsenian normativism, and indeed sets itself in contrast to it? And in fact, once this conception is introduced into Kelsen's original system, elements of strong antinomy and contradiction arise, such that Kelsen's normativism itself appears as a foreign body in a "content based" and voluntaristic approach, just as Merkl's conception is a foreign body in the normativist system espoused by Kelsen, whose research activity not incidentally started out with a radical criticism of voluntaristic conceptions.

The legal-empirical (in a certain way 'sociological') approach—always careful to mark the effective reality of things and the changeful motivations acting behind the process by which law is produced—also played a prominent role in Merkl's theory of interpretation, which too was bound to have a strong influence on the pure theory of law. Merkl espoused a relativist theory of interpretation: In his view, "however legal science may interpret the law, that interpretation will be legally unexceptionable, for the law bears the face of its science. Whatever interpretation comes out, that will be the law" (Merkl 1993a, 77; my translation).[62]

In this sense, as much as Merkl's legal science did certainly have a part in shaping Kelsen's *reine Rechtslehre*, it moved away from that theory in such a way as to rise to the rank of an autonomous conception of law and of legal science—two areas that, unlike what happens in Kelsen, are not closely bound up but exist *ab origine* as two different activities. From here we also get a different

[62] The German original: "Jedes Auslegungsergebnis der Rechtswissenschaft ist rechtlich einwandfrei, da das Recht das Antlitz seiner Wissenschaft zur Schau trägt. Wie die Rechtsauslegung, so das Recht."

political outlook and a different political involvement than Kelsen's. Which is another reason why Merkl should deserve to be studied entirely independently of Kelsen's thought.

2.4.2. Alfred Verdross and the Grundnorm *of International Law*

Alfred Verdross (1890–1980) is one of the three main exponents of the Viennese school of law, the other two being Hans Kelsen and Julius Merkl. He attended law school at the University of Vienna, where he studied international law under Leo Strisower (that would become the focus of Verdross's research and the subject he would officially be entrusted with teaching), but he was also very much influenced early on by Hans Kelsen when Kelsen was still a *Privatdozent* at the same university, teaching public law and the theory of the state. The circle of intellectuals who gathered around Kelsen also included, aside from Verdross, Merkl, Pitamic, Sander, and Felix Kaufmann. Verdross participated in its activities with several presentations and discussions on the relation between international and municipal law, a "classic" topic of the time.

One can clearly appreciate how, in this early phase, Hermann Cohen's and Paul Natorp's neo-Kantianism influenced all those in the circle in their discussion of theoretical questions, especially as concerns the idea that the method of knowledge "produces" the object of knowledge. Verdross subscribed to this idealistic method at least until his 1921 article *Grundlagen und Grundlegung des Völkerrechts* (Principles and foundations of international law: Verdross 1921).

It is from the perspective of such critical idealism—or critical positivism, as Kelsen would describe the method espoused by the "fledgling Viennese school of law"—that Verdross would write his first important article, *Zur Konstruktion des Völkerrechts* (On the construction of international law: Verdross1914), permeated through and through by the constructivist idea. Here Verdross contributed two fundamental building blocks to what would then become the "pure theory of law," namely, the monist conception of a single legal system operating as a unified whole from the level of the international community to that of the single nation-states, and the idea of a *Grundnorm*, or basic norm, which in Kelsen's acceptation actually traces back to Verdross. "Indeed, every act the state carries out in a legal sense logically presupposes from the start a legal norm on which basis this act can be recognized as being imputable to the state, and hence as issuing from its will" (Verdross 1914, 329ff.; my translation).[63]

In the 1914 article, where the idea of a basic norm was first introduced, monism was still conceived from within the framework of municipal law;

[63] The German original: "Denn jede Staatstätigkeit im juristischen Sinne setz bereits logisch eine Rechtsnorm voraus, auf Grund welcher eben erkannt werden kann, daß dieser Akt dem Staate zugerechnet wird und daher als sein Wille erscheint."

but in the work Verdross wrote for his habilitation, "Die völkerrechtswidrige Kriegshandlung und der Strafanspruch der Staaten" (The internationally illegal act of war and the criminal claim of states), the relation was inverted, and it was international law that would thenceforward take pride of place, in a conception in truth much more coherent than Kelsen's, who by contrast chose (albeit only apparently) to leave "open" the question of whether it is international law that should prevail (the pacifist option) or whether such primacy should instead be recognized for the domestic law internal to each state (the imperialist option), and in all likelihood the reason for not committing to either of these choices is that, in Kelsen's view, a decision to exclusively uphold the primacy of international law would clearly usher in aspects of natural law, something he instead wanted to avoid, even if in reality he failed in the attempt to remove any appearance that his conception might have a moral foundation.

Be that as it may, it is in an essential way that Verdross contributed to the *reine Rechtslehre*, as Merkl also did with his theory of the *Stufenbau*, the hierarchical construction of the legal system, an idea that Kelsen would bring into his own system, and in so doing he also unwittingly ushered in the problem of value judgments, which Kelsen would rather have cleared away from his field of vision, but which kept coming back in various forms. As we saw earlier, Kelsen's thought can be interpreted as a logico-formal theory of natural law underpinned by a logical structure that presents itself as a deduction, as is typical of the natural law approach modelled after Leibniz. In contrast to this empty and abstract natural law, Verdross, a devout Catholic, developed a theory on which this "law-producing movement" cannot happen independently of some evaluative choices and hence from some determinate legal contents.

In this way, Verdross, who would otherwise remain very much in sympathy with Kelsen, was led to distance himself from what might be called the "official" *reine Rechtslehre*, meaning the understanding of the theory closest to Kelsen's account. And so, as early as in the 1923 article *Völkerrecht und einheitliches Rechtssystem*, Verdross moved away from Kelsen's positions, and in the most significant contribution Verdross would make from a legal philosophical standpoint—the 1923 book *Die Einheit des rechtlichen Weltbildes auf Grundlage der Völkerrechtsverfassung* (The unity of the legal worldview on the basis of the constitution of international law: Verdross 1920)—monism and the primacy of international law are justified on the basis of arguments that by now had taken a clear departure from his early neo-Kantian orientation. Indeed, Verdross explicitly drew on Thomistic philosophy, while also relying on the most recent currents of objectualist philosophy, such as that advanced by Edmund Husserl and the now-forgotten Josef Geyser; and a decisive influence also came from the Spanish school of international law (Francisco de Vitoria and Francisco Suarez). Some have also descried an influence exerted by Othmar Spann's universalist and organicist philosophy (Carthy 1995, 78–97), this also with a view to justifying Verdross's supposed "groß-deutsch" leanings, but there are

no real arguments backing this interpretation, even though Spann did in fact play a prominent role in Vienna in the period between the two world wars; it is documented, in any event, that Spann kept up an acquaintance with Kelsen, too, who also espoused the push for a "great Germany" (on Spann see Section 6.2 in this tome). In certain respects, though, Verdross appears to have been more closely tied to the old imperial Austria (Seidl-Hohenveldern 1994, 98). The ideas of an "objective order" and an "objective value" took root in the cultural debate between the two world wars in the German-speaking area, and in many respects the very cultural conception of the old Austria played a decisive role in forming a conservative Catholic like Verdross. As has been commented,

> the social and constitutional experience of the Austro-Hungarian empire constituted a determining factor both for the formalist approach to the law advocated by the Viennese School and culminating in Kelsen's *Pure Theory of Law*, and for Verdross' universalism. I am further convinced that the trauma of World War I, the ensuing collapse of Austro-Hungary and the hope in the newly established League of Nations, had a heavy impact upon their most obvious expression in the monist construction of the relationship between international law and national law. Monist theory, as developed by Verdross, granting the primacy within the hierarchy of legal orders to that of international law, is nothing but universalism applied to positive law. (Simma 1995, 37)

On Verdross's new philosophical approach, the subject and the object each have an independence of their own, while also being bound by a reciprocal symbiosis. So it is no longer critical idealism that Verdross would embrace in his mature philosophical phase, but what he described as *critical realism*. What counts is no longer above all the method (which according to neo-Kantian philosophy produces and constitutes its object) but the contents of norms, and hence the values that manifest themselves in life and so also in law. There is an objective reason that grounds the values which manifest themselves in norms, moral and legal alike.

So Verdross took it upon himself to revive the classic theory of international law and attempted to tie this rebirth to the philosophy of values propounded by Brentano, Scheler, and Nicolai Hartmann, thus rejecting any idea of international law informed by 19th-century positivism whereby the norms of the international community, no matter what form they may take, are solely dependent on the will of the state. In this Verdross remains tied to Kelsen's conception: Both thinkers set law in contrast to power, because only in contraposition to power does law retain its autonomy without running the risk of dissolving into power.

At the core of Verdross's conception lie the "general principles of law," which principles do not depend on the will of the state or a prince or on a "constructivist" method. They are principles of fairness that the civilized nations (*Kulturstaaten*) bring into being when forging a law of peoples: Such are the good-faith principle, the *Pacta sunt servanda*, and the prohibition against infringing the rights of others. But these are principles that Verdross wanted to deduce from the states' concrete practice, as if to say that a demonstration of

the goodness of natural law lies not in any abstract logical deduction but in the facts of statesmanship. Verdross turned on its head the positivist criticism of natural law by arguing that it contradicts experience to claim that the whole of international law rests on the will of the states and on their agreements: Only as the outcome of a proper "dogmatics" can such a claim be made (Verdross 1931, 356). The states, by contrast, apply these general principles of law because there is a legal consciousness which lives in all of us and which we all recognize: "It must therefore be that we are necessarily dealing with fundamental legal principles that find their way consensually in the legal systems of civilized states [*Kulturstaaten*], because the legal consciousness of the modern cultural community considers them to be necessary presuppositions of civilized societal life" (ibid., 364; my translation).[64]

But how to work out a theory for this basic norm, this nonpositive norm that lies at the basis of the single legal systems and of the international legal community? This is a problem that Verdross entered into in his 1926 monograph *Die Verfassung der Völkerrechtsgemeinschaft* (The Constitution of the international law community: Verdross 1926), where this *Grundnorm* still resolves itself into the principle *Pacta sunt servanda* (as it does in Kelsen), but this is still too abstract a basis on which to satisfy the need for concrete principles, and this is something that increasingly compelled Verdross to look to the Church's social doctrine, even though he never completely turned away from the positions espoused by his friend Kelsen, whom Verdross did, however, interpret more and more openly as a theorist who could never ultimately really dispense with the evaluative factor. The law is understood by Verdross as a value among other values: It comes into the world of the *Sollen* not as a complex of empty and abstract propositions about value but as part of a world that in effect can be identified with the world of the Western tradition—that of classical thought at first, and then specifically that of Christian thought. Stoic-Christian natural law was thus conceived by Verdross as one of several possible doctrines of natural law, and, even more than that, as the one doctrine most suited to the specific anthropology of the European people, an anthropology that presupposes a unity of humankind even with its partitioning into separate states (it is Saint Augustine that Verdross looked to as his reference point). The basic norm thus takes in content as a prescription under which we are to observe the basic principles deriving from the nature proper to each individual and to the communities, as well as from the covenants of international law and from customary law, the one and the other alike understood as bodies of law that have historically developed on the basis of these same general principles (Verdross 1964, 24). And

[64] The German original: "Es muß sich also offenbar um Rechtsgrundsätze drehen, die sich deshalb übereinstimmend in den Rechtsordnungen der Kulturstaaten vorfinden, weil sie das Rechtsbewußtein der modernen Kulturgemeinschaft als notwendige Voraussetzungen eines gesitteten Zusammenlebens betrachtet."

so the basic norm cannot be a mere hypothesis by which to know the law, nor can it be a fiction, but must somehow be a norm proper that picks up specific content. As Pitamic has commented, this is the content on which is predicated the efficacy "of norms that regulate the outward behaviour of human beings" (Pitamic 1960, 213; my translation). In the 1931 article, Verdross specifically suggested what the content of the basic norm of law might be by offering the dictum "Sovereign and quasi-sovereign legal communities: Behave in your mutual relations in accord with the general principles of law, insofar as no valid norms that stray from these principles have yet been formed in the conduct of international affairs" (Verdross 1931, 362; my translation).[65]

Here Verdross established a specific connection with Suarez, who would stand as an essential reference point in Verdross's philosophy of international law. For Suarez every state is a member of the universal family of nations, and for this reason the relation among all states needs to be legally regulated, precisely as a relation among states belonging to this society (Suarez 1872, 19). Suarez's position would subsequently be taken up by Grotius and Christian Wolff, whose idea of a *civitas maxima* Kelsen explicitly invoked in *Das Problem der Souveränität* (Grotius 1625, par. 44.1.; Wolf 1764, par. 8, 10–20; cf. Verdross 1958, 138). The primacy of the international community, derived from the concept of humanity and from the logico-legal principle of unity, thus led Verdross to a monist theory of the relations between domestic and international law, but it is a moderate monism that he embraced, informed by what can ultimately be described as a realist position. As Simma (1995, 39) underscores, for example, Verdross "admits that conflicts between the two systems may indeed arise," and so in some way Verdross recognized a distinction between the international legal system and the national ones, so much so that (as just remarked) the two may come into conflict, but because this normative conflict will have to be resolved at the international level, the primacy of international law would at this point be reconfirmed, along with that minimum moral foundation which underpins international law and requires a respect for the dignity of the person and for the person's basic rights. The general principles of law are thus understood by Verdross to establish a "bridge between pure natural law and pure positive law" (Verdross 1964, 39; my translation).

In the writings that Verdross produced between the two world wars we find all the premises on which he would continue to work in later decades, and which would lead him to increasingly focus on the philosophy of law, to which in the post-war period he would devote a few works that would become well known in the history of this discipline and of its main issues: *Grundlinien der*

[65] The German original: "Souveräne und teilsouveräne Rechtsgemeinschaften verhaltet Euch in Euren gegenseitigen Beziehungen nach den allgemeinen Rechtsgrundsätzen, soweit sich nicht im internationalen Verkehre besondere, von jenen Grundsätzen abweichende, gültige Normen herausgebildet haben."

antiken Rechts- und Staatsphilosophie (Basic lines of ancient legal and political philosophy: Verdross 1946); *Abendländische Rechtsphilosophie* (Western legal philosophy: Verdross 1959); *Statisches und dynamisches Naturrecht* (Static and dynamic natural law: Verdross 1971); and *Die Quellen des universellen Völkerrechts* (The sources of universal international law: Verdross 1973).[66]

2.5. Kelsen's Critics

2.5.1. Introduction

There is certainly no shortage of critics who have taken aim at Kelsen's pure theory of law, coming in from both "the left" and "the right": They range from Carl Schmitt to Rudolf Smend, from Erich Kaufmann to Hermann Heller. In this chapter we are going to focus on three of them who have not been discussed elsewhere in this volume as exponents of other currents of thought, since their fame is tied precisely to their role as critics of Kelsen. Indeed, no one today would know who Hold von Ferneck or Ernst Schwind are if they hadn't each attacked Kelsen's pure theory and if Kelsen hadn't responded to them with specific "anti-criticisms."

The third critic of Kelsen we will be looking at is Fritz Sander, and though it is certainly fitting that he should be discussed in that role, we believe his work also deserves to be considered in its own right, independently of Kelsen's.

As was mentioned a moment ago, the three legal philosophers treated in this section do not make up the whole of the landscape of Kelsen's critics. There are many others who deserve mention. Among these critics is Wilhelm Jöckel, who sharply criticized Kelsen's pure theory in an intellectually subtle book that—perhaps for this very reason—Kelsen chose to completely ignore. But there are also Sauer, Baumgarten, Moór, Somló, Marck, Fraenkel, and Nawiasky, all of whom would have deserved their own discussion apart from their engagement with Kelsen, but who have unfortunately had to be left out, essentially for reasons of space (on Somló and Moór see, however, Sections 19.2 and 19.3.1 in this tome).

2.5.2. Fritz Sander (by Federico Lijoi)

The life and work of Fritz Sander (1889–1939) became a focus of attention especially with the controversy he had with his teacher, Kelsen (Kletzer 2008, 447–8).[67] The most acrimonious episode took place during Sander's early years

[66] On these writings, see Truyol y Serra 1994, 60ff.

[67] The controversy had an echo even in Germany, especially in the letters that Erwin Jacobi wrote to Carl Schmitt, who in turn also mentions Sander's writings. On this question, see Korb 2010, 282–3.

in Prague, with the charge of plagiarism made against Kelsen in *Kelsens Rechtslehre: Kampfschrift wider die normative Jurisprudenz* (Kelsen's theory of law: A polemic writing against normative jurisprudence: Sander 1923c, see in particular 63ff.).[68] At issue was the authorship of the parallel between God and the state (*Gott und Staat*), a parallelism that, as Sander alleged, Kelsen had worked out without duly acknowledging Sander's own *Staat und Recht* (State and law: Sander1922a).[69] The situation came to a head with Kelsen's own request that the matter be submitted to the judgment of the competent disciplinary chamber, which on July 16, 1923, issued a ruling firmly rejecting any allegation that would in any way cast doubt on Kelsen's scholarly integrity.

A decade later the two scholars' destinies would again cross paths. When Kelsen was ousted from the University of Cologne, in 1933, Sander was among those who objected to his appointment at Prague's school of law.[70] Once Kelsen's appointment came through, Sander became two-faced with Kelsen, on the one hand lavishing him with praise and attention, and on the other, if not directly organizing, at least morally supporting the demonstrations staged against him by National Socialist students (see H. Schenk 1971, 614–6; Olechowski and Busch 2009). The contrast between Sander's kindness in private and his hostility in public cannot be ascribed to any psychological instability on his part. On the contrary, it was quite likely that Sander's own situation hung very much in the balance, considering his Jewish background and his role as a National Socialist informer collecting information on what was going on within the university. Indeed, at first, when the Germans occupied Czechoslovakia and drove the Jews from the university, Sander held on to his post—evidence that he received recognition for the services rendered for the party. But on October 3, 1939, he died suddenly—in unclear circumstances, seven months into the German occupation, and without any physical infirmity portending his death (Métall 1969, 73).

The unique position that in a 1923 article Fritz Schreier (1923, 317–8) ascribed to Sander as part of the *Wiener rechtsphilosophische Schule* is certainly owed in the first place to the fact that Schreier was in agreement with the school's main objective—that of purifying legal science of any teleological,

[68] The charge had already been hinted at in Sander 1922a, 1301. From a scholarly standpoint, the controversy got underway with Sander's charge of plagiarism in the journal *Zeitschrift für öffentliches Recht* (Sander 1988), in which Kelsen offered an equally caustic reply (Kelsen 1922c). On the whole matter, see Kelsen 1922–1923 and Sander 1923d.

[69] According to Sander, Kelsen deliberately delayed the publication of *Staat und Recht* to the benefit of his own *Der soziologische und der juristische Staatsbegriff* (The sociological and the legal concept of the state: Kelsen 1922b), which likewise makes the explicit argument that theology needs to be driven out of the realm of legal science. But the analogy between theology and jurisprudence, it bears mentioning, had been established by Sander even before the publication of *Staat und Recht*: It is a point clearly stated in Sander 1988, 246–78, as well as in Sander 1921.

[70] On the details of the incident, see Korb 2010, 238–9.

sociological, moral, or political element—but rejected the means chosen to pursue that objective (Korb 2010, 55, 173). At first, in *Rechtswissenschaft und Materialismus* (Legal science and materialism: Sander 1918, see in particular 333–5, 350–2), Sander defended the *reine Rechtslehre* from the charges laid against it by Bernhard Stark (Stark 1918, 301–4): Sander reiterated the need for a transcendental logic that would proceed from the *Faktum der Rechtswissenschaft* and would define its constitutive principles (*quid iuris*), just as Kant had done for the science of nature. Sander even sought to go *beyond* Kant, who in his assessment "had failed to bring his fundamental philosophical principle to bear on his inquiry into practical reason, this by neglecting to take into account the fact of science" (Sander 1918, 30; my translation).

In subsequent writings, however, it became increasingly apparent just how much Sander diverged from Kelsen's theory (Sander 1919–1920a). This can be appreciated in the first place in Sander's idea that the object of transcendental logic lies not in the fact of legal science (*Faktum der Rechtswissenschaft)* or in the "exit fact" (*Ausgangsfaktum)* of critical philosophy but in the fact of law (*Faktum des Rechts)* (Sander 1919–1920b).[71] As a transcendental philosophy of law, legal science should only be concerned with bringing to light the syntheses the pure will effects in the propositions of law as a fact of experience (the law as a body of positive norms) (ibid.). The judgments of such a science are merely analytic and explicative (*Urteile über das Recht*), not synthetic and constitutive (*Urteile des Rechtes*). Judgments of the latter sort, just like the judgments of natural science, are for Sander "existential judgments" (*Existentialurteile*), meaning that they contain an *Aussage über ein Sein* (a statement about an existent), whereas the normative structure of judgment as formulated by Kelsen "does not in the least amount to a judgment [*Urteil*], despite the use of the word *judgment*, but is rather an evaluation [*Beurteilung*]" (Sander 1922a, 1117–8, 1120, my translation; J.L. Kunz 1923). In Sander's view, then, law falls within the sphere of the *Sein*, not within that of the *Sollen* (Sander 1922–1923, 286–8, where Sander criticizes Kant for having unduly restricted the concept of experience to the *Sein* of nature): The law is the device through which legally relevant facts are brought into synthesis with categorial forms, in such a way that these forms acquire objective validity exclusively within the processual structure of jural experience (*Rechtserfahrung*).

The sense of Sander's argumentation is rooted in the need to free the existence of law and of its norms from the constitutive function of logic and from the ethico-normative presuppositions of legal dogmatics,[72] seeking law's immanent foundation in the synthetic function of the pure will. In the rejection

[71] On this point, see F. Kaufmann 1922 and Schreier 1922–1923, 318.

[72] This point is made, for example, in Sander 1921a, 194. See also Holzhey 1988, 64, and J.L. Kunz 1922, 25–7, 39–42 (see esp. 40).

of science as the productive source of the legal "phenomenon" lies the main impulse behind Sander's attempt to reposition the principles of law within law itself, so as to wrest them from the spell that Kelsen had brought them under as unifying metalegal functions.[73] These principles, therefore, cannot be anything but "analogous" to those of natural science, governing the pure synthesis between the concepts of the intellect and the senses: They can accordingly be described as axioms of legal intuition, anticipatory inklings of legal perception, analogies in the experience of law, postulates of empirical law in general.

Building on the insights of Bülow, Bierling, and Merkl,[74] Sander puts forward a dynamic conception of law. This conception develops out of his criticism of the absolute distinction between norms and *Tatbestände*—the states of affairs or classes of facts to which norms apply—and it accordingly argues for the relativity of the two concepts, under the so-called *Prinzip der relativen Apriorität* (principle of relative apriority) (Sander 1919–1920a, 59). In the legal process, to which corresponds the transcendental schematism of the imagination in natural science, the object of law "develops gradually into increasingly fuller concretions" (Sander 1919–1920b, 85; my translation). The *Tatbestandsfunktion* is the device that makes it possible for each degree of the legal system to be an object or *Tatbestand* for the higher one and a norm for the lower one, in such a way that the law is organized as a hierarchical and progressive system (*Rechtsverfahren*). By analogy to the *Hypothesis der Substanz*, the process's entire movement finds its ultimate foundation in the *Weltverfassung* (the constitution of the world), understood as a methodological hypothesis productive of the unity of the entire legal system (Sander 1919–1920, 73). This makes it possible not only to push aside the problem of the birth of the state, but also to move beyond the dogma of sovereignty: The revolutionary fact from which the state arises no longer consists of a metalegal and preprocessual event but in a state of affairs or class of facts produced by the rules of international law (ibid., 65, 69, 71–3).[75]

Sander's move to substitute the pure will for logic, together with his criticism of the postulate of the normativity of law, contributed to the progressive sociopsychological transformation of his theory. In *Rechtsdogmatik oder Theorie der Rechtserfahrung* (Legal dogmatics or a theory of the experience of law: Sander 1988), he forsook the concept of *Weltstaat* (world state) as

[73] On Sander's point that law needs to be endowed once again with immanence and dynamism, see Marck 1925, 42–59 (see esp. 44), and F. Kaufmann 1924, 143ff.

[74] See the *Kritik der Lehre vom Stufenbau des Rechts* (Critique of the theory of hierarchical systems in law) appearing in the appendix of Sander's *Verfassungsurkunde und Verfassungszustand der tschechoslowakischen Republik* (The constitutional charter and constitutional status of the Czechoslovak Republic: Sander 1935, 169–94).

[75] The problem of revolution and the meta-legal origin of the state had already been clearly identified by Sander in Sander 1918, 34.

an idea overcharged with ethico-political connotations (Sander 1988, 127),[76] whereas in *Das Verhältnis von Staat und Recht* (The relation between the state and law: Sander 1926) he criticized the identity claimed to exist between state and the legal system, arguing that concepts such as state, law, legal system, society, power, and sovereignty "are real opinions of real persons; they are multiplicities (collective entities) of psychical acts, of objective intentional relations; and, accordingly, they all fall within the province of descriptive psychology" (ibid., 160; my translation).[77] Indeed, in the very identity between *Staat* and *Recht*, Sander descries the neoliberal presuppositions underpinning Kelsen's *Rechtslehre*, analyzed by Sander as no more than a "resolute stance taken in favour of parliamentary democracy" (Sander 1936a, 534, my translation; 1934, 3–5, 22–3). In *Das Problem der Demokratie* (The problem of democracy: Sander 1934), Sander assesses the *reine Rechtslehre*, together with the entire 19th-century theory of the state, as an assemblage of "liberal axioms in disguise" (ibid., 23).[78] Specifically, he found political liberalism guilty of having taken an ambiguous and wavering position between the value of *Herrschaft* (*Archismus*) and that of *Freiheit* (*Anarchismus*), an indecision that in his view spawned a deleterious "system of fictions and illusions" (Sander 1934, 22; my translation).

So, in rejecting parliamentary democracy, Sander set that idea in contrast to "liberal Fascism," something that, on the one hand, would be clearly distinguished from historical Fascism—whose nationalism, in a state comprising different nations, proves dangerous for minorities—but that, on the other hand, is essentially oligarchic and antidemocratic (ibid., 4, 85–7). The Czechoslovak Republic's political situation of the time, the basic frame of reference for Sander's political writings, emerges here even more clearly in this role in his constitutional writings (Sander 1931, 1932a, 1932b, 1933, 1935, 1936b, 1938). Indeed, the programme behind Sander's analyses consists above all in comparing the formal constitution (*Verfassungsurkunde*) with the material organization of the public powers (*Verfassungszustand*). In the *scientific* acknowledgment of the widening gap between the two constitutions (Sander 1935, 5), the formal one and the material one, lies for Sander the starting point of *political action*, and this confirms "the need for a theory of law and of the state, a theory serving to answer the different questions that come up in the experience of public and jural life" (ibid.; my translation).

[76] This move would become even more radical in Sander 1936a, 421–5.

[77] Also testifying to the new direction Sander takes in *Allgemeine Gesellschaftslehre* (Sander 1930) is a letter he wrote to the dean of the Law School of the German University of Prague, asking whether his teaching could also extend to sociology, though the request was denied (*Archiv Karlsuniversität Prag*, Fond Sander, *Brief Sanders an den Dekan der rechts- und staatswissenschaftlichen Fakultät vom 9. Februar 1932*). On this question, see Korb 2010, 182; Kletzer 2008, 460–6.

[78] But on this point see the earlier Sander 1988, 260, 269.

One last observation is in order now, and it concerns the *Staatsverteitigungsgesetz* of May 13, 1936, whose *Notverordnungsrecht* (emergency powers) had severely set back the Czechoslovak Republic's democratic development. Sander strenuously resisted this development, and did so insisting on the hierarchy of normative sources set out by the very person with whom he had been so much at cross-purposes politically, namely, his teacher, Kelsen.[79]

2.5.3. Alexander Hold von Ferneck (by Antonino Scalone)

Alexander Hold von Ferneck (1875–1955)[80] studied at the Universities of Vienna and Innsbruck, earning a *doctor juris* degree in 1899. He then further pursued his education at the Universities of Berlin and Heidelberg, where he focused in particular on the philosophy of law. The outcome of this research was his first work and habilitation thesis, *Die Rechtswidrigkeit* (Illegality, in two volumes: Hod von Ferneck 1903–1905), which takes an approach described by commentators as rigidly determinist and imperativist. More to the point, he set out a view of law as made up of a complex of relations, imperatives, and hypothetical judgments. On account of this essentially relational makeup, the law entails a necessary correlation between the rights of some and the duties of others, in such a way that it proves impossible for there to be anything like a right unconnected to a duty. The term *rechtswidrig* (illegal) is to be understood in relation to a right which is violated and which is a right only in relation to a duty-holder (*Verpflichtete*). As a consequence of this approach, Hold von Ferneck denies the existence of a wrong from the "objective" standpoint of the law itself, while he distinguishes two types in the "subjective" sphere of those who are subject to the law: We have a wrong proper (*Rechtswidrigkeit*), connected with a subject's (or person's) actual capacity for action, and we have the kind of wrong that falls outside the scope of legal protection (*ohne Recht*) (Hold von Ferneck 1903–1905, vol. 2, 122). Hence Hold von Ferneck's denial that one who is incapacitated can be found guilty, and his thesis that there can be no wrong without guilt. Because guilt is the outcome of a behaviour contrary to a legal duty, a finding of guilt will simply coincide with a finding that someone was personally responsible for an act the legal system deems contrary to law—a view Hold von Ferneck would reiterate in two later works on criminal law, his 1911 *Di Idee der Schuld* (The idea of guilt: Hold von Ferneck 1911) and his 1922 *Der Versuch* (The attempt: Hold von Ferneck 1922).

[79] On this point, see Sander 1936b, 47–60, 89–94; and Kelsen 1923a, discussing the March 3, 1923 "Law for the Protection of the Republic" (whose provisions were expanded on July 10, 1933). In this regard, see Olechowski and Busch 2009, 1106–9, 1120.

[80] Among Hold von Ferneck's main works are Hold von Ferneck 1903–1905, 1907, 1911, 1922, 1926, 1927, and 1930–1932. On Ferneck, see Graßberger 1972, 523ff., and Korb 2010.

Hold von Ferneck also devoted himself to international law, specifically in two works, *Die Kriegskonterbande* (War contraband: Hold von Ferneck 1907) and the two-volume *Lehrbuch des Völkerrechts* (Textbook on international law: Hold von Ferneck 1930–1932). It is a deeply cautious attitude he takes to the question of the concrete existence and possibility of international law, for on the one hand he locates in a very distant future the construction of an international legal system proper—"Humankind is looking at an evolution stretching out into the millennia, perhaps millions of years long, that may perhaps one day give rise to an international law proper" (Hold von Ferneck 1926, 9; my translation)—while, on the other hand, the existence of international law is equated by him with the concreteness of the jural relations obtaining among states, that is, with the concreteness of the norms "under which states and federations of states *in fact* live" (Hold von Ferneck 1930–1932, vol. 1, 62; my translation). This conclusion is the outcome of Hold von Ferneck's preliminary decision not to set out a general definition of law, despairing of the possibility of finding an agreed concept; what follows is the need to confine oneself to identifying the de facto differences between what is ordinarily understood by municipal law, on the one hand, and international law, on the other.

One can speculate that the main reason why Hold-Ferneck rose to prominence has to do with the acrimonious exchange he engaged in with Kelsen. In 1926, he wrote against the pure theory of law an accusatory piece titled *Der Staat als Übermensch* (The state as *Übermensch*: Hold von Ferneck 1926) to which Kelsen retorted with an article bearing the same title, which in turn elicited Hold-Ferneck's rejoinder, in the form of the 1927 essay *Ein Kampf ums Recht* (A struggle for law: Hold von Ferneck 1927). The two legal thinkers had already been in competition, just after the close of World War I, when it came time to draft a constitution for the new Austrian republic. Chancellor Karl Renner chose Kelsen for the job, nor did Hold von Ferneck succeed in his subsequent attempt to somehow influence the drafting of the text. Hold von Ferneck is highly critical of Kelsen's endeavour to achieve a pure science of law: He takes the view that the legal dimension cannot be separated from the social; and in fact it appears to him that only sociology can grasp the essential features of law and the state (Hold von Ferneck 1926, 27), two entities that unlike Kelsen he understands to be separate. Furthermore, also in contrast to Kelsen, he understands states to be *empirical* entities: "No statesman and no historian," he writes, "has ever thought to doubt the reality of the state" (ibid., 18; my translation).

The law itself spills over beyond its formal description, since its existence, for all practical purposes, is to be found in our habitual compliance with norms (ibid., 5). But it is likely that Hold von Ferneck's main concern in polemicizing against Kelsen lay in what he took to be the politically dangerous, if not subversive, implications of the *reine Rechtslehre*. Indeed, Kelsen's theory, by reason of its "unbridled formalism and empiricism," can bring about consequences (which Hold von Ferneck would like to believe Kelsen is unaware

of) "set to undermine all respect for law and the state" (ibid., IV; my translation). And it is for this reason that Hold von Ferneck felt it was "incumbent upon him," in writing his article, to launch a veritable "campaign" against that theory.

Kelsen's response to Hold von Ferneck's objections was to the point but no less polemical. And, in addition, he could not refrain from closing his discussion with a similar "appeal to police [...] the dignity of free science" (Kelsen 1926a, 24; my translation).

2.5.4. Ernst Schwind: Between History and the Philosophy of Law

Ernst Schwind (1865–1932) is being grouped here among Kelsen's critics, but with the caveat that he was not by training a legal philosopher: He was instead a historian who took up philosophy solely for the purpose of understanding and criticizing the bases and premises of Kelsen's pure theory of law.

Perhaps for this reason the tools at his disposal were weak, for it is certainly not by underlining the primacy of "pulsing life" over abstract logic that one can rebut Kelsen's logico-legal argumentations. Schwind's advantage lay only in his knowledge of the history of law, enabling him to point out the wide cross-fertilization between is and ought, reality and value, that over time contributed to deepening the human awareness of the complexity of reality (Schwind 1928, 26–30).

Schwind saw history and the theory of law as closely bound up—exactly the opposite of what Kelsen argued as early as in the preface to the first edition of his *Hauptprobleme*. Indeed, Kelsen conceived history as a causal science, making it distinct and inherently different from legal science as a purely "normative" discipline. As Kelsen would remark in his reply to Schwind, it makes no sense to bring history into comparison with the theory of law, for these two disciplines are extraneous to each other.

Schwind's criticism of the pure theory of law is emblematic of the rift that in the 1920s pushed two sorts of legal philosophy into opposite camps: On the one hand were the Kantian and neo-Kantian approaches founded on the separation between is and ought, and on the other those that sought to transcend that separation, to this end drawing on Hegel, but also on the historicist tradition (as in Schwind's case), which clearly could not fathom a reflection on law that failed to take account of history, that is, of reality:

> Here, too, the deepest reason for Schwind's criticism of Kelsen's theory of law went to the core, that is, it issued from Schwind's failure to appreciate the decoupling of is and ought, a decoupling that in his view would be a roadblock to history and to the "real pulsing life" connected to it. (Korb 2010, 88; my translation)

From a theoretical point of view, Schwind managed to make an argument proper only in relation to the *Grundnorm*, or basic norm, but here, too, it

must be noticed that Schwind's criticism appears to proceed from a misunderstanding, or rather, from an inability to grasp Kelsen's thesis on the "non-positivity" of that norm. Schwind's objection was that the basic norm posited by the pure theory is no more than a "fiction" (Schwind 1928, 48), one that every political leader could very well do without, and even though he did put his finger on a problem of the *reine Rechtslehre* that many years later Kelsen himself would go back to—rejecting his own earlier view of the *Grundnorm* as a "hypothesis" and claiming it to instead be a "fiction"—Schwind lacked the theoretical tools needed to build on his insights and fashion them into a full-fledged critique of Kelsen's positions. Even so, he was certainly keener than others in seizing the ahistoricism of the pure theory of law, an aspect of it he forcefully condemned. In fact, such was the emphasis he laid on "historical concreteness" that he occasionally risked being mistaken for a scholar not devoid of anti-Semitic leanings.

Chapter 3

THE SOCIOLOGICAL PHILOSOPHY OF LAW AS AN ALTERNATIVE TO NORMATIVISM

by Agostino Carrino

3.1. Hermann Ulrich Kantorowicz and the Free Law Movement

The name Hermann Ulrich Kantorowicz (1877–1940) stills seems to conjure up the free law movement and little else besides:[1] The German jurist's fame is closely associated with a banner programmatic pamphlet he wrote in 1906 under the title *Der Kampf um die Rechtswissenschaft* (The fight for legal science: Kantorowicz 1962d). Even so, his free law continues to receive an interpretation contrary to his intent, especially in the matter of "judging *contra legem*," a motto ascribed to the free law movement despite vehement protests by Kantorowicz himself (Kantorowicz 1911a, 258ff.).[2] Nor have we managed to properly situate Kantorowicz as a legal philosopher influenced by the neo-Kantianism of the Baden school and as someone who anticipated a nondogmatic, relativist sociology of law, an approach not far from Radbruch's conception.

Kantorowicz—influenced in philosophy by Rickert and in jurisprudence by Jhering[3]—was in turn quite influential in the United States: His work and that of the Austrian legal scholar Eugen Ehrlich certainly caught the attention of Karl Llewellyn and the broader legal realist movement. In part, however, Kantorowicz was concerned with mitigating what he saw as the excesses of American legal realism[4], in a critique that goes to show just how "fanciful" the thesis was under which Kantorowicz and the free lawyers sought to confer on judges the power to decide controversies in an arbitrary way without taking the lawbooks into account. Indeed, as Würtenberger observes, the "rationalist" criticism of legal realism shows that Kantorowicz was bound by a strong commitment to the law, which he regarded as being "among the most impor-

[1] For a biography of Kantorowicz that also looks at the political aspects of his activity and at his academic career, held back on account of his Jewish background, see Muscheler 1984. See also the entry devoted to him in Kleinheyer and Schröder 1976, 145–8, and the entry in Frommell 1988.

[2] Kantorowicz subsequently severed his close ties with the free law movement, even if he continued to defend it from the attacks made against it by Marxist socialism—see, for example, Fraenkel 1968—and by the sociological natural law theory championed by conservatives like Erich Kaufmann. On this question, see Muscheler 1984, 50ff.

[3] On Jhering's importance for Kantorowicz, see Kantorowicz 1914; 1962b, 65ff. See also Fikentscher 1975–1977, vol. 3, 365ff.

[4] On Kantorowicz's influence in the United States, and in particular on Karl Llewellyn, see Fikentscher 1975–1977, vol. 2, pp. 282ff. In Patterson 1953, 541, Kantorowicz 1934 is judged to be the best criticism of American legal realism, a criticism somehow internal to that current.

DOI 10.1007/978-94-007-1479-3_3

tant guarantees of human freedom and security" (Würtenberger 1962, 4; my translation).

It is a multiform oeuvre that Kantorowicz handed down—with contributions in a variety of disciplines that range from criminal law to the history,[5] philosophy, and sociology of law—and the whole of it is of current interest even to this day. Here we will concern ourselves with his framing of the concept of law. It bears recalling, by way of a first approximation, that sociologically oriented legal philosophy itself originates from a specific current of philosophical thought, that advanced by the southwest school of German neo-Kantianism. At the core of this concept of law lies the separation between the is and the ought, between facts and values, and for Kantorowicz, Rickert's theory of science, duly complemented with "Max Weber's annotations," offers the "guide" on which basis to found sociology as a science, that is, as a "theoretical and systematic discipline" (Kantorowicz 1962c, 146; my translation).

Kantorowicz's dualistic premise, however, did not prevent him (as it did not prevent Radbruch before him) from developing a three-dimensional theory of law, that is, a theory that rejects the mode of procedure whereby a single aspect of the complex legal phenomenon is picked out and absolutized; on the contrary, a necessary cooperation is postulated among three types of reflections on the law, the first being legal dogmatics, concerned with the *meaning* of law; the second the philosophy of law, whose task, in keeping with Lask's conception, is to be confined to the problem of the *value* of law; and the third the sociology of law, which instead is tasked with empirically investigating the effective *reality* of law. Whereas on the approach advocated by Ehrlich (who, too, was a precursor of the sociology of law) this new science, understood as a pure science, wound up being magnified into the *only* true science of law, Kantorowicz was well aware that if we are to gain a comprehensive understanding of law, we will need to view it from a "panoptic," or all-seeing, angle. And this is the reason why, even when Kantorowicz appears to be focusing on just one of the three aforementioned problems, he is also bearing the other two problems in mind. This is because Kantorowicz's sociological problem does not *directly* involve the fieldwork of sociology as a practical investigation (be it sociology in general or the sociology of law); what instead do have a direct bearing on Kantorowicz, on account of the neo-Kantian premises from which he proceeds, are the theory of sociological knowledge, along with the epistemological and philosophical foundations of sociology, and, consequently, of that applied sociology which investigates the way legal norms relate to social life. "My current research," he writes in *Rechtswissenschaft und Soziologie* (Legal science and sociology), "does not [...] fall within the sociology of law or within sociology in general,

[5] Kantorowicz's historical interest was focused above all on the "Middle Ages of law," importantly contributing to this topic in his *Studies in the Glossators of the Roman Law* (Kantorowicz and Buchland 1938).

but instead [...] concerns itself with the knowledge of sociology, understood as a general auxiliary discipline, that is, as forming part of a theory of knowledge, or rather, a theory of science. My research will therefore always operate as the theory behind the theory" (Kantorowicz 1962e, 119; my translation). In this sense, Kantorowicz must be considered a legal philosopher proper.

It was previously remarked that Kantorowicz proceeds from the dualism between fact and value proper to the southwest school of German neo-Kantianism. From a strictly sociological point of view, this dualism becomes a dilemma, indeed a central dilemma, in his theory. The dualism between fact and value can be made into an unbridgeable divide, as it is in Kelsen, but it can also be taken up as a point of departure—and it is this latter position that distinguishes every authentically critical and historical sociology of law. Now, this problem was worked out and overcome by Kantorowicz on the basis of an epistemological premise quite similar to that of Emil Lask and Gustav Radbruch, whereby culture represents an "interregnum" between pure facts and pure values, a world in which the legal phenomenon sits comfortably. Kantorowicz's methodological trialism thus stands in contrast to the pure, nondialectical dualism propounded by Kelsen, who accounts the separation between the is and the ought, between fact and value, to be all-inclusive, in such a way that there can be no synthesis between the two: the law thus belongs entirely in the sphere of the ought, and legal science can only be a science of the ideal objective meanings of law, a purely normative science of what must (and what must not) be done, and never a science of what actually *is* done. As early as in *Der Kampf um die Rechtswissenschaft* (The fight for legal science: Kantorowicz 1962d), Kantorowicz had positioned himself against this approach:

> Those who have advocated methodological dualism have laid too much emphasis on the notion that the social sciences concern themselves with the way things *are* and the legal sciences with the way things *ought to be*. Indeed, it cannot be neglected that even everything that *ought to* be is something that *is*. What ought to be is what is willed [*Sollen ist Wollen*], even if there is a peculiar streak to this willing: If there is a recognized ought, this is a will of its own; if there is no recognized ought, this is an extraneous willing. Conflicts between willing and the ought are conflicts arising out of a discrepant will. An ought not conceived of as something willed by a personality, be it an individual or a collective personality, one's own or an extraneous one—and so an ought conceived as an "objective" norm—is an unrealizable representation: It is empty. So even jurisprudence must elaborate a *positive* material pertaining to the is: Specifically, it must elaborate a psychological material, as many other sciences do. Jurisprudence can never step outside the sphere of willing: Only in that sphere can jurisprudence find the benchmark against which to evaluate that which *is*; only in that sphere can it find an indication of the ends to be pursued. The is can ever be evaluated only on the basis of the is. The δος μοι π' αν στω και τα γαν κινάσω of objectivist legal philosophy remains eternally unsatisfied. Jurisprudence cannot proceed from this starting point in justifying a principled epistemological difference; it is therefore with good reason that the majority of those who espouse the free law movement call on jurisprudence to cooperate, on the one hand, with psychology and, on the other, with social science, both sciences being akin to jurisprudence. (Ibid. 1962d, 30; my translation)[6]

[6] The German original: "Es ist von den Vertretern des 'Methodendualismus' zu viel Gewicht

The long passage just quoted is important for many reasons, but the first of these lies in the clear stand it takes in antithesis to the methodological dualism that Kelsen would soon thereafter have championed, becoming its chief exponent (though it bears recalling in this regard that Kantorowicz considers Kelsen's work significant and important). Kelsen replied by reasserting the pure normativity of law, and so the pure normativity of the science devoted to the study of law, and by absolutizing the moment wherein lies the value of law, which value is understood not in a cultural sense but in the objective sense of that which is encapsulated within a norm (Paulson 1991, 254). As much as this reply appears logically stringent, however, on closer inspection it cannot but reveal its weakness, especially if we set out to criticize the pure theory of law from within, bringing to light its aporias and contradictions, which invariably eventuate in an outcome contrary to the starting assumption (Carrino 1992). No one can call into doubt the normative character of law—and Kantorowicz doesn't do that, either, especially not in his "rationalist" criticism of American legal realism, which he charges with confounding law with fact, and of failing to also consider the value inherent in law (Kantorowicz 1934, 1248ff.)—but by the same token, no one can deny that a purely normative account is inadequate and unilateral, aside from reducing reality to an oversimplified picture. Legal science serves a practical and historical function insofar as it always also concerns itself, as a science, with the study of a social system made up of human beings and their actions, which actions are meaningful and aimed at achieving a purpose. This is another way of saying that the science of law cannot do without sociology, and precisely sociology of a Weberian cast, which sets up a relation to values (and specifically to law understood as a cultural value encapsulating the entire complex of the ends pursued by a society), and which "seeks to offer judgments but not value judgments, to describe and not to prescribe, to observe and not to guide," and "whose content does not include any

darauf gelegt worden, daß die Sozialwissenschaften darstellen, was *ist*, die Rechtswissenschaften was sein *soll*. Denn es darf nicht übersehen werden, daß auch alles Sollende ein Seiendes ist. *Sollen ist Wollen*, wenn auch eine eigentümlich gefärbte Art des Wollens, und zwar eigenes Wollen, wenn anerkanntes Sollen vorliegt, nur fremdes Wollen, wenn nicht anerkanntes vorliegt. Die Konflikte zwischen Wollen und Sollen sind Konflikte zwiespältigen Wollens. Ein Sollen, das nicht als Wollen einer Persönlichkeit gedacht wird, einer individuellen oder einer Gesamtpersuonlichkeit, der eigenen oder einer fremden, eine 'objektive' Norm ist eine unvollziehbare, leere Vorstellung. Also hat auch die Jurisprudenz einen positiven Stoff des Seins zu bearbeiten, und zwar einen psychologischen, wie viele andere Wissenschaften auch. Über den Kreis des Wollens kann sie nie hinaus, nur in ihm den Maßstab für die Beurteilung des Seienden finden, nur in ihm die Angabe des Zieles. Sein kann immer nur an Sein gewertet werden. Das δος μοι π' αν στω και τα γαν κινάσω der objektivistichen Rechtsphilosophie bleibt ewig unerhört. Ein prinzipieller wissenschaftstheoretischer Unterschied läst sich also von diesem Punkte aus für die Jurisprudenz nicht begründen; ein Zusammenwirken der Jurisprudenz mit Psychologie einerseits, Sozialwissenschaft andererseits wird daher als zwischen verwandten Wissenschaften von den meisten Vertretern der freirechtlichen Bewegung mit gutem Grund erstrebt."

value judgments, for its object consists only in what is given" (Kantorowicz 1962f, 77; my translation). Any one-sided understanding of law will thus fail to grasp law in its complexity, that is, in its "three-sidedness" (Kantorowicz 1962f, 69–70).[7] This triadic theory of law is clarified by Kantorowicz by way of the following example:

> When a lawyer says to a client, "On a correct interpretation of the law applicable to your case, you are in the right; but this is an outdated and unfair law; and so our judge, as far as I know him, will interpret it in such a restrictive way as to not make your case fall within its purview, and so you will be defeated at trial," the lawyer is referring to the *meaning* of the law in the first sentence, to its *value* in the second, and to its *reality* in the third. The reality of law is for the sociology and the history of law to investigate, both of them sciences of reality, their method being empirical. They therefore bear a resemblance, on the one hand, to the natural sciences (while differentiating themselves from the latter, which concern themselves with the physical objects of the external world) and, on the other hand, to the cultural sciences, whose objects are psychical in nature, and which interpret these objects "according to the importance they have for culture." (Kantorowicz 1962f; my translation)[8]

The important link between history and sociology is something that Kantorowicz underscored on several occasions in his writings, and in fact his sociology of law is a history of law, just as his history of law is a sociology of law epistemologically justified by his methodological trialism. The history and sociology of law pose the empirical question of "how the law was envisioned by its authors, how it has been construed by its interpreters, how it is actually applied by judges and officials, and how it is in effect being complied with by those who are subject to it, in such a way as to present a whole spectrum of degrees of realization" (ibid., 72; my translation).

The meaning and value of law form the object of investigation of the general theory of law and legal dogmatics, respectively. In a manner analogous to Kelsen's approach, the general theory of law and legal dogmatics pose the question of "which of the possible interpretations [of law] yields a complex devoid of any contradiction" (ibid.; my translation). The general theory of law and legal dogmatics are sciences properly equipped to enable the judge to work out a solution to the case before the bench, even though they must reckon with possible disparities when it comes to interpreting, and hence applying, the law, in that the same reality can harbour a range of quite diverse viewpoints (ibid., 70).

The philosophy and politics of law are directly concerned with the value of law: Their problem is that of understanding whether the meaning of law is

[7] To be sure, it would be useful here to compare Kantorowicz's position with Max Weber's—considering, too, that they both draw on the same scientific theory, Rickert's—but a comparison would take us too far afield. It will only be noted here that Weber has always served as a model for Kantorowicz and that Kantorowicz's sociology of law owes in several respects a debt to Weber's sociology.

[8] Psychology (at least its "main part") is understood by Kantorowicz as a natural science, whereas sociology is understood as a cultural science. See Kantorowicz 1962c, 151.

just, and whether it ought to accordingly be realized (ibid., 72). A science of experience, a science of meaning, and a science of value: That is how Kantorowicz's methodological trialism is set up.

> Consequently, legal science must necessarily proceed in a constructive, a critical, and an empirical way; it is therefore exceedingly limiting to single out either dogmatism, rationalism, or historicism as the one and only possible method. In any event, legal science, like any other science, can always proceed either in a systematic way (sometimes in a generalizing way, other times in a typological one) or in an individualizing (historical) way. (Ibid.; my translation)

Where does the sociology of law fit into this scheme? This discipline is for Kantorowicz "a systematic science of the effective reality of the law in its entirety," as such contiguous with the history of law understood as an individualizing science of the effective reality of a determinate system of law. Drawing on Rickert's classification of the sciences, Kantorowicz thus classifies as follows legal science as a whole: (1) legal dogmatics, or legal science in the strict sense, which is an individualizing science by reason of its studying law as a historical given; (2) the general theory of law, a systematic science concerned with the meaning of any system of law (a study that consequently also develops into a theory of categories); (3) the politics of law, an individualizing science concerned with the value of a given system of law; (4) the philosophy of law, a generalizing science concerned with the value of law in general, a discipline that consequently also flows into a theory of justice; (5) the history of law, an individualizing science concerned with the effective reality of a given system of law; and (6) the sociology of law, a systematic science concerned with the effective reality of the whole of the law.

Of course, this overall approach raises the problem of the validity of law. According to Kantorowicz, the actual validity of law depends solely on the way the judicial organs make use of the law, that is, on the use they make of enacted and habitual rules. Irrelevant in this respect are those who from time to time issue a rule or norm (the legislature, administrative agencies, private social groups, or other organizations); what counts as decisive is only the judge's recognition of something as law, for only in this way does a norm become legally binding. At the basis of Kantorowicz's legal-sociological conception lies the effort to overcome the methodological dualism between the is and the ought, a dualism from which it is nonetheless necessary to proceed in any rigorous approach to the problem of law. The normativity and facticity of law are two different areas of study, even though they do both figure in the concept and the phenomenon of law (Rehbinder 1967, 114ff.). The concept of law proper of legal science cannot be set in contrast to the sociological concept; what is necessary is for jurists and sociologists to devote themselves to different areas of study, but that without pretending they do not know each other. As has been observed, it makes no sense to keep insisting on distinguishing a legal concept of law from a sociological one, almost as though there were two truths to be

told about law. Differences do exist between jurists and sociologists, to be sure, but they only concern the division of labour between them as they each go about investigating their own field: "That is all" (ibid.; my translation).

3.2. Ignatz Kornfeld and the Law as Force

As much as Ignatz Kornfeld's name may have lapsed from memory, it is worth bringing him up and discussing his work as a jurist who fully grasped the sense of the sociological philosophy of law as a viable alternative to legal formalism: Perhaps, in certain respects, this is an accomplishment for which we owe more to him than we do to the official founder of the sociology of law, Eugen Ehrlich. It is not incidental, in this sense, that the most important discussion of Kornfeld's *Soziale Machtverhältnisse* (Social power relations: Kornfeld 1911) should have been written by Rudolf von Laun (1886–1975), in a work in which he also at the same time addressed Kelsen's coeval *Hauptprobleme der Staatsrechtslehre* (Laun 1912). Kornfeld and Kelsen, both Viennese, both of Jewish cultural background, represent two possible avenues of legal science at the dawn of the 20th century: On the one hand was Kelsenian normativism, attentive to the purely formal dimension of law; on the other hand were all the cultural currents that found such purely abstract considerations of the law unsatisfactory.

As Laun observes, Kornfeld and Kelsen alike were convinced that their respective work was ushering in a new phase in legal science. But as it turned out, Kornfeld's sociology of law would soon be sidelined, not only by the spate of writings that Kelsen put out from his normativist perspective, but also, paradoxically, by the fact that Kelsen did not elect Kornfeld as the symbol of the orientation he criticized (legal sociology) but rather cast Eugen Ehrlich's *Grudlegung der Rechtssoziologie* in this role, as we will see in what follows.

For Kornfeld positive law constitutes not a normative order but "a system of rules that in point of fact frame our social life, and any normative function that can be ascribed to them comes only as a consequence of this effective validity they have" (Kornfeld 1911, IV; my translation). The legal scientist is thus tasked "with explaining the positive law as a system of factually valid rules of social life, and so with explaining law from a sociological point of view, in such a way that the science of positive law—to the extent that it is not merely an applicative discipline or a technique but a general theory of law—can be endowed with the same logical method that other areas of theoretical knowledge use" (ibid., 3; my translation). The "rules' effective validity," however, cannot be confused with the "reality" inherent in the phenomena, for that would amount to mistaking the sociological approach to law for the *contractarianism* of natural law, thereby falling into an improper methodological syncretism between the is and the ought.[9] Kornfeld channels his criticism in two directions,

[9] On the relationship between natural law theory and sociology, see Menzel 1912. Adolf

taking aim at previous sociological theories, on the one hand, and at normative ones, on the other: The former collapse the law into reality; the latter are forced to postulate a fictitious will of the state (Kornfeld 1911, 5ff.), neglecting to consider that human beings have no need for fictional entities, for it is the jural community they build which is primarily functional in enabling them to achieve their aims (ibid., 21).

As the product of society, in consequence, legal rules are not "exact laws and are not in any way general; they are only empirical, describing regular phenomena that do not take place of necessity but rather unfold along experimental paths, and so on a probabilistic basis; aside from not excluding the exception, then, these laws so much as *presuppose* it" (ibid., 27; my translation). "Jural relations therefore amount to social forces, to the realization of power relations geared toward an interest in welfare; to jural forces; and to jural constraints on force" (ibid., 38; my translation).

And so there exist in society legal rules proper, and these must be distinguished from the rules the human spirit devises for ordinarily political ends, in the manner envisioned, for example, by the materialist conception of history (ibid., 50, 69). What matters in the final analysis, Kornfeld argues, are the energies issuing from the will of all those who form a jural community, or the law's effective validity, on which depend other forms of validity that can in a sense be described as derived, as is the case with normative validity or with moral validity as an empirical fact of consciousness (ibid., 58–9). Kornfeld thus explicitly equates law with force: "Juridical power, then, is not encapsulated in the willing subject but is grounded in the set ways of behaving in society" (ibid., 35; my translation). Juridical power is not for Kornfeld a force, quality, or capacity but is rather a relation among willing subjects. Even in this latter sense, however, the concept of force or power always describes an exclusively causal relation among the members of society and so cannot be taken up as a distinctly *legal* consideration. The life of law lies in an effective cooperation among those who form the law for communal social purposes, and the law is the system of empirical rules inherent in the law and aimed at achieving such cooperation. Law, then, is for Kornfeld a system of rules of social behaviour having effective force.

For Kornfeld law does not fall within the sphere of the "normative," for in this sphere we only find value judgments, or morals. Wherever there is no correspondence with facts, the propositions concerned with the normative are for Kornfeld no more than expressions of expectation, discourse having to do more with literature than with actual law. Significant in this respect is the polemic between Kelsen and Kornfeld: For the former, law is concerned only

Menzel (1857–1938) taught at the University of Vienna starting from 1894. In the final years of his life he moved closer to Fascism. Among his works are Menzel 1894, 1895, 1898, 1907, 1912, and 1929.

with the normative; for the latter, only with facts. The *sources* of law are accordingly understood by Kornfeld as "those motivations that, for the purpose of ensuring a social interest, those who form a jural community transform into behaviour that institutes social forces and limitations on force" (ibid., 73; my translation).

The statutes, customs, and sentiments that make up or underpin the law can be sources of positive law only insofar as they draw forth social behaviours compliant with rules that further social purposes. More to the point, the legislative imperative should not be confused with the normative function arising out of that imperative (ibid., 82). Indeed, the legislator's imperative is grounded in the certainty that juridical peers—on account of the rules at work within society—can be expected to obey the imperatives contained in the statutes. The normative moment arises only at a later stage, following that initial moment both logically and temporally (ibid.). Even Kornfeld appears to have been influenced by the free law movement, especially in his taking up a practice that had become common among the movement's exponents, that of referring to Article 1.2 of the Swiss Civil Code, providing that the judge, should any gaps be found in the law, is to decide according to "such social needs and motivations as are widely recognized by the members of the Swiss state" (ibid., 119; my translation).[10]

What matters, then, is that juridical norms should compel obedience, both in the case of the positive law's regular development and evolution and in that of a revolution (ibid., 132–3, 137). The reasons accounting for the birth and extinction of jural relations are not causes but presuppositions of the validity of the rules through which a jural relation is established or terminated (ibid., 136–7). The power to carry out a jural transaction belongs to the person whose will, in accordance with valid legal rules, constitutes a condition for the birth or termination of jural relations (ibid., 142).

It would seem, however, that Kornfeld has not succeeded in clearly drawing the boundaries that distinguish a legal obligation from other types of obligation, *in primis* moral obligation. Any move to collapse the law into power relations carries precisely the risk of causing the law as such to disappear. It stands to reason, then, that this is exactly the aspect of Kornfeld's theory that Kelsen trounces on most pointedly:

> But then, for Kornfeld, legal obligation is no more than a moral obligation. Kornfeld expressly characterizes the obligatoriness of juridical rules as a "moral injunction addressed to every juridical peer who is bound to obey [a legal rule]" (p. 67); he equates legal obligation with "the moral obligations arising out of legal norms" (p. 58); and he even defines legal obligations as "moral forms of free will" that bind everyone to every other juridical peer in socio-juridical life"

[10] The German original: "Kann dem Gesetz keine Vorschrift entnommen werden, so soll das Gericht nach Gewohnheitsrecht und, wo auch ein solches fehlt, nach der Regel entscheiden, die es als Gesetzgeber aufstellen würde."

(p. 60). It is Kornfeld's view, then, that legal obligations are only a specific type of moral obligation. (Kelsen 1912; my translation)

Kornfeld's sociology of law clearly touches many other issues, and he would go back to this subject in his *Allgemeine Rechtstheorie und Jurisprudenz* (General theory of law and jurisprudence: Kornfeld 1920), but without adding much to the approach he laid out in his first work. Indeed, the question of legal obligation remains the sore point of any sociology of law that fails to explain legal obligation as a distinctly *legal* obligation, confusing normativity and obligatoriness, or rather, as is the case with Kornfeld himself, predicating a norm's obligatoriness on its effective obedience by those who form a jural community. In this respect, Kelsen's criticism finds common ground with Laun's previously discussed commentary:

But what has to be considered essentially a failure in Kornfeld is, in the first place, his theory of the obligatoriness of legal norms [...]. That a law should be a legal source only if it is in fact obeyed sounds like a quite enticing proposition, but it leads to the consequence that the judge or administrative official could not apply any legal provision without first determining whether it is actually being complied with or is likely to be complied with—something that cannot possibly be put into practice. Indeed, the practice does not exist, and that, on Kornfeld's own theory, means it does not belong to the law of any state. (Laun 1912, 333; my translation)

Kornfeld builds a sociology of law hinging entirely on the is, thus neglecting the dimension of the *Sollen*. Kornfeld in this sense gives us a unilateral theory. Unilateralism, however, is both a drawback and an advantage of many theoretical constructions of the German cultural world of the period: None of these constructions are self-sufficient, and each forces us to resort to the others. The same goes for Ignatz Kornfeld, too.

3.3. Eugen Ehrlich and the Foundation of Legal Sociology

Although Eugen Ehrlich (1862–1922), along with Emile Durkheim and Max Weber, can be reckoned among the pioneers of legal sociology (Pound 1959, 20, 351),[11] his name continues to be associated with the famous (and in some respects ill-famed) criticism that Hans Kelsen wrote against him in 1915.[12] To

[11] It can be said of Ehrlich as a pioneer of the sociology of law what he himself says of Montesquieu, namely, that it is a "dangerous thing to be a pioneer. The idea of building a sociology of law with the means and materials of the eighteenth century is one of astonishing grandeur, but here, as elsewhere, grandeur is separated from the ridiculous only by a pace. The efficiency of mental effort is conditioned not only by the merits of the originator but also by the whole condition of the country. Even a genius running before his time cannot entirely get away from the atmosphere wherein he breathes" (Ehrlich 1986a, 207; my translation).

[12] Of course, the controversy between Kelsen and Ehrlich did not come out of the blue, not only because Kelsen had already addressed issues in the sociology of law in some previous writings, but also because the problem of the use of sociological methods in jurisprudence had been a focus of attention for several years running, owing in particular to the spread of the *Freirechts-*

be sure, one could no longer comment, as Manfred Rehbinder did as recently as fifty years ago (give or take a few), that "even Eugen Ehrlich, the founder of legal sociology, is extraneous" to legal culture (Rehbinder 1967, 9; my translation), but there is no doubt that a long stretch of time passed during which Ehrlich's influence in the philosophy of law was negligible, and that his importance in Germany was being misestimated even as, paradoxically, his work was drawing much attention in places like the United States and Japan.[13]

The point of departure for Ehrlich, confined in an outlying town like Chernivtsi, was essentially given by the following question: What is the relation between formally valid law and human transactions in real life among a people comprising a diverse range of groups (Bukovina was home to Germans and Jews, Russians and Rumanians, and Romanies and Slovaks, along with several other nationalities)? What is the relation between unity and multiplicity in law? How is it possible that such real-life multiplicity can at the same time constitute a juridical unit? How is it possible that such a unit—the law of the Austro-Hungarian Empire—can be a single, unitary system of law, all the while encompassing, despite such oneness, a diverse social landscape? From the very outset, the same question moved both Ehrlich and Kelsen, but their answers would take opposite paths. Ehrlich started out from the *life* of law, while Kelsen made his primary focus not the breakup of social life but the *unity* of juridical forms, even though, on closer inspection, this problem is itself a problem of life, in which lie unity and multiplicity alike. What gripped Ehrlich's mind was the plurality of concrete jural experience, and in a sense he can be considered a frontiersman; Kelsen, by contrast, came from the "heartland," observing social reality "from Vienna," and so from afar, not quite conversant with its bustle, whereas Ehrlich was fully surrounded by the flavours and colours of life in the province. It wasn't just the concreteness of jural experience but also that of the present, of the here and now, that drove Ehrlich's reflection in his endeavour to deal with different yet coeval social realities. As Rehbinder has observed, empirical inquiry into jural life is useful to the sociologist of law in investigating the law's immanent regularities "in the present," the idea being that such an investigation will eventually develop into a "modern theory of law" that can be turned to for support in developing a politics of law (Rehbinder 1967, 13).

bewegung. A list of readings should at least include Sinzheimer 1909; Spiegel 1909; Gmelin 1910; and E. Fuchs 1910a, 1910b. Also by Fuchs is the collection of the most important writings in the sociology of law and in the free law movement, namely, E. Fuchs 1965, as well as E. Fuchs 1970. See also Kantorowicz 1911b, 275ff.; Kantorowicz 1962e; Wüstendörfer 1913; 1915; 1915–1916, 170–80, 289–320, 422–55; Nußbaum 1968.

[13] See Kawakami 1987. The attention that Roscoe Pound devoted to Ehrlich's works helped to spark the interest that led to the translation of his *Grundlegung* (titled Fundamental Principles of the Sociology of Law: Ehrlich 1936). One indication of Ehrlich's influence in Japan is the book Isomura 1953.

As Dias has observed, the *Grundlegung der Soziologie des Rechts* (The foundation of sociology of law: Ehrlich 1913, 1967b), Ehrlich's best-known work, exerted "a powerful influence in driving jurists to lay aside their purely abstract preoccupations and turn to the facts and problems of social life" (Dias 1985, 426). This work condenses years of empirical research on the Bukovinian people (among others), while also incorporating comparative historical studies. His fundamental thesis is stated in the book's preface:

> It is often remarked that a book should be such that its meaning can be captured in a single sentence. If the present work were held to a similar standard, that sentence would sound like this: "Even at the present time, as in any other epoch, the centre of gravity driving the development of law lies neither in legislation, nor in legal science, nor in the case law, but in society itself. (Ehrlich 1967b, preface; my translation)

This thesis is based not only on empirical fieldwork done in the borderline areas of the Austro-Hungarian empire but also on a vast historico-legal inquiry undertaken according to a philosophico-historical method. Indeed, it is in certain respects a preeminently historiographical approach, it need be said, that Ehrlich takes in arriving at his results: It is history (or rather, the history of law) that forms the basis of his legal sociology.

In effect, his sociology of law as a "pure science" is a historical sociology that uses existing empirical material as a testing ground for historical analysis. The present must serve the purpose of bearing out the results of historical inquiry. As Sinzheimer has underscored, Ehrlich also saw the historical school (Savigny, Puchta) as a sociology:[14]

> As early as with the founders of the historical school, legal science took the path of sociology. The way they conceived the history of law was not much different from what we today call sociology. History and sociology are at least in part complementary: It is from history that sociology sources much of its material. A sociological account of law on historical bases is an account of law in the social context, explaining how law springs from the historical evolution of its society. (Ehrlich 1986b, 193; my translation)

History and reason thus stand as two dialectical opposites in an otherwise incomprehensible polemic. And in this way they find themselves drawing the boundaries of two disciplines: the *sociology* of law, on the one hand, and the *philosophy* of law, on the other. The former, Ehrlich explains, concerns itself with "law as it is"; the latter, with "law as it ought to be" (Ehrlich 1986b, 179;

[14] "Ehrlich was aware that his sociology of law bore a connection to the historical school of law, which held the view that in the spirit of the people lay the original source of law. But this view is something he [...] transformed and developed. He applied the metaphysics of the historical doctrine to the sociological doctrine. He integrated the spiritualism of the 'spirit of the people' with the 'facts' on which legal representations depend. In highlighting the national peculiarity of the legal consciousness, he also underscored its dependence on universal social sources" (Sinzheimer 1938, 249–50; my translation).

my translation).[15] The sociology of law also becomes a sociology of juridical ideas and concepts and sets out to investigate the role and place of legal philosophy in the context of social change. And that, in turn, causes legal philosophy to morph into a *fact*, something that can form an object of empirical analysis (the kind carried out in legal sociology):

> If the philosophy of law has really had an influence on the formation of law, and that has happened frequently, then we have here a social *fact*, one a sociologist cannot fail to take into account but must, on the contrary, observe so as to investigate its causes and effects. (Ehrlich 1986b, 179–80; my translation)

Of course, the relation between legal sociology and legal philosophy is also one of distinction. Indeed, it is precisely through a specific awareness of the need to distinguish empirical analysis from evaluative discourse that a sociology of law can be conceived as a sociology of legal philosophy (or of juridical ideas).

Ehrlich distinguishes three types of law: primary societal law, the jurists' secondary law, and the secondary law of the state. Societal law is founded on social development: It contains legal precepts that play a fundamental role in shaping human behaviour, and it arises autonomously out of the facts of law (relating to use, control, and possession and to declarations of will) as a rule of action structuring a social group.[16] The possibility of violating the primary system of peace brings into existence a functionally different order than that of primary, or societal, law; that is, it brings about the jurists' secondary law, which essentially consists of decision-making rules addressed to the courts (the

[15] Ehrlich is referring in particular to Stammler's theory of just law. This is of great interest because it shows that Ehrlich did not reject the philosophy of law but on the contrary was himself influenced by the neo-Kantian rebirth of this discipline. Indeed, Ehrlich's neo-Kantianism seems even more coherent than Kelsen's, since Ehrlich very much appreciates the sense of the distinction between is and ought as a distinction between the world of the is and that of *freedom*. Whereas Kelsen confuses the method and object of legal philosophy—applying to the world of freedom a method that is only *apparently* normative, a method that ultimately reveals itself to be pseudo-causal, for it is influenced by the method of the natural sciences and is dependent on it, however much *a contrario*—Ehrlich remains within the boundaries of the Kantian conception of law as a moment of the human world of freedom, a world accordingly separated *ab origine* from any purely causal or naturalistic description. The philosophy of law is a science of the spirit in an authentic sense. In the end, Ehrlich takes the *Sollen* more seriously than Kelsen and shows an appreciation for the distinction Simmel drew between two meanings of the concept of a norm. According to Simmel, the term "*norm* has a twofold meaning, for on the one hand it refers to that which happens universally or generally, while on the other it refers to that which must [*soll*] happen even though it may not" (Simmel 1989a, 77; my translation). Whence Ehrlich's thesis that law reveals two systems. As H. Sinzheimer has explained it, one system "contains norms aimed at settling controversies; the other contains norms according to which human action should actually take place. This is a fundamental distinction. The norms in the first system are ones Ehrlich calls adjudicative; those in the other system he calls organizational: The former are 'legal propositions'; the latter, 'societal law'" (Sinzheimer 1938, 234; my translation).

[16] On the concept of the facts of law in Ehrlich, see Rottleuthner 1981, 172ff., 133ff.

courts are for Ehrlich a "third" system of law, and they need not be the courts of the state's judicial apparatus). The jurists' secondary law does not primarily serve the purpose of enabling the *formation* of social groups but is only intended to protect *existing* groups. The enacted law of the state, the third class of legal precepts, "derives from the state, but not so much on account of its form as on account of its content: It is a law which has arisen solely through the state, and which could not exist but for the state, whatever form such law may take in its coming about" (Ehrlich 1967b, 110; my translation). This is ultimately the state's coercive system, which manifests itself in the state's organizational law and in the law serving to protect social life, this latter body of norms containing what Ehrlich calls "rules of intervention" (*Eingriffsnormen*), or what today we would call administrative rules.

These three complexes of rules are engaged in a process of mutual feedback, and as a whole they form what may be called living law, which in Rehbinder's definition consists of "a social law operating on a higher level, for it comes about as a reaction to the jurists' law and the state's law" (Rehbinder 1967, 64; my translation). This conception of living law deserves to be taken up in connection with Roscoe Pound's conception of law in action (Pound 1910), considering that Ehrlich's theory has been found to be a counterpart to Pound's (Zeigert 1979, 225ff.; O'Day 1966, 210ff.).

Ehrlich's interest in the "physiology of law"—in social regularities as against the pathological phenomena of so-called deviance and of the consequent application of penalties—can be clearly appreciated above all from the criticism he makes of the idea that law is made up of legal propositions:

> The *Lex Salica Francorum*, in its boundless provisions, contained all the legal propositions existing among the Salian Franks. But if we compare that text with what Brunner in his legal history has to say about the Franks' law, we will find that only a fraction of this law is derived from the *Lex Salica*: Most of it is reconstructed from indications contained in historical works and documents, among other sources. And so, only a fraction of the Franks' law was encapsulated in legal propositions. (Ehrlich 1986b, 243; my translation)

And, likewise, as Ehrlich remarks elsewhere, if we want to understand the makeup of our agrarian law, we cannot gain that knowledge just by relying on "positive" legal propositions. For the picture these propositions paint is one marked by vague, fuzzy contours: "Anyone looking to find out the real 'constitution' of agrarian law will have to study the actual relations arising out of customs, contracts, and the way estates are divided among heirs" (ibid., 184; my translation). Ehrlich appears to be saying that the regular and orderly functioning of the social organism, of the concrete, always comes before the abstract:

> The state is older than its law; the legal propositions of marriage and family law presuppose the existence of marriage and family. The legal propositions that regulate possession could not have been developed without a given practice of possession, nor could the propositions relating to

contracts have come about before the corresponding contracts were formed; human beings have inherited property for centuries, before any rules on succession were ever formulated. (Ibid., 248; my translation)

The development of these various systems "rests on society's internal movement and is essentially independent of the state" (Ehrlich 1966, 81; my translation).

This emphasis laid on the centrality of the "concrete" in relation to the "abstract" raises a question we should take up, that of the "constitution," or *Verfassung*. The legal propositions set down in the codes never capture the "constitution" of a jural relationship or of any given vital part of the law. So, what does Ehrlich mean by *constitution*? I believe we should take this term to designate a real, effective dimension which precedes any conventionalist account of the law, and whose structure is *ordered*. If we deepen the question, we could easily reach the conclusion that Ehrlich's harmonizing sociology of law presents remarkable affinities with early French sociology, the kind advocated by Joseph de Maistre, Louis de Bonald, and their coterie. Ehrlich can certainly come across as a conservative thinker in this respect: His appeal to a juridical relationship's "existential" constitution can be extended by analogy to the entire legal system. And so it is the social group's legal system that turns out to be "existentially" founded on an unwritten constitution, one that lives in the actual, *physiological* principle regulating relations within and among the groups that make up society. As Julius Binder has observed, it is Ehrlich's view that "law is therefore not coercion but *order*" (Binder 1925, 1001; my translation).[17] Regulation in this sense is sociologically the very existence of a society or social group, and it is therefore not contingent on a judicially mandated punishment or writ of execution or, for that matter, on any threat of punishment:

Coercion is indeed as a rule considered essential to law; that idea, however, rests on a confusion. There generally can be no social rules without a certain degree of coercion, that is, without the idea that compliance is tied to a reward and noncompliance to the infliction of a loss. Morals, customs, education, and the like are imbued with this idea no less than is law. When we speak of legal coercion, we mean the coercion peculiar to the legal norm, that is, the coercion on which depend the criminal justice system, the enforcement of judgments, and especially the enforcement activity of the state at large. This sort of coercion, however, has been entirely absent from the law for extended periods in its development, and the importance of coercion is overstated even today. (Ehrlich 1986b, 185; my translation)

As Ehrlich goes on to observe, no law prohibiting usury can prevent that practice if the conditions for its flourishing obtain (ibid., 186), and these conditions flow directly from the group's structure, from its "constitution." The legal proposition is in Ehrlich something akin to the conception the French reactionary thinkers have of the written constitution of modern states, who view

[17] In Ehrlich's view, Binder further comments, "the only valid law is the law actually observed in the life of the community" (Binder 1925, 1002; my translation).

it as an accretion on the unwritten constitution, conceived as living in the concrete reality of a group or people (or, as Maistre would have said, the nation). Law therefore does not in the least depend on there being penalties: Although this may characterize the legal proposition—it is no accident that Kelsen, a theorist of modern law, makes it a central element of his definition of the legal norm as a hypothetical judgment—the law can even *do without* this element. If the laws protecting property were abolished, Ehrlich comments, this would not make for any greater violations of property than those which take place under the current system.

None of these considerations, however, can make up for the basic flaw of Ehrlich's sociology of law, a flaw that undoubtedly lies in his distinction between legal norms and other types of social norms (Partridge 1961, 1). Indeed, Ehrlich locates this distinction in the different degrees of psychosocial sentiment a norm can elicit: "A legal proposition is above all a product of social forces, and insofar as its scientific study revolves around psychological questions, it is the social psyche that plays the decisive hand" (Ehrlich 1967a, 212; my translation). The various social systems are hierarchically ordered. The law stands highest in the hierarchy, but this ordering is only *psychological*, manifesting itself in the *feeling* that social peers feel when norms belonging to different social systems are violated:

> Different kinds of norms draw forth feelings of different intensities, and it is accordingly with different feelings that we react when these norms are breached. Compare the feeling of indignation [*Empörung*] that follows the infringement of a right, the feeling of contempt [*Entrüstung*] provoked by the violation of a moral imperative, the resentment [*Ärgnis*] one feels at being slighted, the reproach [*Mißbilligung*] felt for a lack of tactfulness, the risibility [*Lächerheit*] occasioned by a lack of bon ton, and, finally, the critical scorn [*Ablehnung*] to which those who champion the fashionable treat everyone who does not measure up. (Ehrlich 1967b, 132; my translation)

Kelsen (1915, 861–2) gave forth with a mordant criticism of this attempt at a psychological classification of norms, and indeed any such classification seems at best unlikely today (Timasheff 1939, 26; Bechtler 1977, 76–8). But aside from that, it is certainly not on the basis of this "orgy of psychological jurisprudence" (as Kelsen described it) that we can appreciate the important role Ehrlich plays as a precursor of modern legal sociology.

Legal science and the sociology of law are thus intertwined, and neither can stand on its own without the other. In a lesser-known passage, Kelsen observes that a jurist must also be a sociologist in order to be a jurist; and the same, conversely, can be said of the legal sociologist, who cannot choose not to also be a jurist, with the only caveat (a matter of intellectual integrity, above all) that one must state up front the role in which one is writing, as a legal sociologist or as a jurist. This, in truth, is something Ehrlich does not do. He is interested in grounding the sociology of law as an authentic legal science. In a sense, that is the fate that befalls those who pioneer a new science, yielding to

the lure of the newfound world. But it would nonetheless be a grave error on our part if we were to stop at Kelsen's criticism, correct though it is, without seeing the reasons behind the sociology of law, and in particular the reasons behind Ehrlich's theory even at this early phase in its development. The legal proposition, Ehrlich says, is "conditioned by society" (Ehrlich 1986b, 250; my translation). Despite Kelsen's mockery of a statement that may seem banal, the view expressed in that statement is anything but trivial. It baffles the mind why Kelsen should have taken Ehrlich to task on this point without saying a single word about another author who held a similar position: That would be Karl Renner, who in a sense was himself a legal sociologist, and who shared a close affinity with Ehrlich on a scholarly level and a political one, too.[18] This circumstance in all likelihood is owed to a specific contradiction in Ehrlich's position, for he confused the *genesis* of legal regulation with regulation itself. Ehrlich, a foursquare adherent to the free law movement, saw that social conflict at some point imposes the making of new law by the judges, as well as the enactment of new statutes, but he confused the locus that harbours the premises and conditions for the creation of new law with the law itself. In the modern state, a *demand* for law is not the same thing as law; for instance, the return to invoking social status as the basis on which social participants (such as women and minorities) in large part assert their claims does not mean that such status in itself is law. Status is the germ from which originates a position that often conflicts with existing law and the current state (on the assumption, for example, that minority groups are discriminated against), but only such law as has already been "made" counts at any given time as law.

3.4. Karl Georg Wurzel and the Social Dynamics of Law

Even among sociologists of law Karl Georg Wurzel is familiar only to those who are conversant with American legal realism or with the free law movement. The first of his two books, the 1904 *Das juristische Denken* (Wurzel 1991a)—translated into English and published in the United States under the title *Methods of Juridical Thinking* (Wurzel 1969)—drew the interest of authors like Jerome Frank, who devoted a chapter to the book in *Law and the Modern Mind* (J. Frank 1970). And yet, despite such relative obscurity, Wurzel must be reckoned among the founders of legal sociology, with his 1924 book *Das Sozialdynamik des Rechts* (The social dynamics of law: Wurzel 1991b).

[18] Indeed, Renner regarded Ehrlich as an ally in the effort to defend the least well-off in society. Two writings by Ehrlich are worth pointing out in this regard: One is *Die soziale Frage und die Rechtsordnung* (The social question and the legal order: Ehrlich 1890–1891), published under a pseudonym in the journal *Neue Zeit*; the other is *Die soziale Frage im Privatrecht* (The social question in private law: Ehrlich 1892), published in 1892, and whose content overlaps almost completely with the first article. Kawakami (1987, 255) speculates that Ehrlich took on a big political commitment at this stage in his life. On Renner see also Section 7.2.1 in this tome.

The foundation of Wurzel's sociological theory lies in relativism: "In the social arena, the criterion of 'truth' is not just *sometimes* relative but is in principle *always* so. There is no eternal truth" (Wurzel 1991b, 113; my translation).[19] In support of this thesis, Wurzel underscores how it is impossible to bypass the subject (the person) as a criterion by which to understand the social world. The subject is certainly the source that can say something about society, but at the same time, as an *acting* subject, he or she is the *object* of such information.[20] To say something, in social science, is to modify the object about which that something is said (the object consisting in the subject's action). In the final analysis, what counts in a social theory is not its truth or nontruth but what the theory can offer, what it inherently "tends toward" its "power to make things real" its "transformative energy": "The most important problem in any area of sociological inquiry is that of the social dynamic" namely, the functional problem (ibid., 114; my translation).

As Wurzel remarks, the sociodynamic question plays a relevant role in any social science, but it is especially prominent when we are dealing with the law. Indeed, the law "is something normative" (ibid., 111; my translation): As such, it cannot coincide with facts, and furthermore, if it is to be valid, it cannot be unstable, or "fact-dependent." In this way, Wurzel rejects two extremes, the first consisting in any uncompromising separation (à la Kelsen) between the world of the is and that of the ought—or rather any distinction which fails to illuminate those connections which do exist between the two worlds—and the second consisting in that doctrine which makes a scientific programme out of praxis, and this is the free law movement as a theory about the "free sourcing of law."

To begin with, Wurzel frames in a new way the transformation undergone by the contrast between a state-centered, positivist conception and the natural law conception of law by arguing that this contrast has now grown into the one between, on the one hand, the pure theory of law, which seeks a pure law, "devoid of any logical obscurity" (ibid., 118; my translation), and clearly set apart from any psychological, social, or physicalist question, and generally any question having to do with the effectivity of law, and, on the other hand, that theory, or rather, that trend, which considers law as a system of empirical rules of social life, and which accordingly regards the description of the facts of social life as the first concern of scientific activity: "Standing in the foreground over on one side is the 'purely formal' concept of law as the condition for any jural experience. Standing in the foreground over on the other side is jural experience itself, the actual *use* of law" (ibid., 182; my translation).

[19] What ultimately matters, Wurzel writes, is not the question of the truth or untruth but that of "what a theory can offer" (Wurzel 1991b, 188; my translation).

[20] "The difficulty involving the sociological-dynamic consideration is huge, since the object of consideration is a part of society, and that object is itself prisoner to the opinions of society" (Wurzel 1991b, 120; my translation).

Wurzel grasps with remarkable lucidity and perspicuity the sense of the contrast between the two currents:

> When, for example, the empirical current asks legal science to do a *comparative* or *historical* inquiry of law, the other current replies, "Before I can even begin to compare the phenomena of jural life among different peoples in different epochs, I must necessarily have a unitary concept of law as a benchmark against which to judge whether this or that phenomenon of life belongs to the life of law. (Ibid., 183; my translation)

In the empirical current Wurzel locates authors such as Jellinek and Ehrlich, for whom validity capitulates in the contrast with facts; and in the opposite, or formal, current he of course locates Kelsen. In the company of Kelsen, however, Wurzel also, and somehow oddly, places not only Kant but also Cohen, and then Stammler, Lask, Iljin, Merkel, and Bierling. In so doing Wurzel makes a certain confusion between the concept of *Richtigkeit* (correctness) and that of *Reinheit* (purity). As theories concerned with social questions, the critical transcendental theory and the empirical one must be judged not on the basis of their truth-content but in view of what they can offer from the standpoint of the social dynamic. Legal science is a practical science, meaning it is driven by practical tasks and purposes. Legal science must develop a sense of reality while also building its own logical force. The pure theory of law can thus be credited with having developed a concept of legal validity that stands firm in the face of facts, even though such facts may be in contrast with valid norms; in a sense, its greatest merit is to have set up a camp on the opposite side of the empirical theory.

But even Kelsen cannot dismiss the empirical moment, because the practical character of legal science requires this discipline to pay as much attention to the formal moment as to the substantive one. The pure theory of law is subject to some operational and performance limits that ultimately make necessary a "leap" proper from the purely "normative" to the factual. To be sure, the limits of Kelsen's doctrine's operational capacity are ones that Kelsen holds up as virtues of this theory, but they are of no help in explaining in a functional (i.e., sociodynamic or sociological) manner the fact that what the jurist constructs is the jurisprudence of the world of the is (the world of force), which is precisely where Kelsen locates the "metajuridical" (and which, on the other hand, makes it possible to treat as valid the various legal systems that lie next to one another in space and come one after the other in time). Now, these limits, with their "bizarre outcome" "force a *leap* into the factual," a leap on account of which Kelsen is compelled to recognize his starting point as an arbitrary choice (ibid., 194).

In reality, even Kelsen is driven by an impulse to assert the world as unity, and antinomies can be detected even in the pure theory of law. Wurzel holds that no consideration of law can do without the sociology of law, for only through such an inquiry can law be presented as a social phenomenon and legal science as a practical science, a science capable of mediating between fact and value. A legal science conceived as a social science must be able to work

simultaneously with two concepts: that of force and that of validity. As Wurzel explains, the concept of force constitutes "the logical tool with which to bear in mind the phenomena of the world of the is, while at the same time not losing sight of the concept of validity" (ibid., 123; my translation). The central concept of Wurzel's legal sociology is (as in Kornfeld's) the concept of force, which on closer inspection will be discovered to be a qualification and refinement of a concept that in turn figures centrally in Ehrlich's legal sociology: the concept of jural life. Indeed, Wurzel addresses the problem which Ehrlich had sidestepped: the problem of the application of law, of a law whose distinguishing feature lies in validity (*Geltung*) and not in its practical effectiveness as determined by its uses and customs. Although even Wurzel is removed from the finer issues debated in the more mindful legal sociology of today, he moves one step ahead of Ehrlich by not rejecting the formal normative aspect of law, and in fact acknowledging its role, all the while taking on the problem of how that aspect can be brought into relation with the real dynamics of society. He is very much aware that sociology is concerned with things such as they *are*, with social life as a complex of facts, and that a contradiction arises between this social consideration of facts and the moment where social life shows deference to law's normativity (that is, to its logico-formal moment); and he also appreciates that the problem is equally contradictory from the standpoint of pure or formal legal science, in that this science concerns itself with law as something intended to be applied, and indeed *requiring* to be applied, and hence conceived as part of the realm of the is, of empirically (i.e., socially) relevant facts. An antecedent to Wurzel's solution can be identified in the one put forward by the Hungarian legal philosopher Felix Somló (1973, 251ff.), who in a criticism of Kelsen draws a distinction between the state and law, the former acting as a "basis" or "support," the latter as that which is "borne" by the state. Just as Somló understands the state, with its forms of organization, as the "force" behind the law (behind the state's enacted laws), so Wurzel sees the question of law's application as pointing to the need for a force capable of "bearing" the norms to be applied. Sociology, however, is tasked with singling out the distinctively social forces, the forces behind the life of law. The sociological concept of law advanced by Wurzel is rooted in the forces (*Kräften*) that act in reality. Indeed, a social science must answer "the needs of *daily life*" (Wurzel 1991b, 215; my translation).

3.5. Ernst Seidler and Empirical Social Science

Ernst Seidler's (1862–1931) legal-sociological thought is essentially set down in a 1920 essay (*Die Theorie des Rechts und ihre Grenzen*, The theory of law and its limits: Seidler 1920–1921) and in another book published one year before his death, *Die sozialwissenschaftliche Erkenntnis* (Knowledge in the social sciences: Seidler 1930).

The 1930 book contains an epistemological analysis, in which regard the reader is referred to the commentary of Günther Winkler, to whom we owe our rediscovery of Seidler, and so we can focus here on the salient features of the seventh chapter, specifically devoted to legal science. For Seidler, law is conceived as made up of norms, where each norm is a *Sollen*, an ought directed toward a purpose. A norm is always a *social* norm, posited by a social institution and coupled to a penalty. As an authoritative and heteronomous construct, a norm acts as an imperative, and as such it represents a force acting on the individual's psyche. Seidler sees law as essentially defined by its constringency, from which it follows that legal science, as an empirical social science or legal sociology, must concern itself with the *content* of legal norms. The object of legal science lies in the *Sein des Sollens*, in the is of the ought, meaning the is as the content of law. To that extent, the science of law is for Seidler a science of the is.

The law expresses a people's vitality, and it is for this reason that in the content of law lies the object of science, because that content is what the people set for themselves as their purpose. Legal norms, then, are not the outcome of a legal method but are instead the given object of legal science, and this object is the product of a will endowed with authority. Legal propositions are consequently legally conceived vital relations. And so, for Seidler, the study of legal form does not suffice; a legal science must fundamentally concern itself with the *content* of legal norms. Undoubtedly, the intellectual lodestar of Seidler's legal sociology is Jhering and his theory of purpose as the creative force of law.

Seidler does not *expunge* the *Sollen* from the law, to be sure, but in framing it as an object of legal science, he considers it to be a psychical phenomenon forming the basis of legally qualified behaviours. A norm is thus a scheme on which basis to qualify behaviours (Kelsen may have drawn on Seidler in formulating his definition of *norm* in the first edition of the *Reine Rechtslehre*, of 1934), and the sociologist

> describes and explains as an is the psychical phenomena of the ought, not unlike what a natural scientist does in identifying and explaining a chemical bond. [...] For an empirical science, the *Sollen* makes sense only if understood as a real, i.e., psychical, phenomenon. Indeed, on this conception, that which cannot be counted among (psychical or physical) phenomena cannot be an object of theoretical investigation: Something like an objective *Sollen* is simply unfathomable. There can be no doubt that a norm is an ought, but it is so only as the content of the will. (Seidler 1930, 200; my translation)

The reference just made to the will implies that for Seidler the law, as an empirical phenomenon, can never be severed from politics and the state, where the will is manifested in relation to a purpose (precisely the point Seidler makes with respect to the law).

3.6. Legal Science and Psychology According to Wilhelm Wundt (*by Federico Lijoi*)

Wilhelm Wundt (1832–1920) is considered the founder of psychology as an experimental science. He was influenced by Müller, Herbart, and Lotze and rejected any unilateral account of consciousness as something to be understood in exclusively materialist or exclusively idealist terms, so he put forward a view of consciousness as a place where a synthesis is effected between the physical and the psychical. Individual psychology so conceived finds a necessary complement in the psychology of peoples (*Völkerpsychologie*). Here Wundt built on Lazarus's and Steinthal's insights so as to drill deeper into the psychological question, while also broadening its scope, by taking into account the higher levels of psychological evolution and organization, thus also grappling with social, religious, and moral problems. So, on the one hand, psychology comes into shape as a psychology of peoples—bringing into play the problems involving morality, society, and religion—and on the other hand it makes it possible to define the structures of psychical individuality through an empirical analysis coordinated with the kinds of investigations carried out in the natural sciences.

Wundt's inquiry into the legal phenomenon is part of a psychological analysis aimed at singling out the conformations taken by the "spirit" of man and of peoples.[21] Wundt held that the law is not fashioned out of an agreement among wills but is rather best understood, by analogy to language and myth, as "a natural product of consciousness" (Wundt 1921, 568; my translation), a product that finds its source in those human sentiments and aspirations which are triggered by social life. In the beginning, law was a single thing with custom (*Sitte*) and was internally connected with religion. But then it broke free and found its own forms of manifestation and application, in the first place as an arrangement of men's social needs effected through organized coercion. Its evolution is depicted by Wundt as unfolding in three stages, though they are not sequential but rather begin to coexist when the last stage is reached: We start out, in the first stage, with the taking of those juridical intuitions whose roots lie in the people's ethical representations; in the second stage the law separates from custom, and juridical ideas find an initial theoretical expression (through the codification of law); and finally, in the third stage, legal norms become an object of systematic analysis of a scientific sort (the systematization of law).

The law is understood by Wundt as an ordering at once logical and ethical (ibid., 590). In the first sense, law finds expression in its being suited to the purposes for which law is intended; in the second sense, it instead finds expression in justice. In both senses, law requires physical coercion. The concept of law

[21] See Wundt 1918 offering a diachronic exposition of the evolution of legal forms; his *theoretical* analysis of law and his method are instead expounded in Wundt 1921, 512–29, 568–624; 1912a, 128–31, 219–44; 1912c, 160–86. On this question, see also Eisler 1929, 633–54 (see esp. 648).

can thus be understood in a threefold sense, for it must be suitable for the purposes it is meant to serve, it must embody a notion of justice, and it must rely on the use of force. Its legitimacy lies in the original general will as manifested in an organic community. And this organicity in turn rests, in the first place, on the sharing of a universal moral content as expressed through common sentiments and concordant representations about the content of justice and of law.

The scientific framing of law takes as its object that peculiar form which the people's juridical intuitions have found in statutory and customary law. The content of these intuitions is expressed in propositions in which are set forth rules for the social action of the members of a juridical community. These rules are the rules of law (legal norms), and as concerns their logical meaning they can be compared to the underivable first axioms of the theoretical sciences. Wundt also draws a distinction between legal norms in a strict sense—*Grundnormen*, or basic norms, so called because they set forth the basic principles of law—and auxiliary legal norms (*Hilfsnormen*), which state not the law itself but the way in which the legal system needs to be protected against the violations it stands to be threatened by (ibid., 614). The basic norms are grounded in universally valid moral intuitions and are accordingly stable and constant, whereas auxiliary norms are contingent on changeful views and external conditions. This contrast is illustrated by Wundt in his remark that the prohibitions "Thou shalt not steal" and "Thou shalt not kill" survive from the dawn of culture as unchangeable legal norms, whereas the laws setting out punishments for theft and murder have changed countless times.

And, finally, as concerns the state, Wundt puts forward a conception of it as the bearer of a high moral purpose, which is to realize the common good and pursue the public interest (ibid., 526; Wundt 1912b, 241ff.). It follows that we have to reject all theories on which the state is claimed to originate out of a pact among individuals. Indeed, the general will manifested in the state cannot come into being through a contract, for it is rather the *condition* for any contract to be possible to begin with. Likewise to be rejected, for the same reason, are those theories of the state that—in accordance with a civil-law method and in opposition to an organic conception of the state—take the single individual as their starting point, on the assumption that the purposes of the state must be tailored to the needs of the members of the community. This erroneous conception, Wundt claims, presupposes the same method that natural law theory rests on, the idea being that individuals—the only reality amenable to any physical or social grasp—must in the first place be protected against the exercise of government power. We must therefore avoid carrying over into public life the concepts proper to civil law. If we are to correctly analyze the essence of the state, we must discard the naturalistic presupposition of an analogy between the social world and the physical and must instead proceed on the basis of an organic cohesion among the multiple forms of social organization (Wundt 1921, 528).

Chapter 4

FROM CRITICISM TO THE PHENOMENOLOGY OF LAW

by Giuliana Stella

4.1. Introduction: The Genesis of the Method

The epistemological programme set out in Edmund Husserl's (1859–1938) phenomenological philosophy, even where phenomenology enters into the realm of law, explicitly consists in an endeavour to seek the ultimate foundation of knowledge. This foundation is found to lie in scientific rigour, a rigour attained in the first place by going through the different stages involved in the subject's analysis of his or her own self, before even proceeding to analyse reality itself. Indeed, it is by carrying out this analysis that we as subjects can reclaim our own original purity, and this, as the phenomenologist would say, enables us to "constitute" reality and "intentionalize" it. What this means is that we become aware of reality through an "intuition" that will seize the "essence" of reality itself, its *eidos* (εἶδος). In a word, our knowledge of the so-called "regions" making up the "material ontology" of the different types of entities—including law, and generally those entities which Husserl speaks of in the *Prolegomena zur reinen Logik* (*Prolegomena to Pure Logic*: cf. E. Husserl 1975)—can come about only after subjectivity and its operations are unveiled, that is, in the language of phenomenology, only upon reaching the transcendentality of the self.

It must be conceded, then, once an approach so described is carried over into the realm of law, that there is no way to arrive at the legal "principles"—understood as "ideas," the essences from which springs the widest variety of contingent legal events, or the models with which such events must comport—unless the subject becomes "transcendental." Kantian transcendentalism meant that we have to represent the very condition for the possibility of knowledge by securing its universality; not too different from that necessity was the kind expressed by Husserlian transcendentalism, which further set out the need to supplement the subjects themselves with the Kantian *noumenon*, something that had hitherto remained *outside* the subject.

Actually, the phenomenological approach, tending toward esotericism and imbued with an aristocratic faith in the value of knowledge, is not so easily comprehensible. It follows that if we are to profitably wend our way through Husserl's theory, we will have to retrace the path taken by those theorists who directly tested that theory by applying its method to a specific area of investigation. Phenomenological philosophy is in the first place a gnosiological method: It needs to be experienced. In the single areas or "regions" of application

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_4

such as law, Husserl's gnosiology effects a refoundation of the relation between subject and object, all the while pursuing scientific rigour in a relentless quest for the truth.

Among the authors making up the speculatively compact "phenomenological school of law" we can count Adolf Reinach and Gerhart Husserl, both German; Felix Kaufmann and Fritz Schreier, both Austrian; and, to a lesser degree, and each in his own way, Gerhart Leibholz and Carl Schmitt, both German. As we will see, the theories advanced by these Husserlian jurists, especially in the 1910s and 1920s, closely followed the ideas and methods of Husserl's first seminal works (cf. in particular E. Husserl 1975, 1984), and so, as we consider legal phenomenological production, we will be able to appreciate how the history of legal philosophy flows directly into the history of philosophy as such, so much so as to make for an additional possibility in interpreting and understanding Husserl's philosophy itself.

The thesis advanced by Husserl and all the Husserlian phenomenologists, including the legal phenomenologists, is aptly encapsulated in the title of a work that Husserl wrote in 1913, namely, *Die Philosophie als strenge Wissenschaft* (Philosophy as rigorous science: E. Husserl 1987). In this sense, the primary objective of a legal philosophy fashioned after this model is pursued by analyzing legal phenomena—such as norms, institutes, organizations, institutions, and nomothetic archetypes—within a framework of scientific rigour. Rigorous science, for its part, ought not to be confused, on a phenomenological conception, with a simplistically experimental reading of the nexus between the subject and the object of knowledge: It rather carries foundational force, for it flows into the broader project, harking back to Leibniz, of a *mathesis universalis*, a science of the sciences. The rebirth of philosophy goes through a rediscovery of it as a foundation of all particular sciences. Therein lies the sense of the Husserlian credo that "the science tasked with the function of critiquing the other sciences, and itself, cannot be anything other than phenomenology" (E. Husserl 1976, 133; my translation).[1]

So the need for "scientificity" that comes through in the phenomenologists' writings reflects nothing if not a concern with finding a renewed way of "philosophizing" and taking the proper caution needed to achieve an effective interpretation of the legal phenomenon. The motto *Zu den Sachen selbst!* (Go back to the things themselves!)—encapsulating the philosophical revolution tied to Husserl's phenomenology as stated in his *Logical Investigations*—does not refer to objects of ordinary experience. Husserl speaks of *eide* (εἶδη, ideas or essences), of *a priori*, for in his view the *eidos* is "prior to all 'concepts' un-

[1] Some essential readings offering a historical and theoretical overview of the phenomenological movement and of legal phenomenology are Van Breda 1952, Schuhmann 1977, Van Breda et al. 1959, Van Breda and Taminiaux 1959, Spiegelberg 1982, Sepp 1988, J. Kraft 1926, Peschka 1967, Gardies 1972, Stella 1990.

derstood as denotations, which, indeed, as pure concepts, ought to be made to fit the *eidos*." In that sense, "in the pure way of the eidetic method," phenomenology is to be interpreted as "an intuitively *apriori* science purely according to the eidetic method" (E. Husserl 1973, 105; my translation).

Husserl's position, clearly expressed in these pages from his 1931 *Cartesianische Meditationen* (Cartesian Meditations), is already present in the two works from which the legal phenomenologists draw inspiration, namely, his 1900–1901 *Logische Untersuchungen* (Logical investigations: E. Husserl 1975, 1984) and his *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie* (Ideas pertaining to a pure phenomenology and to a phenomenological philosophy), whose first book, not incidentally, is titled *Allgemeine Einführung in die reine Phänomenologie* (General introduction to a pure phenomenology: E. Husserl 1976). And the same position is explicitly taken up in the works of authors like Adolf Reinach, Gerhart Husserl, Fritz Schreier, and Felix Kaufmann. Thus, for example, Reinach makes use of the *a priori*, a concept that figures in the title of his main work, his 1913 *Die apriorischen Grundlagen des bürgerlichen Rechtes* (The *a priori* foundations of civil law*:* Reinach 1913);[2] Gerhart Husserl, for his part, resorts to the concept of 'essence' or 'idea' in applying the method of phenomenological reduction to the analysis of law considered before time and history; and, finally, Kaufmann and Schreier rely on the concept of 'purity' as the end result of a phenomenological philosophy, and it need be mentioned here that these two authors' cross-pollination between Husserlian and Kelsenian thought also bears witness to the influence that Husserl exerted on Kelsen himself, so much so that only after reading Husserl's *Logische Untersuchungen* did Kelsen alight on his "pure theory of law."

4.2. Adolf Reinach and the *A Priori* Elements of Law

Adolf Reinach (1883–1917)—the first of Husserl's pupils (Husserl himself held him in the highest regard)—was also the first of the legal phenomenologists. He wound up formulating a project driven by the thesis that legal phenomenology ought to be an "Ontologie oder apriorischen Gegenstandslehre" (an ontology or *a priori* knowledge of the object) in the proper sense of the expression, that is, an ontology understood as an *a priori* theory of objects. Indeed, as Reinach writes:

> The so-called fundamental legal concepts, those having a specifically legal status, also have a non-positive legal existence, just as numbers have an existence independent of mathematical science. Positive law can elaborate and modify such concepts at will: These concepts are themselves often

[2] Later published in Reinach 1921, 166–350. Only later would the work be published on its own, under the title *Zur Phänomenologie des Rechts: Die aprorischen Grundlagen des bürgerlichen Recht* (Reinach 1953, translated into English as Reinach 1983). A critical edition of this work can be found in Reinach 1989a, 141–278.

found by positive law, rather than being produced by it. Furthermore, these legal forms come under the purview of eternal laws independent of our understanding of them, as is the case with the laws of mathematics. The positive law can welcome these laws within its sphere and can even set forth exceptions to such laws. But even where it upends them into their contrary, it cannot touch their proper existence. (Reinach 1989b, 145; my translation)[3]

It thus falls within the compass of the phenomenological mode of philosophy to make an idealist methodological choice compatible with an indispensable ontologism, the former aimed at outlining the criteria proper to the subject, and the latter instead intended to make it possible to recognize reality in its autonomous existence, all the while recognizing that the nature of such existence is clearly contingent on the mutual influence between subject and object. In this framework, what it means to grant the existence of legal principles is to move law closer to those "objective" sciences (especially mathematics) whose principles exist independently of whether they will be "grasped" or discovered. That indeed seems to be what the phenomenological programme consists in: in an endeavour to grasp the essences of law. In fact, if legal phenomenology had confined itself to taking cognizance of contingent legal-positivist phenomena, then it would simply have followed in the footsteps of the *Begriffsjurisprudenz* and the subsequent *Allgemeine Rechtslehre*, that is, it would have embraced the method of "inductive generalisation." Reinach's doctrine opened up a whole new scenario for the understanding of law, a scenario where, as is stated in his main work, it becomes evident that

the forms generally designated as being specifically legal can be said to exist in the same way as do numbers, trees, or houses; it thus becomes evident that such existence is independent of whether or not humans become aware of it; and, in particular, it becomes evident that we have to do with an existence independent of any system of positive law. It is not just false but ultimately senseless to define legal forms as creations of positive law. (Reinach 1989b, 143; my translation)

Reinach specifically devoted his analysis to the foundations of civil law, and in particular to the legal concepts of promise and property, in the same way as, for example, fifteen years later Leibholz, in his masterly analysis of political representation, would apply the phenomenological method to public law (Leibholz 1973). Reinach's approach to law, however, is not simply confined to applying a method, since he primarily devoted himself to solving the epistemological question about essences. It was Reinach himself, in his pioneering work in bringing Husserl's investigation to bear on law, who envisaged the application of that investigation to a variety of areas of law. Certainly, it is not irrelevant that Reinach's theory should proceed on the basis of that alphabet

[3] For a better understanding of the phenomenological concept of *a priori*, specifically in the way Reinach uses it, see Reinach 1989c: a posthumously published lecture dated 1914. Not all of Reinach's works are devoted to a legal subject matter. It is worth recalling, as concerns that subject matter, Reinach 1989d, 1989e.

of law which is private law, and even on the basis of that *primum movens* of private law, the idea of the pact, an idea that serves to put the seal on the very concept of obligation. Indeed, it is precisely Reinach's analysis of the promise that sparked the greatest interest even in contemporary theory, which in Reinach's investigations has found an important precedent (this is especially true of John L. Austin's and John R. Searle's theories of speech acts).[4] It is not uncommon, either, for Reinach's exegetes, to make him out to be a sort of guardian of orthodox phenomenology, understood as a form of philosophical realism. That kind of interpretation seems to be just a legitimating alibi for the controversial view that Husserl's thought could be divided into two fundamental, and conflicting, phases: an initial realist one, where Reinach would recognize his own view, and a subsequent idealist one, not in any way genuine. There are multiple reasons that have prompted this line of interpretation. It should be pointed out, to begin with, that Reinach certainly played a prominent role among the first generation of phenomenologists in the years coinciding with Husserl's early work. Among the disciples who in Göttingen formed the circle that gathered around Husserl, he stood out as being especially active and inspired, gaining quite a following as an emerging author, a faithful pupil, an effective teacher, and a versatile scholar. He was even awarded a professorship at the University of Göttingen in 1909. Conspiring with that factor, however, and even more consequential, was Reinach's untimely death in World War I, which put an end to his scholarly output, this in a phase when the inspiration for his thought came from Husserl's first fundamental works.[5]

Reinach's philosophy of law—if interpreted coherently and thus according to its explicit intentions, specifically as concerns his theory of the promise—can be said to present itself in such a way as to take cognizance of a certain *notwendige Wesensbeziehung*, a "necessitated essential connection," a connection qualified as no less than a *Wesensgesetz*, or "law of essence"; his theory, in other words, recognizes that to make a promise is to bind oneself to a performance: Unless a promise entails a duty, or obligation, it will shed all specificity. And by arguing that "a claim and an obligation are grounded in the promise as such," Reinach in fact shows that he holds with the view of the apodictic nature of the nexus by which a promise, a claim, and an obligation are bound together. Coherently with these premises, and specifically in accord with Germanistic legal theory, which diverges conspicuously from Romanistic legal theory on the definition of a promise (see esp. Siegel 1969), Reinach would draw

[4] For an interpretation of Reinach's idea of a promise as an illocutionary act, see Burkhardt 1986 and the essays collected in Mulligan 1987. For an argument against that interpretation, see Stella 1990, chap. 2, pars. 5–6.

[5] Information on Reinach and the early adopters of phenomenology, as well as on the Munich and Göttingen circles, can be found in E. Husserl 1919, Spiegelberg 1982, Avé-Lallemant 1975a, 1975b, Crosby 1983, Sepp 1988.

the important conclusion that a promise is valid even without the promisee's acceptance, a move through which he locates in the promisor, and hence in the obligor, the very source of legality. "In the promise," Reinach writes, "it is the selfsame promisor who takes on an obligation; on the addressee's side, there only emerge claims," meaning that "promises are in and of themselves both binding and irrevocable" (Reinach 1989b, 172, 184; my translation).[6] There can be no conclusion, then, other than that "it is in the essence of a promise to be irrevocable" (ibid., 174; my translation). No doubt, one can conceive the promise as the first act in a contract, but what marks out a promise in its deepest essence is the unilaterality of the obligatory performance, and the promisee is not in fact obligated to do anything in return.

This nexus existing between a promise, on the one hand, and a claim or an obligation, on the other, a nexus in which Reinach recognizes one of the foundations of law *tout court*, is a nexus that from a theoretical perspective is to be conceived as a synthetic *a priori*, for it is precisely in the nature of promise-making that a promise should encapsulate a quality which comes on top of our immediate perception of it in its simplicity, and that quality is a promise's obligatoriness, its having to be kept. One will not find it difficult to see that this view—this decision to qualify the nexus in question, this special *notwendige Wesensbeziehung* (necessary essential relation), as a synthetic *a priori* judgment—conjures up the Kantian gnosiological universe. But Reinach moves beyond Kant, for he winds up making the nexus itself ontological and concludes that the reality proper to it, a pure reality, becomes a possible object of knowledge in the same way as a mathematical truth does. This foundation of law—no less important than law's other foundations, and perhaps even more so—is entirely informed by a principle of self-evidence, in that promise-making embodies a specific *Wesenszusammenhang*, or "essential connection,"[7] and in turn points to further essential connections. It must therefore be noted, first and foremost, that the moment we understand a legal claim as structurally entailed by the act of promising, we do away with the problem of showing promise-keeping to be obligatory: The connection becomes manifest, having the immediate clarity of any intuitive nondiscursive truth. And as Reinach comments, this "is certainly as clear as only a logical or mathematical axiom can be" (ibid., 239; my translation), such that "an attempt to clarify and thus make intuitive [*einsichtig machen*]" the proposition

[6] It is also true, however, that precisely this peculiar and stringent understanding of a promise can be the basis from which to proceed in identifying the essence of law not so much with an obligation (*Verbindlichkeit*), which binds the *promisor*, as with the claim (*Anspruch*) the *promisee* may legitimately assert, demanding that the promise be performed: Such an understanding of the law—as a claim rather than as an offer—would have greater explanatory power and would certainly be sociologically sounder.

[7] According to Reinach the act of promising, in whose essence the production of claims and obligations lies, is an "immediately intuitive and necessary essential connection" (*ein unmittelbar einsichtiger und notwendiger Wesenszusammenhang*): see Reinach 1989b, 157.

that making promises as such brings into being claims and obligations "would make as much sense as an attempt to explain the proposition '1 × 1 = 1'" (ibid., 188; my translation). This is precisely what is meant by saying that it forms the very essence of a promise to give rise to a claim and an obligation, and that the connection between these three elements (a promise, a claim, and an obligation) is grasped by an immediate intuition. An understanding of the juridical world requires "that we go deep and reach for the basic elements of law," moving toward those "connections which are structured according to the laws of essence [*wesensgesetzliche Zusammenhänge*]" (ibid., 205; my translation); such are the connections that issue from those elements, particularly from the promise. In this case, the essential connection lies in the compulsory link mutually binding the promise, the claim and the obligation (see ibid., 172).

Reinach does not rule out that promise-making can be framed as a "social act." Indeed, that is precisely the expression he uses, underscoring that the conventional understanding of a promise as an act or declaration of will needs to be supplemented by taking into account what a promise communicates, this being, on the one hand, the intent contained in the making of a promise, and, on the other, the necessary mirror image of that intent, namely, what the promisee understands that declaration of will to communicate.[8] However, an analysis of the foundations of law that were to stop at this level would simply collapse into an empirico-psychological investigation and would contradict the prime philosophical aim of phenomenology as set out in Husserl's revolutionary works. Reinach speculates that an inquiry into law will lead to an ontology, one he explicitly understands to be a theory of *a priori* objects, that is, objects that only come about as a reality having a sense, or *Sinn*, conferred on it by a "transcendental" subject, rather than by a merely psychological one.[9]

The innovation brought by the phenomenology of law, and specifically by Reinach, consists in postulating an immediate grasp of juridical ideal objects.

[8] Reinach outlines the so-called *Erlebnisse* (or "lived-through experiences") peculiar to law, and especially the equivalence between promise-making and the will's *Erlebnis* as realized in a "social act." To be sure, the question of the *soziale Akte* occupies a rather marginal place in Reinach's phenomenological theory; even so, there is plenty of literature that takes this particular angle rather than concerning itself with the authenticity of the phenomenological reading. This can be appreciated in particular in Anglo-American literature and in the "realist" interpretation of phenomenology. See in general the work found in *Aletheia: An International Journal of Philosophy*. This journal, put out by the International Academy of Philosophy, based in Irving (Texas), presents itself as "the only publication representing phenomenology in its original form as a philosophical realism." Exemplary in this regard is Seifert 1983.

[9] Husserl fights that psychologism at full throttle, not only in his *Logische Untersuchungen* but also in his 1913 *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie*. It is not incidental that that year also marked the publication of Reinach's *Die apriorischen Grundlagen des bürgerlichen Rechtes*, and that both of these book-length essays (Husserl's and Reinach's) were published in the first volume of the phenomenological *Jahrbuch für Philosophie und phänomenologische Forschung* (E. Husserl 1976 and Reinach 1913).

Thus, as we have seen, Reinach posits law's attainment of an ontology, an ontology he understands as an *a priori* theory of objects. This result led some to speak of a sort of "Platonism" of two worlds, the empirical one and the essential one, by which is meant an unresolved decoupling of an *a priori* law and a positive law.[10]

The reading of law for which Reinach paves the way is patently a reading that gives access to the law through the mind's eye, through an "inner seeing" or "intuition" that does not stop at sense perception, still beclouded, still caught in the empirical. This intuition, moving past the necessary first step of knowledge, empirically contaminated, manages to attain a level of knowledge that can be described as superior only inasmuch as it possesses objectivity. This is a level the Ego can reach only if it can break its habit of frequenting the empirical, that is, if through an act of *epoché* (ἐποχή) it can bracket the world of experience and thereby distil its essence, or idea. The *a priori* elements of law can thus be described as "constituted" into realities proper only through a knowing self-attaining a higher and higher degree of knowledge—in fact Husserlian philosophy after Reinach would develop the knowing self into a mature conception as the *transcendental* self, a self that by degrees takes on an independence and objectivity of its own—in an evolutive process through which the knowing self "intentionalizes" legal cases in their essence and in this way constitutes them as such, that is, as legal *a priori*, or universals, and so also as the "realities" on which positive law, historical and contingent, is founded. The essences that *a priori* legal theory sets out to investigate are the "prime legal elements," those which the objective legal *will*, the will exercised by power or by an authority, has failed to create (Reinach 1989b, 205).[11]

It is clear that Reinach frames the problem of law with a view to arriving at a *definition* of it, that is, finding an adequate method by which to know the object to be defined. On his philosophical approach, *a priori* legal rules may well have an unconditional value placing them above the rules of positive law. On the other hand, the rules of positive law could not in any way undercut the veridicality of the existence of an *a priori* rule or the veridicality of its distinctive structure. After all, it is precisely the theoretical coherence and impenetrability of the *a priori* which makes it possible to provide a foundation for every possible systematic legal construction. As Reinach says, it becomes necessary

[10] See specifically Bobbio 1934b and 1948. This interpretation, understandable though it may be from a strictly legal-positivist standpoint, fails to consider that what the decoupling effected in Reinach's work seems to suggest is actually to be taken as its pointing out the possibility of two different modes of knowledge.

[11] Reinach's first interpreters were careful to point out the deep meaning of his *A Priori*, and for this reason, coupled with their chronological and cultural proximity to Reinach, they more accurately captured the meaning of his theory. See, in particular, Schreier 1922–1923, Sauer 1923–1924, Dobretsberger 1974, Petraschek 1932; a later but rather faithful account can also be found in Peschka 1967.

to "turn our gaze in an altogether different direction so as to gain access to the realm of purely juridical legalities, which in every respect subsist independently of human knowledge and organization, and above all independently of the world's actual evolution" (Reinach 1989b, 277–8; my translation).

There remains the question of how two entities logically and factually so different from each other as *a priori* law and the law in force can coexist: What kinds of relations hold between them? Is it possible that one of the two elements should prevail? And, if so, what principle would determine its course? Lying in wait here is the risk of lapsing back into the traditional decoupling between positive law and natural law. The solution, again, will consist in clarifying that our grasping of *a priori* law—and so also the very existence of this law—is a matter regarding the effective capacity for an "adequate" knowing, such that nothing deriving from the determinateness of historically enacted law can bear against it, even if such posited legal content should show itself to be contradictory. Reinach writes in this regard that "we cannot speak of 'contradictions' between the *a priori* theory of law and positive law, but only of deviations which the law of being [*Seinsgesetze*] makes from prescriptions of duty [*Sollensbestimmungen*]" (Reinach 1989b, 252; my translation). When "every prescription will conform in the first place to the law of essence [*nach dem wesensgesetzlich Seienden*], insofar as this essence, considered in and of itself, always also coincides with that which ought to be [*das Seinsollende*]" (ibid., 261; my translation)[12] then there will be an identity between positive law and *a priori* law. Reinach thus manages to put forward a conception that appears to inherit the task of natural law: He does so by freeing that theory from any theologizing or axiological presuppositions, that is, by translating the decoupling into logical terms.

4.3. Gerhart Husserl and Law between Time and History

In the preface to *Rechtskraft und Rechtsgeltung* (The force and validity of law: G. Husserl 1925), Gerhart Husserl (1893–1973) makes the following remark:

> The dedication this writing makes to my father is something more than a token of filial recognition. I owe it to him if I have come to understand the principled necessities proper to any authentic science, even in a jurisprudence adequate to the ultimate requisites of scientificity. It is out of this knowledge that the task and method have arisen. In this way the phenomenological model of investigation has exerted an influence. (G. Husserl 1925, VII)

These are words that G. Husserl dedicated to his father in 1925, once he had already committed to a professional and intellectual path. Indeed, the follow-

[12] Reinach's accommodating stance did not exclude polemical episodes, as when he claimed that legal positivism "knows nothing outside the arbitrary positing of positive law and does not want anything to do with the relations of validity existing outside such positing" (Reinach 1989b, 268; my translation).

ing year G. Husserl received tenure in Kiel at the School for the Sciences of Law and the State. And so his dedication recognizes in the most natural way his debt to a thinker who, as the first and foremost source of inspiration for "phenomenological" philosophy of law, also provided that same inspiration for his son's work.

Phenomenology really did provide a model for G. Husserl, who made constant reference to it in his work. In that lies one of his signature traits, a characteristic that comes into even sharper relief by virtue of his no less constant willingness to test that model against other approaches, first among which the one that, while deriving from phenomenology itself, purported to offer an alternative to it, namely, Heideggerianism. In addition to this influence were those of neo-Kantianism and the free law movement (Kantorowicz 1906).[13] This speculative blueprint is clearly present in the previously mentioned *Rechtskraft und Rechtsgeltung* and would grow even stronger in his later production.

The central question G. Husserl took on in this work is that of legal validity. This remained a primary concern for him across the arc of his research, and it is what in his own time drew the attention of legal scholarship, which was especially interested in a line of investigation that could view itself in relation to the Kelsenian standard. Then in 1929 came another important work, a long article titled *Recht und Welt* (Law and world: G. Husserl 1964), where the central themes of G. Husserl's research are developed in a mature way: This applies *in primis* to legal temporality, a question he would go back to over time, even in works of a much later date, and in full consonance with his early beginnings (G. Husserl 1930–1931, 1933, 1955, 1964, 1969).

What is especially striking about the long course of G. Husserl's intellectual development is its coherence and continuity, all the more so if we consider the extensive American experience he shared with the many intellectuals who found refuge in the United States in the 1930s. Indeed, instead of *shaking* the early foundations of his thought—especially as concerns his espousal of the phenomenological principles—this experience served to *enrich* them.

In April 1933, in Hitler's Germany, G. Husserl was dismissed with immediate effect owing to his "non-Arian" origin: He was barred from teaching at the University of Kiel, where he was replaced with Karl Larenz. He thus moved to the University of Frankfurt am Main, but with the passage of the so-called Nuremberg Laws, he was forced to withdraw for good. He thus emigrated to the United States, and in 1941 became an American citizen. He taught at the University of Washington from 1940 to 1948, subsequently serving as legal counsel for the Allied High Commission (High Commission for Occupied

[13] The influence Kantorowicz had on the legal phenomenologists can easily be appreciated just by considering that one of them, Adolf Reinach, had a long scholarly exchange with him (on which topic see Schuhmann and Smith 1987, 6).

Germany), and in 1952 he returned to Germany (at that point a federal republic), where he taught at university as a visiting professor.

His legal philosophy revolves entirely around the idea of temporality as the canon through which to interpret the whole of law. Indeed, this is understood by him as a foundational category, not only in gnosiology but also in practical philosophy. His best-known work, *Recht und Zeit* (Law and time: G. Husserl 1955), actually came much later than other, equally important writings in which he develops the theme of temporality in law, and its title is meant as a deliberate reference to Martin Heidegger's *Sein und Zeit*, whose first edition dates to 1927. In fact it is from this work by Heidegger that G. Husserl took some of the philosophical categories used in writing the earlier *Recht und Welt* (G. Husserl 1964), where for the first time he tackled the question of legal temporality, though it cannot be disregarded that time is also closely bound up with the question of validity, addressed even earlier in the 1925 *Rechtskraft und Rechtsgeltung*. But it also bears mentioning that despite the points of assonance which tie *Recht und Welt* to Heidegger's existentialism, this article was published in the Husserlian journal *Jahrbuch für Philosophie und phänomenologische Forschung* (Yearbook of philosophy and phenomenological research), and it is accordingly an essentially phenomenological imprint that the article bears. So it is in the first place this 1929 article that we must look to for an understanding of G. Husserl's "temporal" reading of law.

The first salient feature of this article lies in the terminology used in it, which is overtly Heideggerian. The existential analytics set out in *Sein und Zeit* forms the basis on which G. Husserl extracts the speculative nexuses describing humans and their specific "there-being" (*Dasein*) as a "being-in-the-world" (*ein In-der-Welt-sein*) and as participation in a being that flows toward death (*ein auf den Tod auflaufendes Sein*) (Heidegger 1979, 12, 53, 65). Now, also belonging to this world of man are those "things" (*Dinge*) which are legal: They are not transitory or artificial, on the contrary they are permanent part of the world of man, they are rooted in it. And yet there is certainly something that changes in connection with these legal things, and that is our way of understanding them (see G. Husserl 1964, 67). Fully in sympathy with the phenomenological school, then, G. Husserl assumes there to be two modes of knowledge, only one of which can lead to a rigorously scientific understanding of law (cf. Edmund Husserl here: E. Husserl 1976, pars. 1, 18–32). The objects of the world, and with them legal objects, are "given" (*gegeben*) to humans in the first place in an intuitive (*naiv*) being-given in which the person remains in the flow of his lived experience of the world, assuming a demeanour that can be described as "natural." The world of experience is a world awash with doubt (*eine Welt des Zweifels*), and this doubtfulness of the world is founded in the temporality (or *Zeitsein*) of human there-being, which in turn is mainly characterized by transitoriness (*Vergänglichkeit*). There does exist, however, the possibility of transcending this "region" (*Weltregion*) of doubt, thereby realizing a world of stable values.

It is necessary to this end to put into practice a behaviour extending beyond the space proper to lived experiences—the space constructed by the "natural" consciousness of the time—so as to move toward a radical "detemporalization" (*Entzeitung*). Therein lies the "ecstatic" (*ekstatisch*) attitude, projecting humans outside their worldly being (*Welt-Dasein*) in the direction of transcendent objects, for in this ecstasy they are "outside theirselves," outside their normal life space, entirely projected toward transcendent things. And so, apart from bespeaking an epistemology cast in a phenomenological mould, G. Husserl's conviction that there are fundamentally two ways of knowing is such that only by lifting ourselves from the "maybe" of the world can we humans be in a position to grasp the *a priori* truths of science, this through an "intentional" stance. Even *legal* objects, after all, fall outside the reach of naive experience, in that inherent in their particular essence is a connection with transcendence (see G. Husserl 1964, 68–9, 70–7). Then, too, since among the shared parameters of juridicality is that of something's being "willed," it can likewise be asked: How can "the once" (*das Einmal*) of a will tied to the here and now form a basis for "the once and for all" (*das Ein-für-allemal*) of legal norms? Here comes into play that "detemporalization" which—by bracketing the immediacy of experience (i.e., performing the "*epoché*" on it) through the so-called ecstatic attitude—can single out an "abstract time," that is, a level of temporality that, however situated it may be between a beginning and an end, does not see its contents reduced to mere contingency.

Let us take a closer look at this passage. G. Husserl claims that law connects certain "legal consequences" (*Rechtsfolgen*) to certain "classes of facts" that can be described as "conditional" (*Wenn-Tatbestände*), forming a hypothetical propositional structure that evidently bears the imprint of Kelsen's normative theory, which at that time stood as an ineludible reference point. These conditional classes of facts cannot, however, consist in temporally contaminated realities; it follows that, in search of an internal truth, the law comes to create its own sphere of voluntary facts, a sphere endowed with a therebeing fully insulated from the changeful reality of social acts. At this point the conditional classes of facts turn into a series of realities of action grasped as to their ability to exist within the region marked off by law (*rechtsregionalen Seinkönnen*).[14] This means that what is rigidly fixed in legal norms is a "complete," self-enclosed world of deindividualized actions, a world that knows no doubt: In it the future has no place, because through the reduction whereby the classes of facts become capable of being touched by norms, the future, from a legal point of view, can be said to have been anticipated (see G. Husserl 1964, 79). Therein lies the temporal abstractness of law.

[14] On the role of the concept of region in phenomenological thought, see E. Husserl 1976, pars. 9, 10, 16; 1971, par. 7.

Shortly after *Recht und Welt*, G. Husserl wrote an article that, as can be gleaned from the title, *Die Frage nach dem Geltungsgrund des Rechts* (The question of the foundation of legal validity: G. Husserl 1930–1931),[15] addresses the question of the foundation of the validity of law. And in treating this question he claims that legal temporality finds its specificity in ascribing to law the singular meaning of a being-there that proceeds from a beginning. Certainly, this comes about not in the sense of contaminating the law itself with a "natural" kind of law, but through the finding that the foundation of legal validity and the beginning of law undoubtedly need to be sought in the structure proper to humans, in their "being-there," which is a being-in-the-world. Precisely from this feature comes the important role the community plays in mediating between law and the individual. And yet this does not yet suffice, because, as G. Husserl sees the matter, we cannot discourse in any exhaustive way on the foundation of legal validity unless our gaze "is turned toward the logico-juridical structure of the beginning of the law's there-being": There are "*a priori* ideas," transcending the present and announced in the there-being through an ascription of meaning, and because this ascription bears a different temporality and is imbued with values, it brings ideas themselves into connection with the there-being, in such a way as to mediate the eternal logical with "natural time" (G. Husserl 1930–1931, 157–66; my translation).

So what G. Husserl is trying to do in this analysis is to find the possible relation between the stability proper to law and the fleetingness of time. And through this investigation he is led to claim that the synthesis of norms with factual circumstances makes it possible to "anticipate" the future, in the sense that the future is phenomenologically "reduced" to the sphere of foreseeability. What it means for there to be no future in the legal corpus is that there is no temporality understood as an immediate flowingness: The temporal structure proper to law is that of "abstract time," which is attained through that special procedure which is conceptually equivalent to the phenomenological idea of reduction (the *epoché*), namely, "detemporalization" (*Entzeitung*). This passage is necessary for the existence of law to have meaning, but is insufficient if the law neglects to come to terms with history. To this end it is advisable to bring law into comparison with a single legal system, which is always the system of a given legal community. We must in the first place understand the determinacy of every single order, and this must be done by mediating its historicity with its underlying social ethos. Indeed, the law always corresponds to the will of a legal community, a community made up of "partners-in-law," and so it is only through a "voluntary intention" (*Willensgesinnung*) to endorse a body of

[15] In this work, which revisits the question of validity, Husserl takes issue with Karl Larenz's *Das Problem der Rechtsgeltung* (The problem of legal validity: Larenz 1967): It is G. Husserl's contention that in this work Larenz confuses the autonomy of the legal region with metaphysics and morals, conceiving the is in light of a hypostatized ought informed by cultural prejudices.

norms that the legal order itself can arise and be sustained. Subjectively corresponding to the objective existence of the norm is a "persisting-in-an-intention-faithful-to-the-norm" (*In-Norm-getreuer-Gesinnung-verharren*). Evidence of this lies in the taking down of law over the course of a revolution, once the members of the legal community at issue no longer share any voluntary intention to keep the law in place, and with the breakdown of that shared voluntary intention also comes the breakup of the single persons who have lost their original intention (see G. Husserl 1964, 80).

There are two bulwarks that law can put to use to ward off contingency: One is pure essence, which lives in abstraction from time and so ensures the identity of the foundation; the other is the guarantee afforded by intention itself, by the voluntary perduration of juridical behaviour.[16] The concept of intention imparts a directedness to the foundation and to perfection, a teleologism that G. Husserl draws from phenomenology itself and whose evident Kantian lineage is completed through another important theoretical move. Indeed, as G. Husserl explicitly claims, even though the transformation wrought by law cannot be understood to mean that social life has been reconfigured under the lodestar of eternity, what actually props up the commitment to law is the human directedness toward perpetual peace (G. Husserl 1964, 80–3).[17] It is noteworthy, then, that G. Husserl should construe the law as structurally "valid once and for all" and as devoted by vocation to being an "end" in itself or, better yet, an "outcome" ("Recht ist selbst ein Ende": G. Husserl 1964, 79). This is an idea he clarifies in this way:

> The human there-being spans from life to death, and that way of being is proper to its essence. Its being temporal has the meaning of being on a journey (a being-toward-death). The law's temporal structure is instead something different. The law is not geared toward the aim, but rather wants to be itself an outcome. (G. Husserl 1930–1931, 157; my translation)[18]

The question one is prompted to ask in connection with a theory so framed—the question, What is the ultimate foundation of law?—can be answered by noting that in G. Husserl's discussion we find two modes of foundational le-

[16] One should not fail to appreciate that this "intention"—this *Gesinnung* that G. Husserl resorts to in backing up his own legal theory—has a philosophical lineage that is no doubt important. The idea traces back to Martin Luther and is picked up by a whole constellation of important thinkers, first among whom is Immanuel Kant in his doctrine of moral intention as treated in his *Kritik der praktischen Vernunft* (Critique of Practical Reason), where it is argued that moral action is grounded in freedom understood as the causal law of the will, from which it follows that what brings about the performance of a willed duty is an "intention" aligned with the moral law. Two other authors that can be included in this lineage are Gustav Radbruch and Rudolf Stammler (see specifically Radbruch 1956a and Stammler 1926).

[17] As is only natural, in treating this topic G. Husserl refers to 1795 Kant's *Zum ewigen Frieden* (Perpetual peace: Kant 1968).

[18] The German original: "Es ist nicht auf ein Ende hin, will vielmehr selbst ein Ende (*finis*, τέλος) sein". On teleology and rights, see Stella 2013, 1–23.

gitimacy, each interwoven into the other and both equally prominent: On the one hand is the mode tied to the *Gesinnung* (or basic attitude), and on the other the one accessed through so-called ecstasy, that is, a distancing of oneself from immediate temporal reality. The first mode lies in the choice we make to go beyond ourselves and project ourselves into the transcendent through the infinite finiteness of the juridical. The second mode is instead modelled on the transcendental phenomenological reduction, in that ecstasy is a means through which *homo iuridicus* can attempt to doubt his own being-there, so as to prime himself to grasp the essence of law.

That is precisely the frame within which the theory can bring the parameter of temporality into play, along with another parameter, consisting in that special event from which the law is claimed to originate, namely, the *Entzeitung*, an event treated in greater depth in the 1955 *Recht und Zeit*. It is by this means that we can attain those specific forms, belonging to abstract time, which are the essential legal categories, a chief example of which is given by the concept of a legal claim. G. Husserl argues that through this detemporalization we can overcome the contingency of the single legal order as an order tied to a given time and possessing a historical uniqueness, since in *this* form a legal order is set in the historical reality of *this* legal environment. There comes into focus in this way "a system of significant nuclei [*ein System von Sinneskernen*]" of legal "ideas" which show themselves to be suited to being relocated from one legal environment to another, and which to that extent can lay claim to universal validity (*Allgemeingültigkeit*). An example of a claim to validity so construed lies in the Roman *ius gentium*:

> The classic example of a system of legal ideas distilled by reducing a given legal environment to its meaningful core lies in the Roman *ius gentium*. The *ius gentium* comes into being claiming to be a worldwide system of law—a system of legal principles and concepts having validity whenever and wherever there are politically organized societies. (G. Husserl 1955, 13; my translation).

However, because the laws of thought "are not maxims of action," and their function consists in setting out "the logical presuppositions a judgment must comply with if it is to be true," then the following must also be the case:

> So long as we proceed correctly, our conceptual recourse to the "significant nucleus" of the legal classes of facts we encounter in legal reality opens our eyes to a system made not of "higher level" behavioural norms but of legal *truths*, which as such have *no* normative force. A reduction that accomplishes as much will reveal to us the fundamental structures of every possible system of law: These structures have the form of a legal *a priori*. What we make our own in this reductive procedure (which is that of abstraction) are certainly the *logical* presuppositions, not the merely logico-*formal* presuppositions, those we are obligated to comply with if a social order is to have meaning as a legal order. (G. Husserl 1955, 13–4; my translation)

As can readily be appreciated, G. Husserl's theory echoes the scheme drawn directly from his father's phenomenology, a scheme that had already been ex-

perimented with by other legal phenomenologists before G. Husserl, and in particular by Adolf Reinach (1913).[19] There is much that G. Husserl extracts from Reinach's investigations, as well as from Felix Kaufmann's inquiries into propositional logic,[20] even though G. Husserl's penchant for quoting Heidegger prompts him to express himself thus: "The juridical man's being-in-the-world is a commitment made to being for the ought" (G. Husserl 1964, 78; my translation). G. Husserl is adamant about the need to embed pure logicity into reality, emplacing the ideal categories of law into the historicity of lived experience; and it is "temporalization" (*Verzeitung*) which can bring the legal *a priori* into contact with human existence, and which is accordingly entrusted with this indispensable task. This means that law grounds its validity in the concreteness of its own actuation. The procedure by which the law's permanent structures are identified, then, unfolds in three distinct stages, namely, *Entzeitung*, *Abstraktion*, and *Verzeitung*. In the first of these, detemporalization, we identify law's significant kernel, ever valid across time; however (and this is where the second and third stage come into play), the force of law cannot move *a posse ad esse* (from potentiality to actuality) unless legal norms, having been "abstractly anticipated" by way of *Abstraktion*, are in their turn "temporalized" in relation to their content: This is the role entrusted to *Verzeitung*, through which norms are applied to the manifestations of social reality.

In order for there to be a "realization of law," it is necessary to move from the "hereafter" of the temporalized world into the "here and now" of willing reality, which is set in the temporal flow of time (G. Husserl 1964, 82). Applied law has the distinction of superseding, completing, and bringing to maturity the pure logicality of norms, which only in this way can gain full validity, thereby coming into force: The role of applied law is to complement legal essence, and in it consists the evidence of law (ibid., 82–4). The task of interfacing the two worlds is carried out by the judge, whose role—in this global vision of juridicality connected with being—is contextualized in an absolutely primary way. This speculative move by G. Husserl—a move reflected in which are the ideas of the *Freirechtsbewegung* (or free law movement), also very much in evidence in Fritz Schreier's legal phenomenology—comes at a crucial juncture in *Recht und Welt*. Here the "theory" of law comes face to face with the "practice" of law, in the sense that "the problem of the concretization of law is that of the social reality of law, which through its concrete operation extends downward into the lived time of society, and in whose sphere of action

[19] A phenomenological reading of G. Husserl's work can be found in the contributions collected in the commemorative Würtenberger 1969a. See above all Reiner 1969, Würtenberger 1969b.

[20] Kaufmann's propositional analysis is something that G. Husserl looks to in light of his essentialist gnosiological vision, and so in keeping with the basic tenets of phenomenology. See G. Husserl 1955, 13.

the legal order intervenes" (ibid., 86; my translation). The absolute protagonist in this phase is the judge; indeed, because judges effect within themselves a "reduction" (*Reduktion*) of their being-persons to their being partners-in-law and alienate themselves from their being-there in the world—this in virtue of the ethico-religious commitment through which they are enabled to reach the law—they make themselves into a single thing with the willing intention of the juridical community they themselves belong to. They act as "living organisms" within the legal community, whose normative will they make effective in the concrete individuality of social reality, and this is possible precisely because they recognize themselves in a "pure" and exclusive way as juridical partners, that is, as subjects for whom only the law is originally given in the entirety of its essence:

> In seeking to arrive at a legal decision, it will be necessary in the first place to proceed in such a way that one's attitude to the social world of actions is reduced to an attitude as a partner-in-law, so that the intention of the juridical community (an intention he must query) will reveal itself in a pure way. (Ibid., 89–90; my translation)

It is a central place, then, that comes to be occupied by interpretation, an indispensable element for the purpose of actualizing the law. Writes G. Husserl:

> When interpreting a law, it is necessary to go back in thought to the historico-temporal context in which the law was originally posited through its creative act. But this is only the starting point in the process of interpretation. In the next step it will be necessary to view the law by reference to its time of inception, so as to "throw it into relief" against that background by mentally tracing its course to the present. Only in this way is it possible to create a living relationship with the current day and its issues. [...] Legal norms carry out an action conforming to their meaning, this inasmuch as, and for as long as, [...] "they travel in the company of time." (G. Husserl 1955, 30; my translation)

Another clear example showing the importance of bringing the study of the different modes of time to bear on law can be appreciated in the analysis of the concept of a claim (*Anspruch*), to which G. Husserl devotes a specific interpretive effort. He maintains that there generally exist legal concepts having the nature of events and actions, "which happen or are carried into execution at an established moment" (G. Husserl 1955, 29; my translation). More complex, by contrast, is the meaning ascribable to legal concepts belonging in another category: those whose structure lies in their "extending over a time span" (*Zeitspanne*), and which in turn break down into two types, depending on whether or not the relevant time boundary is set by law. It is under the first type that we should classify a claim, understood as a "mandatory legal request," since these kinds of requests are creatures of law through and through (ibid.). A claim reveals itself as a pure category, its peculiar structure being given by its unhistoricalness. Its existence is bounded by two temporal endpoints, "from-to" (*er besteht von - bis*), and can therefore be measured; a claim does

not entirely lies beyond time, and yet it is not contaminated by happening. It has its own internal structure, and this characteristic makes it exemplary in outlining the temporality distinctive to legal truths.

4.4. Felix Kaufmann: The Form and Meaning of Legal Norms

Felix Kaufmann (1895–1949) owes his fame to what is considered a classic of sociological thought, a work known especially in its English version, namely, *Methodology of the Social Sciences*.[21] He is not equally famous as a legal philosopher, to be sure, but this, too, is a field to which he has made an original contribution. He introduces us to a cultural milieu whose distinctive trait by comparison with that of the fountainhead of phenomenology of law, Adolf Reinach, lies in the new important place occupied in legal philosophy by Hans Kelsen. Indeed, Kaufmann regarded both Kelsen and Husserl as his teachers, but unlike Kelsen he did not shy away from the project of analyzing law and society with the tools of phenomenology, and he wound up bringing Kelsen's deontic logicism into relation with Husserl's ontology.

Initial evidence of cross-pollination between Husserlian and Kelsenian modes of thought can already be found even in Kelsen's *Hauptprobleme*. It is Kelsen himself who, in the preface to the 1923 edition (Kelsen 1923c), outlines the evolution of his innovative theory pointing out Husserl's contribution to it, while also mentioning two of his own disciples, whose work likewise drew inspiration from Husserl's philosophy. As Kelsen remarks,

> There emerges in the *Hauptprobleme* the contraposition between the pure theory of law and socio-psychological speculation, in parallel to the general contraposition between logicism and empiricism, such as it is classically represented in Husserl's *Logische Untersuchungen*. (Kelsen 1923c, IX)

And he goes on to say that "this tendency was then carried forward" not only in his own writings, notably in his 1916 *Die Rechtswissenschaft als Norm- oder als Kulturwissenschaft* (Legal science as a science of norms or as a science of culture: Kelsen 1968f) but also, and especially, in the work of Felix Kaufmann and Fritz Schreier, both of whose writings are "oriented toward Husserl's phenomenology" (Kelsen 1923c, X; my translation).

Kaufmann, who in 1922 was supervised by Kelsen (along with Hold-Ferneck) for his habilitation exam in legal philosophy at the Vienna University School of Law,

> soon became a regular participant in the *privatissimum* that Kelsen held at his home for an elite circle of budding young jurists and political scientists. The core of this group was formed, from before the Great War, by Adolf Merkl, Alfred Verdross, and Leonidas Pitamic. After the war,

[21] The German original is F. Kaufmann 1936, republished with a rich and learned foreword by G. Winkler (F. Kaufmann 1999). The subsequent English version, dating to Kaufmann's American period, is a different work: F. Kaufmann 1944.

the group gradually grew by also taking on board Felix Kaufmann, Fritz Sander, Walter Henrich, Fritz Schreier, Josef Kunz, Josef Dobretsberger, and Erich Voegelin. (Winkler 1999, XIV; my translation)

However, even though Kelsen, the founder of the Vienna School, drew his original inspiration from the phenomenological element, he would soon fall out of harmony with it, finding himself better attuned to the theory set out by the coeval and homogeneous neo-Kantian Hermann Cohen. In this way he parted with realism in favour of a logicistic choice.

Quite different was the position taken by Kaufmann, who on the contrary never disowned the phenomenological lineage. In light of that fact, it even makes sense that in his approach he should have turned to the social sciences: The realism proper to the social sciences did not stray too far from the phenomenological method and subject matter.[22] After all, starting from about the latter half of the 1930s, Kaufmann set aside legal issues to focus on socio-economic ones, and it looks like in so doing he resorted to an eclectic array of methods, displacing phenomenology as the sole methodological reference point.[23] This should not come as a surprise if we consider that

from the 1920s (from 1923, actually) Kaufmann also regularly took part in the colloquia of the philosophical circle that in Vienna formed around Moritz Schlick. Rudolf Carnap, who arrived in Vienna a couple of years later, recalls the situation as follows: "Also a frequent attendee at the meetings was the legal philosopher Felix Kaufmann, though he did not count himself as a member, because his philosophical outlook was something quite apart from ours. He was mainly influenced by Husserl's phenomenology, and then, in America, he moved closer to an empiricist view." (Winkler 1999, XV; my translation)[24]

It should be considered that just as Kaufmann was trying to move his own posi-

[22] In *Methodology of the Social Sciences*, Kelsen's *Reine Rechtslehre* is hailed as "one of the most remarkable critical achievements in the social sciences," attesting to Kaufmann's conviction that the science of law is only "one" of the social sciences, forming a continuum with all the others (F. Kaufmann 1944, 209).

[23] Kaufmann was *Privatdozent* of legal philosophy in Vienna until 1938, the year in which, on account of his Jewish origin, he was forced to flee to the United States, where he continued to teach the same subject at the Graduate Faculty of The New York School for Social Research, a position he held until his untimely death. He was also coeditor of the journal *Phenomenology and Philosophical Research*.

[24] Winkler's source is Voegelin 1994, 22ff. See also Stadler 1997. A firsthand account of the relation between logical empiricism and phenomenology can be found in F. Kaufmann 1940. It should also be noted that the doctoral dissertation in philosophy that Kaufmann submitted in 1924 at the Vienna University School of Law was supervised by Moritz Schlick and Robert Reininger.

Other accounts of the intellectual life surrounding Kaufmann's activity can be found in Métall 1969 and Zilian 1990. Interpretations of Kaufmann's legal philosophy viewed by analogy with Fritz Schreier's can be found in Bobbio 1934a and Ebenstein 1969. An exceptionally prescient critical reading is offered in Walz 1928.

tion closer to the specific point of view of Moritz Schlick's circle, he focused on the essential role played by the "*a priori* conception" and on the dual mode of knowing, which elements are both typically phenomenological objects of study.[25]

Two are the essential works we need to look at if we are to grasp the sense of Kaufmann's phenomenological philosophy of law: *Logik und Rechtswissenschaft* (Logic and legal science: F. Kaufmann 1966a) and *Die Kriterien des Rechts* (Criteria of law: F. Kaufmann 1966b), published in 1922, and in 1924 respectively). The first one is significantly subtitled "Elements for a system of pure theory of law"; the second, a more mature work of greater depth and complexity, embarks on "an inquiry into the principles of the legal theory of method" (so reads the subtitle); but the point is that the one and the other alike start out from Kelsen's already established theory of law. It bears pointing out, however, that Kaufmann recognizes an equal debt to both Husserl and Kelsen.[26] This nod of recognition is reiterated again and again over the years, even when, having broken away from the logicism inherited from them—whether such logicism be real or presumed, homogeneous or heterogeneous—Kaufmann will turn to a sociologism of both method and content. This sociologism is supposed to be a natural consequence of the phenomenological concept of experience. The Husserlian method in fact invokes a kind of knowledge that passes through many steps. The first of these is the one proper to sensitive intuition: It is a step wholly set in experience (*Erfahrung*). Only later is it possible to reach intellectual, *a priori* intuition. Between these two "locations" (let us so call them) one can find a whole graduality, where the subject begins to reveal himself to himself, in a movement through which he eventually achieves transcendentalism and, from a realistic point of view, grasps the related εἶδη.

Kaufmann espouses Husserlian transcendentalism, at the same time showing a full understanding of an epistemological project that starts out from antipsychologism and finds a coherent conclusion in transcendental idealism. In this very criticism of psychologism, and in the endeavour to supersede it by bringing transcendentalism to bear on the law, lies the point of departure for Kaufmann as he sets out to analyze legal norms. This analysis consists of a twofold quest to find a norm's "specific content of sense," while also holding fast to the pursuit of "form" in law. As concerns the first prong of this programme,

[25] See the letter Kaufmann wrote to Carnap in 1929, asking him not to include his name in the pamphlet "The Vienna School on the Scientific Understanding of the World," in that he feels he cannot fully espouse that school's epistemology (The University of Pittsburgh Libraries, Special Collections Department, serial number 028-25-03, quoted in Zilian 1990, 21).

[26] See F. Kaufmann 1966a, and 1966b, chap. 4. The 1922 work is nothing other than Kaufmann's habilitation thesis in the philosophy of law, while the 1924 work is his doctoral dissertation in philosophy. The Viennese years are those in which Kaufmann's work turns to legal issues. Dating to 1929 is his book on criminal law (F. Kaufmann 1929). After that comes an essay published in an anniversary volume for Kelsen: F. Kaufmann 1931. His last legal work clearly signals his choice to analyze law within a socioeconomic frame: F. Kaufmann 1934.

Husserlian orthodoxy leads Kaufmann to develop his logical investigations along a path clearly divergent from Kelsen's. And as concerns the second prong, as much as Kaufmann is very much with Kelsen in looking to Cohen as an important source and inspiration,[27] he nonetheless will end up more or less wittingly moving away from Kelsen's pure theory, an inevitable outcome of the two thinkers' different understandings of form. Whereas Kelsen understands form to coincide in the final analysis with the *Sollen*, Kaufmann equates form with the idea, with the essence or archetype, the *a priori*: Form thus encompasses the full spectrum of possibilities, *including* the *Sollen* but also extending beyond that sphere. So for Kaufmann—and so also for Husserl, obviously—if there is any *Sollen* (an ought), it is because there is a *Sein* (an is): Form is ultimately connected to the *Sein*. Kaufmann subscribes to Husserlian logic, and so his theory of law is to be considered completely independent of Kelsen's theory: It is by proceeding from Husserl's theory that Kaufmann approaches the analysis of legal norms, thus enriching his own vision of law by bringing a speculative element to bear on it. Kaufmann's formalistic theory hinges on certain "relations of essence" and describes the validity of these relations as dependent on the given area of content, this in accordance with two postulates: that of the freedom of experience and that of the delimitation of content (see F. Kaufmann 1924, 26). In his system, the "pure theory of law" morphs into a "legal theory of forms," by which is meant "the system of those truths that come from the specifically meaningful contents of norms, that is, a theory of the formal criteria of law" (F. Kaufmann 1924, 68; my translation). Kaufmann thus moves beyond Kelsen, for he is convinced that

> the biggest obstacles in the way of finding solutions to methodological questions usually arise from a denial of the theoretical knowledge of the *essence* [...]. The expression of this fundamental belief lies in the *postulate of methodological purity*, pointing to the need to structure scientific subjects from exclusively theoretical standpoints. (Ibid., 162; my translation)

He thus starts out from a theory of "purity" as a matter of theoretical choice, driven as he is by the need to come to an understanding of the prime elements of knowing. This purity cannot just be reduced to purity in the manner of Kelsen, for the theory, in its avowed commitment to search for the "essential" foundation, sets out a more engaging argumentative challenge. There is

[27] A motto encapsulating both of Kaufmann's books on legal philosophy is found in a famous passage he quotes from Cohen: "Only that which is formal is real [*sachlich*], and the more a method is formal the more it can become real. And the more a problem is objectively [*sachlicher*] framed in the full depth of the real [*der Sache*], the more it needs to be grounded in the formal" (Cohen 1977, 587; my translation). A few years later Kelsen would quote the same passage making the following comment: "Like every species of knowledge, legal knowledge must necessarily formalize its object. This 'formalism' cannot be the basis of an accusation, for in this formalism lies what, as a virtue, is set in opposition to 'formalism' viewed unfavourably as a vice, namely, its reality [*Sachlichkeit*]" (Kelsen 1929a, 1723; my translation).

no doubt that behind Kaufmann's system looms Kelsen, with his pure theory of law and his drawing on the legacy which set up the classic problem of the spiritual sciences versus the natural; in Kaufmann, however, the issues are driven to extremes, edging beyond the safe boundaries of Kelsen's theorizing, as to both the object of the theory and its method. And so, in turning to the standard distinction between explicative and normative sciences and to Kelsen's outline of the tasks of legal science, Kaufmann innovatively comments that

> The normative sciences represent [...] only one species within the area encompassing the sciences of value. The statements "Something (if its makeup is thus and so) ought to [*soll*] take place" and "An event of that type is valuable [*ist wertvoll*]" are equivalent. [...] [T]he methodological separation between the science of nature and the empirical science of value cannot lead us to disregard all the things they have in common, which from the outset are rooted in the very nature of these sciences as sciences of experience. (Ibid., 63–4; my translation)

The essential "form" of the juridical—the form of norms—would appear, on the face of it, to be framed in similar way in Kelsen and Kaufmann; yet this is precisely the question that brings out Kaufmann's peculiar take on Kelsen. We should bear in mind, to this end, that Kaufmann offers two specific definitions of law.

The first one reads: "The law as an object of legal science is a system [*Inbegriff*] of norms, that is a system of propositions, of legal objects" (ibid., 52; my translation).

The second one reads: "The law is a system of sanctionative norms applying to human behaviour" (ibid., 69; my translation).

Kaufmann ascribes greater theoretical importance to the first of these two definitions, proceeding on that basis to reformulate the pure theory as a special discipline aimed at analyzing the legal contents of meaning, which meaning can be arrived at through an "intentional judging" connecting subject and object into a single meaningful thing. In Kaufmann's description, there is an added complexity gained by the "form" of norms in the sense inherited from Kelsen, that is, the form of so-called *pure* norms, or, better yet, of norms one comes to know in a pure way. Indeed, Kaufmann works from the phenomenological model to mould the legal proposition, or *Rechtssatz*, in relation to three constitutive moments. Behind the "You ought to," the prescription, one finds an underpinning value judgment (the axiological moment), and behind this judgment, connecting this value to a subject (or person), one finds the norm's meaning, or sense, which is configured through the intentional act; in turn this act can express a judgment only insofar as it intentionalizes an object. This is the object to which the norm's meaning itself refers: It is an ideal object, and this ideal object, the *eidos*—the idea, essence, or form—is what makes it possible to say that behind the ought there necessarily must be the is.[28]

[28] The idea that the analysis of law needs to take into account the role played by the propositional meaning of norms is something that Kaufmann pursues in the 1920s and in the essay *Juristischer und soziologischer Rechtsbegriff* (Legal and sociological concept of law: F. Kaufmann 1931).

Consequently, the "form" of a (pure) norm is so configured: "If A does not display behaviour B^1, a behaviour he ought to display, there ought to take place behaviour B^2 in relation to him" (F. Kaufmann 1924, 71).

This signifies something essential as concerns the so-called pure norm. As much as this norm, in Kaufmann's own words, conjures up Kelsen's theory, this is precisely the place where it reveals the deepest difference from Kelsen's pure norm, considering that, as is stated on the same page, the pure norm in Kaufmann's sense

> is distinguished from the simple norm "If A does not display behaviour B^1, there ought to take place behaviour B^2 in relation to him" only through a *Normierung*, that is, through an ascription of value to behaviour B^1. Accordingly, for the purposes of *legal dogmatics*, which is called on to *define classes of acts*, it is irrelevant whether any value, positive or negative, is ascribed to a given behaviour [...], but this question is not the least bit irrelevant for the *pure theory of law*, which is called on to investigate the *meaning* of legal propositions. Indeed, evaluative sentences have their own meaning, and the proper meaning of each legal proposition is given by its containing two of these evaluative sentences. (Ibid.; my translation)

If we want to set out the "content of meaning" of legal propositions, and so also the "type of nexus" by which variously many legal propositions are connected in the unity of law, we will have to push to the background the definition of law as a "system" (*Inbegriff*, embodiment) of *sanctionative norms*, favouring in its stead a definition where the task is to describe a system of *ideal objects*. Indeed, if in a Husserlian manner, we consider the *Inbegriff* as "the objectual correlate of the act of conjunction,"[29] we will be able to grasp the intentional-coordination effect exerted by the subject in ascribing meaning to a behaviour. Of course the sanction here still figures as only an empirical "criterion" (*Kennzeichnung*), whereas logico-propositional meaning is a formal-universal criterion (*Merkmal*). Kaufmann writes that "the definition of an object by empirical indication as a *distinguishing mark* [*Kennzeichnung*] must be distinguished from the logical *definition*" (F. Kaufmann 1924, 18–9; my translation). Distinguishing marks are of course something other than "markers" (*Merkmale*): Although both are criteria [*Kriterien*] of knowledge, the former are empirical, whereas the latter are logical. The *criteria of law*, for which Kaufmann entitled his 1924 work, approach the object of inquiry in such a way that they show themselves to be perfectly integrated by the deep gnosiological and methodological concern shared by both of the schools of thought that were current at the time, the phenomenological school and the neo-Kantian.

[29] It is a pregnant role that term *Inbegriff* plays in Kaufmann's discussion. It comes from the speculative system that Husserl set out in his first and second *Logical Investigations*. Here it retains the meaning just mentioned as "the objectual correlate of the act of conjunction," where it is necessary to highlight the presupposition of the act out of which meaning arises. The intentional subject has an active part in the moment of the knowledge-gaining approach. Therefore, like the system through which knowledge is gained, the legal "system" is such only to the extent that the subject confers meaning on a series of data, on a certain material reality with which he or she is confronted.

Kelsen's methodological approach therefore receives a critical rereading in Kaufmann, who reinterprets it thus:

> In knowing the opposition between *is* and *ought*, we must therefore forgo any attempt to seize the essence of normative concepts by way of is-data, and so we must also stand firm in our refusal to define punishment and enforcement as "coercion," and, correspondingly, legal norms as coercive norms, in the manner that *ought* himself picked up from ancient doctrine. (F. Kaufmann 1924, 73; my translation)

The contrast Kaufmann sets up between his own approach and the one embraced by Kelsen can best be appreciated in the following passage, however long-winded it may perhaps be.

> The term *legal obligation* must be understood to designate a commanded behaviour—that is, a *behaviour endowed with a positive "value index"* (an obligation)—whenever its omission entails a certain other behaviour that must take place with respect to the omitter. Now, this "behaviour with respect to" is called the "consequence attendant on an offence" (it is a punishment). Conversely, a behaviour designated as the consequence attendant on an offence (a punishment) defines as a *legal obligation* that behaviour whose omission means that the behaviour in question must take place. An omission consisting of an unperformed obligation is called an *illegality*.
>
> However, because in the performance of a norm-bound [*normiert*] behaviour, i.e., a behaviour understood as value-laden, lies the content of obligations in general, legal obligations do not consist of a certain class of obligations—in that their *content* would be a "determination" of "obligation at large" in relation to content—because here the specific characterizing marker [*Merkmal*] consists only of the sanctionative nexus. It is therefore the "behaviour with respect to" that marks out an *obligation* as a *legal obligation*, enabling us to recognize it as such; and yet a behaviour usually defined as an obligation is never characterized as an obligation only in that way. (F. Kaufmann 1924, 78; my translation)

The "characterizing marker," the *Merkmal*, which as we have seen is a formal-universal criterion, cannot be identified with the sanction, for this is rather an empirical factor, as such devoid of logical self-sufficiency. The sanctionative nexus is still only a contingent determinative modus: It is simply an accretion coming on top of an obligation that was already characterized as such from the outset. The meaning of a legal proposition lies in its *denotatum*, in the being proper to essence, that of the ideal object. A norm is a value judgment, and as such it refers to a being. So, only in the sense just explained can Kaufmann claim that "one can speak of a definition only where the genus falls within the range of compatibility of the specific difference" (F. Kaufmann 1924, 17; my translation), namely, of the *Merkmal*.

4.5. Fritz Schreier and Legal Interpretation

Fritz Schreier (1897–1980) is rightly included in the "circle" that formed around Kelsen,[30] and in the study of the different currents that shaped the phi-

[30] Schreier is indeed mentioned in an essay by Meinhard (2008) as being among the authors

losophy of law in the early decades of the 20th century, he is usually set, in particular, next to Felix Kaufmann, not only because they both studied under Kelsen and Husserl but also because in applying the phenomenological method to law they both devote special attention to the analysis of the legal proposition.

Schreier was Jewish and in his life felt the blunt hand of Nazism, winding up, like many, taking refuge in the United States, where he unfortunately did not manage to find a stable academic position that would enable him to systematically resume the research which had previously yielded brilliant essays. In his work, however, he never ceased to concern himself with issues in the philosophy of law, and his writings kept to a methodological blueprint consistent with the speculative choices he had made in his youth (Schreier 1922–1923, 1924, 1926, 1927, 1929, 1931, 1935). The first work we must refer to is his *Grundbegriffe und Grundformen des Rechts* (Fundamental concepts and forms of law: Schreier 1924), which he submitted as his *Habilitationsschrift* for his degree in legal philosophy, and clearly evidenced in this work is his commitment to applying Husserl's phenomenological method to law. This youthful effort, dating back to 1924, earned him praise from both Kelsen and Husserl, but it also drew the trenchant criticism of Hold von Ferneck, who apparently wouldn't so much as call Schreier by name, choosing to instead refer to him as the pupil of the intellectual foe on the opposite side, Kelsen.[31] Just like Kaufmann's coeval works *Logik und Rechtswissenschaft* (Logic and legal science: F. Kaufmann 1966a) and *Die Kriterien des Rechts* (Criteria of law: F. Kaufmann 1966b), this dissertation can immediately be perceived to bear a Kelsenian imprint, in that the author unhesitatingly deploys the indispensable assumption of the pure theory of law, namely, the idea that in order to define law it is necessary to define a norm, and that the latter needs to be interpreted in logical terms. It must also be noted, however, that even at this inceptive stage, Schreier's programme declaredly consists in "attempting to ground the pure theory of law—such as it is pursued by *Kelsen* and his disciples—in *Husserl's* phenomenology, so as to frame legal issues from new points of view, thus possibly unravelling them" (Schreier 1924, III; my translation). And so it is that Schreier, in the preface to his dissertation, acknowledges his debt to both of his "highly esteemed teachers," that is, "to his secret mentor *Husserl* and to Professor *Kelsen*," but "especially to the former for having made his unpublished manuscripts available for study" (ibid., IV; my translation).

It is in fact significant that, as can be gathered from the numerous references present in Schreier's writings, he engaged not only with Husserl's *Lo-*

in Kelsen's circle. See also Loidolt 2010, 153–61; Goller 1997, Jabloner 1998. Earlier commentaries that continue to hold their value, offering insight into Schreier's thought as they do into Felix Kaufmann's, are Bobbio 1934a and Ebenstein 1969.

[31] See Hold von Ferneck's criticism in Hold von Ferneck 1926 and Kelsen's reply in Kelsen 1926a.

gische Untersuchungen, but also with the other of Husserl's two basic works, namely, the first book of his *Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie* (Ideas pertaining to a pure phenomenology and to a phenomenological philosophy), published in 1913 under the title *Allgemeine Einführung in die reine Phänomenologie* (General introduction to a pure phenomenology: E. Husserl 1976). That very fact marks Schreier's distance from Kelsen, who in his famous *Hauptprobleme* had declared himself to be in agreement with Husserl's new epistemological objectives, this at a time (1911) when Husserl had not yet come out with the work that would advance the development of the basic elements of the phenomenological theory. What marks out Schreier's contribution (in which regard we ought not to discount his access to Husserl's manuscripts) is that his recourse to Husserl's gnosiology as his chosen model for the analysis of legal phenomena takes into account the transcendental development of that gnosiology. This enables him to extract important consequences concerning the study of legal phenomena in general and the interpretation of law in particular. So, as much as Schreier retained a lifelong allegiance to Kelsen's schooling, he reinterpreted Kelsen's theory in an intelligent and innovative way that undeniably evinces a direct link to the developments of phenomenology.

That Schreier was pursuing an objective essentially different from Kelsen's can be appreciated from the very title of his *Grundbegriffe und Grundformen des Rechts*, where he refers not only to forms but also to concepts: The latter, as we can see, are characterized as "basic," or fundamental, and this tells us that Schreier is invoking axioms and principles. Kelsen, by contrast, had very early on settled into a clear relativist antimetaphysical position, from which a theoretical analysis of law could only be undertaken within the framework of a "general theory." Not so in the case of Schreier, who, in sympathy with the phenomenological approach, sought to uncover meaningful laws of essence for a science of law and for any possible law; so, while on the one hand the highest principles of law are formal—as well as "unreal," but only to the extent that the products of law do not belong to the natural world—on the other hand it crucially falls to phenomenology itself to identify them, and that consistently with a conception barring the possibility of their being invented out of whole cloth, that is, created from scratch. Principles are ontologically autonomous.

Schreier reveals himself to be a phenomenologist through and through when—reasoning from a perspective that recognizes legal essences, the ideas of law, as having a subsistence of their own—he speaks of the need to "find" or "discover" the concepts underlying the existence of legal products. As early as in his first philosophically mature work, namely, the previously mentioned *Grundbegriffe und Grundformen des Rechts* (Schreier 1924), the fundamental concepts and forms of law are to be understood within the framework of a "phenomenologically founded formal theory of law and state" (which, as we learn from the subtitle, is precisely the kind of theory this same work attempts

to sketch out). And so, in studying Kelsen's work and taking up his conception of the norm as an objective hypothetical judgment structured by the imputative nexus, Schreier appears to be primarily interested in mastering Husserl's teaching, reducing every science, including the science of law, to a *mathesis universalis* harking back to Leibniz.

That is the sense of the argument laid out in the chapter titled "Law and logic" (Schreier 1924, chap. 11; my translation), which in combination with the chapter titled "Possible law and real law" (ibid., chap. 12; my translation) makes up the core of a discussion aimed at showing that the pure theory of law forms a part of logic. As we have seen, Schreier subscribes to the idea of the need to identify the "fundamental forms" of law (which he believes ultimately come down to the forms "class of acts," "person," "performance/sanction," and "state"), and at the same time he espouses Adolf Reinach's view of the basic legal laws of essence:[32] These two elements of his thought combine to bring out not only the "ontologizing" intent behind his reliance on Husserl's theory but also the importance of two specific passages in Schreier 1924. The first of these concerns the theory of "possible law," while the second blocks out an analysis of legal "interpretation"—two themes not contained in the original core of Kelsen's theory of the purity of law, and Schreier treats them in an original way. What prompts him to define the phenomenological "essence" of law in terms of possibility is the need to clarify the dialectical relationship between *a priori* law and positive law, a relationship that can otherwise be framed as that between ideal and real law. Here the concept of possible law replaces that of *a priori* law or essence, in such a way as to explain the *a priori* itself, understood in its Leibnizian and anti-Kantian acceptation as a "necessity," of which "reality" is but one of multiple realizations.[33]

Possibility, so understood as one of the modes of being, is thus laid at the foundation of law. This move adds a further dimension to Schreier's theory, and as is the case with the foundational strategies adopted by legal phenomenology—apriorism, essentialism, realist idealism—it can be understood as what sets phenomenology apart from Kelsen's pure theory. Indeed, one has the impression that this last theory contents itself with attaining a dogmatic coherence, at which point it ceases to concern itself with its own speculative bases, especially the phenomenological one (perhaps prematurely so, thinking there is no longer any need for such bases). The "doctrine of possible law" reveals a

[32] Reinach's pioneering 1913 essay *Die apriorischen Grundlagen des bürgerlichen Rechtes* (The *a priori* foundations of civil law) is discussed in Schreier's book, in which Schreier points out its phenomenological orthodoxy.

[33] The analysis of so-called possible law (*möglichen Recht*) was developed by Schreier as early as in Schreier 1924, and not long after that, he went back to that analysis in greater detail in the important essay *Über die Lehre vom "möglichen Recht"* (On the theory of "possible law": Schreier 1926). For this thematic idea Schreier has deservedly been described as "the most original continuator of the pure theory of law" (Weinberger 1988a, 117; my translation).

decidedly superior coherence: By addressing the question of the system's need for a foundation, this doctrine firms up some important theoretical passages—so important, in fact, that one comes to regret that Schreier did not make this the main focus of his investigation.

The question whose analytical development Schreier does not, by contrast, nip in the bud—so much so as to turn this into an opportunity to integrate Kelsen's theory—is that of legal interpretation, which is not just a fundamental theoretical tract for an adequate understanding of law but is, more specifically, the place where Schreier manages to successfully work together phenomenology and the pure theory of law. Schreier's theory of legal interpretation is set out in two writings, namely, the 1927 book *Die Interpretation der Gesetze und Rechtsgeschäfte* (Statutory interpretation and legal transactions: Schreier 1927) and an article of 1929, so they both precede the most organic text that Kelsen devotes to this topic (*Zur Theorie der Interpretation*, On the theory of interpretation: Kelsen 1934a, 1968n).[34] As can be appreciated from the title of the 1927 book, Schreier was attempting a theory for the interpretation of laws and legal transactions, a theory homogeneous with Kelsen's, which at the time was still lacking on this topic. This is something Schreier expressly comments on:

> It must be recognized […] that until a fairly recent past the Vienna school showed little interest in the issues pertaining to legal interpretation, in effect not taking any position in this regard. This vacuum was thus filled with equivocal positions thought to be deducible from the claims the proponents of the Vienna school put forward with regard to other issues. (Schreier 1929, 322; my translation)

In going about integrating Kelsen's pure theory, Schreier takes up the innovative conception of interpretation systematized by the *Freirechtsbewegung*, or free law movement, which revolutionized the old schemes still bearing the imprint of the exegetical school:

> In my own *Die Interpretation der Gesetze und Rechtsgeschäfte* I studied the relationship between the Vienna school and the theory of the free law movement; I treated the issues of interpretation from the standpoint of the Vienna school, and the result validated the theses upheld by the free law movement. (Ibid.; my translation)

To which he adds that his book "is driven by a strong gnosiological concern." This is not to say that he has "turned away from the view espoused by the Vienna school, as has been claimed in some reviews." On the contrary, because his conception "is shared by the proponents of the Vienna school," he feels he is within his rights to speak "for the entire Vienna school" (ibid; my translation).

[34] See Schreier 1927, 1929, as well as Kelsen 1968n. Kelsen's text was immediately included in Kelsen 1934b, 90–104. On the question of interpretation in Kelsen, see Paulson 1990, Walter 1993, and Winkler 1990, esp. chap. 8.

The theory that Schreier formally developed within the framework of the *reine Rechtslehre*, and to which he devoted his most original work, clearly bespeaks the influence of Husserlian phenomenology—this despite Schreier's own concern to team up with the Vienna school. Kelsen, for his part, found himself in a sense "forced" to absorb his own pupil's approach to the interpretation of law, even if this approach not too circumspectly wound up encasing the pure theory of law within a vision, the one developed by the free law movement, that instead was careful to stay away from any notion of legal purity. It is for different reasons that Kelsen and Schreier were prompted to take the different attitudes they in fact took. Kelsen was taken up with the problem of rebutting the charge of formalism, a charge which at that specific point was being laid against his theory, and which, on the level of the history of ideas, tended to throw the theory back into a mere "conceptual jurisprudence." So the theory's "befoulment" with an approach as "sociological" and "empirical" as that of the free law movement can equip the theory to keep at bay the spectres of abstractness and artificiality. And Schreier, for his part was so taken up with Husserlian phenomenology that it proved impossible for him to think form distinctly from essence, and hence from being, even though he does not shun the moment of contact between being and experience as the first indispensable step toward the truth; so, from Schreier's viewpoint, the free law movement makes it possible to integrate legal "reason" with "experience," and it is for the most part the judge, the interpreter par excellence, whose shoulders are made to bear that experience.

In Schreier's analysis, the question of the interpretation of law turns on what he calls the "integration" principle (*Ergänzungsprinzip*), under which we must not confine ourselves to "analytically" interpreting the law in a literal way but must also engage in a substantive "synthesis" by which to fill the gaps in the law. Schreier seems initially to simply follow in the footsteps of Kelsen's theory of validity, and so—by analogy to Kelsen's anchoring the validity of law to the *Grundnorm*, or basic norm—he claims that the interpretation of law must proceed on the basis of this integration principle as a principle understood to ensure the operativeness of law. Schreier feeds this principle to methodological doubt, eventually finding a "third foundational way." Indeed, he reaches the conclusion that it is impossible to proceed solely on the basis of inductive experience or deductive reason, and from this premise he deduces the necessary existence of a metalegal principle governing the interpretation of law. In this sense, then, the integration principle, expressly derived from Kelsen's principle of the *Grundnorm*, becomes indispensable, for it "carries the validating logical value of a hypothesis," insofar as it comes into play in combination with positive norms. Which in turn betokens a transcendental nexus entrusted with the task of averting the opposite extremes of logicism and sociologism. Schreier's approach, however, differs from that of Kelsen, since Kelsen's transcendentalism is integrated by him with that of Husserl.

Kelsen himself, after all, takes up the theme developed by his pupil, bringing the question of interpretation into his pure theory, precisely for the purpose of defending this theory from the charge of formalism. The trail has already been blazed: Schreier develops his theory of legal interpretation by splicing the principles of the free law movement onto the trunk of the pure theory of law. Speaking for the Vienna school, he even declares that the two approaches to law are fully compatible, and this gives him quite some leverage in dismantling the charges of formalism laid against Kelsen and his school:[35] He can do so by showing that this charge relies on a false parallelism between the pure theory of law and conceptual jurisprudence, a parallelism based on the (equally false) claim that the two theories share a rejection of "legal content." Schreier instead believes that there is no real divide between the pure theory and the free law movement, and indeed that the two are connected by many points of affinity. He strenuously argues that the works coming out of the Vienna school are entirely consistent with those produced by the free law movement, and that the "guiding theme" of Kelsen's purity of method—namely, the method of legal science understood as a theory of law in general, a "theory of the essence of law," in Schreier's description of it—does not entail any need to aprioristically rule out the role of content next to that played by the essence of law, even if Kelsen did deploy this essence as mere form. The purification effort undertaken by the Kelsenian theory was only targeted at abstractly constructed "preconceived ideas," precisely the sort of baggage ascribed to conceptual jurisprudence by its critics, and so it can be appreciated in this sense how the pure theory works in the same direction as the free law movement (see Schreier 1929, 321).

The approach worked out by Schreier—avowedly so close to the Kelsenian Vienna school, yet not fully in agreement with its theoretical presuppositions—makes it possible to reconstruct in a fairly accurate way a speculative situation that had taken shape over time through a confluence of multiple and diverse stimuli. This confluence can be appreciated, in particular, by noting the proximity the Husserlian jurists saw between the theoretical contributions coming from Husserl's methodological model and the properly Kelsenian contributions; and so it came to be that, as pupils of Kelsen, these jurists also championed the Husserlian conception. This is precisely what happened with regard to the theory of legal interpretation, with Schreier staking out a position that Kelsen would also later adopt, though admittedly this was not a perfect fit. In fact it bears noting that Kelsen would never have fully endorsed the perspective of the free law movement, for as has been pointed out already, he "cannot be said to belong *in spirit* to the free law movement" (Lombardi Val-

[35] Schreier 1929 offers an account of the dispute among the different schools active at that time.

lauri 1975, 364; my translation)[36] and undoubtedly it was Schreier's book that held his feet to the fire on a question he had hitherto neglected.

To understand what triggered Schreier's speculative turn, prompting him to graft onto the trunk of the *reine Rechtslehre* that "law which we live and which, by virtue of its living in us, we feel," as Hermann Kantorowicz put it in setting out his *Freirechtsbewegung* (Kantorowicz 1962d),[37] we have to go back to the new doctrinal outlook he embraced, leading him to lay emphasis on the need to take more directly into account the social reality in which that living law is set, and so, even as he welcomed the logicism of the pure theory, he came to believe it was necessary to explore the possibility of an osmosis between logic and psychology. Having taken to heart the *Freirechtsbewegung* catchphrase that calls for specialization, while also being versed in the phenomenological method, which advocated an experience aimed at grasping the truth, Schreier could emblazon himself with the title of dual defender of logic and psychology, fully to the advantage of an understanding of law on which no moment or event was to be expunged from it. Wrote Kantorowicz:

> Husserl has no doubt radically severed the whole of the psychological from logic, but the converse undertaking—the task of freeing psychology from the logical elements that have illegitimately crept into it—is something he has not at all set his hand to. (Kantorowicz 1962d, 30; my translation)

At work in these remarks is an authentic appeal to the Husserlian phenomenological method. On the one hand this method is careful to prevent a rudimental "psychologism" from undercutting the result obtained by logically investigating the ultimate foundations of knowledge (these foundations are ideal, and only as such they are real), but on the other hand the same method is also intent on expanding its project to make philosophy anew, the intent being to bring within the scope of the project the inexhaustible task of setting psychology itself on a new foundation as a transcendental science, in accordance with a transcendental perspective that is not merely formal. It is no accident, then, that when it comes to outlining a renewed landscape for the analysis of law, Schreier should urge us to take into account the contribution that may accrue by virtue of "jurisprudence cooperating with psychology, on the one hand, and social science, on the other, [...] as between like sciences" (Kantorowitz 1962a; my translation), nor is it an accident that his theory of interpretation should devote a great deal of attention to the question of the will (Schreier 1927, 53–73).[38]

[36] "Kelsen does not belong to the free law movement *in spirit*, for his theory does not at all proceed from the basic experience (*Erlebnis*) of that movement; it rather proceeds from a contrary *Erlebnis*, that of 'purity,' an experience that led him to separate legal science from ethics and sociology, rather than seeing them as forming a necessary, organic whole with legal science—as the free law movement instead sought to demonstrate" (my translation).

[37] Later published as Kantorowitz 1962a. In sympathy with that conception are also Ehrlich 1888, 504ff.; 1917, and 1987.

[38] A similar view can be found in Walter 1993.

The paradox Schreier's doctrine ultimately runs into, in its relying on Husserl's phenomenology to surpass Kelsen's construction, lies in the fact that this doctrine turns out to be most controversial and problematic precisely where it most deliberately invokes Kelsen's theory, that is, where it brings into play the theoretical construct of the *Grundnorm*. As we have seen, Schreier takes up the two questions of validity and interpretation precisely in order to set up a parallelism between Kelsen's basic norm (the condition of validity) and the basic principle of legal interpretation (the integration principle), since through this parallelism the conclusion can be reached that, just as metapositivity (and metajuridicality) is key to the essence of the *Grundnorm*, the same goes for the *Ergänzungsprinzip* forming the basis of legal interpretation. But whereas Kelsen over time strips the *Grundnorm* of substantive content—of any suggestion that it may figuratively allude to natural law, for he is rather looking to firm up a logico-formal transcendentalism by which to carry through the original plan to "purify" law—Schreier proceeds in exactly the opposite direction: What Kelsen moves away from is precisely what in Schreier serves to legitimize an "empirical" function like that of legal interpretation, an activity that certainly could not exist unless it was firmly anchored in metalaw.

In this way, Schreier could confidently assert that

> the integration principle stands *in front of* positive norms; it is suprapositive by nature, transcending positive law, and hence is not immanent in such law. […] Naive positivism is untenable: Oozing from every pore of the positive law, and making its way forward, is "natural law." [...] We see how interpretation comes in from all directions; it is governed by principles whose validity is not predicated on positive law. The integration principle transcends positive law. (Schreier 1927, 53–4; italics added; my translation)

Indeed,

> what brings out the fact that positive law bristles with suprapositive elements is the choice made in setting out, not so much the basic norm, as the interpretive method. [...] The substrate of positive law and of the nexus of validity is metapositive, and, especially, it is meta-legal-positivist in nature; in the same way, the problem of interpretation shows that every single determination of positive law is laden with suprapositive content. (Ibid., 9; my translation)[39]

[39] This is an argument Schreier can make with much ease, in a footnote, by setting up a contrast with the formal apriorism found in Kelsen's 1920 *Das Problem der Souveränität*, though this work certainly lacks many of the contents that Schreier himself would give to apriorism having gone deeper into Husserl's phenomenology.

Chapter 5

FROM THE CRITICISM OF NEO-KANTIANISM TO NEO-HEGELIANISM IN THE PHILOSOPHY OF LAW

by Agostino Carrino

5.1. The Crisis of Neo-Kantianism in Erich Kaufmann's Philosophy of Law

Erich Kaufmann (1880–1972) was an international lawyer as well as a philosopher of law. His point of departure in the philosophy of law was the neo-Kantianism of the southwest school (Windelband, Rickert, and Lask), a current of thought concerned with the problem of values, and which at the same time sought to lay out the method and epistemological framework specific to each of the special sciences. But with the 1921 *Kritik der neukantischen Rechtsphilosophie* (Critique of neo-Kantian philosophy: E. Kaufmann 1921), he avowedly abandoned the neo-Kantian method and took a neo-Hegelian and ontological turn. This turn is undoubtedly rooted in historical reality, in Germany's new situation, which led Kaufmann to turn away from his former beliefs and embrace a "metaphysical" worldview. What prodded Kaufmann in this direction was an attempt to offer an "internal" explanation of why the German empire fell apart and turned to democracy. Neo-Kantianism—especially that of the Marburg school—no longer appeared to him as the antipole of Marxist sociology and materialism: It was rather perceived by him as a mode of thought that somehow underpins any empiricism involved in breaking up the whole. So his metaphysics is not a simple metaphysics of natural law but is rather cast as a new metaphysics seeking to grasp the "essence" of things from a neo-Hegelian perspective (a perspective in some respects also describable as institutionalist). What we have, then, is not a metaphysics of "nature" but one of "essence," and most importantly of the historical essence of the German people. This comes through very clearly, more than in his 1921 *Kritik*, in his essay on the principle of equality under Article 109 of the Weimar Constitution (E. Kaufmann 1927). At issue was whether the principle should also apply to legislators as a standard limiting the scope of their activity; and in keeping with the metaphysical outlook just briefly mentioned, Kaufmann interprets this principle not in a "normativist" way but in an "essentialist" one as a principle *inherent* in the German people: "The principle of equality before the law is a fundamental right of the *German* people, that is, a right owed to every German as such in relation to the state, that is, in relation to the Reich and the *Länder*" (E. Kaufmann 1927, 7; my translation; Kaufmann's own italics on the word *German*).

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_5

The philosophy of law and of the state must therefore be made to rest on a people's *essential* nature, not on stale theoretical legacies. Kaufmann goes so far as to say that because Germany had

> no philosophy of the state or of law—considering that the state and society had been founded merely on the pale legacies of Kant, Hegel, Stahl, and Marx, and not on any independent and living social philosophy—the country's state and law ultimately rested on feet of clay, which broke into pieces through the great trials of history that the German spirit and state alike had to overcome during the Great War. (E. Kaufmann 1921, 2; my translation)

But in reality, concealed beneath these principled statements was a specific political agenda: Through his "essentialist" reading of Article 109 of the Weimar Constitution,[1] Kaufmann was hoping to thwart the activities of the democratically elected legislative body. Even in 1930, Hermann Heller (1930) made it clear that this was an attempt, set on a purportedly scientific foundation, to keep the parliament in check through the judiciary, whose members had been serving since before the advent of the republican form of government.[2] The community, in a sense—still conceived in a historical and cultural sense, rather than in a biological and racist one—was thus set in contrast to the law, just as the "spirit of the people" was in relation to the exsanguine, diaphanous forms of formalist and neo-Kantian methodology, and as arrant subjectivism was in relation to the objectivity of the legal system's procedural mechanisms and forms.

The problem of legal philosophy is thus brought closely into connection with the question of a people's destiny: Neo-Kantianism, with its value-neutral method and relativism, reflected an age steeped not in the essence of the German people but in abstract intellectualistic conceptions that undermined the very quality of the people. Only war and defeat, then, can make it possible to reframe the philosophical problem within its proper context in the clash among worldviews or, better yet, in a clash between an indeterminate, universalist, subjectivist worldview and an objectivist, determinate worldview rooted in the essence of the people.

The contrast can be framed as one between is and ought, *Sein* and *Sollen*: The *Sollen*, pure neo-Kantian duty, cannot establish a connection with the sociological concreteness of the existential given of the people, but rather impos-

[1] Kaufmann's talk at the conference on public law held in Münster in 1926 stood in contrast to the one given by Nawiasky, in which an argument was made in favour of formal equality, and which was greeted favourably by Kelsen, Heller, Thoma, and Anschütz.

[2] "In effect, Heller and those jurists who were more attentive to the political import of their activity appreciated that the new reading of the principle of equality became a conduit through which to develop the 'scientific' attempt to curtail and possibly thwart the initiatives of the legislature (its majority initially liberal-socialist, and in any event progressive) through the intervention of the judges, who had no sympathies for the democratic, liberal republic looking to effect socialist transformations by enacting a constitution, and who even made direct compromises with the 'right-wing' reactionary forces and the Nazi Party" (Volpe 1977, 102–3; my translation).

es from the top statically conditioned constructs devoid of any substance. The rejection of neo-Kantianism in its various forms, from Stammler to Kelsen, is rooted in this need to underscore the evolution of the spirit (Hegel), in this making of the spirit in the historical concreteness of a people transitioning from a given set of conditions to new vital conditions. The turn against neo-Kantianism therefore did not also apply to Kant's own philosophy, which answered a real need of the time. For it is only *neo*-Kantianism that, betraying Kant's spirit, detached thought from being.

By fashioning the philosophy of law and of the state into a science of pure forms, neo-Kantianism caused those who are spiritually and intellectually most gifted to move away from the science of the state, which consequently lost any ability to express the essence of the people, leaving them at the mercy of Marxism and making morality authoritarian, a rule imposed on the German people from the outside.

That very idea forms the basis on which Kaufmann criticizes Kelsen: Kelsen, with his radical *Sollen*, wants to impose a certain morality (that of the Enlightenment) on the German people's spontaneous morality. Kaufmann's interpretation of Kelsen's formalism is significant precisely because it seizes the political import of that formalism by showing how Kelsen's critical positivism is itself politically and morally charged. Kaufmann and Kelsen therefore embody a conflict between history and reason, between rationalist universalism and historical concreteness. Not incidentally, Kaufmann cannot conceal a certain affinity with the historical school of law, while Kelsen's legal-political theory continues to be ahistorical.

However, Kaufmann's propensity for this new kind of natural law—organically woven into the essence of the people—cannot be read as having anticipated the Nazi theories,[3] this despite the controversial thesis he advanced in his best-known book, *Das Wesen des Völkerrechts und die Clausula* rebus sic stantibus (The nature of international law and the *clausula rebus sic stantibus*: E. Kaufmann 1911), where he claims that "it is not in the freely willing community of human beings that the social ideal lies: The social ideal is rather to be found in victorious war" (ibid., 146; my translation).[4] For it is Kaufmann's view that in the particular there is always manifest the universal, and that the particular has no legitimacy and no dignity of its own except insofar as there abides in it the universal:

> The distinction between general and particular law is but an aspect of the general problem of the relations that hold between the universal and the particular—the great conundrum that has preoccupied the human spirit from Plato to Aristotle. The universal is always inherent in the par-

[3] "Kaufmann's scholarly work is absolutely devoid of any connection to Fascist thought" (W. Bauer 1968, 260; my translation).

[4] The German original: "Nicht die Gemeinschaft frei wollender Menschen, sondern der siegreiche Krieg ist das soziale Ideal."

ticular, in a sense constituting the very soul of the particular, its shaping force, its living energy. (E. Kaufmann 1935, 314; my translation)

What the essence of the German people ought to have consisted in, however, remains an obscure point. In the run-up to Hitler's rise to power, Kaufmann lamented a compassless stewardship of the ship of democracy, pummelled by movements, isms, and decisionisms of all sorts, but he cannot be held blameless in relation to the very crisis he denounced. Wasn't the absence of any debate, a failing he himself decried (E. Kaufmann 1960, 297ff., esp. 299–303), precisely the issue of that "essential" law he invoked? He took issue with positivism as the reason for the bewilderment that had taken root, but his rejection of relativism is precisely what in part lay at the basis of the call for surefooted decision-making and will power.

Kaufmann's criticism was met by Kelsen with a counter-criticism contained in a long footnote in his 1922 book *Der soziologische und der juristische Staatsbegriff* (The sociological and the legal concept of the state: Kelsen 1922b, 99–104). Kelsen's counter-criticism addresses in the first place the charge of "deception," the idea that Kelsen would have passed off as a scientific theory what in reality was a political agenda, meaning his predilection for the primacy of the international legal system, a subjective and morally driven predilection. Kaufmann, more to the point, accuses Kelsen of "deducing" international law from the *Sollen*, and in this way—by deducing the idea of a *civitas maxima* superior to national legal systems—Kelsen would have confused the political with the legal, thus undermining his own basic premise of the separation between is and ought, while also failing to stay true to his rejection of the theory of the state's two faces.

Kelsen denies that the postulate of the unity of the entire law must necessarily entail the primacy of international law: The two hypotheses, says Kelsen, are equivalent from a legal point of view; one can for moral or political purposes choose the primacy of international law or that of domestic law, but the outcome in either case will be the same, and we will always find that from a scientific point of view the whole of law is a single, unitary entity, whereas the basis on which we choose the one or the other is always going to be political and moral. But in this counter-criticism, in truth, Kelsen does nothing except reiterate what he previously stated in *Das Problem der Souveränität* (Kelsen 1920a), without addressing Kaufmann's criticism on its merits, where Kelsen's conception is reconstructed in such a way as to bring out some underlying incongruities.

Likewise, on the matter of the confusion that in Kaufmann's opinion Kelsen makes between the is and the (pure) ought, Kelsen simply refers us to some of his own previous writings, where he defends the separation between is and ought and the impossibility of bridging the deep gap between the causal world of the is and the world of norms and values. And here, too, in reiterat-

ing these theses, Kelsen does not really address the substance of Kaufmann's criticism—which points out a contradiction between the premises of Kelsen's thought and its concrete outcomes—but rather turns the criticism into a counter-criticism concerned more with Kaufmann's overall conception than with the specific view expounded in the book on neo-Kantianism. Kelsen faults Kaufmann for confusing sociology (a causal-naturalistic science) with normative science and for proceeding on a naturalist, non-normativist basis in the study of law. It is impossible, writes Kelsen, not to consider the legal system's specific unity, a unity demanding that the law be understood as a noncontradictory system. Two norms contemporaneously prescribing *a* and non-*a* cannot both be said to be valid, because the content that makes up the meaning of legal propositions expressly rules that out. To be sure, it can certainly be imagined that someone, in their will, might represent the contemporaneous validity of two norms standing in contradiction to each other, but this is not possible in mathematics or in the legal system:

> The essence of law (and the state) lies in the specific content, or meaning, of legal propositions, not in the psychological process of our contemplating those propositions or in the physical movements caused by psychical processes. (Kelsen 1922b, 101; my translation)[5]

Kelsen rejects Kaufmann's criticism by rejecting the very idea of a jurist dealing in sociology. If truth be told, this does not look like an adequate reply to Kaufmann's criticism, and one can only remark here, on Kelsen's behalf, that Kaufmann's position cannot but conjure up in certain respects the conception expounded by one of the founders of legal sociology, Eugen Ehrlich, in that they both underscore the priority of unwritten law over codified and legislatively formulated "legal propositions."

5.2. Two Precursors of Legal Neo-Hegelianism: Josef Kohler and Fritz Berolzheimer

When speaking of neo-Hegelianism in German legal philosophy, the mind cannot but travel back to the thinkers who wrote in the 1920s and 1930s, from Binder to Larenz. These authors will be discussed later, but before we do that, a few words are in order about two precursors of the neo-Hegelian rebirth, namely, Josef Kohler (1849–1919), perhaps chiefly known today for his essay on Shakespeare and law (Kohler 1919), and Fritz Berolzheimer (1869–1920).

Together, these two authors founded the journal *Archiv für Rechts- und Sozialphilosophie* (Archive for legal and social philosophy)—initially titled *Archiv für Rechts- und Wirtschaftsphilosophie* (Archive for legal philosophy and eco-

[5] In this book, on the sociological and the juristic concept of the state, Kelsen uses the same thesis to also criticize Max Weber's "interpetive" sociology.

nomics)—intended to serve as a tool through which to foster the Hegelian rebirth.

This rebirth, however, looked to Hegel more as a historicist than as the theorist of the ethical state or of the dialectical method, so much so that, as has rightly been observed, Kohler's neo-Hegelianism ranges "between legal positivism and neo-Kantianism" (Hürstel 2010, 58; my translation). It is no accident that, whereas the neo-Hegelianism of the 1920s and 1930s revived the concept of community as the locus for the unfolding of ethicity, Kohler regarded ethicity "as a secondary phenomenon" (Kohler 1914–1915, 45; my translation). The philosophy of law is thus brought into relation with the history of law, in the sense that only in empirical history, in his opinion, can philosophy find the material on which to engage in reflection. Kohler's Hegelian renaissance is thus hemmed in by historicism and legal positivism, and Kohler can in this sense be said to be a thinker firmly ensconced in the 19th century. His Hegelianism is thus confined to recovering "the unity of subject and object, the movement of the universal spirit, and its realization in an infinite number of particular beings, as well as the constant progress brought about through the ever-renewing output of history" (Kohler 1911–1912, 106; my translation).

The same idea of an idealism (or presumed idealism) attentive to historical fact and to culture can be found in Fritz Berolzheimer, for whom the philosophy of law acts as a principle regulating the activity through which a given legal culture comes to be known. So in this sense, as much as Berolzheimer may look to Hegel, he appears still tethered to Kant and to neo-Kantianism, and even more to the positivist tradition of the 19th century (Berolzheimer 1913–1914). Kohler's and Berolzheimer's *Kulturphilosophie* is thus informed by a conception of law as an empirically determined entity.

5.3. Julius Binder, Founder of the Neo-Hegelian School

As Ralf Dreier has remarked, Julius Binder (1870–1939) was not a great legal philosopher, but he certainly was a "tragic" thinker (R. Dreier 1991, 144), in the sense that he wanted to achieve great things but failed in a big way. His neo-Hegelianism—he can rightfully be recognized as the fountainhead of this current in 20th-century German jurisprudence (considering that Kohler and Berolzheimer slot more easily into what might be termed the Hegel Renaissance)—was supposed to deliver groundbreaking results, making significant contributions not only to the philosophy of law but also to philosophy as such. But the fact is that this legal neo-Hegelianism can essentially be considered to have been crushed under the rubble of the fallen Third Reich. And indeed, as much as Binder comes into the picture as a neo-Hegelian legal philosopher (and this is how he will be discussed here), for all practical purposes he can equally be counted as a Nazi jurist.

Binder was born in Würzburg in 1870, and in 1939, just two days before the outbreak of World War II, at the age of sixty-nine, he died of complications from a surgery. He was professor emeritus at the University of Göttingen. In the first phase of his scholarly activity he was mainly concerned with themes and subjects in Roman and civil law. In his second phase, from 1914 onward, he enthusiastically devoted himself to the philosophy of law, which in essence became his proper area of study.

Of course, a personal philosophy of law can be discerned in his work even before this second phase, in a development that initially led him to espouse legal positivism, especially as interpreted by Windscheid and Bergbohm. Law, for this early Binder, is a fact of being from which no obligation of any moral nature can be derived. In his pro-rectorial address of 1911 he put in a remark that would become famous in its own right: "Legally, the law does not obligate anyone to do anything" ("Das Recht verpflichtet rechtlich zu nichts": Binder 1911, 16; my translation). In light of this remark, Leonard Nelson, who would later be a colleague of Binder precisely in Göttingen, elaborated his thesis of "legal nihilism."

But Binder's strictly legal-positivist phase would not last long, for he soon felt drawn to neo-Kantianism, even though he did so criticizing the thinker who at the time was its main exponent, namely, Rudolf Stammler. Indeed, it is to Stammler that Binder devotes his first dense work in legal philosophy, his 1915 *Rechtsbegriff und Rechtsidee* (The concept and idea of law: Binder 1915). In this book, Binder strives to stay true to a "pure" understanding of the concept of law, taking Stammler to task for setting out a legal-philosophical doctrine which formally rested on a Kantian foundation, but which in reality ended up driving the object of the transcendental method right back to its original empiricalness, without showing any real categorial transcendentality. Binder therefore thought that Stammler's philosophy of law was actually empirical, ultimately resolving itself into a psychological concept of law. Our willing is an empirically observable event, not a precondition of our knowing; it is therefore in this willing that Stammler in the end grounded his legal thought, not in the transcendental categories of thought. Binder's philosophy of law was thus grounded in Kant (though to some extent it was already looking beyond Kant), and central to it was the *idea* of law, an idea that serves two complementary functions, one of them being constitutive and the other normative. This means that on the one hand (on the normative side) law asserts itself as being *just*, but at the same time (on the constitutive side) it asserts itself as *being*, by institutionalizing itself into forms made determinate by their content. For Binder, this twofold function entails a differentiation between the idea of *law* and the idea of *morality*, two ideas that in Stammler instead wind up merging into a single thing, a kind of natural law. In Binder's view, *law* owes its value to its ordering function, in the sense that through law individuals find themselves obligated to take their place within their own political communities, whereas *morality* owes its value to something *other than* this po-

litical function of law, whose form, not incidentally, was for Binder that of the state—and that is how he would continue to understand its form.

If truth be told, Binder's criticism of Stammler looks weak, this to the extent that it seeks to be itself a neo-Kantian criticism. It is no accident, in this connection, that Binder would not dwell long in neo-Kantian territory, shortly thereafter taking a surefooted turn away from Kant toward Hegel, so much so that he would go on to become Germany's leading exponent of legal neo-Hegelianism in the 1920s and 1930s.

The move from Kant to Hegel was in reality implicit in Stammler's criticism for distinctly *political* reasons. Indeed, one could ask: What was it about Kant that might have made him worthy of study and appreciation in the eyes of a German philosopher in Binder's time? It wouldn't be unreasonable to say: The fact that Kant, despite his cosmopolitanism, rested practical reason on the concept of duty (*Pflicht*), which is what at that very historical juncture (1915) was driving the German troops to a variety of fronts. Evidently, this Kantian concept of duty was not reason enough for Binder to stick to neo-Kantianism, so much so that he was already aligned with Hegel by the time the war was over (with Germany winding up on the losing side): He got there through Fichte, and although his reading of Hegel was initially mediated by Rickert's neo-Kantian philosophy of values,[6] he did construe Hegel as a philosopher of the German spirit and of the authoritarian state—a political-philosophical outlook Binder found himself quite at home with. After the war, it would no longer do to lay out a "just" concept of law and the state; it was instead necessary to remake the state and the law from the ground up:

> The issues arising in connection with the nation and the state move from a marginal concern of reflection to its centre. In *Rechtsbegriff und Rechtsidee*, the state was merely conceived as the guarantor of the validity of law. From here on out, he would address the meaning and conditions of the state's existence. Binder's philosophy of law came to importantly incorporate a theory of political philosophy [*Staatsphilosophie*]. (Jacob 1996, 36; my translation)

Binder's neoidealism itself went through two phases—a first one that can be termed "objective" idealism, and the second "absolute" idealism—both to be distinguished from any sort of "rationalism," as was essentially true of his previously espoused critical approach. But even in the most significant book he wrote in his first phase, the 1925 *Philosophie des Rechts* (Philosophy of law: Binder 1925), a massive work, to say the least (running to 1,063 pages), and not devoid of passages brimming with nationalistic pathos, we find the groundwork for his absolute idealism in the consummate criticism he directs at legal positivism, liberal naturalism, and Marxism. What Binder is trying to do here, in this sense tak-

[6] In a 1921 essay (Binder 1923a), Binder recognizes that the object of legal science, namely, law, is not prescientific but is itself laden with concepts, as had previously been observed by Emil Lask (see the previous discussion in Section 1.4 in this tome).

ing up the criticism of formalistic neo-Kantianism advanced by Erich Kaufmann and others, is to replace the "formal" concept of law with a "material" one, and indeed to replace the abstract conceptualism of neo-Kantianism with an idea of law whose contents are determined by the values specific to the German people: These are the values of the *Gemeinschaft*, the nation, but they are interpreted as contents distinctive to the form proper to them, that of the state.

The state is the cultural state, the national state. Politics and philosophy always go hand in hand in Binder.[7] In relation to the state as a form of the national community, the law is tasked with organizing into a harmonious unity among the individuals who make up the nation itself:

> The idea of the state, however, is conceived here [...] as the synthesis between the individual and the totality [*Gesamtheit*], a totality that conditions the people's community and community life, which is made possible by the coercion of the law. In this way, the legal order itself figures as a condition for the existence of the state; it is the law which endows this whole [*Ganzen*] with its own form, transforming it from an aggregate into an organism, through which [...] there emerges a relationship of exchange between the individuals and the entirety, a relationship that makes the latter a condition of the former, and vice versa. (Binder, 1925, 487; my translation)

The state is understood by Binder as an "organic" state, because only in this way can the state make it possible for there to emerge, out of the chaos of experience, the harmonious cosmos of a politically well-ordered society (Binder 1926a, 45ff.). The law is consequently defined as a coercive mode of being part of an ethical community ("Zwang zur sittlichen Gemeinschaft": Binder 1925, 359). The philosophy of law therefore cannot confine itself to recognizing the law's internal structure (in the manner of Kelsen, for example): It must also take on the question of its *telos*, the aim of the legal system as a whole, an aim that cannot be sought in a "metalegal" sphere but should on the contrary be construed as being inherently legal.

In an essay on Binder, Ralf Dreier argues that although in 1925 Binder was no longer neo-Kantian, he wasn't yet neo-Hegelian, either, for otherwise he would have had to accept the rationality of the real, and in particular of the very real he rejected, namely, the democratic Weimar Republic (R. Dreier 1991, 154). But in reality, even in the 1925 *Philosophie des Rechts*, Binder had already laid the groundwork for a resolute move to an absolute idealism, that is, to a conscious Hegelianism, and indeed this orientation can already be espied in the criticism that in 1915 he directed at Stammler and his methodological dualism between the concept and the idea of law. "Indeed," Binder argues,

> if the law is everything that exists in virtue of the idea of law, then the more something corresponds to this idea, the more it will be law, or, in other words, if we try to restate this idea in Stammler's terminology, our representations of legal aims can in general be measured only against the idea of law. (Binder 1915, 203; my translation)

[7] On the point, see Hürstel 2010, 168, 74–5.

And according to Binder this idea of law cannot and must not be traced to natural-law theory (no matter what premises this idea rests on) or to any of the abstract, anti-historical forms of liberalism. As early as 1915, in other words, Binder's neo-Kantianism was projected beyond Kant himself, however much in a still ambiguous and contradictory way, to the extent that the dualism of form and content was softened but not solved.

It is only in 1925, with the *Philosophie des Rechts*, that Binder made a decisive move beyond neo-Kantianism toward a return to Hegel. This work is judged by Larenz as the "the highest point reached over the entire course of legal philosophy, while also setting a milestone in the philosophical evolution of our own times" (Larenz 1931, 31; my translation). So, while the law Binder is concerned with is the *positive* law, qua real law, the sense of this positive law is found to lie in its rationality. Hence the idea that "law is rational reality and real reason" (Jacob 1996, 50; my translation). What imbues law with rationality is its aim, the law being understood as a tool through which to achieve an ethically grounded community where individuals each find their role on the basis of the obligations the community ascribes to them, and where rights, in a way, can accordingly be said to emerge only as a reflection of the obligations so assigned (Binder 1923b).[8] Binder is now openly declaring himself to be contrary to any form of abstract individualism and in favour of a transpersonalist worldview (albeit a conservative one by comparison with Radbruch's progressive transpersonalism). Writes Binder:

> Transpersonalism is not the negation of personality but its affirmation; I have personality the moment I know myself to be a member of the whole, to the extent that in my actual and living consciousness I know the very reason which at the same time is the idea of the whole. (Binder 1925, 288; my translation)

In this work, however, the march toward Hegel grinds to a halt where Binder takes the view that law (and hence the state) needs to be subordinated to morality. Binder's idealism, in other words, is still a transcendental idealism that owes a great debt to Kant and Fichte, who indeed in his opinion live not in the "neo-Kantian" revival (especially not in the neo-Kantianism Cohen was advancing in Marburg) but in idealism itself, that of Hegel, and now that of those for whom Fichte, Schelling, and Hegel are models to look to.[9]

[8] Fichte is regarded by Binder as the true precursor of the idea of transpersonalism and of community understood as the specific place of individual freedom: "The I needs other beings endowed with reason, for its being lies in freedom, and only in relation to other free beings am I free" (Binder 1923b, 215; my translation).

[9] What in Kant is eternal, writes Binder, "survives in the systems constructed by his followers, the great idealists. It thus seems to me that neo-Kantianism has not resulted in Kant's true resurgence: This is something that has yet to be realized through the nascent movement for a new idealism" (Binder 1924, 50; my translation).

But it is in the ensuing years, as the Weimar democracy fell deeper and deeper into crisis, that Binder followed through and completed his move from Kant to Hegel, a move we can appreciate in the two works of his maturity—his 1935 *Grundlegung zur Rechtsphilosophie* (The foundation of legal philosophy: Binder 1935) and his 1937 *System der Rechtsphilosophie* (System of legal philosophy: Binder 1937)—reflecting as well an intensification of the antidemocratic, anti-egalitarian tendencies in Binder's thought, with Binder increasingly intent on reconciling Hegel with the Nazi regime. The criticism that in the 1925 *Philosophie des Rechts* Binder devoted to the logicist philosophies of law (the neo-Kantian ones, but also the phenomenological ones and those based on the experience of law)[10] now translates into a call to supersede the mere conceptual signification of a legal norm and embrace the centrality of the sense of law as a whole, by which is meant its ideal meaning as given by the aim the legal order sets out for itself. Here Binder is deepening some themes that in truth had been simmering in him from the outset, but their development is now explicit in the two works of 1935 and 1937, and even though these works had been anticipated by some minor writings—particularly the one devoted to the *Volkstaat*, or popular state (Binder 1934)[11]—we now see a footsure connection being established between the positive law and the world of ethico-political values.

In the first two chapters of *Grundlegung* (Binder 1935), Binder systematically sets out the basic tenets of his absolute idealism, where the whole of law is defined as the "unity of the particular and the universal will," and consequently as "freedom existing in itself" (Binder 1935, 116, 117; my translation). Writes Binder going back to this definition:

> If the many wills are to develop from a mere collective will [*Kollektivwille*] into a unitary will [*Einheitswille*], they are going to need a will which knows what the people's true will is, and which wants this will and actually imposes it. A person who fits this description we call [...] Führer. (Binder 1937, 317; my translation)

This person, Binder goes on to say, cannot be elected or nominated, insofar as the bond between the Führer and the people is, so to speak, natural; in fact it is a sort of "God-sent miracle" if a people that has long been guideless will ultimately find its own guide in which it recognizes its own will. This political dimension can be said to come about as a result of of carrying over into the practical realm the theoretical premises of the absolute idealism characteriz-

[10] See Binder 1925, 196ff. On Binder's stance against Sander and his philosophy of jural experience, see ibid., 204ff.

[11] According to Hürstel, one can perceive in this booklet by Binder "an inflection clearly evincing an affinity for Nazism and for the idea of a total state (*totaler Staat*)" (Hürstel 2010, 194; my translation). In reality, this sliding toward the total state is not as clear as this author makes it out to be, though admittedly Hegel's philosophy of law does take on strong Nazi overtones in Binder's hands.

ing Binder's philosophy of law in the 1930s, that is, the idealism under which consciousness and reality come together as a single thing in the absolute spirit. The value of law is entirely resolved in the reality of law, in the sense that the idea of law is, at this point, the concept of law fully realized: "The idea is not an atemporally valid norm to be compared with temporal law, but is rather the concept that realizes itself over time as temporal law" (Binder 1935, 147; my translation).

However, despite recognizing the Führer's role in this and other respects on a theoretical level, in the 1930s Binder's absolute idealism would come into conflict with a central aspect of Nazi legal thought, namely, its contempt for the state as a freestanding entity specifically endowed with a dignity of its own. Hegel's idea of the state as a historical expression of its citizens' freedom could not but elicit hostility from the likes of Reinhard Höhn and Alfred Rosenberg. Indeed, as Dreier observed, "one could not neglect to appreciate that Hegel's philosophy of the spirit, even in the interpretation Binder gave to it, was hard to reconcile with the *Blut-und-Boden* [Blood and Soil] motto embraced in the new epoch" (R. Dreier 1991, 161; my translation). Indeed, Binder's philosophy of law is devoid of that biologistic naturalism distinctive to the Nazi doctrine, and in fact the state is also meant to serve precisely the purpose of "denaturalizing" the nation, which itself lies at the foundation of everything: "The state, according to its own concept, is the living form of the nation, and as such it fundamentally constitutes the nation's effective reality, and that means that the nation is the idea and the state its realization in process" (Binder 1935, 48; my translation). And so it came to be that other neo-Hegelians closer to the regime, like Schönfeld, actually took Binder to task for espousing a sort of "noble positivism,"[12] a charge Binder was unable to rebut.

Indeed, despite Binder's best efforts to embed the reality of the state and of Nazi law into the forms of his idealist philosophy, the unity of consciousness and reality (not contingent reality but the "essential" reality)—the unity of the general and the particular will—is traced by him to a universality that cannot easily be reconciled with the Nazi theory of law and of the state. Binder's philosophy of law is a "dialectic" philosophy, in the sense that it supersedes the antithesis between universality and particularity, between the people and the ruler, by reconciling the two into a higher unity where even the parts are maintained and preserved, in such a way that the individuals themselves ultimately find their place. It should not come as a surprise, in this regard, that Binder cannot do without the concept of the *Rechtsstaat*. As an essential reality, the authoritarian state can only be a *Rechtsstaat*, however much in a new sense. The state in a universalistic sense is the state community that maintains and

[12] Schönfeld 1938, 106. Schönfeld had already criticized Binder on a previous occasion in reviewing his *Grundlegung*: see Schönfeld 1935, where he accuses Binder of falling behind the times.

moves beyond its parts, whereas on the Nazi conception, the parts are simply analyzed as ultimately inexistent, and the same goes for the concept of the person, which Binder instead understands to be ineliminable. Writes Binder in his 1937 *System der Rechtsphilosophie*:

> Man is thus necessarily a person and is thus endowed with legal capacity, by which is meant that the legal system must, in accordance with the necessity proper to his concept, recognize him as a person, as an end in himself, and has having legal capacity; and the legal system would fall apart if it failed to do that. And to that extent, men are all equal, regardless of whether they belong to the Arian race. If an attempt were made to deny this undeniable consequence of the concept of law, that would lead to Bolshevism. (Binder 1937, 36–7; my translation)

Nor can it be denied that the Nazis understood their own ideology to stand in opposition to philosophy as such, which by contrast aims for the universal (cf. Hürstel 2010, 205).

None of this should be taken as a reason to downplay the fact that not only did Binder attempt (however much in vain) to make Hegelianism the official philosophy of the Nazi state, but even sought to play up the new regime's racial aspects and objected to the academic appointment of "Jewish" thinkers like Gerhart Husserl in Göttingen. On the other hand, it cannot be ignored that his idealist philosophy found no significant take-up among the leading exponents of the Nazi regime, and this, too, is a fact that cannot be pushed to the side. Even his 1935 *Grundlegung*—despite making the validity of law dependent on the positive law, and hence indirectly construing the idea of law as the form taken by the valid law currently in force, namely, Nazi law—was not welcomed as warmly as his 1925 *Philosophie des Rechts*. And the reason for this overall lukewarm reception is that Binder's conclusion about the form of law was a mere possibility, in that, even in the *Grundlegung*, he makes the positive law dependent not on the Führer's will, which is but one element of validity (even though the text makes no explicit reference to the political contingency of the moment), but on legality as such, which is always a synthesis between law and liberty. There is a concept of law that cannot be brushed aside or disfigured by any discretionary power, for otherwise legal norms and court rulings alike would have to part with their legality.

All told, Julius Binder is a philosopher worth reading and knowing even today, albeit in many respects critically, especially as concerns his last major work, his 1937 *System*: Perhaps realizing that his own idealist system in several ways stood in contradiction to the reality of Hitler's regime, he sought to overcome these antinomies in a final attempt to reconcile his own philosophy of law with the *völkisch* ideology of Nazism and with the idea that the foundation of law lies in the Führer's will (see Binder 1937, 312–20; cf. Binder 1934). But this, too, was a failed attempt, and it does not carry much theoretical weight, either, since at best it betokens a certain opportunism on Binder's part, who in any event cannot do without concepts and categories that continue to be

incompatible with the Nazi ideology. Suffice it to mention here the concept of a person, which an author like Höhn instead tried to unreservedly expel from legal conceptualization.

Binder would end his life in a state of relative intellectual and political isolation. His disciple Karl Larenz, along with another neo-Hegelian, Walther Schönfeld, emarginated him by reason of his erstwhile positivist and Kantian allegiances (to which Schönfeld ascribed what he alleged to be the erroneous interpretation Binder offered of the relation between Kant and Hegel: Schönfeld 1938),[13] and together they sought to lay the groundwork for a reconciliation between Hegel and Nazism, even though Hegel's spirit—geared toward reclaiming the process of liberty in history—would undoubtedly not survive their construction in any meaningful way, so much so that Larenz (1938b, 237ff.), accusing Binder of failing to appreciate the historicity of law and falling back on natural law, would attempt a *völkisch* theory of law that would consciously move even beyond Hegel.

Binder's reply was rather ineffectual and clumsy: He reprimanded his former pupils for criticizing his own Hegelianism from a standpoint closer to that of Schelling than to that of Hegel himself (see Hürstel 2010, 275).

5.4. Karl Larenz up to 1933

Karl Larenz (1903–1993) studied in Göttingen and formed a bond with Julius Binder, whose conception he inherited, while also fashioning himself into a critic of the neo-Hegelian rebirth. Larenz's dissertation thesis (Larenz 1927b) tackles the Hegelian theory of imputation and of objective imputation, against which he sets a *teleological* account of imputation: "In teleology lies the truth of causality; it is only as an end that a cause becomes what it is, or that an effect becomes its own effect and not an accidental one" (ibid., 44; my translation), Larenz claims drawing on a theory of the subject found to be at work in Hegel's philosophy of law, as well as on the principle of free will. Only by going through Hegel will it be possible to bring back to prominence the properly ethical and social character of law, beyond the formalisms that law has been reduced to by the neo-Kantian approach.

In 1927, Larenz published an article on the reality of law where that topic is treated by filtering the philosophy of culture through an understanding of culture as a unity of meaning and form, that is, as the manifestation of form

[13] "In truth," writes Schönfeld (1938, 106), "Julius Binder's idealism, as a conception that is not critical but dogmatic, appears to be more a positivism than an idealism. [...] As a 'positivism of conscience,' it is certainly a refined form of positivism, a sort of high-level positivism, so to speak, but precisely for this reason it reveals itself to be particularly dangerous, as it is not easy to recognize. [...] It is a positivism that has donned the cloak of idealism, a contradiction in terms that sooner or later must blow up and self-destruct" (my translation).

through history (Larenz 1927a, 204–10). In this sense, the reality of law can be understood only by proceeding from the historicity of law, a historicity that comes through in the idea of law: "All law is real, but all law is ideal, that is, it looks to the idea of law, in that law is real only insofar as it carries meaning, and it carries meaning only inasmuch as it reflects the community's will, which knows itself as a universal will" (ibid., 210; my translation).

In 1929, Larenz published a more extended essay on the problem of legal validity (Larenz 1967): What can the validity of law be made to rest on from an idealist perspective? Can that validity be grounded in the neo-Kantian distinction between *Sein* and *Sollen*? Clearly, in Larenz's view, any such separation is going to set up a false answer to the problem of validity (*Geltung*), for it is only by reconciling ideality with reality, or the normativity of law with its positivity, that a theory can be worked out capable of accounting for the phenomenon of legal validity in its full complexity. The *Sein* and the *Sollen* must be thought contemporaneously as moments dialectically connected in the consciousness of the self. Larenz believes that in this way he can also transcend the opposition between legal positivism and natural law: "Hegel," he writes, "is the philosopher who, in German idealism, demonstrated the positivity of law proceeding from the essence of the Idea, and who at the same time grounded positive law in the *idea* of law" (ibid., 26; my translation). In this sense, Larenz takes the validity of law to mean

> the existence over time of a norm whose bindingness [...] rests on that timeless foundation of validity which is the idea of law. [...] Natural law and legal positivism alike are thus transcended, since natural law asserts the timelessness of law and legal positivism its plain timefulness. (Ibid.; my translation)

The idea thus realizes itself in the historical world of human communities through a specific tripartition, that is, through the idea of law, through right law (*richtiges*), and through positive law:

> We thus have to draw a distinction among the idea of law as such, which can be determined only as the dialectical unity of all the "moments" that manifest themselves in the history of law; right law [*richtiges Recht*], that is, a representation of law corresponding over time to the Idea or to the ideal of law espoused by a given people in a given epoch; and positive law as the realization of the idea of law which at any given time is current. (Ibid., 32; my translation)

In this way we have a validity of law specific to, and immanent in, law as such, understood at once as an idea (the idea of law) and as that law which actually regulates a people's life. Larenz makes himself out to be more coherently Hegelian than his teacher, Binder:

> It is Hegel's theory of the "objective spirit" that makes it possible to consider law as an "autonomous" sphere of value, where law finds the foundation and criterion of its own validity in itself, that is, in its own Idea, such that its ethical character rests on its agreement, not with positive law and the moral convictions of individuals, but with its own Idea. (Ibid., 36–7; my translation)

In a Hegelian sense, then, it is "the present time" that determines the content of both philosophy and, clearly, of legal philosophy: "The famous saying 'The world's history is the world's tribunal' holds also for the philosophy of law" (ibid., 41; my translation).

So, on the one hand Larenz is a neo-Hegelian philosopher of law whose adherence to Nazism (as discussed in Section 9.4 in this tome) cannot be said to follow as a matter of necessity from his thought in its development until 1933, but on the other hand some of the premises can be espied in the essay on the theory of the community he wrote in 1932 and published the following year, as well as in the first edition of another essay published in the same year on the contemporary history of legal philosophy (Larenz 1931, 1933c, 1933b).

5.5. Walther Schönfeld: From Idealistic Personalism to Christian Theology of Law

Worthy of note among the jurists tied to the neo-Hegelian movement, many of whom would then adhere to Nazism, is Walther Schönfeld (1888–1958), a philosopher known only to a few today, but who nonetheless deserves to be studied not only as a matter of historical interest but also for some of the content and theses of his legal philosophy, which in truth is best described less as neo-Hegelian and more as neoidealist.

Indeed, as much as Schönfeld looks to Hegel, he is perhaps even more influenced by Schelling, but above all he draws on the entire German idealist movement starting from Kant, who instead of being rejected is actually drawn *into* the idealist revolution. So it is the *neo*-Kantian movement that Schönfeld takes exception to, from a philosophical as well as from a legal standpoint: As Schönfeld (1936, 5; my translation) sees it, Kant as interpreted by neo-Kantianism "is not the whole of Kant, and so is not the real Kant. Neo-Kantianism stands to neo-Kantian philosophy roughly as the Pandectist law of the 19th century stands to Roman law in its full breadth." The indictment against neo-Kantianism is that it ignores the complex dialectic internal to Kant's philosophy, where practical reason may be an end-result from an *external* point of view, but from an internal one it comes in at the beginning of Kant's philosophizing, and that precisely because Kant's philosophy is

> a philosophy of community, of man, and of freedom [...]: Therein lies the deep import of his theory, with the primacy it assigns to practical reason, and that is precisely what neo-Kantianism has failed to appreciate, having failed to gain a clear grasp of its governing dialectic. (Ibid., 7; my translation)

Schönfeld's legal philosophy is mainly devoted to the historical movement, and it accordingly regards Hegel as the apogee of idealism, but for that very reason it also understands that to be the point beyond which any further going can

only be downhill. And because Schönfeld's legal philosophy is in fact open to history, it takes the view that no definition of law can neglect either of the two moments, the dogmatic one and the historical one. For it is in history that the Spirit—the *Geist* of universal history—plays itself out and becomes manifest, and one cannot underestimate how significant it is in this regard that Schönfeld should seek to reconcile two thinkers who appear to have been at odds with each other, namely, Hegel, on the one hand, and on the other the founder of the historical school, Savigny (Schönfeld 1927b, 361).

In fact, despite Schönfeld's neo-Hegelian and idealist background, it is impossible for him to abandon Savigny, because concealed in Savigny's historical and historicist approach is a deep philosophical calling; the real, making possible a positivist approach, presupposes a prepositivist dimension, which does not mean a sort of natural law (a theory Schönfeld would nonetheless arrive at over the course of his speculative development) but is rather to be conceived as a *logos*, consisting in particular of legal reason, the kind that confers on positive law its specific quality as law. The positive law is such because it finds its place in history, and therein the is and the ought are never irreconcilably separate, as they are in Kelsen, because to remove the factual from the law means to remove the law as fact, which is precisely the law as the object of legal science (Schönfeld 1927a, 11). Although the is and the ought can be distinguished from each other from a *logical* point of view, the *historicity* of law implies that the history of law and the science of law cannot be separated in such a clear-cut manner. Not incidentally, as Schönfeld comments, Ehrlich's sociology is a history of law, and so a *science* of law, only to the extent that any science of law in its own turn must presuppose a philosophy.

In this way, in this connection between reason and history, idealism is reconciled, on the one hand, with some phenomenological approaches (Schönfeld mentions Reinach, G. Husserl, and Fritz Schreier) and, on the other hand, with von Gierke's "corporatist" conception. Indeed, Schönfeld anticipates the effort that in the 1930s some of the main proponents of Nazi law put forth to revive Gierke. This twofold reference to Hegel and Gierke permeates what is arguably Schönfeld's theoretically most significant work before his decision to adhere to Nazism, a work of 1927, *Die logische Struktur der Rechtsordnung* (The logical structure of the legal order: Schönfeld 1927a), analyzing the connection between the history of law and legal science. Schönfeld understands law as an inherently historical phenomenon, from which it follows that there can be no such thing as a unilaterally normativist and formalist legal science purporting to seize an abstract, ahistorical reason. Schönfeld appreciates that the formalist approach—premised on the primacy the modern sciences ascribe to function—appears to prevail over the historico-teleological approach; however, as he opines in a review of a book by Kelsen, "we believe this to be a Pyrrhic victory, and that the truth in the end lies with the temporarily vanquished enemy, for a legal philosophy that deliberately 'shuts out' the history of law

cannot and will not do justice to the nature of law or to its science" (Schönfeld 1928–1929, 620; my translation).

At the same time, however, historicity does not *ground* the scientificity of law, the latter of which presupposes a prepositive legal reason. Yet this reason is not something *apart from* positive law but actually lives *in* positive law itself. As Schönfeld explains it:

> Quite simply, even if there exists no natural law, there does exist a *reason* of law [...], and positivism wrongheadedly objects to this fact. There is an *a priori* of positive law, a system of conditions that any historical system of law must meet in order for it to be possible as real law [...]. Of course, this prepositive *a priori* of law does not in itself constitute law, for it is none other than the *possibility* of law. (Schönfeld 1927a, 37; my translation; italics added)

As Sylvie Hürstel points out in her brilliant reconstruction of legal neo-Hegelianism, "the logical structure of law, which couples the historical reality of law with its ideality, is understood by Schönfeld as having a teleological nature rather than a purely formal one, as Hans Kelsen would have it" (Hürstel 2010, 168; my translation). Teleologism is indeed what separates the two main currents of German legal philosophy since Heinrich Rickert's 1888 dissertation, "Zur Lehre von der Definition" (On the doctrine of definition): On the one hand is a rejection of the idea that law should be driven by a purpose, so as to assert the coherent (noncontradictory) nature of the legal system; on the other is the contrary idea of law as *imbued* with purpose, and so with the reasons and motives behind juridical decisions (rules and rulings), which reasons and motives are often political. Writes Schönfeld:

> Legal science, as a science of positive law, is an *ideological* science; or, stated otherwise, if we fear this term for its otherworldly overtones and want to express ourselves in more down-to-earth ways, it is a *teleological* science, since a purely logical consideration, one devoid of ideas or ends, winds up destroying positivity, which is what we should be trying to understand in the first place. (Schönfeld 1927a, 47; my translation; italics added)

On these premises Schönfeld openly invokes Julius Binder, embracing the need to set legal science on a philosophical foundation. And as much as he will later criticize this view, in the mid-1930s, he now positively affirms: "Legal science, understood as the unity of all the sciences of law, is a philosophical science, and the jurist who seeks this unity is a philosopher and not a historian. Legal philosophy is the science of all the sciences of law" (ibid., 84; my translation).

Schönfeld's criticism of legal positivism, then, is based precisely on the principle for which Schönfeld himself held good positive law as *law*, rather than positive law as the "positivity" of law. That amounts to reducing law to legislation, and so the science of law to a legislative science, that is, to a merely technical craft, which nonetheless winds up making absolute what is actually relative.

Schönfeld's legal philosophy is in effect an original philosophy of law of his own making: It cannot be reduced to neo-Hegelianism or to the *völkisch* philosophy that would take hold with the advent of Nazism, even though he would later count himself in as part of that movement. This is probably because Schönfeld's underlying conception is at once personalist and religious and cannot find any adequate expression in his philosophy of law and of the state.

The reference to Christianity is of course a reference to Protestant Christianity, and to Luther's in particular, which Schönfeld views as part of a line of development that includes Hegel, Bismarck, and Gierke—and also Adolf Hitler! And Christianity so understood is viewed by Schönfeld as closely bound up with Germanic thought, so much so that one can only wonder about the reasons that led him to embrace Nazism, a movement that fought not only Roman law but also, to a good extent, Christianity as such.

It should not come as a surprise, in view of the ambiguous and sometimes convolute premises of Schönfeld's thought, that he should ultimately reveal himself to be a proponent of natural law understood in a Christian evangelical light: we can see this in his 1943 article *Die Geschichte der Rechtswissenschaft im Spiegel der Metaphysik* (History of legal science in the light of metaphysics), as well as in the republished version of it, which came out 1951 under the title *Grundlegung der Rechtswissenschaft* (The foundation of legal science: Schönfeld 1951). And so, in effect, he closes his career as a theologian of law.

Chapter 6

LAW AND THE STATE IN THE CONSERVATIVE REVOLUTION

by Agostino Carrino

6.1. Law and the State in Oswald Spengler

Law is the subject to which Oswald Spengler (1880–1936) devotes some fifty pages in his *Untergang des Abendlandes* (The decline of the West: Spengler 1922–1923), and he also devotes to it some theoretical considerations in the second volume of that same work. However, it is not from here that I wish to start in offering the brief remarks that follow but from the fourth chapter of Spengler's 1924 *Neubau des Deutschen Reiches* (Reconstruction of the German Reich: Spengler 1924), where Spengler writes that "Roman law has corrupted us" (ibid., 241; my translation). This is not just an assertion of fact, for it gives us to understand that a different development of German culture might have been possible in which this culture was not saturated with Roman law, and hence was not "corrupted" by it, in virtue of the historical phenomenon of reception. Why is it that Roman law (or rather what came to be called Roman law from the time Irnerius rediscovered the Justinianian Pandects) exerts this corrupting force (and so carries a negative connotation)? The reason for it, Spengler explains, is that Roman law "dangerously stokes up the average German's tendency to stray from the course, to imbibe anything existing as a matter of fact" (ibid., 241–2; my translation). What this actually means is not entirely clear, even if a little later we do get something of a clarification: The reception of Roman law—the law of the Pandects—has corrupted the properly German ideal of liberty; this reception, in other words, has fouled up the original German liberty with the idea of obligation, the idea of the synallagmatic relation between a claim and a performance. And as Spengler specifies, this idea of obligation came about as the result of an interpretation tailored to the needs of the emperors of Byzantium: It was therefore moulded by the shaping hand of an oriental spirit, a spirit that knows no spiritual freedom but only knows obedience and servitude. Law has in this way taken the path of its rationalistic formalization, of its abstract conceptualization, but this has given rise to a contrast between "the book" (Justinianian Roman law) and "life," in an effort to adapt the latter (life) to the former (the book). As has been observed, "the whole of the modern development of law would seem to bear out this long struggle between the book and life, between the authority of the concept and reality, between theory and practice, between form and substance" (Farina D'Anfiano 1931, 311; my translation). Roman law was understood by Spengler as the unique and untranslatable product of the

DOI 10.1007/978-94-007-1479-3_6

politico-economic needs of the time; law was something concrete, having no use in the modern world; the idea of copyright, for example, is a specifically modern, i.e., nonconcrete, construct. In relation to this process, the modern jurists—"infected" by Roman law and by the geometrizing formulas of natural law—instead of favouring the concrete, the needs of concrete life, have sought to adapt life to the categories of the book. Romanists are, in Spengler's view, pedantic conservatives insensitive to the needs of concrete historical processes.

This push to reassert the primacy of Germanic law over Roman law (an issue that certainly became a focus of attention among German historians of law at the time) was increasingly taking on political overtones: The charge laid against Roman law, however much this law may have been misconstrued and even doctored, was aimed at advancing an ostensibly ancient Germanic law politically founded on specific values, those of subjectivity, entailing a corresponding set of choices. What was being criticized, in essence, was the concept of *Rechtsstaat*, such as it had been developed in European thought from the late 18th century onward: One should think here of the monopoly on the use of force, a use that on the criminal wrongdoer is reserved to the state and its organs (organized under the principle of the division of labour). This idea is criticized by Spengler, arguing that the criminal offender, "when in the act of committing a crime and fleeing [...], has no rights" (Spengler 1924, 246; my translation). The *Rechtsstaat*, in other words, "denies the free man's claim to defend himself, his own dignity, his own security and property and those of his people and homeland using all the means available to him" (ibid., 245–6; my translation). In truth, pressing forward in full force behind this reference that Spengler makes to Germanic freedom are the preoccupations of a petit bourgeois spirit, perhaps shaken by the end of the empire and the collapse of the Bavarian Soviet Republic: Those "who forcibly break and enter into other people's property to raid the place or commit theft are outlaws" (ibid., 246; my translation),[1] that is, they become an object of any possible action by the person wronged. Even in his subsequent book, the 1933 *Jahre der Entscheidung* (Years of decision: Spengler 1933a), Spengler does not soften the hard line he takes with deviants, a group in which he unqualifiedly includes "failed academics, adventurers and speculators, criminals and prostitutes, bums, the mentally deranged" (Spengler 1933a, 90; my translation)[2]—all of them set in contrast to those who bear their poverty in silence.

When Spengler remarks that "a universally valid law can be found only in the minds of intellectuals and dreamers far removed from reality" (ibid.; my

[1] Not incidentally, Spengler's "political existentialism" has also been characterized as the "literary outlet for his fear of actual reality" (Lübbe 1993, 143; my translation).

[2] A certain bourgeois mentality comes through as well in Spengler's response to Jünger's gesture of sending him a copy of *Der Arbeiter* with a nice dedication on it: see Lübbe 1993, 145. But on Spengler's reaction to Jünger's work, cf. Koktanek 1968, 429ff.

translation), he contradicts the content of his own properly Germanic law, which instead very much resembles the instinct for vengeance that everywhere and everywhen takes hold of property owners upon realizing that their property has been taken away.

It was, however, typical of the conservative German bourgeoisie of the time to compose hymns to the "justice" of victory, or at least, as was the case with Erich Kaufmann, despite his Jewish background, it would not have been unusual to belaud "victorious war" (E. Kaufmann 1964), what in Spengler is the "success through which the law of the strongest becomes law" (Spengler 1922–1923, vol. 2, 450; my translation). We find in Spengler an opposition—no less stark than it is unsupported by any argument—between truth and reality: There is a law based on speculation geared toward the truth, and there is a law that is simply real, effective; the former corresponds to what is known as domestic or state-enacted law, the latter to what would instead be recognized as international law, even though Spengler only speaks of "external systems of law." These outside systems, thought Spengler, "do not in any way make a claim to justice. They just need to be effective. What speaks to them is *life*, embodied in which is not any causal or moral logic but a much more coherent organic logic" (ibid., 451; my translation). But if this is the essence of international law, it is only for a love of symmetry that Spengler also speaks of so-called municipal law. Law, Spengler writes, "is an expression of power" (ibid., 452; my translation), regardless of whether this power is internal (national) or external (international).

What is striking here is that Spengler's thesis can be construed as quite close to Marxist theory of law, so much so that one can make out in his thought a sort of relation of dependence of the superstructures on the structure of life and culture, or rather of life understood as structure. And yet, precisely at the point where he appears to be closest to this theory, we can also find the deepest contrast. Indeed, as much as the law is always the law of the most powerful class (such as the Roman patricians) or the most powerful state, the "power" held by this class or state is never understood in economic terms but is rather invested with a meaning of "sacredness." The law being conjured up here is an everlasting law "rooted in time immemorial, for it springs from the experiences of the blood, and yet it reveals itself to be efficient" (ibid., 449; my translation), that is, "sacred."

The law is for Spengler form, but in a sense altogether different from the way in which the jurists take it: Law is form understood as the manifestation of a specific, historically determined substance, that is, as a sign, as an abstract token of the worldview espoused by those who have created it. It is static, for example, in ancient Rome, but dynamic in Faustian modernity. Every culture thus has a law proper to it, and in this sense there is no reason why the West, having moved into the phase of civilization, should replace the law corresponding to the Faustian phase of its movement with a law that no longer

belongs to it. Modern law—geometric, rationalist, formalist—is precisely the law of what we call modernity, so it would prove futile, and even contradictory, to hold up against it the idea of an alternative law, a law that for the reasons explained would exist simply as the figment of the imaginings and egoisms of a highly conditioned class.

Therein lies, in truth, the basic contradiction of the whole of reactionary thought, which mixes into its analytical lucidity a programmatic strain preventing it from really accepting the implications of its diagnoses, even when these are correct. For Spengler, as for other great reactionary thinkers like Joseph de Maistre (see also Section 3.3 in this tome, on Eugen Ehrlich), it is not the written law that matters:

> What is written in a constitution is always inessential. Everything turns on what the general instinct at any time does with that written text. The English parliament governs on the basis of unwritten laws, sourced in an ancient practice and often very little democratic, and precisely for that reason with great success. (Spengler 1920, 18; my translation)[3]

Spengler can be situated here in a tradition critical of liberal constitutionalism, a tradition that goes back to Edmund Burke, Maistre, and Luis de Bonald, who share the view that the true, "authentic" constitution is given by a people's existence, not by what is statutorily set down in writing, which is no more than the contingent product of an arbitrary will. From this perspective, Spengler's overall conception, like those of many other champions of the German "conservative revolution," can be seen to owe a debt to a work that truly broke new ground in social philosophy, namely, Ferdinand Tönnies's 1887 *Gemeinschaft und Gesellschaft* (Tönnies 1887, translated into English as *Community and Civil Society*: Tönnies 2001). The very distinction between culture and civilization is in several respects a historico-philosophical sublimation of the sociological categories analyzed by Tönnies.

6.2. Law and the State in Othmar Spann's Universalist Philosophy

Othmar Spann (1878–1950) taught political economy and social theory in Brünn and then, from 1919 onward, in Vienna. Despite this focus, there can be made out in his work a veritable philosophy of law and the state, a philosophy cast in a conservative and "organicist" mould. In Vienna, in particular, he developed a theory of society based on a conception structured around logico-philosophical categories, though a mystical strain does also run through his vision (his writings include a book on Meister Eckhart).

[3] In this regard, Koellreutter saw a similarity between Spengler and Weber, in that they both rejected that "cult of the constitution" with which the German theory of the state became so infatuated after the revolution (Koellreutter 1925, 482).

Spann's philosophy,[4] which he himself defined as "universalism," or "theory of wholeness (*Ganzheitslehre*)" (Spann 1928b) declaredly presents itself as an ontologically oriented effort to renew idealist philosophy, albeit through a reformulation of it couched in an original vocabulary that coeval philosophers and sociologists could not always understand. In any event, he does array himself against what he called pseudo-universalisms, especially Marxist collectivism and 19th-century materialism and naturalism. In so doing, however, he resists the pull of any methodological tendency that, like neo-Kantianism, appears to him to indulge too much in value relativism, with the result of according some sort of primacy to individuality, thus neglecting to recognize the originality and import of "aggregates" and "totalities," of society conceived as an organism and a whole—whence Spann's theory of "wholeness"—in the sense of a logico-conceptual and spiritual dimension where the whole is manifested in the parts and the parts are components of the whole, where the individual and the community are engaged in a dialectic meant not to crush the individual but to enable both to thrive.

Spann is not interested in a causal investigation of society and its structures but in the *telos* or ends a society pursues by virtue of its existence. It can be appreciated, in light of these premises,[5] why he should have taken exception to the materialist conception of history as one of his main targets. What it means to understand society and its structures, he thought, is to move beyond causal explanations, which break up the social whole, and which in this way lead to individualism. In contraposition to that approach he offered a method aimed at seizing the essence of things, an essence he understood to lie exclusively in their organicity.

What comes first, for Spann, is the spirit. What he means by the spirit, however, is not the manifestation of culture as a changing historical reality; rather, the spirit is itself reality and is universally valid. Then, too, this reality is not devoid of a mystical dimension transcending any sociology of religion or the church. This mystico-spiritual propensity leads him to favour small communities and to unqualifiedly deny the premises of any totalitarianism. For this reason it would be wrong to characterize Spann as a "reactionary" thinker, much less as sympathetic to the totalitarian movements of his day: He certainly was conservative, but he worked within an independent theoretical frame.

Spann recognizes society as an evident historical datum. However, society is made up not of individuals, as the liberal conception would have it, but of

[4] Spann's main works include Spann 1914, 1921, 1924, 1928a, 1932, 1934, 1937, and 1947.

[5] It has rightly been observed that Spann works out an *a priori* concept of wholeness independent of empirical analysis, and indeed simply superimposed on such an analysis. See the critical reconstruction in Baron Wrangel 1929, 3–4. Indeed, the science of society is not understood by Spann as a pure experiential science, for it does not proceed inductively, this despite the fact that references to experience and induction do come up in his work from time to time.

many small communities, and these are not separate from one another but are organically linked up through a system of evaluations pertaining to the function proper to law and the state. Despite the difference among communities, and even the potential for conflict among them, the state remains a corporative organization, connected to all the others but superior to them in virtue of its proper end, and this is so even in a liberal society, where "it is necessary to preserve a minimum degree of organization in determining evaluations, government approval, benefits, and subjection" (Spann 1931, 215–8; my translation). Indeed, this "classist" view of society does not prevent Spann from envisioning a decisive role for the state; in fact, it is social pluralism itself—in a society made up of corporative bodies, communities, and social formations—that compels the state to take on a role where it acts to integrate and unify the diversity existing within society. Spann's state is not a machine—in the sense of the metaphor through which the modern state is conceived, as an entity separate from society and its conflicts—but rather exists entirely *within* pluralist society: It represents, as it were, a phase or "state" (*Stand*) of that society and is made up of a political elite or an aristocracy of the spirit. This is no doubt a *premodern* vision of the state, but it does reckon with the reality of social conflict, a reality that Spann is very much aware of as a sociologist.

Spann's state is of course a "decentralized" state. One can appreciate, then, how difficult it is to square Spann's ideas with the centralist visions propounded by the Nazi and Fascist regimes. Spann's conception of law clearly takes an anti-normativist and anti-formalist angle. The law is such, for Spann, only if morally grounded, and indeed only if it coincides in good measure with morality. Indeed, an amoral law can only make a subjective claim, that of atomized individuals detached from the organic and vital community of the state. As Spann remarks,

> when law is considered from the universalist standpoint, it is at one with ethicity: Only that which is ethically right can be law. This is what sound reason also wants when it cannot bring itself to embrace the "heteronomous" law of the doctrine of singularity. (Spann 1931, 49; my translation)[6]

Spann's universalism thus stands in stark contrast to the liberal conception and to legal positivism (ibid., 19). Law is not a heteronomous entity, one that (as early as with Kant) is found to be in contraposition to autonomous morality; rather, law and morals are blended into a single thing in the universalistic vision of society, where there are no autonomous arenas to be found, since every area of social life is functional to the welfare of the whole, the *Ganzheit*, which alone constitutes the primary reality as objective spirit (in Hegel's sense). The error of neo-Kantian positivism, understood by Spann as embodied in the

[6] The German original: "Universalistisch gesehen ist Recht außerdem eins mit Sittlichkeit; nur was sittlich richtig ist, kann Recht sein. So verlangt es auch die gesunde Vernunft, während sie das 'heteronome' Recht des Einzelheitslehre niemals annehmen kann."

work of Stammler and Kelsen, lies in its absolutizing a partial datum, making out of it a sort of totality that absorbs the rest, just as in Kelsen the law can be seen to absorb the state, and the state is accordingly collapsed into the legal system, shedding all dignity and autonomy. All the spheres of social life beckon to one another and in some way depend on the entireness, which makes them into manifestation of the entireness itself. Writes Spann:

> The methodological claim at hand is perhaps nowhere better illustrated than in the example of law. […] We can understand Stammler's error and that of the like-minded Kelsen. Stammler only wants to distinguish "the activity of regulating" (the law) from the "content" of that which is regulated (the economy), both understood as partial wholes in the global whole of society. Kelsen does not go that far, but he does seek to reduce the state to the law, and in this way he essentially winds up doing the same thing, that is, making law the only feature of the social world. Kelsen indirectly and Stammler expressly and directly refuse to acknowledge the existence of many partial wholes within society, and they instead pretend to reduce the whole of law to its matter. They appear to succeed in this effort precisely because the partial whole can in effect be understood in relation to law only through its own legal nature. They regard the whole of society from a single point of view, that of a single partial system. But, by the same token, everything in economics appears in an economic light (witness Marx's historical materialism), everything in science in a logical light, and so on. [...] The task of a theory of society, however, is to observe society not from the viewpoint of a single partial whole, but as a global whole made up of all the partial wholes. (Spann 1921, 486; my translation)

It is the main concern of Spann's theory of society to overcome the absolutist tendencies of partial social systems, all the while recognizing the unity of these systems, and specifically that of the law as a unity of norms (*Satzungen*) and of the state as a unity of legal institutions and principles (*Anstalten*) (Heinrich 1979, 354ff.). This means that we have to overcome the classic dualisms, particularly that between *Sein* and *Sollen* (is and ought) at the basis of neo-Kantian philosophy of law (see Spann 1923, 555ff.). Indeed, Spann analyzes the is as that which ought to be (*gesolltes Sein*); and the ought, for its part, *fulfils* the is and thus makes up its very essence: "The whole of the real can be understood only as the realization of an ought. The essence of being lies in its realizing an ought" (ibid., 560; my translation). For this reason knowledge is understood by Spann as an evaluating knowledge, never as neutral (*wertfrei*) knowledge, from which it follows that what is deduced from the logical categories cannot be exempt from ethico-legal postulates of one sort or another, but as Sander comments in a critical essay, this leads Spann to confuse the *method* of inquiry with its *object* (Sander 1924).

Spann is thus led, on this approach, to embrace a political philosophy that recognizes the autonomy not only of the political sphere but also of the state as such, this to the extent that the state is recognized as the embodiment of a culture, rather than as a "minimal" night-watchman state. However, Spann's state is a decentralized entity based on the subsidiarity principle (Heinrich 1979; 359–60): It is a state that recognizes differences and indeed rejects the concept of equality (a concept endorsed only to the extent that it entails a respect

for the equal dignity of all persons). The state is an organic entity that does not depend on the individuals' will or on any meeting of the minds. It essentially consists of a spiritual entity entailing the primacy of quality over quantity, and hence a rejection of democracy in whatever form, including the form for which Hans Kelsen provided a justification. But now we are entering into the question of Spann's ideological choices, and that falls outside the scope of the present discussion. It should only be underscored here that law and the state are partial wholes making up the overall whole we call "society," and that they partake of the inner nature of this whole despite their distinctness. So, instead of having the law as *Sollen* and the state as *Sein*, we have two phenomena that both transcend the is-ought dualism posited by Stammler (Spann 1902) and Kelsen, with an ought incapable of realizing itself and as a reality that allegedly has no traffic with the *Sollen* (Spann 1923, 556–7).

As much as Spann may criticize Kelsen's neo-Kantianism and methodological dualism, his universalism can be analogized in several respects to Kelsen's legal, moral, and political universalism, insofar as the concept of unity prevails over that of division, and the concept of coherence over that of antinomy: Just as Kelsen's legal system can be an object of knowledge only to the extent that it is unitarily and coherently constituted by the normative scientific method, so Spann's universalism is founded on the coherence of organic wholes. The system, and specifically the legal system, precedes its parts. It is no accident that a disciple of Kelsen, Alfred Verdross, should have attempted to pull Kelsen's theses closer to those of Spann and to reconcile the two (Verdross 1924–1925, 413–31), offering a positive evaluation of Spann in light of the concept of objective value they both subscribe to: In Verdross "the organic theory of Spann is employed to support the mutual interaction of State and international community as equal expressions of a unified legal world" (Carthy 1995, 87).

6.3. Nihilism, Power, and Bourgeois Law in Ernst Jünger

Among the keywords in Ernst Jünger's (1895–1998) *Der Arbeiter: Herrschaft und Gestalt* (The worker: Domination and form, Jünger 1982), published in 1932, is *scheinbar*, "apparent."[7] Apparent is in the first place the whole domination of the bourgeoisie,[8] by which is meant the 19th-century liberal legisla-

[7] In the growing literature on Jünger, one ought to at least see Graf Von Krockow 1958 and Barnouw 1988, 194ff. Even more essential are two older works: H.-P. Schwarz 1962 and Bohrer 1978.

[8] As Delio Cantimori has observed, Jünger "does not use the term *bourgeoisie* or the term *bourgeois*. He instead uses *Bürger*, a term set in contrast to *Arbeiter* (worker), to designate now the bourgeois in the military, now the citizen, now the *citoyen* among jurists and politicians, now the bourgeois depicted in socialist propaganda. So *Bürger* does not have any clearly defined meaning in his work, but rather packs all those meanings into one: This engenders a certain confusion in the inductions he makes, but it does not prevent him from achieving the coherence of deductive logic in the consequences he extracts." It is Jünger's disdain "for the 'civilian'—such as

tive state that sought its legitimacy in the social contract as a sphere of defensive security—an illusory (apparent) security, because structurally incapable of seeing and seeking danger, the basic element which always *is*, and which does not just pretend to be part of any possible order "but is also the matrix of that higher security from which the bourgeois will always be excluded" (Jünger 1982, 51; my translation). Negotiation and compromise, which characterized the Weimar democracy itself, are what the bourgeois tends toward by nature. The bourgeois's central concern is with defence. As Jünger writes, this explains "why in bourgeois politics, lawyers as a class [*Advokatenstand*] have played a quite peculiar role from the outset" (ibid., 48; my translation). At the same time, however, the apparent dominance of the liberal state reveals the deep, concealed essence of abstract rationalism, or formalism: "The ideal in the space governed by liberal principles is that of outsized power, exercised not conspicuously but in a veiled manner, counterbalanced by a veiled slavery" (ibid.). Outsized power and slavery, piracy and free trade based on liberal concepts (Jünger 1980d, 464), are two sides of the same coin, namely, appearance, meaning the absence of form, of "metaphysics," or, stated otherwise, the hovering of the world "in a strange phase where there is no *longer* any dominance and not *yet* any dominance" (Jünger 1982, 190; my translation), where the individual has lost the ability to manage the state.

But appearance, for Jünger, is always working away in the background, sucking life, nature, and spirit from the world of form. The age of the apparent dominance of the liberal legislative state subtracts meaning and significance from things, life, and the world. It subtracts being from power and power from being, that is, it does away with the primacy of form. What survives is an abstract order where all bonds of responsibility are transformed into "contractual relationships with the option to rescind the contract" (ibid., 23; my translation), and the transformation of these relationships distinctive to the *Rechtsstaat* brings on the advent of nihilism. Appearance prospers in purely social, contractual relationships, the repudiation of what the state is in essence, an essence originarily extraneous to those spaces which are purely legal (in a formalistic sense) and moral (ibid., 267).

Not incidentally, the liberal space of apparent dominion, as Jünger would write in his 1950 *Über die Linie* (Beyond the line), "becomes a nihilistic object" (Jünger 1980c, 248; my translation), and the legal regulation of violence in which consists its function reveals the absence of limits on the use of violence itself.[9] The state that has turned apparent brings about a total absence

it has been handed down by tradition, as well as his disdain for its intellectual and moral culture and for life according to rational norms—that grounds all the other motifs in his impassioned plea" (Cantimori 1991, 220; my translation).

[9] "In the military clashes with the East, the rules that govern on the Western battlefields have no place. Their codification in the Hague Conventions [of 1899 and 1907] already bespeaks a

in the meaning of things: This is precisely the kind of absence that goes by the name of nihilism, where nothing is left for the individual to do "but choose among different modes of injustice" (Jünger 1980c, 256; my translation): As Jünger writes in *Der Gordische Knoten* (The Gordian knot: Jünger 1980d), "where the sword of Themis rusts, the axes glisten with sparkling lustre" (ibid., 419; my translation). Nihilism "can actually harmonize with ordinative worlds of vast proportions" (Jünger 1980c, 249, my translation), and in fact it must presuppose a sort of prearranged legal order, a unique and abstractly immutable system of law, as a condition lacking which it could not be nourished and grow. But we know, Jünger writes in reply, that "there is no such thing as an immutable system of law: There only exist systems of law which are created and maintained and which perish. [...] Because life is multifarious, it is necessary for law to also be multifarious, to the effect that what is good for one could not in any way be suitable for the other" (Jünger 1927, 4; my translation). An abstract, formal, apparent order devoid of an organic "landscape" of its own—an order that is just "spiritual" (intellectualistic, rationalistic, economistic)—"is not just fit for nihilism but also belongs to its style." It is the very aim of nihilism" (Jünger 1980c, 249),[10] and so it comes to be that "in concentration camps, a murderer can look to a more favourable treatment than that reserved for the political prisoner" (Jünger 1980d, 419; my translation).

Certainly, in the 1950 *Über die Linie*, Jünger's positions are in many respects different from those he previously advanced in the period immediately after World War I, with the idea of a "conservative revolution," as well as from those set out in his 1930 *Die totale Mobilmachung* (The total mobilization: Jünger 1980a) and his 1932 *Der Arbeiter*. Once again, it was the war that marked the watershed. But the deeper themes remain in place, this through the personal equation in Jünger, who keeps thinking about the same problem, that of the opposition between appearance and reality. Even after we move past the vanishing point, the domination of appearance, of arbitrary will,[11] will still be found to remain standing—and, what is more, also unfulfilled will be the promise that the nihilism proper to the mythicized Worker can be overcome so as to found a "new dominance" in a new metapolitical community. The state, the Leviathan, will continue to show itself to be invincible, to the point where "it could gobble down in a single bite what residue continues to be extraneous to the secularization processes, were it not that a certain mistrust prevents it from doing so" (Jünger 1979, my transla-

certain decadence. Indeed, the knightly warriors had no need for them, because these warriors were well aware of the limits of violence" (Jünger 1980d, 450; my translation).

[10] Something along the lines of this *Stimmung* (sentiment) in the German conservative milieus of the Weimar Republic can be found in E. Kaufmann 1921.

[11] The theme of the arbitrary will as opposed to the organic will—a contrast analogous to that between society and the community—is developed by Ferdinand Tönnies in his 1887 *Gemeinschaft und Gesellschaft* (Community and society: Tönnies 1887).

tion). In spite of that, or maybe precisely *because of* that, its invincibility still is and always will be an illusion, and yet in this very illusoriness and appearance "lies its strength. The death promised by [the Leviathan] is illusory, and hence even more terrible than death on the battlefield" (Jünger 1980c, 270; my translation). There emerges here a relevant difference between Jünger and Schmitt. For Schmitt, who in this instance is evidently writing under the influence of Hegel,[12] "in Germany the spirit has once again outdone the Leviathan" (Schmitt 1950, 16–7; my translation); Jünger, by contrast, believes that the invincibility of the Leviathan lies precisely in its "appearance," in its lightness and illusoriness. Here Jünger is more insightful than Schmitt, seeing the Leviathan in the unwritten legal system, and seeing this as the normal state where the nihilist acts, and where "the only thing left for the individual to do is choose between different modes of injustice" (Jünger 1980c, 256; my translation).

There are indeed two ideas of justice, one of them abstract and formal, or functional, and the other concrete, which is more than real, in the sense that it has always been embedded in the range of possibilities, sustained by the eternal effort of the being, whose action is guided by an ancient ethics. Jünger's Worker is a character representing the will to power in the age of the planetary domination of technique: It is the "cosmic clockwork," and as such it symbolizes the idea of "concrete" justice found in the "natural" order of things, a justice rooted in the task assigned to it, manifesting itself as power in the effort to lay bare meaning (Jünger 1982, 83).

This task is to uncover the *nontechnical* essence of technique in the very process of subjugation to technique through the heroic act of accepting pain in the world. This is the task that puts the Worker on the line, that is, on the vanishing point of completion and announcement: the completion of nihilism and the announcement of its supersession. This completion and this announcement manifest themselves in the Worker's inner capacity for *ascribing and generating meaning*. Like Nietzsche's *Übermensch*, Jünger's Worker belongs with the essences of the will to power; as Heidegger has pointed out, however, this drive signals a lacking, a shortcoming, and hence a will. In the provisionalness of the total mobilization of planetary energies—the total mobilization in which lies the distinguishing feature and import of modern progress—"nothing has any lastingness except the diagram of power" (ibid.); the will to completion, however, is unaware of the apparent state and of calculative liberalism. The overall sense of Jünger's enterprise, then, apart from the contingent interpretations he himself put forward, is to be found in a (metapolitical) conception of politics intended not to reject but to supersede the state's role in that sphere:

[12] An aspect that in those years was certainly common to Jünger and Schmitt is their interest in Georges Sorel (1847–1922), whose importance in Jünger's work was first underscored by Cantimori (1991, 210, 217).

"Those wishing to pronounce themselves on supreme things must stay outside the state" (Jünger 1959, 253; my translation). Jünger's Worker, then, appears as a metapolitical figure, touching the intimate and arbitrary aspects, purely subjective, typical of the bourgeois world, of the bourgeois as an apparent figure, as a mere "individual."

6.4. Rudolf Smend and the Constitution as "Integration"

Rudolf Smend (1882–1975) played a significant role in conservative thought in the context of the Weimar Republic, specifically on account of a book on public law he wrote in 1928, namely, *Verfassung und Verfassungsrecht* (The constitution and constitutional law: Smend 1968).

As was the case with conservative thought across the board at the time, so also for Smend individuals have any meaning only insofar as they are members of a community, not in the sense that the latter will prevail on the individual but in the sense that the individual gains self-consciousness only as a social being, and hence as an individual situated in a cultural community. Smend's most important philosophical reference point in this regard was Theodor Litt (1880–1962), the author of a book titled *Individuum und Gemeinschaft* (The individual and the community: Litt 1924).

Here it won't be possible to lay out in full the arguments Smend deploys on the state and on the central concept of his constitutionalist thought, namely, that of integration. But it will be mentioned that his politico-legal conception owes a significant debt to the experience of the Italian Fascist state, taken up as a model in conceiving the state as a dynamic entity. The state as integration is indeed understood as a politico-intellectual process in which the single individuals participate as members of a national community so as to make the state itself into an experience of collective life.

The state, as Smend conceives of it, is not given once and for all but is every day built and rebuilt, thus finding its own legitimacy in the mutual recognition between the state itself and the community. This integrative activity is both personal and functional, in the sense that the organs of the state contribute in different but necessary ways to fashioning the state into a spiritually and politically unified—and hence "integrated"—entity.

One can easily appreciate how this conception of Smend's stands sharply in contrast to Kelsen's, on which the state is equated with the norms of the legal order, the state being conceived as no more than the formula expressing the legal order's logical coherence. Whereas Kelsen understands coherence as belonging exclusively to the world of norms (see Kelsen 1930)—made logically "homogeneous" with one another in virtue of the constitutive activity of legal science, this in contrast to the sociopolitical world, overtaken by conflict and by the plurality of classes, parties, and the like—Smend takes the view that homogeneity can and must belong precisely to the people, whose representative

organs, whether they are rulers or a parliament, must serve a further integrative function on the basis of this social and spiritual homogeneity.

In Smend and Schmitt alike, democracy and parliamentarism each go their separate ways: Parliamentarism has seen its demise, and parliaments can play any role only if they can contribute to an integrative process by representing the people as a unitary and somehow homogeneous entity. The state and its people are accordingly conceived by Smend as coextensive with a territory with its distinctive landscapes, history, and traditions. Integration is therefore a complex process that cannot be reduced to formal legality but must have a legitimacy of its own stemming solely from integration in its every form: personal, functional/formal, and material. Once again Smend's conception can be seen to be quite sympathetic to the experience of Italian Fascism in the 1920s, where integration appears to him to respond to the sociological reality of society and the state as modern formations, for in this setting it would certainly no longer be possible to envision a traditional type of community, blotted out by the advent of industrialism and capitalism. The modern age is an age of masses, and so neither liberal parliamentarism nor any reactionary mythology can meet the challenges posed by the radical socioeconomic transformations set in motion by World War I.

When viewed in this light, Smend falls comfortably under the rubric of the conservative revolution. The state is not conceived by him as something given, a bureaucratically organized structure, but as an ongoing construction. And, by the same token, the "constitution"—understood as an "integrative order"—is itself a continuing process, one that eludes any formalism and resists any attempt to exalt the "ought" without any ontological foundation on which to base such an endeavour.

Chapter 7

MARXISM IN THE PHILOSOPHY OF LAW

by Agostino Carrino

7.1. Anton Menger and "Ex Cathedra Socialism"

Anton Menger (1841–1906) will be remembered here for his *Neue Staatslehre* (New theory of the state: Menger 1903). He can rightfully be considered the father of legal socialism, perhaps the first thinker to have put forward a "democratic theory of law" (Reich 1972, 93), a theory informed by a specifically reformist and hence nonrevolutionary intent, for it is concerned to preserve the institutions of the *Rechtsstaat*, while positing the need for the working class to take part in those institutions, however much for the purpose of transforming economic reality in keeping with a social democratic model.

Menger's legal socialism differs from Marxist legal socialism by reason of the way it frames the distinction between structure and superstructure, in that he stresses the need not to reduce ideological forms, and specifically the law, to what is understood to be the economic structure (though, in truth, something along these lines can be said to hold as well for all Marxist and neo-Marxist jurists). Law is to be viewed primarily in connection not with the relations of production but with force, so much so that through force the law can even modify economic relations; to be sure, this transformation can work in favour of the ruling classes, but it can also work out to the benefit of the underclasses, should these seize hold of the means of lawmaking. As N. Reich has observed,

> an important role is played [in Menger] by ideas of social justice, by the reformulation of basic social rights, and by the need to prevent exploitation and eliminate unearned windfall income. In contrast to Marx, he subscribes to the view that the present flaws of a concrete legal order can be eliminated. (Reich 1972, 93; my translation)

Menger is thus essentially concerned with private law, in which regard he underscores the primacy of public law, understood by him as the primacy of the collectivity over the abstract individual *qua* self-interested subject placed at the centre of social relations. In putting forward his "legal socialism," Menger seeks to point out a viable political avenue for the workers' movement, fashioned into an active subject presupposed by a new science of law, a legal science understood in a "social" sense, that is, as disclosing the ideological and class presuppositions of the categories of bourgeois law (whose "functional transformation" Renner will subsequently bring into relief), a law that can be changed through a specific politics of law.

Consequently, if the law rests on force, the state, on Menger's analysis, must be an instrument of power, and one would be hard put to it to imagine (on

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_7

these premises) how the state might be extinguished, even in a socialist society. Indeed, if anything, the state in such a society will have to *augment* its powers, inasmuch as "there will be a need for direction not only in relation to the process of social production but also for the purpose of keeping human beings within the legal order" (Menger 1930, 189; my translation), the latter conceived as an order of power aimed at transforming the nature of property relationships (understood in the classic sense) from individualistic to social.

Despite this role ascribed to force, Menger's theory of the state was regarded by his contemporaries as essentially utopian, since Menger's emphasis on rationalistic centralization, with its Benthamite overtones, cast the socialist as a threat to concrete individual liberties. In fact, as Menger saw it, the tool by which to achieve socialism was distribution, which cannot be effected without recourse to the law. In this sense, it can be appreciated that Menger is a "gradualist," and "evolutionist," and certainly not a revolutionary. And in fact his legal socialism drew criticism from much of the Marxist intelligentsia, especially from Engels and Kautsky—with an 1887 review of Menger's *Das Recht auf den vollen Arbeitsertrag in geschichtlicher Darstellung* (The right to the total labor product in a historical perspective: Menger 1886), Engels and Kautsky 1887—and subsequently from Rosa Luxemburg, among others.

7.2. Austro-Marxism

Marxist legal philosophy in the early 20th century played no more than a marginal role in thrashing out the central issues of the politico-ideological debate: class struggle, the relation between structure and superstructure, Bernstein's revisionism, parliamentarianism, the primacy of equality, the extinction of the state, religion, and nationality. Even so, some of the leading Marxist philosophers of the time saw fit to devote themselves to the problem of law and its functions, both within the legal system in force (and hence the "bourgeois" system) and in regard to a future socialist system.

Among these thinkers were some of the most significant exponents of so-called Austro-Marxism, designating socialist thought within the frame of *felix Austria*. Nor could it be otherwise: Austria at the turn of the 19th and 20th centuries was a crucible into which flowed the most diverse cultural streams, from art to literature to psychoanalysis.

What *was* Austro-Marxism? Politically, it was an attempt to find a third way between Marxist orthodoxy and revisionism, whereas in a human and cultural sense it was an actual intellectual community, one that would later be described as follows by one of its chief political exponents, Otto Bauer:

> What brought them together was not any particular political orientation but the nature of their research. They had all come of age in an era when people like Stammler, Windelband, and Rickert were using philosophical arguments to fight Marxism. Marx and Engels had taken their cue

from Hegel; later Marxists found their starting point in materialism; the youngest of the "Austro-Marxists," by contrast, proceeded in part from Kant and in part from Mach (cf. Adler 1911). But in the university milieus, in the arena of political economy, they also had to reckon with the so-called Austrian school, and it was through this exchange, too, that the method and structure of their thought was shaped. (O. Bauer 1970, 49–50; my translation)[1]

The Austro-Marxist school was thus forged alongside the Austrian school of economics (Mises, Hayek), the Austrian school of law (Kelsen, Merkl, Verdross, Pitamic), and other currents typical of Austrian thought in this period. It also bears mentioning, however, that this intellectual community was not immune from internal dissension, especially after World War I in the 1920s: The arguing even grew bitter, going to the very foundations of the theories being put forward. In response to a criticism by Renner, for example, Max Adler, who was radicalizing his own positions, took him to task for espousing a "crass empiricism" (Adler 1983, 51; my translation)[2] and a conception of the state as a means by which to advance the workers' struggle, a conception exactly contrary to that of Marx, for whom the state is inevitably a tool for the *oppression* of the working classes (ibid., 58). And indeed it would not have been too difficult to make out, within Austro-Marxism, different attitudes split along basic political lines. Still, as has been observed, the practical achievements of Austromarxists in Vienna

were very great, and they might well have been extended successfully to the whole country if the S.D.P. had attained the majority in parliament [...]. In the theoretical sphere they made acute analyses of studies of the changing character of twentieth-century capitalist society; of the economic structure, the development of social classes, and the changes in law and the state. (Bottomore 1978, 44)

The leading exponents of Austro-Marxism in Vienna were Karl Renner (1870–1950), Otto Bauer (1881–1938), Max Adler (1873–1937), and Rudolf Hilferding (1877–1941), but only Renner can also be considered a jurist, whereas Adler, a philosopher, was mainly concerned with the theory of the state, of which he put forward his own conception.[3] Both thinkers, in any event, engaged with Hans Kelsen, who worked with Renner in drafting the Austrian Constitution of 1920 and trenchantly criticized Adler and his conception of the state.

7.2.1. Karl Renner

Karl Renner is the theorist of Austro-Marxism who more than any other thinker in this current developed a theory of law conceived in its own terms, a

[1] An anthology of significant writings by Bauer, including on Marxist philosophy and the question of nationalities (which he particularly cared about) can be found in O. Bauer 1961.

[2] This is Adler's reaction to Renner in Renner 1983, 31ff.

[3] See in any event, more in general, Butterwegge 1991.

theory seeking in particular to guarantee at once the dignity of the individual and that of the community, all the while recognizing that there is no way to avoid conflict (political or otherwise) within the forms of law and through the tools made available by the legal system as the expression of a historically determined culture.[4]

The main problem Renner's legal thought is concerned with is that of the relation between individual will and the general will, between autonomy and heteronomy.[5] This ultimately boils down to the problem of democracy and the ability of this political arrangement to realize a practicable form of individual liberty. Renner thought this was an imprecise and limited realization, in that it works especially by *mediation*, or, as Kelsen would have said, by *compromise*.

As the outcome of a compromise, the general will fails to reflect the individual wishes of those who have taken part in the compromise: It rather constitutes a complex mechanism that works precisely through the diversified input provided by the gears and levers it is made of (Renner 1950, 136). And so in a posthumous work, *Mensch und Gesellschaft* (Man and society: Outlines of a sociology, Renner 1953), Renner argues that there is no way to eliminate the tension between the autonomy of individual will and the heteronomy of the general will (ibid., 211).

The inevitability of heteronomy means that individuals cannot be considered equal, because if there were equality among them, then no community would be possible. The social impulse, which Renner brings out overtly drawing on Aristotle's *Politics*, forms the premise for a political community, but this is not to be understood as an authoritarian community; it only amounts to an alternating play between individual rights and obligations. Writes Renner:

> Dominion is like labour, divided among all components of society, and just like obedience it does not lie in a privilege conferred on this or that individual. Dominion is shared among everybody, not because all are equal, but precisely because they are each endowed in different ways. Everyone constitutes the general will, and precisely in that lies everyone's supreme organic right [...]. We thus know what equality in human society consists in—certainly not in any physical or

[4] In Renner's *Die Menschenrechte* (Human rights), for example, we find this significant and emblematic passage of his thought: "In this agreement between the community and the individual, in this juridically ordered agreement, we see realized the essence of democracy, which lies precisely in the cooperation of all despite the inherent fight against all, in the cooperation of all next to the struggles of all against all—but that within the forms of law and through legally regulated means" (Renner 1948, 39; my translation). On Renner, see Hannak 1965.

[5] Writes Renner in this regard: "All law is imperative, an imperative directed by the collective will at the individual will. All law is heteronomy of the will; it is a will imposed on the autonomous will of the individual from the outside, absorbed in his consciousness and which has thereby become the co-determining motive of his actions" (Renner 1953, 211; my translation). The German original: "Alles Recht ist imperativ, das von dem Gesamtwillen an den Einzelwillen gerichtet ist. Alles Recht ist Heteronomie des Willens, ist ein Wollen, das dem autonomen Willen des Individuum von außen auferlegt, in sein Bewußtein rezipiert und dadurch zum mitbestimmenden Motiv seines Handelns geworden ist."

natural equality [...]. What is natural is precisely the particular, the individual. Only society can reduce the individual to the universally human, in the same way as the social economy reduces concrete labour to socially abstract labour, universally human, and the law operating in society reduces the concrete individual to the unitary formula of the so-called legal "person" and to this person's rights. (Renner 1908, 295; my translation)

For this reason, too, Renner thought, it is a mistake to reduce human nature to the causal laws of nature. He did not shrink back from the philosophical debate that also took Austro-Marxism by storm, a debate ignited precisely by the contrast between causality and teleology (cf. Adler 1904). He does not enter into the problem per se but accepts the distinction between facts and norms, a distinction that will form the basis of the pure theory of law. No appeal to nature—whether in gnosiology or in ethics—can legitimize a scientific method; and, what is more, any such appeal is going to entail a social policy not functional to the essence of the political will.

Freedom naturally conceived winds up contradicting the very essence of the concept of freedom, whether the concern is to guarantee the rights of the individual or those of the collectivity. Anarchism and liberalism are from this standpoint homologous, both being grounded in natural law, a conception that Renner rejects. Many are the analogies that Renner's theory of law bears to the later theses of the pure theory of law. Writes Norbert Leser:

Karl Renner, in his pioneering work *Die soziale Funktion der Rechtsinstitute* [The social function of legal institutions: Renner 1904], did not only investigate the way the right to property and its functions have changed over the centuries, while also offering a contribution "to the critique of bourgeois law" (as the subtitle of his book indicates), but also developed the groundwork for a distinctive theory of law, one that shows broad systematic overlap with Hans Kelsen's later "pure theory of law." (Leser 1978, 43; my translation)

Even so, it would be an error to see Renner as having anticipated Kelsen, at least Kelsen at the time of his first "pure theory of law." Like Kelsen, Renner separates knowledge from will, but he does not believe that knowledge and the scientific method can engender social and political liberation. What matters in this regard is will, the will that Kelsen (in the 1910s and 1920s) views as secondary to the ability of the scientific method as such to yield effects in the very determination of the object of knowledge. In this sense, the analogies that Norbert Leser underscores between Renner and Kelsen apply much better to Kelsen at the time of the second edition of the *Reine Rechtslehre* and in the 1960s, with his change of tack as concerns imperatives and the imperativeness of norms.[6]

Undoubtedly, in any event, law is conceived by Renner as a normative phenomenon, a phenomenon in a state of tension with social reality and its needs, which determine the structure and functions of legal concepts, especially the

[6] On the second phase of Kelsen's *Reine Rechtslehre*, see Section 2.3.2.2 in this tome.

concept of property (Renner 1965, 70). Sociology and jurisprudence work hand in hand, and yet Renner will declare himself to be against any syncretism of method (as Kelsen will later also do), for that would amount to confusing the efficacy of law with its normativity. But unlike Kelsen—at least in the phase where he was making overtures to neo-Kantianism—Renner understands norms to be imperative.[7]

It would be a mistake, however, to judge Renner's theory simply against the pure theory of law, not least because Renner takes the view that no theory of law can be pure, since legal norms and the legal system as a whole are very much contingent on social transformation, which in turn is contingent on the outcome of class conflicts. There are no such things, for Renner, as rights operating independently of the concrete socio-historical situation or, consequently, of the concrete legal system. The right to property, an ever-evolving legal concept, is determined by the norms currently in force, not by any prelegal "natural rights." No division can be drawn between public and private law, in that the whole of law is law belonging to the state and to its legal system; thus, for example, the capitalist's right to exploit the product of wage labour "is transferred public power, blindly handed over to the power holders: The work relationship is a mediated relationship of domination" (Renner 1965, 107; my translation).

The core of Renner's legal philosophy clearly lies in his critique of private property, whose changing function he investigates proceeding from the distinction between its economic and its legal function and arguing that the latter cannot be explained by reduction to its economic function. Over time, however, legal concepts (here property) and the underlying social relations undergo change, and this process will eventually make those concepts obsolete, when jurists fail to appreciate the ways in which the society at hand has changed. This is not to say that the structure determines the superstructure, but it does mean that they interact as a unitary entity, what might be called socioeconomic formation broadly understood. Unlike the medieval socioeconomic formation, the capitalistic one is not conscious of the world of production, and yet it pretends to separate this world from ideological forms, separating form from matter, as Renner puts it, bringing the example of Stammler's philosophy of law (see Section 1.3 in this tome), where

> the formal element is moved entirely within the law. In effect, the purely economic object (capital) finds its own formal determination prior to the law. A given sum of money, for example, where no question arises as to its legal qualification, appears in an exchange under the form of an equivalent, in a mortgage under the form of capital, in the process of circulation as a means

[7] "Certainly Renner, with the strong emphasis he lays on the imperative character of all norms, anticipated the modification that Kelsen would later make to his own theory of the basic norm so as to bring that norm into line with the maxim No imperative without an emperor" (Leser 1978, 43–4; my translation).

of circulation, in the hands of a property owner under the form of a cache. (Renner 1965, 86; my translation; cf. Renner 1924)

Law and the economy are thus connected, but over the course of history they develop unevenly, showing that what causes the economy to evolve is not the law:

A legal system in a historically given form acts as the presupposition and condition for the existence of society such as it is, but not as the cause of social change. [...] The function of society changes without an accompanying change in the legal concept. (Renner 1965, 172; my translation)

But social change does not determine legal change if not gradually and in the first instance in relation to the function of a norm, which can continue to exist as the same norm even as its meaning changes in accordance with social change, understood by Renner not in a normative way but in a naturalistic one:

The change in function consequent on society's shifting economic and natural base can continue until the norm ceases to be in any way effective, and this explains desuetude, the fact of a legal concept having fallen into disuse even though it has not been legally eliminated. If a legal concept becomes functionless, it can tacitly and unobtrusively vanish from society, without the components of society itself having any conscience of this vanishing, and so without its being laid down from the top. (Ibid., 177; my translation)

It is thus a complex relation that holds between law and society, a relation requiring, on the one hand, the autonomy of legal science (since what this science takes for its object is a "whole"),[8] and on the other a scientific, sociological foundation for social analysis. But this autonomy does not entail that either legal science or the scientific foundation can do without the other: Legal science itself, understood as the "art of legislation," "consists above all in an accurate judgment of the mutual influence between norms and their substrate" (ibid. 178).[9] All this happens over the course of the slow but uncheckable process through which the legal system shifts from the primacy of private law to that of public law, a process that from a distance can also be seen to mark the shift from capitalist to socialist society.

Science, whether it be jurisprudence or sociology, thus proves necessary if, even in the sphere of law and the state, Marxism is to be prevented from collapsing into a sort of catechism of the proletariat. Just as legal concepts evolve and change their function, so science operates not in the manner of a reality given once and for all but in the manner of a dynamic process, inevitably in-

[8] Renner writes in this regard that "the law is an articulated whole determined by the needs of society" (Renner 1965, 70; my translation).

[9] The German original: "Die Kunst der Gesetzgebung liegt vor allem in der richtigen Abschätzung der Wechselwirkung von Norm und Substrat."

teracting with the proletariat's political perspectives and struggle, without this meaning that we have to fall into the trap of the unity of theory and practice, a unity that winds up being a simple ideological mask.

This did not prevent Renner from embracing a political view of legal science, however indirectly so, especially as concerns the relation between national states and the international community. It ought to be observed that in this very regard Renner's conception probably influenced Kelsen as he went about developing his own conception of the *civitas maxima* and his criticism of the dogma of sovereignty. In a significant work of 1914 devoted to the nation as a legal idea, Renner presents the state as an entity destined to yield ground to the primacy of the international community. Wrote Renner:

> The concept of sovereignty is conceivable only within a community of states [...]. The legal system will be complete only when the law of the most powerful among the states will have been replaced with the regular legal process of international jurisdiction and enforcement. (Renner 1914, 10; my translation)

And yet, from Renner's realist perspective, the state can hardly be transcended; quite the contrary, the state is conceived as the tool, the basic lever for moving from capitalism to socialism (see Renner 1917, 28; cf. Leser 1966, 156ff.). He can in this sense be said to espouse an interventionist, social, and administrative conception of the state, so much so that Kelsen defined Renner's position as nothing less than the "apotheosis of the state" (Kelsen 1924, 12; my translation).

7.2.2. Max Adler

Max Adler was the *philosopher* of Austro-Marxism. Here we will be concerned not with his epistemological and moral conception—though it, too, is worthy of being investigated,[10] at least from a historico-philosophical perspective—but only with his conception of the state.

It should be observed, however, before we start, that Adler rejects the dualism of structure and superstructure, believing it to be abstract and inadequate as a basis on which to understand the role of ideology in history; in fact he explicitly underscores instead the autonomy of the "forms of consciousness," including law, morality, religion, art, and the like (see Adler 1964a, 33ff.). This is not to say that ideology cannot turn into appearance: It will do so if it casts off its presuppositions and becomes established as something independent of the socioeconomic context. The "material" element and the "ideal" one are somehow both retained in the historical process and in every single socioeconomic

[10] On Adler's philosophy, see at least Heintel 1967. A collection of minor writings can be found in Leser and Pfabigan 1981.

formation: "Ideality without materiality is ineffectual; materiality without ideality is senseless" (Adler 1913, 17; my translation).

The foundation of Marxism—understood as a sociological, not a political, theory—lies in the unity of theory and practice (Adler 1981, 56).[11] This leads Adler to view the state as a "phenomenon of social life" (see Adler 1964a, 72ff.; my translation), where the concepts of society and life are to be understood as forming part of being. "The starting point for Marxism is thus the concept of society as a social being and happening, making human beings as isolated impossible from the outset" (ibid. 31; my translation). Human beings, on Adler's conception, are always consubstantial with society itself, in that there is no original or foundational moment of society. Humans are by nature social beings—admittedly not a new thesis, but Adler supplements it by stating that even the state is not something apart from society: "Society and the state are not for a Marxist two different things, much less are they set in contraposition to each other" (ibid. 33; my translation). When the state is effective, it always exists as the form of society.

One can understand here the basic criticism Adler directs at Kelsen.[12] On Kelsen's conception, the state is equated with the legal system understood as a normative system; Adler, by contrast, equates the state with society and makes both into an object of causal, sociological knowledge.

To investigate the state sociologically is to historicize this ideal form of social relations. The state can thus perform two functions, each opposite to the other, depending on whether it is to be construed as the ideological form of a solidaristic society or a conflictual one, as is the case with the capitalist society. This means in the first place that it is wrong to think of the state as something that must be "extinguished," for it can easily serve a positive function in a solidaristic society, the kind a future socialist society could be. But in a world dominated by opposing interests, economic and ideological, the state cannot be considered in any other way than as the expression of class conflict, and hence ultimately as a class instrument itself. In fact, democracy, founded as it is on the majority principle, ultimately itself amounts to a dictatorship, to one class's domination over the rest of the population.[13]

This confers on the state its characteristic contradictory position, for on the one hand it claims to be "universal," but on the other it cannot help but represent the interests of a specific social class, the one that controls relations of production. Writes Adler:

[11] The German original: "Diese innige Beziehung des Sozialismus zur Wissenschaft, vielmehr diese Stellung der Wissenschaft selbst, demzufolge Sozialismus gar nichts anderes ist als ihre umfassende gesellschaftliche Praxis, ist die zweite große Bedeutung des Sozialismus für den Intellektuellen."

[12] On the debate between Kelsen and Adler, see Pfabigan 1978.

[13] In making the case that there is no antagonism between democracy and dictatorship, Adler also draws on Carl Schmitt essay on dictatorship. On this subject, see Ananiadis 1999, 118.

> Only in a classless society can the interest of the individuals in the totality coincide with the interest of the whole. In a class society there is not yet a totality to which such a universal interest can conform; and what is habitually labelled as such comes down to the most elemental vital necessities, which can encompass the greatest inequality of vital interests. (Ibid., 155; my translation)

Adler would consequently come to the conclusion, in *Politische und soziale Demokratie* (Political and social democracy: Adler 1964b), that democracy and the state are mutually exclusive, that the order existing within the state cannot but stand in opposition to the order which will come into being in a socialist society.

As far as the law is concerned, then, it will be necessary to envision a society founded on heteronomous norms and another one founded on autonomous norms, the latter so designated in the sense that they have been set up by agreement among their addressees themselves. A nonsolidaristic society requires a heteronomous order; a solidaristic one, by contrast, requires an essentially autonomous legal-political organization. In societies of this latter kind, writes Adler, constriction "is owed exclusively to everyone's working and living conditions; it is [...] experienced not as constriction but as something that regulates all individual working and living conditions with respect to this society" (ibid., 45; my translation).

Clearly, Adler's conception of social democracy, as distinguished from his political conception, is not devoid of utopian traits, but it must be underscored that in this democracy the primacy of collectivity should in any event be reconciled with a respect for individual freedoms, where individualism expresses not a self-interested conception but a drive toward self-determination and a conscious deepening of one's own personality. As much as Adler's political philosophy undoubtedly bristles with "illusions" (Leser 2013, 116), we would do him wrong if we failed to recognize his effort to develop a neo-Marxism attentive to the critical points of its own premises, his effort—at least in the first phase of his thought—to find a "third way" (this is his own expression; see Pfabigan 1981, 14) between revisionism and Bolshevism.

7.3. Georg Lukács, Karl Korsch, and "Western Marxism"

Georg Lukács (1885–1971) and Karl Korsch (1886–1961) (and subsequently also Ernst Bloch, 1885–1977) represent the current of thought that in the 1920s in Germany revived a mode of philosophical reflection that moved away from the orthodoxy of the Second International (Karl Kautsky), as well as from the Third International of Bolshevik persuasion (Lenin, Bucharin, Stalin).

This, however, was a reaction to the criticisms directed at Marxist thought from outside Marxism itself, found to be dogmatic and incapable of adapting to the social and cultural changes the political and social consciousness of European intellectuality had gone through in the 19th and 20th centuries.

Marxist philosophy had not yet produced anything on the order of Rudolf Hilferding's 1910 *Das Finanzkapital* (Finance capital), Rosa Luxemburg's 1913 *Die Akkumulation des Kapitals* (The accumulation of capital), or Vladimir Ilyich Lenin's 1917 *Imperialism, the Highest Stage of Capitalism*. The Marxists' philosophical speculation found itself trapped in an exegetical exercise narrowly focused on the writings of Marx and Engels themselves. Even Lenin, with his 1909 *Materialism and Empirio-Criticism*, could not overcome this limitation. In reality, the philosophical rejuvenation of Marxism was in large part the outcome of the October Revolution and sprang from the need to reflect on the transformations underway in Russia as well as in the countries of Western Europe. But this reflection on the revolution would soon, in its own turn, become revolutionary, sparking reactions from both the orthodox Marxists and the Russian revolutionary Marxists. Western Marxism thus acted as a catalyst precipitating internal dissension among Marxist parties. But it would take several decades before anything positive could come of this situation, opening new perspectives when Western Marxism was rediscovered, and with it the critical thought of Antonio Gramsci.

7.3.1. The Concrete Totality in Georg Lukács's History and Class Consciousness

At the core of the conception developed by Georg Lukács lies a reading of dialectics as a method to be applied uniquely to the historico-social world, a method aimed at uncovering ideology as a false consciousness. Specifically, for Lukács, Marxism needs to be explained as a historically determined conception: as a method for subjecting the capitalist bourgeois world to critical analysis and not as a science of society in general. The basic elements of this method were, as Lukács's development of it, the identity between subject and object and, even more importantly, the concept of a concrete totality.

The concrete totality is a socioeconomic formation in a state of constant flux. Writes Lukács:

> It is not the primacy of economic motives in historical explanation that constitutes the decisive difference between Marxism and bourgeois thought, but the point of view of totality. The category of totality, the all-pervasive supremacy of the whole over the parts, is the essence of the method which Marx took over from Hegel and brilliantly transformed into the foundations of a wholly new science. [...] *The primacy of the category of totality is the bearer of the principle of revolution in science*. (Lukács 1971, 27; cf. Lukács 1968, 94)

As Korsch did in an even more straightforward manner, Lukács refused to imagine a socioeconomic formation entirely dependent on the economic structure. To speak of the concrete totality is to say that the social structure cannot be reduced to a single factor but rather represents a set of jointed material and spiritual elements, where being and consciousness are interlaced, giving rise to

a dialectically complex reality that cannot be reduced to any naturalism. Empirical data can take on any meaning only if embedded in the concrete totality, where the structure and the superstructure condition each other, and where the dialectical method uncovers the reifications and the ideological alienations concealing the real power relations. The method of the concrete totality "deconstructs" the object in its false givenness and reconstructs it in light of theoretical concepts making it possible to understand real data (in Weber's sense of the term *understanding*), all the while explaining the same data, and to unmask the social conflict existing in the concrete totality, in which Lukács also sees the potential for revolutionary, political action:

> Thought and being are therefore identical not in the sense that they "correspond" to or "mirror" each other or that they proceed "in parallel" or "wind up coinciding" (all these expressions are just dissembled forms of a rigid dualism): Their identity rather consists in their being moments of the same historico-real dialectical process. (Lukács 1968, 349; my translation)

Class consciousness therefore plays an essential role in the process of transformation: It does so as a historical outcome that, having been subjectivized, is then objectivized in a historically ongoing dialectic, a dialectic that for this reason cannot be reduced to a gnosiological relationship, for it is tailored to the praxis of the subject understood as a collective subject. As Lukács sees it, even "nature is social a category" (Lukács 1971, 130; cf. Lukács 1968, 372), and reality "cannot *be*; rather, it *becomes*, but it cannot do so without the intervention of thought" (Lukács 1968, 349; my translation). The most important objection made to Lukács was that of subjectivist idealism, and indeed the idealist strain comes through clearly when viewing Lukács against the background of Marxist orthodoxy.

His conception of law and of the functions of legal institutions in the formation of the capitalist society and economy hinges on his theory of reification as a core concept of the Marxist method. In *Die Verdinglichung und das Bewußtein des Proletariats* (Reification and the Consciousness of the Proletariat, in Lukács 1971), law appears as something static, in the sense that the bourgeois false consciousness (bourgeois ideology) has transformed the meaning of rules, for these are functional to class interests even though they also appear to be ontologically given, so much so that one is at a loss to figure out how to overcome reification itself as distinct from objectification, and so as subject to the proletariat's revolutionary action.

Lukács looked to the general theory of law, not in general, as Korsch would later do, but with specific reference to the conceptions expounded by Georg Jellinek and Hans Kelsen, this because, in keeping with Marx's insights, capitalist legal relationships are to be understood by him as entirely distinct from legal relationships such as they existed in precapitalist societies, where they are *not* mediated. In precapitalist societies,

legal forms must constitutively intervene in economic nexuses. There are no pure economic categories [...] that appear in legal forms, having been folded into legal forms and become enveloped in them. Rather, economic and legal categories are in their content concretely, indissolubly interwoven into one another. (Lukács 1968, 135–6; my translation)

This is so in the same way as economic relations themselves are not independent of other sorts of relations, especially the state as one such relation. Writes Kelsen in his *Hauptprobleme*:

What is done in the lawmaking act represents the great mystery of law and the state; so there may well be good reasons why the essence of this act is made intuitive only through adequate images. (Kelsen, 1911, 411; my translation)

Lukács proceeds by taking up an observation that Somló makes in his *Juristische Grundlehre*:

It is a distinctive feature of the essence of law that even a norm which has come into being in a way contrary to law can be a legal norm, and so, in other words, that the condition for its coming into being cannot be included in the concept of law. (Somló 1917, 117; my translation)

Lukács's comment on these passages by Kelsen and Somló is particularly significant:

This clarification intended for critical knowledge could take on the sense of an actual clarification, thus advancing our knowledge, if on the one hand the problem of the origin of law, consigned to other disciplines, could really find a solution, and if, on the other hand, it were possible to really grasp and deepen the peculiar nature of law as it arises in this way, whereby law only serves the purpose of calculating the consequences of our actions and framing, from a classist point of view, certain rational modes of action. (Lukács 1968, 206–7; my translation)

It must preliminarily be recalled that the genesis of modern law is described by Lukács, who in so doing draws on Max Weber's insights, as a "rational systematisation of all statutes regulating life, which represents, or at least tends towards, a closed system applicable to all possible and imaginable cases" (Lukács 1971, 96; cf. Lukács 1968, 189), and "it requires no further explanation to realise that the need to systematise and to abandon empiricism, tradition and material dependence was the need for exact calculations (Lukács 1971, 97; cf. Lukács 1968, 189–90).

Lukács criticizes Kelsen for failing to see that history, sociology, and the other empirical sciences are not up to the task of solving the problem of the "origin" of law, as well as for failing to see that "the law maintains its close relationship with the 'eternal values,'" and that "this gives birth, in the shape of a philosophy of law, to an impoverished and formalistic reedition of natural law (Stammler)" (Lukács 1971, 109; cf. Lukács 1968, 207). Clearly, the problem is for Lukács that of "recomposing the totality" that "the particular sciences have so conspicuously renounced by turning away from the materi-

al substratum of their conceptual apparatus" (Lukács 1971, 109). Traditional jurisprudence has methodologically given up on the possibility of a rational foundation, on the idea that the content of law can be rational, and has seen nothing in law other than "a formal calculus with the aid of which the legal consequences of particular actions (*rebus sic stantibus*) can be determined as exactly as possible" (ibid., 108; cf. Lukács 1968, 206). "With this the primitive, cynically sceptical campaign against natural law that was launched by the 'Kantian' Hugo at the end of the eighteenth century, acquired 'scientific' status" (ibid.; cf. Lukács 1968, 205–6).

In Lukács's view, then, the Austrian pure science of law is no less blameworthy than the traditional jurisprudence that spans from Savigny to Jellinek, for its "formalism" is none other than the final outcome of a process that goes way back in the foundation of the bourgeois world, a process that substantiates itself in an "inability to penetrate to the real material substratum of science," an error that "is not the fault of individuals. It is rather something that becomes all the more apparent the more science has advanced and the more consistently it functions from the point of view of its own premises" (ibid., 107; cf. Lukács 1968, 203). This incapacity of post-revolutionary "bourgeois" science (set in contrast to the "synoptic view of economic life" captured by the 18th-century bourgeois scientists and philosophers) "emerges with even greater clarity and simplicity" in the science of law, since this science is no longer cognizant of revolutionary natural law theory, where reason and content cannot be decoupled, in that, by contrast, the "universality of the law (and hence its rationality) was able at the same time to determine its content" (Lukács 1971, 107).

> Of the tenets of natural law the only one to survive was the idea of the unbroken continuity of the formal system of law; significantly, Bergbohm uses an image borrowed from physics, that of a "juridical vacuum," to describe everything not regulated by law. (Lukács 1971, 108; cf. Lukács 1968, 205)

> Science is thereby debarred from comprehending the development and the demise, the social character of its own material base, no less than the range of possible attitudes towards it and the nature of its own formal system. (Lukács 1971, 105; cf. Lukács 1968, 201)

> By confining itself to the study of the "possible conditions" of the validity of the forms in which its underlying existence is manifested, modern bourgeois thought bars its own way to a clear view of the problems bearing on the birth and death of these forms, and on their real essence and substratum. (Lukács 1971, 110; cf. Lukács 1968, 201)

So, in Lukács's view the "'systematisation' of the whole" (Lukács 1971, 102) cannot be effected by going through the empirical sciences, not even through the philosophical sciences, for these

> divorce these empty manifestations from their real capitalist foundation and make them independent and permanent by regarding them as the timeless model of human relations in general.

(This can be seen most clearly in Simmel's book *The Philosophy of Money*, a very interesting and perceptive work in matters of detail.) (Lukács 1971, 94; cf. Lukács 1968, 187)

As has been correctly observed, this conception

evinces Lukács's specific journey from Kant to Hegel, a journey that by virtue of its specific object must necessarily proceed beyond Hegel: Formal law is the real universality of bourgeois society; it spreads across the concrete totality of the life of the people, but (contrary to what Hegel still thought) it does not in effect constitute the dominant principle of bourgeois society; rather, it is itself only a function of the dominant economic anarchy. (Apitzsch 1990, 80; my translation)

Lukács's theses on law do not on the whole differ a great deal from Korsch's. One significant difference does, however exist, for the two authors take different positions on the question of natural law. Indeed, for Lukács, natural law can be analyzed as the linear expression of the revolutionary bourgeoisie, and formal law, such as it emerges from a dissolution of the principles of natural law, winds up being no more than "a function of economic realities" (Lukács 1971, 228), and hence a universal and insurmountable *antinomy* of bourgeois thought; for Korsch, by contrast, with his substantially unitary conception of the process of human liberation, natural law takes on a historically boundless but ontologically determinative dimension in the process of liberation itself.

7.3.2. Karl Korsch: From the Free Law Movement to the Materialist Critique of Law

Karl Korsch completed his studies earning a law degree at the University of Jena in 1911. As Goode (1979, 5) reports, "philosophy would have been his own chosen area of study, but his father insisted on law"—precisely the lot that had befallen the young Marx.

Korsch became engrossed in the *Freirechtsbewegung*, or free law movement, devoting his doctoral dissertation to the question of how the rules of evidence apply in civil procedure (Korsch 1911). The whole discussion revolves around the distinction between *abstrakte Beweislast* and *konkrete Beweislast* (abstract and concrete evidence), and even though Korsch does not stray too far from traditional legal dogmatics, at the very outset, in the introduction, he touches a question that would be crucial to him, that of the relation between praxis and "abstract ideas."

What held his interest at this early stage was the classic concern of the free law movement itself, namely, the need to critically reassess the whole notion of the completeness of the legal system, a question he turned to in the first part of a 1914 article (Korsch 1914), where he discusses the interpretation and application of foreign legal rules on the part of a domestic judge, a procedure essentially made to depend on "the way in which abstract norms ought to be applied in practice" (ibid., 286; my translation).

But our focus here needs to be on his most widely known work, namely, *Marxismus und Philosophie* (Korsch 1923, translated as *Marxism and Philosophy,* Korsch 1970). It is in this work, and in the coeval *Kernpünkte der materialistschen Geschichtsauffassung* (Principles of the materialist conception of history: Korsch 1922), that Korsch fleshes out his interpretation of Marxism as a specific revolutionary epistemology and his so-called critical Marxism. Writes Korsch:

> It is a grave error the erudite bourgeois make when they set out from the assumption that Marxism sought to replace traditional (bourgeois) philosophy with a new "historiography" and the traditional (bourgeois) theory of the state and of law with a new "theory of the state and of law." (Korsch 1922, 5; my translation)

For Korsch, the essence of Marxism instead lies in its critique of the ideological premises underpinning the bourgeois sciences. Marxism is thus understood as the theoretical expression of the revolutionary practice in a social movement that unmasks the class interests informing the bourgeois sciences. Clearly, this conception of Korsch's falls some distance from the conception of Marxism as a social science, a conception expounded in his 1938 *Karl Marx*: "Every critique [...] of law must therefore necessarily find its ultimate foundation in the 'most radical' of all critiques, that is, in the critique of political economy" (Korsch 1938, 286).

In other words, Korsch understands there to be in Marx a *layered ontology* where political economy grounds the totality of the social formation. This grounding, however, does not immediately make for a criticism of forms and of "spiritual" production in general. Indeed, as much as forms are real (this also applies to the form law), they cannot be grasped through a Marxist critique. It follows that it would be useless to attempt a "Marxist" theory of law and the state; in fact, any such theory would be mistake proper from the standpoint of historical materialism, since no "partial" theory can be self-enclosed but must necessarily bring into play the layer that grounds the totality encompassed in which is each single object, including each single "theory": A theory may well be ideological, but it is an effective reality all the same (and Korsch is referring here to Emil Lask's *Rechtsphilosophie*: see Section 1.4 in this tome).

Korsch's totality, however, is not the same as the one envisioned by Lukács: Korsch takes totality to be more an empirical criterion of analysis than a philosophical category. All the branches of knowledge are connected with production, but the social sciences are so only in a "mediated" way, and the spiritual sciences are only connected with spiritual production.

In Korsch's assessment, therefore, the Austro-Marxist Karl Renner is proceeding along a false path in his attempt to integrate Marxism's political economy with a theory of law: "The Marxist system," writes Korsch, "is in no need of any such integration, just as it does not need a Marxist 'philosophy' or 'mathematics'" (Korsch 1922, 13; my translation). If from the standpoint

of Marxism as an expression of revolutionary practice, "even the science of ought is conditioned by the degree to which material production and the other branches of the overall social propaganda have advanced," then the very notion of a Marxist legal science must be a contradiction in terms, since a science of this sort would have to be "specifically" concerned with an object—law, though this also holds for the state or for any other "form," including language in general—that in itself refers to its own grounding layer, the one that founds, determines, and supports it in the complex of totality.

Law and the state, such as they have emerged from the process of history and from the breakup of the medieval unity through the epoch-changing bourgeois revolution, are closely bound up with a specific historical time, that of the bourgeoisie, after which, through a succession of real cleavages, there is only the classless communist society. That is why Marxism, as an expression of the social revolution effected by the proletariat, sets itself up as a revolutionary criticism of the bourgeois science of law and the state, using this critique to arrive at the object of this science, in just the same way as Marx criticized Hegel's philosophy of the state so as to arrive at a critique of the state itself.

Law and the state are construed by Korsch as the immediate expression of the bourgeois revolution, and as the perfectly rational accomplishment of any conceivable class rule. The state embodies the final and most powerful form of bourgeois and capitalistic domination, effecting the "the grand, all-inclusive synthesis in which all contradictions are or can be resolved" (Korsch 1922, 53; my translation). For this reason, writes Korsch,

> Marx and Engels not only combated one specific historical form of the State, but historically and materialistically they equated the State as such with the bourgeois State and they therefore declared the abolition of the State to be the political aim of communism. (Korsch 1970, 49)

What is original about the kind of Marxism propounded by Korsch (who in this sense can be counted among Emil Lask's indirect pupils) is the suggestion that the method of historical materialism can be applied recursively to historical materialism itself, thus historicising historical materialism. In fact, we have here the central point of *Marxismus und Philosophie*, namely, the thesis of the reality of the forms of consciousness, of ideology, and generally of all so-called superstructures: "It is essential for modern dialectical materialism to grasp philosophies and other ideological systems in theory as realities, and to treat them in practice as such" (Korsch 1970, 66).

The economic conditioning of the forms of law and of the state should not, in Korsch's opinion, be taken to mean that the proletariat's practical activity thereby collapses into the economic sphere. Rather, this activity must invest the totality as a whole, and so must also invest "forms" as such. And it is not just law and the state that are "real" but also the ideologies themselves, along with legal and political theories. According to vulgar Marxism, Korsch claims,

there are three degrees of reality: (1) the economy, which in the last instance is the only objective and totally non-ideological reality; (2) law and the State, which are already somewhat less real because clad in ideology, and (3) pure ideology which is objectless and totally unreal. (Korsch 1970, 73)

This contradicts the Marxist notion of the concrete totality, where the structure and the superstructure call each other out, as it were, in the sense that the forms of consciousness are not simply the product of economic reality but are ultimately what makes possible the very reproduction of economic relations. Law, the state, and the economy all conspire in constituting the socioeconomic formation we call the bourgeois or capitalist society; in this sense law is to be understood not as the formal reflection of class interests but as constituting the necessary form of class relations, in such a way that to upend jural relations is to upend economic relations.

There is, however, another writing that needs to be taken into account in blocking out Korsch's legal thought: an introductory lecture he delivered as an untenured professor in 1923 at the University of Jena under the title "*Jus belli ac pacis* im Arbeitsrecht" (*Jus belli acpacic* in labor law), an ambivalent text, in that it can be read in light of his earlier writings on *Sozialisierung* (socialization), on workers' councils, and on labour law, but it can equally lend itself to a more straightforwardly legal-philosophical reading. In *Marxismus und Philosophie* Korsch sets out to reclaim what he takes to be the historically and theoretically necessary relation between Marxism and classic philosophy; in *Jus belli ac pacis* he proposes to lay the groundwork on which basis to reclaim the relationship between the bourgeoisie's natural law theory and the new natural law of the working class (see Seifert 1972).

The categories devised by the revolutionary bourgeoisie, Korsch argues, retain their validity even in the era of the proletarian revolution, despite the transformation they undergo as to their immediate contents: There is an "essential and necessary relation between German idealism and Marxism" (Korsch 1923, 67; my translation). There is therefore a connection between the war waged by the proletariat against the capitalist bourgeois society and the war waged by the bourgeoisie against the feudal class society:

This is in particular where we should locate the fact that with the classic theorists of natural law (Grotius, Hegel, and Clausewitz) and with the political economists of the working class (Marx and Lenin) we can understand the real nature of war and of its relation to peace. (Korsch 1972, 147; my translation)

Natural law theory—the kind that can be described as "authentically scientific, living, creative, and revolutionary" (ibid.; my translation)—is recovered by the workers' movement of the 19th and 20th centuries as a critical weapon against the wedge driven by bourgeois legal positivism between the "peacetime order" and the "law of war," a separation that according to Korsch was entirely unknown to the first great bourgeois natural lawyer, Grotius.

What in Korsch's opinion made Grotius's work scientific was the idea that "the whole of law, considered according to its true concept, is a law of war and peace [...]. For Grotius, war and peace form a social totality, and it is precisely as a totality that jurists ought to understand and develop it" (ibid., 143; my translation). To distinguish a particular *jus belli* from the law "ordinarily" in force is tantamount to concealing the real fact that "inherent in any and every legal event in the contemporary bourgeois society—in the most private jural relationship as in imperialist trading on a world scale—is a moment of war" (ibid., 144; my translation).

By comparison with the mystifying "positive" science of the bourgeoisie, the working class hoisted in the legal arena the flag of natural law that had been taken down by the reactionary bourgeoisie, thus bringing the law of war and peace among classes back into the fold of social relations. And one can also appreciate here why Korsch should later have taken an interest in Carl Schmitt and in his concept of the political grounded in the theory of the distinction between foe and friend (see Korsch 1932).

7.4. Hermann Heller: Socialism, the State, and Culture

Hermann Heller (1891–1933) is certainly among the most interesting and original socialist philosophers of law.[14] He, too, thought that class struggle cannot rest on the force of economic interests alone but must also involve a cultural struggle framed in terms that go beyond the classic Marxist categories. This can be appreciated, for example, in Heller's relation to the German Social-Democratic Party (which he joined in 1920 even though he was Austrian by birth), in that he sought to bring back within the party's conceptual frame the idea of the nation and the state, whose universality cannot be disacknowledged for the sake of an alleged primacy of the economic structure.

Heller's philosophy in effect presents itself as a philosophy of culture very much indebted on the one hand to Hegel's idealism and on the other to the sociological dichotomies of the time, such as community vs. society and *Kultur* vs. *Zivilisation*.

In Heller's view, neither the individual as a conceit of liberal thought nor the class as a notion popularized by Marxism can help us gain any substantive insight into the historical process, since it is the nation, not the class, that figures as the basic engine of evolution. There comes to light here the distinctly Austrian imprint of Heller's cultural background, in the sense that Heller shows himself to be sensitive to the question that had gripped the political debate in the Austro-Hungarian empire, that of the relationship among national minorities. It is the nation that, for Heller, provides the proper setting—or rather, the com-

[14] For an essential bibliography on Heller, see Albrecht 1983, Blau 1980, Dyzenhaus 1997, Müller et. al. 1984, Robbers 1983, and Schluchter 1983.

munity—within which culture can thrive: "The human being is a dead conceptual abstraction" (Heller 1992a, 464; my translation).[15] As Dyzenhaus observes:

> Human nature is culturally determined but also determinative of culture. Culture comes about because human nature is utopian in the sense of setting goals and then trying to attain them. But these goals necessarily operate within the context of a culture that is not directly of our making and which thus forms a relatively objective and constitutive basis for our individual efforts. (Dyzenhaus 2000, 254)

This view—let us call it "substantialist"—makes Heller's democratic socialism unique by comparison with the interpretations offered by the other social-democratic legal philosophers who were writing on political science in Germany at the time of the Weimar Republic, so much so that the interpretation Heller offers of democracy and Fascism does not hold back from revealing certain sympathies with the latter, however much superficially, or from giving certain decisionist undertones to the democratic system, fundamental to which, in his view, is the organizational function of decision-making freedom. Heller would be dismissed from his teaching position and be forced to emigrate with the advent of Nazism, but later on, in the post-war Federal Republic of Germany, his social-democratic conception came back into the limelight thanks to a couple of concepts he had theorized, namely, the "social *Rechtsstaat*" and the homogeneity of the national collectivity:

> In the absence of a "social homogeneity" that guarantees social equality, he reasoned, individual liberties for which liberals fought are worse than worthless. For these liberties can be politically and socially divisive when groups of individuals find the law's formal promise of equality and liberty for all to be merely formal—that is, insubstantial. (Ibid., 250–1)[16]

Heller's philosophy of law is in synchrony with his theory of the state. Its primary concern is with rebutting normative and "nomocratic" positions, specifically as embodied in Kelsen's pure theory of law. Heller criticizes any methodological purity at root, calling instead for a methodological syncretism making it possible to grasp the law as a multiplex phenomenon. The law cannot be reduced to a norm: It rather requires investigations at once jurisprudential, sociological, and politological. Writes Heller in *Die Souveränität*: "Every legal problem, none excluded, is anchored at the bottom in sociology and at the top in the ethico-political sphere, and it is not just *amenable* to both a caus-

[15] The German original: "'Der Mensch ist eine tote gedankliche Abstraktion; dieses abstrakte Gespenst kann deshalb auch niemals das zu gestaltende Material des Sozialismus sein."

[16] Writes Heller (1992c, 427): "Democracy is supposed to be a conscious process of the formation of political unity from bottom to top; all representation is supposed to remain legally dependent on the community's will. The people as a plurality is supposed consciously to form itself into the people as a unity. For the formation of political unity to be possible at all, there must exist a certain degree of social homogeneity. [...] It is thus the case that the degree to which it is possible to form a political unity depends on the extent of social homogeneity; likewise the degree to which it is possible to put in place a system of representation, and stabilizing the representatives' position" (translation from Heller 2000).

al and a normative analysis but actually *requires* both" (Heller 1992b, 57; my translation).[17] From a methodological standpoint this means that no adequate understanding of law can be had through a merely logico-formal analysis; from the standpoint of the premises and results of an inquiry into the law this means two things: first, that no jurisprudential theory of the state can ignore practice (and vice versa), and second, that law is not a pure form but is also content, for it consists not just of procedure but also of decision-making.

The state cannot be dissolved into the legal system: It rather *precedes* legal norms, for otherwise the theory of the state would resolve itself into a theory of the stateless state. Norms should accordingly be recognized as imperatives issued by the organs of the state at its various levels: They express the decision-making capacity proper to the state. Unlike Kelsen, Heller thinks that the foundation of law lies not in the law itself but in power, which in turn cannot but be the expression of a conflictual society.

From this also follows Heller's conception of sovereignty, set in sharp contrast to Kelsen's, on which sovereignty instead needs to be eradicated, root and branch. For Heller, sovereignty is founded on the existence of a "universal decision-making unity" in which lies the origin not only of political decisions and legal norms but also of the very rights of those subject to the legal order. Sovereignty "is the property of a universal unity of effectiveness and decision across the territory, a unity owing to which sovereignty, for the benefit of law, will in certain cases assert itself in an absolute way, even contrary to the law" (ibid., 185; my translation).[18]

Heller's conception cannot, however, be fully understood if we overstress the ways in which it may come into contradiction with concepts he accepts, even if only formally. Despite the points of contact with conservative thinkers like Carl Schmitt, Heller remains at heart a socialist thinker, fully aware that politics is conflict,[19] and hence that law, as an abstract and equal rule, may *conceal* conflict but not root it out. In this sense, as much as Heller may depart from vulgar and deterministic Marxism, he certainly can be said to follow in the tradition of the workers' movement, and specifically in that strand of the tradition which most sharply criticizes liberal formalism and the illusion of parliamentary compromise.

[17] The German original: "Ausnahmslos jedes juristische Problem ist nach unten in der Soziologie und nach oben in der ethisch-politischen Sphäre verwurzelt; jedes juristische Problem ist einer sowohl kausalen wie normativen Betrachtungsweise nicht nur zugänglich, sondern fordert sogar beide."

[18] The German original: "Souveränität ist die Eigenschaft einer universalen Gebietsentscheidungs- und Wirkungseinheit, kraft welcher sie um des Rechtes willen sich gegebenenfalls auch gegen das Recht absolut behauptet."

[19] Even the homogeneity that Heller believes is needed to achieve political unity "can never mean the abolition of the necessarily antagonistic social structure" (Heller 1992b, 428; my translation).

It is precisely this socialist tradition critical of bourgeois formalism that Heller would return to in his last work, the posthumous and unfinished *Staatslehre*. However, in this work—evidently under the impelling force of a number of factors, not least of which was the escalation of political events that led to Hitler's rise to power and to Heller's own emigration to Spain—Heller reconsiders the categories of liberal constitutionalism, reevaluating the role of the parliament and of parliamentary representation, and in so doing he moves away from his earlier decisionist positions.

7.5. Franz L. Neumann's Critical Theory of the State

Franz L. Neumann (1900–1954) is the author of some writings of fundamental importance to political science. This is especially true of *Behemot* (F. L. Neumann 1977) a work devoted to the institutional makeup of Nazi Germany. It was published in 1942, during his exile to the United States, and in it he analyzes the demise of the liberal *Rechtsstaat* and its transcendence by the Nazi "nonstate" (*Unstaat*) understood as a social form where "the dominant groups directly control the rest of the population without the mediation of the minimally rational coercive apparatus thitherto known by the name *state*" (F. L. Neumann 1977, 543; my translation).

Neumann is among the few jurists directly or indirectly affiliated with the Frankfurt school (another one is Otto Kirchheimer, 1905–1965, though he will not be treated here because the legal-philosophical component of his thought is, all told, minimal,[20] and there are also Georg Rusche, 1900–1950, and a few other lesser lights). In any event, Neumann ought to be remembered here for an article of 1937 devoted to the changing function of law, though in the 1920s he had also come out with a considerable number of constitutionalist and legal-philosophical writings, even if this was at a time when he was mostly busy as a lawyer working for the social-democrat unions.

Neumann's first stab at dealing with issues in jurisprudence came with his habilitation thesis (F. L. Neumann 1923), but where takes a properly jurisprudential angle to these issues is in the second (1929) edition of a study discussing Karl Renner's article on the concept of property.

However, it was Carl Schmitt's decisionism that would exert a stronger influence on Neumann (see V. Neumann 2009, 79ff.), and subsequently even more so on Kirchheimer. Indeed, Schmitt's ideas on the parliamentarianism and the constitution of the Weimar Republic certainly provide an important frame of reference for Neumann (who espoused socialism in his legal philosophy), at least until Hitler's rise to power. Neumann at one point put forward the idea of a "social *Rechtsstaat*" (comparable to the one advanced by Hermann Heller), but he subsequently saw this idea founded through the inability

[20] But see the essays collected in Van Ooyen and Schale 2011.

of both the left and the conservative right to work out a non-totalitarian alternative in the face of the crisis of parliamentarianism and the rule of law, which Neumann did account to be inherently limited, but which nonetheless, in his view, still served as a guarantee for the weaker and secured at least a modicum of freedom and equality for the underclasses (see F. L. Neumann 1978a).

In the 1930s, Neumann radicalized his views by laying even greater emphasis on the classist nature of social conflict, thus seeing the need to set in contraposition to the bourgeois dictatorship a proletarian dictatorship understood as a stepping stone on the way to a socialist society (see F. L. Neumann 1978b, 1978c), which society will nonetheless never be able to do without a state.

In 1937, Neumann published in the journal *Zeitschrift für Sozialforschung* an article titled *Der Funktionswandel des Gesetzes im Recht der bürgerlichen Gesellschaft* (The statute's functional change in the law of the civil society: F. L. Neumann 1967), analyzing the concrete relationship between the concept of law on the one hand, and on the other the capitalist mode of production at the peak of the transformations leading to monopolistic capitalism and mass democracy. The backdrop against which Neumann carried out his analysis was that of the political situation of the Weimar Republic and its law, where a conservative judiciary made it a practice to invoke general clauses and principles, thus turning the law into a pliant tool, liable to a range of interpretations depending on the circumstances of the moment. Writes Neumann:

> This rediscovery of "general principles" destroys the system of positive law, a system into which many important social reforms had been built: What gets destroyed is the rationality of law. The structural transformations the economic system had undergone wrought significant changes in the function of the "general principles," which had thitherto been like illegitimate children and now became favourite darlings. (F. L. Neumann 1967, 78; my translation)

Principles and general clauses are for Neumann "indicators" signalling the socioeconomic transformations in the system underlying the legal order. Law sheds its generality, and in its place come individual provisions more closely reflecting the exigencies of monopolistic capitalism. It is clear that if we proceed on the basis of these analyses in sociology and political science, any legal philosophy of a positivist sort is going to appear incapable of adequately explaining, and indeed understanding, the system's socioeconomic and legal transformations. As it turns out, however, institutionalism itself mystifies real social relations: just as normativism concealed the reality of social conflict by putting on it the mask of the "legal person," a procedure suited to the era of competitive capitalism, so institutionalism effects a concealment suited to the new era of capitalism: "To the extent that norms, as against contractual agreements, take the form of unilateral commands, the legal theory of positivism will disintegrate and be supplanted by institutionalism" (ibid., 87; my translation).

The law is understood by Neumann as "the state's hypothetical judgment on the future of its subjects." This judgment takes a statutory form, but its

universality conceals the bourgeoisie's class rule and the fact that individuals formally (i.e., legally) endowed with equal status are socially and economically unequal, and this inequality is entrenched in virtue of the notion of the state as a supposedly neutral power, a notion that clearly appears to him as a mere ideological fiction. The formalism of modern law, a formalism consequent on a Weberian *Entzauberung der Welt* (disenchantment of the world), and so also the formalism of law as such, has eventuated in a definitive disconnect between natural and positive law, and so also between law and morals.

The formalism of the statutes therefore contains at least three fundamental functions of statutes themselves as abstract and general rules: On the one hand this formalism dissembles the real power relations among human beings; on the other, encompassed within the statutes' generality is the close relationship between capitalistic calculability and the predictability of normative consequences, a relationship functional to free trade; but there is also an ethical function served by general statutes, in that positive law guarantees a minimum degree of liberty and equality, a minimum standard that definitely collapses with the shift from competitive to monopolistic capitalism, the former modelled through the legal form of the rule of law, the latter having the politico-legal makeup of the Nazi nonstate (*Unstaat*). In the *Rechtsstaat* of general and abstract statutes, economic and legal calculability stood as a protection not only for the bourgeois but also for citizens as such, whom the totalitarian state effaces:

> If the general statute is the basic form of law, if the statutes consist not only of *voluntas* but also of *ratio*, then the Fascist state cannot be said to have any law. Law as a phenomenon separate from the sovereign's political command is possible only on condition that law is manifested in general statutes. (F. L. Neumann 1977, 522; my translation)

Neumann argues on this basis that the Second Reich, the one governed under Bismarck and Wilhelm II, can still be considered a *Rechtsstaat*, clearly distinguished from any totalitarian state.

As a Marxist legal philosopher, then, Neumann can be seen to be in several respects eclectic, so much so that we even find the occasional reference to Kelsen, whose conception is indirectly evaluated by him in a positive way, even though Kelsen's formalism could not be reconciled with Neumann's content-laden approach. At the same time, many of Neumann's positions show the influence of Carl Schmitt's teaching, as in the way the idea of homogeneity as the premise of democratic organization is translated into a distinctly social concept. As Scheuermann (1994, 206 n. 37) has observed:

> Neumann's category of homogeneity lacks the explicitly anti-universalistic elements basic to Schmitt's formulation of it. At the same time, the way it is linked to the idea of a fundamental contradiction between political liberalism and democracy [...] probably reveals something of the imprint of Carl Schmitt [...]. Here again, Neumann's traditional Marxist position is probably mediated by categories shaped or even borrowed from Schmitt.

Chapter 8

FROM NORM TO DECISION TO THE CONCRETE ORDER: THE LEGAL PHILOSOPHY OF CARL SCHMITT

by Agostino Carrino

8.1. Constitutional Theory

Carl Schmitt (1888–1985) went through cultural periods shaped by different doctrinal and political worldviews and systems, and there is no way to treat authors like these by exclusive reference to any specific work. So if we are to reconstruct Schmitt's philosophy of law, we must instead take the broader view and look at his overall approach, considering the important role he played in Europe's intellectual history in the 20th century, and considering as well that he still finds himself at the centre of lively discussions, especially as concerns his involvement with the Third Reich and his adherence to the Nazi Party.

It would be inaccurate and misleading to reduce Schmitt to his Nazi phase, and even more so to paint him as a Nazi through and through.[1] It is, by contrast, in light of what Schmitt says and writes about legal science itself that we must construe him, without attempting to force his entire scholarly output through the view afforded by a single phase he went through (considering, too, that his work goes back as early as the 1910s). Schmitt's thought should be neither under- nor overestimated, and we cannot discount the fact that it has been deemed worthy of discussion by authors as diverse as Raymond Aron and Alexandre Kojève.

An error often made in evaluating Schmitt lies in making him out to be a political scientist, when in reality he was a jurist and wanted to be regarded that way: "I am a jurist!" he once exclaimed, and it is as a jurist that he ought to be studied, even if his legal science requires that specific attention be paid to philosophy, theology, and politics, and even literature. And this is because the law making up the object of his science of law is unlike what it is in conceptions such as Kelsen's, where law is the object constructed by the scientific method itself. For Schmitt, law instead faces the observer as an object distinct from the scientific method through which it is known: It is in this sense an object the observer must adapt to, in an effort to grasp it in its full complexity. And so for Schmitt law must never be analyzed *only* as a norm but *also* as a

[1] I am referring here to Jean-Yves Zarka's recent work and to the 2005 debate published in the French daily *Le Monde*. See Pol-Droit 2005, but see in particular the very balanced article Kérvégan 2005.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_8

norm; never *only* as a decision but *also* as a decision; never *only* as will, custom, or reason but *also* as will, custom, or reason. Law, in a word, is a complex historical phenomenon bound up with a people's concrete life, with its *Geist* as revealed to us by experience. We can thus understand Schmitt's focus on Savigny, and also on Roman law and its reception, but this only after Schmitt's wavering in the Nazi period, considering that the Nazis condemned Roman law as extraneous to the German tradition. On the other hand, it would be misleading to neglect Schmitt's lineage from Max Weber and his characterization of politics as conflict, for Schmitt's concept of decision is in effect a legal translation of Weber's sociopolitical concept of conflict. It is not irrelevant in this regard that Schmitt and Weber alike were historically situated in a specific context, that of the heyday of the nation-state as a power state, and this is also what marks out the historico-theoretical boundaries of the conceptions developed by Schmitt and Weber alike.

Schmitt's juristic thought can best be understood starting out from his views on the constitution and on constitutional law, bearing in mind from the outset that, for Schmitt, even Plato, Aristotle, and Hegel are essentially jurists, not philosophers:

> The philosophy of law does not, as I understand it, consist of a glossary extracted from a given philosophical system and applied to legal questions, but rather consists in developing concrete concepts rooted in the immanence of a concrete legal and social order. (Schmitt 1950, 427; English translation from Schmitt 1990).

Here we can confine ourselves to two essential writings by Schmitt affording a better grasp of his legal philosophy than does his overtly "theoretical" work: The first of these is his 1928 *Verfassungslehre* (Constitutional theory) and the second his 1930 essay on what he calls the guardian of the constitution.

Schmitt distinguishes between a constitution in an absolute sense and one in a relative sense. The former lies in the essence of a state as a form of power, and in this sense the state can never be said to have a constitution, for it *is* the constitution. The state's will is not formed through the provisions set forth in the constitution, which would thereby limit the state and shape its decisions "into form"; rather, the state's will is *itself* the form of its own substance, and it alone enables the state to exist. Making up the state is a political substance that determines its form as a political unit. Here the constitution lies in the very existence of the state: The constitution is a *fact of the state's being*, and not a set of norms that from the outside impose certain behaviours as being "due." As a de facto existing form, the state qua constitution, that is, the state's constitution, always exists in a given form: that of a monarchy, a democracy, a government of the soviets, and so on. As much as this form may be part of the world of the is, it cannot really be conceived as a form given once and for all; as a form in history, it undergoes change and is always in becoming, for in order to overcome existential continuity, it must overcome the crises, conflicts, and transforma-

tions imposed on it by history. From this point of view, Schmitt shows himself to be indebted to Rudolf Smend's theory of integration (see Section 8.4 in this tome), arguing that the constitution as a whole "is the active principle of a dynamic process of effective energies, an element of the becoming, though not actually a regulated procedure of 'command' prescriptions and attributions" (Schmitt 2003a, 19; my translation). Schmitt's conception can thus be summarized under the motto "the constitution as existence," where existence is governed by history and tradition and by the political forces acting in concrete ways at a given historical moment. In this sense, the constitution is equated by Schmitt with the state, and the state with the historical form giving expression to a certain people's mode of existence in a certain phase of its being.

In contraposition to this concept of constitution in an absolute sense there can also be another concept, one that might be termed "bad absoluteness," along the lines of Hegel's idea of "bad infinity." This bad absoluteness is that of the normative claim: an absoluteness that does not come from being—it is not existential—but is rather willed from the outside by a reason that arbitrarily imparts its own form to that which *is*, in such a way that instead of the state being the constitution, it is the constitution which is the state, where the constitution is understood as the "law of the laws," seeking an order conforming not to itself as a historically shaped entity but only to the constitution as a higher law, indeed as an immediately sovereign law.

Here Schmitt singles out a specific form of state, namely, the 19th-century legislative state, pretending to finally realize the age-old ideal of a "government of laws," where the sovereign is no longer the prince or the people—which in any event are concrete entities, at least to the extent that the people are understood in a determinate way as the poor, the working class, the bourgeoisie, and so on, well outside the modern false representation of democracy as the "government of all"—but is rather the constitution. This idea of the sovereignty of the constitution is functional to the neutralization process underway since the 17th century, a process geared toward singling out a "neutral sphere" beyond conflict, a sphere which by that time appeared to be well established, insofar as it had come to be identified with technique.[2] Schmitt seems to be setting up a homology among technique, the neutralization process, and the *Rechtsstaat*,

[2] Writes Schmitt in 1929: "In the 19th century, the monarch and then the state became neutral entities, and in the liberal doctrine of *pouvoir neutre* and of the neutral state, there came to completion a chapter of political theology in which the process of neutralization settled into its classic forms, since by that time it reached a decisive point, that of political power. [...] The European humanity has continuously been migrating from battlefield to neutral territory, and ceaselessly a newly conquered neutral territory is promptly transformed anew into a battlefield, so it becomes necessary to find new neutral spheres. [...] The process of neutralizing the different spheres of cultural life has come to a head, for it has arrived at technique. Technique is not neutral territory in that process of neutralization, and any power politics can use it to advantage" (Schmitt 1963; my translation).

that is, the state as an entity based on the rule of law;[3] indeed, the last of these items (the rule of law) constitutes a specific and autonomous element within the state: It is the *formal legal* element, over against another element also embedded within the state, namely, the *political* element.

To be sure, the political element and the *Rechtsstaat* element both lie within the state form, and yet they somehow efface each other. The rule of law makes it necessary to limit the state's power through the technical devices of constitutionalism—especially the separation of powers as the principle organizing the state's functions, which are an expression of this neutralization process—but within the state there always exists a contrary principle, consisting in the original, properly political element that claims its privileges: "In reality, the *Rechtsstaat*, despite all its legality and its juridical foundation, continues to exists as a *state*, and so next to the specific element of the *Rechtsstaat* itself (the rule of law), it will always also contain the specifically *political* element" (Schmitt 2003a, 125; my translation). This position, to be sure, is turned on its head with Schmitt's adhesion to the Nazi Party, but the framework in which the position is set out does not change. In the Third Reich there is no longer a *Rechtsstaat* because the premises have changed and the foundations have crumbled that made it possible for that form of state to subsist ("Hegel is dead"). The Nazi regime has eclipsed the separation between the state and society: It has done so by realizing a living political unity, thus making the *Rechtsstaat* "superfluous" (Schmitt 1995b).

For Carl Schmitt, then, politics comes *before* the law, at least in the sense of law as enactment, meaning the statutory law designed to regulate social, economic, and historical contingency.[4] Politics is primary and original, for it is inherent in the ontological naturality of things, in which there is to be found that conflict and antagonism that humans always tragically strive to overcome: "The political is the most intense and extreme antagonism, and every concrete antagonism becomes that much more political the closer it approaches the most extreme point, that of the friend-enemy grouping" (Schmitt 2007, 29–30). "The political can derive its energy from the most varied human endeavors, from the religious, economic, moral, and other antitheses. It does not describe its own substance, but only the intensity of an association or dissociation of human beings [...]" (ibid., 38).

It is this originalness of the political element that initially leads Schmitt to criticize the Weimar constitution as a constitution founded almost unilat-

[3] Of course, it is well known that the German "Rechtsstaat" is similar to but not identical with the term "rule of law."

[4] The idea that the political order precedes the social one is highlighted in Mortati 1973; cf. Nigro 1986b. Schmitt himself makes the following claim: "Before any regulation, there is a fundamental political decision by the constitutional power holder" (Schmitt 2003a, 23; my translation). And in the same vein is his claim that "only (political) decision can ground norms and the system alike. [...] Sovereign decision is the absolute beginning. (Schmitt 1993, 23–4; my translation).

erally on the rule of law and so as a decadent and even "posthumous" constitution (Schmitt 1995a, 44ff.), and then to interpret the age of fascisms as the age of "total politics" (Schmitt 2003b). The *Rechtsstaat*—the state under bourgeois law—will hold itself up only to the extent that representation is homogeneous, that is, only insofar as the state's command is unitary, in the sense of there being a relation of identity between the people and their representatives (between those who are represented and those who do the representing): The identity in this case is one of class, as in the census-suffrage phase of the *Rechtsstaat*, when the "electoral body" accounted for only a fraction of the population. Representative government makes sense and works only as the government of a homogeneous power, as when the *Rechtsstaat* is a one-class state, where the discussion is among subjects representing the same interests, such as the interests of the propertied classes.

Where representative government is plural, rather than homogeneous, and so where it is conflictual, the *Rechtsstaat* becomes an ideological superstructure, serving only to cover clashes and power struggles, and indeed makes it impossible for the state to carry out its new tasks and function, which is to deal with the problems the state itself faces with the advent of the masses. From this point of view, in Schmitt's assessment as well as in that of other jurists, like Hugo Preuss, the Weimar constitution was no more than an armistice. It is significant, however, that in a book Schmitt devoted to a discussion of Preuss, he expressed the hope that it could be something more than that, namely, "a peace" (Schmitt 1930, 42; my translation). After all, we all too readily forget that before 1933, the threat from which Schmitt was trying to save the Weimar Republic was coming from two fronts: There was the Nazi threat and there was the Bolshevik threat.

Schmitt's criticism of the *Rechtsstaat* as a partial and hence antinomic, contradictory element leads Schmitt to distinguish two concepts of the constitution: On the one hand is the constitution as the product of the bourgeois revolution—and so as an expression of what Marcel Gauchet calls the "human-rights revolution"—and on the other is the constitution as a fact, as the "fundamental political decision by the bearer of the constitution-making power" (Schmitt 2003a). The former is merely the *Rechtsstaat*'s *Konstitution*; the latter is the *Verfassung* of the political order as such. The concept of the constitution as a fact and as a fundamental political decision presupposes someone capable of *making* this constitution: It presupposes a *pouvoir constituant*. Here Schmitt's conception reveals its historical limitation, especially in virtue of its dependence on the views advanced by contemporary authors like Charles Maurras of France. Indeed, the constitution-giving subject is identified by Schmitt not with the people (however conceived) but with the nation:

> Nation and people are often treated as equivalent concepts. Nevertheless, the word "nation" is clearer and less prone to misunderstanding. It denotes, specifically, the people as a unity capable of political action, with the consciousness of its political distinctiveness and with the will to politi-

cal existence, while the people not existing as a nation is somehow only something that belongs together ethnically or culturally, but it is not necessarily a bonding of men existing *politically*. The theory of the people's constitution-making power presupposes the conscious willing of political existence, therefore, a nation. (Schmitt 2008, 127; cf. Schmitt 2003a, 79)

While, on the one hand this conception locates Schmitt in a dark tract of history fraught with gloomy and ghastly connotations, and in this sense can be said to represent the less significant part of his thought (making him a theorist of something that might be described as "legal nationalism"), on the other hand he ought to be credited with having put forward a concept of the constitution that cannot be reduced to the idea of the constitution underlying the bourgeois state, that is, the idea of the constitution as a norm grounded in another norm or, worse still, in itself. The constitution as a normative fact entails a deeper reality forming the foundation for that particular norm we call "the constitution." This deeper reality is referred to by Schmitt as the concrete legal order, a typically German rendition of the Italian and French concept of institution (Santi Romano, Maurice Hauriou).[5] A state can only exist in a given form, and this form is always complex, in that it can never do without, on the one hand, some kind of representation and, on the other, some elements of identity, the latter consisting in that specifically modern translation of ancient acclamation which is public opinion, the foundation of the identity principle: "There is no democracy and no state without public opinion, as there is no state without acclamation" (Schmitt 2008, 275; cf. Schmitt 2003a, 243).

Schmitt's constitutional theory is thus a realist theory, for it does not deny the existent but rather embraces its deepest structures, even when they reveal themselves to be antinomic, as in the case of the relation between pluralism, by which Schmitt means conflict, and the consequence necessarily entailed by it, meaning the need for representation based on identity, this through a political entity capable of "representing" that which is not present, namely, the people, in the decision-making phase.

Public opinion, about which Ferdinand Tönnies wrote an essay at roughly the same time that Carl Schmitt wrote his *Verfassungslehre*, is thus construed as the modern translation of traditional acclamation, in that it legitimizes the sovereign powers' political decision: "The people as an entity that is not officially organized [...] become valid in individual moments and only by way of acclamation, hence today as 'public opinion'" (Schmitt 2003a, 275; my translation). No state exists without conflict, but every conflict needs to be overcome through a decision, and that presupposes the existence, somewhere and somehow, of a sovereign entity capable of resolving the conflict, even if only temporarily.

[5] On Italian and French institutionalism see, in this tome, Sections 11.4 and 12.2 respectively.

It is for this reason that Schmitt ascribes a particularly important role to constitutional preambles as concerns a people's fundamental political decision about its own future and form of political organization. In preambles Schmitt finds an express statement of the will forming the basis of the constitution itself. The Weimar constitution is in effect a decision in favour of democracy, federalism, and liberalism. That is the basic political decision lying at the basis of that constitution, and it is all contained in the preamble to the constitutional charter itself:

> The 1871 and 1919 Reich Constitutions contain prefaces, "preambles," in which the political decisions are expressed especially clearly and emphatically. [...] But the decisive point is that the preamble of the Weimar Constitution contains the authentic declaration of the German people that as the bearer of the constitution-making power, it will decide with full political consciousness. (Schmitt 2008, 78–9; cf. Schmitt 2003a, 25)

Why does Schmitt ascribe such importance to constitutional preambles? The best guess is that they appear to him as a succedaneum for the essence of "pure" democracy, which he identifies not with electoral procedure, the secret ballot, and the like, but in the power of the people to say yes or no to, a power through which decision-making proper is exercised:

> Individual secret balloting, not being preceded by any procedurally regulated public debate, wipes out the very potential specific to a united people. Indeed, [...] the original democratic phenomenon, that with which even Rousseau identified authentic democracy, lies in acclamation, the cry through which a gathered mass expresses its approval or rejection. [...] Acclamation is an eternal phenomenon present in any political community. No state can exist without the people, just as no people can exist without acclamation. (Schmitt 1927, 34; my translation)

From this approach stems Schmitt's distinction between the constitution and constitutional law: The constitution owes its existence and legitimacy not to a legal norm but to a politico-legal will; constitutional laws, by contrast, do rest on an existing set of norms. Under Article 76 of the *Weimarer Reichsverfassung* (the Weimar Constitution), constitutional laws may be modified according to a formally established procedure; the constitution, by contrast, is a nation's founding political decision that can only be modified through another such basic decision, that is, through another constitution based on a different political decision. Schmitt's position can in certain respects be said not to stray too far from the materialist conception of history, with the only caveat that in the "materiality" of history we find not only economic relations but also ideological, religious, and moral ones, along with the facts of the spirit, even though it is only to the extent that these ostensibly immaterial elements and relations find themselves embodied in certain political forces and classes that they count as part of the material structure.

The constitution as conceived by Schmitt thus runs head-on against the idea of it proper to normativism. The constitution is for him a historical fact,

and only consequently and by reflection a norm, whereas what liberalism *imprimis* and fundamentally sees in the constitution is a project conceived to bring about something that has to be concretized (equality, rights, freedom, and the like). In reality, Schmitt argues, no legal system can as such overcome the dominant political forces prevailing in society, and in fact the constitution always and only exists as the juridical form giving expression to the legal order's political substance, a substance that may manifest itself as a norm, as a decision, or as both, as the case may be. There is a "constitutional law" more substantive than the enacted, written constitutional law, a deeper law which consists in the dynamic of political relations, and which cannot but prevail on the positive law, whether it be in a gradual, peaceful manner or in a dramatic, tumultuous fashion. For this reason, Schmitt's decision can never fall outside the law: It is always inherently legal and law-creating.

That is the reason why Schmitt denies that the guardian of the constitution can be a judicial organ, a constitutional court, as Kelsen instead argues. An organ of this sort would, by its nature and by virtue of its functions, be incapacitated from interpreting the political forces at work in the social structure; what would matter is formal positive law as interpreted in light of the court's own reading of the letter of the law or in light of the values the judge subjectively injects into the normative text. Only a representative of the people can defend the constitution, because only those who directly interpret the popular will can grasp the present reality of political power relations, such as they are given on the level of the homogeneous body social. Indeed, it is essential for Schmitt to know who makes the decisions. Even in what is apparently a highly technical work, the 1927 *Volksentscheid und Volksbegehren* (Referendum and popular initiative: Schmitt 1927), the argument for this view boils down to a few lines:

> As is the case for all indeterminate concepts that are indispensable for the state's existential reality (such as security and a public system of laws), so here, too, the need to normatively understand every conceivable case through a formulation conforming to the state of affairs is less important than the question of who it is that *decides* how such concepts apply in the concrete case. The question here, too, is the decision-centred *quis judicabit?* (Ibid., 30; my translation)[6]

Or, in other words, quoting a famous passage from his *Politische Theologie* (Political Theology: Schmitt 1985a) "sovereign is he who decides on the exception" (ibid., 5; my translation), in that only by looking at how a state of exception is worked out is it possible to know who the sovereign is in any given historico-political phase a given people may be going through.

[6] The German original: "Wie bei allen unbestimmten Begriffen, welche für die existenzielle Wirklichkeit des staatlichen Lebens unentbehrlich sind (z. B. öffentliche Sicherheit und Ordnung), kommt es auch hier weniger darauf an, in einer tatbestandsmäßigen Formulierung jeden denkbaren Fall normativ zu erfassen, als vielmehr auf die Frage, wer über die Anwendung solcher Begriffe im konkreten Fall entscheidet. Die Frage ist auch hier das dezisionistische *quis judicabit?*"

Through the problem of the sovereign we can see what Schmitt takes to be the limits of the constitution. His view, in a word, is that the constitution always depends on the relation among political forces. This makes it possible to appreciate why Schmitt thought that the legislative-parliamentary form proper to the 19th-century liberal *Rechtsstaat* made for a harmonious relation between the formal constitution and the material one, for it enabled the state, the constitution, and the dominant political forces to flow together on a basis of homogeneous correspondence in making the fundamental political decision. This is different from what is the case with post-liberal states, the so-called welfare state, for in these states the constitution is based on compromise, which is always liable to come undone, so there is always the prospect of a separation between the formal constitution and the material one—which in turn means that the state of exception is ever ready to break out. So much is that so that these forms of state were designed to revolve around the parliament as their central organ, and for some time this organ has ceased to carry out any useful tasks and functions, ever since the dominant social force (the bourgeoisie) splintered and thus lost its homogeneity. The parliament is thus regarded by Schmitt as unfit to effect the synthesis needed for the conflicting interests in modern society to coalesce into a coherent force.

So it won't suffice, in Schmitt's view, to simply agree on a method to be adhered to, on a set of procedures, on *Legitimität durch Legalität* (legitimacy by legality), to frame the idea from a Weberian perspective. Always lying in wait, on any approach centred on the formality of procedure, is the risk of unchecked pluralism, of the emergence of conflict that breaks asunder the unity of political decision in favour of partial and special interests. That is one of the reasons why Schmitt does not accept that the role of "guardian of the constitution" may be entrusted to a judicial organ. It hasn't been emphasized enough, in this regard, that one ground on which he criticized the "judicial state" and the judge's power is that in the United States, for example, judicial review has been used to advance specific class interests, sacrificing women's protection and the fight against child labour to the overriding concern to secure a business-friendly capitalist economy. Writes Schmitt in his *Hüter der Verfassung* (The guardian of the constitution; Schmitt 1985b):

> In this way, it has become the practice of the United States Supreme Court to look to the Fifth and Fourteenth Amendments—setting out the much-debated due process of law—as a basis on which to strike down the lawmakers' initiatives in a bid to uphold the principles of the bourgeois socioeconomic order as the highest system and authentic constitution. (Ibid., 14; my translation)

It is indeed a mistake to view Schmitt as an absolute theorist of presidentialism. He does defend the powers of the president of the Reich under Article 48 of the Weimar *Reichsverfassung*, but he sets this view within a broader argument that in the first place calls into question the idea of a "judicial state" (*Richterstaat*) as

an alternative to the legislative state. As much as parliaments may no longer be capable of carrying out their tasks and functions, and for this reason have come to pose a threat to concrete constitutional systems, no less inefficient and perilous are, in Schmitt's view, the projects for "judicializing" the state. Legislative and judicial power are both bounded by clearly marked, indeed "natural" limits, overstepping which would be deleterious to politics and justice alike. It is significant in this regard that Schmitt should quote a passage from an important book by François Guizot, *Des conspirations et de la justice politique* (On conspiracies and political justice: Guizot 1821), where Guizot, staking out a position against the "juridification" of vital relationships, states that "politics has nothing to gain from that, and justice everything to lose" (ibid., 109; my translation).

The crucial flaw, for Schmitt, is that the normativist and formalist approach is stopped in its tracks the moment it takes up the problem of defending a higher law. Indeed, there can be no jurisdiction of one norm over another, unless the term *norm* becomes a vehicle for all manner of ambiguities;[7] in essence, a constitutional judge is always only a "constitutional legislator holding a high-ranking political office" (Schmitt 1985b, 48; my translation), but devoid of any democratic legitimacy, an organ empowered to decide on its own competence, that is, on the grounds of its own sovereignty. What follows is therefore a violation of the Weimar Constitution itself, which "embraces the democratic idea of the homogeneous, indivisible unity of the German people" (ibid., 98; my translation). Invoking the judge as the "guardian of the constitution," then, simply amounts to concealing the reality of things under an artificial contraposition between what is "legal" and what is "political"; it also amounts to positing "pure" forms of state, failing to see that every concretely existing state is always a mixed state, however much there may be in it an organ that prevails over the others, as the case may be.

8.2. On European Jurisprudence

It will serve us in good stead at this point—if we are to have a more organic appreciation of the complexity of Schmitt's philosophy of law—to devote

[7] It is significant in this regard that Schmitt should have criticized as follows the speech Hans Kelsen delivered at the conference the German constitutionalists held in 1927: Kelsen's "entire talk proceeds from the fact that the constitution is the same thing as constitutional law, and constitutional law the same thing as norms. Here this ambiguous concept of a norm once more reveals itself to be a vehicle of conceptual overreach, for it turns out that the whole of the possible is in force as a norm. We can even lose the basic trait distinctive to the concept of the constitution, which finds itself at the centre of every practical and theoretical discussion in constitutional theory—Is the constitution a political decision of the unity of the people? Is it a law? (And, if so, who is its maker?) Is it a contract or a compromise? (And, if it is a contract, who are the contracting parties?)—and this whole ensemble, inclusive of decision-making, law, and contract, can be brought under the umbrella of the word *norm*" (Schmitt 1985b, 63; my translation).

some time to an essay he wrote in the wartime years, and which foretokens the catastrophe that was about to unfold. The essay was originally written for a conference whose proceedings were initially published in Hungarian, and only in 1950 did it come out in German, under the title *Die Lage der europäischen Rechtswissenschaft* (Schmitt 1958b), later translated into English under the title *The Plight of European Jurisprudence* (Schmitt 1990).

The essay was originally meant for a *Festschrift* devoted to Johannes Popitz,[8] and it figures among the most important of Schmitt's works when it comes to understanding how his thought evolved, this in two respects. For on the one hand the essay helps us gain a grasp of Schmitt's theory of law and the state, and on the other it opens a window into his relation to the Nazi regime and into the way his politico-existential outlook changed over time.

As concerns Schmitt's philosophy of law, *Die Lage der europäischen Rechtswissenschaft* testifies to the scope and import of the *legal structure* of Schmitt's thought, while also highlighting the central role the concept of *jus* plays in shaping the overall cast of his oeuvre, which is less doctrinaire than it is attentive to, and grounded in, the concrete situations in the world about us (from which also comes the charge that this essay is "occasionalist").[9] But we must also bear in mind here another element characterizing Schmitt even

[8] This *Festschrift* was never published, because Popitz was executed for his role in the July 24, 1944 plot against Hitler.

[9] The charge is made in Löwith 1935. To which Schmitt might reply along these lines: "There is nothing significant that can be said about culture and history without an awareness of one's own cultural and historical situation" (Schmitt 1988, 121; my translation), an attitude he shares with Weber and Hegel, and which therefore does not easily lend itself to "occasionalist" interpretations.

Schmitt's close engagement with the concretely given situation has made it difficult, and will continue to make it difficult, to definitely settle the question of how to "periodize" his thought, or rather, the intellectual phases he went through, as can easily be appreciated in connection with what is perhaps the most authentically Schmittian problem, that of legitimacy. As Hasso Hofmann has illustrated, Schmitt's theory of legitimacy goes through several phases, and even though Schmitt was very much aware of that fact, he deliberately chose not to explain those phases, viewing them as the (intellectual) outcome of a concrete (historical) situation. As C. Gusy has observed, Schmitt's "theory of legitimacy is for the most part developed in different phases. Schmitt himself refrained from bringing the links to light and clarifying any perceived contradictions. The reason for this silence on his part may be that political and legal concepts are understood by him as operating in relation to the concrete situation of the moment in the state's existence" (Gusy 1987, 47; my translation).

See in any event Hasso Hofmann's fundamental *Legitimität gegen Legalität* (Legitimacy against legality: Hofmann 1995c): "Through our consciousness of the utter contingency of our being-there, we experience its facticity in its unique and unrepeatable specificity. It is therefore an extraordinarily prominent role that in his work is played by the concept of the concrete in general and the concept of the concrete situation in particular—and that is so much earlier than the turn he took in 1933/34 in embracing the 'concrete legal order.' The word *concrete* comes up in many contexts and is more frequent than any other word. Nothing appears to him to be amenable to a general understanding any more; rather, each and every thing can only be understood starting from the concrete existential situation" (ibid., 167; my translation).

under the Weimar Republic, and that is his ambiguity, a trait that in an essay on the methodological controversy in public law led Erich Schwinge to dub Schmitt the "Sphinx" of modern German public law.[10]

The first thing we have to draw attention to here is the role that legal science takes on in Schmitt's historical approach and in relation to the legal phenomenon as such: What is the relation between legal science and law? Here Schmitt comes up with the illuminating idea of reception, an idea he does not confine to the better-known reception of Roman law but extends to the entire history of European peoples and interprets as a phenomenon having deep roots:

> It can even be claimed, without exaggeration, that the entire history and development of the European peoples is a history of receptions cutting both ways, where by *reception* is meant not a banausic acceptance devoid of any creativity, but a back-and-forth process of incorporation, adaptation, and refinement, often in the face of strong resistances—a process that may even feed back on received law itself, whose evaluation in each single case is a question apart. (Schmitt 1958b, 391; English translation Schmitt 1990)

To which I would add that in this essay Schmitt allows it to be understood (a suggestion not backed by any argument) that law and legal science might almost be the same thing, such that neither could logically be the product of the other. The reception of Roman law appears to be a preeminently cultural phenomenon, where different European peoples recognize one another as belonging to a single clan, the issue of a common lineage as a people who have dwelt in the same land:

> Through the work of the jurists of all European peoples, Roman law has become a common vocabulary, the language of the community of legal science, the de facto standard for conceptual legal work, and hence a conceptual and spiritual European Common Law, without which it would not even have been theoretically possible for jurists across national boundaries to understand one another. The cultural edifice here put up by the European spirit rests on this shared basis produced by a common European science of law. (Schmitt 1958b, 396; English translation Schmitt 1990)

This mutual recognition among European peoples through the life of the law takes on a peculiar meaning in this essay. Indeed, whereas the state is, for Schmitt, a historically determined phenomenon (Schmitt 1958a), and as such is bound sooner or later to be eclipsed, the law is understood by him as that specific form—a form distinctive to European culture—wherein the European consciousness can attempt to find a new beginning, having been uprooted and alienated from itself through the progressive and looming loss of the state, considering that the state had been Europe's answer to the crisis of Christian medieval unity and the ensuing religious wars (at once religious and civil). And

[10] "Carl Schmitt is the Sphinx of the modern theorists of public law, since he eludes from the start any attempt to classify him" (Schwinge 1930, 15; my translation).

so this essay (which I suggest reading in parallel with Ernst Jünger's roughly contemporaneous essay on peace: Jünger 1980b, 193ff.)[11] is undoubtedly deserving of credit, for as much as it may not be judged equal to his later *Der Nomos der Erde* (*The* Nomos *of the Earth*: Schmitt 2003c) it shows that Schmitt did not give in to the pessimism then rampant but instead sought to cast his gaze beyond the ruins of contemporary Europe.

And indeed *Die Lage der europäischen Rechtswissenschaft* carries some broadly "Catholic" undertones, in the sense of its embracing hope, and what nurtures this sense of hope is precisely the force of law, in that law resists any attempt to collapse it into the state, much less to outright *identify* it with the state à la Kelsen. We cannot here take up the question of how Schmitt positions himself relative to natural law and legal positivism. But we can say that this latter current is certainly criticized by him for its legalism, that is, ultimately, for its reducing the law to a product of the state. It is still a deep misconception found in any superficial account of Schmitt that he revered the state form. In fact, the contrary is actually the case: The state for him (who never lost sight of his own Catholic roots) is at best a "magnificent evil." It is magnificent because this product of European culture has worked wonders in the project to overcome civil war, for it managed to set itself up as a "mortal god," thus establishing its own teleological structure; at the same time, however, it is an evil, not only because the modern state, precisely through that attribute (its being modern), necessarily falls subject to the modern world and therefore follows its course, embracing a purely instrumental and calculative "rationality,"[12] but also, and ultimately, because the state issues from a mode of thought that is itself the outcome of a cleavage, a dualism that has not yet been worked out, namely, the dualism between thought and being, between subject and object. The state is construed by Schmitt as the answer to European civil war, but at the same time—with Bacon, Descartes, and anti-theological rational philosophy—it is viewed as encapsulating the modern revolution.

On Schmitt's conception, law is firmly set in reality. In fact, reality is *itself* law. Or, as this idea has been expressed (including by Schmitt himself), law is the "concrete [legal] order"—though it can also simply be said to consist of the *jus* (and later the *nomos*), i.e., law as distinguished from the positive law. And so law is equated by Schmitt not with the *ought* (a mere *Sollen*) but with

[11] Aalthough the work was published in 1945, it had already been blocked out in 1941. It will be mentioned in connection with Jünger that the essay by Schmitt under consideration (*Die Lage der europäischen Rechtswissenschaft*) closes with a note on pain: "Let us recall to mind the history of our travails, for our strength is rooted in the close familiarity we have with pain" (Schmitt 1958b, 426; my translation). And these words are reminiscent of Jünger's extraordinary 1934 essay, while also conjuring up the pain proper to the Worker, representing man thrown into titanic modernity, the full weight of which rests on his shoulders, and that is precisely all pain.

[12] "The modern state has historically arisen out of a practical technique (*Sachtechnik*) within the political order" (Schmitt 1994, 12; my translation).

the *is* (the *Sein*), so much so that this latter element, the *is*, comes into contrast not with the *ought*, as it does in Kelsen, but with the *non-is* (with the *Nicht-Sein*, or nonbeing) (Hofmann 1995c, 21).

The *is* Schmitt is thinking about is not an empirical, contingent *is* but a historical one, so much so that the law he speaks of in this essay is Roman law such as it historically lives in legal science: Law is not the "product" of legal science but is what is *thought* by legal science; it is what legal science *knows* about law, or what its consciousness and understanding of law is. One cannot underestimate in this regard the import and significance of the German historian Savigny, whose work, in Schmitt's words, "is an existential reflection *on* the law *by* the law itself, a great appeal made to the science of law in its role as custodian of law, enacted or otherwise" (Schmitt 1958b, 411; English translation Schmitt 1990). We can appreciate, then, by virtue of this feature alone, that the science of law can be likened to an art: Just as Europe is ultimately encapsulated in its essence in its cathedrals, churches, palaces, art museums, and music, so it is encapsulated in its legal wisdom.

But Europe is also its *positive* law, which needs to be actualized and does not content itself with a lifeless existence in the pure abstraction of norms. It does not emerge clearly enough from this essay that Schmitt is not putting forward a theory of *natural* law:[13] He does not set natural law against "positive" law, for in positivity—understood by him as the historicity of law—we also find positive law, namely, enacted law, and to some extent also written law. There is Savigny on the one hand, and there is Hegel on the other. The existentiality of law is certainly its "positivity," in the sense of its unfolding through an unwitting evolution, in the sense of its givenness, its being an order that in some respects calls to mind Friedrich von Hayek's "spontaneous order." Writes Schmitt:

> As absolutely existential sense can be ascribed in particular to Savigny's theory of the sources of law. Through his conception, Savigny gave a new and intense meaning to the theory of the sources of law and to our image of it. Savigny and his peculiar concepts of "historical" and "positive" can be understood only by seriously reflecting on the fact that his theory of legal sources, and the image through which he depicts such sources, are closely connected to the fight for survival in which legal science is engaged. As a concrete order, law cannot be isolated from its history. True law is not posited but rather arises through an unwitting evolution. In the present day, then, what is true law can only be determined by looking at its concrete historical form of existence as shaped by jurists cognizant of this evolution. The concept of what is positive, in the sense that legal science ascribes to this term, is understood by Savigny as tied to a particular kind of legal

[13] Worthy of mention in this regard is the Catholic criticism directed at Schmitt by F. A. Von Heydte: "Carl Schmitt [...] neglects to consider that [...] over the last twenty years" a new legal science has resurrected that "does not fear speaking about God and about a God-given natural law. It is here that this science looks for the authentic source of natural law, instead of proceeding, as Carl Schmitt does, from a secularized human science" (Von Heydte 1950–1951, 288; my translation).

source—the kind safeguarded by jurists, with whom the law in a quite distinctive way finds its origin as something *given* rather than enacted. (Schmitt 1958b, 411; English translation Schmitt 1990)

So nothing, then, is more positive than this law which the jurists are safeguarding, and nothing could be farther from uncritical positivism or even from (Kelsen's) critical positivism, since the former reduces law to an arbitrary act of will, and the latter espouses a purely scientific vision purporting to reduce to unity and make coherent the law posited by the lawmaker. But at work in this legal positivism and this "positive law" Schmitt also sees something deeper, namely, their will to power, their being an expression of the epoch of formal computability and predictiveness: Legal positivism "only knows fundamental, hypothetically posited causes or norms. It seeks the opposite of a law devoid of ambitions, and its ultimate ambition lies in domination and calculability" (ibid.). The motto of legal positivism is "Predict in order to regulate"; on an existential conception of the legal order and the world, by contrast, the law is understood as the fruit borne by a tree, that is, as the end result of an original moment that has no purpose other than that of being itself. And for this reason, despite the opportunistic compromises Schmitt made with the Nazi regime, he cannot intellectually be ascribed to that regime, whose plebeian and massifying, crudely racist traits could very well be located in a linear history which is that of modernity and its mythologies.

Whence the paradigmatic significance of the positivity of law, set in contrast to legal positivism—and also the emblematic significance that in this sense Schmitt ascribes to the debate between Savigny and Hegel:

As much as the highly charged nature of this debate may have made it unfruitful, in Schmitt's eyes the debate testified to what was at stake, one last time before legal positivism was to sally forth, and before legal positivism could bring to light the crisis of the state as a subject of law. The breakdown of this dialogue is, among other historical factors, one of the reasons for the legal incognizance characterizing the 20th-century "motorized lawmaker," for whom the decree, the ordinance, and the administrative memo are in point of fact substituted for the general legal norm, but who has failed to extract the legal and political consequences deriving from this fact. (Kervégan 1992, 142; my translation)

But if all of this is true, what are we to make of the fact that for several years Schmitt was tied to the Nazi regime, even styling himself as its authentic and "official" interpreter (*Kronjurist*)? It is true that many regard the Nazi phenomenon as a sort of a reaction against the modern world, as an anti-modern movement. But if, as I would argue, this interpretation is mistaken—and Nazism ought to be understood precisely as an unleashing of Titanic, and hence essentially modern forces—how can we reconcile that with Schmitt's philosophy of law and politics, which takes a critical stance to modernity?

In support of the thesis of the "Titanic" and technological nature of Nazism, I should like to recall a largely unknown author, Fritz Nonnenbruch,

the theorist of Nazi economic policy: Not only does Nonnenbruch not see any contradiction between Nazism and technology, but on the contrary, the new politico-economic system put in place by Hitler is regarded by him as none other than an "infinite push for technology" (Nonnenbruch 1936, 154; my translation; cf. Nonnenbruch 1939). As much as capital (big money) is for him stateless, and branded by him as "Jewish," it is also at the same time regarded by him as the enemy of the very technological progress championed by Nazism (Waibl 1988–1989). If that is the case, and there is in fact no way to separate Nazism from technology, then on this basis might be rested the claims of the apologists for the other great "decisionist" of the time, Martin Heidegger, since it was their strategy to equate Nazism with technology so as to fashion Heidegger into a critic of Nazism (albeit an indirect one). In other words, the exaltation of Titanism is set in contraposition to all those who instead have criticized modernity for its will to technology, and so for its drive for domination.

It is therefore not impossible to see, either on a literal level or an intellectual one, how Nazism might be incompatible with Schmitt's conception—an incompatibility that becomes apparent in his essay on European legal science, all the more so that *Nazism was a staunch adversary of Roman law*. The fight against the corrupting spirit of Roman law even found its way into the Nazi Party programme, where it is presented as a basic tenet of Nazism: "We demand that Roman law, which serves a materialist ordering of the world, be replaced by German common law."[14] This was a statement meant to apply in particular to property, but in reality Roman law had always been targeted as such in German conservative quarters.[15]

Now, it can easily be appreciated, even on a superficial reading of Schmitt's 1950 essay on European jurisprudence, that he does not take exception to Roman law or to Roman legal science. Yes, he does generalize the phenomenon

[14] Point 19 of the "Program of the National Socialist German Workers' Party" (1933). In *The Avalon Project: Documents in Law, History and Diplomacy*, at http://avalon.law.yale.edu/imt/nsdappro.asp. The German original: "Wir fordern Ersatz für das der materialistischen Weltordnung dienende römische Recht durch ein deutsches Gemeinrecht." On Roman law in Nazi Germany and on the issues arising in connection with the Nazi rejection of Roman law, see Pieler 1990.

[15] If we just consider the movement that came to be known as the Conservative Revolution, it will suffice to look at the writings of Oswald Spengler (as a rule included in that movement) to appreciate that Roman law was regarded as a corrupting force proper, gutting the primeval "Germanic freedom." Writes Spengler: "Roman law has corrupted us. It dangerously abets the average German's tendency to daydream, to wander, to buy into whatever exists as a matter of fact" (Spengler 1933b, 241–2; my translation). An even more ideologically uncompromising position was expressed by the Nazi jurist Helmut Nicolai in *Die rassengesetzliche Rechtslehre* (The jurisprudence of race-based laws: Nicolai 1932, 6ff.). Of course, it is out of the German studies of the mid-19th century that had come the dogma according to which "the reception of Roman law has been a national curse" (Pieler 1990, 430ff.; my translation; also discussing the same attitude on the part of Gierke and the later Fuchs).

of legal reception, but nowhere on these pages do we find any hint of an unsympathetic attitude. This observation is all the more significant if we consider just how different Schmitt's attitude to Roman legal science is here by comparison with the view he had previously espoused from 1933 to 1936. This is a point that comes through clearly in two writings from that period: his 1934 book *Über die drei Arten des rechtswissenschaftlichen Denkens* (Schmitt 1993, translated under the title *On the Three Types of Juristic Thought*: Schmitt 2004) and his 1936 article *Aufgabe und Notwendigkeit des deutschen Rechtsstandes* (The task and necessity of the German jurists: Schmitt 1936). Let two passages illustrate:

> Medieval Germanic thought [...] was fully concrete, but starting from the 16th century the reception of Roman law in Germany removed this mode of thought from the jurists by favouring an abstract normativism. (Schmitt 1993, 9; English translation Schmitt 2004)

And then, in the 1936 article, Schmitt argued that only by overcoming the "domination of Roman law" is it possible to do away with the "class system keeping watch over German law":

> Neither thing is thinkable without the other. If the emperor's clothes go, so must the emperor. If we fight the reception of Roman law, we will not only be fighting the content of certain legal propositions, on whose coherence we might perhaps have a debate, but we will also, and in the first place, be fighting to construct a unitary German guardianship of law, one whose organization and structure will satisfy all the conditions needed to create and keep watch over a common German law. (Schmitt 1936, 181–2; my translation)

It is impossible not to see the chasm that separates Schmitt in this phase, in 1934 and 1936,[16] from Schmitt in 1943, or even, going back in time, from Schmitt as a quasi-neo-Kantian normativist in his 1914 essay on the state (Schmitt 1914). It falls beyond the scope of this discussion to try and understand what drove Schmitt to adhere to Nazism, through a rather unnatural conversion. But one thing is certain: About this time he was a prominent exponent and an *authentic representative of Nazism*, or at least this is the role he fashioned for himself,[17] and that is how he was regarded by jurists abroad, for example, in France and Italy.[18]

Is Schmitt the Nazi proponent the coherent outgrowth of Schmitt the scholar of the 1920s? My own view is that that is quite implausible, just as it seems to me that one cannot doubt the fissure between the Nazi Schmitt and

[16] On Schmitt as *Kronjurist* of Nazism, see (among the earliest and most virulent writings) Schultes 1947.

[17] As did his pupils, a case in point being Ernst Forsthoff, who in 1933 wrote an essay on the total state fully aligned with the directives of the new regime (Forsthoff 1933).

[18] See Wilk 1934, Perroux 1940. Likewise, A. Volpicelli commented thus: "Carl Schmitt, one of the official theorists of National Socialism" (Volpicelli 1935, V; my translation).

his later avatar.[19] Of course, it must still be possible to discern a red thread running through the "three Schmitts," a basis and a personal equation explaining the thinker's outlook in every phase of his thought. I believe this means tying Schmitt closer to the "ruler" of the party—closer to the "body" and "functions" of the Führer—than to Nazi ideology, and it also means throwing into relief the drive for unity which characterizes Schmitt's thought, a drive which on the one hand would lead him to defend Hitler after the Night of the Long Knives (or Röhm-Putsch, the purge carried out against Ernst Röhm and his *Sturmabteilung*, or SA), and which at the same time would also cause him to see in the *ruler* the defender of law, representing an impartial, organic legality.[20]

Indeed, in the Nazi phase stretching from 1933 to 1936 (and perhaps lasting a few more years),[21] Schmitt followed a certain Hegelian revivalist vogue then underway, and in so doing highlighted some elements of Hegelian Prussianism or Prussian Hegelianism that certainly could not be reconciled with the Catholic view. One need only mention here the passage he wrote on Hegel in the book on three types of juristic thought. Writes Schmitt: "Before the demise of subsequent generations, concrete institutional thought comes back to life with an immediate force one would scarcely have expected after the 17th- and 18th-century development of the theory of law and the state." Hegel's state, which appears to Schmitt as more an empire than a modern state, "is not to be found in bourgeois peace, in the security and order of a legal functionalism. It lies neither in sovereign decision nor in a 'norm of norms' [...]. It is the concrete order of orders, the institution of institutions" (Schmitt 1993, 38–9; English translation Schmitt 2004).

But there is also in Schmitt's legal thought an underlying continuity that is usually not brought into relief. In other words, there is in Schmitt the constant idea of a twofold superiority: that of the spiritual world,[22] on the one hand,

[19] That there is a definite break in the "development" of Schmitt's thought is evidenced (albeit circumstantially) by the fact that already in the second edition of his *Begriff des Politischen* (the 1935 edition), the bibliography in the appendix does not list any relevant juvenilia, not even the 1924 essay he wrote on Roman Catholicism. (Might this be a sort of self-censorship à la Lukács?)

[20] Here we ought to bear in mind a theme that runs through Schmitt's thought from the outset, namely, the view that absolute sovereignty never stands *above* the law but rather *embodies* the law: "The absolute sovereign rises above the relativities of temporality; he no longer counts as an individual at all; he no longer has moods and amusements; he has in every respect become 'the law'; he is not above the law any more than he is above grammar" (Schmitt 1917, 95; my translation). And shortly thereafter: "The dignity he demands and which is conferred on him is good in his capacity as a sovereign and not as a mortal man. Owing to the divine cachet the monarch has qua 'living law,' he is subject to the law, just like God as conceived in theology, whose all-powerful will cannot will anything bad or nonrational" (ibid., 96).

[21] Just how many more years is not easy to say. But for an interpretation that sees a line of continuity, especially as concerns his *Großraumtheorie* (or theory of spheres of influence) as a justification for the Nazi predominance in Europe, see Gruchmann 1962, 121ff.

[22] This idea has been used to explain Schmitt's compromise with Nazism: The core of

and that of the "spiritual" nature of law, on the other. When in his youthful book on the state he wrote that law is an abstract idea, independent of facts and having no relevance for facts (Schmitt 1917, 37–8),[23] he was expressing the same thought one can see expressed—however much with greater pathos and a rhetoric befitting the new, tragic experiences Europe was going through—in his essay on European jurisprudence, and that is the idea that

> even in the terror of the instruments of annihilation that the modern science of nature places in the hands of every power wielder, a legal science made to rest entirely on its own foundation will find the mysterious crypt in which the germs of its spirit are protected from any persecutor. (Schmitt 1958b, 426; English translation Schmitt 1990)

Law is not the same thing as the positive law, just as legal science cannot be equated with the relentless activity of the "motorized lawmaker." The one and the other are rather rooted in a positive but invisible reality, in a form not amenable to modern humanity's will to dominate. Here Schmitt brings back a modicum of rule of law (*Rechtsstaatlichkeit*) as something inherently valuable, contra the vilification directed at the desire "to secure an individual sphere persistently protected as a typically bourgeois liberal need, as a sense of mistrust that undermines the state's power" (Stolleis 1972, 145; my translation):

> We cannot choose regimes and fleeting power-holders depending on whatever suits our fancy; rather, with each changing situation we must protect that on which rests a rational way of being human, something that cannot do without the principles of law. Among these principles are a recognition of the person, which recognition cannot fail even in controversy, and which is grounded in mutual respect; a sensitivity for logic and for the coherence of concepts and institutions; and a sense of reciprocity and for the minimum degree of procedural regularity, that due process of law absent which there can be no law. What everywhere shelters law's indestructible kernel from any splintering normative activity is the dignity we are endowed with, a dignity that today is present in Europe more than at any other time and more than in any other part of the earth. (Schmitt 1958b, 422–3; English translation Schmitt 1990)

Schmitt's essay on European jurisprudence thus marks Schmitt's "return" to his pre-Nazi phase, and perhaps it also foretokens a rethinking of the youthful roots to which he will soon be compelled to return by the new post-war experiences ("wisdom from the cell": *Weisheit der Zelle*). The essay certainly also signifies a disavowal, but not—mind you—a denial: While disavowing what he undoubtedly did, he also accepts responsibility for it. Only fools or

Schmitt's openness to Nazism, P. Noack has commented, "lies in my view in the fact that as one representing a spiritual world, he felt far superior to those he was making himself available to. I have already quoted his remark, 'I felt spiritually infinitely superior to Hitler.' But this remark bore the mark of Schmitt's Hegelian background. This man, who thought the worst of human beings, nonetheless believed that the spiritual world would one day reveal itself to be superior to all other worlds" (Noack 1993, 211–2; my translation).

[23] The German original: "Das Recht ist abstrakte Gedanke, der nicht aus Tatsachen abgeleitet und nicht auf Tatsachen einwirken kann."

the weak can pretend to deny their own past (something that in the manner of Heidegger can only mean self-denial). Schmitt brings his own mistakes to fruition so as to give deeper thought to himself, to the modern world, and to the possibility of human redemption.

This is where he discovers himself to be a jurist, as against a political philosopher. In rediscovering the legal structure of his thought, he of course also rediscovers the philosophicalness of the legal thought distinctive to the German cultural consciousness. I am not sure whether it is more appropriate here to speak of a Christian and Augustinian vision,[24] or of a Hegelian one, or of a sui generis existentialist one. On the specifically "philosophical" dimension of Schmitt's thought I will for the time being withhold judgment. But those who knew him well, like Hugo Ball, singled out a personal propensity that somehow can shine a light on those many aspects of his thought which still lie in the shadows: This is his "propensity for the absolute." However, it is a propensity that

> does not in any way incline one toward abstraction [...] but is rather geared toward concreteness. [...] Like any Kantian, Schmitt starts out from *a priori* concepts: He starts out from his own ideology of law. But he does not content himself with defining these concepts in themselves and bringing them into relation with one another. He seeks to locate his legal concepts in forms of state that either currently exist or have existed in tradition, and does so in a progressive way, following their primal connections, following their secularization relative to all the other higher categories (philosophy, art, theology). (Ball 1983, 101; my translation)

The burden of this passage ought to be clear to anyone familiar with German epistemology in the first two decades of the 20th century. For Schmitt takes a Kantian or even a neo-Kantian approach, but gives it a phenomenological and ontological angle (following the path opened by the neo-Kantianism of the Baden school, especially with Emil Lask: see Section 1.4 in this tome). It is this connection that anyone looking to seriously investigate Schmitt will have to focus on. What we have here, in other words, is a neoplatonic perspective which, when viewed through a Catholic lens, turns Augustinian (this is the interpretation offered in Beaud 1993), but which, in my own assessment, retains its inherent neoplatonism even when the Catholic vein fades away (at it did in the Nazi period). And crucially, if this assessment is correct, one cannot fail to see the dual nature of all phenomena, at once historical (and hence fleeting) and perdurable. It is no accident that, while Schmitt strives to define the concept (the essence) of the political, he nonetheless fully appreciates the historicity of the state. And to this latter feature of his thought we should devote a few words.

Schmitt at the same time grasps the historicity of the state and its decisive importance in the modern history of the West. While it is true that he is not a

[24] Schmitt's purported Augustinianism forms the central theme of the introduction O. Beaud (1993) writes to the French translation of Schmitt's *Verfassungslehre*.

true étatiste (contrary to what some are prone to thinking), it is equally true that the state is for Schmitt an inherently valuable phenomenon (a "magnificient evil"), such that he could not but look askance at all those phenomena that ended up chipping away at the state's sovereignty (Vesting 1992, 29ff.). All through this, however, Schmitt is a studious analyst, clear- and cool-headedly investigating the historical processes in progress. Indeed, there are two concurrent phenomena he identifies in the gradual erosion of sovereignty: on the one hand is the socialization of the state, and on the other the statization (or juridification) of society (two phenomena that would subsequently be investigated by one of Schmitt's most important disciples, Ernst Forsthoff). To be sure, this amounts to staking out a position, but even more importantly, Schmitt is laying out an issue. It has been observed in this regard by M. Nigro that

> once we credit Schmitt with having understood way ahead of his time and with true ingeniousness that a process was afoot merging the state and society in the dual form involving the statization of society and the socialization of the state, and with having recognized as existent and widespread the bewilderment and powerlessness the current state is experiencing, precisely in virtue of pluralism and its increasing development, we have to view pluralism not as the antithesis and corrupting element of the administrative state, but rather as its dialectical correction. (Nigro 1986a, 793; my translation)

In other words, the import of Schmitt's discourse goes well beyond his deliberately staked-out position; Schmitt shows that only a hard-boiled analysis makes it possible to construct a discourse about what is valuable, a discourse grounded in a worldview. Although a worldview does not issue from any scientific investigation, no historically justified worldview can ever neglect to engage in a disentranced diagnosis of the "state of the world."

In this sense, Schmitt can be said to owe a great debt to another towering figure of contemporary thought, namely, Max Weber. There is no way to understand Schmitt without taking into account the sociology of politics and law developed by Weber, whose most significant student was indeed Schmitt himself. And I should like to advance here the thesis that the common denominator between Schmitt and Weber lies in their rejecting the tendency to absolutize any single factor or area of life. This is something of a bold thesis, to be sure, because Schmitt could easily be grouped among those for whom "everything is politics," in line with Charles Maurras's idea that politics comes first (*politique d'abord*). And in fact it is not difficult to find in Schmitt several toeholds for this interpretation. But it is also true that the contrary thesis is not so rash as it might seem. And testifying to that view is the article he wrote on European jurisprudence.

Chapter 9

NAZI PHILOSOPHY OF LAW AND OF THE STATE

by Agostino Carrino

9.1. Introduction

We cannot enter into the Nazi philosophy of law and the state without first drawing a preliminary distinction between two groups of philosophers: On the one hand were those who had their own conception of philosophy or legal philosophy and for a variety of reasons decided to adhere to the Nazi regime; on the other hand were those who specifically and deliberately worked out a "philosophical" theory *of* law and *on* law conforming to the tenets of the emerging Nazi regime.

Figuring prominently in the first group are Carl Schmitt and Julius Binder, for which reason they are both treated separately from the other authors in this chapter: see Chapter 8 and Section 5.3 in this tome, respectively. An exception is Karl Larenz, who would have to be classed in the first group in every respect but for an important book he wrote (Larenz 1936) which bears directly on the question of Nazism, and for this reason he, too, unlike Schmitt and Binder, has been placed in this chapter, where we turn to what can specifically be described as the Nazi philosophy of law and the state (but, on Larenz, see also Section 5.4 in this tome).

The premise of this philosophy, assuming we can so call it, lies in the primacy of the community and the people. These entities, however, are conceived in neither a sociological, nor a spiritual, nor a moral sense but are rather understood as an organic, racially determined reality. What we have here, in effect, is a structurally racist theory of law, grounded in the idea of blood and soil (*Blut und Boden*), rejecting any history having any place for the "race" enemies of the German people, namely, Christianity and the Catholic church (see Baehr 1939), Roman law, Hebraism, and even the state and its theorists, in that the modern state has failed to absorb the Church, along with all the realities external to the people, thus failing to reduce everything to the unity of the people as a racially homogeneous group (see Keller 1939). Even a conservative like Erich Kaufmann—the author of an article on international law ending with a song of praise for "victorious war-making" as a "social ideal" (E. Kaufmann 1911, 146; my translation)—was rejected as incapable, by reason of his Jewishness, of grasping genuine "German law" as founded on the idea of *Volk*, or race (Gürke 1935, 15).

9.2. Race as the Foundation of Law: Helmut Nicolai and Others

The sense in which National Socialism embraces a fundamentally antijuridical conception of law,[1] understood as a form of shared life, is nowhere more clearly exemplified than in the work of Helmut Nicolai (1895–1955),[2] a staunch supporter of Hitlerism. In a writing on the legal theory of the racial laws, Nicolai underscored how the Nordic god Týr encapsulated a dimension at once juridical and warlike, for he is depicted as carrying a sword, symbolizing both law and war. War, Nicolai (1932, 19) comments, "is not a violation of law but a juridical action," because the strong "have a right over the weak, a rightful claim that the weak should make way for the strong" (my translation). Nicolai doesn't say that the strongest must necessarily be identified with the German people, but he nonetheless appears to reduce law to the law of the strongest, where the criterion for identifying the strong is fundamentally that of the race one belongs to.

For Nicolai and the other Nazi theorists of law, any consideration about law must take concrete reality as its point of departure. This reality (in this foundational role) is understood by them to lie in the permanent division of humanity into races. And there are two models on which basis society can be organized into races: the typically organicist, positive model consisting in the racial homogeneity proper to the *Gemeinschaft*, and the negative, dissolutive, sociological model of the *Gesellschaft*.

From a Nazi perspective, the community is a *biological* entity, not a cultural one. It is founded on blood and soil (*Blut und Boden*), making it in its most authentic sense the community of a racially pure people (*Volksgemeinschaft*) (M. Bonnard 1936). Racial purity is the basis for an effective (i.e., "scientific") understanding of reality, this because, among other reasons, law is understood to preexist the community conceived as a phenomenon that binds people by virtue of the very blood of the race. This type of community is indeed "a creation of nature, and like nature it arises out of the forces from which springs all life: from the impulses of blood, from the *Saften* (juices) of the soil, from the interiority of an equal *Gesinnung* (frame of mind)."[3] As Erik Wolf (1934, 3) writes, "law is something that lives in the blood" ("Recht ist etwas im Blute Lebendes": my translation).

This way of invoking nature warrants a characterization of Nazi legal theory as a theory of natural law (however much in a sense specific to these

[1] That National Socialism was an essentially anti-juridical political movement was perceived by more than a few people, and almost immediately at that. See, for example, the proceedings of the conference held in Paris in December 1935 published under the title *Le droit national-socialiste* (National Socialist law: Cot et al. 1936), with a contribution by Harold Lasky.

[2] Nicolai's relevant works as a legal philosopher are Nicolai 1932, 1933a, 1933b, and 1934. On Nicolai, see Housden 1992, 252.

[3] See Eberhard (1934, 22), for whom "German blood carries in its character [*Naturanlage*] the idea of German law" (my translation).

authors), in that nature, blood, and race, in a biological and empirical sense, are found to lie at the foundation of law, which can actually be "felt" by the people—the more so, and more clearly, the more the people themselves are racially "pure."

The people's law is therefore a natural law, but is neither universal nor absolute, for it is distinctive to each people and is thus relative (Eberhard 1934, 40), insofar as a people's concrete needs are historically contingent and hence changeable.

What carries primary importance in this natural law biologically underpinned by race is a notion of race inequality that draws on the work of Joseph-Arthur, comte de Gobineau, whose ideas attracted a following in this period. It is against the background of this idea of race inequality that the Germanic race is held up as the chosen race, selected as superior on account of its biological characteristics. The Nazi theory of law is thus a politically driven theory, envisioning a form of law functional to the interests of the chosen race, in a struggle for supremacy and survival. Law is consequently always the law of the strongest (Nicolai 1932, 21).

One can see here the sense in which the state ceases to be the highest form of national life and is demoted to the status of an instrument. As Carl Schmitt put it, Hitler's rise to power definitely marks Hegel's demise in Germany: "For us National Socialists," writes Hans Frank (1900–1946), minister of justice and an influential organizer of the legal profession at that time,

> the people in themselves constitute a primary, God-given ordering. As a form of human organization, the state must serve this community entrusted to it by divine providence. The people do not exist just to provide the state with content; quite the contrary, a state is entitled to exist only insofar as it can serve the people entrusted to it, in the manner of a means to an end. [...] Every people thus has an original right to shape the state's organization in the manner necessary to its own existence. (H. Frank 1938, 11; my translation)[4]

The state has in effect been reduced to a tool, and positive law, that is, the law of the state (*Staatsrecht*), is none other than the racially determined "natural law" of the people: of the *Blutgemeinschaft* (blood community). This is precisely the justificatory basis for the Führer-principle, which holds good only insofar as a supreme ruler is capable of "sensing," grasping, interpreting, knowing the "truth" deposited in the deep layer of "his" people's life. Whatever furthers the good of the community is law (*Recht*); whatever fails to do so is nonlaw (*Unrecht*), a wrong. As Karl Larenz writes, what is decisive for the makeup of the community in the National Socialist state is above all "the idea of race, which determines one's understanding of the conditioning that unfolds in keeping with the people's blood" (Larenz 1934, 39ff.; my translation).

[4] On Frank, see D. Schenk 2006.

9.3. The Fight against Rights

Clearly, in this strongly organicist, biologically determined conception of race there can be no place for the distinctive concepts of the liberal legal tradition, especially not for the concept of rights, a concept in different ways rebuffed by all the main Nazi jurists, from Karl August Eckhardt (1901–1979) to Karl Larenz and Ernst-Rudolf Huber (1903–1990), as well as others who did, however, try to soften this veritable crusade against the concept of rights (see Thoss 1968 and Grimm 1990, 38–54). Thus, for example, Eckhardt (1936, 7ff.) viewed rights as a holdover from a bygone world—that of individualism and liberalism, both enemies of the community—and for Larenz, a jural condition should not be seen, from the standpoint of "private" law, as what enables individuals to relate to one another, for it is a condition that instead means "occupying one's place within the order of a people's life, having one's assigned function and station as such a member." Legal capacity, then, consisted in "having not rights [...] but rather certain jural positions. Legal capacity is the capacity *of* the law, pointing to the possibility of taking part in the community's jural life" (Larenz 1935, 240, 244; my translation). Larenz does not deny that the individual may have rights, but these do depend on one's juridical position, and in particular on the obligations owed to the community of which one is a member. Still, even in Larenz the individual is understood to have at least some leeway, this insofar as the community cannot substitute for the individual in every respect, from which follows that "even in the National Socialist regime there must necessarily be some space for individuals to realize their personality, while at the same time identifying with an interest in the progress of the community's jural life" (Thoss 1968, 48; my translation).

Similarly, Ernst-Rudolf Huber took the view that, from the standpoint of public law, the *Grundrechte*, the fundamental rights enshrined in the constitution, had made it possible for the people's life to be depoliticized in the Weimar Republic, in such a way as to destroy the basic "unity and totality [*Ganzheit*] of the people" under the pressure of disarraying individualistic impulses. Even Huber, however, makes an effort to salvage at least some degree of individuality, by drawing a distinction between the individual as a member of the community from the individual as the subject of an absolutistic regime. Even in the Third Reich individuals are free, but their freedom "consists in the free, creative, responsible use of personal talents and strengths for the people's totality" (Huber 1936, 441; my translation). Even more emphatic in this sense was Walther Schönfeld, a Hegelian turned National Socialist who sought to soften the contrast between the individual and the community, and in fact claimed it to be essentially a spurious contrast.[5] Every community is made up

[5] On Schönfeld, see also Section 5.5 in this tome.

of individuals, who only as such can be held responsible for the community and accountable to it: "A community that does not know and does not recognize the individual as such will cease to be a community" (Schönfeld 1937, 108; my translation). These positions debouch into that of the most sure-footed rights advocate in the Nazi era, Alfred Manigk (1873–1942), the author of a monograph on private autonomy where rights find their place as necessary elements for the legal order at large (Manigk 1935). In the final analysis, despite the criticism that Larenz addressed at this very book, even from the standpoint of the positive law the new National Socialist Civil Code, which was to replace the *Bürgerliches Gesetzbuch* enacted under Wilhelm II, simply could not fail to take into account the latter's enshrinement of rights (Grimm 1990, 52).

9.4. Karl Larenz and the Call to "Renew" Legal Philosophy

A logical place to start from as we turn to the Nazi legal philosopher Karl Larenz is his short book *Deutsche Rechtserneuerung und Rechtsphilosophie* (The renewal of German law and legal philosophy: Larenz 1934), where he outlines a new legal-philosophical programme designed to advance the National Socialist vision. The purpose of this Nazi call to remake and renew law was to "bridge the disconnect between the people and its law, creating a law that will be in agreement with the moral conceptions of our people and will answer its vital needs"—a law, in other words, that can "truly be called *German* law" (Larenz 1934, 3; my translation, italics in the original). This German philosophy of law, if we so choose to call it, is driven in the first place by an exigency to fight the spirit of the Enlightenment and is rooted in an interpretation of German idealism (Fichte, Schelling, Hegel) solely concerned with refuting the 18th-century philosophy of rationalism. Law, on this "novel" conception, is "a vital ordering closely bound up with the community's moral and religious life, an ordering that with its own claim to validity sets itself against the individual (ibid.). Nazi legal philosophy is thus in Larenz an all-enveloping communitarian philosophy, uncompromisingly opposed to any individualistic or contractarian conception. The community of the people (by which is meant the *German* people) comes first and trumps all else: It is the *prius*, and individuals can have any role in it only as elements necessary to this community, a community that Larenz, going back to Hegel, qualifies as "concrete." Law arises not out of individual will, but out of the collective or general will (*Gemeinwille*)—but what this collective will is he does not say. It is not Rousseau's *volonté générale*, which is no more than individual will writ large, but rather the general will hypothesized by Hegel or by the Historical School's spirit of the people. What matters, it would appear, is the question of the interest to be furthered: This is not the individual's interest, which only comes second, but that of the community, which for Larenz finds its highest expression in the state, understood precisely as the most important community. It is significant that Larenz, an

author with a deep knowledge of the idealist philosophies, does not conceal Kant's and Hegel's conceptions of the individual but instead bends them to a specific communitarian conception. To be sure, there is a role envisioned for the individual in Larenz, too, but this role consists in being responsible toward the community. Individuals are free to the extent that they are responsible, and their responsibility means that they must specifically be accountable to the community they are part of. The law cannot be reduced to what is set forth in the statutes, for it is grounded in the moral ideas that live within the community. Legal positivism, and specifically Kelsen's *reine Rechtslehre*, is so concerned to safeguard the bindingness of law that it fails to recognize the judge's responsibility toward the people's community, and although this is actually a misstatement of Kelsen's account—which precisely on this point takes a view of judicial interpretation as a law-*creating* activity—Larenz insists that if the judge no longer has a commitment to the community, the blame lies with the legal-positivist emphasis on the binding nature of law, intended to safeguard the certainty of law, a desideratum in turn understood by him as an expression of economic liberalism. So the legal renaissance prefigured by Larenz actually positions itself by carrying forward the fight that for some time had been in progress against legal positivism, "and in particular against the 'pure theory of law'" (ibid., 15; my translation). This push for the new shifts the focus from the subjective to the objective, from formal logic and abstract theory of knowledge to an objective logic immanent in things themselves ("zu einer immanenten Sachlogik des Gegenständlichen"). Here Larenz draws on two sources—the revival of Hegelianism (an effort he himself is part of, as discussed earlier) and modern phenomenology—seeing both of these movements as having restored strength and substance to the idea of an objective spirit, by which Larenz means "the community's spiritual life, with this life depositing into the community's objectifications, into works of the spirit that, however much separate from the stream of creative life in motion, are bound to serve this life, and in this life they find their subsistence" (ibid., 15–6; my translation). If this was only about a people's language, customs, law, culture, and the like, there would be nothing to object. But for Larenz this "objective spirit" is never to be ascribed to any single individual as such: It rather belongs to the community as a "living totality" (*Lebensganz*), and so in reality it consists in the spirit of a given people as shaped from within by its "blood and destiny" (ibid., 16). For Larenz, law is not immediately a norm but is "something effectively real," "a real force in the life of the people and of men" (ibid., 19; my translation) and it is real as something embodied in the state, in culture, in morality, in social life in general.

Law realizes itself because, quoting Hegel, it is not an "impotent *Sollen*" but rather claims a staying power and substance for itself and is thus closely bound up with power, enabling judges and the executive to flesh it out and bring it into being. Law does configure itself as a norm, however, to the extent

that individuals can gain consciousness of their possible separateness from the community, thus becoming aware of their each being a single entity. At this point the will of the community—coinciding with the will of the individuals insofar as they recognize themselves as members of that community—morphs into something different, becoming for individuals an obligation, a duty, and the law to them becomes a "norm." Law thus turns out to be something complex, and in the new National Socialist conception it discovers in the judge someone entrusted with applying not "the law" but the community's common will, which of course ultimately resolves itself into the will of the Führer.

In this way Larenz drives to extremes certain earlier trends in German legal philosophy, so much so as to distort their import. Indeed, these movements had good reasons to exist in the 1920s, yet the shape Larenz gave them in his Nazi period just turned them into inconceivable theses for any sensible legal-philosophical mode of reasoning, so much so that, on closer inspection, they turn out to be the mirror image of the normative stance. In Kelsen, for example, we have the unity of the normative order; in Larenz, the unity of the community; likewise, both hold that the judge *makes* law; and both view this judge-made law as an individual norm, but for Kelsen this norm serves the unity and coherence of the legal system, whereas for Larenz it serves the will and interests of the community, specifically through "the continuity of the people's life" (ibid., 26; my translation), and so through the historical tradition of a given community marked by racial homogeneity. In this community lies "the real," wherein the is and the ought do not come apart but rather share a space and indeed *meld* into each other, in that this communitarian reality, this effectively real community, is at the same time a reality, a being, and a norm. The community is the unity that internally differentiates but does so remaining loyal to itself as a unity of is and ought, fact and value. What ensures this unity of the community and its law is the Führer, in such a way that the legislator and the judge do not just act *in compliance with* the Führer's will but do so by specifically embodying his "spirit." This book by Larenz in effect offers the best possible introduction to the ideas of Nazi legal philosophy, for it lays out the premises from which the various strands of Nazi "legal philosophy" subsequently branch out. Writes Larenz:

> In the French revolution the ideal of coexistence among individuals is coupled with that of their equality. Justice consists in equality for all. The basic principles of law are thus to be found in the abatement of all class, gender, and religious differences. The abstract principle of equality ultimately leads to communism. According to the German idea of law, mere coexistence among individuals is replaced with the community, and abstract equality with the *individual's physical membership* [*Gliedhaftigkeit*] *in the community*. (Ibid., 39; my translation)

This community is grounded in the idea of race (*Rassengedanke*). The core concept around which revolves the new legal conception is no longer that of the person (as is paradigmatically the case with liberalism) but that of member-

ship, in the sense of the individual being concretely determined through the specific communal function of serving the community and its Führer, a function the individual serves as "farmer, soldier, intellectual worker, wife, family member, servant of the state" (ibid., 40; my translation).

The real relations of private law lose their meaning in Larenz because understood as expressing a liberal conception of the state and of law. This also changes the content of rights. What matters is the individual's responsibility toward the community: It is not the individual's will that drives the content of rights, but the sense to be ascribed to that will. What counts, in other words, is not what individuals may think or will but their objective position within the racial community, so much so that marriage and family ultimately have any value only "from the standpoint of racial hygiene and political demography" (ibid., 41; my translation). And so likewise, for example, a punishment is no more than retribution (*Vergeltung*) for the crime committed. There is no way to educate the individual if not through punishment and for the good of the community. "The highest juridical good," Larenz comments, "is to be located not in the freedom or welfare (*Wohlergehen*) of the individual, but only in the *people* and the *state* as unified entities expressing the will of the community forged out of blood and soil, culture and history" (ibid., 43; my translation). This willing unit is represented by the Führer, "who embodies all responsibility to the community: All those who act as members or organs of the community answer to the Führer" (ibid., 44; my translation). The Führer does not obey any abstractly posited norm but only follows the vital law of the community, a law that "has become his own flesh and blood" (ibid.; my translation). The conclusions drawn in this little book, mystically informed by a sacred vision of Hitler, certainly prove difficult to reconcile with the philosophically thought-out ideas that Larenz put forward as a neo-Hegelian jurist. This "making anew" of legal science rather looks like the foundering of reason into the *darkness* of reason, including reason as exercised by reputable jurists, philosophers, and intellectuals like Larenz, among many others.

9.5. Reinhardt Höhn: The "State's Personality" and the *Volksgemeinschaft*

Of all theorists of Nazi law, Reinhardt Höhn (1904–2000) was certainly the most coherent, driving to extremes the regime's politico-ideological premises, beginning with that of a racially determined *Volksgemeinschaft*, or "people's community."[6] Paradoxically, for example, Höhn argues against the possibility of preserving the idea of sovereignty, at least in the domestic legal order, because the state is no longer a legal person set in contraposition to so many atomized holders of public rights—such is the "liberal" construction offered by legal dogmatics—but is rather a simple tool, the means through which to

[6] Hohn's relevant works as a legal philosopher are Hohn 1929, 1935a, and 1935b.

satisfy the interests and will of the people's community. Höhn credited Nazism with introducing an ideal conception radically subverting the established order, for which reason, he thought, it becomes the basic task of legal science to single out concepts and constructs suited to Germany's new cultural and political makeup.

Höhn's *bête noire*, the constant target of his criticism, was individualism. He thought it necessary to set out a legal science capable of moving beyond the conceptual legacy issuing from the individualistic worldview, so as to erect a science of law founded on the idea of *Gemeinschaft* and race. In this complete categorial *bouleversement*, Höhn spared nobody, not even the jurist that some, notably Otto Koellreutter, had pointed out as being among the precursors who paved the way for a National Socialist philosophy of law, namely, Otto von Gierke. Höhn even devoted an entire book to criticizing Gierke, in an attempt to show that Gierke's *Körperschaft* (corporative body) has nothing to do with the *Volksgemeinschaft* envisioned by National Socialism. Indeed, as much as the two ideas may share an emphasis on the community, the former is framed within an individualistic conception, as the latter is not.

The same idea forms the basis of Höhn's argument in this work as in all his work from the 1930s, all of it driven by Nazi ideology: In the idea of the "personality of the state" lies the stigma of the liberal, individualistic conception, and the new legal philosophy is tasked with laying this idea bare wherever it might be hiding, even in the legal philosophy of a thinker like Gierke, who in the eyes of many conservative commentators, even those of Nazi persuasion, appeared to be a reference point for a *völkisch* reconstruction of the law and its concepts.

And, in fact, Höhn was doing a great favour to Gierke in this way, in effect validating Gierke's theory of the medieval corporations (*Genossenschaften*) as a scientifically grounded theory incompatible with a Nazi worldview. Gierke rejected formalism and its conceptual abstractions (he thought concepts are inherently abstract) and confined himself to bringing out the concrete dimension of the social and sociological substrate of law. This, in a word, was perceived as too little from the standpoint of one who had theorized the *Volksgemeinschaft*, all the more so that Gierke recognized the liberal constitutional state as a state founded on rules formed by a parliament to which he ascribed the attribute of being a *Genossenschaft*, just as he recognized the people as having the attribute of being a person—a method of operating that went in a direction exactly opposite to that of Höhn.

9.6. Franz Jerusalem: From the Individualistic State to Equality Under the Law

It wouldn't quite be accurate to remember Franz Jerusalem (1883–1970) as just a Nazi jurist, in part because one of his chief works, *Soziologie des Rechts* (Soci-

ology of law: Jerusalem 1925), dates back to 1925, and one can scarcely find in it any hint of a political view suggesting that he would inevitably adhere to the Hitlerian regime, so much so that only in 1937 did he become officially affiliated with it. But on the other hand, the work for which he is most famous, *Der Staat*, of 1935, ought to justify his being treated here as a Nazi jurist, as perhaps does his role as a teacher to the most dogmatic of all Nazi jurists, namely, Höhn.

Jerusalem's most important work before Hitler's rise to power was the aforementioned *Soziologie des Rechts*. In it Jerusalem draws on Weber and Ehrlich to construct a sociology of law he describes as grounded in the method of the *reine Gegenständlichkeit* (pure objectivity). This legal sociology he built is expressly set in contrast to Kelsen's pure theory of law, for it refuses to reduce law to the pure normativity of the *Sollen*, instead taking a view of law as part of the social experience. Social life, however, is not for Jerusalem a vague, ever-changing notion; rather, specifically where the law is concerned, it presupposes two core ideas that stand as conditions of pure objectivity, namely, legality and collectivity (ibid., VI). Clearly, the more important of the two principles is the second one, for it runs contrary to individualism, which in this early phase Jerusalem already targeted as his main enemy, drawing to this end, among other sources, on the organicistic views put forward by the Viennese thinker Othmar Spann (see Section 8.2 in this tome).

Jerusalem's approach is clearly organicistic, and indeed there is no shortage of references to so-called vitalist authors in his writing. And this is one respect in which his philosophy can be regarded as having anticipated the Nazi philosophy of law, to the extent that it sets itself against the phenomena of modern life, which through processes of "reduction break up the whole, the totality, into plural mechanistic relations. Thus, for example, modern bureaucracy becomes the instrument of a conceptual abstraction, namely, the state, rather than functioning as the vital servant to a concrete person, as the prince instead was" (ibid., 119; my translation). Social life does not accomplish itself by disgregation, which is only apparent, but does so in the "self-realization" of an impulse inherent in any organism, namely, the impulse to realize a concrete order, that is, to be in conformity with the laws.

The state thus expresses the originalness of the collectivity, whose decisive importance to social life was first remarked by Rousseau. This neocollectivism now found expression in the nationalist conceptions, and in particular in Italian Fascism and the *völkisch* movements (ibid., 220), attesting a shift toward collectivism that followed the age of individualism, which had brought on a loss of the sense of law as a "spiritual lived experience."

It is incumbent upon us, at this point, to see how Jerusalem's "sociology of law"—as expounded in his 1925 *Soziologie des Rechts*, which was meant to continue with a second but never-published tome—comes to bear concretely on his theory of the state as expounded in his later book of 1935, *Der Staat* (The state: Jerusalem 1935).

In *Der Staat* Jerusalem proceeds from the idea of the state as a *Gemeingeist*, or collective spirit, but in a way that sets it apart from any of the perspectives in classical idealism, and in particular from Hegel's conception of the state as an objective spirit. Jerusalem says he wants to ground his philosophy of the state in Weber's concept of authority, but he is ultimately forced to depart from that concept because Weber's sociology is based on the rationality of *individual* action: It therefore commits one to a methodological individualism that cannot recognize or allow for the rationality of *communitarian* action as such.

Jerusalem distinguishes two types of community (the term he now uses in place of *collectivity*, which instead was in use in the works he wrote before the Nazi regime took power): We have open communities and closed communities. The latter are marked by the people's racial unity, and the individuals are fully embedded in the *Gemeingeist*. History has shown that communities can shift from one form to the other, each expressing, in the final analysis, its own worldview: individualism and communitarianism, respectively.

So, on the one hand, we have rights and obligations set forth by the legislator, for whom there only exist individuals acting according to their own free will; on the other we have a community borne by individuals (who can accordingly be described as its "bearers"). Jerusalem evokes the new "epoch" of National Socialism as he writes:

> If today, having moved past individualism, we have ushered in an epoch of community, then this individualistic method will likewise have to be superseded. It will be necessary to again place the social forces of our sense at the basis of decision-making. (Jerusalem 1935, 80; my translation)

So, if we ask what the unifying element is behind the reflections advanced by Jerusalem, whose importance should not be overplayed, but who distinguishes himself, if not for anything else, for being thoroughly conversant with the legal and philosophical literature, a body of literature that—it bears pointing out—he quotes without drawing any "racial" distinctions, we would see that, as was discussed at the outset, the unifying element we are looking for lies in the concept of the *Gemeingeist*. What is the *Gemeingeist*? The *Gemeingeist*, Jerusalem cautions us, must be kept distinct from both public opinion, which is changeful, and from a political system's founding decision. And in truth he does not commit to any conceptual definition. The collective spirit, the *Gemeingeist*, appears to ultimately rest on the existence of a given juridical community having its own distinctive features: It is, in a word, a sort of principle of effectivity.

Like other Nazi jurists, Jerusalem cannot resist characterizing the Hitlerian state as a *Rechtsstaat*, a state under the rule of law, on the reasoning that "as a state organization, it preserves its individualistic character" (ibid., 305; my translation). The Nazi state, on this conception, would have moved beyond the bourgeois principle of equality whereby people are equal in a merely formal

sense, meaning that each individual in such a state is no longer an "abstract personality" but is a bearer of "concrete forms" beyond the reach of parliamentary lawmaking: The subjects continue to be "addressees" of the state's norms (therein lies the state's individualistic makeup), but now they do so only as factory workers, peasants, craftspeople, writers, and so on (and here we find the corporative conception of the state). In Jerusalem the point is to *set aside* the system of "abstract rules" in favour of an organic state based on a class system (*ständische Staat*), and it is this thesis that, moving him closer to Othmar Spann's conception, prevents him from grasping the radical *Unrechtsstaatlichkeit* (lawlessness) of the Nazi state. Writes Jerusalem:

> With the birth of a class-based legal system, and a law *particular to* each class, it would be possible to definitely abandon, within the framework of such a class-based system, the principle of formal equality under the law which characterizes the individualistic state. Through a principle of legal equality gauged to the various members [of society]—a principle that can fully be developed only within this class-based system—we would truly usher in a new age of law, and to that extent the age of individualism would be eclipsed. (Ibid., 320; my translation)

9.7. Otto Koellreutter: People and the State in the "Return to Gierke"

Otto Koellreutter (1883–1972) expounded a general theory of the state whose undoubtedly Nazi cast should not be a reason to dismiss this jurist altogether, for he has some culturally interesting insights to offer. Koellreutter starts out from the people as a primigenious element of his legal and political philosophy. The people are for him that which gives content to juridical forms—such as the state, the party, and the movement—which would exist as mere abstractions but for the people providing them with content; the state is the "shaping into form" of the people, he writes referring to Oswald Spengler (Koellreutter 1927, 8; my translation). The idea of the people should not in this sense be confused with that of the *Volk* appealed to by National Socialism, for in reality we have to do here with a way to express the historicity of the state. In a short essay on the German state as a federal state, an essay published before Hitler even took power, Koellreutter wrote that "the state is not [...] mere form, not mere organization, for what is essential to the concept of the state is its content as a historical reality, as a historical existential quantity." The national people's community makes up "the real foundation of all state life" (ibid.; my translation).

Legal and political concepts alike, then, are defined not by abstractions, as through Schmitt's distinction between friend and enemy, but by concrete historico-spiritual and cultural realities. For Koellreutter the basic presuppositions of legal philosophy are to be found in aggregations, not in oppositions; thus, for example, he does not challenge the persistence of individuality but makes it an element specific to one's belonging to a people, a community, which certainly is conceived as a racially determined community but is also a

community grounded in history and culture. In this way the people become a politically conscious nation, and we will come up short here if we rely on Oswald Spengler's idea of a cultural nation (*Kulturnation*),[7] for there is lacking in this construct the element of a will, an element through which the people can form into a nation having an active role in political history.

The people's will is properly a communitarian will: It is the will of the community understood as an existing and acting agent. Here Koellreutter draws on Otto von Gierke's theory of corporative organizations (*Genossenschaften*). What in some way distinguishes Koellreutter from the other theorists of National Socialism like Höhn, for whom nothing ever counts outside the Führer's will, is that on Koellreutter's conception, in order for the people to make themselves into a conscious nation, there needs to be a process that can never do without the form of the state, for it is in the state that the people's nation becomes self-conscious as a unitary acting subject. Significant in this regard is Höhn's criticism of the conception of the state advanced by Koellreutter, who in Höhn's opinion cannot qua jurist "part with the individualist notion of the state's legal personality"; Koellreutter, Höhn underscores, is caught within the "typically individualist thinking of the 19th century" (Höhn 1935a, 11; my translation), this even in his theory of the state, encased in a conception of the state's legal personhood, such that, as much as Koellreutter may be "politically" aligned with the new regime and may have worked out an adequate concept of "the people," that concept winds up being "altogether individualistic" from a legal standpoint, since the people are for Koellreutter none other than "the sum total of all individuals bound by the legal vinculum of the state" (ibid., 14; my translation).[8]

Without ever making a point of it, Koellreutter treads this traditional legal ground because he understands that some form of organization is necessary, and that this role can only be entrusted to the state, absent which any community risks breaking up. Clearly, the question whether this state can still be construed within the liberal framework of the rule of law doesn't even come up, because it is immediately clarified that we are dealing with a *Machtstaat*, a state grounded in the use of power. But how is power exercised? Koellreutter is quite mindful of the risk of falling back on some form of normativism, for which reason he seeks to single out a kind of "law" and a "rule of law" originating directly out of the people, out of the *Rechtsgemeinschaft*, which is here conceived as rooted no longer in the *Volksgenossen* (fellow countrymen) but in the *Rechtsgenossen* (fellows under the law). The legal dimension, then, is the necessary form of the political dimension as an expression of the will of a self-conscious nation: "Law and power," Koellreutter writes, "are thus substantial-

[7] Not Spengler's idea of *Kulturnation* but his idea of state forms the subject of another essay by Koellreutter. On Spengler, see Section 8.1. in this tome.

[8] Quoted in Koellreutter 1933, 35.

ly different and yet bound up by a mutual relation" (Koellreutter 1933, 73–4; my translation). In this way Koellreutter theorizes a National Socialist rule of law, but without disremembering law's ordering, regulative function.

"The National Socialist state," writes Koellreutter, "falls within the rule of law in the proper sense of the term because in it the ideal of the state and the idea of law arise out of the same source, namely, the people, and the German people as a political entity give expression to their innermost essence in the framework of the National Socialist understanding of law and the state." Koellreutter even works out a Nazi theory of legal certainty, a classic tenet of liberal bourgeois society: The individual in this case, under Nazi rule of law, winds up having "the feeling that the use of law within the ordering of national life unfolds in accordance with precise and certain norms, in such a way that the citizen knows what to expect when it comes to the legal regulation of different cases" (Koellreutter 1935, 11ff.; my translation).

The state and the law are for Koellreutter two different essences, but their source is the same: It lies in the people's life, a life that realizes itself politically and juridically, and so the national rule of law, which in Germany displaced the liberal rule of law, is for him the one and only rule of law.[9]

9.8. Anton Baehr and the Fight against Catholicism

Anton Baehr, virtually unknown today, deserves to be remembered only for his book *Katholische Solidarität und Volksgemeinschaft* (Catholic solidarity and the people's community: Baehr 1939), a rejection of Catholicism that in this work presents itself as an obvious and necessary consequence of the Nazi ideology grounded in the principles of blood and soil. Baehr discusses St. Augustine and Thomas Aquinas without bringing any general prejudices to his analysis—if we discount his view that St. Augustine reflects a racially chaotic and bastard race, whereas Thomas Aquinas is even judged to be a German, having managed to reconcile the individualistic spirit of Christianity with the communitarian one of the Germanic race[10]—but he does take a stand against Catholic dogmatism qua dogmatism, almost unaware that the greatest dogmatism is precisely that of Nazism, which he defends and represents.

Contra the Catholic dualism of the two souls of the individual, the political soul and the religious, Baehr asserts that

[9] Other works by Koellreutter which are relevant for legal philosophy are Koellreutter 1932, 1934a, 1934b, 1938.

[10] "Whereas Saint Augustine, the representative of original Christianity, absolutized the superstructure in contraposition to nature, through the contraposition he set up between *Civitas Dei* and *Civitas Diaboli*, Thomas Aquinas has [...] provided a philosophical foundation for the attempt at compromise made by the Christian Germanism of the medieval world" (Baehr 1939, 89; my translation).

man is in his total personality a unity. He is not so from a religious standpoint and a political one. The people's community finds its reality in the unity of its political nature, precisely in the unity of its community and in that of its guide [*Führung*] [...]. A people cannot be divided into a political department and a religious one, not without effecting a breakup of that people as an idea representing the unity of life. (Baehr 1939, 35–6; my translation)

The authors Baehr looks to are Friedrich Nietzsche, Paul de Lagarde, H. S. Chamberlain, and Alfred Rosenberg. Religion is for him a "matter of nature," having nothing to do with history: Much less, therefore, can it depend on a supposed revelation. Christianity has caused great harm to civilization by insulating the soul's relationship with God from the individual's community, thus turning that relationship into an entirely private and individual affair: "Every people has its own gods, in which it sees embodied the ideals of its life, in just the same way as every people is one of a kind. Religion in antiquity has a mission to carry out with the people and not a mission of love for the entire world" (ibid., 39; my translation). The unity of the people is expressed not only in the relation between religion and politics but also in that between religion and law. Christianity is for Baher a "slavish morality" that has ruined the Germanic peoples even more than Judaic Marxism has. Christianity—the individualistic product of a racially bastard epoch (ibid., 45)—has introduced a dualism between church and state and has brought to Germany the idea of a religious spirit independent of race. The Catholic church is for him no more than the deleterious effect of the racial chaos which came with the demise of civilizations rooted in racial purity, and specifically the demise of the Greek polis and then of the Roman empire. It follows that law cannot be bound by a relation to the state but only to a people conscious of its being a race. Corresponding to the individualism of dogmatic theology is the despotism of the Church as a political institution filling the void of moralistic abstraction. The Church's natural law is none other than the cloak behind which acts the clerical theocracy, which dissolves every authentic community in the name of despotism, on the one hand, and individualism, on the other.

The deepest significance of Baehr's work lies in his having clearly spelled out the more heartfelt and concealed strains of the Nazi mentality even as it took shape in the years ensuing the regime's rise to power. The reduction of the individual to a sheer element of the racial totality is crystal-clear in Baehr even from a legal standpoint:

Corresponding to the totality of life is the totality of the legal order. Neither sovereignty, however, rules out the other. The political constitution of the *völkisch* community claims the whole of humankind for itself down to its ultimate reality. The totality of the people's community [*Volksgemeinschaft*] has no place for any other order. (Ibid., 158; my translation)

The legal order of the German people's racially determined community finds its only authentic "source" in the Führer's will as an immediate and outright expression of the German people. Not incidentally, the book ends with a criti-

cism of Othmar Spann's organicist universalism (see Section 8.2 in this tome), which in Baehr's view cannot be likened to the Nazi worldview, because Spann envisions a spiritual community, a relation between the individual and society, whereas Nazism, "in its doctrine of races, has brought 'the spirit' down to earth, from its empty heights to the substantive soil of a racially determined nature [*artbestimmten*]" (ibid., 216; my translation).

Chapter 10

THE DEVELOPMENT OF GERMAN-LANGUAGE LEGAL PHILOSOPHY AND LEGAL THEORY IN THE SECOND HALF OF THE 20TH CENTURY

by Hasso Hofmann

10.1. Introduction

The text material from five decades is very voluminous and highly diverse. In order to achieve even the semblance of an overview, it is necessary to attempt a distinction between periods, as the usual classification according to philosophical "schools" or "main tendencies" would not be appropriate. After World War I, the Western bourgeois world with its humanities, grown from the cultural tradition, had been shaken, but not destroyed, and therefore it was possible to revive the great lines of intellectual tradition. There was neo-Kantianism with its different varieties, phenomenology and neo-Hegelianism, the older Marxism and the beginnings of legal sociology, and neo-Thomism, in addition to positivism in political theory with the attendant so-called "opposition in the spirit of the humanities" (*geisteswissenschaftliche Opposition*). After the unimaginable breakdown of civilization and rupture of tradition, however, at least in Germany after 1945 everything was initially different. Was it possible, after Auschwitz and faced with ruined landscapes, to take up the threads of abstract theories of legal philosophy of the past – and to what end? The general consciousness was absorbed by the shattering experience of mass injustice legally sanctioned and perpetrated. Therefore, the focus of legal thought was on injustice committed by law. This was the central *paradeigma*—a term that indicates not only model and archetype in Greek, but also a cautionary example—of West German society as it reformed itself, and thus also of legal philosophy. It may seem trivial to remark that only from this vantage point is it possible to understand the phenomenon that has been called the "renaissance of natural law" after 1945. However, it must be pointed out that this leads us to a new criterion for classifying very diverse theoretical attempts. In view of the short life of that renaissance of natural law, the question arises which new problem replaced and superimposed itself on the previous one, and why – especially since the waning of existential philosophy did not give way to a new school of philosophical interpretation of the world that dominated the intellectual landscape. It is possible to discern a broad palette of catchwords, ranging from *Analytical Legal Philosophy* to *System Theory*, from *Argumentation Theory* and *Legal Hermeneutics* to *Renaissance of Legal Positivism, Utilitarianism, Return of the Philosophy of Justice* and *Proceduralization of Legal Thought*, all of them pointing in various directions. However, continuous "main schools"

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_10

can hardly be reconstructed from these, due to overlapping, rapid shifts in the focus of attention and the lack of reference to a philosophical system or school, instead of mere individual elements of the philosophical tradition. Ralf Dreier's 1995 overview *Hauptströmungen gegenwärtiger Rechtsphilosophie in Deutschland* (Main trends in current legal philosophy in Germany: R. Dreier 1995) confirms this analysis more than it refutes it.[1]

10.2. The Shock of Mass Injustice Perpetrated by Law

10.2.1. "The Renaissance of Natural Law": Christian and Existentialist Natural Law

10.2.1.1. Christian Natural Law

The so-called "renaissance of natural law" of the post-war years was first and foremost a renaissance of the Catholic tradition of natural law. However, it consisted not only of the revival of an old, Aristotelian-Thomistic school of thought, but developed as part of Catholic social teaching, as represented strongly in West Germany after 1945 by political Catholicism, a movement which had attained a strong influence, as the moral integrity of the church was considered to have been maintained (see Wieacker 1967, 600ff.; Kühl 1998, 604ff.; Wehler 2008, 369ff.).[2] In this strongly political sense, this slogan of the "renaissance of natural law" had already been used once, at the beginning of the 20th century, and it was no coincidence that it had been in a French context (Charmont 1927).[3] After all, at the time, French reform Catholicism had argued for social equalization, expanding the Aristotelian and Thomistic concept of justice by using the term "social justice," coined around 1848. This impulse gained political impact towards the end of the 19th century, mainly through the "Solidarism" movement (Charmont 1927, 144ff.; Wildt 1995, 1008ff.). In post-war Germany, of course, the focus was no longer on the hardships of the proletariat in an industrial society, but the misery—far exceeding basic material needs—of a demoralized society in a devastated country that had been occupied, divided and disenfranchised by foreign forces. In an essay on the "Rebirth of Natural Law" which an expert contemporary witness published in the *Theologische Rundschau* in 1951, the introduction reads:[4]

[1] A brief overview of the most important theoretical concepts can be found in Herget 1996. Another instructive overview of the general history of philosophy is offered by Martina Plümacher (1996).

[2] Very instructive on the overall topic of the "renaissance of natural law" is U. Neumann 1994, 145ff.

[3] On the coining of the term "social justice" by Count Antonio Rosmini-Serbati, and on the history of the term's use Hofmann 2008a, 45ff.

[4] On the following observations, see also Foljanty 2009, 214ff.

> One of the most urgent problems after the breakdown caused by World War II is the question how a new and lasting legal consciousness may be developed and how a new order of human coexistence may be possible, in which tyranny and force are banned, as are anarchical disorder and an extremism of liberty […]. The issue at stake is the right law […]. (Schrey 1951, 21; my translation; cf. 154–86, 193–221)

This description of the situation also demonstrates that during the earliest years of its existence, the 1949 *Grundgesetz* (Constitution) of the Federal Republic of Germany was not perceived as an order for the future which would stand the test of time. Detailed answers to the question of what the new order should look like were provided by Catholic theologians—remaining true to their "party line" despite all their attempts at modernism, as the Austrian Benedictine padre Albert Auer assured his readers in the preface to his book *Der Mensch hat Recht—Naturrecht auf dem Hintergrund des Heute* (Human beings have rights: Natural law seen against the current background,[5] Auer 1956) in 1956. The monumental *Handbuch der Gesellschaftsethik, Staatsethik und Wirtschaftsethik* (Handbook of social ethics, state ethics and economic ethics) by the theologian Johannes Messner, professor of ethics and sociology at the University of Vienna, published in 1950 as *Das Naturrecht* (Natural law: Messner 1966), met with heightened interest and saw several new editions (cf. Funk 1952). Messner develops his definition of natural law, which he sees as ultimately derived from the creator-god defining the purpose of being, "as an order of individual and social competencies, the foundation of which is human nature and its individual responsibilities" (Messner 1966, 304; my translation, cf. 225), in a work encompassing more than 1200 pages, contemplating it historically, systematically and in great details. The work, first published in English during his exile in the United Kingdom, is based on numerous earlier social-philosophical studies as well as his political experiences in Austria during the period of the Dollfuß cabinet, i.e., it was not conceived with a view only to the post-war situation. What is typical for this period, in which the law was in a "derelict state" and in dire need of repair, is less the content of the work than the extraordinary interest it aroused. On the other hand, wherever the focus was on the question of the "right law"—always posed with reference to the perverted Nazi laws—the discussion in legal philosophy concentrated on two aspects: the reason for the validity of natural law, and its priority over positive law created by the state (see U. Neumann 1994, 145ff.). The reason for this obvious attack on legal positivism lay in the theory (debatable as it might be)—formulated by Gustav Radbruch and taken up by many (sometimes gratefully, as an excuse)—that it had been legal positivism ("law is law") which had left German jurists "helpless against laws with arbitrary and criminal content" (Radbruch 1956b,

[5] *Translator's note*: "Der Mensch hat Recht" is a case of wordplay, which may mean both "Human beings have rights" and "Human beings are right."

352; my translation).[6] Therefore, Werner Maihofer (whose work shall be explored in greater detail shortly) simply used the alternative *Naturrecht oder Rechtspositivismus?* (Natural law or legal positivism?: Maihofer 1962a) as the title for his commendable collection of important documents pertaining to the "renaissance of natural law." Catholic authors were able to base their answers on the Stoic and Christian hierarchy of norms—*lex aeterna, jus naturale* and *jus positivum*—using the Aristotelian and Thomistic theory of natural purposes as their point of departure.[7] One example from 1948 is Georg Stadtmüller's brochure *Das Naturrecht im Lichte der geschichtlichen Erfahrung* (Natural law from the perspective of historical experience: Stadtmüller 1948). The author claimed that the "age of a positivistic understanding of law" had "ended," welcoming "the rebirth of eternal natural law" (ibid., 33; my translation). According to him, natural law is part of the law of ethics, independent of human insight and will (ibid., 45), curbing positive law as "its insurmountable boundary" (ibid., 51; my translation), consistent with the hierarchical order of the three levels of norms, i.e., "1. Absolute norms per se (*lex aeterna*), 2. human insight into these norms (conscience), and 3. the implementation of these norms in positive law" (ibid., 39; my translation). For the "basic ethical norms" of the second level, he falls back once again on the familiar maxims, ancient but meager in content: *Suum cuique, neminem laedere, pacta sunt servanda* (ibid., 46ff.).

The situation for the protagonists of Protestant social ethics was incomparably more difficult. After all, the primary Christian dualism of God's realm, will and mercy on the one hand and the fallen human being, subject to secular rule and with his ability to gain insight ruined, on the other—envisioned by Luther as existential—leaves no room for a natural law comprehensible to natural reason (Ilting 1978, 245ff.). Radically abandoning it, therefore, might lead back to a positivism "justifying itself from the Christian's basic religious decision" (Wieacker 1967, 602; my translation). However, there remained the possibility of seeking orientation in Biblical instruction, an endeavor pursued by Erik Wolf (1902–1977), professor of legal philosophy and canonic law in Freiburg (see Wolf 1948).[8] In this precarious situation, some authors sought redemption in Thomism, thereby following historical examples. Among them

[6] For early critical comments, see Rosenbaum 1972, 143ff.; doubtfully Franz Wieacker (1965, 8; my translation): "[...] whether the balance of iniquity was not tipped more heavily by the violation of existing laws." Bernd Rüthers's monograph (Rüthers 2005) should have rendered Radbruch's theory obsolete.

[7] Hofmann (2008b, 92ff.) provides the central references from St. Thomas Aquinas' *Summa Theologiae*.

[8] Later, Wolf no longer considered love (*caritas*) as the limit of human law, but as the foundation of existential renewal through a "law of charity" (Wolf 1958). A counterpart of this effort is Günther Küchenhoff's attempt to view traditional natural law—which had been increased through the Biblical commandments of love, "baptized," so to speak—as a "law of love"(Küchenhoff 1948, 69ff.).

was the jurist Hermann Weinkauff, who was very influential intermittently and whose work will be discussed extensively in Section 10.2.4. At this point, it will suffice to quote a confessional essay by Weinkauff which he published in the journal *Zeitwende* in 1952 under the title *Das Naturrecht in evangelischer Sicht* (Natural Law from a Protestant Perspective: Weinkauff 1962):

> The physicality of human beings, and the belief that they are created in the image of God, as well as their placement within the orders of the preordained creation, all these explain both the primal legal order—as it is autonomously valid and demanding and as it binds our conscience—and the fact that the human law-giver cannot dispose of or manipulate it; furthermore, it explains the limits of any legal order devised by humans, which ends where the order of creation and the human personality begin. (Ibid., 210; my translation)

On the other hand, Weinkauff took Lutheran tradition into account, continuing thus:

> The fall of creation and human finiteness and temporality explain the peculiar fragmentation of any human legal order, the necessity of making laws compelling [...], and even the shattering of human law, its incessant change, its revolutionary upheavals, its constant danger of degenerating into an empty, even unjust mere order of force, its inability to provide a clean solution for social and national tensions. (Ibid., 213ff.; my translation)

The Graz-based logician Ota Weinberger (more on him in Section 10.3.3) counts Weinkauff's theory among the theories of natural law he labels "weak," as they do not offer a complete foundation for law, but merely formulate weak and generally plausible preconditions and only sketch the outlines of consequences (Weinberger 1980b, 326ff.). Weinkauff's biographer Herbe concurs with this evaluation, speaking of a "conglomerate" of parts of Catholic moral theology, the reformatory views of Emil Brunner (1943) and Erik Wolf (see above) and "profane legal philosophy, as outlined by 'Scheler and Hartmann's value ethics'" (to be discussed forthwith) (Herbe 2008, 163; my translation).

10.2.1.2. Existential Natural Law

After a world had collapsed in Germany, it seemed obvious to seek out solid ground by taking recourse to a sacred tradition of immutable concepts of order. However, this view towards the past was but one aspect of the matter. In addition, there was the forward-looking challenge of creating a new order from the power of natural law, an existential decision in the spirit of freedom. This, however, remained a marginal aspect. An "existentialist natural law" was far removed from the Catholic Church's doctrine of natural law, and it was impossible to implement the newly revived political Catholicism in terms of legal dogma and practice, and therefore it failed to find a place in legal politics.

An excellent documentation of this aspect of post-war philosophy appeared in Erich Fechner's (1903–1991) *Rechtsphilosophie* (Legal philosophy:

Fechner 1962), described as "sociology and metaphysics of law," in 1956, where he described the "nature of law." Fechner wrote his dissertation in philosophy under Max Scheler and also studied and completed a doctoral thesis in law, subsequently teaching legal philosophy, legal sociology, as well as labor and social law in Tübingen interrupted by army service and being taken prisoner of war from 1943 to 1945. Fechner (1962, vi) claimed that the ontological core of his legal philosophy, influenced by Heidegger's existential philosophy, had "already taken shape during the war and in the unforgettable days of imprisonment under the clear sky of France (where a harsh form of asceticism was combined with the possibility of intellectual activity)." His experience of the spontaneous establishment of order in the prisoner-of-war camps and on the "black market" served to illustrate what jurists call "the nature of things" (ibid., 154; my translation). This concept plays an important role in the context of the renaissance of natural law in post-war legal philosophy. This has been discussed extensively in Section 10.2.1.1. In Fechner's case, it is treated in the context of the analysis of objectivity (the "integration into being" or *Seinseingebundenheit*) of the factors influencing laws. Following the philosophy of Scheler and Hartmann's theory of levels (*Schichtenlehre*), Fechner differentiates between real and ideal forces shaping laws, i.e., biological, economic, political and sociological factors on the one hand, and reason, values and religious experience on the other (ibid., 87ff., 130ff., 155ff.). Since the real-life situations the law touches upon are always influenced by supra-individual ("objective") ideal factors as well, however, "the search for objective foundations of law that are integrated into being and removed from human arbitrariness" reveals a "colorful and differentiated picture." This means that the human being stands between certainty and uncertainty in law. Therefore, Fechner falls back on existential philosophy, which deals specifically with this human uncertainty (ibid., 223). Thus, Fechner's legal philosophy is ultimately a philosophy of decision-making, an aspect that could be derived (with some effort) from the existential philosophy of Martin Heidegger and Karl Jaspers (ibid., 244ff.). Inasmuch as real and ideal factors leave room for the formation of law and where recognized criteria are lacking or have disintegrated, these rare and narrow spaces of "true (existential) legal uncertainty" witness "magic moments of legal life" which make existential decisions unavoidable (ibid., 251). "Although it may not be oriented towards given criteria, it is determined with regard to the future, in which the subjective brings forth something objective. Every creative decision which reveals new elements and thereby creates obligations brings forth a piece of natural law" (ibid., 261; my translation). It is a natural law in which human beings "dare to test the durability of what is new" in a context largely unknown to them, a natural law which grows through ever-renewed efforts, and "only proves itself right in and after the deed, which – being subjective in its origins and objective in its goals – only exists when it is risked" (ibid.; my translation). According to Fechner, such de-

cisions have a metaphysical dimension; after all, they require a prior decision about the "meaning of human existence" (ibid., 278; my translation).

Even if Fechner emphasizes that this question arises frequently in law, his legal-philosophical attempt to comprehend the "essence of law" in an existentialist fashion not from its genesis, but from its ultimate goal (Hofmann 2010, 166), can only be understood as the echo of an extreme historic experience, as a response to a situation in which the risk of a new, collective design for existence had become unavoidable.

Another concept oriented decidedly towards the future, the non-doctrinaire, Marxist alternative that Ernst Bloch (1885–1977) offered with his legal philosophy *Naturrecht und menschliche Würde* (Natural law and human dignity: Bloch 1961) took the external shape of a brilliant review of the history of legal and political philosophy, in which he sought to discern traces of the future from the past (cf. Gramm 1987, 30ff.). The work—written mainly during his exile in North America and underpinned by his philosophy of hope (Bloch 1954–1959), which his critic Helmut Schelsky called the "Marxist existential philosophy of a member of the youth movement" (Schelsky 1979)—was published in 1961 in West Germany. It could not appear in the GDR, where Bloch had held a chair for philosophy in Leipzig since 1948, after Bloch—who had even been awarded the GDR's National Award in 1955—had fallen out of favor there and had been forbidden to lecture in 1956. Having moved to West Germany in 1961, he held an adjunct professorship in Tübingen and received the Peace Prize of the German Book Trade in 1967.[9] In the style and attitude of an Old Testament prophet, Bloch speaks eloquently and thunderingly of the "future realm of freedom," that all-encompassing, class-less "concrete order, with freedom as its only goal and content" (Bloch 1961, 310; my translation). The realm of freedom grows "by anticipated influence" (ibid.; my translation), but it cannot be conceived in institutional terms. For it is only the "space" of "the independence of everybody with everybody that has become possible," i.e., it bears no "resemblance of a state" (ibid., 259; my translation). Both state and law will die away (ibid., 253ff.). It is especially the bourgeois state under the rule of law that must perish: "With the bourgeois state ruling by law over the poor and the rich—an ideological, ultimately deceptive formal instrument—it is impossible to enter socialism" (ibid., 164; my translation). In the event of success, however, one of the signs of socialism would be "that the purified banner of human rights has been raised again" (ibid.; my translation). According to Bloch, the fact that human rights do not disappear together with the rule of law, but (can) enter into socialism—albeit with a different function ("purified") as mere warning signals— follows from the ambiguity of the so-called *Überbau* or superstructure, which on the one hand reflects the circumstances of the bourgeois (or any other) stratified society, but on the other

[9] See Section 10.6.3 for greater details.

hand—and this applies both to human rights and to natural law—also points far beyond its class-bound development (ibid., 199ff., 203ff.) as a "noble power anticipating something better" (ibid., 237; my translation). Thus, a core of the "postulation of human dignity" remains as a cultural "heritage" of the formerly revolutionary natural law (ibid., 232): "Abolishment of all conditions in which the human being is alienated, becoming a commodity alongside inanimate objects […] with zero value in and of itself" (ibid.; my translation). In socialism, the distance between human rights (the "subjective and public rights") and the "objective rules" decreases, but it is possible to "bring it to a head through great mistakes" (ibid., 253; my translation)—a cautionary reference to Stalinism (cf. Christensen 1987, 144ff.).[10]

In the midst of the Marxism discussion in West Germany, dominated as it was by the sterile polemics of the "cold war," Bloch's dedicated emphasis on the critical and emancipatory side of Marxism supported a certain differentiation, which had already begun with the discovery of the young, "humanistic" Marx when Siegfried Landshut had begun publishing his *Early Writings* in 1953 (Marx 1953). Bloch had the strongest impact on the legal philosophy of Maihofer. Werner Maihofer (1918–2009), professor of criminal law and legal philosophy in Saarbrücken, a politician for the liberal FDP specializing in legal matters, Federal Minister of the Interior from 1974 to 1978, published his habilitation thesis entitled "Recht und Sein—Prolegomena zu einer Rechtsontologie" (Law and being: Prolegomena for an ontology of law) in 1954, choosing an ambitiously parallel title to Heidegger's *Being and Time* of 1927 and reviving the great topic of the 1950s, natural law and the nature of things, while adding an existential and ontological analysis of the complex social connection between people to Heidegger's considerations. This will be discussed in depth in Section 10.2.3; see also Section 2.4.1 in Tome 2 on this volume. In the meantime, Maihofer pays homage to other authors. Maihofer's contribution to the *liber amicorum* for Erik Wolf in 1962 (*Konkrete Existenz. Versuch über die Philosophische Anthropologie Ludwig Feuerbach*, Concrete existence: Essays on Ludwig Feuerbach's philosophical anthropology) marks the transformation of his philosophy (Maihofer 1962b, 246ff.). Following this new path, Maihofer wrote about "natural law as existential law," i.e., as the human being's right to an existence which is dignified and worth living (Maihofer 1963). His studies of Ludwig Feuerbach and the young Marx (Maihofer 1968) as well as Bloch's influence made Maihofer consider not only the "nature of things," but, with it, in dialectic unity also the "destiny of man" (Maihofer 1962b, 20; my translation). Lacking an animalistic definition of human nature, natural law thus acquires a new meaning, as a "pre-conception of the historic self-determination of man" (ibid., 21; my translation). This, however, is not bare-faced existen-

[10] See Ralph Christensen (1987, 219ff.) on the problem of subjective rights and the rule of law according to Bloch.

tialist decisionism, but indicates the constant transcending of reality towards a "better world" (ibid., 39; my translation), following the "guideline of a dignified human existence worth living in conjunction with other human beings" (ibid., 37; my translation). The point of departure is the definition, backed up by historic experience, of what is human and what the basic rules of interpersonal relations, which cannot be abandoned or undercut without leaving the level of humanitarianism, are (ibid., 44). This indication of historically evolved material legal ethics, parallel to Bloch's cultural Marxism, distinguishes Maihofer's existentialist natural law from what Erich Fechner wrote a few years previously in his existentialist legal philosophy. Furthermore, this is also the basis of Maihofer's introduction of dynamics into the concept of natural law: "Natural law: To us, this is the term denoting the constant need for evolution and revolution of human relations in daily life, towards the outline of a truly humane society among men" (Maihofer 1963, 50; my translation). Maihofer's receptivity for Bloch's writings reached its high point in his contribution on *Demokratie und Sozialismus* (Democracy and Socialism: Maihofer 1965b) in the *liber amicorum* published to commemorate Bloch's 80th birthday in 1965. There, Maihofer waxed enthusiastic that only the principles of the French Revolution of 1789 and the Russian Revolution of 1917 would be able to bring about "the future liberal, class-less society of citizens of the world and human beings in this, our only world" (ibid., 67; my translation).[11]

10.2.2. A Legal Philosophy of Values and the "Radbruch's Formula"

10.2.2.1. The Phenomenological/ Ontological, Sociological and Psychological Justification of Law through Values

Born of the misery of its time, the "renaissance of natural law," that striving for a solid, immutable foundation for law and normative certainties based on it and removed from human arbitrariness, had its center clearly distanced from the law of reason of the enlightened subject—in Catholic natural law of the Aristotelian-Thomistic tradition, but it also pursued another ancient path toward insight: *Wesensschau* (perceiving or seeing the essential being)— ultimately rooted in Platonic ethics. Its modern form was psychological phenomenology, as formulated mainly by Max Scheler (1874–1928) in his non-formal value ethics, which adopted Edmund Husserl's (1859–1939) phenomenology

[11] It should be pointed out that the short book *Existenzialismus und Rechtswissenschaft* (Existentialism and jurisprudence: Cohn 1955) published in 1955 in Basel by Georg Cohn, Member of the Permanent International Court of Arbitration, has nothing to do with the existentialist legal concepts discussed in this chapter. Instead, this is a late contribution to the "free-law movement's struggle against the 'jurisprudence of concepts' and its 'logical methods'" (Hofmann 2009, 301ff.; my translation). Going beyond even the free law theory, Cohn (1955) proposes a variety of decisionism of individual, concrete decisions, without any additional rules.

as its point of departure. It promised objectively valid ethical criteria: Instead of Kant's formal ethics, it propagated material or non-formal values, i.e., ones with a fixed content, as immutable entities that could be experienced by intuitive perception (Scheler 1954, 1980, 2007). Nicolai Hartmann (1882–1950) had also developed similar non-formal value ethics (Hartmann 1962). However, his ontology had an even stronger influence on a world which had come undone: The revival and dualistic development of the old Aristotelian theory of levels of reality, i.e., a tiered order of real levels or layers of being, ranging from the inorganic to the organic and mental to the spiritual and the ideal level, encompassing the "objective spirit," language, art, science and ethical and aesthetic values (Hartmann 1949a; 1949b).

An excellent documentation of the strong influence non-formal value philosophy exerted on the unsettled jurists of post-war Germany is provided by the "attempt to reestablish natural law" first published by Helmut Coing (1912–2000), professor of civil law and legal history in Frankfurt, in 1947 under the title *Die obersten Grundsätze des Rechts* (The highest principles of law), successfully expanded soon thereafter (1950) in his *Grundzüge der Rechtsphilosophie* (Outlines of legal philosophy: Coing 1985). Based on an intuitive "perception of values" (*Wertschau*) (ibid., 116), a feat whose possibility he derived mainly from Scheler and Hartmann, he recognized justice as the central value of law, flanked by the complementary values of reliability, faithfulness, truthfulness and trust, as well as personal dignity and liberty for the social and political area, and furthermore the values of family, state and church, which give rise to institutions (ibid., 29ff., 36ff.). From these values, he extrapolated legal principles in the sense of guidelines (ibid., 57). Apart from Scheler's works (1954; 2007) and Hartmann's theory of levels, Coing also made general reference to Wilhelm Dilthey's *Geisteswissenschaft* or human science as well as to the philosopher and sociologist Georg Simmel (1858–1918) (Simmel 1989b, 1994) and Helmuth Plessner (1892–1985) (Plessner 1961, 33ff.), confirming his fundamental conviction, derived from these authorities, "that man is characterized both by the capability of objective perception and exploration of the world, and by the ability to grasp and implement spiritual values" (Coing 1985, 129; my translation). While the "implementation of values" might be the point of human existence, he also claimed that reason, ever imperiled, is not its determining power (ibid.)—a concept that is extraordinarily typical for the time. Regarding social order, the central issue for Coing was whether there are "value contents that transcend time, manifested in legal precepts" (ibid., 203; my translation). The solution suggested was to derive exigencies from the essential values, and to retain them as principles pertaining to the elements that typically recur throughout human existence (ibid., 206ff.). This leads to a natural law acting as a "criterion to judge positive law" (ibid., 214; my translation), the latter losing its moral binding force in the event of a contradiction: In extreme cases, he argued that judges are not allowed to apply it for reasons of justice (ibid., 211, 291).

The highly respected legal historian Heinrich Mitteis (1884–1952) went especially far with his statements on natural law. In a lecture at the (East) Berlin Academy in 1948 entitled "Über das Naturrecht" (On natural law), published by the (East) Berlin Academy's publishing house and licensed by the Soviet Military Administration, he propagated the following thesis: "Natural law is the actually applicable law […] Natural law trumps positive law" (Mitteis 1948, 38; my translation). His reasoning was that natural law was the expression of the legal idea, aimed at "the highest values," as a critical instance above law. The ultimate and highest value, however, "in which the legal idea finds its central object," the highest value "recognized by man," was the personality, meaning "the personality as part of the community," which consisted of "connected personalities" (ibid., 34; my translation). Their differences formed the basis of "solidarity" (ibid., 35). Mitteis did not elucidate any practical legal consequences.

On the one hand, the assumption of absolute values met with sharp criticism early on (see Weischedel 1956; Würtenberger 1950, 98ff.).[12] It was subsequently summarized by Ernst-Wolfgang Böckenförde, who argued that the justification of laws through values lacks a rational foundation of arguments that would stand up to discourse,

> both with regard to the definition of values, the insight into values and to the intensity of a value's validity, and the establishment of a system of preference among values, which is the only thing that could lend theory of values any practical utility. (Böckenförde 1987, 12ff.; my translation)[13]

On the other hand, non-formal value ethics remained very much present in legal writing, at least in the form of hypotheses and quotations: A phenomenon comparable to the "quotational" use of Karl Marx' writings in the GDR's real-socialist literature of scientific justification (see Paul 1988, 329ff.). This recourse to "values" was simply a cipher for the rejection of legal positivism, which was declared the root of all legal evil: This also simplified coming to terms with the country's most recent history. As Gustav Radbruch had written in 1946, it had been positivism that had "made German jurists helpless against laws with arbitrary and criminal content" (Radbruch 1956, 352; my translation). Larger-scale theoretical concepts, however, had to pay heed to these scientific objections and therefore try to do without such metaphysics of values.[14] Thus, Heinrich Henkel (1903–1981), professor of criminal law in Hamburg, still based the argumentation of his *Einführung in die Rechtsphilosophie* (Intro-

[12] For a general overview, see Luf 1980, 127ff.

[13] The most extensive philosophical criticism of value philosophy can be found as early as 1937 in the writings of a member of the *Wiener Kreis* (Vienna Circle) Victor Kraft (V. Kraft 1951).

[14] Due to their deeply religious foundations, the two volumes of Karl Brinkman's textbook on legal philosophy (Brinkmann 1960, 1975), however, were quite untouched by such philosophical criticism.

duction to legal philosophy: Henkel 1964), put out as a textbook by a leading legal publisher in 1964, on a "theory of values," but only in the sense of an "objective relationism of values" (ibid., 148ff., 236–60; my translation). This indicated no more than a hierarchical system of social valuations (ibid., 246ff.). As a living order, this system was to be changeable, but founded on a broad basis of "lasting values." The social order of values resulted in such "building blocks for law making and the application of law" (ibid., 257; my translation). Upon further examination, however, these "real factors" of legal decision-making are revealed as mere "orientation points," as sketches of "preferential tendencies." Thus, the metaphysical theory of values in law ends up a kind of legal sociology.

However, besides the phenomenological/ontological and the sociological, there was a legal-psychological approach to the concept of values. This aspect was formulated in 1957 by Arthur Kaufmann (1923–2001). Kaufmann, Radbruch's most important and influential student and, like him, a scholar of criminal law, was a constant observer and a highly influential protagonist in the development of West German legal philosophy: First as a professor in Saarbrücken, followed by decades in Munich (see A. Kaufmann 1991, 144ff.). During the phase when the "renaissance of natural law" began to wane, he wrote: "The history of our most recent past has shown us with the exactitude of a scientific experiment that values too are realities which do not cease to exist or exert an influence because they are relativized or denied" (ibid.; my translation). After all, experience had shown that "the forced consolidation (*Gleichschaltung*) of justice and the state's written laws" can lead to "nihilism of values," making it possible to "justify" even the murder of mentally ill persons and the gas chambers of Auschwitz (see A. Kaufmann 1984e, 3). Taking this experience of absolute in-justice (without which, according to the philosophical maxim of Heraclitus, man would not know the name of justice)[15] as a point of departure, according to Kaufmann it becomes apparent that these "values" are actually "supreme principles," whose function is "not so much to define the content of a given positive law, but rather in the regulatory function of excluding absolutely unethical and unjust laws" (ibid., 15; my translation; cf. Hofmann 2008). The claim that we concur in primal experiences of absolute injustice, however, changes the focus on the issue. The concentration on the possibility of achieving consensus for such a justification for law makes the discussion of justice and injustice relatively independent of the various philosophical justifications of natural law, i.e., all theories regarding the "nature" of human beings, the natural world and law (see Ellscheid 2004, 148ff.).

[15] "Were there no injustice, men would never have known the name of justice" (Heraclitus 1957, 31).

10.2.2.2. The Heritage of Neo-Kantianism: The "Radbruch's Formula"

Outstripping the attempt to find normative certainties in a Platonic world of eternal values by far, the relativistic evaluation of law, as developed before World War I by Gustav Radbruch (1878–1949), an expert on criminal law and a very important legal philosopher, was a far more sustainable approach, following in the wake of the value philosophy of the Southwest-German school of neo-Kantianism concentrated in the province of Baden.[16] According to this approach, the "legal idea" which provides the orientation for any legal term, is made up of three components which contradict but cannot be separated from each other: The first is expediency with regard to the subject and method of equal treatment, the second is the stability of law attained through the positivism of law, and the third is the idea of justice (see Radbruch 1956a, 168ff.), which may be absolute and generally valid, but remains merely formal, and therefore—in a display of cultural-philosophical relativism—requires the infusion of content from liberal, democratic, socialist or conservative ideologies. After the years of the reign of terror, with his famous "formula," in 1946 Radbruch took recourse to the antinomy of legal stability and justice, writing:

> The conflict between justice and the stability of law should be resolved by giving precedence to positive law, reinforced by statute and political power, even when its content is unjust and inexpedient, unless the contradiction between positive law and justice reaches such an unbearable extent that the law must cede to justice, being 'wrong law.' (Ibid., 353; my translation)

And he continues: However,

> where justice is not even strived for, where equality, which lies at the core of justice, has been consciously denied in the passing of positive laws, there the law is not merely 'wrong law', but indeed it is no law at all […]. Measured by this standard, entire swaths of Nazi law making never attained the dignity of being valid laws. (Ibid.; my translation)

The criminal-law expert Radbruch clearly aimed this wording at the critical issue in many criminal proceedings of the post-war era, i.e., the question whether the formal validity of Nazi laws could be used to justify felonious atrocities. It is logical that this concentration on the problem of the validity of laws led to the revival of the "Radbruch's formula" after Germany's reunification, when GDR border patrol soldiers who had shot people attempting to escape the GDR at the German Wall (the so-called "*Mauerschützen*" or "Wall marksmen") were tried before criminal courts and invoked the GDR's Border Law (*Grenzgesetz*) in their defense. Both the German Federal Court of Justice as well as the Federal Constitutional Court fell back on Radbruch's arguments when confirming the verdicts against the accused.[17]

[16] For greater detail, see Hofmann 2009, 301ff. On Radbruch's formula see also Sections 1.1.3.2, 9.1, and Chapter 2 in Tome 2 of this volume.

[17] Cf. instead of many H. Dreier 1997, 421ff.; most recently Vest 2006.

Because he had originally strongly emphasized the element of legal stability attained by positivism in law, Radbruch had been considered a positivist. After the publication of his "formula," general opinion was that he had converted to natural law, especially since during those post-war years, he explicitly repeated the old insight that there was a "higher law" above the written laws, "a natural law, a divine law, a law of reason—in short, a law beyond laws, measured against which injustice remains injustice, even if it takes the shape of a law" (Radbruch 1962, 2; my translation).[18] However, taking into account Radbruch's general concept of law, which had always been complex, the issue is not that easy to decide. Rather, on the one hand we are dealing with a certain shift of emphasis within the concept of law, while on the other, the issue is the experience that in extreme situations, the formal concept of justice, related as it is to the idea of equality, is transformed in content into a negation of concrete injustice. One might label this moral protest against injustice committed by the state a conversion towards natural law. However, Radbruch with his value-oriented legal philosophy had never been a positivist earlier either, in the sense of the simplistic "law is law." What was new was his distinction not only between applicable and "wrong" law, but his addition of a category for ostensible law, which is actually non-law because it has perverted the idea of the law.

10.2.3. Phenomenological Recourse to the "Nature of Things"

Given the background experience of injustice committed by law, Kaufmann and Coing, and later even Henkel, introduced another "natural law" criterion of written law, in addition to the postulates of eternal rules of the order of creation and an unchangeable set of values: The "nature of things."[19] In itself, this was not a new topos. Suffice it to recall the first sentence in the first chapter of Montesquieu's *The Spirit of the Laws*: "Laws, in their most general signification, are the necessary relations arising from the nature of things." The classic legal phrasing was coined by Heinrich Dernburg, a scholar of the pandects (1829–1907): "The circumstances of life bear their measure and order within, albeit more or less developed. This order inherent in things is called the nature of things" (Dernburg 1892, 87; my translation). Gustav Radbruch took up this topic in 1948. Presumably, this too was part of his endeavor to overcome positivism ("law is law"), which he considered the reason for the helplessness of the legal profession towards the evil spirit of the Nazi regime (see Radbruch 1948, 166 ff.; 1956b, 352).[20] This, however, was only the case for the executive, if at all. After all, the worst excesses in the legal system resulted

[18] On Radbruch's complex concept of law and its changes, see Kühl 1998, 605ff.

[19] The context between natural law and the nature of things is the topic of a dissertation by Gerhard Sprenger (1976), supervised by Werner Maihofer.

[20] On Radbruch's theory of the nature of things in greater detail, see Maihofer 1965, 52ff.

from the ideological abuse of positive law by way of "unlimited interpretation" (cf. Rüthers 2006). With his legal concept of the "nature of things," Radbruch means the analysis of a real-life situation to be assessed, and its reconstruction according to a legal idea. By paring away anything superfluous, this ideal reconstruction causes an ideal type of law to emerge in reality: A value. Thus, this concept offers an "ultimate means" of interpreting laws and filling lacunae in the law, but must never contradict the spirit of the law. Therefore, according to Radbruch, the nature of things can only somewhat alleviate the precipitous dualism between "ought" and "is," between value and reality, but never eliminate it completely.

Like Radbruch, Hans Welzel (1904–1977), professor of criminal law and legal philosophy in Bonn, considered the idea of the legal omnipotence of the law-giver the "original sin of legal positivism," holding up "innate limits of positive law" against it (Welzel 1962b, 334ff.; my translation). He considers these to be the "ethical autonomy of the human being" (i.e., Kant's term of human dignity), but mainly and above all in the "logical structures of reality" (*sachlogische Strukturen*) that supposedly "appear at points throughout the entire material of law" and "sketch out" a certain provision for the law-giver. This, however, is to be understood only descriptively, sociologically, not in a prescriptive sense. The consideration of these "logical structures of reality" should not affect the validity of a provision (which is always subject to the decision of the law-giver) but only its effectiveness, the question of whether it achieves its goal. Welzel's legal philosophy, as expressed mainly in his major work *Naturrecht und materiale Gerechtigkeit* (Natural law and material justice: Welzel 1962a), however, goes far beyond the recourse to "logical structures of reality" in law (ibid., 231ff.). On the one hand, it condemns positivism and all ideologies which aim to reduce the human being to its vitality and all legal questions to questions of power. On the other hand, it also rejects the ossification of historically changeable social orders by natural law and dismisses the idea of a system of eternal material principles of law. At the same time, however, Welzel insists upon an "eternal content of truth of natural law." By this, he means mainly profane natural law, especially the Enlightenment's law of reason. He expressly rejects attempts—current in the 1950s as well as today—to "pick fruits that have grown on the tree of reason from the tree of knowledge." According to Welzel, four truths of natural law remain valid: (1) the experience of an unconditionally valid conscience, i.e., the experience of an obligation, a "duty transcending existence"; (2) the recognition of human beings as responsible persons; (3) the "state of order," i.e., a certain structure and regularity of social action; (4) a "concordance" of all directives of social life, however tension-filled such concordance may be. From all this follows an ever-new natural-law "obligation of positive law to ensure that the struggle for the right formation of social relations remains an intellectual struggle and does not end in abuse or even the destruction of human beings by human beings."

Helmut Coing—his intuitive "perception of values" (*Wertschau*) has already been discussed— was also of the opinion that without attention to the factual regularities of the various areas of life, "a just order" could "never be created" (Coing 1985, 189ff.; my translation). According to him, the authority of the law must necessarily suffer, for example, when, after the war during the time of the so-called "pent-up inflation," the law forced the fiction of the value of money to be upheld and suppressed a "legitimate desire to receive a true counter-value for goods sold" by penalizing the barter of goods. Neither on the whole nor in detail would this lead to an "insight into a cohesive order," as for example Thomas of Aquinas had taught, classically. Establishing the structures of social life "does not liberate us from the task of interfering ourselves, imposing values and order." The fragmentary character of the structure of things becomes even clearer, according to Coing, when two different areas of life, such as politics and religion, collide: At this point, an "ethical decision" based on values becomes indispensable.

Werner Maihofer (1918–2009), a professor of criminal law and liberal politician who was Federal Minister of the Interior in Germany from 1974 to 1978, went an essential step further in 1958 by declaring the "nature of things" a source of law and a concrete natural-law yardstick of material justice for the law-giver and judiciary (Maihofer 1965a, 83ff.). This was based on his theory that the "ought" can be derived from the "is," both for general situations from the analysis and reconstruction of their factual regularities, and for individual, special situations, such as a purchase, as a "legal situation, from analysis of the natural expectations and interests, claims and obligations in the social roles and circumstances constituting the concrete situation" (ibid., 83; my translation). According to Maihofer, the existential and ontological analysis of such complex occurrences between the subjectivity of the human being and the objectivity of the world, in which being and meaning are combined in an "objectivation," shows the "existential structure" of mutual "reference and equivalent," the "value structure" of "expectation and interest," just as much as the "duty structure" (*Sollensstruktur)* of "claim and obligation" (ibid., 20ff.; my translation). The historic change of natural interests and obligations in certain roles and situations is not a valid objection against the historic inevitability of their concrete and current power of validity, their recurrent and ever-current historic objectivity, "the actual existence as a father or brother, as a husband or son, as a judge or doctor" (ibid., 82; my translation). All these statements are based on Maihofer's habilitation thesis *Recht und Sein* (Law and being; published in Freiburg in 1954), in which he tried to comprehend the social connection between human beings existentially and ontologically, strongly influenced by Martin Heidegger's fundamental phenomenological ontology *Sein und Zeit* (Being and Time; published in 1927) in his nomenclature, method and language. If the historicity of natural law and the nature of things is apostrophized as a "history of objectivity in existence and meaning" here, one must bear in mind that there

already were more profound analyses available since the days of Rudolf Stammler (1856–1936) (Stammler 1888, 1ff.; 1902; see Section 1.3 in this tome). Furthermore, basing this historicity of natural law and the nature of things on the "historicity of the actuality of being-as" (Maihofer 1965a, 83; my translation) is little more than a fashionable garnishing of a dead end in legal philosophy. After all, the factual results of upgrading that traditional juristic figure of argumentation, the "nature of things," to an ontological category, are far too meager.

The same is true of Ottmar Ballweg's "theory of the nature of things," which remains entirely in the realm of the approximate (Ballweg 1960). There, the result is as follows: "The nature of things is the objectively discernible, factual-logical structure of reality; the law is an essential constituting element of the character of order that corresponds to its being" (ibid., 67; my translation). What exactly this "essential constituting element" was to mean remained open, whether pertaining to fact or law. There is a notable lack of convincing exemplary concretizations here. In addition, the open recourse to Carl Schmitt's "concrete concept of order" remains questionable, due to the latter's proximity to Nazi ideology (ibid., 39 n. 9, 52 n. 29).

The most sophisticated treatment of the subject in terms of philosophy was written by Arthur Kaufmann, whose lecture *Analogie und 'Natur der Sache' – Zugleich ein Beitrag zur Lehre vom Typus* (Analogy and the 'Nature Of Things': Also a Contribution to the Theory of Type: A. Kaufmann 1965) marked a certain final point in the discussion. Following juristic prudence, he seeks a middle path between Radbruch's position (nature of things: A manner of thought) and Maihofer (nature of things: A concrete source of law), along the lines of the scholastic model of the *analogia entis*. Accordingly, thinking in terms of the "nature of things" is "pre-logical" thinking to him, necessary for each act of establishing law and judging, in order to bring the legal idea respectively legal regulation and real-life situations, i.e., the "ought" and the "is" into a state of "equivalency," i.e., an analogous relationship, by way of continuous comparison (ibid., 44ff.). This implies the equation of unequal elements "according to a criterion that proves itself essential" (ibid., 20; my translation). This leads Kaufmann to a "typological school of thought," whereas the normative type "represents the middle ground between the legal idea and the real-life situation," "around which ultimately all legal thought revolves" (ibid., 38; my translation). This may be true for the law-giving process and the application of law and may be particularly apposite for legal hermeneutics; however, the statement hardly sums up legal thought per se.[21]

Günter Stratenwerth had already returned the concept of a nature of things to the level of legal hermeneutics—which will be discussed in greater detail—in *Das rechtstheoretische Problem der "Natur der Sache"* (The problem of the "nature of things" in legal theory: Stratenwerth 1957). He conceives of the ori-

[21] Cf. also the afterword of the 2nd edition (A. Kaufmann 1982).

entation towards the nature of things simply as a means for jurisprudence to liberate itself from the lacunae, ambiguities and contradictions of the law, by taking the value aspects of the law as the point of departure and thus viewing its regulations as the appropriate consequence of certain basic principles and forming these into one dogmatic entity (ibid., 30ff.). Thus, he emphasizes the practical legal importance of the topos, contrary to any theoretical use of the term as an ontological justification of a system of norms by means of evidence of metaphysical value-structures in the object of a regulation. These fundamental differences in usage led Ralf Dreier (R. Dreier 1965) to recommend foregoing the term altogether in his dissertation analyzing the terminology.

10.2.4. The End of the "Renaissance of Natural Law": The Constitution of the Federal Republic of Germany as an "Objective Order of Values"

Born of the misery of the post-war period in Germany, the so-called renaissance of natural law appears as a kind of "coping literature" (Hilgendorf 2005, 28; my translation). Therefore, it ultimately succumbed less to scientific criticism than that it lost its foundation and resonance as the establishment and stabilization of the new political and legal order proceeded.[22] The steep and constant economic growth experienced at the time was another contributing factor. The so-called "economic miracle" (*Wirtschaftswunder*), caused by the export boom after the Korean War (1950–1953) (Wehler 2008, 48ff., 67ff., 153ff.), allowed the idea of the social obligations inherent in property (*Sozialbindung des Eigentums*), which had played a major role in Catholic social teaching, to fade. "Socialization," which a representative work of the natural law renaissance published in 1956 diagnosed as the "trend of the time" (Auer 1956, 15; my translation) was no longer seriously under discussion in West Germany, a fate shared by the "Ahlen Program" of the Christian Democrats, which had postulated the nationalization of mining and heavy industry in 1947, in the spirit of Christian socialism (Rosenbaum 1972, 108ff.).

In the jurisdiction of the West German high courts, however, the reborn idea of natural law soon developed a certain life of its own.[23] Recourse to natural law not only served the legal coping with the Nazi regime's atrocities, although this was the initial focus. In addition, the Federal Court of Justice believed that natural law allowed a distinction between a higher and lower category of constitutional law, including the possibility, claimed by the Bavarian Constitutional Court, of the existence of "unconstitutional constitutional law"

[22] Early criticism by Wilhelm R. Beyer (1947), and Wilhelm Weischedel (1956). On the end of the natural law renaissance see Ulfrid Neumann (1994, 145ff).

[23] On this subject, selected from a wealth of literature: Hermann Weinkauff (1960, 1689ff.), who, however, overemphasizes the tendency; more completely Kristian Kühl (1998, 620ff.); most recently and extensively Daniel Herbe (2008, 175ff.).

due to a violation of "law predating the constitution"; it also claimed for itself the ability to recognize an order of families dictated by creation.[24] One of the lasting contributions of the judiciary was the derivation of a "general personality right" (*allgemeines Persönlichkeitsrecht*, which protects private writings and a person's image, and also justifies the awarding of claims for immaterial damage, *contra legem*) from Art. 1 and 2 of the *Grundgesetz* (Constitution), derived from the natural-law protection of the human personality.[25] The right of a nation to exist and to determine its own fate was also justified by natural law.[26] What proved to be rather ephemeral, however, was the recourse of the Grand Panel (*Großer Senat*) for Criminal Cases of the Federal Court of Justice to a supposedly immutable moral law, which had been used to justify the conviction in 1954 of a married couple which had allowed its daughter's fiancé to spend the night with her. Supposedly, this qualified as "procuration," since intercourse between adults engaged to each other should be classified as "fornication"; after all, the binding nature of the "norms of moral law" was based

> on the given order of values, which must be accepted, and the obligations ruling human coexistence. These are valid, no matter whether those to whom they are addressed, with the expectation of being obeyed, truly obey and accept them or not. Their content cannot change because general opinion about what is valid changes.[27]

Arthur Kaufmann called this decision "monstrous" (A. Kaufmann 2004, 81). Another interesting opinion of the court is that natural law, by way of the equality principle and guarantee of property, also protects civil servants' claims to wages and pensions, even against the provisions of the Constitution.

One of the most influential figures for this practical implementation of natural law was Hermann Weinkauff (1894–1981): After a career in the Bavarian

court system, he was named *Reichsgerichtsrat* (Imperial Court Counselor) in 1937, became President of a Regional Court (*Landgericht*) in 1946 and President of the Higher Regional Court (*Oberlandesgericht*) in Bamberg in 1949, made his first statements on natural law during his time as an elected member of the state synod of the Evangelical-Lutheran State Church of Bavaria (1947–1950), went on to become the first President of the newly constituted Federal Court of Justice from 1950–1960, and received an honorary doctorate from the University of Heidelberg in 1961 (cf. Godau-Schüttke 2005). He caused considerable stir when the Grand Panel for Civil Cases of the Federal Court of Justice, which Weinkauff chaired, openly rejected a legal opinion passed by the Federal Constitutional Court. The Federal Constitutional Court had judged at the end of 1953 that any civil servant status (*Beamtenverhältnis*) had ended on May 8, 1945, the day of Germany's capitulation, because the Hitler regime had purposely destroyed the *Berufsbeamtentum,* or professional civil service system, with its neutrality from Party affiliations, by making a personal oath of allegiance to Hitler part of the terms of employment.[28] This decision had negative consequences for many civil servants' rights to wages and pensions—as a former *Reichsrichter* or Imperial judge, Weinkauff, was one of them. In an unprecedented and unique statement, the Federal Court of Justice harshly criticized the Federal Constitutional Court's reasoning. In its opinion, the Nazi regime had "not destroyed or even touched the institution of professional civil service." The chastisement of the judgment culminated in the accusation that the Federal Constitutional Court had made "not a legal, but a historic judgment of value" on this central issue, and in the explicit refusal to follow its judgment in this point.[29] In cases regarding the civil service, the Federal Court of Justice's natural law decisions reached another high point under Weinkauff's leadership: The civil servant's right to receive "a livelihood befitting his station" from his employer was held to be part of the civil servant's property, and this right to property was protected by human rights, before the Constitution and above all laws.[30]

Only under the legal-political perspective of a competition among institutions, of the struggle surrounding the unclear position of the Federal Consti-

[28] BVerfGE 3, 58 (the so-called *Beamtenurteil* or "Civil Servants' Case"): Decision dated December 17, 1953. In *Entscheidungen des Bundesverfassungsgericht*. Vol. 3. Ed. Members of the Federal Constitutional Court, 58–161. Tübingen: Mohr (1954).

[29] BGHZ 13, 265 (299, 301): Resolution of the Joint Senate dated May 20, 1954. In *Entscheidungen des Bundesgerichtshofes in Zivilsachen*. Vol. 13. Ed. Members of the Federal Court of Justice and the Federal Prosecutor's Office, 265–319. Berlin and Cologne: Carl Heymanns Verlag (1954). The Federal Constitutional Court later rejected this criticism just as vehemently and confirmed its legal opinion. See in this regard BVerfGE 6, 132 (167ff.): Decision dated February 19, 1957: In *Entscheidungen des Bundesverfassungsgericht*. Vol. 6. Ed. Members of the Federal Constitutional Court, 132–222. Tübingen: Mohr (1957).

[30] BGHZ 11 App. 81: Opinion dated June 8, 1952. In *Entscheidungen des Bundesgerichtshofes in Zivilsachen*. Appendix to Vol. 11. Ed. Members of the Federal Court of Justice and the Federal Prosecutor's Office, 81–5. Berlin and Cologne: Carl Heymanns Verlag (1954).

tutional Court with its new competencies within the court organization of the young Federal Republic of Germany,[31] is the full relevance of a decision of the Federal Constitutional Court revealed, which has been said to mark the actual "baptism" of the Federal Republic (Roellecke 2000, 632ff.) by giving rise to a "rebirth of the legal order from the spirit of the basic rights" (Wahl 2004, 746; my translation). This is the so-called "Lüth" decision, named after the plaintiff, who had called publicly and repeatedly for the boycott of a new film by the director of an Anti-Semitic Nazi propaganda film, and had been ordered to cease and desist pursuant to the *Bürgerliches Gesetzbuch* (Civil Code), as his actions were deemed a violation of morality. This decision, published in early 1958, marks the beginning of the process of "constitutionalization" of the entire legal order of the Federal Republic of Germany, i.e., its orientation towards the Constitution as a "system of values."[32] Especially in the section on basic rights, the Federal Constitutional Court sees an "objective order of values" which prevents a statement protected by the political freedom of opinion to be persecuted as immoral under civil law. This order of values increases the validity of the basic rights and "radiates" into all areas of law and the judiciary system – as a "system," obviously meant to be exclusive. Thus, according to the Constitution, it is now the exclusive and final province of the Federal Constitutional Court to declare laws null and void because of violations of higher-ranking laws.

This jurisdiction on the system of values received major support from the commentary on Art. 1 Section 1 of the *Grundgesetz* (Inviolability of Human Dignity) by Günter Dürig (1920–1996), professor of constitutional law in Tübingen, who thereby exerted an extraordinarily strong influence on legal theory and practice of the young Federal Republic of Germany. Dürig interpreted human dignity as a moral value in the spirit of Christian natural law and its values, which the constitutional law-giver had also turned into a legal value forming the "foundation for a whole system of values"—independently of its subjective, individual bearers—unfolded in the various basic rights of the constitution (cf. Dürig 1956, 117ff.).[33]

After the Federal Constitutional Court had extended its competencies to include the judicial review of laws beyond the protection of the rights of individuals, thus occupying the "central role in the structure of institutions" (Wahl 2004, 763; my translation), and the situation had stabilized, the Federal Con-

[31] Extensively on this subject, see Jörg Requate (2008, 36ff., 43ff., 50ff.).

[32] BVerfG 7, 198 (205): Decision dated January 15, 1958. In *Entscheidungen des Bundesverfassungsgericht*. Vol. 7. Ed. Members of the Federal Constitutional Court, 198–230. Tübingen: Mohr (1958). See also Thomas Henne and Arne Riedlinger (2005). A recent contribution on the "constitutionalization" of the legal order of the Federal Republic of Germany is by Jörn Ipsen (2009, 314ff.).

[33] This essay formed the basis of Dürig's commentary of Art. 1 by Theodor Maunz and Günter Dürig (1958). On its criticism, see Hofmann 2008, 47ff.

stitutional Court at least conceded to the wide-spread scholarly criticism of its decisions (cf. Goerlich 1973) inasmuch as it gave up the use of the expression "value system" and its attendant pathos, and by semantically emphasizing the constitutional core statement of the Lüth case, the "most spectacular innovation of German constitutional law since 1945" (Wahl 2004, 746; my translation), more strongly; thus holding that the basic rights, such as the freedom of opinion, constitute not only a protection of subjective and individual rights, but also play an important objective role in structuring the community, the state and society as a whole (H. Dreier 1993; 2004, 89ff.). Thus, the Constitution now caps and permeates the entirety of the Federal Republic of Germany's laws and has taken on the role of supra-legal natural law. One might say with Erich Fechner (see Section 10.2.1.2) that the liberal and democratic structure of the Constitution, proven as it is through the test of time, is a kind of "evolved natural law."[34]

10.2.5. Natural Law Revisited: Fending off the 1968 Revolution

As early as 1963, Maihofer had described the danger inherent in society's "losing itself in mere, complacent maintenance of what had been achieved […] after the reorientation during the years after 1945" (Maihofer 1965b, 47; my translation). His warning was justified. Students began to rebel against the generation of their parents and the order the latter had restored. The movement found one of its temporary icons in Herbert Marcuse (1898–1979). This was due to Marcuse's criticism of the "late bourgeois" affluent society, derived from Hegel's dialectics and Karl Marx's philosophy, together with Marcuse's utopia of a liberated society (Marcuse 1965, 1966, 1967).

Directed expressly against Herbert Marcuse and the "New Left," who maintained that there was a right to violent and revolutionary resistance against the existing social order, the Austrian René Marcic (1919–1971), professor of political theory, constitutional law and legal philosophy at the University of Salzburg, published his *Rechtsphilosophie: Eine Einführung* (Legal philosophy: An introduction, Marcic 1969, 11, 29ff.) in 1969. He wished to demonstrate that society can develop without violence, that democracy and the rule of law are forms of political coexistence "designed for continuity, development, unfolding, constant change, for flowing permutations, so that any social transformation is controlled by law and thus takes place in a non-violent, peaceful fashion" (ibid., 31; my translation). The law can only accomplish this if it is an order based on unity encompassing all people. Thus, both legal philosophy and Kelsen's *Reine Rechtslehre* arrive at "the methodological postulation of the unity of the legal view of the world" (ibid., 162; my transla-

[34] On the concept of the attainment of legitimacy through the test of time, see Hofmann 1977.

tion). To Marcic, "law as a whole" seems meaningful when the pre-positive order of law, the law of being (*Seinsrecht*) and the historic, positive law are able to be "ascribed" by degrees "to a common principle: Being as the original norm." Therefore, he seeks to "expose the law of being as the ontological and logical basic rules underlying positive law," that is, in a rather Austrian fashion,[35] to "use the method of the Pure Theory of Law […] is to underlay positive law with the law of being, without leaving the field of the Pure Theory of Law" (ibid., 135; my translation). First of all, this accentuates the formal question of the context of validity (*Geltungszusammenhang*). Coherence of content is achieved later through normative didactic passages about human nature, human dignity and the common good (ibid., 262ff.). These, in turn, are based on Aristotelian and Thomistic tradition, in short: Catholic natural law.

Marcic's book did not achieve a widespread effect. Not only did it seem too sketch-like, but—despite the contemporary reference to the student revolt—it was not in keeping with the times. The scientific weaknesses of the "renaissance of natural law" had become all too obvious in the meantime.

10.3. The Modernization of Scientific Theory during Times of Reform

10.3.1. Times of Reform—Questioning the Scientific Character of Jurisprudence

Starting in the late 1950s, the invocation of the traditional German bourgeoisie with its authoritarian concept of the state which had dominated the years of reconstruction began to lose its power (Herbert 2003, 7ff., 25ff.). The country's institutions had been democratized. Its firm integration, both in terms of politics and international law, into the Western bloc provided an anchor during the "Cold War" (Hofmann 2003, 373ff., 382ff.). This Western alliance of the Federal Republic (*Westintegration*), a decidedly new element in German history, was now followed—more or less as a matter of course—by an inner orientation towards the West, from the liberalization and modernization of society which brought with it the disintegration of traditional milieus, to the pluralization of lifestyles and all the way to a certain cultural "Americanization," despite all the restorative ("occidental") tendencies noticeable in anti-Communist cultural life (Görtemaker 1999, 253ff.). The first to register these tendencies towards modernization and liberalization was the sociologist Ralf Dahrendorf (1929–2009) in his 1965 book *Gesellschaft und Demokratie in Deutschland* (Society and democracy in Germany: Dahrendorf 1965, 10), bearing in mind that in the author's words, "democracy" indicates a liberal form of state rather than an egalitarian society. This process of adaptation, never easy to begin with, was

[35] See however the sharp criticism by the Viennese professor of constitutional law Günther Winkler (1969, 22ff.).

complicated further by the rising of a new youth movement, complete with the attendant exaggerations and radicalization. Any deficit in liberalism and openness—and some of these were ancient and ingrained indeed—appeared to the younger generation to be the remains of "fascism," and thus the fault of their parents. Ultimately, the active and successful publicity work of the "1968ers" convinced the general public that they, the 1968ers, had initiated the wave of modernization, whereas in truth it had been many years in coming and they merely surfed its crest (Wehler 2008, 277ff., 310ff.). Historical scholars have called this fundamental change of circumstances *Umgründung der Republik*, i.e., the "re-founding and changing of the Republic" (Görtemaker 1999, 475; my translation). A more concrete term resulted from a more focused political examination: *Reformzeit* or "time of reforms" (Conze 2009, 311ff.; cf. Görtemaker 1999, 516ff.). This refers mainly to the years from 1966 to 1974: Those of the (first) Grand Coalition between the Christian Democratic Union of Germany (CDU) and the Social Democratic Party of Germany (SPD) and the (first) term of office of Chancellor Willy Brandt. In our context, the great economic and financial acts of legislation are important, but even more so the reforms of criminal law that were enacted between 1969 and 1974, which streamlined criminal law, liberalized especially sexual crime legislation and eased restrictions on abortions. The modernization discussions of the 1960s also resulted in the great reform of marital and family law, which finally went into effect in 1976 (cf. Conze 2009, 370ff., 402ff.).

At the time, the field of philosophy was faced with the challenge of catching up on Anglo-Saxon theoretical developments, many of which had been promulgated by German emigrants (Topitsch 1965, 13–4). The process was comparable to that which had restored the cultural achievements banned after 1933 to the education system's canon, beginning in the late 1950s. At the center of the philosophical discussion was "analytical philosophy" (see Plümacher 1996, 77ff., 87ff., 127ff.). This had begun with the neo-Positivism of the "Vienna Circle" surrounding Moritz Schlick and Rudolf Carnap and influenced by Ludwig Wittgenstein as well (Hacker 1996), which strove to solve (or dissolve) philosophical problems through linguistic criticism (see V. Kraft 1950). The older school employed formalized logic for this purpose, while the younger relied on the analysis of colloquial language and its own logic (cf. E. Savigny 1993). For this anti-metaphysical renunciation of things, especially those things and situations that are merely thought up, in favor of the statements, terms, principles and axioms of the sciences, the term *Linguistic Turn*, has become common; it was introduced in 1967 by Richard Rorty (1931–2007), a student of Rudolf Carnap and Carl Hempel who made reference to Gustav Bergmann's work (Rorty 1967). Rorty's philosophy also combined all the terms that were characteristic for this development: Linguistic critique, logic, rhetoric, hermeneutics and pragmatism.

These, therefore, were the guiding elements of the catching up taking place in legal philosophy in Germany. It is typical for the history of our sci-

ence that these terms have come to indicate sub-disciplines of the theory of law, or legal theory (*Rechtstheorie*: R. Dreier 1981a, 17ff.). Instead of the *values* of law, this focuses on structural analysis of legal *norms*, both in detail and in the larger context (ibid., 20; Nawiasky 1948, 1ff.). In opposition to classical legal philosophy and to the "renaissance of natural law," legal theory created a kind of rebirth of legal positivism 25 years after the end of the war, emerging very decidedly as a theory of positive law and finding its main expression in analytical jurisprudence. Alongside its founding fathers, Jeremy Bentham and John Austin, today Hans Kelsen and Herbert Lionel Adolphus Hart are considered its most important protagonists. Kelsen's theory (1934), especially his *Reine Rechtslehre*, had originally not found much positive resonance outside of Austria. The interest aroused by H. L. A. Hart's (1961) analytical "concept of law," however, led to a slowly awakening interest in Kelsen as well (Koller 1988, 129ff.). In 1972, the "Hans Kelsen Institute" was founded in Vienna as a Federal Foundation.

Since a realistic theory of law had competed with the positivistic theory of law since the days of the free law movement (Hofmann 2009, 317ff.), it was in the "nature of things," so to speak, that the new upswing of the analytical theory of law also caused a new blossoming of legal sociology. (There was even an attempt to create an empiric "legal anthropology": see Pospisil 1982).[36]

It is worth noting that a *Jahrbuch für Rechtssoziologie und Rechtstheorie* (Yearbook of legal sociology and legal theory: Luhmann et al. 1972) has been published since 1970. Its second volume, edited by Hans Albert, Niklas Luhmann and others in 1972 and dedicated to *Legal Theory as the Basic Science of Jurisprudence*, lists the following areas: Epistemology of law, logic of law, terminological and systematic theory of law, decision and information theory of law, linguistic and argumentational theory of law, in addition to which it also deals with the relationship between legal theory and legal dogmatics and that between legal theory and legal politics. The journal *Rechtstheorie* (Legal theory), also founded in 1970, was publicized by its highly symptomatic subtitle as a "Journal for the Logic, Methodology, Cybernetics and Sociology of Law."[37] In 1971, Günther Jahr and—no surprises here—Werner Maihofer edited a volume entitled *Rechtstheorie* with various "contributions to the discussion of fundamentals," according to its subtitle (Jahr and Maihofer 1971). A 1971 anthology edited by Arthur Kaufmann (1971), also entitled *Rechtstheorie*, offered "Legal Theory as an Analytical Theory of Science," as "Critical Reflection," as "Proto-Juridics" and as "System Theory" rather adding to the impression that

[36] From the large number of *theoretical* anthropologies of law, suffice it to mention: Lampe 1970, Broekman 1979b, van der Ven 1981, Zement 1983.

[37] A subtitle that was incidentally changed in 2005 to read "Journal for Logic and Legal Methodology, Legal Information Science, Communication Science, Norm and Action Theory, Sociology and Philosophy of Law."

here was a theory in search of its subject: Was it to be justice or the law, the legal norm, dogmatics, interpretation, application or legal argumentation? Invariably, the term "theory" indicated a scientific approach free of metaphysics and—if not the entire redefinition of jurisprudence as a social science (Rottleuthner 1973)[38]—at least a certain openness towards the social sciences, in other words: Modernity. Obviously, the self-esteem of legal scholars had seriously suffered. Thus, Dieter Grimm (1937–), an expert in constitutional law, legal theory and subsequently a judge at the Federal Constitutional Court, began his preface to a 1973 anthology edited by him and trendily entitled *Rechtswissenschaft und Nachbarwissenschaften* (Jurisprudence and related sciences: Grimm 1973) by stating: "This book is an expression of the waning self-confidence of jurisprudence" (ibid., 7; my translation). Referring to similar phenomena at the beginning and end of the 19th century (Brockmöller 1997, 47ff., 238ff.; Hofmann 2009), the Würzburg-based professor of criminal law and legal theory Eric Hilgendorf (1960–) has spoken of the "renaissance of legal theory between 1965 and 1985" (Hilgendorf 2005; my translation).

On the whole, the "rapid rise" of questions of legal theory (which went far beyond the precursors mentioned by Hilgendorf) "could only be compared in its breadth with the renaissance of natural law after 1945," as a critical observer rightly remarked at the time, under the title *Rechtstheorie ohne Recht?* (Legal theory without law?: H. Schneider 1972, 108ff.; my translation).[39] In brief, during the "time of reform," the central topic of legal philosophy, i.e., "legal injustice and law transcending written laws," was pushed aside in favor of the critical examination of the scientific character of jurisprudence and the metaphysics-free definition of its subject. Therefore, the main objective was to achieve a scientific—i.e., non-speculative—term for law, which appears only as language and therefore requires interpretation. The classical methodology of legal interpretation, as developed by Friedrich Carl von Savigny and his followers, which involved the examination of a law's wording, context, systematic positioning, evolutionary history and objective (Raisch 1995, 103ff.), was replaced by an "argumentation theory" and—as a subsequent counterpoint—new "legal hermeneutics."

10.3.2. The Analytical Theory of Law and of Legal Argumentation

10.3.2.1. Legal Theory

If, consequently, there was a "calling"—to use Savigny's term—for philosophy during this "time of reform," it led to the philosophy of science (*Wissen-*

[38] A critical evaluation by Naucke (1972).

[39] See also K.-L. Kunz 1977, which includes a fundamental critique of the culturally misguided reception of the analytical model of legal theory.

schaftstheorie). In fact, science had found a new frame of reference, beyond philosophy, in the monumental work *Probleme und Resultate der Wissenschaftstheorie und Analytischen Philosophie* (Problems and results of the philosophy of science and analytical philosophy) by the Austrian-German philosopher Wolfgang Stegmüller (1923–1991), appointed professor in Munich in 1958. Following Hempel and Carnap, the first volume, published in 1969, emphasized the pivotal role of the examination of linguistic logics undertaken by analytical philosophy for the philosophy of science as a theory of scientific statements (Stegmüller 1969). In 1973, the first half-volume of Part IV extended the mission of the philosophy of science,—i.e., the transcendental philosophy of scientific insight—to include the meta-theory of rational action (Stegmüller 1973). Complementary reflections on this entire school of thought were provided by the Tübingen-based philosopher Walter Schulz (1912–2000), with consideration of the background of the history of Western philosophy (Schulz 1972, 68ff., 76ff.). He explained the development of the philosophy of linguistic analysis with the historical problems of Logical Positivism which had occupied the "Viennese Circle," demonstrating how the extension of linguistic analysis to colloquial language leads to the revocation of the original exclusion of any ethical problems.

This is the scientific platform from which the most important work of latter-day positivistic legal philosophy since Hans Kelsen's *Reine Rechtslehre* issued forth: The epochal work by Oxford don H(erbert) L(ionel) A(dolphus) Hart, *The Concept of Law* (Hart 1961). In German-speaking jurisprudence, however, Hart's legal thinking was only received with great hesitation. One exception was Horst Eckmann's 1969 monograph on the concept of law in Hart's legal theory (Eckmann 1969). This state of affairs changed after Hart's book was published in 1973 by Suhrkamp in Frankfurt am Main under the title *Der Begriff des Rechts*. One of the scholars principally responsible for its dissemination has been Norbert Hoerster (1937–). After studying law and philosophy in Germany and the USA, he completed his habilitation thesis in philosophy—under the benevolent eye of W. Stegmüller—in Munich (Hoerster 1971) and held a chair for legal and social philosophy at the University of Mainz from 1974 onwards, without also teaching a dogmatic subject (i.e., an area of civil, criminal, or public law), as was the custom in German legal faculties. This institutional anomaly was due to the attempted reforms that had propagated the advancement of the so-called legal "basic subjects" of legal theory and legal sociology, in contrast to the conventional training of young jurists, which was limited to the three core areas of civil, criminal and public law. After Hoerster had already translated three essays by Hart, published with his preface under the programmatic title *Recht und Moral* (Law and Morality) in 1971 (Hart 1971), he followed his author further, propagating a concept of legal positivism cleansed by linguistic analysis. Against all claims of natural law and polemic distortions, he insisted upon a strict terminological and

definitional separation between law and morality (*Trennungsthese* or "separation theory"), i.e., a scientific definition of law without any attributes of justice, and upon the exclusively linguistic analysis of legal terms, which leaves room for the simultaneous recognition of the possibility of rational moral (but *only* moral) criticism of the law's content.[40] Thus, this 'true' legal positivism, based upon the philosophy of science, claimed neither that the law is identical with the commands of any law-giving authority, nor that there is an obligation to obey any given law. The persuasiveness of this rehabilitation of legal positivism (or rather: Of one form of legal positivism) was buttressed further by the simultaneously spreading insight that the verdict passed by Radbruch and others, according to which it had been legal positivism that had made the German legal professions helpless against the perversion of the legal system under the Nazi dictatorship, was not tenable. Indeed, the utter deterioration of the system was only due in a relatively small part to specific Nazi law making and strict compliance with such laws, but rather to the unrestrained and unscrupulous ideological interpretation, instrumentalization and overwhelming of the existing laws (cf. Rüthers 1968).

Incidentally, without yet knowing Hart's work, Martin Kriele (1931–), who went on to become professor for political theory and public law in Cologne, had also turned to the method of linguistic analysis in his 1963 dissertation, arguing against relativism as the consequence of the somewhat faded natural law. Specifically, under the title *Kriterien der Gerechtigkeit* (Criteria of Justice: Kriele 1963), he examined the linguistic meaning of the terms *gerecht/ungerecht, recht/unrecht* and *billig/unbillig*, i.e., "fair," "unfair," "just," "unjust," "equitable" and "inequitable," as used in general speech. A reaction to the contemporary problems of legal philosophy similar to Kriele's came from Werner Krawietz (1933–), whom the politics of reform later allowed to become professor exclusively of the basic subjects of legal sociology, legal and social philosophy in Münster, and who was also co-founder of the journal *Rechtstheorie* (Legal theory), in his doctoral dissertation in 1967; however—being oriented rather towards the "reality of law"—he saw the task of any theory of law, beyond traditional legal philosophy, in the clarification of the relationship between positive law and social reality, or, more specifically (and this made him a prime example of the contemporary "planning euphoria" encompassing society as a whole): In the examination of the ways that law determined social circumstances. His dissertation was entitled: "Das positive Recht und seine Funktion—Kategoriale und methodologische Überlegungen zu einer funktionalen Rechtstheorie" (Positive law and its function: Categorial and methodological considerations on a functional theory of law, Krawietz 1967).

Given the broad popularity of the term "legal theory," Ralf Dreier (1931–), who had taken over the newly-created chair for the *General Theory of Law* in

[40] As summarized in Hoerster 1989.

Göttingen, another result of the modernization movement, was able to sum up the situation of jurisprudence in his inaugural lecture in 1974 by saying: "Legal philosophy is dead, long live legal theory!" (R. Dreier 1981a, 17; my translation). This, however, did not mean any clearly defined integral theory of law or jurisprudence, but the colorful multitude of theoretical attempts and concepts we have just witnessed, ranging from legal linguistics, legal sociology and legal anthropology to the theory of methods and argumentation and all the way to the logic, information science and cybernetics of law (ibid., 40). Dreier conceived of the general theory of law as a theory of legal *dogmatics*. While the latter was to penetrate the terminology and establish a system for the law of a legal community (ibid., 37 n. 32), the task of legal theory was to examine the empirical and theoretical information provided by "neighboring disciplines," especially legal sociology, booming at the time, with regard to their relevance for jurisprudence, i.e., dogmatics (ibid., 25). Accomplishing this task, however, required a "substantial basic and framework legal theory," "containing verifiable statements about the structure and function of law as a social phenomenon" (ibid., 26; my translation). Regarding the traditional question of legal philosophy, that of the "right" law, in 1974 Dreier saw only two possible levels of developing theories, in order to arrive at a scientific answer: Either a theory of argumentation or a "non-formal legal theory embedded in a non-formal social theory" (ibid., 29; my translation). However, Dreier himself voiced doubts "whether legal theory could be pursued in a scientifically legitimate fashion as a social theory of law" (ibid., 26; my translation).

However, some neo-Marxists, such as Oskar Negt (1934–), professor of sociology at the Technical University in Hannover, were convinced that this was the only possible scientific approach (Negt 1975, 10ff.).[41] With only Marx's and Engels's writings as a basis, Negt wished to establish a "materialist theory of law encompassing the given social formation" using "the legal norms created in the context of production" (ibid., 34; my translation). After all, Marx and Engels did not create a separate legal theory, and according to Negt, "legal theory as it occurs in the socialist transformational society" had "lost its frame of reference […] in its narrow guise of a justifying science," that frame of reference being "the specific relationship between production, the state of development of society's productive forces and the character of the intended or actual revolution" (ibid., 31; my translation). In order to extrapolate an "autonomous socialist position," however, he considered it essential to "avoid the alternative between emotional […] anti-communism and simple identification, even over-identification with 'real socialism,'" through "analysis and political examination of the reality of transformational societies, especially the question—so decisive for the German left—of the conditions of development of

[41] See also the contributions in the same volume by Paul (1975, 72ff.), and Böhler (1975, 92ff.); and furthermore the references quoted below in Section 10.6.1.

socialism in the GDR" (ibid., 29; my translation). Since a Marxist theory of law needed to serve as guidelines for action as well, it should also encompass "a systematic examination of the actual steps" leading to the "gradual dying of the state" and the "overcoming of law," the ultimate goal being self-administration by the workers (ibid., 58ff.; my translation). This program remained unchanged throughout. The rest consisted of the social romanticism of the early 1970s:

> Only because work has become the prime need in life, meaning that the most important form of self-realization available to individualism merges with a largely self-determined regulation of social coexistence […], legal form is losing ground, inasmuch as it is based on varieties of forced labor […]. Only the associated producers, who abolish the political rule of humans over humans, can […] ultimately overcome [the iniquities of a bourgeois society] by disposing of society's wealth as they see fit. (Ibid., 67; my translation)

In this atmosphere, the term of alienation also attracted renewed interest. In 1970, the methodologist Friedrich Müller (1938–)—we will soon examine his legal hermeneutics— dedicated a slim monograph to that category of political theory as it occurs in the works of Rousseau, Hegel and Marx (F. Müller 1985). It began with the sentence, "Marxism remains the philosophy of our times" (ibid., 5; my translation) and ended with thoughts on the possibility and necessity of a contemporary counterpart for Marx's *Capital* (ibid., 86ff.; my translation). Fifteen years later, a second edition was published. Its additional eight new chapters provided a profound and detailed observation of the topic in the development of Marxism, Leninism, Stalinism and socialism, including Bloch's criticism of the latter. During its course, a certain skepticism arose: "A systematic abolition of alienation cannot be observed in socialism" (ibid., 79; my translation). Moreover, outside the realm of economics, an "end of alienation by the state, law, bureaucracy […] is even further removed from reality in the states that call themselves socialist than in the bourgeois ones" (ibid., 190; my translation). And yet: "The great fundamental movement towards democracy and socialism first sensed by Rousseau has continued unabated, and has grown […] Stalinism was unable to discredit it permanently" (ibid., 182; my translation). However, it is "not the convergence of capitalism and socialism" (which—as the reader will recall—Werner Maihofer had dreamed of) "that appears to be the direction of this movement. Instead, it looks to be a convergence of various forms of socialism, the democratic and the 'real' ones" (ibid.; my translation): Thus Friedrich Müller's perspective in 1985. Shortly thereafter, real socialism imploded. Our author returned to methodology. And we shall follow him.

10.3.2.2. Legal Argumentation Theory

Critical theories regarding the concept of law and jurisprudence must necessarily also concentrate on the application of law to individual cases, i.e., the

legal decision and its underlying reasoning in the context of a given legal system and with a view to its written laws. Corresponding to a similar tendency observed in international discussion, this complex of problems also appeared in the foreground of German-language discourse in the 1970s and early 1980s, the period we are here examining. The topic of the symposium of the German Section of the International Association for Philosophy of Law and Social Philosophy (IVR) held in Munich in 1978, "Argumentation and Law," was symptomatic for this development, as were the contributions at the international symposium hosted by the Austrian Section of the IVR together with the Institute for Legal Philosophy at the University of Graz in 1979, and those published in Supplement 1 of the journal *Rechtstheorie* in 1979 under the title *Argumentation und Hermeneutik in der Jurisprudenz* (Argumentation and hermeneutics in jurisprudence). On the one hand, the problem resulted from the insight, gaining currency since the late 1880s, that the old dogma of positivistic legal subsumption, according to which a judge should be able to logically derive his judgment from the written law, was untenable; on the other hand and more importantly, however, from the attempt to avoid the alternative of an irrational decision handed down by a judge when deciding an individual case. Thus, a solution was sought in the theory of a decision that might not be wholly determined by the written law, but certainly oriented towards it, that was reasonable and just, and in any case rationally understandable. The instruments appropriate to this goal were (and continue to be) logic on the one hand and, on the other, linguistic critique or—more practically or pragmatically oriented—*topics* in the Aristotelian sense (*Topik*), rhetoric and discourse theory.

The broadest effect was first achieved by the revival of *topics*. A slim volume first published in 1956 by the Mainz-based legal philosopher Theodor Viehweg (1907–1988) entitled *Topik und Jurisprudenz* (Topics and jurisprudence: Viehweg 1974) proved to be groundbreaking (see also Section 23.3.1 in Tome 2 of this volume). It touched a nerve of its time by turning against the only superficially objective solution of legal problems by supposed derivation from a given system of norms and concepts, and by pleading for decisions that were problem-oriented, appropriate and providing ground for consensus, by considering all relevant criteria and following the classical *topics* of Antiquity introduced by Aristotle and Cicero. Between 1962 and 1974, therefore, the book saw four further editions. The prescription of an all-inclusive discussion of arguments related to the given problem further promoted the study of the prerequisites and rules of legal argumentation, especially since the mere collection of *topoi* obviously did not lead very far. Thus, in later editions of his programmatic book and in other works in 1977 and 1978, even Viehweg himself argued for a further development towards a "contemporary rhetorical argumentation theory" (ibid., 111; my translation). The rhetorical perspective emphasized the situation of speech and the necessary relationship between situation and argumentation. Traditional methodology was thus transformed into

a legal communication theory. In the terminology of Charles William Morris (1946), who distinguished between "syntactics" as relations between symbols, "semantics" as relations between symbols and meaning, and "pragmatics" as the situational context of the use of symbols, it is therefore "pragmatic." This situational and dialogue-oriented conception goes some way towards preventing the foreshortenings and distortions that jurisprudence is prone to, due to the dominance of the systematic and semantic aspect which arises from the assumption that words constantly have the same meaning, from the ontologization of legal ideas and from the reification of legal matters.[42]

One outstanding publication was the dissertation of Robert Alexy, a student of Ralf Dreier, submitted in Göttingen: *Theorie der juristischen Argumentation* (Theory of legal argumentation: Alexy 2006a).[43] Its main theory, which posits legal discourse as a "special case of general practical discourse," is based upon, but also sets itself off against Jürgen Habermas's "consensus theory of truth" (more upon which later) and the "theory of practical counseling" of the so-called Erlangen School of the philosophers Lorenzen and Schwemmer. Alexy himself described his point of departure as a critical acceptance of the intentions of legal *topics*. After all, he shared its assumption "that even where no compelling justifications can be given, it is not necessary to leave the field to irrational decision-making," and "that the concept of rational justification is intimately connected with that of rational discourse" (ibid., 43; my translation), yet he strove to avoid its shortcomings. Such shortcomings he saw in "the underestimation of the importance of written law, dogmatics and precedent, in the inadequate penetration of the deeper structure of arguments, and in the insufficiently precise definition of the subject under discussion" (ibid.; my translation). Therefore, reverting to the aforementioned philosophical theories serves to define criteria for a rational discussion. Thus, the discussion is expected to yield correct results inasmuch as it refers to ideal conditions under which all reasonable persons would have to agree. Assuming that legal discussions too are subject to this assumption, such a theory of discourse becomes necessary in this respect. In legal discourse, however, "not all questions are open to discussion. Such discourse is limited" (ibid., 262; my translation), leading to the abovementioned theory of a "special case." In detail, Alexy names the limitations as "the binding nature of written law, the necessary regard for precedent, the context of the dogmas established by institutional jurisprudence," as well as "the limitations established by the rules of legal procedure," inasmuch as the subject of the discourse is not purely jurisprudential

[42] From the multitude of publications on this subject, at least the following should be mentioned: Seibert 1973, 54ff., Clemens 1977, Podlech 1977, Struck 1977, C. Westermann 1977, Schreiner 1980, Gröschner 1982, Haft 2007, U. Neumann 1978 and 1986, Hilgendorf 1991. See also the overviews provided by Schlieffen (2001, 175ff.) and Launhardt (2005).

[43] On Alexy's theory see also Sections 1.5.4.1, 10.3, and 25.4 in Tome 2 of this volume.

(ibid., 34; my translation). These restrictions may reduce the assumption of the correctness of legal results. Unlike in general practical discourse, "nobody assumes that the normative statement which is suggested or handed down as a judgment is reasonable per se, but only that it can be reasonably justified within the framework of the applicable legal order" (ibid., 264; my translation). The question of a reasonable legal justification then leads back more or less to traditional methodology.

In the early 1980s then, the pendulum swung back. Hans-Joachim Koch, professor in Hamburg, and Helmut Rüßmann, professor in Bremen, both of them also higher court judges, published their *Juristische Begründungslehre* (Theory of legal reasoning: Koch and Rüßmann 1982) in 1982; In it, they concentrated fully on judicial decision-making, rejecting Alexy's approximation of discourse theory in order to derive rules for legal argumentation as "superfluous and dysfunctional," since the idea of a discourse "which anyone who considers himself a concerned party may join, in order to express and describe his interests and ultimately have a say in any decision taken" (ibid., 371; my translation) had no relation whatsoever to the situation found in a court of law. Instead, the two authors dedicated themselves painstakingly to the refinement of the traditional model of deductive reasoning. What is remarkable is the attempt to achieve interdisciplinary depth through

> logic for the discussion of justification structures of legal arguments; linguistic philosophy and logic for the description of problems of the interpretation and application of laws as well as the further development of laws by the judiciary; meta-ethics as a sub-specialty of analytical philosophy for the discussion of whether legal judgments can be justified; the philosophy of science and statistics for the examination of arguments of empirical science used in legal judgments. (Koch and Rüßmann 1982, 2; my translation)

This multitude of far-reaching aspects serves to illustrate the breadth of the discussions about legal theory taking place at the time. However, it is too voluminous to be examined here in depth with the exception of the exploration of formal logic by jurisprudence, which will be described briefly in the following chapter. The importance accorded to this discipline at the time may be illustrated by the fact that Koch and Rüßmann (ibid., 31ff.) considered it necessary to give readers of their *Theory of Legal Reasoning* an introduction to logical connectives, predicate logic and deontic logic.

10.3.3. Legal Logic

The term "legal logic," a permanent fixture in legal parlance, does not describe a particular formal discipline, but usually stands for legal methodology and argumentation theory, thus including legal *topics* and rhetoric as well. As early as 1918, Eugen Ehrlich, a protagonist of the "free law school," stated that the only thing "legal logic" had in common with "real" logic was its name: In

reality, it was "no logic at all, but a technique, for it does not aim to provide a touchstone for the methods of applying law, but is merely such a method itself, which must first be examined for its correctness" (Ehrlich 1966, 299; my translation).[44] The German-language attempts to arrive at such a touchstone by employing "real" logic hark back to *Logische Studien zur Gesetzesanwendung* (Logical studies in the application of laws: Engisch 1943) by Karl Engisch (1899–1990), the major criminal law expert and legal philosopher who taught in Heidelberg starting in 1934 and in Munich after 1953. His logical analyses of the so-called syllogism of justice concentrated on the analysis of the minor premise and the "logic of fact-finding." "Traditional logic" seemed sufficient to him as the formal basis of his analyses. His *Studien* first appeared in 1943, but quickly saw two further editions after the war, in 1960 and 1963. A similar success was enjoyed by *Juristische Logik* (Legal logic: Klug 1966) by Ulrich Klug (1913–1993), a professor of criminal law in Cologne and a critical politician specialized in legal matters, who, incidentally, maintained an intensive scientific correspondence with Hans Kelsen from 1959 to 1965 (Kelsen and Klug 1981). Klug's *Juristische Logik* first appeared in 1951, the second edition in 1958, and 1966 saw the much-quoted expanded third edition (a fourth was published in 1982).[45]

This work opened a new chapter in the discussion of methodology. To Klug, "legal logic" is defined as "the theory of the rules of formal logic to be employed in the application of law" (Klug 1966, 6; my translation). In our context, its outstanding characteristic is not so much the mathematical procedure of representing logical terms and their relations using symbols and formulas and calculating them according to algebraic rules, but its critical function of revealing incompleteness, i.e., ambiguities, in the conventional syllogistic method of deduction. This pioneering insight was followed by a multitude of publications on this same subject.[46] Ultimately, an "introduction to the logic, semiotics and method of empirical sciences" summed it up: The protagonists of "real" logic were out to "annex" jurisprudence—traditionally considered an "art"—to the "sciences" (Herberger and Simon 1980, VII).

Naturally, a major element in this context is the discussion of *deontic logic*, i.e., the logic of statements of "ought" or norms, which cannot reasonably be called true or untrue. But how, then, can generally valid conclusions be drawn in this field, if general validity depends on the truthfulness values of the premises employed?[47] One of the attempted solutions was to modify the concept

[44] On Ehrlich's view see also Section 3.3 in this tome and Sections 1.1.4.1, and 22.3.1 in Tome 2 of this volume.

of the values of truthfulness in such a way that they could also be associated with norms; another was to combine every norm with a so-called "norm statement," i.e., a statement about the validity of this norm that itself was potentially truthful.

Another, fundamentally different route was taken by Ota Weinberger, with great consistence and widespread resonance: He differentiated categorially between descriptive (theoretical) and prescriptive (practical) statements.[48] Born in 1919 in Brünn (known today as Brno), he suffered persecution and oppression as a Jew and democrat, and decided not to return to his homeland after attending a symposium in Vienna in 1968. From 1972 to 1989 he directed the Institute of Legal Philosophy in Graz, having completed his habilitation thesis in logic. The subject of his dissertation, submitted to the legal faculty in Brno (which was to be closed down shortly thereafter), had already been an attempt to formulate an independent "Grundlegung der Sollsatz-Logik" (Fundamentals of a Logic of Statements of "Ought"). The version that was submitted in 1956 to the Czechoslovak Academy of Sciences was published in 1958 in German as part of its Proceedings: *Die Sollsatzproblematik in der modernen Logik* (The problem of ought statements in modern logic: Weinberger 1958). If, however, it is correct that such categorial differentiation excludes the translation of statements of fact into practical statements (norms) and of norms into statements of fact, it is necessary to use the means of formal logic to construct a separate normative logic which exceeds mere translation. In the course of this operation, all elements must be carefully analyzed linguistically with regard to their descriptive or prescriptive/evaluative meaning. On the basis of these "semantics differentiated by insight," (Weinberger 1988b, 54; my translation) normative logic deals mainly "with the structure of normative statements, the logical relations between normative statements and statements of fact, as well as normative-logical deduction" (ibid., 59; my translation). The examination of the relations between normative statements and statements of fact adds a "theory of the justification of norms" to the "centerpiece of normative logic" (i.e., the theory of the structure of normative statements and normative-logical deductions), a justification theory dealing with decisions of the will and elements of rhetorical argumentation (arguments of plausibility), beyond their logical foundation (cf. Krawietz 1980, 426ff; Weinberger 1988b, 205ff.).

Thus, Weinberger expanded his legal logic by the theory of the justification of norms, with an eye to the reality of legal practice; he applied a similar treatment to his theory of law. While he uses the theory of the levels of the legal order—in the sense of the Pure Theory of Law developed by the Vienna School (Adolf Merkl, Hans Kelsen) and the Brno School (Franz Weyr, Adolf Procházka), (Walter 1964, Öhlinger 1975) with which Weinberger grew up, so to speak—as the "fundament of the structural theory of law" (Weinberger 1988b,

[48] On Weinberger, see also Section 18.3.2 in this tome.

108; my translation), he complements it with the sociological consideration of the reality aspects of law. He calls this consistent embedding of his normativistic analyses of law into the context of social and political action and of society's institutions *institutionalistic legal positivism* (Weinberger and MacCormick 1985, 4, 131). The proximity to H. L. A. Hart's theory is obvious (ibid., 126).

It remains to be stated that the elaborate instruments of legal logic have only rarely been used to clarify concrete legal problems on a larger scale. Two exceptions that deserve mention are Adalbert Podlech's *Gehalt und Funktionen des allgemeinen Gleichheitssatzes* (The content and functions of the general principle of equality: Podlech 1971) or Jürgen Rödig's *Die Theorie des gerichtlichen Erkenntnisverfahrens* (The theory of the judicial process of knowledge: Rödig 1979b). These, however, remained isolated swallows that failed to make a summer. Too great was the discrepancy between theoretical effort and practical benefit.

10.3.4. Systems Theory

The central political catchword of the reform period was "planning." As a matter of course, progressive social science at the time considered "reform politics during late capitalism" a problem of "political planning of complex social processes" (Scharpf 1973, 135ff.). The notion that it was possible to shape society in an ordered, rational way took hold in almost every aspect of life, beginning with the family and extending to education, urban development, land use, economic development, energy supplies and traffic, all the way to protecting and conserving nature. "Planning," as the Freiburg-based professor of constitutional law Joseph H. Kaiser proclaimed in 1965 in his preface to a series of a six-volume anthology on this topic, "is the great trend of our times. Planning is a *key term* for our future, currently pervading the general consciousness" (Kaiser 1965, 7; my translation). In an exalted tone, Kaiser's preface continues (ibid., 15; my translation): "The plan is the localization of utopia. A utopia that combines political will and the power of its realization meets its *topos* in time and space, and thereby becomes a plan." The political success of this "planning euphoria" is documented by a multitude of planning laws and governance regulations. Soon enough, jurisprudence developed a system of types of state planning, according to their subject, scope and level of binding effect. The theory of administrative discretion was expanded to include the dimension of "the freedom of planning design" (*planerische Gestaltungsfreiheit*). Given the explosion of goals and purposes described in planning laws, the extension of the administration's decisionary discretion was the only point of introducing the memorable term "final control programs" (*finale Steuerungsprogramme*), in contrast to the traditional, conditional decision-making programs following the pattern of if-then, which occasionally suggested a fundamental difference in the normative-logical structures. In any case, the neces-

sity of estimating the consequences of planning decisions for the future led to an increased jurisprudential interest in prognostics and in the consideration of possible consequences when making and evaluating legal decisions (Lübbe-Wolff 1981). This, in turn, resulted in the postulation of increased empirical social research. And this coincided with the demand for an in-depth reform of legal education, following the overall concept of *social engineering* (Roscoe Pound). The desire to displace dogmatic training in civil, criminal and public law in favor of social sciences, however, had another reason, a political one, based on the emancipatory ideas of the so-called critical social theory (cf. Wassermann 1970; Requate 2008, 161ff., 259ff.). We shall return to this point.

Another measure of the extent to which the idea of planning held sway at the time was the fact that Friedrich Tenbruck (1919–1994), a cultural sociologist in Tübingen who had completed his doctoral thesis in 1944 on Kant's *Critique of Pure Reason*, saw himself compelled to publish a study in 1972 with the highly ambitious title *Zur Kritik der planenden Vernunft* (On the critique of planning reason: Tenbruck 1972). The meaning of all this for the development of legal thinking was never illustrated more pointedly than by social theorist Niklas Luhmann (1927–1998). The creator of a systems theory which became philosophically relevant due to its universal outlook, and which considers society not ontologically as a comprehensive sum of all parts, but functionally, as a closed operational process of social communication, and is among the most successful and popular theories in the German-language region, had studied law and worked as an administrative civil servant before encountering Talcott Parsons and his structural-functionalist systems theory during a study visit to Harvard University. After completing his dissertation (1964) and habilitation (1966), he taught from 1968 to 1993 in Bielefeld as a professor of sociology. In 1973, he gave a lecture at the World Congress of Legal and Social Philosophy in Madrid which was devoted to the "functions of law" and posed the question of function with a view to the chronological aspect of past and future, of normative stabilization and planned change of social circumstances: *Die Funktion des Rechts: Erwartungssicherung oder Verhaltenssteuerung?* (The function of law: Securing expectations or controlling behavior?, Luhmann 1974a, 31ff.). The pointed question was whether the constant change of legal norms brought about by changes in society did not "change the function of law itself or even the meaning of normativity" (ibid., 32; my translation). If the conviction gains currency that judgments must ultimately be justified by their consequences (Podlech 1970, 185ff.), i.e., that in case of doubt consequences are the only valid criterion by which to judge law, in the end the future will judge justice and injustice, and the importance of forecasting the consequences of decisions increases in the present. Thus, the relevance of social sciences for jurisprudence became a central topic, at least in Germany (see Lautmann 1971). As Luhmann wrote in his provocatively drastic analysis of the intellectual situation in the early 1970s,

it is considered progressive to affirm the relevance of social sciences, and conservative to deny it. This political dichotomy replaces the dichotomy of justice and injustice. The main fear is that the law might be antiquated, not that it might be unjust. The attempts at reform focus on education. Jurists are to be educated to criticize society, and to change it wherever possible. (Luhmann 1974a, 34; my translation)

Thus, what was at stake was no less than the "meaning of 'ought'" and the differentiation between justice and injustice, which provided a structure for the entire legal system. Therefore, Luhmann opposed the rejection of legal dogmatics and pleaded for an "extension of the relevance of dogmatic considerations" (Luhmann 1974b, 55; my translation). Contrary to the tendency to "reduce complexity" in the outside relationship with its environment, in this situation the legal system must become more complex internally, while maintaining the closed nature determined by its structure of "ought." Only in this way, thus Luhmann, would the law be able to "bridge […] greater discrepancies between past and future" (Luhmann 1974a, 59; my translation), meaning that plans and behavioral rules for the future could be "controlled […] normatively," i.e., according to the model of justice and injustice, "with consideration of the past and present." This leads to a plethora of questions and problems which Luhmann's systems theory, however, can only describe, but not solve (ibid.). Luhmann's antithesis of past and present seems all the more characteristic of the *Zeitgeist* of the early 1970s, as "time" had played only a minor role—as a mere "ordering factor" in the decision process—when Luhmann adopted the matching terms of the conditional and the goal-oriented program, when characterizing the development from police state to rule of law, a few years earlier (Luhmann 1968, 58ff., 162ff., 172ff.).

Beyond inducing a certain healthy insecurity, resulting from the perception that jurisprudence and sociology arrived at completely different descriptions of the same situation, Luhmann's legal sociology—as he acknowledged himself—is only occasionally and coincidentally useful to jurists (Luhmann 1986, 44ff.). Thus, it only fulfils a critical function by exposing the "nature" of legal institutions through the conditions of their substitutability with functional equivalents (Dubischar 1983, 79). However, it is as pointless to lament the consequence of the lack of normative elements in Luhmann's purely descriptive systems theory as it would be to lament that a *football* stadium offers no games of *Fußball* (soccer).

In his late work *Das Recht der Gesellschaft* (The law of society: Luhmann 1993), Luhmann repeated and confirmed his point of view on a higher level of abstraction. In reviewing the decades of reform, he explicitly positioned his systems theory—which had been developed further in the meantime through the inclusion of the concept of *autopoiesis*, the self-differentiation of communication systems—against all linguistic, logical, hermeneutic, rhetorical, institutional and similar theories of law and reflective theories of law (ibid., 11ff., 18, 36). His main objection was that all legal theories retained the "inside perspec-

tive" of law, and thus considered the concept of the norm as basic and indispensible. His legal sociology, on the other hand, remains "wholly on the level of what sociology can state as fact." Among these facts, a norm merely lends a definite form to expectations that can be objectively observed. Thus, the point is not to transfer sociological theorems to the area of law, but to establish a theory of society, with its law as a partial system. According to Luhmann, the systems theory of law is addressed to "science itself, and not the legal system" (ibid., 31ff.; my translation).

Werner Krawietz offered a fundamentally different systems theory in his *Recht als Regelsystem* (Law as a System of Rules), a collection of essays from 1970 to 1982, in which he focused instead on the "classical topics and problems of jurisprudence, such as the identification of rules as law, the interpretation, application and development of law as well as the legal formation of terms and systems," thus attempting to complement analytical legal theory and legal sociology with "legal realism as a critique of meaning" (*sinnkritischer Rechtsrealismus*) (Krawietz 1984b, XIff.; my translation).

10.3.5. The Hermeneutical Counterpoint: Understanding Meaning Instead of Objective Structural Analysis

As analytical philosophy, whose effects we have traced at least in outline, began to spread, it met with opposition early on. This sparked a controversy which has entered the annals of German sociology as the "positivism dispute" (*Positivismusstreit*). The debate sprang from the lectures given by Karl R. Popper and Theodor W. Adorno at the Conference of the German Society of Sociology in Tübingen in 1961, on the "logic of social sciences" (Adorno et al. 1971, 103ff., 125ff.). In the following dispute, which lasted until the Society's 1969 congress in Frankfurt and whose protagonists were Jürgen Habermas (1929–) and Hans Albert (1921–) (ibid., 155ff., 193ff.), the original question, which had focused on the philosophy of science, increasingly shifted towards a political dispute between neo-Marxist social theory, criticizing the ruling authorities on the one hand, and social technology, which supposedly stabilized and legitimized the existing power structures, on the other (Habermas 1971b, 142ff.). In 1963, Habermas sketched the original issue in *Analytische Wissenschaftstheorie und Dialektik* (Analytical philosophy of science and dialectics: Habermas 1971a), his contribution to the *liber amicorum* for Adorno, roughly as follows (ibid., 156ff.): Analytical theory only recognizes a formal concept of the system as an interdependent relationship between functions which are understood as variables of social behavior. Therefore, theories are merely formulas for order based on constructs, and must be measured against experience. The process of "controlled observation of physical behavior, taking place in an isolated field under reproducible circumstances, by randomly interchangeable subjects" (ibid., 159; my translation) is therefore basically the same in nature

and cultural sciences beyond all value judgments. The insights of sociology—always conditional—are not applied directly to practical life issues, but merely offer technical advice regarding a rational choice of means to achieve goals. The dualism between the scientific collection of facts and the decisions that affect and shape life is viewed as irresolvable. In contrast, Habermas's dialectic theory insists upon the difference between natural sciences and sociology, and, in opposition to a functionalistic definition of system, upon a "dialectic concept of totality" (ibid., 156; my translation). The totality of the social circumstances of existence, of course, can only be grasped by "hermeneutic anticipation," which must "prove its correctness during the course of the explication" (ibid., 161; my translation). This circle cannot be broken; it must be "thought through dialectically in connection with the natural hermeneutics of social life" (ibid., 158; my translation). History is another area dialectic theory approaches hermeneutically; however, it is not content with "subjective hermeneutics aimed at understanding meaning," but deciphers the objective context of meaning of the historic situation with a view to the interests of social reproduction, so-to-speak "behind the backs of the subjects and institutions" (ibid., 164; my translation). The decisive factors in this process are the tendencies of historic development. "Society reveals itself […] only in what it is not" (ibid., 165; my translation): Thus Habermas.

It is no coincidence that this self-reflection by the Frankfurt-based "Critical Theory," with its central goal of understanding the meaning of the overall social context and its laws of motion, mingled with the widespread resonance Hans-Georg Gadamer's (1900–2002) 1960 *Wahrheit und Methode* (Truth and method: Gadamer 1965), with its questioning of the very possibility of understanding, was enjoying. Gadamer too tried to overcome the modern philosophy of subjectivity by interpreting understanding as a non- and supra-individual, all-encompassing and universal process taking place in the medium of language. According to Gadamer too, the hermeneutic circle cannot be resolved, but instead it is an "ontological structural element of understanding" (ibid., 277; my translation). Moreover, in the inevitable application of understanding to one's own life practice and to the self-encounter in the set text (ibid., 312ff.), hermeneutics is not a method, but, in a measuring of remembered truth against the here and now, a practical philosophy providing orientation in the world. It is the "anticipation of perfection" (ibid., 278; my translation), which leads all of Gadamer's understanding, that returns in Habermas's "hermeneutic anticipation" of the totality of the social context of life. For our topic, it is mainly important that Gadamer considered legal hermeneutics to have "exemplary importance" inasmuch as it concretized the law by mediating between general laws and the individual, special case (ibid., 35ff., 307ff., 312ff., 489ff.). He even went so far to label "the re-definition of the hermeneutics of the human sciences through legal and theological hermeneutics" a current philosophical task, one he highlighted in his text (ibid., 294).

Thus bilaterally sensitized towards the topic of "hermeneutics" at a time of more or less dramatic changes and insecurity, German legal scholars produced a sudden outburst of contributions on legal hermeneutics from the mid-1960s to the early 1970s. These went back to an older tradition founded by Schleiermacher and opposed analytical philosophy by concentrating—as classical jurisprudential tradition would have it—on individual judicial decisions within the framework of a given legal system; at the same time, they also rejected the critical social theory with its claim of totality. When Arthur Kaufmann, an inveterate registrar of any new tendency, published an essay in 1975 significantly entitled *Durch Naturrecht und Rechtspositivismus zur juristischen Hermeneutik* (Via natural law and legal positivism towards legal hermeneutics: A. Kaufmann 1984a, 79ff.), this was already a small retrospective of the just-experienced "beginning of the development" of new legal hermeneutics (ibid., 86; my translation), for which he himself had already provided inspiration ten years previously in his plea for a "typological manner of thinking" when applying law according to the "nature of things" (cf. Section 10.2.3). Trusting in the "insight" of "recent philosophical hermeneutics," Kaufmann abandoned his own ontological concept of law as fixed, objective relations, and followed Gadamer's circular philosophy of understanding instead. According to Kaufmann, this was the only way to overcome the methodological dualism between "is" and "ought" and the identification of law with its written norms. Kaufmann's new standpoint is very important, symptomatically, and can be defined by three theses: 1. Law is only the possibility of justice, and requires completion by outside elements. 2. Law must be concretized in its given historical situation. "Correct law," therefore, is not a fixed entity or state, but something which "*takes place historically* in a never-ending process" (ibid., 81; my translation). 3. Understanding the text is thus "a practical, creative *action*" (ibid., 85; my translation).

A somewhat more differentiated view of legal hermeneutics was provided in *Vorverständnis und Methodenwahl in der Rechtsfindung* (Pre-understanding and choice of methods in the application of law: Esser 1972*)* by Josef Esser (1910–1999). This is easily understood when considering that the scholar of civil law, unlike the criminal law scholar, deals not with a comparatively simply structured system of sanctions for socially detrimental behavior, but instead with a highly differentiated complex of model solutions for conflicting interests. According to Esser, the exemplary importance of legal hermeneutics lies in the fact that the hermeneutic circle appears here as a "circle of application" (*Anwendungszirkel*) (ibid., 139; my translation), inasmuch as the jurist defines the understandability of the text according to its possible application. In other words, the "questioning of the norm" depends upon a "decision-related pre-understanding of the conflict situation," which defines the general, non-individual "horizon of expectation" for the judicial decision. Esser sees the interpreting judge as a mediator between this social understanding of law

of those involved, a horizon of expectation that may thus be new, and the "legal system's dogmatic tradition of order" (ibid., 140; my translation). Since this tradition, however, is only understood "depending on time and society," as Esser emphasizes with reference to Gadamer and Habermas, the "interpreter's dogmatic attitude" is ultimately hitched to the "general changes in consciousness" (ibid., 141; my translation). Apparently, the objective changes this effects are certain common, pre-positive ideas of justice and reason; these, however, only become apparent through a hermeneutic anticipation of the whole (ibid., 23).

The state of consciousness of the stakeholders, which Esser described as ultimately decisive for the interpretation and application of law, had changed—increasingly obviously—in one other respect since 1958. This was the year in which an extraordinarily consequential process had begun, sparked by the so-called "value order decisions" (*Wertordnungsrechtsprechung*) of the Federal Constitutional Court, which had been established in 1951. By calling the "objective value order of the basic rights" a "value system" in its well-known "Lüth Case," a value order that must be "valid for all areas of law" and inform all the state's activities, the Court gradually achieved a complete "constitutionalization" of the entire legal system (cf. Section 10.2.4). This establishment of a comprehensive and—due to the authority of the country's highest court—exclusive horizon of legal meaning soon encompassed the whole of jurisprudence. This spreading of a certain "Constitutional Court positivism" (Schlink 1989, 161ff.) is comparable to the blossoming of legal positivism which followed the establishment of a central law-giving body in Germany in the shape of the *Reichstag* in 1871. One might say that the "anticipation of the meaning as a whole," previously oft-postulated by legal hermeneutics, subsequently materialized at least in a first step as an anticipation of the Constitution's meaning as a whole. Two impressive milestones of this "constitutionalization" of legal thought are provided by two habilitation theses which appeared almost at the same time in the mid-1960s. One of them, written by Friedrich Müller (1938–) in Freiburg and published in 1966, is entitled "Normstruktur und Normativität" (The structure of norms and normativity: F. Müller 1966) and is devoted to the clarification of the relationship between law and reality in hermeneutics. The other was authored by Martin Kriele (1931–) in Münster and published under the title "Theorie der Rechtsgewinnung" (The theory of the finding of law: Kriele 1967, i.e., the interpretation and authoritative application of laws) in 1967. The element that unites both, beyond the central issue of the interpretation of laws, is indicated by the subtitles: It is the primary problem of the interpretation of the Constitution. While Müller begins with the traditional contrast between norm and fact, he does not wish to overcome it theoretically, but instead to resolve it "hermeneutically" by the intellectual process of interpreting the norm, in such a way that he adds a mediating level between the normative arrangement of the law and the real-life situation it is

aimed at, a mediating level that is "hermeneutic," i.e., affecting the process of interpretation and application, but is not real or objectively comprehensive. It serves as a kind of case-specific definition of the elements concretized in the law, and thus it belongs to the positive norm—constituting what Müller called the "norm structure"—without, however, participating in the regulating character of the norm with its comprehension of the objective problem structure, i.e., without pertaining to the true normativity of the norm. Indeed, the norms of the Constitution, which are mostly open and often incomplete and cannot be executed in and of themselves, must usually be made operational through the assignment and adaptation of real-life situations which they apply to.

> As a typological intermediate level, the norm area (*Normbereich*) identifies a potentially real structural area of real, individual cases that might be subsumed under the regulation. Topical hermeneutics uses the intermediate level of a typical concretization of the program (*Normprogramm*) and the area of the norm to connect 'the case' with 'the norm,' both of which are not isolated endpoints of the application, but integral parts of it. (F. Müller 1966, 191–2; my translation)

The hermeneutical "progress" presumably consists of the fact that first of all, this mediation does not circle around the pre-judice that conveys meaning but must also be overcome, but moves around the poles of norm program and norm area in an elliptical fashion (ibid., 186ff., 196); and secondly, that the *topics* become the postulation of a typology ordered according to case groups (ibid., 189). This process, however, does not reduce those aspects requiring justification, but rather increases them, in the sense of a more finely honed and sophisticated interpretation. The clearest trace of the constitutionalization of legal thought is evidenced by the paradox that the so-called norm area is viewed as a hermeneutic part of the norm—which is therefore not identical with its literal wording—but that the topical interpretation, on the other hand, is not supposed to exceed that wording on any account, for reasons of the rule of law (ibid., 147ff.). In his general *Juristische Methodik* (Legal methodology: F. Müller 1997) which Müller developed from the beginnings described above and which no longer confined itself to the constitutional realm, this anchoring in the constitution—which was our point of departure—is clearly stated:

> Since questions of methodology are factual questions, the problems of methodology today cannot be separated from the specific nature of this Constitution, from its subject areas and from the fate of this constitutional order as part of the history of the Federal Republic of Germany so far. (F. Müller 1997, 208; my translation)

Furthermore, regarding the sore point of the supposedly insurmountable interpretational limit of the wording of the Constitution, it is now sensibly understood only as a "relational limit": The binding nature of the law is "realized in the process of *creation* of the legal norm" (ibid., 238; my translation). On the one hand, the judge is "originally" bound by the applicable text of the lawgiver's norm. "On the other hand, he [must] establish its case-deciding *mean-*

ing first, as the 'normativity' of the legal norm." In this process, however, he is not free, but "bound by the standards of an argumentative culture" sanctioned by the constitutional state (ibid.). The content of these statements, however, might also be summed up as follows: "A judge does not violate the wording of a law as long as his interpretation remains within the boundaries of recognized interpretational standards." Whether this is preceded by the sentence "A judge is bound by the wording of the law," or "A judge is not bound by the wording of the law," seems fairly irrelevant to the observer. Moreover, Müller leaves the question of the European dimension of the interpretation of the constitution open. (Incidentally, this is an area to which the Bayreuth-based professor of constitutional law Peter Häberle (1934–)—like Müller, a student of Konrad Hesse, professor of constitutional law in Freiburg and judge at the Constitutional Court—has dedicated much of his output for many years).

What remains to be added is that Müller originally used the terms "hermeneutics" and "hermeneutical" in such an inflationary manner that categorizing his 1966 work as part of the newer school of legal hermeneutics seemed to suggest itself. The second edition, which appeared in 1984 as Part 1 of a *Strukturierende Rechtslehre* (Structuralizing legal theory: F. Müller 1994), however, wishes to be read as a "theory of norms" or "legal (norm) theory." Furthermore, it is no longer labeled as "legal hermeneutics," but explicitly as a "jurisprudential norm theory" (ibid., 11; my translation). Therefore, the terms *hermeneutic* and *hermeneutics* are replaced by *methodological* and *methodology*, or more frequently *norm-theoretical* and *norm theory* or *legal (norm) theory* (cf. ibid., 244ff.). To give just one example: In the first edition, explicit reference is made to Gadamer and the subject of discussion is an "understanding of hermeneutics" which asks "how a legal regulation may be appropriately concretized"; in the second edition, the Gadamer quotation has been omitted, the term "hermeneutics" has been replaced by "methodology," and the essential question has been specified: "how a legal regulation may be concretized rationally, while still attached to the norm in accordance with the rule of law and democracy, i.e., as demanded by the constitution" (ibid., 66; my translation). The addition of a second part, intended to demonstrate practical utility—"The static structural model of the legal norm is complemented by a dynamic, developing model of concretization" (ibid., 1; my translation)—makes the entire construct into a theory of law which structures law by differentiating between norm, normativity, norm text, norm program, norm area and norm structure. Thus, today it considers itself not only a rationalization of legal methodology for the decision of individual cases, but—in explicit competition with Kelsen's "Pure Theory of Law"—as a "post-positivistic," non-formal concept which is supposed to "lend scientific structure" to the content and formal aspects of positive law (ibid.). In this manner, his method claims to combine "legal (norm) theory, methodology and dogmatics" and also constitutional law. Thus, Müller ultimately joined those efforts at legal theory that aimed for the scien-

tific modernization of legal thought after the end of the so-called renaissance of natural law and the philosophy of values.[49]

Like Müller, Martin Kriele attempts to "open up the legal thought process in constitutional law to the rational control of jurisprudence" (ibid., 16; my translation). And like Müller, Kriele too makes this attempt consciously "under the conditions of the rule of the Bonn *Grundgesetz*" (ibid., 158; my translation), with a view to the method used here "*on the whole*" (ibid., 155; my translation). The rational basis for the non-formal content of this operation is the rationality which has "expressed itself […] in the history of progress of our legal and constitutional system" (ibid., 185, 336; my translation). This basis derives its "clarity and plausibility" from the "overall context of a political theory oriented towards constitutional history" (ibid., 337; my translation), like the one that Kriele introduced himself in 1975 under the title *Einführung in die Staatslehre* (Introduction to political theory: Kriele 2003). "If, however, constitutional law in the democratic constitutional state can only be understood *on the basis of the historic conditions of the European tradition of reason*, then it follows that it can also only be developed further on the basis of this understanding" (ibid., 338; my translation). This means that not all the value judgments necessary for the process of legal interpretation and application of laws can or need to be derived from the *Grundgesetz* itself. After all, neither the law maker nor the constitution-giver can monopolize all legal evaluations (ibid., 6). Consequently, the possible literal meaning as the supposedly insurmountable limit of constitutional interpretation plays no role in Kriele's hermeneutics. Only this: "Wherever the law-giver or constitution-giver has made decisions, these are binding" (ibid., 160; my translation) and this bears repetition: The "decision," not its literal wording.

Incidentally, Ralf Dreier's constitutional theory with its much-discussed "incorporation thesis" (*Inkorporationsthese*) shows great similarity with Kriele's. Dreier ultimately did not follow any of the three paths he had identified in his inaugural lecture in Göttingen in 1974 (see Section 10.3.2.1). Instead of pursuing legal theory further as a theory of legal dogmatics or as argumentation theory, or working on the development of a non-formal legal theory as part of a non-formal theory of society, he turned towards an integrative theory of law, i.e., one that encompassed structural, normative and social elements, as opposed to only legal dogmatics, for which he saw the "return to the tradition of political enlightenment and especially to Kant" as characteristic (R. Dreier 1981b, 8 ff., 180ff.; my translation). However, there is no tendency whatsoever here towards forming a neo-Kantian school. Agreeing to a great extent with Kriele's legal and political theory, which was inspired by the Anglo-Saxon legal tradition, he emphasizes that legal and political theory as well as legal and moral theory belong together (ibid., 14), thus rejecting the positivistic "separa-

[49] Müller's theory is discussed excellently by Bernhard Schlink (1976, 94ff.).

tion hypothesis" and propagating a "definition of law that has been modified (in the weak sense) in terms of legal ethics, and is therefore appropriate to the subject and problem" (ibid., 14; my translation). However, it only claims validity where the conditions of the rule of law are fulfilled. After all, only under those conditions does positive law already "incorporate" principles of morality and justice, by way of the constitution (ibid., 193). As examples—with a view to the rational and legal ideals of Enlightenment—he lists the basic rules of the German constitution regarding human dignity, liberty, equality, the division of powers, republicanism and democracy. For the problem of the obligation to obey laws, this amalgamation of Kantian tradition and "Radbruch's formula" results in the general principle "that one should obey the constitution, supposing that such constitution fulfils the criteria of the rule of law, and also obey the laws passed according to the rules of such constitution, supposing that these are not in evident conflict with the principles of morality and/or justice" (ibid., 197; my translation).

10.4. The Welfare State in Crisis: The Rehabilitation of Practical Philosophy and the Return of the Idea of Justice

10.4.1. Crisis Symptoms and the "Rehabilitation of Practical Philosophy"

In 1975, a German translation of a Harvard professor's book was published which had caused a stir in the USA in 1971 and had gone on to inspire philosophical discussion around the world: John Rawls's *A Theory of Justice* (Rawls 1975). It is not surprising to find that the "main structures of the concept of justice" are developed here in opposition to the great utilitarians, ranging from Hume to Bentham to John Stuart Mill: What is surprising is *how* it is accomplished. Admittedly, criticism of classical utilitarianism had become widespread even in the Anglophone countries. Moore, Hare, Toulmin and other meta-ethicists, however, criticized it from a standpoint of linguistic analysis, operating with the contrast between "is" and "ought," the difference between descriptive and normative statements and the accusation of a "naturalistic false conclusion" (E. Savigny 1993, 166ff.; my translation). Rawls, however, simply leaves this "English variation of the German 'value judgment dispute' (*Werturteilsstreit*)" (Lasars 1982, 38; my translation) in sociology aside, returning instead to Kant and the "social contract theory" (Rawls 1975, 15), which he translates into the language and concepts of modern game and decision theory. Thus, this renewal of the philosophy of justice was not seeking a yardstick by which to measure legal norms or judicial decisions, nor did it lead to an imperative for all protagonists of legal life or an appeal to virtue; instead, it discussed the qualities of a fair social system for the distribution of goods and the possibility of consensus regarding the social constitution of a community. The extraordinary popularity the work enjoyed in Germany may have had something

to do with the liberation it promised from so many more or less formal theories, and its return to traditional, familiar, "old-European" philosophy. As a return to Kant, it also signaled a movement towards political philosophy, i.e., the unity of the philosophy of law and state, which had last been taken for granted by German Idealism. By returning to Kant and reviving the idea of the social contract, this new philosophy of justice also rejected the Marxist Hegelianism of the "New Left." Thus, it ran parallel to a thought process that was also already noticeable in the new legal hermeneutics, and which has been called the "rehabilitation of practical philosophy" in the traditional sense (Riedel 1972, 1974). Its attempts to restore the reputation of a unified philosophical treatment of morality, law and state had begun in the field of philosophical history, with Joachim Ritter's 1960 essay on the foundations of practical philosophy in Aristotle's work (Riedel 1974, 479ff.). Now, this recourse to the classical tradition of philosophy was aimed both against Existentialism's mere individualistic analysis of human existence and against all varieties of neopositivism (Riedel 1972, 10). Once the battle-lines had been drawn up, terms that had been abandoned as particularly unhistorical and unrealistic during the 19th century, such as the original state or the social and government contract, enjoyed a revival of interest as "elements of an *a priori* normative construct."[50] Thereby, legal philosophy also lost some of the character of a specialized, more or less formal philosophy of jurists which it had acquired. Rawls turned legal philosophy into a subject that was once again of interest for general philosophers.

However, there was another, more deep-seated reason for the strong resonance Rawls's theory inspired: During this period, the crisis of the social state began which has lasted until the present and occupies us to this day, also in theory. It began with characteristic symptoms: In 1975, the Federal government's new debt increased by 46.1% over the previous year, and the number of unemployed reached more than 1 million, after years of full employment. Base unemployment increased, and there seemed no end to further debt. The so-called oil-price shock, a true economic slump followed by severe recession, and the currency turbulences connected with the breakdown of the global monetary system of Bretton Woods were severe blows for the Federal Republic of Germany, which was growing into an economic world power. In addition, there was regrouping within the economic sectors as the country turned into a service economy—in short, the "end of the modern era of industrialism" (Conze 2009, 517; my translation; cf. Doering-Manteuffel and Lutz 2008, 34ff.)—and all these factors eroded the foundations of the social security systems. Furthermore, demographic changes played a major role. Beginning in the 1970s, the percentage of social security contributions to the gross national product rose just as massively as the level of social spending in public budgets.

[50] See also the anthology by Alfred Voigt (1965), part of the programatically titled series *POLITICA*.

"The dream of perennial prosperity was dead" (Conze 2009, 468; my translation). Since social pressure could no longer be alleviated by spending surplus contributions, it was time to consider the issues of distributive social justice.

Thus, the strong reverberation of a book by a political scientist demanding democratization of the economy and its re-ordering through socialization in the name of the constitutional clause guaranteeing the social state came as no surprise: Hans-Hermann Hartwich's voluminous work *Sozialstaatspostulat und gesellschaftlicher status quo* (The postulate of the social state and the social status suo: Hartwich 1970), published in 1970, saw two further editions during the following eight years. At the same time, the awareness of ecological destruction, the increasing shortage of resources, the population increase and the enormous prosperity gap between the rich and poor countries grew even beyond national borders.

Even before the major impulse with which Rawls propelled legal theory and legal philosophy rather abruptly in the direction of a renaissance of political philosophy, a similar, albeit not nearly as widely noticeable voice had been registered in the German-language region. It hailed from a world of greater continuity and a political conscience that had grown over a long time. Thus, the Swiss scholar Hans Ryffel (1913–1989) brought the "close connection between law and state" as the outstanding elements of political thought back into focus. Without falling prey to any form of metaphysical speculation, his "philosophy of law and state," conceived as a philosophical anthropology of politics (Ryffel 1969; my translation), wishes to separate the theory of neo-positivism and linguistic analysis from the "pre-conceived notions" with which they reject "the question of the basic structure of human reality and […] the law and the state, or the question of absolute rightness or even rightness in general," considering them "supposedly unscientific and pointless" (ibid., 11; my translation). Then, he immediately clarifies that any return to the question of rightness must proceed from the assumption that today, it must be answered "in a democratic manner" (ibid., 13; my translation). After all, after the downfall of preordained absolute systems of order, the criteria for rightness may lie within the human possibilities of self-realization (ibid., 308ff.), i.e., in human autonomy (ibid., 433), which also forms the core of political democracy (ibid., 441). This pluralization of metaphysical holistic and ultimate interpretations excludes any formulation of absolute rightness which would be binding beyond the individual. Still—and this is where Ryffel's democracy theory differs from Kelsen's—this thought of absolute rightness is essential, because only this transcendental precondition of a common human cause enables ever-searching individuals to struggle for what is right and obliges them to engage in dialogue. Declaring the criteria of rightness themselves as relative, and not just his attempts at phrasing the opposite, necessarily leads to self-destruction or to violent dogmatization (ibid., 273ff., 294). No one may lay claim to occult knowledge, everyone must state his reasons, but may also voice his criticism as

in science, thus in politics and law (ibid., 275, 447). In law, too, all concepts and insights are preliminary and subject to unlimited criticism by all. Only the political system of democracy is able to combine autonomy and an obligation to follow the state's laws

> if (1) what is right is not dogmatized by any party, (2) everyone, or at last their representatives, together determine the fundamental norms (laws), (3) everyone has equal access to state office and functions, (4) specialized knowledge is fully taken into account and (5) open criticism and control by everyone is guaranteed. (Ibid., 441; my translation)

The common good of a modern state organized in this manner consists in guaranteeing the development of all its citizens (at least in a minimal way) as a "welfare state" (ibid., 468). Ryffel sees the actual goal of development, however, beyond the welfare state which creates the concrete conditions for dignified human liberty, in the self-responsible existence of all, free of direct influence from the state, apart from the necessary establishment of boundaries (ibid., 475).

One very significant example for the transformation of the problem towards the question of the right and just law, in the sense of a just order of social life as a whole, is the shift of emphasis in Arthur Kaufmann's work. Although the concept of justice did not play a special or even outstanding role, neither at the beginning of his legal-philosophical path— characterized by himself as "ontological legal objectivism," born from the epochal shattering of legal consciousness (A. Kaufmann 1984b, VII)—nor after his "metamorphosis" (again, his own term) into a practitioner of legal hermeneutics (ibid.; 1984c, VII), this now changed. Between 1984 and 1989, no less than three pieces authored by Kaufmann appeared which name the concept of justice in their titles: *Theorie der Gerechtigkeit* (Theory of justice: A. Kaufmann 1984d), *Gerechtigkeit – Der vergessene Weg zum Frieden* (Justice: The forgotten path to peace, A. Kaufmann 1986), and *Prozedurale Theorien der Gerechtigkeit* (Procedural theories of justice: A. Kaufmann 1989). And in 1992, he dedicated the second edition of his final lecture *Rechtsphilosophie in der Nach-Neuzeit* (Legal philosophy in the post-modern era: A. Kaufmann 1990) programmatically to "all legal philosophers who never cease to confront the true problems of legal philosophy, especially social justice […]." That was exactly Rawls's point. Thus, Kaufmann's merely formal categorization of Rawls's philosophy of justice as one of the procedural theories of justice is not far-reaching enough.

10.4.2. Political and Social Justice

None less than the great analyst H. L. A. Hart confessed: "No book of political philosophy since I read the great classics of the subject has stirred my thoughts as deeply as John Rawls's *A Theory of Justice*" (Hart 1989, 230, 348–50). Obviously, this was an experience shared by many. Only three years after its publi-

cation, about 60 English-language reviews had appeared. In Germany, one of the first scholars to study Rawls's work (even before the German translation was published) was Otfried Höffe (1943–), who went on to become professor of philosophy in Fribourg, Switzerland, and later in Tübingen (Höffe 1975, 187ff.). His preoccupation with the work was a lasting one. However, it was obviously not Rawls's egalitarian and liberal theory of a just distribution of goods, not the justification of the liberal social state under the rule of law, but Rawls's methodological recourse to the law of reason which Höffe—the philosopher who had recently (1971) completed his habilitation thesis in Munich on the practical philosophy of Aristotle, following the trend towards a rehabilitation of practical philosophy—considered a reactivation of classical political philosophy and a demonstration of its current possibilities. Thus encouraged, in 1987—now in the politically rather dampened atmosphere of the Kohl era, when history seemed frozen in Arnold Gehlen's *posthistoire* (Welsch 2008, 17ff.)—Höffe published his voluminous "foundations of a critical philosophy of law and state" entitled *Politische Gerechtigkeit* (Political justice: Höffe 1987). The work— appearing a good ten years after the supposedly final fragmentation of legal philosophy into multiple varieties of diverging legal theories—deals with the "ethical idea of law and state" as the basis of the justification and limitation of law and state (ibid., 11; my translation). A comparable tone had not been struck in Germany since the triumph of positivism in constitutional law: About 100 years earlier. Höffe audaciously undertakes to establish a "fundamental philosophy of the political" (ibid., 33; my translation) in the form of a theory of justice (ibid., 35), thereby taking back for general philosophy what had been lost to jurists and jurisprudence's legal philosophers since the days of Rudolf von Jhering, when "jurisprudence of concepts" (*Begriffsjurisprudenz*), realism inspired by the social sciences, legal positivism and later—reflexively fragmented—legal methodology arose and began to dominate the field.

Accordingly, the author begins by first providing a philosophical critique of "positivism of law and state." Having shored up the possibility of a supra-positive critique of law and state through an anti-critique of the natural law critique (ibid., 88ff., 109)—Kant looms somewhat unclearly in the background—and having destroyed the "myth" of *only one* legal positivism (Hoerster 1989), Höffe proceeds to prove his hypothesis. It claims that "law in general" requires a "basic layer of justice" (Höffe 1987, 171ff.; my translation) without which a social order cannot even be defined as a legal order. This law-defining element is the distributive (i.e., not just collective) advantage that the order brings to all its constituents. Whether explicitly or implicitly, this is a point conceded by all the legal positivists quoted as examples. The proof is easy to follow in the case of Hobbes's *Leviathan*, one of his main examples, but it fails in the case of the second main example, Kelsen's *Pure Theory of Law*. Of course, it is easy to accept that the famous statement *non veritas sed auctoritas facit legem*, with which Hobbes subjected the claim of the proponents of *com-*

mon law to have their rights recognized to the law-giving authority of the king, was based on the representative authority of the sovereign, grounded in law, although the statement was frequently distorted into a bogeyman of positivism (cf. Hofmann 2008d, 19ff.). The sovereign has absorbed the will of everyone, and therefore demands submission from all and, in exchange, protects all, thus conveying a "distributive advantage." The salient point of Höffe's criticism of Kelsen is Kelsen's apparently provocative hypothesis in his *Pure Theory of Law* that "any random content (might) be law" (Kelsen 1934b, 201; Höffe 1987, 153; my translation). Höffe's counter-hypothesis is: The claim that the content of legal norms is arbitrary is only valid under the condition that this legal order assumes as given the law-defining element of justice, i.e., collective security. And indeed, Kelsen characterizes collective security as a basic function of any legal order (Kelsen 1934b, 38ff.). However, he states explicitly that this recognition of the peace-keeping function of law does not imply "the assignment of a value of justice" and therefore cannot serve to distinguish between robber bands and states in the sense of the famous Augustine question "Justice removed, what are states but great bands of robbers?" (*Civitas Dei* IV 4), which Höffe quotes extensively. After all, even among robbers, robbery and murder are prohibited as a matter of course. Otherwise, "there would be no community, no 'band' of robbers." Although originally, Höffe discussed the "legal form of social coercion" as opposed to other forms of social coercion," Part 2 of his work, which explores "anarchism" (which, however, remains without a concrete historic profile), sets out to prove "that coercion of humans by other humans is permissible at all" (Höffe 1987, 192; my translation). Since the extensive reasons for social cooperation, following Plato and Aristotle, justify a society, but not a community employing coercion, this leads to the question of the avoidability or unavoidability of human conflicts that necessitate coercive force. The "proof" consists in the all-too-familiar "thought experiment": The idea of a natural state according to Hobbes's model (ibid., 289ff.). The result is predictable: The freedom from rule leads to unlimited despotic rule of humans over humans (ibid., 341). In order to demonstrate that political justice is "the basic principle of a free community" in the crowning third part of his work, Höffe aims to demonstrate "that a free coexistence guided by rules is […] superior to spontaneous self-regulation; then, that the institutionalization of rules in general […] and ultimately, that their institutionalization as a legal system of state is even more advantageous for all involved" (ibid., 381; my translation). These assumptions seem plausible to a jurist; however, one has a hard time following the argument of the proof. According to Höffe, the state's institutionalized coercive force guided by the rule of law results from the collectivization of the rights to exercise force which supposedly accrue to the individuals as universal human rights of coercion from their reciprocal renouncement of liberties (Höffe 1991). A public coercive force resulting from private barter? Incidentally, towards the end the author concedes self-critically that one might

argue against his legitimation theory that it only justifies a minimal state "confined to protecting its citizens against violence, theft, fraud and guaranteeing the enforcement of contracts, and therefore blind to the specific problems of the 19th and 20th century" (ibid., 469; my translation). Indeed, that exactly is the case.

It was the reunification of Germany which led once again to renewed interest in the topic of social justice, and thus the core of Rawls's theory of justice. After all, the political and constitutional end of the country's division turned the differences between two social systems into an urgent social problem of the just division of goods and obligations within the country. Studies in social psychology undertaken during that period illustrate this point very impressively (Montada 1996). Wolfgang Kersting (1946– , professor of philosophy in Kiel since 1993) has devoted intensive thought to Rawls's distributive justice. The pertinent works by Kersting, who delivered his habilitation thesis in 1982 in Hannover (which, according to the preface, attempted "an extensive philosophical rehabilitation of Kant's legal philosophy"), aim for a goal that is equally grand and distant: A legal philosophy of the democratic social state (Kersting 2000a). The point of departure is his criticism of the so-called difference principle in Rawls's theory of justice. Following the postulate of equal liberty for all, this second principle of justice states that social and economic inequalities can only be justified if they are beneficial to the least-advantaged members of society. This principle is institutionalized by a distributive system that assigns goods not according to the needs or wishes of individuals, but with a view to their belonging to certain groups or classes. Despite this, Rawls "is celebrated quite undeservedly as the philosopher of social democracy and welfare-state capitalism" (Kersting 1997, 239; my translation). For at most, his theory is one of the just distribution of advantages within the community of cooperating individuals, or more concretely: Of those in possession of employment. Indeed, Rawls designs a just system of the distribution of goods within a cooperative community of citizens acting rationally and economically, even if they are unskilled laborers or only marginally employed (Hofmann 2008a, 56ff.). Outside the field of mutually advantageous cooperation, Rawls's theory is inapplicable. The unemployed, unemployable, elderly, sick and disabled have no place in it. As an individualistic and egalitarian justice principle of mutual advantage, it fails to cover this area of genuine solidarity within the social state. This is the point Kersting's argumentation proceeds from. He seeks a theoretical justification for the extension of distributive justice to the larger community of solidarity of the social state. To this end, he puts forward three main arguments: One concerned with the rights of liberty, one with the theory of contracts and one with ethics and ethos. The first is based upon the famous *numerus clausus* decision of the Federal Constitutional Court of 1972, which caused quite a stir at the time with its mere consideration of deriving an original, actionable entitlement (like the creation of university places) from a right of liberty (like the right to choose

one's profession and educational institution freely).[51] In the meantime, though, neither the Court nor scholars of constitutional law have drawn this consequence. Only the right to a guaranteed minimum subsistence, including humane accommodation, has been recognized (H. Dreier 2004). However, this right has been derived not from the idea of liberty, but human dignity. Kersting's argumentation, on the other hand, goes beyond these "welfare provisions of the social state" and aims for "freedom provisions of the social state" instead (Kersting 2000b, 21ff.; my translation). In his opinion, the "obligation to establish a social state" necessarily follows "human rights and liberty, which carry the obligation to establish the rule of law" with the consequence that the social state— which is beholden not only to guarantee mere subsistence, but is oriented towards the person who "wishes to lead an independent and self-responsible life"—must guarantee an "adequate non-formal subsidiary possibility of individual liberty" for "those who cannot provide for themselves," regardless of the cause of such inability (ibid., 24ff; my translation). At the same time, with this rather Kant-inspired argumentation, the author turns against those discourse theorists—whom he considers followers of Rousseau—who, according to the illiberal precedence of public before private autonomy, see the problem of the justification of the social state and the guarantee of entitlement rights only under the aspect of enabling citizens to participate in the discourse. According to Kersting, this concept means that if a citizen refuses to engage in communal matters, the consequence should be the denial of services (ibid., 26ff.). Kersting's second argument consists in an extension of the contract model in Rawls's theory of the original choice of a just order of distribution, even if Rawls himself has long given up this contractual element—a fact yet to be discussed here. Since every one of the individuals choosing a constitution must take into account the possibility of becoming unemployed or unable to provide for himself and his dependents for other reasons, according to Kersting they will "agree upon a procedure that nationalizes charity, i.e., a rule that obliges the constituted community to extend to those members of society in need of help the support they need to cover at least their basic needs" (Kersting 1997, 241ff.; my translation). Even if this contract-theory argument is not as far-reaching as the one regarding the rights of liberty, it still obliges the constitutional state to pursue an active social policy, which necessarily affects economic policy. The third argument resembles an appeal to the "community of citizens" and their willingness to help each other, which is founded on their "political identity" (Kersting 2000a, 396ff; my translation). Plausible consequences are the postulates of "basic services ensuring a dignified and integrated lifestyle in case of need," a proactive labor market policy, because labor is not only an economic value, but also "a good with a value for the citizen's ethics," as well as

[51] *Amtliche Sammlung der Entscheidungen des Bundesverfassungsgerichts* (Official collection of decisions of the Federal Constitutional Court), Vol. 33: 303.

"equal development opportunities" for all, but without egalitaristic compensation services from the state to "correct natural differences in talent and ability and different social milieus" (ibid., 7ff., 390; my translation). Specifically, the author has the solidarity-motivated support of families with children in mind. What remains unclear is how the creation of equal development opportunities can coexist with the maintenance of different social milieus. However, of course the main question is what to base the "political togetherness" and the "social and historical identity" upon which form the foundation of the community's solidarity. The issue is the stabilization of the constitutional state through social ethics. According to Kersting, this can only be delivered by a "communitarian democracy" (Kersting 2000b, 484ff.). Thus, against the atomism of the liberals, Kersting joins the "communitarians," who begin with the given communality and go on to seek the ethical endpoint of a political community not in the constitution or in an order of justice, but whose "hopes for integrative politics" are founded upon "the element of political practice which engenders communality" in a deliberative democracy (ibid., 485). With this return to the key term of active participation, we appear to have reverted to the Rousseauism of the discourse theorists, which Kersting had set out to chastise. And indeed, our author now explicitly pledges allegiance to a Rousseau-derived spirit of communitarian democracy, albeit not as an embodiment or even institutionalization of the General Will, but as a necessary supplement of "constitutional patriotism." After all, political discourse in a communitarian democracy denies the restricting separation made by discourse ethics between the universal questions of justice, which are open to consensus in principle, and the particular questions of the good life; it engages in rational discussion even if there is no possibility of achieving consensus, and transcends the antagonism between universalism and sectionalism by recognizing the morale of solidarity, internally graded into levels from friendship to the large group of the national state (ibid., 486ff.). Even if the name is not mentioned, it is clear whom Kersting is arguing with here: It is Jürgen Habermas with his distinction between moral and ethical discourse. This too shall be discussed at a later point.

Incidentally, the above-mentioned topics of support for families, children and education as well as group solidarity indicate how varied the question of social justice has become. Thus, in the case of the social security systems, today generational justice plays a large role in the issue of health insurance, as its conceptual basis, the "inter-generational contract," is no longer valid due to the changes in demographic development following the drop in birthrates intensified by the introduction of the pill. Should the needs of future generations not be included in our concept of social justice; should environmental advantages and burdens not be distributed with geographic fairness? The discussion of these problems has long begun and has shown with sobering clarity that one unified principle of social justice can no longer serve as a solution (cf. Hofmann 2008a).

10.4.3. Results of the Renewal of Practical Philosophy: Principles of Legal Ethics and the Procedural Concept of Law

10.4.3.1. Developing Principles of Legal Ethics

In response to his critics, Rawls relativized his theory of justice (cf. Hinsch 1992). In this process, it moved closer to Rousseau's differentiation between a constitutional level of state organization and an operational level of law-giving. The first principle of justice, i.e., the liberty principle, is now taken to refer to the essential institutions of the constitution, while the second (the so-called difference principle) appears rather more as a regulatory principle of simple law-giving. The principle of constitutional freedom thus lends a preliminary justification to the results of a fair process of decision, without claiming general consensus for this – with the difference principle providing the non-formal criteria of control. Because of the complexity of economic problems, reasonable differences of opinion always remain an option in this context. With the explicit recognition of ideological pluralism, the area of application for the consensual theory of justice shrinks, encompassing only the institutions of the liberal, democratic and constitutional state and the culture of its societies. Rawls has since conceded or clarified (as one may have it) that this alone is his framework, and that his theory is not a unified philosophical concept, such as Hobbes presented, nor an all-encompassing philosophy of history and society on the basis of a defined anthropology like Rousseau's, nor a consolidated practical philosophy or moral theory like Kant's. Thus, the new contractual thinking—reduced to a methodological principle—ends with the attempt to create an intrinsic, moral and normative systematization of the mental and institutional circumstances of Western societies, thanks to the mutual recognition of free and equal persons and the formulation of a mechanism of equalization which encompasses and integrates all the pluralistic differences: The overlapping consensus.

Exploring the work of his teacher H. L. A. Hart, Ronald Dworkin (1931–2013) developed a model of legal-moral discourse which complements Rawls's political liberalism of constitution and law-giving, concentrating on the judicial application of law to the individual case (Dworkin 1984). His point of departure is the situation of the judge who must come to a decision even when the law, although materially applicable, is unclear, inappropriate, inconsistent to the point of contrariness or incomplete. In such cases, the judge is obliged to fall back on legal principles providing judicial orientation as the main distributive principles of rights and obligations, extending these while taking into account the fundamental values of the community in the context of all the legal rules, procedures, principles and recognized theories. In short: In difficult questions of law, "political morality […] which is presupposed by the laws and institutions of the community," rules (ibid., 215). In terms of legal theory, this

means that any given legal order does not consist only of rules that are either applicable or inapplicable, but also contains rules or principles that determine the direction of a decision (for example, "nobody should benefit from his own wrongdoing"), the scope of which, however, can only be determined by individual cases (ibid., 54ff., 130ff.). Unlike legal norms, these principles cannot be declared valid according to certain legal "rules of insight," as postulated by Hart (1961, 142ff., 215ff.), but, according to Dworkin, must be justified philosophically according to their "moral" derivation and nature (Dworkin 1984, 247). If one compares this with the dense development of German legal thought, it is fair to say that here the continued dogmatic development of the basic rights and the principle of the social state, continuously inspired and refined by the extensive activities of the Federal Constitutional Court, furthered the "political concept of justice" which, according to Rawls, "formulates the fundamental political and constitutional values (for everyone)." In terms of legal philosophy, this process is underpinned by Ralf Dreier's "incorporation theory" (R. Dreier 1981b, 193ff.; cf. Sections 10.3.2.1 and 10.3.5) mentioned above and the relativization of the so-called "separation theory" (cf. Section 10.3.2.1; Hoerster 1989, Osterkamp 2004), and supported—from the other end, so to speak—by the proof that elements of legal ethics are indispensable for the interpretation of basic rights (exemplary is Mahlmann 2008).

Dworkin's distinction between rules and principles was taken up in parallel by Robert Alexy in his *Theorie der Grundrechte* (Theory of constitutional rights: Alexy 1985b, 71ff.). Yet, unlike Dworkin, he considers the principles (such as freedom and equality) as imperatives of optimization, and again unlike Dworkin, he also aims to establish a comprehensive, non-formal (i.e., influencing the content of decisions) theory of basic rights, at a high level of abstraction and in terminological, analytical and systematic terms. The results, however, remain modest. Since a "hard" theory, which would mandate a fixed solution for every single case involving basic rights, is impossible to establish, at least the argumentation regarding basic rights is to be structured rationally. According to Alexy, his theory of principles (*Prinzipientheorie*) fulfils these conditions as "a value theory that has been cleansed of untenable assumptions," inasmuch as it "contains a bundle of basic rights-related principles, which it puts into a loose order by establishing *prima facie* antecedence between them, favoring the principles of legal freedom and legal equality" (ibid., 18, 520; my translation).

In contrast to Alexy's analytically influenced theory of principles, a work by the Viennese legal scholar Franz Bydlinski (1931–) on *Fundamentale Rechtsgrundsätze* (Fundamental principles of law: Bydlinski 1988) published at almost the same time offers a voluminous list of highly differentiated principles of legal ethics, which—as the subtitle indicates—constitute something like the "*legal-ethical constitution of society*." With the self-confidence of one who has gathered plenty of experience in "quotidian legal work," Bydlinski attacks the positivistic "separation theory" and all merely descriptive *theories* of law, aim-

ing to prove the "indispensability of a fundamental dimension of legal ethics in legal thought" (ibid., VII, 128ff.; my translation; Larenz 1979).[52] He also claims that it must be differentiated from the dimension of constitutional-law reflection (Bydlinski 1988, 70ff.). This may be immediately plausible for Austria with its positivistic legal tradition, but it is less so for the jurisdiction of the German Federal Constitutional Court and the reflections upon basic rights of a "constitutionalized" way of legal thinking that arose from and expanded this jurisdiction. Bydlinski's moral point of departure, which is also the maxim of his thoughts, is the equal consideration of every human being and the consequences arising from it: Personal dignity and the protection of life (ibid., XII, 171ff.). According to this guideline, he arrives at and justifies three categories of very detailed fundamental legal principles: These are (1) universal and positively applicable, derived from the legal idea (justice, stability of the law, expediency); (2) rationally advisable and partially positively applicable; as well as (3) merely rationally advisable, but not positively applicable (ibid., 133ff., 291ff.). Incidentally, his extensive examination of Rawls's theory of justice (ibid., 93–114) demonstrates once again the intensity and breadth of the effect characterizing this impetus towards the renewal of practical philosophy.

10.4.3.2. The Procedural Concept of Law: Discourse Theory

The enormous resonance enjoyed by Rawls's philosophical claim to authoritative distinction between *just* and *unjust* was also due to an amplification resulting from a parallel development in Germany. Here, at the same time, Jürgen Habermas expounded his theory that practical discourse could decide the question of normative rightness with the same authority accruing to theoretical discourse in questions of truth (Habermas 1984, 127ff.; cf. Steinvorth 1999, 17ff.).[53] As is well-known, his discourse theory culminated in the two-volume work *Theorie des kommunikativen Handelns* (Theory of communicative action: Habermas 1981). According to this, even principles of justice cannot be decided by philosophers, but only by those affected. Thus, what guarantees the reasonability banning the danger of relativism is not the yardstick of objective idealness, but the establishment of its highly demanding ideal intersubjectivity of the discourse on questions of truth and rightness. Unlike Rawls's theory of justice, Habermas's discourse theory, aimed at overcoming the subjective philosophy of consciousness of modernism and determined by the model of

[52] Karl Larenz (1903–1993), professor of civil law and legal philosophy in Munich, had also pursued the same idea of mediation "between the legal idea as the ultimate reason for the normativity of law and concrete regulations of positive law" through "a closer definition of the content of the legal idea, in view of possible regulations" through the legal-ethical insight of the principles of right law (Larenz 1979, 23ff.).

[53] On Habermas's theory see also Sections 10.4 and 25.3 in Tome 2 of this volume.

finding truth, also concerning questions of normative rightness, may not lead directly to a political philosophy. However, from the start Habermas and his sharp criticism of society exerted a strong political influence. Let it suffice to recall his 1961 Marburg habilitation thesis *Strukturwandel der Öffentlichkeit – Untersuchungen zu einer Kategorie der bürgerlichen Gesellschaft* (The structural transformation of the public sphere: An inquiry into a category of bourgeois society: Habermas 1962), a work which continued Carl Schmitt's critique of parliamentarianism from the 1920s, complete with its story of decline, thereby preparing the ground for the so-called "extra-parliamentary opposition" (*Außerparlamentarische Opposition*) to a certain extent (cf. Kennedy 1986, 380ff., H. Becker 1994, 132ff.). The work enjoyed an extraordinarily wide circulation and had soon advanced to cult status among the student movement of 1968. Habermas only turned to legal philosophy relatively late, during the mid-1980s. During this time, his formerly critical and rather disinterested attitude towards law and his critical and distanced position towards the democratic constitutional state began to change. He may also have been inspired by some young legal scholars' ambitious attempts to use the mechanisms of justification of claims of validity—which he had outlined in his theory of communicative action and discourse, derived from a "consensual theory of truth"—for legal argumentation and thus for the interpretation of law. Regarding the legal, especially the procedural framework conditions, legal discourse had to be classified as a "special case" of general practical discourse. Viewed in broad daylight, though, its specific circumstances leave very little of general practical discourse intact.

This "special case theory" originally developed by Robert Alexy (cf. Section 10.3.2.2, Alexy 2006a) and reshaped by Klaus Günther (1957–), professor of criminal law and legal philosophy in Frankfurt, who distinguished between its reasons and application and added the hypothesis that legal argumentation is a special case of moral *application* discourse (Günther 1989, 182), was taken up and examined critically by Habermas in his broadly sweeping *Faktizität und Geltung: Beiträge zur Diskurstheorie des Rechts und des demokratischen Rechtsstaats* (Facticity and validity: Contributions to a discourse theory of law and the democratic constitutional state, Habermas 1992; translated into English as *Between Facts and Norms*, Hamermas 1996a). Its fifth chapter, bearing the classic title *Unbestimmtheit des Rechts und Rationalität der Rechtsprechung* (Indeterminacy of law and rationality in jurisdiction), is dedicated to proving the correctness of the discourse-theoretical approach to that same central topic of legal theory (ibid., 10, 238ff.). The centerpiece is an intensive examination of Dworkin's hermeneutics, which, however, is judged to be inadequate in its monological approach (ibid., 248ff.). Habermas criticizes the insufficient degree of abstraction of the special-case theories, claiming that they suggest a "misleading subordination of law to morale – misleading because it has not been liberated entirely from natural law connotations"

(ibid., 286; my translation). His discourse theory of law, on the other hand, wants to demonstrate that legal forms of argumentation and communication are directly "*embedded* in the legal system" from the outset ("innately," ibid., 287; my translation) and "refer to laws democratically passed." Therefore, the decisive confrontation is that between moral argumentation on the one hand and legal and political discourse on the other. Thus, there is no categorial difference between law-giving and its application. Instead, in principle the system of subjective rights that forms the foundation of the legal order, i.e., those basic rights "which citizens have to grant to each other in order to achieve a legitimate regulation of their coexistence by means of positive law" (ibid., 151; my translation), is interpreted and applied in the same manner in the democratic process of law making as in the process of judicial application of laws (ibid., 287). If, however, both processes are ruled by the same logic and therefore court procedures function no differently than minor acts of law making, there is no longer any rational reason to assume that laws have a formal binding nature and that legal form has a value in and of itself. What is abandoned is the constitutional guarantee of formal equality, in other words, the meaning of the universality of the law (Lieber 2007). It should also be noted that the use of the terminological opposites of factuality and meaning— sometimes employed in a rather careless manner—leads to a short-circuit when that terminological tension is identified with the contrast between the two *normative* principles guiding any judgment, namely the stability of the law and individual justice (Habermas 1992, 241ff.), as both of them express behavioral expectations, even though they express them in a contrary manner. Examples for the rather flexible use of the title-giving terminological pair can also be found elsewhere: At the communication-theory point of departure, this contrasting pair indicates the factuality of the communication process and the ideal content of its pragmatic preconditions and its results, which seek the rational consent of those involved. In this meaning, the terminological pair serves as a bridge for the introduction of law into discourse theory, inasmuch as legal theory also deals with the "determination of the relationship between factuality and validity" (ibid., 22; my translation). However, the normative implications of the terms law making and law enforcement—this brings to mind Kelsen's simple example of the payment claims made by robbers and by tax collectors—remain unconsidered here, just as the multifaceted term of validity (in lieu of many, Alexy 1994) remains unexplained, due to a tacit reduction to the dimension of legal-ethical meaning. Thus, the conceptual antithesis of the title may be identified with the contrast between social reality and norm (conventionally: "is" and "ought") (Habermas 1992, 109, 517), but just as easily with the contrast between positivity of law and the claim to rational acceptability (ibid., 57) or democratic legitimacy (ibid., 163), even of the idealism of constitutional law and the materialism of a capitalistic legal order (ibid., 60). Habermas claims that the tension of factuality and validity is "concentrated" in the fact

that the political basic rights to exercising communicational liberties in public must necessarily be institutionalized in the form of subjective rights of private arbitrariness (ibid., 164).

Similar objections have been raised against the treatment of common judiciary discourse as well as against Habermas's interpretation of constitutional jurisdiction (ibid., 292ff.; cf. Lieber 2007, 197; Möllers 2009, 259ff.). Inasmuch as constitutional jurisdiction can turn directly against laws passed by the democratic law-giver, as is the case in Germany and the USA, Habermas views it with great skepticism, slightly reminiscent of the attitude of a French *citoyen* who fails to understand, in view of the famous *Déclaration des droits de l'homme et du citoyen*, that simultaneous declaration of individual and national autonomy, how a handful of judges should be able to decide about the general will of the nation reflected by the law. Habermas sharply criticizes the much-censured high-handedness with which the Federal Constitutional Court controls the law maker through its decisions on whether laws are compatible with the constitution (*abstrakte Normenkontrolle*), measuring them against a constitution which the Court has misinterpreted as an order of values. "By allowing itself to be led by the idea of realizing material values inherent in the constitution, the Constitutional Court transforms itself into an authoritarian body" (Habermas 1992, 315; my translation). In contrast to some constitutional law scholars, however, Habermas of course does not draw the conclusion from this that the only way to counteract the "value order decisions" is to emphasize the original libertarian meaning of the subjective guarantees embodied by the basic rights. After all, he claims, today private autonomy is not only endangered by the state, but also by economic and social bastions of power, and furthermore it is dependent on the possibilities of its being exercised effectively and politically. Since, however, "only the *procedural conditions of the democratic genesis of laws* can [guarantee] the legitimacy of laws that have been passed" (ibid., 320, 517; my translation), the Constitutional Court should examine the questionable content of norms mainly "in the context of the communicative preconditions and procedural conditions of the democratic law-giving process" (ibid., 320; my translation). The problem of the legitimacy of constitutional jurisdiction is given a "turn towards democracy theory" through such a "*proceduralistic concept of the constitution*" (ibid., 321; my translation). After all, according to Habermas, only a democracy theory can support a concept of procedural justice of the process of political decision-making (ibid., 324) since the core of the realization of rights is always about a reference to the original meaning of the system of subjective rights, i.e., "to guarantee the citizens' private and public autonomy *uno acto* by ensuring that every legal action can also be understood as a contribution to the political and autonomous definition of the basic rights, in other words, as elements of a constitution-giving process meant to be permanent" (ibid., 494; my translation). Moreover: Only through a continuous interpretation of the constitution, taking place on all levels of

law-giving, does Habermas concede that such a thing as a constitution can have permanence. As a democratic process which encompasses all levels of jurisdiction, this continuous process of constitutional interpretation is based "on the foundation of anarchically unleashed communicative liberties" (ibid., 228; my translation). And moreover: "In the delirium of this liberty, there are no fixed points except democratic procedure itself—a procedure whose meaning is already decided by the system of rights itself" (ibid., 229; my translation). The above-mentioned objections, therefore, are aimed against the fact that Habermas's criticism interprets the procedure of *abstrakte Normenkontrolle* as a procedure of radical or ancient democratic revision, which must take that idiosyncrasy of the democratic decision-making process into account. Incidentally, the "fixed points" which the jurist wishes for make a surprise reappearance when he discusses the majority principle. "Generally, majority decisions," one reads (ibid., 221; my translation), "are limited by the minority protection inherent in the basic rights." Obviously, this means more than mere procedural guarantees. So there we have it, after all: Basic rights do provide protection from the tyranny of the majority.

Towards the end of his work, Habermas (1992) extends the above-quoted "proceduralistic concept of the constitution" to law as a whole. In the last chapter, he discusses three "paradigms of law": The paradigm of the rule of law, the paradigm of the social state and his own legal paradigm, the procedural one, born of the critique of the two others (ibid., 468ff.). The expression "legal paradigm" is the modern guise of a social model that opens an interpretational perspective to the theory of a concrete legal order (ibid., 468ff., 472, 527). Thus, according to Habermas the paradigm of the rule of law relates to a certain idea of civil society, is based on *formal* legal equality, which makes it socially blind, while the paradigm of the social state with its system of *material* claims tends to forget the original promise of human dignity and emancipation, shows a paternalistic tendency and is thus democratically blind in a certain sense. "The complementary blindness of the legal paradigms of the social state and of liberalism stems from their common mistake of equating the legal constitution of freedom with 'distribution,' and to align it with the model of the equal distribution of […] goods" (ibid., 505; my translation; cf. ibid., 528). The "proceduralistic" or "procedural" legal paradigm is to lead out of this dead-end street by "continuing" the project of the social state "on a higher level of reflection" (ibid., 494; my translation). Unlike the liberal rule-of-law paradigm and that of the social-state, it does not imply an ideal society, but broaches not only the issue of the insufficiency of private autonomy and the dangerous ambivalence of social engineering, but also the context "between forms of communication which guarantee private and public autonomy simultaneously *as they arise*" (ibid., 532; my translation). Essentially, this means the "continuous combination and mutual enabling of legally institutionalized and non-institutionalized sovereignty of the people" to use a phrase by Ingeborg

Maus (1992, 203ff.) quoted approvingly by Habermas (Habermas 1992, 532). Somewhat more concretely, the idea is that from the "civil society," with its multiple associations and cooperations, and the political public, "streams of communication" and journalistic influences arise, which are "transformed into communicative power through democratic procedures," which is then, in turn, transformed by law into administrative power (ibid., 532ff., 187, 399ff.). Slogans such as expanded citizens' participation, taming and constitutionalization of the power of the media, criticism of the nationalization of political parties, introduction of grass-roots procedures for the nomination of candidates and party-internal discussion, the entrenchment of plebiscitary elements in the constitution and others may serve as illustration (ibid., 533). In 1993, Jörg Paul Müller (1938–), professor of constitutional law and legal philosophy in Bern, undertook a systematic exposition of these moments from the perspective of democracy theory and ethical discourse, published under the title *Demokratische Gerechtigkeit* (Democratic justice: J. P. Müller 1993, 145ff.). On the whole, Habermas's procedural legal paradigm speaks of a certain Rousseau-like longing for immediacy, authenticity and self-responsibility, despite the inevitability of parliamentary representation. A further characteristic is his attempt to remedy the democracy deficit of the German rule-of-law tradition by persistently championing his hypothesis of the same origin of the rule of law and democracy, private and political autonomy, of human rights and the sovereignty of the people thanks to the development of democracy from the mutual permeation of legal form and the discourse principle, i.e., the shaping of law and the formation of opinion and will through discourse and the exercise of civil rights. Indeed, the triumph of the idea of the rule of law in Germany began with the suppression of the democratic movement, and thus it developed a certain compensatory function. This proved itself again after 1945 amidst the ruins left by the lack of democratic practice (similar observations could be made in Spain after the end of the Franco dictatorship and in other transformational societies). However, the chronological coincidence of the reconstruction of the constitutional state with certain restorative tendencies in West-German society also gave rise to several ideological misinterpretations.

In attempting to evaluate the results of recent practical philosophy for legal philosophy, there can be no question regarding its contribution to clarifying the content of fundamental principles of legal ethics. The same cannot be said for the procedural-legal concept propagated by discourse theory. The reason for this is a fundamental deficit in the argumentation with which Habermas attempts to reconcile subjective private liberties with the citizen's autonomy (Habermas 1992, 111), thereby attempting to clarify the inner cohesion between human rights and the sovereignty of the people (ibid., 157). According to Habermas, "the substance of human rights" is contained "in the formal conditions for the legal institutionalization of that kind of discourse on opinion and public will in which the sovereignty of the people assumes a le-

gal shape" (ibid., 135; my translation). Seen by daylight, this takes Rousseau's democracy of the *polis*, developed for small areas and groups, and develops it further to suit large political collectives. What is interesting here in terms of legal theory is that Habermas sees the "logical genesis of rights" in this melding of the legal forms resulting from subjective freedom and the democratic process, a genesis which takes place in a "circular process" of the establishment of subjective rights, the legal code and the "mechanism" of democratic lawmaking "from the same source" (ibid., 154). If one examines the legal code in isolation, it is established through "the right of equal subjective freedom of action, together with the correlates of participation rights and the guarantees of legal recourse" (ibid., 159; my translation). Without these rights, that "logical" circular process obviously does not work, and therefore, without these rights—and that is the salient point—there can be "no legitimate law" (ibid.). Legitimate law is therefore liberal and democratic law and, according to the discourse principle, reasonable law. Thus, the procedural concept of law allows us to distinguish between legitimate, democratic, reasonable law and illegitimate, undemocratic and unreasonable law. But what about such defective law? Is it, perhaps, not law at all? Yet, if it is: What status does it have? Is it binding upon the members of that legal body politic? And if so: Why? What about laws whose genesis, while generally democratic, shows flaws or deficits? Obviously they are binding, otherwise the recognized right of the Constitutional Court to examine their compatibility with the constitution would be meaningless. But what is the basis of this—at least preliminary—binding nature? Should the very first discourse not deal with the question of submission to a legal order? Philosophy's procedural, discourse-theoretic "legal paradigm" falls behind the state of the discussion in constitutional theory and legal philosophy. Ultimately, the question remains: Where is the elementary differentiation between justice and injustice in this?

10.5. *Globalization*, or: Arriving at World Society

10.5.1. The Constitutionalization of International Law and the Universalism of Human Rights

In 1995, legal philosophy had cause to celebrate, commemorating the 200th anniversary of Kant's popular treatise *Zum ewigen Frieden* (Perpetual Peace: Kant 1968, 193ff.).[54] It was celebrated with a multitude of publications; most of them were philosophical, but some dealt with the law of nations, or international law (Hackel 2000, 220ff.). Beyond the piety of philosophical history and the interest in Kant's political philosophy revived by the "rehabilitation of practical reason," there were timely reasons for this too. The breakdown

[54] On this general topic see also Cavallar 1992 and 1998, 137ff.

of the Eastern bloc, that victory of the liberal, democratic West in the "Cold War" against "actually existing socialism," inspired hope for a new international order of peace. In addition, there was the push for European integration as a consequence of Germany's reunification, a development which led to the signing of the Treaty on European Union in Maastricht in 1992. Furthermore, the process of increasing interdependence of economy and information, politics and culture right across the planet invaded public consciousness: This began to be called "globalization" during the 1990s, a term which quickly spread in an inflationary manner. As Germany had thus "arrived in a world society" (Schlink 2009, 569; my translation) where—as Kant had already foreseen (Kant 1968, 216)—"a violation of laws in *one* place on earth is felt *everywhere*," it seemed obvious to examine once again Kant's project of a world-wide order of peace, and to view his idea of world-wide civil rights from the angle of universal validity of human rights. For a brief moment, some of the *enthusiasm* was felt without which, according to Kant, "the most exalted idea" of man's destiny cannot be imagined: "To imagine oneself as a member of the world's society of citizens (*Weltbürgergesellschaft*), with which one is compatible according to the law of citizenship" (Hofmann 2008b, 88; my translation).

Mainly, interest was focused on the "Second Definitive Article" of the treatise on peace: "The law of nations shall be founded on a *federation* of free states" (Kant 1968, 208; my translation); after all, this deals directly with the relations between states. In addition, this section of the text contains a special interpretational challenge, inasmuch as Kant—presumably for the only time in his entire oeuvre—explicitly favors the second-best solution, i.e., a federation of states instead of a world republic, for reasons that remain rather intransparent, and thereby revises his earlier standpoint (Brandt 1995, 138ff.). The problem lies in the unification of peace and freedom. Giving priority to peace, according to Kant, means preferring the universal monarchy of a unified world population, yet this carries the danger of despotic rule. Giving priority to freedom, on the other hand, leads to the idea of an all-encompassing world republic, if one follows the system-engendering analogy of the natural state between individuals and between nations, of the founding of states and the order of peace. However, this has no chance of realization, since the states are unwilling to give up their claim to sovereignty. Presumably, Kant's optimistic appraisal of the consequences of the French Revolution led him to assume that if a powerful and enlightened people can turn itself into a republic, "this gives a fulcrum to the federation with other states so that they may adhere to it […] and thus secure freedom under the idea of the law of nations. By more and more such associations, the federation may be gradually extended" (Kant 1968, 211ff.; my translation; cf. Gerhardt 1995, 18ff.). To him, the peace treaty of Basel between the Prussian monarchy and the revolutionary French Republic signed in April 1795 may have seemed like a signal of the possibility of "change" through "rapprochement" in the law of nations.

Otfried Höffe marginalizes the idea of development—the truly forward-looking point of the treatise on peace—and points out the contradiction between the Second Definitive Article with its founding of the law of nations upon a "federation of free states" and Kant's premises, which called for a "republic of republics" as the foundation of international law (Höffe 1995, 115).[55] After all, without a certain measure of coercive force employed by the state, permanent peace could not be imagined, neither within a single state nor between states. This exigency, however, does not necessarily lead to Kant's alternative of either the complete waiver of sovereignty or the maintenance of full sovereignty. Instead, according to Höffe, the world republic could be imagined as a state with very few sovereign rights, strictly limited to guaranteeing the safety and self-determination of the individual states (Höffe 1995, 131). Such a legal "stratification model" (*Mehrebenenmodell*) corresponds to recent transnational and international development, which has made great strides, especially in the European Union.

The philosophers Reinhard Brandt (1937–) in Marburg and Volker Gerhardt (1944–) in Berlin consider the treatise on peace a highly political text and judge Kant's plea for a league of nations to be more than "half-hearted" or a "compromise solution." Thus, only this form of maintaining the multitude of states provides the postulate of world citizenship described by Kant in the Third Definitive Article with a specific legal function. For in the construct of the league of nations, the relationship between the individual and his state is defined by constitutional law and the relationships between peoples are defined by the law of nations. What is left open, however, is the relationship between the individual and foreign states. This is the gap which world citizenship fills (reduced by Kant, however, to a visiting right: A barb against European colonialism), making the league of nations a complete legal order (Brandt 1995, 139ff.; Gerhardt 1995, 102ff.). From the perspective of political theory, the character of Kant's treatise on peace mirrors the constellation of problems at the end of the 20th century: It seems to mark the transition away from a concept of politics referring exclusively to the state, and "towards a concept of politics which counts the economic, cultural and legal interdependence of states among the conditions of peace for any political action" (Gerhardt 1995, 222, 232; my translation).

Following this line, against the backdrop of recent developments of international law, other authors—such as Peter Koller (1947–), professor of legal theory in Graz (Koller 1996, 222ff.; 1999, 236ff.), Wolfgang Kersting (1946–), professor of philosophy in Kiel (Kesting 1996, 182ff.) and Julian Nida-Rümelin (1954–), professor of philosophy in München (Nida-Rümelin 1996,

[55] The idea of a subsidiary, federally structured world republic, responsible for a global legal framework order responsible to the principles of justice, was further developed by Otfried Höffe (1999).

245ff.)— argued against Kant's alternative (either world state or league of nations) citing the possibilities of institutional peacekeeping through structural governmental cooperation with divided competencies, below the level of a world state. Like Kersting, Koller, for instance, discussed the possibility of federally structured communities of states organized in subsidiary levels, which could have supranational organs with limited authority to pass laws and employ coercive measures (Koller 1996, 236). Koller also pointed out that there are not only pragmatic, but also moral reasons for a plurality of states, e.g., the mobilization of social solidarity and enabling of different cultural lifestyles. In addition, he has also emphasized the connection between a global order of peace and the international protection of human rights (ibid., 237, 239ff.).

This discussion sheds light on the other current aspect of the anniversary treatise, inasmuch as it invites the reader to understand Kant's right of world citizenship as a subjective right of citizens under a world citizens' order, and to relate it to our idea of universal human rights. This is an aspect studied intensively by Jürgen Habermas, who of course saw—in keeping with his main hypothesis of the order-engendering meaning of subjective rights—the actual, innovative core of the treatise on peace in Kant's world citizenship (*Weltbürgerrecht*) (Habermas 1996b, 7ff.; 1999, 192ff.; 1998, 168ff.; 2004, 113ff.). In this, he sees the "transformation of international law—as a right of states—into world citizen rights as rights of individuals" (Habermas 2004, 123; my translation). However, the recognition of universal human rights beyond this point encounters two fundamental difficulties. These result from the ambivalence of human rights per se. Regarding their content, they are moral norms, i.e., they mainly formulate obligations and demand universal applicability for "any being with a human face," while in formal terms, they are subjective entitlements, which require a local law-giver to turn them into positive law for a particular legal community. In terms of legal institutions, our task is therefore to establish a global order "in which," as Art. 28 of the Universal Declaration of Human Rights of the United Nations proclaims, "the rights and freedoms set forth in this Declaration can be fully realized." Complementarily, objections to the universal *moral* validity of human rights must be refuted *philosophically*. Traditionally, among the main arguments against the universalism of human rights are their Euro-centrism and their political instrumentalization ("human rights imperialism"). Such objections are founded, of course, in historic development. However, their genesis also demonstrates how the concept of human rights has overcome such self-contradictory limitations resulting from their development conditions and political instrumentalization, time and again, through self-reflection. The reservations against the European individualism reflected by human rights universalism have many different reasons. Thus, dictatorships in Asian developing countries try to justify violations of the basic rights to a free judiciary system and of civil rights by claiming to give preference to collectively interpreted social and cultural basic rights, in order to guarantee de-

velopment. This, however, is not a normative, but merely a political argument to justify authoritarian, paternalistic public welfare. Viewed in normative terms, the "Confucian" critique of a legal order built mainly on subjective rights is not entirely unfounded, given its dangers for established social relations in a culture oriented towards consensus. Indeed, the "possessive individualism" of traditional and neoliberals fails to recognize the "contrary *unity* of processes of individualization and socialization" (Habermas 1998, 188; my translation). Ultimately, however, this is about the allegation that culturally the community takes precedence over the individual, and that a strict division of law and morality is impossible, for cultural reasons. This is flanked by the fear that the individualism inherent in human rights individualism might secularize existing ways of life by separating political rule from traditional religious or cosmological world-views. This is first countered by Habermas with the statement that the rights of liberty, protecting as they do the individual from moral paternalism, protect a religious lifestyle as much as other individual lifestyles. His main argument, however, is the hypothesis that regardless of the conditions of its development, the criticism levied against European individualism is not inescapably connected to it, like an accoutrement embedded in its cultural genesis, but must be viewed as an effect of a process of social differentiation and economic modernization which has long reached the cultures of East Asia and even some African ones.

> From the Asian countries' point of view, the question is not whether human rights as part of an individualistic legal order can be combined with one's own cultural traditions, but whether the traditional forms of political and social integration have to be adapted to the hard-to-reject imperatives of an economic modernization that is desired on the whole, or whether they can be maintained against it. (Habermas 1998, 185; my translation)

This "modernization theory" is easily recognizable as an economic reiteration of the traditional development pattern commonly assumed in the history of ideas, hypothesizing that the concept of human rights is constantly expanded, such as Lutger Kühnhardt (1987), to name just one example, proposed in 1987, displaying little sense of history, and which also colors Habermas's text.[56] Even this brief sketch shows what a great argumentative burden it is to prove—as Habermas sets out to—that the universal validity of human rights is the only element bestowing legitimacy on political rule around the world. For that is the result when universal human rights are interpreted as that order of subjective law which brings forth both the rule of law and democracy. Therefore, a more humble argumentation strategy promises greater effect, in the interest of concrete measures of protection for the oppressed, a strategy that is oriented towards the historic tiers of subjective rights and the frontiers that these indicate, so that elementary protection rights are its foremost inter-

[56] For criticism of this concept, see Hofmann 1999 and Bielefeld 2008, 98ff.

est (Hofmann 1999; 1995a, 51ff.).[57] These are based on the evidence of human vulnerability and are supported by a universal minimal moral consensus (Hofmann 1995b, 27ff.; Kersting 2000c, 229ff.; Gosepath 2008, 195ff.). The justification of the rights to life and physical integrity, to protection from arbitrary incarceration and from exploitation does not require a universally accepted theory of private and democratic self-determination.

10.6. The GDR in Retrospect

10.6.1. Variations on Marxist Legal Theory

There never was, there never could be scientific exchange or "discourse" between legal theorists in East and West Germany. Of course, this was mainly due to the "Iron Curtain" which separated Germany during the time of the "Cold War." In addition, the fundamental difference in world views, continuously fuelled by polemics, made any free and reasonable dialogue impossible, especially since the legal theorists in the GDR—like all other scientists—were under the direct control of the Socialist Unity Party of Germany (SED) (R. Dreier et al. 1996). Even the budding interest in Marxist legal theory as a modern social science (see above, Section 10.3.2.1), which arose during the period of reforms and the modernization of scientific theory in West Germany, failed to bridge the abyss. Karl A. Mollnau, director of the department of legal theory at the "Institute for the Theory of the State and Law" of the GDR Academy of Sciences, immediately discovered a subtle—and therefore especially dangerous—"anti-Communist barb" in the orthodox Marxism of Oskar Negt (1975, 10ff.) and Norbert Reich (1973). Indeed, the scientific study of original Marxist legal theory would have had to turn against the law of actually existing socialism, and would have exposed legal theory in the GDR as a mere "science of justification" (*Legitimationswissenschaft*) (Mollnau 1974, 41ff., 49ff., 54). The additional accusation of a covert revival of the merely reformist ("revisionist") "jurists' socialism" of Anton Menger (Hofmann 2009, 327ff.) as a "counterweight" was aimed against Werner Maihofer's emancipatory and critical attempts to create a better, more humane law (Mollnau 1974, 35, 38ff., 67 n. 82). As we have already seen, Maihofer's inspiration for this idealistic transformation of Marxist class struggle into legal reforms had been Ernst Bloch, whose thinking (possibly in a rather too harmless interpretation) seemed to Maihofer to open the possibility of bridging the gap between liberal democracy and liberal socialism. In this spirit, he ended his contribution on *Demokratie und Sozialismus* (Democracy and socialism: Maihofer 1965b) in

[57] Hofmann proposes a fourfold differentiation between the form of declarations of feudal liberties, the moral content that goes back to antiquity, the catalyst of the law of reason, and the revolutionary political instrumentalization.

the *liber amicorum* for Bloch's 80th birthday in 1965 in a rather effusive vein, presenting the "insight" that it had only been the principles of the French Revolution of 1789 and the Russian Revolution of 1917 together which were able to achieve "the future liberal, classless society of world citizens on this, our only planet Earth" (ibid., 67; my translation). At that point, however, the bridgehead on the other side had long since been razed. Bloch, who had been banned from teaching as early as 1956, had emigrated to West Germany in 1961. Following common GDR practice, Mollnau never mentioned his name again.

The fact that Marxist legal theory did not present a unified picture, and indeed could not present one, was ultimately due to Marx himself. His statements on law, never consolidated into a consistent theory, began with a "critique of law." It aimed to unmask the ideal claims for justice made by law through the social and economic analysis of the entirely biased concealment of the ruling class interest as "ideology." In this process, his analysis follows the categorical, humanistic imperative to "overthrow all relations in which man is a debased, enslaved, forsaken, despicable being," as he writes in *Kritik der Hegelschen Rechtsphilosophie* (Critique of Hegel's legal philosophy: passage from Marx 1953, 216; my translation). The phenomena of law (written laws, judgments, dogmas, theories) are not analyzed as ideal structures or independent units of meaning, but are examined in their developmental context of society as a whole, and explained from the viewpoint of the structure of their material basis. However, this form of historical materialism is first of all a heuristic process of insight criticizing ideology, serving to unmask all relationships of power obscured by legal forms, and helping to radically change them (Paul 1988, 334ff.). In this central point, Marx himself had undergone a fundamental change of mind, having repeatedly returned since the mid-1840s to a fixed model of explanation which regarded any social phenomenon as dependent on the process of evolution, advancing like a force of nature. This law of history is an economic one, and is demonstrated by the dialectics of productive forces (*Produktivkräfte*) and production relations (*Produktionsverhältnisse*). This is the reason for the class structure of society and its institutional and ideological superstructure, as well as for the class struggle, all the way to revolutions. The "economic law of motion of modern society"—which Marx claims to have "revealed," like a physicist, according to the Preface of the first edition of *Das Kapital* (Capital)—one-dimensionally declares law, like all other social phenomena, to be a product of material production relations, thereby stripping the "superstructure" of any independent meaning and the relationship with the actual base of its dialectic tension. The salient point, however, is that the dialectic critique of law is transformed into an aspect of positivistic "historical materialism," which claims the status of an objective science, representing an all-encompassing causal knowledge of the social process, and promises to provide all necessary explanations of social phenomena through mere deduc-

tion. It was especially the Marxist Ernst Bloch who criticized this reductionist movement away from Hegel's idealistic "mystifications" towards the materialistic ones of history. And Hermann Klenner, the most prominent Marxist legal theorist of the GDR, published a critical review in 1991 in which he held that Marx "may not have denied, but he certainly marginalized the influence of the spiritual (and thus also the legal) process of life on the development of mankind" in this transition from idealism to materialism. "Thereby, he abetted legal-nihilistic patterns of thought and action, with fatal consequences for theory in the hands of dogmatists and for practical life in the hands of dictatorships" (Klenner 1991, 444; my translation).

This leads to the so-called "further development" of Marxist legal theory by Soviet Marxism of the Leninist and Stalinist style, which was, in truth, a transformation into a political instrument of the supposedly continuing class struggle through the "scientific" justification of the "dictatorship of the proletariat," executed by the Central Committee of the Communist Party. This development was propelled by a disagreement about the right direction to take among Soviet-Marxist scholars of law, of whom Evgeny Pashukanis should be mentioned as a proponent of the Marxist left and Andrey J. Vyshinsky for the Stalinist right (Pfaff 1968; Paul 1974, 139ff.).[58] The subject of the debate was the question of the "applicability" of Marxist legal theory to the victorious October Revolution. Now that the "realm of freedom" had dawned, should law and state not lose their meaning and "die off"? On the other hand, how could the factual perpetuation of state and law, that supposedly merely ideological superstructure, be explained in a Marxist fashion after the base had been revolutionized? To the orthodox Marxist Pashukanis, law, justice and jurisprudence were expressions of bourgeois legal thinking, and thus their continuance counterrevolutionary, indicating the perpetuation of class rule and repression; furthermore, he considered unscientific the assumption of a specifically proletarian revolutionary law. Pashukanis, however, lost the debate, and paid for his mistakes with his life, which ended in the cellars of the Soviet secret police. The great victor over this "illness of legal nihilism" was Andrey J. Vyshinsky, a Member of the Academy and state prosecutor from 1924 to 1938. He had turned the tables by countering the assumption that law would die off after the proletarian revolution with his invention of a law that would only then begin to blossom: "law of the transition period, socialist law, created by the dictatorship of the proletariat." This was based on the interpretation of the transition period—which Lenin had already introduced in theory—as a special socio-economic formation, an independent period of socialism with a new type of specifically "socialist" law (new in world history), whose "socialist nature" was defined by Stalin in no uncertain terms to be threefold: State ownership of the means of production, an egalitarian mass society under the absolute rule

[58] On the Pashukanis-Vyshinsky debate see also Section 17.3 in this tome.

of one single party, and centralized state control. Within the framework of the "Marxist-Leninist general theory of state and law" thus established, Vyshinsky was able to formulate a supposedly universally valid concept of law which the "progressive" theorists of the GDR, founded in 1949, submitted to as well. Thus, the young Hermann Klenner begins his propagandistic treatise of 1954, *Der Marxismus-Leninismus über das Wesen des Rechts* (Marxism-Leninism on the nature of law: Klenner 1954), with that definition (ibid., 8) and returns to it at the end in the "enhanced" version of the *Moscow Legal Dictionary* of 1953—the remarkable, but uncommented "progress" consisting in the fact that Vyshinsky's "rules of conduct, passed by way of law making" have become "rules of conduct" "fixed by the power of the state"—i.e., liberated from any formal procedure and the discipline this would bring:

> Law is the totality of those rules of conduct (norms) which express the will of the ruling class and are fixed or sanctioned by the power of the state, and whose observance and application is safeguarded by the state's coercive power, in order to strengthen and develop the social circumstances that are advantageous and suitable for that class which exercises the social leadership of the state. (Klenner 1954, 88; my translation)

Klenner also gives the reason for Vyshinsky's authority: During the 1930s, he had managed "to unmask and destroy the Trotskyist vermin at the legal frontier with their bourgeois and fascist legal nihilism," of course, under "Stalin's guidance" (ibid., 8; my translation). Between these definitional alpha and omega points of Stalinist Soviet Marxism, the supposed class structure of law is spelled out in embarrassing detail. One example shall suffice: Thus, it was posited that the highway code had class character because it served the goal of road safety in the interest of the ruling class. This was also the case for the GDR; for the accidents thus prevented wasted "the working man's money." Moreover, the recent highway laws in West Germany showed "that there, Capitalist motorcar drivers follow the American model and are allowed to treat pedestrians as an annoying obstacle, which is best proven by a look at the accident statistics" (ibid., 39; my translation). There is no concept of legal theory here to develop. The sprinkling of Marx quotations is mere decoration. And concerning problems, terminology and argumentation, all that remains is simple positivism.

10.6.2. The Babelsberg Conference and its Consequences

An occasion to rethink the social function of law and the meaning of civil rights arose two years after Stalin's death, when his successor Khrushchev revealed part of the crimes of the Stalinist system of violence at the 20th Party Convention of the Communist Party of the Soviet Union (CPSU) in 1956. During the ensuing unrest within the system, some younger staunch Marxists hoped especially that now jurisprudence and legal practice could be liberated

from Stalinist deformation, in the name of the original Marx and true socialism. A critical point was the definition of law as a mere political instrument, or as a measure of state action, with the resulting questions of the legal position of the individual and of a body of administrative judiciary decisions based on subjective rights. All attempts at reform in East Germany, however, were immediately, decisively and mercilessly crushed by the ruling SED under Walter Ulbricht. The specially organized and carefully scripted "scientific" conference held in early April 1958 at the German Academy for Constitutional Law and Jurisprudence "Walter Ulbricht" in Babelsberg served as a forum for the public and explicit condemnation of anyone suspected of "revisionism," i.e., bourgeois, formalistic legal thought (see *Staats- und rechtswissenschaftliche Konferenz in Babelsberg am 2. und 3. April 1958, Protokoll*, 1958; Eckert 1993; Berlin 1994, 59ff.; Mollnau 1991, 236ff.; Caldwell 2003, 57ff.; Klenner 1992, 612ff.; 2005, 291ff.; Güpping 1997). For the legal scholars thus chastised, party-internal disciplinary measures followed, including ousting from academic chairs and lecturer positions. The intimidating effect, fully intended, was enormous. The main organizational consequence was the abolishment of administrative law as an area of law and as a discipline of scientific jurisprudence. The draft for Walter Ulbricht's keynote lecture on "Die Staatslehre des Marxismus-Leninismus und ihre Anwendung in Deutschland" (The political science of Marxism-Leninism and its application in Germany) had been written by Karl Polak (1905–1963) (see Howe 2002). In 1933, Polak had delivered his doctoral thesis in Freiburg/Breisgau under the guidance of Erik Wolf, entitled "Studien zu einer existenzialen Rechtslehre" (Studies toward an existential theory of law: K. Polak 1933)—a modest attempt to "dissolve" the "concreteness" of law through Heidegger's existential analysis[59]—before emigrating to the Soviet Union, escaping discrimination because of his Jewish background. After moving to the post-war Soviet zone of occupation, where he was involved in the drafting of the GDR's constitution as director of the legal department of the Communist Party of Germany (KPD) and the Socialist Unity Party (SED), he started teaching in 1949 as an adjunct professor at the legal faculty in Leipzig and became a founding member of the GDR's *Staatsrat*, or State Council, in 1960. His theories dominated legal thinking in actually existing socialism in Germany almost until the end of the GDR: "The applicable legal norms are […] invariably only an expression of existing circumstances, they do not exist outside of the state's power, but instead are a function of this power. Therefore, they can never be designed as its yardstick or, even more, restraint" (K. Polak 1948, 55; my translation). "The term '*Rechtsstaat*' (rule of law, or constitutional state) is […] completely devoid of meaning" (ibid., 57;

[59] There is a certain irony in the fact that two years later, Polak was to accuse Carl Schmitt of "close imitation of Heidegger's fashionable existential philosophy" (K. Polak 1968, 53ff., 70 n. 4; my translation).

my translation). The importance of human rights in 1789 lies only in the fact that they were "revolutionary catchwords," not in their entirely bourgeois content, which supported the development of capitalism. In truth, "socialism [is] […] the concept that realizes human rights; and human rights are […] only realized to the extent in which socialism becomes reality" (ibid., 59–60; my translation).

The Babelsberg Conference was particularly harsh in its judgment of the legal philosopher Hermann Klenner. After studying law in Halle, Klenner, born in 1926, had been appointed lecturer in 1951 and professor in 1956 at Berlin's Humboldt University. His writings had been suspected of attempts to de-Stalinize jurisprudence (a science to whose Stalinization he had previously "contributed not insignificantly," as we have already seen: Mollnau 1993, 35). Klenner's essay in the anthology commemorating the 40th anniversary of the October Revolution (1957), *Zur ideologischen Natur des Rechts* (On the ideological nature of law: Klenner 1957), did indeed contain "offensive material" (ibid., 84, 87, 93, 97, 100). In his comparison of bourgeois and proletarian revolutions, the "Great October" is not the only one to emerge in a shining light. According to Klenner, law is a yardstick for the reality content of the great design, Marxism the heir to bourgeois Enlightenment and Vyshinsky's criticism of Pashukanis "exaggerated" and "distorted." An added barb presumably lay in the fact that Klenner had left no doubt about his intellectual superiority to the Party leaders. Klenner lost his chair and was ordered to redeem himself through practical service as a village mayor in the Oderbruch area; however, in 1965 he was allowed to return to scientific life as a professor at the Academy of Economy in Berlin-Karlshorst, and in 1967 he became director of a working group on political and legal theory at the Academy of Sciences. During the rollback after the crushing of the "Prague Spring," he again lost this position, but was given the possibility of working at the Academy's Institute of Philosophy. This was a kind of "leave of absence" which Klenner used to launch an immense journalistic output. In this manner, he became a spokesman of jurisprudence in the GDR during the 1970s and 1980s, representing the GDR at scientific congresses and before the UN Commission on Human Rights (Güpping 1997, 170). Since he enjoyed travel privileges, he attended the conferences of the International Association for Legal and Social Philosophy in West Germany since 1966, where he had friendly relations with Werner Maihofer, who dedicated a two-volume *liber amicorum* to him for his 70th birthday, which he edited together with Gerhard Haney and Gerhard Sprenger (Haney, Maihofer and Sprenger 1996).

Klenner's first major publication after his "banishment" was *Studien über die Grundrechte* (Studies on basic rights: Klenner 1964) in 1964. Because of the ongoing competition with the Federal Republic of Germany and its "bourgeois constitution," the topic was politically explosive. This fact, combined with the author's personal experience, make it understandable that the text,

with its political slogans, toes the party line: It remains an interesting historical document, but in terms of jurisprudence, it is worthless. Some samples shall suffice as illustration: Socialist basic rights are proclaimed to be "state means of controlling the mobilization […] of the masses on their way to their self-liberation" (ibid., 54; my translation). Thus, individual liberty is not realized by the individual, but "through the state" (ibid., 98; my translation). There is no "liberty of the citizen from the state" in socialism; that would spell "arbitrariness and anarchy" (ibid.; my translation). In more concrete terms: Since the state has become a "lever of progress" in socialism, a Western-style right to freedom of opinion would constitute "irresponsibility of the individual towards the development of society, and thus his own, clad in the shape of a legal norm" (ibid., 114; my translation). The point of the freedom of opinion in socialism is not a plurality of opinions, but the crystallization of the one "*correct* opinion" (ibid., 113; my translation). Consequentially, this one correct opinion of Marxist legal theory also underpins the critique of "bourgeois legal philosophy" which Klenner published in 1976 under the title *Rechtsphilosophie in der Krise* (The crisis of legal philosophy: Klenner 1976). Since Marxist legal theory—unlike all other legal philosophies—did not "mirror" the interests of a class of exploiters, according to Klenner, it had a "scientific character throughout" and thus refused to join "the game of dialogical pluralism" (ibid., 20ff; my translation). Instead, it set out to expose the flowering of legal philosophy in the Federal Republic of Germany from the early 1960s to the mid-1970s as a "fake flowering," i.e., expression and element of a lasting crisis of capitalism (ibid., 9). Therefore, legal philosophy was obliged to offer a justification theory for the exercise of bourgeois power in an "apologetic and demagogical function," but also to contribute in a "direct administrative and controlling manner" (ibid., 15ff.; my translation). The second remark is obviously aimed at the blossoming of methodological literature, already discussed above. Its supposed connection with "imperialism," however, remains in the dark. Klenner then proceeds to measure legal *topics*, system theory and legal hermeneutics, but also—somewhat anachronistically—Kelsen's pure theory of law and finally, extensively and sharply, Maihofer's realistic jurisprudence, by this one ideological yardstick. Unsurprisingly, given the goal, the result owes less to scientific differentiation than to ideological leveling. At least, however, readers in the GDR were able to learn something about the ongoing legal-philosophical discussions in West Germany, especially since the volume contained excerpts from original texts by Viehweg, Kelsen, Luhmann, Arthur Kaufmann, Hassemer, and Maihofer (ibid., 135ff.). During Stalinist times, such would presumably have been unthinkable. Now, the censor's office judged the additional inclusion of two decisions of the party conference of the DKP (a West German successor organization to the KPD after the latter had been banned by the Federal Constitutional Court, a party which, however, was almost completely ignored in West Germany) to be sufficient.

There are several—objective—reasons for Klenner's tackling the problem of human rights again by writing a further book in 1982 (Klenner 1982). Upon joining the United Nations, the GDR had signed the UN Charter in 1973. Of course, however, in no way did this result in an internal implementation of the protection of human rights according to international law, as they are generally understood. In the meantime, though, political and moral pressure mounted in 1975 when the GDR signed the Helsinki Accords of the CSCE, which included a commitment to respect human rights and basic liberties, including the freedom of thought, conscience, religion and conviction. In 1977, the new US President Jimmy Carter began his worldwide human rights campaign. Suddenly, Klenner's Stalinist, brutally anti-liberal answer of 1964—that in socialism, the freedom of the individual is realized through the state—was no longer sufficient. The defense of the real-socialist position now consisted primarily in declaring the concept of human rights to be historical and relative, secondly of a polemic against its supposed abuse in West German domestic politics and by the imperialistic and interventionist foreign policy of the USA, as well as thirdly, and finally, in a new, much more differentiated attempt to "socialize" the concept of human rights. Only this last aspect is of any interest here. In a fourth argument, first of all the class standpoint is affirmed: (1) Basic rights under socialism are not a class-neutral concept of freedom and equality, not a freedom of laissez-faire (ibid., 130ff.); (2) therefore, at the same time socialist basic rights are basic obligations (ibid., 135); (3) socialist basic rights are products of the socialist revolution and society, and therefore (irrespective of possible continuities) derived from them, individually. Paraphrased in "bourgeois terms," this means: There is no original basic right, and no system of basic rights. In politically clear terms: There is no common heritage of the constitutional state (ibid., 131). (4) According to socialist understanding, human rights justify a revolution, but not a counterrevolution (ibid., 132). This is followed by a correction of the Stalinist hypothesis of the realization of individual freedom by the state which is clear, but comes much too late: "The self-determination of individualism is not an alternative to, but the condition of the self-determination of a people (and vice versa). Civil rights do not destroy a state's sovereignty, but strengthen it; in its turn, state power of socialist quality requires and guarantees functioning civil rights" (ibid.; my translation). Therefore, Klenner opines that the system's main direction of development points to "the further expansion of basic rights and an increase in their level of realization" (ibid.; my translation). He cites three indicators for this: (1) Instead of leveling individual interests and needs, the need for and even "enjoyment of individuality should be protected" (ibid., 133; my translation); (2) against his previously held conviction, it is not law that "shapes" human beings, but "with the help of law, man also shapes himself" (ibid., 134; my translation); (3) the theory of the socialist unity of "state and people, society and individual" and the resulting uselessness of the differentiation between objective and

subjective rights has been revealed as "untenable." Therefore, violations of basic rights by the state are imaginable. In order to redress such violations—this supposedly being merely a question of expedience—apart from the petition system, judicial control could be employed, but not exclusively, since Montesquieu's theory of the division of powers could not be binding for any socialist, due to the socialist principle of democratic centralism. At least, this reference to Montesquieu's theory of the division of powers sounds somewhat more respectful than his previous assessment of it as "paltry," made at a time when Klenner was still out to disqualify Montesquieu's theory of the division of powers politically, by formally reducing it to a "legally regulated division of competencies," in order to protect anti-liberal "democratic socialism" (Klenner 2002, 97ff.; my translation).

Be that as it may, all this has long become history from which legal philosophy can reap no lasting insight. The case is different for the great number of Klenner's works on the history of legal thought, which are marred only by repeated relapses into ancient and somewhat stale polemics, due to the frustration of the disillusioned ideologue. In these writings, he used Marxism in its original, heuristic function as a path to insight that is critical of ideologies, sometimes somewhat idiosyncratically, but certainly fruitfully. A recent anthology of his essays, published in 2009 under the title *Historisierende Rechtsphilosophie* (Historicizing legal philosophy: Klenner 2009), is an impressive witness to that.

10.6.3. Remigrants from the West

We have already discussed Ernst Bloch's Marxist rehabilitation of natural law as a promise for the future traceable in the past; the same goes for the echo which *Naturrecht und menschliche Würde* found but only in the West. For in 1961, when the book was published in Frankfurt/Main (and the Wall was being built in Berlin), Bloch, the famous author of a great philosophy of hope (*Das Prinzip Hoffnung*, The principle of hope: Bloch 1954–1959), had long fallen from grace in the GDR. To East German Marxism, Bloch's metaphysical proclivities and his exploration of the relations between Christianity and socialism were not acceptable (see Münster 2004).

Born in 1885 as the son of a Jewish railway employee in Ludwigshafen, which he experienced as a workers' city in contrast to the feudal-bourgeois Mannheim on the other side of the Rhine, after graduating from a humanistic *Gymnasium,* or high school, he studied philosophy with the minor subjects of physics, German literature and music, first with the philosopher and psychologist Theodor Lipps in Munich and later with the philosopher and psychologist Oswald Külpe in Würzburg, who represented a critical rationalism in epistemological terms. As early as his 1908 doctoral thesis on Rickert and modern epistemology, Bloch examined "that which has not yet become," fore-

shadowing his later utopian thinking. After the end of World War I, Bloch joined the KPD and lived in Berlin as a freelance author during the 1920s, but also traveled extensively, in the spirit of the anti-bourgeois *Wandervogel* movement. Shortly after Hitler seized power, he was expatriated for political reasons and emigrated to Switzerland. From 1936 to 1938 he lived in Prague. His public defense of Stalin's brutal cleansings led to the termination of several friendships, for example with Theodor W. Adorno. Shortly before German troops invaded Prague in 1939, his family managed to escape to the USA, where Bloch—adhering to the German language—wrote *Das Prinzip Hoffnung* and *Subjekt-Objekt* (Subject and object), a study on Hegel, and where news of his appointment to a chair of philosophy at the University of Leipzig reached him in 1948. With great hopes for a new, humanistic development in German society, he moved to the newly founded GDR the following year, where he also became a member of the Academy of Sciences and received the GDR's *Nationalpreis* or National Award in 1955 as a kind of state philosopher of the GDR. However, such harmony was bound to be short-lived. After all, the first volume of his opus magnum *Das Prinzip Hoffnung* had been available since 1954. It made obvious that Bloch was anything but a dogmatic Marxist, and was instead deeply attached to his humanistic ideas of freedom. At the same time, however, the revelations of the 20th Party Convention of the CPSU in 1956 had led to a wave of repression, fuelled by the fear of the ruling party, exacerbated by the experience of the workers' revolt in 1953. The wave gripped not only Bloch, who was forced to accept emeritus status in 1957 for political reasons (and not because of his age) and no longer allowed to lecture, but also a circle of his critical students.[60] When the Wall was built in 1961, Bloch failed to return to the GDR from a vacation in the West, and accepted a guest professorship in Tübingen.

One reason for the Party's criticism of Bloch was a lecture he gave in 1956 on the occasion of the 125th anniversary of Hegel's death, which was interpreted as an attack on the foundation course in social sciences, containing a derogatory remark ("*Schmalspur*," indicating low quality). The main motivation, however—similar to the Klenner case—was a fear of "bourgeois" legal thinking, i.e., mainly the abandonment of the concept of class struggle, and in addition, the defense against anything viewed as idealistic metaphysics and covert religious teachings. All this was exacerbated by fury at any demonstration of intellectual superiority. These motives are named more or less explicitly in a 1957 anthology documenting the witch-hunt against Bloch instigated by the SED leadership at the Institute of Philosophy of the University of Leipzig: *Ernst Blochs Revision des Marxismus. Kritische Auseinandersetzung marxistischer Wissenschaftler mit der Bloch'schen Philosophie* (Ernst Bloch's revision of

[60] Among them was Gerd Irrlitz (1935–) for example, who went on to become a professor of philosophy in Berlin.

marxism: A critical study by Marxist scientists with Bloch's philosophy, Horn 1957). The 14 contributors arrived at a "unanimous condemnation" of Bloch's philosophy of hope and lamented—highly significantly—its "pernicious influence." The tone was set by the first article, an impressive example of the Party's philosophical simplemindedness: *Ernst Blochs Hoffnungsphilosophie: eine antimarxistische Welterlösungslehre* (Ernst Bloch's philosophy of hope: An anti-Marxist theory of global salvation, Gropp 1957; cf. Gramm 1987, 138ff.).

The GDR career of another prominent remigrant from the West, Arthur Baumgarten, on the other hand, was outwardly smooth. His biography made him nearly unassailable: He had voluntarily given up his chair in Frankfurt in 1933, accepting personal losses as a consequence, had emigrated to Switzerland, where he morphed from a liberal to a socialist, had participated in the founding of the Swiss Communist Party (*Schweizer Partei der Arbeit*) and had left Switzerland in 1948 for the GDR, which, however, he was free to leave at any time, thanks to his Swiss passport (cf. Naucke 1989, 136ff.; K. Polak 1963, 553ff.; Klenner and Oberkofler 2003; Irrlitz 2008; M. Kaufmann 2009, 87ff.). Furthermore, since he had remained a member of the Swiss Communist Party and had not joined the SED, he was not subject to its party discipline. Arthur Baumgarten, born in 1884 as the son of a university professor in Königsberg, Prussia (today Kaliningrad), grew up in Tübingen and studied law there and subsequently in Geneva, Berlin and Leipzig. He wrote his doctoral dissertation in Berlin, supervised by the head of the "modern" (meaning: Sociological) school of criminal law, Franz von Liszt (cf. Hofmann 2009, 317). That very same year, 1909, without having submitted a habilitation thesis, he was appointed adjunct professor of criminal law and legal philosophy in Geneva, and became a full professor in Cologne in 1920. From there, he moved on to Basel in 1923. In 1929 he was appointed professor in Frankfurt am Main, where he gave an inaugural lecture ("Die Jurisprudenz im Kreise der Geisteswissenschaften": Jurisprudence among the humanities) advocating consequent empiricism in the spirit of the *Modern School* (Klenner and Oberkofler 2003, 17ff.), having repeatedly and intensively studied and published on questions of methodology (Baumgarten 1978b; 1927). That same year, he also published his *Rechtsphilosophie* (Philosophy of law: Baumgarten 1929), for which he had already laid the foundations during the 1920s. His point of departure was the conviction that legal philosophy was only possible in the context of a scientific—and to him, this meant metaphysical—philosophy of life. He conceived of it—a kindred spirit to the American empiricist, pragmatist and panpsychist William James (1842–1910), who was quite unknown at the time in Germany—as an infinitely optimistic, universalistic development philosophy of social solidarity. Therein, the realization of transcendental happiness appears as the goal of any existence, and universal happiness as the ultimate goal of the course of the world (ibid., 44ff.). According to this, God is nothing "but the universal spirit into which souls have developed, meaning that God himself

belongs to the future" (ibid., 46; my translation). The consequence for legal philosophy is that there can be no true legal order in the world as long as there is no world state. From this follows the high importance he ascribes to international law.

After Hitler had seized power, Baumgarten immediately gave up his chair before any outward pressure was applied, thus heeding his conscience, and emigrated to Switzerland with his wife, who was from Bern, waiving all claims to pensions and annuities. There, the former Basel professor was appointed to a chair for legal philosophy and general legal theory that had been created especially for him at the University in Basel. His sweeping philosophy of morality, law and history, *Der Weg des Menschen* (The way of mankind: Baumgarten 1978a), published the same year, demonstrated that the author too had long since begun his journey "from liberalism to socialism," as he himself was to describe it later (Baumgarten 1967). This 1933 work once again sketches the development of human culture as a path for humanity towards ultimate happiness, a state "in which everyone's deepest longing of the heart is fulfilled" (Baumgarten 1978a, 81; my translation; cf. 283). This is a "metaphysical goal" (ibid., 289; my translation): The "realm of the universal spirit" (ibid., X; my translation; cf. 80, 328). To Baumgarten, empiric-pragmatic epistemology and metaphysical eudaimonism in ethics do not exclude each other—in this he follows William James—as "the presentiment of a transcendental, superhumanly perfect state" remains no mere dream for those to whom that presentiment "has become a real experience" (ibid., 77; my translation). In concrete terms, common development must take the course of a global reform of the private economic order, and therefore also of international law. On the way towards the social economy that he considers unavoidable, the "experiment of Bolshevism" is an "epoch-making event in the history of the world," the "economic counterpart of the French Revolution." Although the Russian Revolution had employed many barbaric measures, he held that its idea was "profound and true" and would "ultimately emerge victorious" (ibid., 566; my translation). This conviction inspired Baumgarten to study the Russian language and to travel to the Soviet Union in 1935. Upon his return to Switzerland, he "immersed himself in the writings of Marx, Engels, Lenin, and also of Stalin," as he described it, and now "stood on the threshold of Marxism" (Baumgarten 1967, 35; my translation). With his *Grundzüge der juristischen Methodenlehre* (Foundations of legal methodology), published in 1939, he meant to "win the progressive bourgeoisie over to the transition from capitalism to socialism" through his excursion into social sciences, as he stated in retrospect in 1967 (ibid.). Indeed, in its volubility, even the Christian-metaphysical-socialistic book on the *Way of Mankind* in 1933 had already demonstrated a marked rhetorical and persuasive character. In 1944, Baumgarten was involved in the founding of the *Schweizer Partei der Arbeit* (Swiss Party of Labor). This led to his exclusion from Basel University life. The festivities for his 60th birthday

were not organized by the University, but by Basel's Workers' Association. The Swiss security authorities began to observe his activities.

After 1945, Baumgarten wished to return to Germany. There, he thought, "a new order of society" should be established, a "socialist one or an anti-fascist and democratic one that […] develops further into socialism" (ibid., 41ff.; my translation). His lectures in Southern Germany to this effect, however, were not well-received, unlike the reception he was given at his guest lectures in (East) Berlin and Leipzig. In 1948, he was appointed rector of the Brandenburg State University (*Landeshochschule*) in Potsdam. Having subsequently been appointed professor for legal philosophy and international law at Berlin's Humboldt University in 1949, he also became the director of the Institute of Political and Legal Theory there, was awarded the GDR's National Award in 1951 and became president of the German Academy of Political and Legal Sciences in Potsdam-Babelsberg in 1952.

In this capacity, he opened the infamous "Babelsberg Conference" in 1958 (which we already discussed in the previous section). Having publicly thanked the Soviet Union for crushing the Hungarian people's revolt in 1956 shortly before, and thus proven his party loyalty (Baumgarten 1956, 959), he must have appeared to its leadership as an unsuspicious party follower. As was the custom, Baumgarten began his speech with self-critical statements about the faults of the Academy's work. His recommendations for improvement, however, show that he truly and naively believed in the scientific nature of the event, and had no idea of its true objective. He earnestly declared that the main requirements for Marxist science were "independence, spontaneity, freedom of thought" (Baumgarten 1993, 42; my translation). Since the entire enterprise was so glaringly opposed to these postulates, the organizers did the only thing they could, from their point of view: They simply failed to reprint Baumgarten's opening speech in the official (!) proceedings of the conference. Even in the GDR, Baumgarten adhered to the heritage of legal culture he had brought with him, contrary to the nihilistic contempt for the normative character of law and subjective rights of the citizens displayed by the protagonists of real socialism: He advocated the constitutional state, the principle of legality, human and civil rights, the division of powers and an administrative judiciary, independence of judges and the principle of *nulla poena* as indispensable legal construction techniques, even in a socialist society.[61] He rejected the Marxist hypothesis that law was merely a reflection of the class struggle (Irrlitz 2008, 153). Any influence on the literature of political and legal theory in the GDR cannot be substantiated. The writings he published in the GDR after the age

[61] After the fact, Klenner and Oberkofler (2003, 30ff.) confirmed this. The panegyrics for his 100th birthday, however, still sounded very different: See *Vom Liberalismus zum Sozialismus* (From liberalism to socialism: Baumgarten 1984). A differentiated and striking portrait of Baumgarten's scientific statements in the GDR is offered by Irrlitz (2008, 52 ff.).

of 60 (Baumgarten 1954, 1957, 1972), of course, bear no comparison to the works he published before 1945, in the prime of his life. Ultimately, because of his international reputation, Baumgarten fulfilled the function of a mere figurehead for the GDR. In the West, only his early works on criminal law continued to be consulted (Naucke 1989, 146). During the 1920s, however, he was perceived as an important representative of metaphysical legal philosophy (ibid., 140; M. Kaufmann 2009, 98). And indeed, this was original and creative, distinguished by an unusual breadth of its scientific horizon. However, his brusque rejection of Kantianism, Hegelianism and phenomenology, and even more perhaps the religious foundation of his eudaimonistic metaphysics of "transcendental evolutionism" combined with his radical empiricism—complete with his confidence in the experimental method of psychological self-observation as propagated by William James—set certain limits to the effect of this rather idiosyncratic legal philosophy, even before the break in 1933. And after 1945, during the period of the "renaissance of natural law," Baumgarten's faith in progress—truly resembling Condorcet's—would have appeared entirely outmoded, had the view not been obscured anyway by the "Iron Curtain" and the dominant atmosphere of anti-communism.

Thus, Arthur Baumgarten lived a divided life, with two separate biographies: a very German life. And his work documents the deep rift that went through intellectual life in Germany, including legal thought, after 1945.

The Southern European Countries and France

Chapter 11

LEGAL PHILOSOPHY IN ITALY IN THE 20TH-CENTURY

by Carla Faralli[*]

11.1. Aspects and Crises of Philosophical Positivism

Italian philosophy—and so also, by reflection, Italian legal philosophy—offers a quite composite picture in the period stretching from the latter half of the 19th century to the 20th century: The dominant trend, at least until the first decade of the 20th century, was that of philosophical positivism.[1]

By a nearly unanimous consensus, philosophical positivism is considered to have had its inception in Italy in 1865. This is the year that Pasquale Villari (1827–1919) inaugurated his academic activity in Florence with a prolusion that would become famous, *La filosofia positiva e il metodo storico* (Positive philosophy and the historical method: Villari 1866), where positivism is presented not as a new *system* but as a new *method*, one that eschews absolute knowledge and ultimate grounds and instead turns to facts and to the laws by which they are governed.

[*] I wish to thank Filippo Valente for translating this chapter into English.

[1] The term *positivism* may give rise to some confusion because, as is known, there are at least two ways in which it can be used, in reference to *philosophical* positivism or to *legal* positivism.

Guido Fassò (2001, 176–78) observes that the term *positive* in *philosophical positivism* refers to that which is given by experience as a fact. As will be commented later on, the jurists who drew inspiration from philosophical positivism accordingly developed a historico-sociological method of studying the legal phenomenon, a method grounded in observation.

The term *positive* in *legal positivism* instead refers to that which is posited or established by a sovereign authority (the *ius positum* as distinguished from the *ius naturale*). Thus jurists committed to legal positivism have studied positive (or formally valid) norms on the basis of a formalist method close to natural law and Kant that had little to do with philosophical positivism.

One who in exemplary fashion used the term *positivism* confusingly is Alf Ross, among others, who suggests the name *quasi-positivism* for 19th-century German legal positivism, this in the context of a discussion underscoring the movement's ties to natural-law theory, so much so as to propose that we regard the same movement as a sort of natural-law theory. Further complicating the matter, and in a highly questionable move at that, Ross sought to coopt the expression *legal positivism* so that it would designate the legal realist conception of which he viewed himself as an exponent. See Ross 1963; compare the observations that Pattaro (2005) makes in the first volume of this *Treatise*.

To remove all ambiguity, I make it clear from the outset that the term *positivism* will always be qualified in this chapter by the modifier *philosophical* or the modifier *legal*, depending on context.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_11

In the years following Villari's essay, philosophical positivism consequently took root in Italy not as a definite school of thought but as an attitude, one that can be described as antimetaphysical and realistic. An effort was begun to go back and identify the precursors of this attitude in the history of Italian culture, and they were found in Galileo Galilei and Giambattista Vico, and more recently in Gian Domenico Romagnosi and Carlo Cattaneo.[2]

The salient characteristic of this first generation in the development of Italian philosophical positivism appears to be its rejection of dogmatism and a striving for system. The idea, in other words, was not to set a new philosophical creed against the old systems, but to offer a critical-scientific approach to the moral, social, and historical sciences, this by analogy to what the Galilean approach did with respect to the natural sciences.

A turning point for Italian philosophical positivism came in the 1880s. The symbolic watershed year was 1881, when Roberto Ardigò was appointed professor of history of philosophy at the University of Padua, and when a journal was founded in Milan at the initiative of Enrico Morselli (1852–1929): It was titled *Rivista di filosofia scientifica* (Journal of scientific philosophy) and it would last for ten years (until 1891), during which time it gathered the most significant contributions of Italy's philosophical positivists, becoming the movement's official organ.

These two events paved the way for the development of philosophical positivism, a system that had gained a foothold in transalpine Europe several years before, taking on different shades and colours, and acting as an ideological beacon guiding much of the bourgeois intelligentsia. Italy was a latecomer in this regard: Its backward industrial fabric, and more generally its sluggish modernization process, did not work in favour of a philosophical positivist movement, which accordingly did not give rise to any original developments and was substantially eclectic, looking to the different European positivisms, albeit with a specific proclivity for Herbert Spencer's evolutionism and a lesser sympathy for Auguste Comte.

As Norberto Bobbio observes with his customary incisiveness, "positivism in Italy was a philosophy with no roots in society; and for all the fervour of its neophytes and the prestige of their fountainhead, Ardigò, it wandered about without a home" (Bobbio 1990, 9; my translation).[3]

[2] In an address delivered in Pisa in 1864 commemorating the third centenary of the birth of Galileo, the same Villari (1884) argued the view that in the history of Italian culture one can detect a realist, scientific, and positive strand spanning from Galileo to Vico. For an overview of Italian philosophical positivism, see Papa 1985, Faralli 1993, Di Giovanni 2007, Bentivegna, Coniglione, and Magnano San Lio 2008.

[3] This 1990 work—*Profilo ideologico del '900* (Outlines of 20th-century ideologies: Bobbio 1990)—was first written in 1968 for the *Storia della letteratura italiana* (History of Italian literature, Vol. 9, devoted to the 20th century: Cecchi and Sapegno 1969) and has gone through several expanded and updated editions.

This phase in philosophical positivism would not last much, however, since evolutionism soon revealed itself to be a *metaphysics* rather than a method: It led to superficial syntheses of scientific knowledge and to a widespread effort to establish evolutionist connections unsupported by empirical findings or by any deep investigation.

From the last decade of the 19th century to the first of the 20th, the crisis of philosophical positivism as both a system and an ideology became increasingly apparent. Contributing to this crisis were external factors that historians of philosophy have variously found to lie in the rise of Marxist culture (tending to move away from the ideology of philosophical positivism), the irrationalistic wave, the neocriticist reactions, and above all the advent of idealism. But the reasons for the crisis were primarily internal, to be sought in the involution of the positivist philosophy—its turning in on itself and its shutting out of external influences—with its fascination for grand syntheses and its inability to tackle the concrete problems that reality lays before us.

And so, using Bobbio's effective metaphor, "idealism in truth killed a moribund creature, not granting it the benefit of a slow agony" (ibid., 10; my translation).

11.1.1. The "Humanist-Historicist" Soul of Philosophical Positivism in the Legal Domain[4]

This course of events that philosophical positivism went through is reflected as well in the philosophy of law: Here, too, philosophical positivism was initially embraced as a new method by which to approach the legal phenomenon, a historico-sociological method reprising and assimilating motifs deriving in part from Vico—depicted as the precursor of philosophical positivism for having sketched out a theory that could be brought closer to sociology—and in part from the historical school, viewed as having anticipated philosophical positivism mainly because, in contrast to certain abstract Enlightenment ideologies, it conceived law as an aspect of a people's life and culture, and so as proceeding in tandem with the evolution of such life and culture.

Two thinkers by whom this orientation is paradigmatically represented are Giuseppe Carle (1845–1917) and Luigi Miraglia (1846–1903).

The former expounded in his chief work, *La vita del diritto nei suoi rapporti colla vita sociale* (The life of the law in its relation with social life: Carle 1880), a philosophy of the history of law where he filled with a rich stock of

[4] Eugenio Garin identified two "souls" or veins in philosophical positivism: On the one hand was a "humanist-historicist" soul, drawing inspiration from Villari's 1865 "manifesto" and geared toward applying the historical method to the human sciences; and on the other hand was a naturalistic soul, which was instead geared toward applying evolutionism (see Garin 1980).

historical material the scheme drawn from Vico's *De uno* (Vico 1974). The latter, also following the lead of Vico, came to the conviction that law should be the object of a science at once historical and philosophical, and he accordingly folded a copious amount of ethnological material into his *Filosofia del diritto* (Philosophy of law: Miraglia 1885).

But the best fruits of this effort to stay true to philosophical positivism, received as entailing a commitment to leave behind the traditional themes of metaphysics and to adhere exclusively to observable and documentable data, came from those authors who devoted themselves to comparative-historical inquiries into ancient law, as was the case with Biagio Brugi (1855–1935)[5] and Pietro Bonfante (1864–1932),[6] or to sociological, psychological, or ethnological inquiries laying the groundwork in Italy for the development of the social sciences, which had never flourished—"eking out," as Bobbio remarks, "a meagre existence in the looming shadow of the sterile and presumptuous philosophy of the Italian schools" (Bobbio 1990, 10; my translation; cf. Treves 1983a, 1983b)—but which were now being encouraged in their development by philosophical positivism itself, and which accordingly came to be regarded as capable of usefully contributing to an understanding of the factors accounting for the development and transformation of law.

I will bring two examples in this regard, with reference to psychology and ethnology.

[5] Brugi was trained in Pisa under Filippo Serafini (1831–1897), a follower of the German historical school, and spent a period specializing in Germany under the guidance of Savigny's last direct pupils. Brugi regarded the historical school as having specifically anticipated the positivist method in three respects: By drawing a full and real distinction between law, on the one hand, and the statutes, on the other; by accounting for legal phenomena on the basis of their connection to all other aspects of a people's conscience and social life; and by looking to history as the force explaining the way legal principles evolve (see in particular Brugi 1883).

In his many works (in which regard see Marino 1980) Brugi offered significant examples applying the historico-sociological method. Proceeding from the premise that every legal fact is a social fact, and that law *does not* and *cannot* resolve itself into pure formal logic, he argued that jurists must pursue two lines of inquiry, with a historical investigation, on the one hand, and a direct observation of facts, on the other; in so doing, they must avail themselves of all the sciences that study the law, society, and the state in their natural relations, for only the social sciences can enlighten the jurist.

[6] From the very outset in his *Storia del diritto romano* (History of Roman law), Bonfante (1923b) says that the evolutionary principle originated with the historical school, and only later was it applied in other areas of study, such as biology, sociology, and economics.

In his inquiries into the origins of property, obligation, family, and inheritance, he used a method which on several occasions he called "organic" or "naturalistic," and which, in his own words, consists in "inquiring with the legal institutions themselves to discover the secret of their own origins and of their own most obscure phases," this by singling out their structure and function. Indeed, as he argues, "the development of legal institutions is inherent in their always adapting their own structure to serve new functions [...]: Outworn institutions die out when the function they serve is no longer useful, and new functions can give birth to new institutions" (Bonfante 1923b, 9; my translation; cf. Bonfante 1917).

As is known, the psychological approach in the legal sciences traces back to John Stuart Mill and Johann Friederich Herbart, and indeed it was the latter's disciples—Georg Waitz, Hermann Steinthal, and Moritz Lazarus—who originated the scientific approach in psychology, an approach whose main exponent was Wilhelm Wundt.[7] In Italy, it was above all Vincenzo Miceli (1858–1932) who upheld the importance of this approach in philosophy of law, convinced that "a discipline must take an approach that in some way reflects the nature of the phenomena it is concerned with, the object of its study, and since legal phenomena owe their nature primarily to the facts of psychology, the philosophy from which to approach such phenomena must prevalently be psychological" (Miceli 1903, 23; my translation).[8]

For Miceli, the first and fundamental task of the philosophy of law as a positive discipline was to link law to social phenomena, so as to seek therein its own explanation and its reason for being; only in this way would the philosophy of law be able to rise to the level of those disciplines whose basis lies in an objective observation and constatation of facts. Like every other social phenomenon, law can only be traced to a single psychological phenomenon—that of belief—which in a certain way makes up the warp and woof of social relations, and by operation of which the rules governing the conduct of individuals in society are determined.

Belief operates at every level in the life of law, regardless of how it manifests itself: As custom, as statutory law, or in the form of rights and duties. Custom, for example, is nothing if not a habit that gains the status of law in virtue of a belief that that mode of conduct is obligatory; statutory law presupposes a belief in a constituted power legitimately empowered to enact law; compliance with the law is grounded in the belief that noncompliance will be punished by the powers in charge, and to the extent that this belief should waver—whether because punishment is not regularly dispensed or because the culprits cannot be found—so will compliance with the rules of law dwindle.[9]

It was not just the philosophy of law that embraced the psychological approach in Italy, owing especially to the work of Miceli, but also (in a lesser

[7] On Wundt, see also Section 3.6 in this tome.

[8] Miceli taught constitutional law at the University of Perugia, where from 1889 to 1901 he also taught philosophy of law, succeeding to the chair held by Icilio Vanni. He subsequently also taught at the Universities of Siena, Palermo, and Pisa. Among his most relevant works on the psychological approach to legal philosophy are Miceli 1899, 1902, 1905, and 1914.

[9] It is worth noting that claims akin to Miceli's remarks about belief can also be found in Scandinavian legal realism, especially in the work of Alex Hägerström: See Chapter 13 in Tome 2 of this volume.

degree) to that of Icilio Vanni (1855–1903),[10] Alessandro Levi (1881–1953),[11] and Alessandro Groppali (1874–1959):[12] The approach can be seen reflected as well in private and public law, especially in criminal law. The principles of philosophical positivism in general, and of the psychological approach in particular, informed what came to be called the positive school of criminal law, this in contrast to the so-called classical school, whose working ideology was firmly grounded in natural-law theory.[13] For the exponents of the positive school—such as Cesare Lombroso (1835–1909),[14] Enrico Ferri (1856–1929), and Scipio Sighele (1868–1913)[15]—a criminal is such by reason of external causes of an anthropological, psychical, or sociological nature. Thus, in *I nuovi*

[10] In a 1900 essay (Vanni 1900) summarizing the orientations already expressed in other works, Vanni argued that the sociopsychological investigation cannot be severed from a historical study, since legal institutions are a product of generative forces that lie and operate at deep strata, and they come to surface only upon completion of a process that is essentially psychical. Just like other rules of conduct, legal norms are an expression of ideas and feelings, for which reason if we are to trace out the formation of law we must also look to the psychical activity of those forming a community. The problems presented to psychology are those of determining in what sense the law is to be understood as a product of the social consciousness, in what ways and forms this consciousness acts on the law, and how legal institutions relate to their respective idealities. If psychology is to solve these problems, Vanni thought, it will have to chart the course of a rigorous realism, accompanied and supported by an observation of historical data and by a keen legal sense, so as to avoid the risk of indulging in metaempirical flights of fancy and conjure up a world inhabited by collective psyches, or by souls animating races, groups, and crowds.

[11] Alessandro Levi was trained under Biagio Brugi, from whom he gained an appreciation of the role the psychological method plays as a support in the historical study of law. In a 1907 address delivered at a conference of the Italian Philosophical Society, Levi (1908) made the case that a modern philosophy of law seeking to know what the law *really* is—or what its concept and its ideal are—should never move beyond the boundaries of experience: For a deeper understanding of the *concept* of law, we must remain anchored to experience itself; likewise, its *ideal* cannot be investigated without taking history into account or, for that matter, without resorting to "that fundamental discipline which is psychology."

[12] Alessandro Groppali rested his entire legal philosophy on the idea that law "is a psychocollective phenomenon, in that it can at once be considered as the resultant of various conflicting social forces and as the average product of the ideas, emotions, and passions common to a given group of individuals" (Groppali 1906, 233–4; my translation).

[13] The main representatives of this school are Giovanni Carmignani (1768–1847), Francesco Carrara (1805–1888), and Pellegrino Rossi (1787–1848).

[14] Lombroso is considered the founder of criminal anthropology, with his three-volume work Lombroso 1876 (republished as Lombroso 1887 under a different title), where he expounds his so-called physiognomic theory. He worked from the premise that we should study not so much the crime itself as the criminal, considering that the crime is nothing but the manifestation of a criminal makeup inherent in certain individuals having specific psychosomatic features. These features will thus have to be anthropomorphically studied so as to figure out the link that ties them to different crimes.

[15] His best-known work—*La folla delinquente* (The criminal crowd: Sighele 1891)—resonated widely not only at home but also abroad: Four editions of it came out in Italy, the last one in 1910 under the title *I delitti della folla* (The crimes of the crowd); and it was translated into five languages, namely, French (1892), Spanish (1893), Russian (1895), Polish (1895), and German (1897).

orizzonti del diritto e della procedura penale (New horizons in criminal law and procedure: Ferri 1881),[16] Ferri spoke not of a criminal's moral responsibility but of social and natural responsibility, and he accordingly understood punishment not as a device by which to punish intentional wrongdoing but as society's physical reaction to an act that has shaken up its order, in precisely the same way as illness is an organism's reaction to the behaviour that threw it off balance.

The other example previously mentioned concerns legal ethnology, a discipline associated with such eminent thinkers as Jakob Bachofen, Lewis Henry Morgan, Henry Sumner Maine, and Albert Hermann Post, all of them sources that Giuseppe Mazzarella (1868–1958) looked to as he set out to write an impressive corpus of contributions on the history of primitive peoples, and especially on the history of ancient Indian law, a study that barely finds any other parallel in Italian culture.[17]

Mazzarella presented his own ethnographic work as a methodological response with which to overcome the perceived limits of Post's thought. Indeed, it was Mazzarella's view that, as much as ethnological research in law found its highest achievement precisely in Post's work—owing both to the sheer amount of material his work is based on and to the advances it made in furthering our understanding of law's genetic-evolutionary process—Post confined himself to giving a merely *descriptive* account of this process, never attempting to investigate the causes and the principles of legal phenomena.

It was with a view to remedying this shortcoming that Mazzarella introduced a new method, which he called stratigraphical, proceeding from the basic premise that every legal system can be resolved into simple social practices reflecting shared ideas and feelings: Just like any other living organism, institutions accrete by incorporating new, irreducible elements, and they change

[16] Another well-known work by the same author is *Sociologia criminale* (Criminal sociology: Ferri 1929). Ferri was not just a theorist but also a prominent man of politics who joined the Italian Socialist Party; so, too, in 1919 he was appointed President of the Royal Commission for the Reform of the Criminal Laws, and in 1921 he published a criminal-code project that attracted wide support.

[17] As Mazzarella himself points out in his autobiography (Mazzarella 1939), his research can be divided into four phases.

The first of these, spanning from 1899 to 1902, is marked by the study of institutions such as the ambilian marriage, trial by ordeal, and lending. His fundamental works from this period are Mazzarella 1899 and 1902, in addition to a few essays published on the *Rivista italiana di sociologia*.

The second phase, spanning from 1903 to 1908, is marked by three essays on the loan in ancient Indian law, also published on the *Rivista italiana di sociologia*, as well as by Mazzarella 1908, where his stratigraphical-analysis method is fully fleshed out for the first time.

In the third phase, spanning from 1909 to 1912, he worked out new methodological tools and carried forward his research on Indian law (in which regard, see Mazzarella 1909).

In his fourth and final phase, from 1913 on, he published his fundamental works: Mazzarella 1902–1909, 1922, and 1902–1938, along with many essays intended to introduce a lay audience to the research developed in his major works.

by virtue of certain of their components becoming extinct or being replaced. Which is to say that institutions have a lifecycle, unfolding over the course of what Mazzarella calls their genealogical period.

The stratigraphical method thus makes it possible to figure out the make-up or composition of a legal system and the function of its every constituent, as well as to trace out and predict its evolution. Mazzarella shared with most positivist philosophers the conviction that every institution's and every legal system's evolutional process unfolds on the whole as a regular and continuing progression, for which reason the social and legal formations that historically succeed one another grow more and more complex and become increasingly sophisticated at regulating individual and collective life.

Many of the previously mentioned investigations—whose guiding idea lays in correctly applying the method of philosophical positivism, and which, in the words of Eugenio Garin, represented the movement's "humanistic and historicist" soul—often failed to proceed beyond a preliminary draft stage, and failed as well to find much application; and even in Italian philosophy of law, what would end up prevailing was the other side of philosophical positivism, the one that Garin always called its naturalistic soul, namely, evolutionism.

11.1.2. Evolutionary Philosophical Positivism

The most rigorous applications of evolutionary philosophical positivism, drawing inspiration from the most representative philosopher of Italian positivism, Roberto Ardigò, are to be found in the work of Raffaele Schiattarella (1839–1902) and Salvatore Fragapane (1868–1909).

It was Ardigò's view that in the whole of reality—whether it be physical, social, or psychical—an evolutionary process unfolds moving from the "indistinct" to the "distinct": In society, this evolution proceeds from the indistinctness of prepotency to the distinctness of justice, where justice is nothing other than the exercise of power through positive law.

Positive law, in turn, is drawn into a continual struggle with natural law, which for Ardigò consists in the entire complex of what he calls "social idealities," understood as society's needs and aspirations, with respect to which positive law is always backward. And it is precisely this ongoing struggle between positive law and natural law, a struggle described by Ardigò as the "process toward the good," that makes it possible for positive law to evolve.[18]

In 1885, in *I presupposti del diritto scientifico* (The presuppositions of scientific law: Schiattarella 1885), Schiattarella sets out the canons of the evolutionary method in the philosophy of law, arguing that just as in biology and the other sciences we must distinguish science from philosophy, so must we do the

[18] Ardigò's most important works on matters of legal interest are Ardigò 1901 and 1908.

same in law. "In zoology as in botany," he observes, "the naturalists are wont to follow one or the other of two methodical processes: They will either study the genesis and evolution of organic forms [...] or they will give an analytical description of the species, just as we find them today, nice and ready" (Schiattarella 1885, 134ff.; my translation). The former method (genetic-evolutionary) is philosophical, while the latter (descriptive-analytic) is scientific. Where law is concerned, "the single steps of established law are studied with respect to their special and determining reasons," and they form the subject matter of legal science, while the philosophy of law is concerned with the genesis and the evolution of law. *Philosophy* of law cannot be confused with the *history* of law, which instead is concerned with the historical succession of legal institutions, "investigating their particular reasons, their particular circumstances, and their particular relations" (ibid.; my translation), this in contrast to the philosophy of law, whose inquiry proceeds not by analyzing the particular but by way of the general laws of evolution.

Revealing himself to be equally rigorous in observing the dogmas of evolutionary philosophical positivism was Fragapane: He, too, like Schiattarella, drew a distinction between science and philosophy. "Scientific research," he remarks in *Obbietto e limiti della filosofia del diritto* (Object and limits of legal philosophy: Fragapane 1897), "collects data from experience, arranges such data to form a hypothesis, and prepares a philosophical synthesis—the final, *a posteriori* result of any scientific research" (ibid., 13; my translation). Coherently with this general conception of the relation between philosophy and science, the philosophy of law is regarded by Fragapane as "the philosophy of the legal phenomenon, the synthesis of the relative phenomenological cognitions" (Fragapane 1899, 164; my translation):[19] It must proceed in its inquiries from the very facts of law and from the legal formations that have their place in society, and must therefore become a genetic-evolutionary study of such facts and formations.

In Fragapane's theorizing, then, as well as in that of all the positivist philosophers committed to an evolutionary approach, the philosophy of law as a "general science of all social phenomena" (Fragapane 1896, 126; my translation) was supposed to bring about an understanding of the origin and historical evolution of law. But without the support of any actual experimental or historico-comparative inquiry, it fell short of these ambitions, offering no more than a superficial construction of syntheses modelled on *a priori* schemes informed by the tenets of evolutionary theory. "Those who preach experimental research—direct, inductive, descriptive, and comparative—in an attempt to ar-

[19] In this context, and in others like it that follow, the term *phenomenology*, from Greek fainomai (to become manifest, to appear), designates a sociological type of research concerned with describing legal phenomena. Hence, the term should not be taken to refer to phenomenological philosophy.

rive at an exact understanding of social phenomena, do no more than to seek yet more evidence of evolution," wrote Fragapane (ibid.; my translation), cautioning scholars in his own time against an erroneous use of the idea of evolution, a use which (it bears mentioning) he himself did not manage to keep away from. "Such an application of a general philosophical hypothesis to the particular scientific explanation of a complex of phenomena is entirely illegitimate" (ibid.; my translation).

These words come not from a critic of philosophical positivism but from one of the strictest observers of its dogmas. And yet it seems to me that no words are more apropos if we are to understand the shortcomings of evolutionary positivism in the field of law, namely, its recognizing for the philosophy of law no more than a phenomenological task, all the while resolving the discipline into that brand of social metaphysics which was evolutionary sociology: These factors combined bring to light the speculative poverty of the approach and its inadequacy in understanding the legal phenomenon.

11.1.3. Critical Philosophical Positivism

By way of an answer to the inward-turning attitude of evolutionary philosophical positivism, there sprang up among legal scholars a number of programs that were critical in outlook and revealed, within the movement itself, the need for a new way forward: Part of legal philosophy thus cast off the evolutionary schemes and sought new avenues in an attempt to overcome all forms of dogmatism and recover the most fertile insights of the method of philosophical positivism.

This need to move beyond naturalistic-sociological determinism found expression in the thought of Icilio Vanni, who from the start, in 1888, in *Prime linee di un programma critico di sociologia* (Outlines of a critical programme in sociology: Vanni 1888), declared himself convinced of the need to impart a critical direction to sociology, for only out of a marriage between philosophical positivism and criticism could a scientific philosophy emerge worthy of its name.

For Vanni, if an alternative was to be found to the evolutionary method by taking up different insights from first philosophical positivism, the way to do so lays in Sumner Maine's historico-comparative method.[20] Vanni pointed to this method underscoring what set it apart from evolutionism. Evolutionism proceeded from the basic assumption that human activity is pretty much the same everywhere across time (this owing to the substantial uniformity of

[20] Vanni (1892) anticipates the critical reading of Maine's work that would later be offered by historiography, which rejected the view of Maine as a typical exponent of the English evolutionary school. Vanni thus brought into the foreground other themes that run through Maine's work, such as his aversion to overly rigid conceptual systematizations, his rejection of all manner of apriorism, and his appreciation of historicity as an inherent value of law.

the human intellect, and this led to a universal history, the outcome of logical operations more so than of historical analysis). The historico-comparative method instead made it possible to shed light on the history of every particular group and to consider legal institutions in view of their historical formation, in such a way as to definitely break the bond tying the study of history to absolute notions, gratuitous hypotheses, and infertile abstractions.

The crisis of philosophical positivism comes through clearly as well in a conception destined to end in fortune, a conception that Vanni put forward setting out the tasks of legal philosophy.

In *Lezioni di filosofia del diritto* (Lectures on the philosophy of law: Vanni 1904), Vanni proceeds from the premise that the philosophy of law must, as a philosophy, concern itself with the three basic problems of knowledge, being, and action,[21] and that it must accordingly investigate three research areas, the first (critical research) aimed at clarifying and determining the concepts used by legal science; the second (synthetic or phenomenological research) aimed at studying law in its evolution, and so at singling out the laws underlying the development of law; and the third (deontological research) aimed at investigating everything the law *should* ideally be. This last line of research Vanni understood as also serving a practical function, its task being to determine the ends of human action in society.

It is clear that this conception took Vanni beyond the boundaries of philosophical positivism, for which, as we have seen, no form of inquiry was legitimate except that described as phenomenological, or sociological. He thus opened the philosophy of law to a broader, more diversified range of investigation—critical and deontological research—absent which phenomenological research would, in his judgment, reduce itself to a passive and sterile observation of what has happened and continues to happen.

Another voice criticizing evolutionism, even as he was declaring himself to be faithful to philosophical positivism, was that of Alessandro Levi, who in Padua studied under Roberto Ardigò and Biagio Brugi.[22] After the demise of a certain flat and presumptuous positivism that reduced philosophy to a mere summary of scientific data, Levi thought, anyone looking to do any positive philosophy of law anymore would have to investigate law as a psychosocial

[21] The question of the tasks of legal philosophy had emerged in Vanni 1894, which prompted the blistering reaction of the orthodox positivist Salvatore Fragapane (1897, 126ff.), levelling at Vanni the charge of taking a dogmatic, uncritical stance, since none of his assumptions are provided with any justification—and yet the very basis of any criticism lies in experience.

[22] Despite some disagreement on the overall assessment of Levi's thought, commentators are of one mind in recognizing in it an initial, thoroughly positivist phase that draws inspiration from his teachers, Ardigò and Brugi. Some hold that Levi's philosophical positivism "fades" into neo-Hegelian idealism, while others make him out to be an exponent of neo-Kantianism. Labels aside, Levi's theory is the typical expression of a critical moment in Italian culture, which was looking for new avenues to explore once the positivist experience had run its full course.

phenomenon, a phenomenon wholly embedded in society as to its origin and development and as to its value and facts. Levi argued that the philosophy of law must essentially be invested in critically investigating the experience of law in its every aspect, clarifying its sources and its content; in other words, the philosophy of law must be configured as "a theory of legal knowledge, that is, as a gnosiology of law."

These premises became for Levi the basis from which to proceed in treating some aspects of the life of the law—some of them broad, others less so—in an enterprise initially undertaken with the four essays collected in *Saggi di teoria del diritto* (Essays in legal theory: Levi 1924): This is something which he further pursued with the two editions of *Istituzioni di teoria generale del diritto* (Main concepts in the general theory of law: Levi 1934), the first published in 1934 and the second in 1937, and which would finally be set down in a definitive and systematic way in *Teoria generale del diritto* (The general theory of law: Levi 1950), published in 1950 but actually thirty years in the making, or close to that.

Among all the problems presented by the reality of law, those that Levi was most drawn to were the ones connected with the sociality of law vis-à-vis its statuality, meaning its status as an issue of the state. These are problems he solved by arguing for the juridical nature of every social system. Indeed, the fundamental concept for an understanding of law was identified by Levi not with legal *norms* but with legal *relationships*, and he argued that wherever a relationship exists among persons, that is, wherever a social aggregate exists, there also exist norms complementarily regulating their behaviour, such that any *social* system is thereby a *legal* system.[23]

This thesis, which seemed paradoxical to jurists closely adhering to legal positivism, found support in Santi Romano's *L'ordinamento giuridico* (The legal order: S. Romano 1917), which we will return to later on in this chapter (see Section 11.4).

The work of Vanni and Levi exemplifies the phase in which philosophical positivism was already past its prime and on its way to extinction, in the late-19th and early-20th centuries, a phase expressly described by its own exponents as "critical positivism." But as one of these exponents, Alessandro Groppali, cautions us, "we must be careful about this word, *positivism*, for we can easily be misconceived about it: The word refers to anything which counts as positive knowledge, and which as such stands in direct opposition to any sort of ideology, be it metaphysical, theological, teleological, conjectural, or hypothetical" (Groppali 1902, 5; my translation). The philosophy of law, Groppali went on to say, cannot turn its back on the task "that was and forever will be entrusted to it," namely, the task of "searching for the permanent essence of

[23] This thesis, previously sketched out in Levi 1911, was systematically developed in the second of the four essays on legal theory previously referred to (Levi 1924), an essay eloquently titled *Ubi societas ibi ius*.

law and pointing out the means by which to make law progress over time in harmony with increasingly elevated idealities of justice." This lent legitimacy to the deontological line of inquiry identified and advocated by Vanni, an inquiry that also concretized in the commitment to civic engagement of many jurists leaning toward philosophical positivism, who considered law a tool of innovation in the effort to solve social problems at large, and solve in particular the conflicts and contradictions distinctive to Italian society after the country's unification in 1861.

So, in summary, the history of late philosophical positivism in the study of law unfolded on two contrary fronts. On the one hand, the approach was characterized by lively discussions that, in tending to reject the warping, the derailing, and the hidden metaphysics ushered in by evolutionism, also saw an effort to revive philosophical positivism's original call to adhere to history and to the reality of facts. But at the same time, to use the words of Bernardino Varisco, "the number of those who worked at digging a grave for the philosophical positivistic approach was growing larger by the day" (Varisco 1905, 320; my translation).

11.2. The Reaction against Philosophical Positivism

Over the course of the first decade of the 20th century, in the philosophy of law as well as in philosophy at large, philosophical positivism spent itself under the thrust of a series of factors, which as we saw earlier were both internal and external, both cultural and political. As Bobbio remarked, "the polemic against antihumanistic determinism, against fallow naturalism, against gross sociological simplifications, against a naive worship of brute facts, against reducing humans to their environment came in tandem with a polemic against the reformist ideas that unsettled the established order, against the dreaded democratic expansion of the power base, against the new social classes' upward mobility, [...] against democracy and socialism" (Bobbio 1990, 14–5; my translation), in a word, against those very ideas that had been taking hold among the more engagé positivist philosophers of law.

Coalescing in the reaction against philosophical positivism were different movements whose common ground lay almost exclusively in their opposition to the deterministic and mechanicist naturalism of philosophical positivism. Among these movements, those that wound up being most influential in Italy were neo-Kantianism and, even more so, neo-Hegelian idealism, which quickly established its dominance and would last until midcentury.

11.2.1. Neo-Kantianism

At a time when philosophical positivism was still the dominant force in Italy, three works by Giorgio Del Vecchio (1878–1970) contributed to the final

downfall of this current in the philosophy of law.[24] As was previously observed, legal philosophy in Italy had already been brewing with antipositivist elements that had not found an outlet through which to develop, but with these three works—*I presupposti filosofici della nozione di diritto* (The philosophical presuppositions of the notion of law: Del Vecchio 1905), *Il concetto del diritto* (The concept of law: Del Vecchio 1906), and *Il concetto della natura e il principio di diritto* (The concept of nature and the principle of law: Del Vecchio 1908a)[25]—there began in Italy with Del Vecchio, in parallel to what was going on in Germany with Rudolf Stammler (see Section 1.3 in this tome), a movement that wound up turning on its head the framing of the philosophical problem of law, and that would then be developed into a radical extreme with the neo-Hegelian idealists. Law, in other words, came to be considered not from the standpoint of the object, as a phenomenon which thought comes to know passively, but from the standpoint of the subject, that is, in relation to the activity of human thought, an activity understood as being to a greater or lesser extent creative.

Taking issue with philosophical positivism—which in its most rigorous form, as we have seen, resolved the philosophy of law into a phenomenology of law (or a sociology of law: see footnote 19 in this chapter)—Del Vecchio took up from Vanni the threefold scheme within which to set out the tasks of law, and so he too identified for law three tasks, consisting in logical research, phenomenological research, and deontological research.

Logical research, for Del Vecchio, is meant to preliminarily establish whether it is possible to determine the concept of law: "Is it possible," he asks, to come to "an objective determination, that is, to a universally valid one, of what law is? And, if so, what are the methodological conditions of law, that is, *how* is law possible?" (Del Vecchio 1905, 12; my translation).[26]

In Kantian fashion, Del Vecchio held the universal concept of law to be logically prior to empirical legal phenomena, not in the sense that the concept is innate, but insofar as the universal is the condition for coming to know the particular: In Kantian terms, it is the transcendental condition. The concept of law, in other words, is for Del Vecchio the *a priori*, transcendental form of the experience of law, and is accordingly defined along Kantian lines as "the objective coordination of possible actions among multiple subjects, or

[24] On Del Vecchio see also Sections 1.1.3.1 and 5.1 in Tome 2 of this volume.

[25] The three works just mentioned were reprinted in a single volume under the title *Presupposti, concetto e principio del diritto* (The presuppositions, concept, and principle of law: Del Vecchio 1959). But long before that reprint, in 1914, they had been collected into a single volume in English under the title *The Formal Bases of Law* (Del Vecchio 1914) as part of the prestigious Modern Legal Philosophy Series. The volume was reprinted in New York in 1921 and 1969.

[26] Cf. Del Vecchio 1903. This work was translated into nine languages (including Japanese) and became an important conduit through which Italian legal-philosophical culture could find an international audience.

persons, in accordance with an ethical principle *determining* such actions, in such a way that they cannot be impeded" (Del Vecchio 1906, 62; my translation; cf. Del Vecchio 1903). From this definition Del Vecchio, proposing to remain on a formal level, deduced what he called the "differential traits of law," essential among which is its coerciveness, and he also deduced all the fundamental legal concepts proper to the theory of law, which thus found itself embedded within logical research, the first of the tasks entrusted to the philosophy of law.

Phenomenological research was instead configured by Del Vecchio as lying somewhere between the philosophy of history and the sociology of law. It consists in tracing out in broad outline the historical development of law, purporting to show how positive legal systems tend to gradually approximate an ideal of justice, in that there progressively emerge and concretize over time the essential prerogatives of the human person.

Lastly, deontological research, concerned with what law *should* be, takes *justice* as its object. Del Vecchio transitioned in this regard from an initial Kantian position to a Thomistic brand of Catholic natural law, by moving away from a formal concept of a person toward a more content-laden one, all the while arguing for the inadequacy of a purely formal definition of justice.

As early as 1920, in the inaugural address Del Vecchio delivered at the University of Rome, where he had transferred from the University of Bologna, he spelled out what he took to be the "general principles of law," meaning those principles that, under Article 3 of the *Preleggi* (general provisions) to the Italian Civil Code of 1865, the judge must base his decision on wherever the law is silent and there is no way to resort to analogy: These were identified by Del Vecchio as consisting of "those principles of natural legal reason which act as basic cornerstones in defining any human and social relationship" (Del Vecchio 1958c, 269; my translation).

Three years later, in *La giustizia* (Justice: Del Vecchio 1923),[27] Del Vecchio argued that justice formally construed amounts to no more than legality, and that it accordingly expresses no values, this in contrast to the expectations of human beings, who experience the law in such a way as to accord absolute weight to the need for values in the law itself.

In taking up the ideal perspective of a just state (a state framed according to justice), Del Vecchio identified the first principle of such a state as consisting in its mandate to protect the natural rights of the individual (or rather, of the person), and he accordingly rejected any theory situating the state above or beyond the legal limit defined by its inherent raison d'être, which is to bring forth justice, in that only from this mandate can the state draw its authority. In fact, any state that should act contrary to justice is for Del Vecchio nothing

[27] This is another work that found an extraordinarily welcome reception abroad: It, too, would be translated into nine languages.

short of a "criminal state" (Del Vecchio 1962). Justice is thus upheld by him as "valid and effective even in the face of a legal system that is positively in force" (Del Vecchio 1923, 168; my translation): Whenever such a state should irreparably contradict the basic need for justice, wherein lies the basis of its validity, then it becomes legitimate to "uphold natural law against any positive law that should deny it" (ibid.; my translation).[28]

A central role was played by Del Vecchio in founding, in 1921, the *Rivista internazionale di filosofia del diritto* (International journal of legal philosophy). As the presentation explains, the journal was conceived as "an exchange forum for philosophers and jurists, since they both too often ignore each other, almost as if to purposely display their mutual incomprehension, whereas both would stand to greatly benefit from casting off their old mental habits and unwarranted mistrust, thereby establishing a certain commonality in their work and an active exchange of ideas as concerns the life and the fundamental problems of law" (Del Vecchio 1921, 1; my translation).[29]

We will later see (in Section 11.3.1) what role the journal played as part of the broader effort to move toward this goal.

Also neo-Kantian was the theory put forward by Adolfo Ravà (1879–1957). Indeed, Ravà drew on Kant's distinction between categorical and technical imperatives to frame an account of ethical norms having absolute validity, as opposed to norms to be followed only in view of a specific purpose we have set for ourselves. Ruling out the hypothesis that law should belong with the former type of imperative—because law would otherwise not admit of any distinction from morals, thereby shedding all autonomy, as well as because the coerciveness proper to law is incompatible with the absolute validity of categorical imperatives—Ravà concluded that law cannot be anything if not a technical norm, that is, a norm framed in view of a given, nonabsolute end.

[28] The question of natural law emerges in numerous works. Among those specifically devoted to the question are Del Vecchio 1949, 1958a, and 1958b.

[29] For almost fifty years Del Vecchio was the lifeblood of the *Rivista internazionale di filosofia del diritto*. He initially edited the journal along with Widar Cesarini Sforza, Antonio Pagano, and Roberto Vacca, but this period only lasted until 1938, when the Italian Ministry of Popular Culture decided to suppress the journal in pursuance of the Fascist government's racial policy, since Del Vecchio was Jewish.

But thanks to Amedeo Giannini—who stepped in as editor alongside Felice Battaglia and Giuseppe Capograssi—the journal started anew in 1939 with a second series that would last until 1943, when the war forced it on a hiatus. Only in 1947 did publication resume, with a third series under the editorship of Giorgio Del Vecchio in collaboration with Felice Battaglia, Norberto Bobbio, Giuseppe Capograssi, and Benvenuto Donati. A fourth and still-running series was started in 1968, when age forced Del Vecchio to give up his role as editor.

He also founded in 1936 the *Società Italiana di Filosofia del Diritto* (Italian society for legal philosophy), serving as the society's president until 1938, the year that the Fascist regime intervened: This role as president he went back to only in 1947, when he was definitely brought back into the university.

In Ravà's best-known work, *Il diritto come norma tecnica* (Law as a technical norm: Ravà 1911), law is accordingly defined as "the complex of those norms prescribing the conduct which the participants in society must necessarily have so that society itself may exist" (ibid., 34; my translation).

Our recognizing the technical nature of law does not detract from the moral worth of law's end. "Morality," Ravà comments, "guides, illuminates, and dominates the entire life of the law, which consequently cannot be entrusted to anything other than a moral organism" (Ravà 1914, 5; my translation). This organism is the state, accordingly conceived as an "organ of law."[30]

We can see, then, that neo-Kantian philosophy of law in Italy did not stop at a formalistic position; on the contrary, it tended to fill its formalism with content. For Del Vecchio, as we considered, this content was that of natural-law theory—an approach that Italy took a renewed interest in, especially in the post-war period (as discussed in Chapter 5, Tome 2 of this volume)—whereas Ravà took this content to be that of an "idealistic" morality, as he himself described it, though without any allusion to neo-Hegelian idealism (discussed in the next section) but rather in a Fichtean sense, considering that Ravà was a great student of Fichte.

11.2.2. Neo-Hegelian Idealism

For about half a century, idealism held sway as the dominant philosophy in Italy, this through the work of two philosophers, namely, Benedetto Croce (1866–1952) and Giovanni Gentile (1875–1944), both of whom drew inspiration from Hegelian thought, though each in his own way.

As far as the philosophy of law is concerned, however, the theoretical contribution made by the two aforementioned fountainheads of Italian idealism was quite limited, this because both denied, however much using different arguments, that law and reflection on law could be recognized as having any autonomy.

Benedetto Croce, as is known, wrote many works of philosophy, history, literary criticism, and aesthetics that resonated widely in Italian culture, so much so that with the advent of Fascism they became the de facto source to look to for the entire movement opposing Fascism from a liberal standpoint. To the question of law Croce specifically devoted a short work published in 1907 and significantly entitled *Riduzione della filosofia del diritto alla filosofia dell'economia* (Reduction of legal philosophy to the philosophy of economics: Croce 1907),[31] with themes and theses taken up

[30] Ravà 1914 and Ravà 1911 have been collected into a single book (Ravà 1950). Other works by Ravà are published in Ravà 1958.

[31] A second edition of this work (Croce 1907) came out in 1926 with an appendix where objections are discussed and the theory is clarified.

two years later in *Filosofia della pratica* (Philosophy of the practical: Croce 1909).[32]

The starting point for his reflection on law lies in his view that the Spirit accounts for the whole of reality. And even though the Spirit is a single entity, this unity does not thereby rule out distinctions: First comes the distinction between theoretical and practical activity, the former concerned with *knowing* and the latter with *willing*, and then each of these two areas is in turn broken down depending on whether the object of activity is the individual or the universal. We thus have a fourfold scheme giving, in theoretical activity, two distinct moments consisting in knowledge of the individual (the aesthetic moment) and knowledge of the universal (the logical moment) and, in practical activity, willing of the individual (the economic moment) and willing of the universal (the ethical moment).

As a volitional and not a cognitive activity (consisting not in knowing but in willing), law belongs in the practical sphere, wherein it does not, however, enjoy any autonomy of its own. Indeed, as was just mentioned, the sphere of practical activity divides into the two moments of economics and ethics, and since this sphere has no other moments apart from these two, there is no choice for law but to resolve itself into either economics or ethics. So, once it is ruled out that law can partake of any ethicality—because there can be *immoral* legal actions, as well as because the distinction between law and morals has been established for centuries—and once law is determined to consist in willing a particular end, then it finds itself being absorbed back into the sphere of willing the particular (particular volition), that is, back into economics. It follows, then, that once law is thus denied any autonomy, the philosophy of law must be reduced to a philosophy of economics.

As was mentioned earlier, this thesis, set out in the short 1907 work, would be taken up two years later in *Filosofia della pratica* (Philosophy of the practical: Croce 1909), where Croce discusses at length the question of law. He denies there is anything "distinctively juridical" about law: Every law follows as such the same system, and so it makes no sense to treat juridical law separately from other laws.

Law is defined by Croce as a volitional act having as its content a series or a class of actions (Croce 1909, 346), and as such—as the volition of a *class* of actions—it consists in an abstract and hence an unreal volition (precisely because it consists in willing something abstract, namely, a class). Only where volition

[32] This is the third volume of Croce's *Filosofia dello Spirito* (Philosophy of the spirit), composed of four volumes: *Estetica come scienza dell'espressione e linguistica generale* (Aesthetics as science of expression and general linguistics: Croce 1902); *Logica come scienza del concetto puro* (Logic as the science of the pure concept: Croce 1905); *Filosofia della pratica: Economia ed etica* (Philosophy of the practical: Economics and ethics: Croce 1909); and *Teoria e storia della storiografia* (Theory and history of historiography: Croce 1917).

consists in willing a single action is it a real volition, and it is carried into effect by applying the law.

Law is located by Croce in the same position within the practical spirit as that which "pseudoconcepts" (as he calls them) occupy within the theoretical spirit. Indeed, pseudoconcepts are understood by Croce as classificatory schemes aiding memory in the task of providing real data with an orderly arrangement: "These very pseudoconcepts," he writes, "once they become an object of volition and are changed from schemes into laws, carry out an analogous function in the practical spirit, making it possible for the will to *will* in a certain direction, where *useful* action is then encountered, a kind of action that is always individualistic."

Law, then, is always, in any of its forms, necessary to action, the reason being that, however much law may be an unreal volition, it is "preparatory to synthetic and perfect volition," which takes place through the single act, this in the same way as the pseudoconcepts the sciences avail themselves of do not constitute authentic knowledge but serve the function of "supporting memory" and "aiding thought in finding its way in the multiform spectacle of the world" (Croce 1909, 352; my translation).

Also finding a place within the frame of Croce's historicism is the subject of natural law: Croce rejects the idea of a natural law as a universal code, eternal and immutable. And he further argues that natural law must not only give up its antihistory but must also cease to be law—at which point, however, it can no longer be distinguished from ethics.[33]

"So-called treatises of natural law," he finds, "are in this case nothing other than treatments (sometimes commendable ones) having *ethics* as their subject." In ethics, natural law overcomes its generality of content and its legalistic generality, thus becoming a principle of action rather than merely an abstract and unreal preceptual system (Croce 1909, 340; my translation).

The other Italian neoidealist philosopher, Giovanni Gentile, was initially a friend of Croce and worked with him. But with the 1913 publication of *La riforma della dialettica hegeliana* (Reforming Hegelian dialectics: G. Gentile 1913), a theoretical rift was opened that grew increasingly bitter with the advent of Fascism, a movement for which Gentile provided theoretical backing, and of which he therefore came to be considered the official theorizer. Indeed, it was he who penned the entry "Fascism" signed by Benito Mussolini and published in 1932 in the *Enciclopedia italiana*, where Fascism is presented as a spiritualistic, ethical, religious, historical, and anti-individualistic conception upholding "the state as the true reality of the individual." (Gentile and Mussolini 1932; my translation).

[33] In 1947, in response to a questionnaire about the theoretical problems that might have been raised by an international declaration of human rights, Croce argued that it would be impossible for such rights or needs to be expressed as anything other than *historical* rights proper to our own epoch (Croce 1952, 133–5; an English translation of this work can be found in Croce 1949).

In the 1913 work just mentioned, Gentile criticized Croce's theses, specifically objecting to his dialectic of distinct moments, in response to which Gentile set out to recover the unity inherent in the life of the Spirit. For Gentile, this unity can be recovered under the principle that the Spirit is real only in its moment of activity (whence the name *actualism* for his philosophy), and so that only the *thinking* Spirit is real: That which is thought, the *object* of thought, has no reality outside the *act* of thinking. Accordingly lacking reality, then, are God, nature, values, and the empirical selves (that is, all particular persons): None of these entities can attain any reality except through the Spirit that thinks them, thereby making them *be*.

Just as there is no real moment outside thought in action, or *thinking* thought, so is there no will outside the act of willing, that is, outside a *willing* will. In the same way as that which is thought is nonbeing with respect to thinking, so that which is willed is unreal with respect to the will in action.

In his work specifically devoted to law, *I fondamenti della filosofia del diritto* (The foundations of legal philosophy: G. Gentile 1916),[34] Gentile frames in terms of will the distinction between law and morality, holding that while morality is a *willing* will, law is a *willed* will, namely, an abstract and hence unreal will. The will, in other words, is real only as a willing will, that is, only when it *makes* law or when, in complying with the law, it likewise *wills* the law as law in actuality: In either case the will is a will in actuality, and this makes it into morality. So the will is either morality—as a will in actuality—or it lacks reality: Law is thus never real, for it is never a *willing* will but is only the abstract moment of the will.

For Croce and Gentile alike, then, law has no reality and cannot be an object of philosophy in its own right. And as we have seen, this common conclusion is something the two thinkers come to taking different paths, Croce resolving law into economics and Gentile into morality.

The attitude espoused by the two fountainheads of Italian idealism exerted a negligible share of influence on Italian legal culture in the first half of the 20th century: Philosophy, which jurists looked on as vaporous and diaphanous, high-flown and vaniloquent, went off on a tangent where it increasingly lost touch with the concrete experience of law; and legal science, for its part, increasingly took on the very empirical traits for which philosophers had faulted it, resorting to Croce, who as we saw accounted all science, in whatever form, to be merely conventional, empirical, and classificatory, and hence devoid of any value for the attainment of knowledge.

[34] This work is now published as Volume 4 of G. Gentile 1961.

11.3. The Demise of Idealism

11.3.1. Idealism and the Esperienza Giuridica *(the Experience of Law)*

The legal philosophers who studied under Croce and Gentile firmly rejected the extreme consequences these two thinkers had come to by reasoning from idealist premises, and so it was that this younger breed of philosophers set out to recover the object of study proper to their discipline (legal philosophy), an object so uncompromisingly eradicated by their spiritual fathers. The underlying premise now became that the experience of law constitutes a historical reality not amenable to being purged by any dialectic, and the period between the two world wars, that is, the 1920s and 1930s, accordingly saw in Italy an idealist attempt to recover a sphere of autonomy for law. Thus, on the one hand, a critical response took shape that challenged the philosophy of both Croce and Gentile—the former criticized for arbitrarily and artificially partitioning the Spirit into distinct moments of activity, and the latter for resolving the entire activity of the Spirit into an undistinguished morality—but at the same time the effort was very much to claim autonomy for the reality of law, arguing that some of its elements are irreducible and so that law cannot be resolved into other realities.

This critical revision of Croce's and Gentile's conceptions, involving as well a reflection on legal philosophy and legal science, revolved in large part around the *Rivista internazionale di filosofia del diritto* (International journal of legal philosophy), which as mentioned earlier was founded in 1921 by Giorgio Del Vecchio with the express purpose of becoming "an exchange forum for philosophers and jurists."

In 1922, Ermanno Cammarata (1899–1971) published in this journal an article titled *Su le tendenze antifilosofiche della moderna giurisprudenza in Italia* (On the antiphilosophical tendencies of modern Italian legal science: Cammarata 1922): It would be the start of a long and lively debate. For Cammarata, writing from an idealist perspective, "philosophy cannot be anything but self-consciousness, and since no reality is conceivable outside the Spirit itself, so the philosophy of law is self-consciousness of that ideal process whereby the Spirit takes shape as law." The primary function of legal philosophy so conceived is to train and refine "that historical sense which acts not as a formula or scheme to be applied to this or that individual problem, but as a criterion informing and even vivifying all the so-called social sciences": The sense in question is that of "the historicity of the reality of law, and the great need for it becomes evident today in the face of what seems to be the highest accomplishment in the study of law, namely, the dogmatic criterion" (ibid., 243; my translation).[35]

[35] Other works by Cammarata on the subject of formalism and dogmatics in law are Cammarata 1925 and 1936, now collected in Cammarata 1962.

The following year the eminent jurist Francesco Carnelutti (1879–1965) replied in the same journal with an article titled *I giuristi e la filosofia* (Jurists and philosophy: Carnelutti 1923), arguing that what is to blame for the inability of jurists and philosophers to understand each other is this "mixed breed we call philosophy of law." As much as jurists do not show a great deal of deference to philosophy when it concerns itself with law, they do hold philosophy in high regard when it is purely and authentically such; and yet Carnelutti drew from this observation the conclusion, all things considered, that jurists, "on account of their average stature," would do better to keep away from philosophy, since philosophy is "a thing too elevated for them to just dabble in it, treating it only in bits and pieces" (ibid., 189; my translation).[36]

The debate set into motion by Cammarata and Carnelutti seemed to set things up for a "doctrine of double truth," positing a philosophers' law on the one hand and a jurists' law on the other; but in time, as philosophers found themselves increasingly committed to bringing law closer to the concreteness of history, the debate drew the philosophers closer to the jurists, who in turn were engaged in an effort to relax the rigid formalism they had acquired from German legal positivism, an approach that was causing them to lose sight of the socio-historical reasons accounting for the norms they studied. Perhaps no one better than Widar Cesarini Sforza exemplified this effort among legal philosophers, and no one better than Tullio Ascarelli did so among jurists.

Proceeding from the philosophy of Croce, Widar Cesarini Sforza (1886–1965) published in 1929 a book titled *Il diritto dei privati* (The law of private citizens: Cesarini Sforza 1929), where he distinguished two conceptions of law: an objectivist one, where law is understood as a complex of norms enacted by authority of the state, and a subjectivist one, where law is instead understood as a complex of relationships among persons. "The legal relationship," he writes, "is truly the primitive cell and the irreducible core of every social reality." There is therefore no social reality that is not at the same time a legal reality, and this holds from the most comprehensive level, where legal relationships are directly regulated by the state's public laws, down to the level where legal relationships are established among private citizens acting on their own accord in those subject areas that neither the public laws of the state nor customary law regulates.[37]

At about the same time, the jurist Tullio Ascarelli (1903–1959) was among the first to take a stand against the then-dominant conceptualism, pointing out the need to study the actual reality of law, underscoring law's role as in-

[36] The debate sparked by Cammarata's article on the *Rivista internazionale di filosofia del diritto* drew other jurists and philosophers into that forum. Among them were Levi (1923), Bonfante (1923a), Miceli (1923), Maggiore (1926), and Perticone (1927).

[37] Cf. Cesarini Sforza 1929, 1931, 1934, and 1939 (this last work went through several revisions).

strumental to society's economic needs, and recognizing the creative function of legal interpretation.[38] Ascarelli's criticism of legal formalism proceeded on two closely connected fronts: He objected to the dogma of legalism where the question of the sources of law is concerned, and to the dogma of legal logicism on the matter of legal interpretation. As to the first front, he took up early on the study of business law, and that led him to frame the relation between law and society as one of dependence of the former on the latter. As to the second front, he always considered interpretation to be a *creative* activity—one through which law is *created* rather than just declared—and he thus ascribed to it a function as a necessary bridge between the *corpus iuris* and the changing reality.

The subject of legal interpretation is also one to which Max Ascoli specifically devoted a 1928 essay titled *L'interpretazione delle leggi* (The interpretation of law: Ascoli 1928), where Ascoli, pointing out the importance of antiformalist currents in Europe, argues that interpretation is "creation in any event," and that "no norm can have any concreteness except one enacted under the cloak of interpretation, and that among those who play a role in the world of law, only interpreters can account themselves to be legislators" (ibid., 52; my translation).

As much as the authors just briefly considered may be credited with giving the initial impetus for this process of reconciliation between legal science and legal philosophy, what made it possible to actually carry the project through to completion in Italy was the mediating work of Giuseppe Capograssi, whose theory of the *esperienza giuridica* (the experience of law) tied together, however much from a uniquely personal standpoint, the loose ends of a development that, as we saw, had been a long time in the making.[39]

Capograssi (1889–1956) developed an extraordinarily broad conception of law, understood not only as a rule or norm but also as an activity, or as experience. Hence the idea of the experience of law, an experience which Capograssi

[38] Most of Ascarelli's work has been collected in Ascarelli 1952, under a title (*Studi di diritto comparato e in tema di interpretazione*: Studies on comparative law and legal interpretation: Ascarelli 1952) that brings into focus the author's two main interests, namely, comparative law and legal interpretation. Comparative law was for him across *space* what the history of law was over *time*, and so the study of different legal systems addressed the same antiformalist concerns that pervaded his entire thought. A comparative study was recognized by him as that moment which brings out the way different legal institutions relate to their socioeconomic and moral premises, thus enabling us to grasp the concrete experience of law in its crucible.

[39] Capograssi's work can be divided into three phases: There is an early phase, in his youth, in the late 1910s and early 1920s, which resulted in two works, these being Capograssi 1919 (largely influenced by Saint Augustine) and Capograssi 1921 (where the prevailing influence is instead that of Vico); there is then the mature phase, during which his original conception was expounded, this in his three most celebrated works, namely, Capograssi 1930, 1932, 1937; and there is finally a third phase, in the 1940s and early 1950s, marked by a deep moral reflection on the evils of war and totalitarianism, as can be appreciated in Capograssi 1952.

took to include concrete experience at large, in its full breadth, and which ultimately can be identified with the whole of human experience.

The concept of the experience of law—a concept deliberately framed in loose and inchoate terms—effectively brings out the intractability and indeterminacy of the legal phenomenon, which poses insurmountable challenges for any theory attempting to reduce it to something simpler, as had paradigmatically been the case with legal positivism. And in fact the conception put forward by Capograssi captured the imagination of Italian legal culture, contributing to open it to livelier and more concrete ways of understanding law.

11.3.2. The Post-war Reaction

With the end of World War II and the fall of Fascism, so did idealism slide into that irrelevance which would bring about its eventual demise: Already crippled by the charge of having been the philosophy of Fascism, idealism was now coming under harsher and harsher criticism. This reaction took several forms, and idealism itself split into two currents, precisely as had happened with Hegelian idealism: On the one hand there emerged a Marxist line of thought—though its impact on legal philosophy was not too influential—and on the other there developed spiritualism.

Exemplifying this last current is Felice Battaglia (1902–1977), who initially adhered to neoidealism, especially in the shape it had been moulded into by Gentile, but would soon depart from it, arguing that only in relational life as supported by legal norms can there be any historicity and concreteness. It follows that law figures as an "original moment of the spirit" and so cannot be resolved into any simpler spiritual form: Law endows the makeup of the spirit with authentic concreteness, in such a way as to entail, first, alterity, understood as the relation through which we each interact with others like us; second, sociality, understood as an irreducible bilateral relationship among people; and, third, the person, understood as an absolute ethical value.[40]

It is Antonio Rosmini[41] that Battaglia looked to, colouring his thought with existentialist overtones, and in this way Battaglia came to regard the person as the metaphysical and absolute core of law: It is in the value of the person as a divine image that law is grounded, and it is from that source that law in turn derives its own value. The true expression of the value of the person is

[40] Battaglia's essential texts on law are Battaglia 1931 and his well-renowned course on the philosophy of law (Battaglia 1940–1942), a work that went through several revised and expanded editions. Some minor writings are collected in Battaglia 1972.

But law is a subject also discussed in his works on moral and political philosophy, both: the former include Battaglia 1957, and the latter Battaglia 1939.

[41] Rosmini (1797–1855), a Catholic priest open to the liberal ideals of the Risorgimento (the movement that led to the unification of Italy), figures among the main Italian thinkers of the 19th century.

given by the fundamental human rights. Condensed in these rights is the true meaning of the person, and since they concern every human being, they must be universally recognized and guaranteed. Battaglia argued on this basis for a process toward the internationalization of human rights, regarded by him as the only tool by which to guarantee respect for the person. "Human rights," he comments, "become effective when, apart from receiving recognition within domestic law, they also find a peaceful international organization watching over them. It does not suffice to proclaim them and write them into domestic law: There need to be organs and tools by which to protect them under an agreed upon constitution of all nations" (Battaglia 1946, XXX–XXXI; my translation).[42]

For Battaglia, this internationalist turn was called for not only on philosophical grounds but also for historical reasons tied to the experience of Fascism and the catastrophe that had befallen Italy with World War II—precisely the same reasons that concurrently led to the rebirth of natural-law theory, both Catholic and otherwise (see Chapter 5, Tome 2 of this volume).

Yet reaction against idealism came in another form, too, much more explicit and polemical than the ones previously considered: It was called neo-Enlightenment, a secular and rationalistic current of thought offering an alternative to both Catholic spiritualism and Marxism.

One of its protagonists was Norberto Bobbio, who observed that neoenlightenment was not so much a philosophy as an attitude and a way of thinking about the problems of humans and their history. The scholars who shared this mode of thought were a diverse bunch by training—indeed we find among their number thinkers like Nicola Abbagnano (1901–1990), whose background was existentialist; Giulio Preti (1911–1972) and Enzo Paci (1911–1976), whose allegiance was to phenomenology; and Ludovico Geymonat (1908–1991), who came from a neoempiricist experience—but they were all joined by a deep aversion to any manner of philosophical gibberish, as well as by a commitment to a cultural and constructive effort on which basis to actively intervene in a society such as was found in post-war Italy, in deep need of change.

These authors are in large part responsible for enabling Italy to look abroad and take in legal and philosophical currents of wide international scope, and this opening also involved the philosophy of law, which until the first half of the 20th century in Italy had to some extent been impervious to the influence of foreign cultures and traditions, with the single exception of Germany's.

[42] This is the second edition, updated by Battaglia himself (originally published in 1934).

11.4. Legal Positivism and Analytic Philosophy

Throughout the first half of the 20th century, the main reference point for Italian jurists was, as we saw, the formalist legal positivism coming out of Germany.

Few discordant voices emerged, but one of them was that of Santi Romano (1857–1947), who in his previously mentioned work, *L'ordinamento giuridico* (The legal order: S. Romano 1917),[43] developed an antiformalist, antinormativist theory built around the concept of an institution, a concept taken up from Maurice Hauriou but with different inflections.[44]

Romano judged "inadequate and insufficient" those conceptions on which law is thought to essentially consist in a system of rules or norms, and in contraposition to such conceptions he set out a conception of law as an order. The legal order makes up a "living whole" comprising not only norms but the underlying will, power, and force through which norms are brought into being: A legal order can thus be equated with an institution understood as a "social entity or body." As Romano puts it, "Every legal order is an institution and, conversely, every institution is a legal order: The equation between the two concepts is necessary and absolute."

Like other institutionalists, however, Romano does not offer anything like an exhaustive definition of an institution. He does note that while every institution is a social entity or body, not all social bodies are institutions. Thus, for example, even though a line of people queuing at a service window or the complex of people who play a certain game make up organizations in "a diffused state," they do not make up institutions proper. But as much as these limitations on the concept of a social body would call for a criterion to be established by which to say which forms of coexistence are institutional and which are not, Romano offers no such criterion and falls into the vicious circle that other institutionalists have fallen into as well, essentially saying that an institution is legal when it is legal.

This shortcoming notwithstanding, Romano's institutionalism did play an important role, which consisted in having called into question the dogma of the statuality of law and having upheld the principle of the plurality of legal systems.[45] As Romano himself comments, such plurality is evidence of the cri-

[43] This work met with great fortune, for it was translated into Spanish (1963), French (1975), and German (1975). There is no English translation, to be sure, but that is made up for by the extensive and accurate exposition of his thought found in Stone 1966, 516–45. Another important work that Romano wrote on the theory of law is S. Romano 1947.

[44] On Romano see also Section 8.8 in Tome 2 of this volume. On Hauriou see Section 12.2 in this tome and Section 1.1.4.2 in Tome 2 of this volume.

[45] An interesting contribution in the matter of legal pluralism comes from Antonio Pigliaru (1922–1969). In Pigliaru 1959, the Sardinian jurist lays out the normative system in effect among a pastoral people of the Barbagia region of Sardinia: This was a customary system based on an oral code that, far from interlacing with that of the Italian state, stood in contrast to it.

sis of the modern state, a crisis that "involves precisely the tendency of social groups to each form for itself an independent legal circle."

Fascism, by contrast, emerged as an ethical state (we saw how it came to be so conceived owing to Gentile), and as such it coopted all intermediate communities, absorbing them into itself, at the same time as it made an instrumental use of the legal-positivist principle that sets out the supremacy of the law of the state, using this as a tool by which to reinforce power and curtail individual freedoms.

This idea is echoed in the words of Alfredo Rocco (1875–1936), who figured among the most influential jurists of the Fascist period, and who also rose to prominence as minister of justice. "For Fascism," he wrote in 1925, "the preeminent problem is that of the law of the state and that of the duty of the individual and the classes. The rights of individuals are no more than a reflection of the rights of the state [...]. As is the case with all individual rights, so is freedom a concession of the state" (Alfredo Rocco 1938, 1103; my translation).

Infused with these ideas, Alfredo Rocco wrote the fundamental Fascist laws of 1925 and 1926, and he arranged for the drafting of the codes of criminal law and criminal procedure enacted in 1930. These were in large part the work of his brother, Arturo Rocco (1876–1942), an exponent of an approach to criminal law that came to be called technico-legal and adhered to legal positivism in its the strictest form, thus taking a critical attitude to the positive school of criminal law (see Arturo Rocco 1910). And so, as much as it would be a mistake to conclude that legal positivism was the legal theory of Italian Fascism, it certainly is the case that the legal-positivist reduction of the entire law to the law of the state proved useful to Fascism in view of its goals.

Despite the criticism from natural-law theory and antiformalism, legal positivism in Italy outlived Fascism. But this is something it did sloughing off the state-centred conception of German derivation and opening up to Kelsen's refined revision of legal positivism. And even though it was not until the 1950s that Kelsen's thought became influential in the Italian debate on legal philosophy, when Norberto Bobbio became its foremost interpreter and popularizer, some of Kelsen's writings had begun to circulate as early as the 1920s and 1930s, especially through the initiative of Renato Treves.

Renato Treves (1907–1992) studied in Turin under Gioele Solari, taking an initial interest in the neo-Kantianism of the Marburg School, which as is known had a profound influence on Kelsen.[46] Treves met Kelsen during a "memorable" study trip to Germany in 1932 (a trip he was urged to take by his teacher, Gioele Solari) and forged with Kelsen a relationship through which he would become the Italian translator of Kelsen's *Reine Rechtslehre*.[47]

[46] On the Marburg School, see Treves 1934a; on the influence the school had on Kelsen, see Treves 1934b.

[47] The earliest translations of Kelsen's work began to circulate in Italy in the latter half of the

Kelsen's pure formalism is something that Treves had always kept at a distance, having developed his own a conception of law as a complex sociocultural phenomenon. Treves held that law cannot be reduced to the world of natural phenomena or to that of pure ideal values, and that it instead belongs to the sphere of culture—the sphere of life and human activity—where those values become effective and those natural phenomena become significant.[48]

These premises would lead Treves to found in Italy the sociology of law, understood as a social philosophy or as a doctrine of life and history, in contraposition to the philosophical-positivist conception, which as we saw reduced sociology to a naturalistic science and resolved into such a science the philosophy of law.[49] Kelsen himself did not deny the legitimacy and importance of a sociology of law so understood, and Treves continued to measure himself against Kelsen, taking Kelsen's thought into account in much of his sociological work.[50]

As earlier remarked, from the 1950s onward in Italy, Kelsen's name became closely bound up with that of Norberto Bobbio (1909–2004).[51] Like Treves, Bobbio also studied under Gioele Solari, and his early experiences unfolded

1920s: These were later collected by Arnaldo Volpicelli in Kelsen 1933b. Also published in 1933, in the *Archivio Giuridico Filippo Serafini*, is Treves's translation of Kelsen's essay *Methode und Grundbegriff der Reinen Rechtslehre* (translated as La dottrina pura del diritto: Metodi e concetti fondamentali: Kelsen 1933a). Treves then translated Kelsen's *Reine Rechtslehre*, a translation published as Kelsen 1952, with a second expanded edition (Kelsen 1967b) carrying in appendix Treves's translation of two essays by Kelsen, namely, *The Pure Theory of Law and Analytical Jurisprudence* (translated as La dottrina pura del diritto e la giurisprudenza analitica) and *Vergeltung und Kausalität* (translated as Causalità e imputazione).

[48] See Treves 1947. The text came out almost simultaneously in Italy and Argentina (Treves 1947a, 1947b), where Treves had emigrated to in 1938, the year the Fascist regime enacted its racial laws, and where he stayed until 1947, when he returned to Italy. Another fundamental text in this regard, completing the conception expressed in Treves 1947, is Treves 1954, where Treves sets forth the critical spirit informing his entire oeuvre, a spirit committing him to a rejection of all dogmatically imposed truths and an openness to all well-grounded and rigorously argued criticisms.

[49] In 1969, a chair in the sociology of law was established at the University of Milan, which was among the first in Italy to do so, and the course was entrusted to Treves. He wrote for it a cyclostyled book titled *Sociologia del diritto* (The sociology of law: Treves 1969), which formed the initial kernel of a text he would keep writing and rewriting through the rest of his life: After the handouts making up the 1969 coursepack came Treves 1977 (with a second edition out in 1980), and ten years later came a complete makeover, Treves 1987, though the reworking continued until the end of his days, so much so that a third edition came out posthumously in 1993 with further changes and qualifications. In 1974, Treves founded the journal *Sociologia del diritto*, which became, and to this day remains, a recognized forum among Italian sociologists of law.

I will not treat here the sociology of law or other disciplines akin to legal philosophy, such as political philosophy, for these disciplines have become completely autonomous from legal philosophy even as they remain closely bound up with it in many respects.

[50] Treves's relationship with Kelsen is documented in Paulson 1992.

[51] On Bobbio see also Section 9.3.1 in Tome 2 of this volume.

in a period when idealism and legal positivism were by far the two dominant forces in philosophy and legal philosophy, respectively, but as early as the 1930s he began to look at Transalpine currents such as phenomenology, existentialism, and antiformalist legal theories, with a specific interest in institutionalism.[52] And then, as mentioned, came his involvement as one of the intellectuals who in the post-war period contributed to laying out the neoenlightenment program, which grew receptive to the methods of analytic philosophy. It was these methods that at once aroused Bobbio's interest, who valued them for their pursuit of rationality coupled with a rejection of ultimate truths.

In 1950, Bobbio published under the title *Scienza del diritto e analisi del linguaggio* (Legal science and language analysis: Bobbio 1950) an essay that for analytic philosophers of law in Italy would take on the meaning of a programmatic manifesto. Its stated purpose was to call to the attention of jurists, and generally of anyone involved in scientific research, the contribution made by the new conception of science developed through the latest methodological approaches falling under the rubric of logical positivism, for this conception can afford a better understanding of the process by which the jurist does research, as well as it offers a new and more adequate way to go about framing the problem of legal science.

In light of this conception—effecting a shift whereby the scientificity of any discourse or research is made to depend not so much on its "truth" as on its "rigour," in the sense of its adhering to rules for the formation and transformation of sentences—Bobbio argued that legal science is fully fit to be considered a science proper. This, however, will require an effort to analyze legal language, on the three levels involving its purification, completion, and systematization, so as to make this language into a rigorous discourse, by clarifying the basic sentences of this discourse, defining and completing the rules for transforming such sentences, and ordering them into a coherent system.

On several occasions in the essays published from 1949 to 1954, and collected in *Studi sulla teoria generale del diritto* (Studies in the general theory of law: Bobbio 1955), one will find it stated that nowhere outside Kelsen's pure theory of law has a higher standard been achieved in the effort to make legal studies scientific, since Kelsen purged from his theory all scientifically unsolvable and legally irrelevant problems, and clearly distinguished the problems related to the *knowledge* of law from those relating to its *evaluation*.

From the early 1950s to the late 1960s, Bobbio proceeded on two fronts, on the one hand blocking out a theory of law—a formal theory modelled on Kelsen's, and so a theory that considers the *form* of law independently of its content and values—and on the other hand defending legal positivism from the charges levelled at it by natural-law theory.

[52] I should point out, among Bobbio's earliest writings, Bobbio 1934b, 1935, 1936a, 1936b, 1940, 1944.

Norberto Bobbio (1909–2004)

His commitment to a formal theory can be appreciated in the course handbooks *Teoria della norma giuridica* (Theory of legal norms: Bobbio 1958) and *Teoria dell'ordinamento giuridico* (Theory of the legal system: Bobbio 1960), as well as in numerous essays published from 1956 to 1968 and collected under the title *Studi per una teoria generale del diritto* (Studies toward a general theory of law: Bobbio 1970). His parallel commitment, in defence of legal positivism, can instead be found in the course handbook *Il positivismo giuridico* (Legal positivism: Bobbio 1968) and in *Giusnaturalismo e positivismo giuridico* (Natural-law theory and legal positivism: Bobbio 1965), collecting essays published from 1956 to 1964.

Bobbio's teachings gave birth to what is known in Italy as the country's northwestern analytic school of legal philosophy and general theory of law. The early exponents of this school studied directly under Bobbio—examples being Uberto Scarpelli (1924–1993), Giacomo Gavazzi, Amedeo G. Conte, Giorgio Lazzaro, and Mario Losano—and then there came a second generation, the students of the students, with scholars such as Mario Jori and Letizia Gianformaggio. What these scholars all have in common is, in Scarpelli's words, "a persevering mode of work, painstakingly proceeding point by point, step by step, and a passionate devotion to clarity and rigour, coupled with a close attention to language and form and a fondness for clear, possibly vivacious exposition" (Scarpelli 1982a, 188; my translation). These authors we will return to in the section on the contemporary debate.

11.5. The Crisis of Legal Positivism

Legal positivism flourished in the 1950s and 1960s in Italy along the previously considered line of development, an outcome of the fecund marriage between analytic philosophy and Kelsen's pure theory. It is in this context that, in the early 1960s, the work of H. L. A. Hart began to circulate: In 1964 came *Contributi all'analisi del diritto*, edited by Vittorio Frosini (Hart 1964); in 1965 came the translation of Hart's chief work (*The Concept of Law*), edited by Mario Cattaneo under the title *Il concetto di diritto* (Hart 1965); in 1966 the journal *Rivista di Filosofia* published *Il concetto di obbligo* (Hart 1966); and in 1968 came *Law, Liberty and Morality*, translated and edited by Giacomo Gavazzi under the title *Diritto, morale e libertà* (Hart 1968).

As Mario Jori has underscored, the reflection on Hart did not reach Italy unexpectedly from the outside but came as a contribution to a debate in which Italian legal philosophy had been actively participating for some time. This contribution stimulated and fuelled criticism regarding some aspects of analytical legal positivism, and it is in large part through such criticism that legal positivism would meet its demise (Jori 1987).

A symbolic date in this regard, marking the beginning of this decline, is 1966, when a roundtable was organized in Pavia by Bruno Leoni to discuss

two works that had come out the year before,[53] these being Bobbio's *Giusnaturalismo e positivismo giuridico* (Natural-law theory and legal positivism: Bobbio 1965) and Scarpelli's *Cos'è il positivismo giuridico* (What is legal positivism: Scarpelli 1965): As much as these were regarded as condensing fifteen years of alliance between analytic philosophy and Kelsen's pure theory, they already signalled the crisis that was to come.

In *Giusnaturalismo e positivismo giuridico* Bobbio distinguished three ways of understanding legal positivism—as an ideology, as a theory of law, and as an approach to the study of law—and declared that only in this last sense did he espouse legal positivism, as a value-neutral and scientific way to go about studying law. At the Pavia roundtable, however, he remarked that even in this last sense legal positivism was heading into crisis, a crisis he ascribed to the "wearing away of certain convictions that had made it possible to mark a clear distinction between law as it is and law as it ought to be, and so a separation between, on the one hand, de facto law—laid down once and for all, and preconstituted, so to speak, before the jurist observing it—and, on the other hand, an ideal, potential, or possible law that should rise atop positive law without thereby overshadowing it." In light of these remarks, Bobbio closed his talk saying, "I must recognize that legal positivism is in crisis not only as an ideology and a theory, as I myself have already conceded, but also as an approach to the study of law" (Leoni 1967, 73; my translation).

And two years later, in an article titled *Essere e dover essere nella scienza giuridica* (Is and ought in legal science: Bobbio 1967), Bobbio went to the extreme of turning on their head the theses he himself had defended in the 1950s: At that time, as we saw, he took the view that Kelsen's metajurisprudence was descriptive, but he was now finding that even Kelsen's model in reality offers a *prescriptive* jurisprudence, for it sets forth the behaviours to be had, and insofar as it prescribes, it cannot be counted as a science.

Scarpelli, for his part, got the legal-positivist model to move "from the universe of science to the universe of political activity."[54] Indeed, he argued that legal positivism resolves itself into the jurist's espousal of positive law understood as a system of valid norms—comprising norms of conduct and structural norms, the former primary and the latter secondary—laid down through the will of human beings, a system "not exclusively made up of general and abstract norms, a coherent system (or otherwise reducible to one), complete because exclusive, and coercive." In other words, legal positivism entails that we subscribe to a specific technique for the formation and expression of political

[53] The proceedings (Leoni 1967) collect reports by Bruno Leoni, Luigi Bagolini, and Alessandro Baratta and contributions by Guido Fassò, Mauro Stoppino, Giovanni Tarello, Mario A. Cattaneo, Amedeo G. Conte, Norberto Bobbio, Uberto Scarpelli, and Angelo Ermanno Cammarata.

[54] On Scarpelli see also Section 9.3.2 in Tome 2 of this volume.

will, a technique where political will is *formed* through procedures governed by positive structural norms and is *expressed* through general and abstract norms.

As Scarpelli remarks, "legal positivism is an aspect of the political technique designed to achieve social control through a regulated production of general and abstract norms." It is, in other words, an aspect of the political technique distinctive to the modern state; yet legal positivism does not just resolve itself into "the determination of a criterion for the validity of law," because accompanying this determination is "a legitimation of positive law."

The grafting of analytic philosophy onto Kelsen's legal positivism—a move that initially gave new impetus to his theory, enabling it to flourish in Italy—thus turned out over time to be a sort of Trojan horse in Kelsen's citadel, as Enrico Pattaro (1976) has effectively described this unfolding of events, for this grafting made it possible to see that implicit in legal positivism is a value judgment. And once it is determined that the positivist theory of law entails an ideological choice, the theory is thereby shown to be incompatible with a value-neutral approach such as that which guides analytic philosophy.

This newfound awareness led legal theorists in Italy to move gradually away from legal positivism as initially conceived, and to take either of two paths: While some held valid the epistemological premises of analytic philosophy, thereby working toward a theory of law as fact, others remained loyal to legal positivism, but recognizing that this does not afford an objective knowledge of law—recognizing, in other words, that this theory is not scientific but resolves itself into politics.

The former path was that taken by Bobbio, who in the late 1960s moved toward a functional, broadly sociological theory of law, amenable to being reconciled with the neoempirical model of the descriptive and explicative sciences. As he himself comments in his introduction to a collection of essays significantly entitled *Dalla struttura alla funzione* (From structure to function: Bobbio 1977), the formal theory of law, entirely given over to analyzing the *structure* of legal systems, has neglected to analyze their *function*. Yet law is not a closed, independent system but rather forms part of the broader social system considered as a whole, and as such it operates as a subsystem next to other subsystems (economic, cultural, political)—partly also overlapping with such systems and counteracting them—and what distinguishes it from these other subsystems is precisely its function within the whole. Hence the need for a functionalist theory of law, not set in opposition to a structural theory but building upon it. From the 1970s on, Bobbio mainly devoted himself with political philosophy, partly on account of circumstances—he was appointed to the chair in political philosophy at the newly established Faculty of Political Science at the University of Turin—and partly by conviction, having come to the conclusion that political theory must nurture and integrate the philosophy of law.

The second path was that taken by Scarpelli, who in the late 1980s, specifically in *Il positivismo giuridico rivisitato* (Legal positivism revisited: Scarpelli 1989) declared himself to be "a believer in the law and a quite repentant defender of positivism" (ibid., 10; my translation; cf. Scarpelli 1987): He argued for the need to single out principles capable of guiding legislation, hopeful that these principles—equated with the constitutional principles—could serve as a basis for creating a judicial apparatus by which to ensure that the law is interpreted in a unified fashion, through an (interpretive) activity carrying out a function similar to that once carried out by the codes and the statutes, which no longer seemed up to the task they had been entrusted with as the main tool of the modern rule of law, namely, the task of guaranteeing rationality and protecting the fundamental rights.

Over the same period, Scarpelli turned his focus to a study of legal ethics and metaethics. The work that best typifies this phase is *L'etica senza verità* (Ethics without truth: Scarpelli 1982b), an emblematic title, for it sums up the gist of the author's entire philosophy, "the overarching theme, the red thread, the backbone and premise" of all his inquiries into ethics, as Scarpelli himself points out in the preface to this work. Indeed, throughout his inquiries he always proceeded on the principle of the "great distinction" between the descriptive and the prescriptive.

A prominent place in this area of interest is reserved for his studies on bioethics.[55] Scarpelli outlined and defended a conception of it as a free and rational inquiry geared toward protecting individual freedoms, and he contributed to opening the Italian debate to a secular perspective on issues hitherto regarded as the exclusive province of Catholic culture.

11.6. The Postpositivist Debate

Over the last thirty or forty years, the Italian debate on legal philosophy has become increasingly internationalized and receptive to Anglo-American culture.[56] Two trends can be observed in the debate, for on the one hand we have witnessed the gradual withering away of the long-established schools and orientations—in fact, it was Scarpelli's assessment that the only surviving school as early as after the war, "the only school properly so called" (Scarpelli 1982a, 174; my translation), was the northwestern analytic school—and on the other hand there has been a broadening of the range of topics and areas of discussion. In addition to covering such traditional ground as the theory of norms

[55] Scarpelli's main writings on bioethics are now collected in Scarpelli 1998.

[56] The discussion in this section will be confined to those approaches and lines of inquiry that have drawn a considerable following, and will leave out the younger scholars whose work is still taking shape and whose contribution to the debate has not yet fully distinguished itself from that of their teachers.

and of the legal system, legal philosophers, not only abroad but also in Italy, have increasingly been concerning themselves with specialistic questions that see them play a role next to moral and political philosophers, sociologists, bioethicists, and computer scientists in facing the new challenges posed by information technology, as with Vittorio Frosini (1922–2001),[57] Mario Losano (1939–),[58] Enrico Pattaro (1941–),[59] and Giovanni Sartor (1959–),[60] as well

[57] Vittorio Frosini—the author of many historical and theoretical writings (including, importantly, Frosini 1962)—published in 1968 a book titled *Cibernetica, diritto e società* (Cybernetics, law, and society: Frosini 1968), making him among the first scholars in Italy to tackle the issues raised by the "cybernetic revolution" as applied to law and society. These issues were further dealt with in four later works, namely, Frosini 1981, 1988, 1991, 1998a.

Especially significant is Frosini's attempt to marry information science and legal hermeneutics, the basic premise being that information science facilitates the information process, and in so doing makes our interpretation of norms more complete and effective: See in this regard Frosini 1989.

[58] Mario G. Losano was a pupil of Bobbio whose research has mainly been devoted to German legal thought (with some now-classic works on Jhering), but also to North and South American legal thought, as well as to comparative law and the sociology of law (I should mention here Losano 1978 and 2002). In 1969, he published *Giuscibernetica: Macchine e modelli cibernetici nel diritto* (Legal cybernetics: Cibernetic machines and models in the law: Losano 1969), distinguishing practical and theoretical approaches in an effort to bring order to the different investigations that were cropping up at the time in law and computer science. The themes therein developed were then taken up in Losano 1985, the first introductory work to appear in Italy for a course in legal informatics, and here Losano develops the question of how computer science can be brought to bear on law: He does so by turning to social scientists who might want to apply the new technologies to their subject matter. The same themes are also taken up in Losano 1986 and Losano 1987, both of them concerned with the converse question of applying law to computer science. The now generally recognized distinction was thus established between legal informatics and information-technology law. See also Losano 1989.

[59] Enrico Pattaro has led the effort to make legal informatics a recognized academic discipline in Italy: He had the discipline officially introduced into the curriculum in legal philosophy, and through his decisive effort it also became a foundational course at law school with the university reform of 1999. Likewise, he founded the doctoral programme in legal informatics at the University of Bologna. Even more significantly, however, in 1986 he founded CIRSFID (Centre for Research in the History, Philosophy, and Sociology of Law and in Computer Science and Law), which is also based in Bologna, and to which he initially drew the world's leading experts in AI & Law. The idea was to invest in the intersection of legal philosophy and legal informatics, looking to make this a fruitful relation when it comes to drafting legal texts, analyzing normative language, and interpreting the law. In 1987, as part of his commitment to internationalize Italian philosophy of law, Pattaro founded the journal *Ratio Juris*, based in Oxford and published in English. Also speaking to the same effort is the role he has played in the IVR (*Internationale Vereinigung für Rechts- und Sozialphilosophie*), with his term as president from 1995 to 1999 and now as honorary president, and finally the present twelve-volume *Treatise*.

[60] Giovanni Sartor, a student at CIRSFID under Enrico Pattaro (see the previous footnote in both regards), has proceeded in his work by coupling logic with legal informatics, making this a platform on which to investigate how information-science models can be used to represent legal reasoning and legal knowledge, and how artificial intelligence can be brought to bear on law and on legislative technique (exemplifying these lines of research are, in particular, Sartor 1990 and 2005, the latter appearing as Volume 5 of this *Treatise*). So, too, he has recently also applied to law the ontologies of information science, along with game theory and social simulation.

as by bioethics, with Uberto Scarpelli, as previously mentioned, and Francesco D'Agostino (1946–),[61] and by the advent of the multicultural society.

Little has survived of the two movements into which late idealism had split, these being Marxism and spiritualism.

As for Marxism, we saw that even in the post-war period the movement did not bear much fruit for legal philosophy in Italy, and even though several thinkers did proceed from a Marxist perspective—this applies in particular to Domenico Corradini Broussard (1942–),[62] Eugenio Ripepe (1943–),[63] Danilo Zolo (1936–),[64] and Pietro Barcellona (1936–2013)[65]—they all moved away from that perspective, each developing his own position.

[61] The bioethical debate in Italy has often unfolded through an interchange, occasionally bordering on a clash, between a secular orientation and a Catholic one, each of which in turn forms not a single bloc but a collection of markedly distinct views. The main pillars of secular bioethics—largely attributable to Scarpelli, above, and set forth in a manifesto signed by Carlo Flamigni (1933–), Armando Massarenti (1961–), Maurizio Mori (1951–), and Angelo Petroni (1956–) (Flamigni et al. 1996)—can be summarized in broad outline as consisting in a commitment to respect individual autonomy (entailing that everyone has a right to choose in matters pertaining to their own health and life) and to respect others' religious convictions (all the while recognizing that religious faith does not ipso facto entail ethical solutions for nonbelievers), coupled with a commitment to promote the quality of life and guarantee equal access to the best medical care available. A newer focus of interest has emerged over the last decade at CIRSFID under the guidance of Carla Faralli: a focus on the new biomedical technologies, and in this way CIRSFID has also become a centre for the study of bioethics, in a multidisciplinary environment drawing on the expertise of jurists, philosophers, physicians, and psychologists.

Catholic bioethics is defended in Italy by an authoritative figure, Francesco D'Agostino, who as we will see shortly is a pupil of Sergio Cotta, and who, like his teacher, follows in philosophy an existentially inflected phenomenological approach. This approach informs D'Agostino's bioethics, which he rests on such foundations as the principle of the inviolability of life, recognizing corporeal and physical life as a fundamental value; the principle of freedom and responsibility, entailing a responsibility to treat the patient as a person, as well as the physicians' freedom not to satisfy requests they cannot in their own conscience morally accept; the principle of totality, under which it is legitimate to intervene in a person's physical life only if it proves necessary in protecting that person's unitary and indivisible totality of body, psyche, and spirit; and the sociality and subsidiarity principle, committing every one of us to *live*, this in virtue of our constitutive and ontological relationality, and by taking part in the fulfilment of fellow humans. On these questions, see in particular D'Agostino 1998, 2004, and 2012.

[62] Domenico Corradini Broussard has focused his interest on matters pertaining to the constitution of the subject and to the symbolic order, this through the study of thinkers such as Friedrich Nietzsche, Carl Jung, and Michel Foucault. See Corradini Broussard 1974, 1986, and 1988.

[63] Eugenio Ripepe has enriched his reflection on the state through the study of eminent elite theorists (such as Robert Michels, Gaetano Mosca, José Ortega y Gasset, and Vilfredo Pareto), and more recently he has devoted himself to the study of the constitution and its modification. See Ripepe 1974, 1982, 1987, and 2006.

[64] Danilo Zolo has coupled a theory of knowledge developed along empiricist lines (Otto Neurath) with Niklas Luhmann's systems theory, thus elaborating an epistemology with which to treat the complexity of social systems; this has enabled him to treat from a realist perspective the questions of democracy and citizenship, as well as the criticism of war and the governing of a cosmopolitan world society. See Zolo 1992, 2000, and 2004.

[65] Pietro Barcellona was a civil lawyer who over time has developed an interest in the theory and philosophy of law, as is evidenced by works such as Barcellona 1984, 1998, 2003, and 2007.

Catholic spiritualism, for its part, inspired the thought of Domenico Coccopalmerio (1940–)[66] and Francesco Mercadante (1926–).[67]

A more lasting influence was exerted by Giuseppe Capograssi's theory of the experience of law, especially so in the Padua milieu, where a number of thinkers were trained at the school founded by Enrico Opocher (1914–2004):[68] These thinkers are Francesco Cavalla (1939–),[69] Francesco Gentile (1936–2009),[70] Franco Todescan (1946–),[71] and Giuseppe Zaccaria (1947–),[72] and they each developed their own line of research as they went deeper into their mentor's processual approach to law (in the sense explained in footnote 68 of this chapter).

Likewise more enduring was natural-law theory, which in the post-war period found renewed interest and continued to thrive into the late 1900s as a reference point for several thinkers (see also Chapter 1 in Tome 2 of this volume).

Prominently figuring among these thinkers was Sergio Cotta (1920–2007), who in a way reminiscent of Heidegger and Husserl called ontophenomenology of law the conception he developed, a conception on which he rests the idea of a natural law understood as a set of principles failing to observe which we would find it impossible to relate to one another and coexist (see esp. Cotta 1981, 1991, 1997, 2004). Cotta's existentialist conception was developed in different directions by his students Bruno Romano (1942–),[73] Bruno Montanari (1947–),[74] and Francesco D'Agostino,[75] the last of whom devoted much of his research to bioethics, where he developed a personalistic-ontological perspective.

[66] See in particular Coccopalmerio 1988, 1989, 2004.

[67] See Mercadante 1974a, 1974b, 2004.

[68] Enrico Opocher developed a "processual approach to law" closely bound up with a "philosophy of values." The law is understood by him as a value insofar as law is in its every aspect lived and suffered in the subject's conscience. Even so, this experience of the law does not exhaust itself in a subjectivist perspective but also finds an objectivization in the legal process. Indeed, in controversy lies the core element around which the entire experience of the law revolves. The value of law lies in the ability to assert claims, that is, in its ability, through a legal process, to make explicit principles endowed with inherent characteristics whereby one's subjective position becomes valid for others, too, lastingly over time, and in this sense the same position acquires value. See Opocher 1977, 1984, 2005.

[69] Francesco Cavalla holds that his teacher's approach finds its most fecund and necessary development in the study of how dialectics can be brought to bear on litigation in court. See Cavalla 1979, 1991, 2007.

[70] Francesco Gentile has developed above all the themes of the irrationality and arbitrariness of power. See F. Gentile 1984, 2000.

[71] Franco Todescan has made his focus the history of legal thought. See in particular Todescan 1979, 1983–2001, 2013.

[72] On Giuseppe Zaccaria, see footnote 89 below.

[73] Bruno Romano's most significant works include B. Romano 1983, 2005, 2009, 2012, 2013.

[74] Bruno Montanari's most significant works include Montanari 1992, 1995, 2013.

[75] On Francesco D'Agostino, see footnote 61 above.

Husserl's phenomenology forms the foundation for the conception developed by Gaetano Carcaterra (1933–), who has taken exception to the imperativist and prescriptivist views of law, finding that the primary characteristic of all norms lies instead in their constitutivity, a concept he takes up from Austin and Searle's philosophy of language.[76]

The contemporary debate has continued to thrive through the work of those whose training was directly or indirectly received from Bobbio and Scarpelli, and who in one way or another followed legal positivism and the analytic method. Giacomo Gavazzi (1932–2006)[77] devoted his research to topics in legal theory such as the interpretation of norms, their coherence, and their antinomies; Amedeo Giovanni Conte (1934–)[78] explored deontic logic in its different aspects, and more recently social ontology and the theory of constitutive rules; Mario Jori (1946–)[79] proceeded from Hart's theory and in so doing developed an original method, so-called open normativism, considered to be the third way between strict normativism and realism; and Letizia Gianformaggio (1944–2004)[80] proceeded analytically to investigate the fundamental principles of law, with a focus on that of equality, as well as on that of gender, bringing feminist themes to the Italian legal-philosophical debate, which has been slow to take them up.

Two scholars whose work can be grouped with these lines of inquiry, but who directly belong to neither of the two schools that developed under Bobbio and Scarpelli, are Alfonso Catania (1945–2011)[81] and Luigi Ferrajoli

[76] See in particular Carcaterra 1974, 1979, 1991. The first part of this last work is devoted to the classic topics the author has covered in his research on the theory of law. The second and third parts are instead devoted to topics in moral philosophy (including bioethics), as well as to metaethical reflection on values and on the nature and structure of values. The discussion in these two closing parts connects to the earlier Carcaterra 1969. See also Carcaterra 2007.

[77] See Gavazzi 1959, 1967, 1970, 1993. Giacomo Gavazzi went deeply into certain aspects of Kelsen's thought and the new analytic methods (recall that he edited the Italian translations of Ross's *On Law and Justice* and Hart's *Law, Liberty, and Morality*, the former published as Ross 1965 and the latter as Hart 1968): His view is that Kelsen's theory must be cleansed, or purified, of unacceptable elements (first among which the concept of a norm), all the while accentuating its innovative aspects, such as the functionalist element. Indeed, according to Gavazzi, Kelsen's view does not preclude a functionalist perspective but rather *accommodates* it, albeit in a less than satisfactory way (Gavazzi 1984): The formal theory and the functionalist perspective are not incompatible; hence Gavazzi's proposal for a general theory of functions (Gavazzi 1984), meaning a theory having a formal basis and yet receptive to functionalist and sociological aspects on the model of Ross.

[78] See esp. Conte 1962, 1970, 1997, 1989–2002.

[79] The most significant works by Mario Jori include Jori 1976, 1980, 1985, 2010, and Jori and Pintore 2014. He has also translated Hart's *Punishment and Responsibility*, a translation published as Hart 1981.

[80] Letizia Gianformaggio was a pupil of Uberto Scarpelli, and his influence on her work is reflected not only in the analytic method she uses (in which regard see Gianformaggio 1973, 1986, and 1987) but also in her research on the basic legal values and principles, which she investigated from a gender perspective, and to which she devoted a number of essays, most of them now collected in Facchi, Faralli, and Pitch 2005.

[81] Alfonso Catania criticizes Kelsen from within, by drawing on Hart's thought. He is very

(1940–):[82] The former draws on Hart's theory to deepen the question of law's efficaciousness and make more "realist" the "purity" of Kelsen's system; the latter has always worked on an axiomatized theory of law, all the while taking up such questions as those of the fundamental rights and the principles of law, an investigation that has drawn him closer to neoconstitutionalism (on which see Chapter 10 in Tome 2 of this volume).

The crisis of legal positivism discussed in the previous section paved the way for the development in Italy of antiformalist theories and of legal realism.

"Realism, or sociological natural-law theory," as Guido Fassò (1915–1974)[83] defines his conception in a letter to Bobbio, is based on the idea of a natural law arising from the historical concreteness of society, a concreteness which reason interprets and which acts as a limit on the power of the state, and also as a guarantee in protecting human freedom: This conception looks to such sources of inspiration as the free-law movement (*Freirechtsbewegung*) and antiformalism, and expresses the need to "always bear in mind, beyond the formally valid norm, such substantively valid norms as reason grasps in its observation of social reality."

Also drawing inspiration from antiformalism is *Saggio sul diritto giurisprudenziale* (An essay on case law: Lombardi Vallauri 1975), published in 1967 by Luigi Lombardi Vallauri (1936–),[84] an exceptionally versatile author who would later confront issues in the politics of law and in bioethics, along with animal-rights and environmental issues.

Legal realism in a strict sense, for its part, is a movement that Luigi Bagolini had begun to call attention to as early as the 1950s (see Bagolini 1950), especially with an eye on Scandinavian realism, but not until Giovanni Tarello (1934–1987) came onto the scene was there an effort to delve deeper into this way of thinking about law. Having proceeded from the study of American le-

much with Kelsen in upholding the distinction between *Sein* and *Sollen* and underscoring the concept of a legal system as central to law, but he also attempts to render more "realistic" the system's "pure" aspect—this by inquiring into the problem of effectivity—for it is people's behaviour that in his view is essential to the concept of a legal system. See Catania 1976, 1979, 1983, 1987, 2000, 2004, 2008.

[82] See Ferrajoli 1970, 2000, 2002, 2007, 2013.

[83] Fassò started out working on themes taken up from Vico (Fassò 1949), and it is precisely from the study of Vico that he derived that sensibility to history (Fassò 1953, 1956) which characterizes his entire thought and which he develops with seamless continuity from Fassò 1964 to Fassò 1974.

[84] Luigi Lombardi Vallauri later devoted himself to studies in the politics of law, sketching out the view of a society that fulfils the Christian end, an end he describes as that of achieving fullness, "the perfect form imparted to the totality, the synthesis of everything that man is". Then, in his more recent works, this idea is extended to encompass "the nonreductive fullness of being, human and nonhuman alike, in its three dimensions, namely, the material-natural one, the historico-cultural one, and the personal-spiritual one". Hence his interest in medico-bioethical issues, as well as in animal-rights and environmental issues. His work in this second phase includes Lombardi Vallauri 1969, 1981, 1989, 2002 and Lombardi Vallauri and Castignone 2012.

gal realism, Tarello developed a realist theory of law resting on a twofold conception of norms conceived on the one hand as normative sentences—that is, as linguistic expressions suited to being normatively interpreted—and on the other as the normative meaning that may be extracted from each such sentence. What follows is a theory of interpretation understood not as a *cognitive* activity but as an activity *productive* of norms.[85]

American legal realism, however, did not play as much a role as did Scandinavian realism in giving birth to original conceptions in Italy.

The main exponents of this current are Silvana Castignone (1931–), Riccardo Guastini (1946–), and Enrico Pattaro (1941–).

Castignone had studied Hume before turning to legal realism, and the empirical approach so acquired, coupled with an espousal of the basic premises of legal realism, led her to lay emphasis on the analysis of legal and political language, this on the model of the "linguistic therapy" to which the Scandinavians subjected this language in the effort to detect and expunge such metaphysical residue as still found itself nested in it.[86]

Guastini was influenced above all by Alf Ross but did not subscribe to Ross's view that law can be reduced to a series of directives addressed to the courts. (This, for example, cannot be said of constitutional law, an area that Guastini importantly contributed to, especially as concerns the question of the sources of law.) But he does share with Ross the conception of interpretation as an *activity*, that of extracting norms from the legislator's provisions or from other normative activities.[87]

Pattaro studied under Fassò, taking up the criticism his mentor had directed at legal positivism. In light of an epistemology broadly informed by the analytic movement, he argues that "a theory of law coherently developed around a neoempiricist philosophy cannot be anything but a theory of law as fact." He developed on this basis a peculiar conception he termed normativist realism, recognizing on the one hand that law is a reality which ontologically is not unlike the reality of empirical facts, and on the other that it cannot be *reduced* to such facts (for which reason he describes himself as a non eliminativist reductionist).[88]

[85] On American legal realism, see Tarello 1962; on the theory of interpretation, see esp. Tarello 1974 and 1980.

[86] Silvana Castignone has translated the first (1939) edition of Karl Olivecrona's *Law as Fact* (a translation published as Olivecrona 1967), along with many of his essays, as well as those of the other Scandinavian legal realists. These essays are collected in three anthologies: Castignone 1981, Castignone and Guastini 1990, and Castignone, Faralli, and Ripoli 2000. Her most significant works on legal realism include Castignone 1974 and 1995.

[87] Riccardo Guastini has collected and translated many essays by Ross, including some little-known ones: See in particular the anthologies Castignone and Guastini 1990 and Febbrajo and Guastini 1982. Guastini's most significant works include Guastini 1982, 1985, 2004, 2006, 2008, 2010b, 2014.

[88] Enrico Pattaro's most significant works on Scandinavian legal realism and on the development of normativist realism are Pattaro 1966, 1968, 1974, 2005, 2010. He has translated the sec-

As clearly emerges from his own Volume 1 of this *Treatise* (Pattaro 2005), law is understood by him as a complex sociocultural and empirical reality whose components are at once linguistic (these being the *directives* of law, a term reminiscent of Ross) and nonlinguistic, consisting of behaviours and of psychical phenomena such as beliefs. For this reason law cannot be investigated from the standpoint of formalistic theory but must instead be approached from those broadly sociolinguistic inquiries that are concerned with language and behaviour, thus bringing into the study of law disciplines ranging from semiotics to the sociology of language, and from the anthropology of law to the sociology of law.

The theoretical developments just discussed—the emergence in Italy of several antiformalist and legal-realist currents—and the historical background of the crisis of justice did much to stimulate in Italy a debate on the interpretation of law.

This debate developed from an interaction between neoformalist positions, on the one hand, and neosceptical ones, on the other, examples of which are Mario Jori in the former case and Riccardo Guastini in the latter. Important contributions on the interpretive question have come from hermeneutical legal philosophers, such as Francesco D'Agostino, Giuseppe Zaccaria and Francesco Viola (1942–), who have looked to the Italian tradition that traces back to Emilio Betti (1890–1968), but who have more importantly drawn on the German models (with specific regard to Hans-Georg Gadamer and Josef Esser), and more recently they have looked to the Anglo-Saxon models (especially the work of Neil MacCormick and Ronald Dworkin). There are two complementary areas that in these authors have become a focus of interest: On the one hand is judicial interpretation and the relation between matters of fact and matters of law (with Zaccaria), and on the other is law as a social practice (with Viola).[89]

A peculiar approach in this regard is that of Alessandro Giuliani (1925–1997), who on the model of Riccardo Orestano (1909–1988) considered the historical study of law a constitutive aspect of the experience of law, proceeding on this basis to undertake important research on the theory of the trial as well as on judges and justice.[90]

Newer insights into the question of legal interpretation have come from the movement which flourished especially in the United States in the 1980s under

ond (1971) edition of Karl Olivecrona's *Law as Fact* (a translation published as Olivecrona 1972). He has also conducted research in the history of ideas, investigating legal pre-Enlightenment; the origin of the notion of a principle from Aristotle to Thomas Aquinas, going through Roman law; and the idea of "what is right," both in Homer (*to dikaion*) and Aquinas (*quod est rectum*). See Pattaro 1974b and 2005, among others.

[89] The main works these two authors have written on these topics include Zaccaria 1984a, 1984b, 1990, 1996, 2012; Viola 1990; and Viola and Zaccaria 2003, 2013.

[90] Alessandro Giuliani's most significant works include Giuliani 1957, 1961, 1971, and 1996, along with the series he coedited with Picardi (Giuliani and Picardi 1975–1994).

the name of Law and Literature, applying to legal texts the methods and tools that literary criticism uses to analyze and interpret literature, and accordingly proceeding from the premise that law is a narrative to be interpreted like any other literary story.[91] This literary approach to law had some precursors in Italy in the 1920s—with authors like Ferruccio Pergolesi (1899–1974), constitutionalist (see esp. Pergolesi 1927 and 1956), and Antonio D'Amato, a judge (see D'Amato 1936)—and it later found favour among legal philosophers, especially with Mario A. Cattaneo (1934–2010), who has devoted several studies to Dante Alighieri, Alessandro Manzoni, and Carlo Goldoni.[92]

It should not go unmentioned that Italy has a rich tradition in writing histories of legal philosophy: Dating back to the late 1960s are the three volumes making up Guido Fassò's *Storia della filosofia del diritto* (History of the philosophy of law: Fassò 1966–1970), a history which spans from Homer to American legal realism, from patristics to Soviet theory, and which in the updated 2001 edition (Fassò 2001) also covers the contemporary debate. This makes it the most comprehensive such history so far written in Italian, and to it I owe in part this very contribution.

[91] I should point out in this regard the Italian Society for Law and Literature (ISLL), founded by Enrico Pattaro in Bologna in 2008 (and based at CIRSFID) for the purpose of promoting research in Law and the Humanities and enabling an exchange among Italian and foreign scholars.

[92] Cattaneo was initially close to the analytical school—he translated and edited the Italian edition of Hart's *Concept of Law* (a translation published as Hart 1965)—but then prevalently devoted himself to studying the philosophy of criminal law from a historical and literary perspective. See esp. Cattaneo 1990a, 1990b, 1991, and 1995.

Chapter 12

20TH-CENTURY LEGAL PHILOSOPHY IN FRANCE

by Pierre Brunet, Veronique Champeil-Desplats, Eric Millard, Carlos Miguel Herrera, Jean Louis Halpérin, and André Jean Arnaud

12.1. Introduction (*by Pierre Brunet and Veronique Champeil-Desplats*)

The very expression "French philosophy of law" has long sounded like an oxymoron, and it still does. For academic reasons, as well as on account of some entrenched cultural strains, French legal scholars interested in studying the philosophy of law are far and few between, and, to be frank, it is not as easy to name a distinguished French philosopher of law as it is for other countries. A few exceptions, however, do fortunately stand out. The contemporary reader expecting the sorts of philosophical debates that have become familiar will probably be disappointed. The French scholars presented here are in the first place law professors, and none of them would have introduced themselves as philosophers. Indeed, some would have outright rejected that appellation.

The group of authors gathered here brings out a strong division between public and private law. Here, again for sociological, cultural, and academic reasons, those most interested in developing a legal science were public lawyers, while private lawyers distinguished themselves by developing a more dogmatic line of inquiry. Their work was technical, their thinking more like that of judges, lawyers, or lawmakers, and they were not as interested in building a strong legal science.

This is certainly true of public lawyers like Raymond Carré de Malberg, Maurice Hauriou, and Léon Duguit. It must be noted to begin with, however, that the distinction between public and private law was not as strong back then as it would later become. The reason is that public law was still a budding field at the end of the 19th century. And, in the second place, it must be added that these authors did not all agree on what shape a science of law should have. It is somewhat surprising and interesting to see that, while both Carré de Malberg and Duguit defended a "positivist" conception of law, they gave very different meanings to that word. Carré de Malberg was very serious about emphasizing the distinction between law and the science of law, or jurisprudence, and was equally emphatic about rejecting all ideas or concepts that were not "purely legal." This means that, from his point of view, it was irrelevant to try to investigate whether "rights" did refer to something in the real world, since it was sheer nonsense to imagine that "the state" could be referred to as anything other than a "legal person." Duguit, by contrast, never ceased to rail against what in his view ought to be seen as pure fictions and metaphysics. Fictions? Carré de Malberg did agree with him on that point. But he considered those

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_12

fictions to be strictly legal ones, so there was no metaphysics to be concerned about. And it was the task of jurisprudence to describe the fictions of law. Then, too, as much as Duguit claimed to be a positivist and to resist the burgeoning Durkheimian sociology, it is not so obvious that he should be called a positivist in Carré de Malberg's sense.

As for Hauriou, he was much more inclined toward the metaphysical approach to law. His "theory of institutions" proved to be a great success, probably because many of Hauriou's readers saw their own assumptions reflected in it. And what about positivism through Gény's eyes? His positivism was neither as rigorous as Carré de Malberg's nor as sociological as Duguit's. But Gény perfectly illustrates what nonsense "antiformalism" was to those who, in this transitional period, wanted to do away with the old exegetical school and its fetishism for statutory law. An efficient strategy to this end was to justify positive law by proclaiming its agreement with "social needs." Hence, some legal scholars in France were working to slip ideas of natural law back into the debate under another name.

Another interest common to all of these scholars was the role of the state in the creation of law. It is now well known—going back to Norberto Bobbio's (1965) tripartite distinction among legal positivism as a theory of law, as an ideology about law, and as a method for legal science—that positivism in the first of those senses (as a theory of law) has been one of the foundational theories of the modern state, since it was distinctly aimed at reducing all sources of law to statutory law. This view is commonly referred to as "formalism." Despite the divergence between Carré de Malberg and Duguit, they did agree on one point: that all law was statutory law. On the other hand, Hauriou and Gény are no doubt the most interesting figures in the formalist tradition, since they were at once enticed by pluralism and leery of it. Gény used the term spontaneous law, while Hauriou preferred to speak of the law as an institution (at least in one of the meanings he gave this word). But both of them were afraid to venture beyond the door they had half-opened.

The hypothesis of legal pluralism was later developed by the no longer nascent but now mature sociology of law. That is true of the sociology of law practiced in France and in other French-speaking areas (though this is not to imply that nothing of the sort was being developed in legal sociology in other languages). And although, even in civil-law countries like France, legal sociology cannot be reduced to the pluralistic conception of the sources of law, it must be conceded that that still remains the most subversive conception that can be developed in this context. The fact is that the sociology of law has flourished because of the development of sociology in general, from Émile Durkheim and Marcel Mauss to Pierre Bourdieu.

An apparent paradox may be worth emphasizing, though. In French academic publishing, the sociology of law has gained much more traction than the philosophy of law. Anyone would agree that relationships between jurists

interested in philosophy and philosophers interested in law have always been more than turbulent. A sociological or at least an empirical investigation of law schools, philosophy departments, and the hiring policies of research agencies like the *Centre National de la Recherche Scientifique* (CNRS) could explain why. Things look quite different from the standpoint of academic teaching. Despite its influence, the sociology of law is not often present in the law schools; lectures and seminars in the sociology of law are rare, and its representatives come mostly from schools and departments of sociology. As much as lawyers have had, and still do have, great esteem for Jean Carbonnier, they have not been entirely convinced of the need to reform legal education and training in light of his call to explore the social sciences as a path to the analysis of law. Here, again, the positivist creed is sometimes used as a justification for maintaining a line of separation between "describing" the positive law itself and "describing" the social uses of it or the axiological assumptions behind the lawyers' thinking.

A big reason why French academic lawyers reject the designation of legal philosophers and legal theorists alike probably has to do with the conception of philosophy, widespread in France, as an enterprise to be viewed primarily through the lens of its history. It is no surprise that Michel Villey, a great historian of legal thought, has also been considered in France to be among the most famous French specialists in the philosophy of law. Although he developed his own conception of law, he was best known for his comments on the works of classical philosophers. The way he made Ockham responsible for the birth of legal positivism, and hence made positivism responsible for the decadence of legal philosophy, is meaningful.

For epistemological reasons, Carré de Malberg (and now Michel Troper) would certainly cast his lot with the legal theorists rather than with the legal philosophers. But this is another way of saying that the two thinkers are both positivists. Troper's view of legal theory runs exactly opposite to Villey's conception of philosophy as an activity reduced to the history of philosophy. Troper thus sought to shape his own theory of law, and in this respect he owes a lot to the American realists and the Italian analytical school. This is precisely the point. His analytical conception of legal theory led him to be much more interested in epistemological questions—in the conditions for a science of law—than in building any philosophical system. Just as Villey took Ockham as one of his targets, so Troper was doubtless taking aim at Kelsen' pure theory of law, so much so that he succeeded in giving a realist account of Kelsen's main thesis.

The following pages present authors who have been chosen because, in our opinion, they have laid the groundwork for what should be termed "French philosophy of law." In rough outline, this can be described as a school of thought whose main concern was to develop a scientific approach to law by drawing on sciences and disciplines other than law: Prominent among these

were sociology, history, and linguistics. Philosophy was certainly in there, too, but it cannot be said to have played as important a role.

12.2. Maurice Hauriou (1856–1929) (*by Eric Millard*)

Maurice Hauriou was a French legal scholar and legal philosopher. Liberal-minded, he was a strong believer in the principles behind the 1789 revolution and a vivid opponent of Colbertism. He was a fervent Catholic, deeply attached to the tradition of the Church and to Thomist philosophy. He never departed from an idealistic approach to law grounded in both the force of individual consciences and the existence of a transcendent conscience. Throughout his career he taught in Toulouse and is regarded as a defining figure of what is often designated as the Toulouse school.[1] He is remembered both as one of the principal classical dogmaticians of the nascent French administrative law and as a strong proponent of legal philosophy understood in a broad sense, i.e., as a social science concerned with legal technique, speculative philosophy, and history, not to mention sociology (at that time just budding) and even physics. His own theory changed direction over time and is not free of contradiction, making it sometimes difficult to follow and, of course, sum up his thought. Hauriou's major contribution to the theory of institutions inspired prominent legal scholars, such as S. Romano (1918), Schmitt (1928), Lourau (1970), and MacCormick and Weinberger (1986), but it also became an object of criticism on their part.[2] Like many anti-formalist approaches to the law, his theory begs the pressing question of the unity and plurality of the law.

12.2.1. The Institutional Hypothesis

Institutional analysis, as Hauriou conceives it, is first and foremost an epistemological vantage point that may be summed up in his famous epigram: "A little sociology entails a *departure* from the law; a lot of sociology entails a *return* to the law" (Hauriou 1893, 4; my translation, italics added).

Hauriou is concerned to transcend a descriptive approach to the law, elaborating an explanatory model capable of articulating the state and the law. His construction is grounded in two principles: that all ways by which to un-

[1] The *École de Toulouse* (or Toulouse school) includes all those legal scholars, mostly in administrative law, who to a greater or lesser extent espouse Hauriou's conception. The school was named for the city that is home to the university where Hauriou taught. It is by convention set in contrast to the Bordeaux school, named for the city and the university where Léon Duguit taught. The Toulouse and Bordeaux schools thus carry forward the legacies of Hauriou and Duguit, respectively.

[2] On Schmitt see Chapter 8 in this tome and Section 8.8 in Tome 2 of this volume. On Romano, see Section 11.4 in this tome and Section 8.8 in Tome 2. On Weinberger, see Sections 10.3.3 and 18.3.2 in this tome.

derstand the law are interconnected, and, no less importantly, that the law is grounded in the social medium. In contrast to formalist legal theories, Hauriou's approach is aimed at explicating the social dimension of the state and the law by relying on the concept of power. At the same time, his theory is intended to be *fully* juridical and not just a juxtaposition of juridical elements with nonjuridical ones for the sake of legal analysis.

Hauriou was strongly influenced by the vitalistic theories propounded by Henri Bergson (1859–1941). He studied thermodynamics and developed a strong interest in the principle of entropy, which he tried to import into his analysis of the law (see Hauriou 1899). Hauriou was well acquainted with the work of Émile Durkheim (1858–1917), who was himself deeply concerned with the issue of institutions, defined by him as follows: "One can call institution all the beliefs and all the modes of behaviour instituted by the collectivity [...]. Sociology is the science of institutions, of their genesis, and of their functioning" (Durkheim 1895, XXII–XXIII; my translation).

The purpose of Hauriou's sociological analysis is to challenge the thesis of the objective nature of the collective conscience, a thesis that constitutes the nodal point of Durkheim's theory. Contrary to Durkheim, Hauriou lays emphasis on subjectivism and introduces the concept of power, using it to replace that of the collective conscience.

Hauriou's theory of institutions thus introduces the idea of power into Durkheim's sociology and, drawing on Bergson, that of duration into legal theory. In short, as we will see in what follows, Hauriou's view is that power is what enables the law to exist and to unpack its effects over time.

The institutional theory sketched out by Hauriou as early as 1906 does not yet clearly articulate in full the concept of an institution (see Hauriou 1906); but by distinguishing between statutory law (*droit statutaire*) and disciplinary law (*droit disciplinaire*), shaping the group's organizational discipline, Hauriou lays the foundation for a broader approach to law.

It is instead the second moment in Hauriou's work which anneals around an institutional theory of the state (see Hauriou 1910). Hauriou distinguishes two claims in this regard. His first claim is that one cannot understand the concept of the state just by analyzing its purported legal personhood, that is, by looking at the state as a unitary entity. Before considering the state's unitary legal personhood, one must embrace a pluralistic approach, investigating the way various social forces (economic, political, etc.) come together and balance each other out in forming the state. Prior to the state, that is, before one can speak of the state's legal personhood, some equilibrium must be reached, or some measure of organized power. This equilibrium constitutes pre-state law. Hence the state is a construction shaped by such juridical elements as the institution, the market, and the contract. Hauriou demonstrates that the power-centered approach to law need not be systematically set in opposition to an approach based on consent. He explicates the foundation of the state on grounds

other than a social contract or a foundational myth, emphasizing instead the role of power and the crucial issue of its acceptance by citizens.

The third moment in Hauriou's work is his fundamental account of the concept of institution *per se* (see Hauriou 1986). Indeed, Hauriou elaborates a theoretical model which does not focus only on the state but also articulates the idea of the group as an organized whole.

Hauriou's approach can be summed up, in his own words, as follows:

> An institution amounts to an idea of an enterprise [*œuvre*] which takes shape and sustains itself over time in a social medium by juridical means; in order for this idea to take shape, a body invested with power is formed, a body starting from which various organs emerge; using different procedural means, the organs direct and regulate the members of the social group, who manifest their communion with one another and are concerned with implementing the idea. (Hauriou 1986, 96; my translation)

Thus, Hauriou's theory of institutions articulates three distinct elements: There is an endeavour, project, or enterprise (*œuvre*), that is, what has to be realized, or a raison d'être; there is the power wielded by an organized government; and there are the manifestations of communion that mutually engender one another and develop into a hierarchy within the institution. The idea of *œuvre* is the guiding principle of the enterprise and so of the action carried out in the social medium. Hauriou's analysis establishes an immediate causal link between the idea and its implementation: between reason and action. These two aspects are inseparable, in that no idea can exist as such, without entailing action, and no action can exist that is not the implementation of an idea. It follows that, just as the idea of *œuvre* cannot be equated with its purpose—for if it were it would remain exterior to the enterprise—so it cannot be reduced to its function, for if it were it would be tantamount to what has already been achieved: The idea of *œuvre* encapsulates at the same time, and with no possibility of separation, the purpose and the means by which to achieve that purpose. The idea of *œuvre* is intrinsic to the *œuvre* itself: It comprises a plan of action, of organization (namely, the means through which the action is carried out).

Moreover, the idea of *œuvre* is geared toward the future, to that which needs to be done but which cannot yet be determined. The idea of *œuvre* is thus the object of the enterprise: "It is through the idea, and within it, that the enterprise is objectivized and acquires a social singularity" (Hauriou 1986, 100; my translation). But there is more: The idea must undergo a transformation in order to evolve from an objective status to a subjective one, or so that it can become the object of a collective enterprise. Indeed, in Hauriou's view, objectivity precludes action: Action is necessarily human, and individuals must relate to this idea, whether by (actively) promoting it or (more passively) by subscribing to it. It is because this idea is objective that it can engender subjective action or acts of adhesion.

From the idea of *œuvre* flows directly the power of organized government, in that it is the purpose of organized government to promote and implement the idea. The subjective reaction that individuals have to the objective idea makes the idea effective, and in this way the enterprise can be said to have an objective status, that is, a social character. Hauriou's theory rests on two important principles: the separation of powers and representation. Moreover, in his view, these two principles govern all institutions: not only the state but also other institutions, whether public or private. Hauriou's conception of the separation of powers is clearly opposite to that of Montesquieu: For on Montesquieu's conception, the separation is structural, a framework that keeps instituted powers apart, while on Hauriou's it is temporal, instituting powers by the succession (and aggregation) of government and adhesion.

Most important in Hauriou's view is that institutions must sustain and bring forth their effects over time. To this end, Hauriou makes the following threefold distinction, which can be said to describe, in one sense, the three stages in the formation of an institution (diachronic analysis) and, in another, the three elements necessary to any "living" institution (synchronic analysis): the *intuitive* competence of an enforceable decision; the *discursive* competence of deliberative power; and suffrage, or the power to assent by vote. The intuitive competence of an enforceable decision (*la compétence intuitive de la décision exécutoire*) is the power of a minority that intuits an idea and takes action to implement it by way of a decision: In this way the idea becomes the idea of *œuvre*. The logic at work here is intuitive: It is the logic by virtue of which the intuiting of the idea by a minority is enabled to move to its implementation by a majority; its nature is foundational rather than contractual. Discursive competence (*la compétence discursive*) means that the idea, as intuited by the executive power, will have to scrutinized by way of rational debate: At this stage the idea remains in the hands of a minority of subjects, those who have become cognizant of it.

Finally, suffrage, or the power of assention (*suffrage ou assentiment*), is the process which allows the idea to move from the sphere of the minority to that of the majority. According to Hauriou, the group does not as such have the ability to take action; it can only react to the idea by accepting or rejecting it, once it has been debated or expressed in a form accessible to all. Owing to this temporal conception of the separation of powers, Hauriou avoids the traditional impasse associated with the notion of representation. In his view, a representative regime is an organization of power allowing the organs of an institution to express the will of the body which it constitutes.

The body exists, acts, and expresses its will solely through its organs. But this is true only insofar as it does so for its own purpose and not for that of its organs. This process makes representation possible, since representation is no longer construed as a relationship between persons (the representatives and those being represented) but as a relation between individuals and the idea

being represented. Otherwise stated, representation requires that the government and the members of the group share the same idea of the *œuvre* at issue, i.e., that they agree on the content of the idea that unites them, as a matter of fact, or ought to unite them, as a matter of principle: "A body is nothing without its organs, and it wants by (or through) them; but they will want for it, not for themselves; this difficult question is solved by the principle of representation, which rests entirely on the directive idea" (Hauriou 1986, 103; my translation, italics added).

Manifestations of communion by the members of the group and the organs of government alike, whether these manifestations concern the idea of *œuvre* to be achieved or the means that need be deployed to this end, play a crucial role in implementing the institution. The core element, again, lies in subjectivity, through which the members of the group adhere to the idea, understand and promote it, and in the end make it their own.

This communion evinces the existence of an immediate causal link between objectivity and subjectivity, the collective and the individual, the group and its members. Hauriou gives two examples of such manifestations: On the one hand are the popular uprisings that lead to the foundation of new political and social institutions when they emerge and engender immediate adhesion and the concomitance of the three powers (see Hauriou 1986, 105), and on the other is the acceptance by the members of the group of the rules that regulate the general functioning of the institution, i.e., the acceptance of the rules of the game (as when the minority accepts the majority's decision owing to the fact that power is exercised with a view to implementing the idea), in which regard, Hauriou remarks, "not all assembly meetings have the same sentimental display of the Tennis Court Oath, but in more dispassionate way they all enable a majority to vote what it claims to be the will of the union" (ibid.; my translation).

The three elements that make up an institution are articulated having regard to a fundamental principle that sustains and explains durability in the social medium: the principle of interiorization (*intériorisation*). This movement from objectivity to subjectivity is made possible by two successive phenomena that characterize the dynamics of institutions: incorporation and personification.

The idea is incorporated by the members of the group, who in turn implement the idea through acts of government and the different procedures available to them. This constitutes the intuitive minority government and is a first interiorization.

The idea is interiorized in a second way: It is personified. This happens when the manifestations of communion become apparent, that is, when the members of the group make the defining idea their own—when the idea is no longer external but, in Hauriou's words, "reflected in the individual consciences" (Hauriou 1986, 106; my translation). This latter moment leads to the birth

of an institution understood as a body proper. The government does not cease to exist, but the majority's adhesion replaces the minority's intuition: "The state is personified when it has reached the point of political liberty, through the citizens' participation in government" (ibid., 111; my translation).

According to the legal formalists, institutions are created by way of juridical acts: foundational documents, contracts, constitutional texts, and the like. Hence legal formalists subscribe to the idea that nonstate (private as opposed to state) institutions are necessarily created in a different way than is state, which is an institution created by stipulation. By articulating the constitutive elements of the institution, Hauriou deploys arguments of a very different nature.

Indeed, for Hauriou, the law cannot in any strict sense "create" anything; specifically, that cannot be the way an *institution* is created. In his view, law is neither a triggering force nor a force of action: It exists only in *reaction* to something. Creation depends on human action, whether individual or collective, and its product is necessarily effaced over time. Otherwise stated, action works against a major corruptor: time. Its driving force, its momentum wears off over time and ultimately disappears. In order for the group not to dissolve and the idea not to be corrupted by time, it is imperative that a force be deployed to counteract the corruptive effect of time—and this force, according to Hauriou, is the law. Hence, it is not that law creates institutions, but rather that institutions necessarily generate law through the instituted (*institué*), versus that which institutes (*instituant*), which tends to disappear over time: "Legal rules represent ideas of limits, not ideas of enterprise or creation" (Hauriou 1986, 127; my translation).

This approach can be appreciated in the twofold distinction Hauriou makes between *status-conferring* legal rules, which guarantee the group members' individual rights within the bounds of the institution, and *disciplinary* legal rules, which guarantee the group's cohesion by promoting organizational discipline, particularly as concerns the protection of fundamental rights and the provision of collective policing (see Hauriou 1906).

The question of the group is addressed by Hauriou in a manner converse to that of those who propound the subjectivist theory, in that he starts out not from the individual but from the *group*. The group exists within the individual, and there is no clear-cut demarcation between the group as an external entity and people as individuals. The objective idea is not likened to Durkheim's collective conscience or to the rule emanating from the social medium, as in Duguit, but is rather an objectification of subjective consciences.

Here the idea is *immediately* objective: It is directly common to all individuals, who are aware of it and make it their own. Hauriou's approach is inspired by a more general ontological approach, that of man as a social animal; but he transcends this approach, since his analysis also draws on social and human psychology, and that leads him to assert that human beings as such constitute

an institution. In Hauriou's view, then, the social character is first and foremost a psychological dimension.

12.2.2. The Aporia of Pluralism

The logic underlying Hauriou's institutional analysis very naturally raises the question of legal pluralism. By characterizing the state as an institution, and the institution as a theoretical model applicable to all organized groups, Hauriou rejects the specificity of the state relative to other organized groups: the specificity that lies in what classical theories of the state call sovereignty or law. Thus, by construing the law as a product of institutionalization, Hauriou articulates a model in which the state's normative order does not monopolize the juridical sphere.

In the first two stages of his institutional analysis, Hauriou develops a conception of the law that starts out, not from the state as a unitary construct, but rather from the elements that precede the state: hence the description of his theory as one of pre-state pluralism. Among the theoretical elements that characterize this pre-state moment, he identifies juridical elements such as institutions, which he now defines as "social organizations established in relation to the general order of things, and whose individual permanence is ensured by way of an internal equilibrium effected through a separation of powers from which a juridical situation ensues" (Hauriou 1910, 131; my translation). The state thus flows from institutions conceived as preexisting juridical situations, and an equilibrium is reached as a result of a plurality of juridical orders in competition. At the third stage of his analysis, as we have seen, Hauriou departs from a diachronic perspective, which views the state as an institution, and focuses instead on the ontology of institutions, so as to then generalize this instituting paradigm to the group as a cohesive whole.

The difficulty, then, is to rethink the relationships among institutions, whether or not these relationships as instituted. Hauriou's analysis raises several pressing questions—not all of which are addressed by Hauriou—in connection with the passage from the static analysis of a given institution to the dynamic process of institutionalization, namely, the dialectic among groups and the circumstance that each individual is not part of just one institution but belongs to several (the family, the state, a business, a union, etc.), and these may in the end come into conflict with one another. By reconstructing the juridical status of these various relationships and institutions (whether relevant or not, in Santi Romano's terminology: cf. S. Romano 1918), the *institué* tends to efface the movement of the *instituant*, which the theory must account for.

Hauriou's analysis thus brings into play two logics that, as Jean-Arnaud Mazères (1998) has demonstrated, he adopted by articulating two theoretical models in turn. The first one is metaphorical: The institution describes various groups including the state. The state is regarded *as*, or *likened to*, an insti-

tution, or it is treated as if it *were* one. Moreover several institutions, among which the state itself, exist synchronically, which means that none can develop to the detriment of the others. The elements that ordinarily characterize the state are thus effaced, and this is true in particular of sovereignty and the unity of the legal system: This gives place to what by contrast is a *plurality* of legal orders, thus calling for a critical reassessment of the prevalent ideological discourses on the state.

This metaphorical logic corresponds to Hauriou's theory of the institution as expounded by him in Hauriou 1986, a theory later taken up by Renard (1930) and then in large part by the critical materialistic analyses that can be associated with the concept of institution (see Sartre 1960 and Lorau 1970). But this legal pluralism leaves open the question whether the possible inter-institutional relations are consistent with its premises.

Hauriou's second (albeit chronologically first) logic is instead metonymic: The state is *composed* of institutions, meaning that the state historically evolved in a way that transcends the particular features of institutions, so as to become the only general institution, structurally paving the way for the effacement or subordination of particular institutions under the more general one. The concept of institution is thus twofold: it refers both to the primary, single and sovereign institution, namely, the state, and to the secondary institutions subordinate to the state.

So, starting out from a metonymic logic by which to analyze institutions *before* and *within* the state (the first and second steps in the institutional theory: see Hauriou 1906, 1910), Hauriou brings out a metaphorical logic (the third step), which investigates the state as an institution. But if the state is an institution like any other, there is no longer any place for sovereignty, that is, for the state itself. That is a concern to him (or at least the ramifications are), and he therefore winds up trying to ward off that scenario, however much unsuccessfully. So here is the aporia: When moving from the metonymic logic to the metaphorical one, Hauriou is unable to articulate inter-institutional phenomena without relying on a totalizing institution that for him can only be the state (and that leads him back to the metonymic logic); but at the same time his personal outlook prevents him from fully subscribing to a deconstruction of the state: This deconstruction is entailed by the metaphorical logic, but he sees it as a *negation* of the state. So in his last writings, Hauriou steps back and, so to speak, finds refuge in a rather strict and narrow view of the institution exclusively devoted to explaining the *origin* of the state (see Hauriou 1929, especially the first two hundred pages, mainly dedicated to a quasi-classical theory of the state, despite a constant reference to the institutional theory).

Returning to sovereignty and unity, Hauriou loses sight of pluralism; at the same time, he neglects the potentially novel use of his approach as a tool for deconstructing legal formalism. His approach thus remains conservative, rather than critical, in that, just where it might have conferred legitimacy on

groups, their role is replaced by that of the individual within the state. In short, he winds up offering a form of corporativism that could perhaps be revived by promoting certain communitarian approaches.

12.3. Léon Duguit (1859–1928) (*by Carlos Miguel Herrera*)

At the time that legal theory began to develop in France, Léon Duguit stood out as perhaps the foremost proponent of anti-formalism. Anti-formalism was of course promoted by other authors, too, but Duguit's work is especially original, and it undoubtedly accounts for the large audience he attracted both in France and abroad. Duguit was indeed an influential, if not the most influential, French legal thinker of his time, owing in particular to several visits on the American continent (Argentina and the United States) as well as in northern Africa (Egypt), not to mention Europe (Spain, Portugal, and Romania).

Much like Maurice Hauriou, Duguit vows allegiance to legal positivism, a conception he equates with a scientific analysis of the law (see Milet 2003). As early as 1899, he claimed that law is a "positive science, that is, a science of observation through and through" (Duguit 1889, 7; my translation), in that it conceives all phenomena solely as observable facts. His principal follower, Roger Bonnard, would later label Duguit's approach to law as "experimental positivism" (R. Bonnard 1926, 1929a). While Duguit was first and foremost concerned with laying down the epistemological foundations of his analysis, the positivism he advocates is of a particular kind, in that it emphasizes a sociological approach. Moreover, we will soon see that, notwithstanding the strong claims made by Duguit himself, an approach so construed can also be viewed as an offshoot of natural-law theory, albeit in an original sense.

12.3.1. Toward a "Realist" Epistemology

Duguit sets out his overall epistemological position in three short sentences: "Positive science observes facts; it is aimed at determining their constant relationships; these constant relationships are called laws" (Duguit 1889, 6; my translation). So, in his view, "legal science, insofar as it exists, does not pertain to a world apart from that of realities but rather *is* part of that world: Its objects are not fictions or abstractions but concrete facts" (Duguit 1901, 614; my translation).

And insofar as scientific progress is concerned with "the aspirations and needs of our epoch," it constitutes for Duguit a major social issue (as will be explained below). It is in this sense that Duguit's analysis can be said to be strongly normative; indeed, in his view a science of law (or at least of public law) "deserves to be so called only if it can account for the existence of a foundational norm, superior to the state per se, that posits both negative and positive duties."

Duguit's epistemology develops in two directions that, roughly speaking, can be designated as "negative" and "positive" (see Herrera 1997). Its negative branch is a critique of the metaphysical holdovers that continue to permeate legal thought. Indeed, Duguit denounces the persistence of a metaphysical, even a theological mentality that he descries "behind the manifestations of thought and human will [...], a thinking and willing substance, the soul" (Duguit 1921, vol. 1, 178; my translation). Duguit claims that this approach leads "lawyers and the legislator to place metaphysical substances behind all protected social activities so as to explicate the protection accorded to them" (ibid., 179; my translation). The best example of this substantialization, in his opinion, is the concept of a subjective right, which developed in the legal sphere as a result of the hypostasis of the notion of the soul. This hypostasis of the human soul leads to "a substantialization of its purported attributes" (ibid., 178; my translation). But, according to Duguit, "the indispensable postulate of any science" is that reality "in the social world, as well as in the physical world, can only be that which I can ascertain by direct observation; and all that which I thus ascertain I take as real. What is real is observable and what is observable is real" (ibid., 329; my translation). According to this positivist model one must, in short, "ascertain the facts, recognizing as true only those facts ascertained by way of direct observation, and must ban from the juridical sphere all *a priori* concepts, all objects of metaphysical or religious belief [...] that are not scientifically relevant" (Duguit 1927, XV; my translation).

Duguit's positivist approach was aimed at elaborating a legal theory that can account for the law's social dimension at a time when political and social transformations had discredited formalist accounts (in France) and personalist ones (in Germany). In one of his elegantly compact turns of phrase, Duguit sums up as follows the doctrines of law he advocates, which can be characterized as social, and to an extent even as socialist (as he himself sometimes describes his theory): These doctrines "start from society to arrive at the individual, from objective law to arrive at subjective law, from social rule to arrive at individual rights" (Duguit 1923, 6; my translation).

In Duguit's view, a scientific investigation of the law is necessarily sociological—which is why he asked that the schools of law be placed under the aegis of the schools of sociology (Duguit 1889). Sociology is understood by him in a broad sense as including *all* the social sciences; which leads him to deepen his understanding of political economy before setting out to study a discipline that was still in its infancy at that time, namely, constitutional law.

Law, as Duguit conceives it, is a branch of sociology, or, more precisely, as he writes in 1893, it is that part of sociology "which aims to formulate the laws of social interrelational phenomena" (Duguit 1893, 206; my translation): In an earlier statement, he had referred to the laws governing "the direction and the conservation of the social aggregate" (Duguit 1889, 18; my translation). According to R. Bonnard (1929a, 63), Duguit's view was original in that

he abandoned the organicist approach espoused in his early years (under the influence of Herbert Spencer), and he even abandoned Emile Durkheim's sociological approach by refusing to subscribe to the idea of a collective consciousness. However, Duguit is of the opinion that the social consciousness "always constitutes the irreducible part of human conscience" (Duguit 1893, 208; my translation), and he would never abandon a certain biologism, at least for the purpose of drawing a parallel whereby the "individuals who make up a social organism are subject to the law of that group" (Duguit 1927, vol. 1, 78; my translation), which law governs both the formation and the development of that group. The only difference from a living organism, for Duguit, is that individuals (as against social entities) act consciously (see ibid.). Charles Eisenmann is right to say that Duguit's conception of the law is quasi-biological (see Eisenmann 2002).

Duguit's appeal to sociology takes him one step further. For, in his view, "social solidarity" constitutes the very foundation of the law. The idea of "ascertaining the facts directly" made Duguit aware of the importance of solidarity understood as a "permanent fact, always identical to itself, the irreducible constitutive element of any social group" (Duguit 1927, 86; my translation). In elaborating his theory, Duguit thus remained immune from the political approach advocated by Leon Bourgeois (1851–1925), a radical political leader, future prime minister, and Nobel Peace Prize laureate who championed a doctrine he called "solidarist." He instead focused on Spencer's organicist view (society regarded as a living organism) and drew on Durkheim's conceptualization of solidarity. Relying on Durkheim's distinction between mechanical and organic solidarity, Duguit sought to demonstrate that "all societies are driven by solidarity; that the purpose of all rules that govern human conduct in society is to achieve solidarity; that human relationships have always been, and will always be, ones of similitude or division of labor; and hence that there is a durability to law and its general content" (Duguit 1923, 11; my translation).

In Duguit's view, solidarity "properly understood [...] does not lie in any permanent coincidence of individual and social purposes," in that humans cannot but seek to achieve solidarity (Duguit 1901, 615; my translation). Indeed, his avowed "objectivism" is connected with the idea that when a social rule imposes a legal rule on society itself, it does so through a traceable (and hence observable) route.

12.3.2. The Concept of Law

This sociological-legal epistemology enables Duguit to avoid what he considers to be the metaphysical notion of a subjective right and to elaborate an "objective" concept of law as a social norm. In Duguit's view, the relationships created by the positive law entail objective powers and duties exclusively. Thus,

strictly speaking, individuals can have no rights: They only have "social duties." Conversely, the state "has a duty to not preclude individuals from fulfilling their social duties and especially from freely pursuing their actions" (Duguit 1923, 213; my translation).

If individuals are subject to a rule under which they "must avoid doing what could harm social solidarity and must do whatever can promote and develop mechanical and organic social solidarity," the role of the jurist will be to determine "the rules of law best suited to the structure of a given society" (Duguit 1923, 11; my translation). That on which the law is built, is of course always factual in nature: "In effect, the law is a set of rules, but the rules ensue from practical necessities that are facts of the *Sein*" (Duguit 1927, 64; my translation). The social norm thus "exists solely owing to the fact that there exist human societies, made up of conscious individuals" (ibid., 70; my translation). Otherwise stated, "society and social norms are two inseparable facts" (ibid.; my translation).

This social-reality approach shapes the basic features of the legal rule. Accordingly, it "is not that the rule is superior to or preexists the group; rather, it is the rule which derives from the transient and changing real-life conditions of a given society, and which can be determined by an observation and rational analysis of its evolution and structure" (ibid., 71; my translation). Moreover, the social norm is "a law whose purpose is to coordinate the individuals who make up the social group: It does so by limiting their action and imposing certain acts, but leaving intact the substance of their willing power" (ibid., 80; my translation).

It remains to be determined how this rule, deriving from the social needs of individuals, becomes a *legal* rule. It is a natural social element that can be determined by observation, serving as a guideline for the transformation of a moral norm into a legal one, that is, into a social constraint. "A social, economic, or moral rule becomes a juridical norm when, for various reasons, in a given society, a mass of people becomes aware that the sanction attached to this rule can be enforced on a permanent basis by a social reaction within a more or less developed organization" (Duguit 1921, 41; my translation). People become aware that a legitimate use of force is needed to guarantee certain social norms, even though such coercion has no bearing on the ultimate purpose of law, which is to promote "cooperation and social solidarity."

As mentioned at the beginning, Duguit's analysis thus paves the way for a natural-law approach: Duguit maintains that enacted positive law "is obligatory only insofar as it is in conformity with *the* legal rule" (Duguit 1921, 170; my translation), by which he means the social rule of solidarity. Duguit remains an ardent advocate of the right to resist the oppression that flows from the naturalistic foundation of law, a foundation to which he more or less overtly subscribes, "insofar as no one has an obligation to obey a legal rule when it is contrary to the law," that is, in his view, contrary to the social rule of solidarity.

Indeed, if a law is imperative, it is "because it ascertains a legal rule, namely, a rule that is itself imperative" (Duguit 1901, 616; my translation).

Duguit's naturalistic trope comes through even more clearly in his analysis of the relationship between the law and the state. Duguit subscribes to a sort of legal pluralism (or rather, to a legal *dualism*), in that, in his view, "the law is not a creation of the state; it exists outside the state; the notion of law is totally independent from that of the state" (Duguit 1921, 33; my translation). It is the *corollary* of what is posited here that is important: The legal rule is imposed on the state, and this idea can be upheld only insofar as "the law is created exclusively by the state; that is, legal rules ensue from the state's formulation or acceptance of economic and moral rules" (ibid.; my translation). So, for Duguit, "the state is subject to a legal rule superior to itself, a rule it does not create and cannot violate" (ibid., 547; my translation).

12.3.3. The Theory of the State

It is no doubt an original contribution that Duguit's theory of the state (including his early work) made to legal theory, at least in the context in which it was formulated, that of early-20th-century France. First, he criticizes conceptions of the state he associates with German culture: those on which the state is said to be a person with a real existence and is thus capable of manifesting its will, that is, of exercising the power to determine itself for what it is, or, in other words, of exercising its sovereignty. It is by virtue of this sovereignty that the state can create law and enforce it. In Duguit's view, however, the idea of sovereignty is a potent sign of the survival of a theocratic conception of law: "If sovereignty is the manifestation of a will superior to individuals, it is capable of conferring rights; however, a right can only result from the will of an entity superior to the sovereign; and, by definition, no manifestation of will on the part of an entity superior to that of the sovereign is possible on earth" (Duguit 1927, 545; my translation).

But the originality of Duguit's approach lies in his effort to deploy this social analysis in constructing the notion of the state. Especially relevant in this regard is the concept of public service that Duguit uses to define the state. Indeed, public service is defined by him as "any activity ensured, regulated, and controlled by those who govern as part of a process aimed at implementing and promoting social interdependence, bearing in mind that this process can be fully achieved only through the intervention of the governing force" (ibid., 61; my translation). This conception allows him to explain the state's intervention in economic and social issues. In his first major book, *L'Etat, le droit objectif et la loi positive* (The state, objective law, and positive law: Duguit 1901), Duguit criticized this neoindividualistic approach to the law, an approach that constrains the power of the state but leaves unanswered the question of the foundation "of the active obligations incumbent upon it."

Numerous duties of the state derive from social solidarity; the state, in other words, has a legal obligation to pass certain laws on such issues as education, social services, and labour. Duguit, however, opposes the notion of a right to active social benefits dispensed by the state (what are generally referred to today as social rights, or entitlements), even though in his view the state, whatever may be its political organization, has a social duty to promote the rights of those who participate in the labour force and to protect them from exploitation, as well as to ensure equal access of all to health care, not to mention minimal standards of subsistence, education, and culture (see Duguit 1923, 214, 299–300). Otherwise stated, "the law the state has an obligation "to formulate and implement" (Duguit 1921, 554; my translation) includes provisions giving "each individual the practical and moral possibility to promote social solidarity" (Duguit 1928, 641; my translation). This is not to say, however, that the power of the state is boundless. Indeed, to begin with, Duguit criticizes the concept of sovereignty and any other account aimed at explaining the state as something other than the community of those who hold power in a given society. Duguit sums up this idea in a rather simple equation: "In the distinction between those who govern and use force and those who are *subject to* this force—therein lies the state" (Duguit 1901, 616). This vision entails important consequences regarding the limitation of power, since, in Duguit's view, "those who govern are individuals like all others, subject like everyone else to social rules based on social and intersocial solidarity." These social rules "impose duties on them, and their acts are legitimate and must be obeyed, not because they emanate from a so-called sovereign, but insofar as they are in conformity with the legal rules which obligate those who formulated them." In other words, the state has a *de facto* power "whose object and scope are determined by objective law" (Duguit 1921, 565, 407; my translation).

After World War I, Duguit took a more liberal and classical path. He valued the idea of human rights and praised the 18th-century declarations for constraining power by proclaiming superior principles. Of course, this does not mean that he turned his back on the sociological approach to legal rules he always advocated; in his view, these declarations never *created* any rights but only *ascertained* them, as in the example of security, which he regarded not as a right proper but as a "socially recognized and protected liberty and property" (Duguit 1923, 217; my translation). From this point on, his analysis of the law would be more overtly congruent with natural-law theory, for he subscribed to the idea that "man enters society with rights to liberty and property" (ibid.; 1927, 603). As for the "practical consequences" of his theory, he readily conceded that he had arrived at the same conclusions as those who advocated an individualistic approach. Moreover, he was in favour of judicial review modelled on the American experience. In the context of the Third Republic in France, he proposed that the constitutional law be distinguished from the 1789 Declaration of the Rights of Man and of the Citizen as supreme

norm, should the former be judged unconstitutional, arguing that the Declaration would survive such a judgment because it carries "full positive legislative force." Duguit was a strong advocate of the possibility for all litigants to challenge the constitutionality of a law by upholding a higher law, whether written or not (see Duguit 1927, 718–9). He believed that judges should have the power "to refuse to apply a law that evidently contradicts a higher unwritten principle of law deemed by the collective conscience to be obligatory for the state" (ibid., 356; my translation).

Duguit's liberalism sheds a different light on his epistemological enterprise. He saw early on that the state is a collective entity which, if personified, is likely to "foster social struggle, thus paving the way, in the short run, for the triumph of revolutionary anarchism and tyrannical collectivism" (Duguit 1901, 615; my translation). He would also change his conception of private property, which he initially refused to regard as a right *per se*, eventually conceding that "the only way to combat communism is to educate people to understand that private property is not a right but a function" (Duguit 1924, 111; my translation). But the solidarity which permeates his legal theory already allowed for a conception of the social devoid of conflict. As Bonnard keenly saw, Duguit's approach is characterized at bottom by two other important features aside from his positivist claim, namely, his liberalism and his social conservatism. Although allegedly "political," these features reverberate through and pervade the core notions of his legal theory. But behind what Eisenmann (2002) took to be an irremediable contradiction between an empirical method and a social normative principle, there may actually be a challenge of no small account: Duguit was elaborating a theory aimed at conceptually embracing the social changes of his time.

12.4. Raymond Carré de Malberg (1861–1935) (*by Pierre Brunet*)

Raymond Carré de Malberg (1861–1935) spent his entire career as a law professor at the University of Strasbourg. Although he succeeded to Paul Laband in 1919, when Alsace was reintegrated as part of France, he pursued a critical reading and discussion of German legal scholars (among whom Laband himself and Georg Jellinek) with a view to articulating their conceptual system in light of the specific features of the French state. He was then regarded, and still is today, as one of the most influential French theorists of the state (*Staatslehre*) and of constitutional law—if not *the* most influential such theorist—and was a prominent representative of legal positivism understood both as an approach to law and as a theory of law.[3]

[3] Here I follow Norberto Bobbio's distinction among three meanings of the word *legal positivism*: as legal theory, as an axiologically neutral approach to law, and as an ideology. In this last sense legal positivism could be identified as legalism, where positive law is held up as an ideal of

Carré de Malberg had a deep understanding of German legal literature. His critical approach to Kelsen's and Merkl's theory of the hierarchy of norms is expounded in a book titled *Confrontation de la théorie de la formation du droit par degrés avec les idées et les institutions consacrées par le droit positif français relativement à sa formation* (The theory of the stepwise formation of law in comparison with the ideas and institutions entrenched in French positive law with respect to its formation: Carré de Malberg 1933), which, as the title suggests, is aimed at assessing the relevance of the hierarchical theory for the purpose of analyzing French positive law, especially with regard to its sources. The main critique he articulates is that the hierarchy of norms does not give a realistic account of the sovereignty of the French Parliament sovereignty or of Parliament as the sole source of positive law. His last book, published in 1935 and titled *La loi, expression de la volonté générale* (The law as the expression of the general will: Carré de Malberg 1984), analyzes the specificity of the French legal system as regards its sources and gives a critical account of parliamentary sovereignty, along with a number of suggestions on how to remedy its defects.

But Carré de Malberg's masterwork is undoubtedly his *Contribution à la théorie générale de l'Etat* (A contribution to the general theory of the state: Carré de Malberg 1920). Written before World War I, it was actually not published until 1920, as Carré de Malberg doubted its relevance following the devastating experience the states went through during the war. Notwithstanding his scruples, this work exhibits a richly detailed and complexly structured theory of the modern state from a positivistic point of view, though it is not immune from methodological criticism, for it is not so consistently positivist in its approach as it regularly claims to be.

If legal positivism, as Bobbio says, encompasses both a theory of law, that is, an axiologically neutral approach to law, and a theory of justice, then Carré de Malberg is surely a legal positivist in the first sense. But Carré de Malberg is also a positivist in the sense that his approach accords with many positivistic theses, and in particular with those identified by H. L. A. Hart, namely, that law is created by an act of human will, that these rules constitute a coherent system, and that legal concepts need to be analysed from a *legal* point of view, not from a sociological one.

12.4.1. The Positivist Theory of the Sources of Law

According to classical legal positivism, law is the product of authoritative acts ultimately backed by force. As Carré de Malberg puts it, law is a command, the expression of the will of an organ of the state, namely, the legislature. This is how he expresses himself:

justice itself (see Bobbio 1965). On Bobbio, see also Section 11.4 in this tome and Section 9.3.1 in Tome 2 of this volume.

Law, in the proper sense of that word, is nothing if not the whole set of rules imposed on men across a given territory by a superior authority having the ability to rule by exerting an effective power of domination and unvanquishable constraint. (Carré de Malberg 1920, 490; my translation)[4]

This is not to say that he promotes a naïve imperativist theory of law (like that put forward by John Austin). Indeed, the legislator is not, in his view, an abstract entity but rather one created through the State's constitution. His analysis is thus strictly legal and does not subscribe to any kind of ontological realism (on which see Section 12.4.2 below).

According to this strain of positivism, the origin of the constitution is a pure fact, and the constitution itself is viewed less as a norm than as a system of legislative and executive organs. This entails two consequences: first, the constitution cannot constrain the legislature; and second, the constitution cannot be reduced to its text.

Carré de Malberg is interested in characterizing the state with specific regard to French positive law. By *positive law* he means not only the French written constitution—which at the time consisted only of three written power-conferring laws enacted in 1875—but also the positive general principles inherited from the French revolution and never since revoked.

He points in particular to two such principles that in his view are closely linked. The first of these is the principle of national sovereignty: Sovereignty belongs to the nation as a whole; it is personified in the state acting through its representatives. The second is the principle that the laws are an "expression of the general will." Carré de Malberg understands such a claim not so much, or not only, as a norm but also as a "real" definition of the law as part of the French legal order, meaning that a law is valid only insofar as (if and only if) it is passed by Parliament regardless of its substance, and also meaning—no less importantly—that a law passed by Parliament is not amenable to judicial review. This explains why Carré de Malberg criticizes the distinction made by French scholars (but not by German ones, such as Laband) between substantive and formal law. According to Carré de Malberg, such a distinction fails to give an accurate account of the positive legal order, since the law can be defined only from a *formal* point of view:

Under French positive law, the real notion of a constitutional statute [...] is above all any decision issued by the legislative assembly in the form of a legislative act. (Carré de Malberg 1920, vol. 1, 327; my translation)[5]

[4] The French original: "Le droit au sens propre du mot, n'est pas autre chose que l'ensemble des règles imposées aux hommes sur un territoire déterminé par une autorité supérieure, capable de commander avec une puissance effective de domination et de contrainte irrésistible."

[5] The French original: "La vraie notion constitutionnelle de la loi selon le droit positif français [...] c'est d'abord toute décision émanant des Assemblées législatives et adoptée par elles en forme législative."

Because the laws enacted by Parliament are the main sources of law, one might expect the judiciary and judicial decisions to be defined as pertaining to the executive branch. Carré de Malberg does indeed claim that once a law is passed, judges have to decide cases in conformity with it. But he also envisages a scenario where no applicable law exists. And he goes on to explain that under Article 4 of the French Civil Code, prohibiting a denial of justice, judges may create new norms, since this power is rooted in the law itself (Carré de Malberg 1920, vol. 1, 704; see also Carré de Malberg 1933, 97ff. and esp. 114). As it stands, this claim can be interpreted in two different ways: On the one hand Carré de Malberg may be regarded as subscribing to the idea that there exist gaps in the law, in which case his approach is probably not as positivistic as it claims to be; on the other hand, his view may be seen as meaning that there can never be any gaps in the law, in that judges have a legal obligation to *create* norms when the law is silent. There are a number of reasons why the latter interpretation is surely the better one: Carré de Malberg's positivism may be deemed old fashioned today, but he was a coherent positivist nonetheless. And this explains why he never subscribed to the *Stufenbau* theory developed by Merkl and Kelsen. Whereas these authors believed that the difference between the creation of law and its application is only one of degree, Carré de Malberg maintains that the difference is in kind: The creation of law is in the hands of the legislature, whereas its application is in the hands of the executive. Even law entrusted to the creation of judges should be understood as *particular* norms, applicable only to the case at hand.

12.4.2. Legal Analysis of Legal Concepts

Under the influence of Jellinek and Laband, Carré de Malberg is concerned to articulate a purely legal theory of the state, that is, a concept of the state that can be distinctly observed by legal science. He also gives a legal analysis of the concepts of sovereignty and representation.

This explains why Carré de Malberg rejects the classical definition of the state as a compound consisting of a people, a territory, and a government. According to Carré de Malberg, this threefold characterization is inadequate because it blurs the distinction between facts and law. As he puts it, as much as the combination of these elements will most surely give rise to the state, the state cannot be reduced to it: "From the standpoint of legal science, the birth of the state is no more than a fact, one not susceptible of legal qualification" (Carré de Malberg 1920, vol. 2, 492; my translation; cf. ibid., vol. 1, 62).[6]

[6] The French original: "La naissance de l'État n'est pour la science juridique qu'un simple fait, non susceptible de qualification juridique."

Since legal science should focus on strictly legal elements, rather than on factual ones, it would be better, according to Carré de Malberg, to define the state as a "legal person," in which regard he comments as follows: "The state should be conceived, not as a real person, but only as a legal person [...]; the state cannot appear as a person until it has been contemplated from a legal standpoint" (Carré de Malberg 1920, vol. 1, 27; my translation).[7]

Very much in the same vein, he also comments thus: "From the standpoint of legal science, the birth of the state is a simple fact, as such not amenable to legal qualification" (Carré de Malberg 1920, vol. 1, 62; my translation).[8] And: "At the outset, the state was a *de facto* organization before it became *de jure*" (Carré de Malberg 1933, 167; my translation).[9] His analysis is in this respect very close to that of the German scholars, and it comes into contrast with the classical, albeit conflicting, views of French scholars who subscribe to the idea of the state as a fiction irreducible to the individuals who act on its behalf—but compare Duguit 1901: "The will of the state is in reality nothing but the will of the officials" (ibid., vol. 1, 261; my translation)[10]—or, on the contrary, to the ontological argument whereby the state is a real, albeit collective, person (see Michoud 1998, 62ff.).

According to Carré de Malberg, the state is a unity as the point through which acts of will are imputed. In this sense, the law never runs the risk of being confounded with facts; nor is the state liable to be viewed as a fiction subject to criticism or as an ontological claim in need of justification. The state is a legal person if, and only if, from a strictly legal point of view, human acts can be said to have a legal purpose. He writes that the state is thus a complex of *systèmes d'organes* (systems of organs), *c'est-à-dire*, "the result of an organization by the unifying effect of which the collection of its members is then reduced to unity"[11] (Carré de Malberg 1933, 167; my translation).

Carré de Malberg can thus account in an original way for the relationship between the will of the state and human acts. Indeed, according to a conception that had wide currency in his time, the state constitutes a person whose will can be set in motion only by way of individuals who act on its behalf. Departing from this view, Carré de Malberg claims that the state is a person *by virtue of* the fact that people act on its behalf. And that is so from what he calls a "logical point of view."

[7] The French original: "L'État ne doit pas être envisagé comme une personne réelle, mais seulement comme une personne juridique [...], l'État n'apparaît comme une personne qu'à partir du moment où on le contemple sous son aspect juridique."

[8] The French original: "La naissance de l'État n'est pour la science juridique qu'un simple fait, non susceptible de qualification juridique."

[9] The French original: "A l'origine, l'organisation étatique a été de fait avant de devenir de droit."

[10] The French original: "La volonté étatique n'est *en fait* que la volonté des gouvernants."

[11] The French original: "la résultante d'une organisation par l'effet unifiant de laquelle la collectivité de ses membres se trouve ramenée à l'unité."

So, for Carré de Malberg, the state is not an ontological entity: It is a pure legal concept, which he analyzes in very much the same way as he does the concepts of sovereignty and representation, both of which are in his view intrinsically linked to the concept of the state.

Carré de Malberg's analytical emphasis enables him to distance himself from the classical views on the sovereignty of the state. He is thus faced with the question: Is sovereignty the essential criterion of statehood and, if so, what distinguishes the state's sovereignty from parliamentary sovereignty?

Here, again, Carré de Malberg relies on German legal scholarship. His analysis rests on the threefold distinction among *Souveränität*, *Staatsgewalt*, and *Herrscher*. The first word is to be understood from a formal point of view: It points to the power of the state as originating from a supreme and independent body or organ. The second word refers to the various powers the state can make use of—especially the power of coercion—and is to be understood in a material sense. The third word refers to the power of a state organ, or the position this organ occupies within the state. Hence *sovereignty* refers to three different concepts, and there is no necessary contradiction in saying that a state is sovereign (in the sense captured by *Souveränität*), that a parliament is sovereign (in the sense captured by *Herrscher*), and that sovereignty (*Staatsgewalt*) belongs to no other entity than the state itself (Carré de Malberg 1920, vol. 1, 79–88).

Carré de Malberg is of course fully aware that positive legal orders are made of heterogeneous norms. He readily admits, for instance, that the German legal order of his time is based on the sovereignty of the monarch, whereas the French legal order is based on the sovereignty of the nation. This constitutes to his mind a most important difference between the two legal orders, insofar as the sovereignty of the monarch evinces a confusion between the monarch as a person and sovereignty itself, whereas national sovereignty allows for a clear-cut distinction between the sovereign—the nation legally personified in the state—and the physical persons who act on its behalf. As much as these natural persons may *exercise* sovereignty, sovereignty does not *belong to* them, because they are acting not on their own behalf but as organs of the state (Carré de Malberg 1920, vol. 2, 306). To better understand this point, we need to examine Carré de Malberg's conception of representation.

His analysis of the concept of representation is a key feature of his overall theory. Here, again, he transcends the academic discussions of his day, and German legal scholarship provides him with a renewed point of departure. According to classical French jurists, mostly focused on private law, political representation is either a mandate or a delegation of power from the electors to their representatives. This view was sometimes criticized, by Duguit, for example, and was even rejected for its lack of realism—a lack of *sociological* realism, as Duguit saw it—on the ground that representation is a myth, if not a kind of lie (see, for example, Duguit 1901, 18).

Carré de Malberg took a very different approach. He relies on Jellinek's analysis of the concept of a state organ (see Jellinek 1900) to show that there is no necessary link between representatives and their electors. His argument is that from a legal point of view, representatives are committed to realizing the will, not of *particular* electors, but rather of the people as a whole. To make the rule explicit: "Representatives are representatives of the nation." As Carré de Malberg comments, "this means that they represent, not the totality of citizens individually considered, but their indivisible and extra-individual collectivity as a whole" (Carré de Malberg 1920, vol. 2, 223; my translation).[12]

Thus the will of particular individuals—as organs of the state—can be attributed to the state itself on the basis of the Constitution, not in virtue of the conformity which that particular will may have with the actual will of the people who elected the representatives. To put it otherwise, the will of the person legally constituted as an organ of the state counts as the will of the state, or, in modern parlance, that person's will is "constitutive" of the will of the state.[13] The question, then, is Why does positive law use the word *representation* rather than *organ*? For Carré de Malberg this has to do with the rhetorical weight the word *representation* carries, in a way that *organ* does not (see Carré de Malberg 1920, vol. 2, 305; Brunet 2004). But rhetoric is not the only explanation. He also points to the previously recalled specificity of the French legal order in distinction to the German one, in that, whereas the former was dominated by the sovereignty of the nation, the latter was by that of the monarch (and of course in drawing this distinction he was making a political claim in defence of democracy against autocracy: see Carré de Malberg 1920, vol. 2; Schönberger 1995, 1997).

12.4.3. Carré de Malberg as a Quasi-Positivist

Despite his oft-reiterated profession of positivism, Carré de Malberg does not adhere to a purely descriptive approach to the positive law: He rather elevates some of his descriptions to the rank of absolute and incontestable truths.

Carré de Malberg's concept of positive law is ambiguous. Indeed, what he has in mind here is not so much a set of rules created in accordance with procedures set forth in the constitution as a set of "principles the truth value of which is unrelated to positivity" (Maulin 2003, 26, 335; 2002, 5–27; see also Beaud 1994, 1251–4; 1997, 219–54).

The epistemological status of the principle of national sovereignty as he defines it raises numerous difficulties in this respect. Carré de Malberg describes

[12] The French original: "Elle signifie qu'ils représentent non pas la totalité des citoyens pris individuellement mais leur collectivité indivisible et extra-individuelle."

[13] Here the term *constitutive* is being used in Searle's sense to mean that what is constitutive can be qualified as such not in virtue of its *creating* any behaviour but in virtue of its providing that behaviour with a *meaning* (see Searle 1969 and 2009).

that principle as a "given" attribute of French constitutional law, without specifying what he means by *given*. Hence he fails to give a plausible justification of his oft-repeated claim that the *Constituante* (or constituent assembly) operated on a general theory of the modern state. According to Franz Weyr, Carré de Malberg regards the revolutionary juridical order in much the same way that theologians regard the Bible (see Weyr 1934): as a source of principles expressing incontestable truths from which other incontestable truths can be derived.

Moreover, the principle of national sovereignty as defined by Carré de Malberg departs "from the norms his method imposes" (Maulin 2003, 107; my translation), insofar as the French Constitution of 1791—which in his view comes first not only in a chronological sense but also in virtue of its principles—does not just lay out a distribution of powers but also proclaims theoretical principles whose truth is unrelated to their status as positive law. As Eric Maulin aptly comments, "it is not because these principles are stated that they have a juridical status but it is because they are true that they are stated and thus acquire juridical value" (ibid., 108; my translation).

So it seems that Carré de Malberg espouses a natural-law approach on which the validity of a juridical norm rests on its truth. Indeed, while defining the essence of the state on the basis of the French Revolution—by which is meant: according to his *own* construal of this revolution—Carré de Malberg (2004, 336) adopts a "fundamentally prescriptive" approach. Indeed, as much as, in the name of science, he is constantly seeking to "verify" or "compare," as he himself puts it, the theoretical claims he advances with the legal system such as it exists, he winds up failing in that effort insofar as, in his view, the criterion for establishing the truth of a theory lies in its agreement with the principles of positive law—but then these principles turn out to be themselves juridical or positive only inasmuch as they correspond to his *a priori* theoretical conception. And in this way, as Michel Troper (1993) rightly observes, "the *a priori* rational conceptions become indistinguishable from the applicable public law" (my translation).

Moreover, Carré de Malberg's approach is not devoid of political presuppositions. Indeed, he not only seeks to determine the defining principles of the legal orders he scrutinizes but also sets up an axiological hierarchy among them, claiming that the principle of national sovereignty led to the adoption of a representative government and fostered the birth of the modern state, over against the sovereignty of the monarch or of the people in such a way as to raise an individual or a group above the rank of the others, and to the detriment of the latter. His demonstration rests on another, more implicit presupposition, which has to do with the philosophy of history such as it was generally understood by the positivists of his time, namely, that history charts a course of progress, and especially that the French Revolution marked a new beginning in this evolution. Stated otherwise, ancient direct democracies conferred sovereignty on the *people*, the *Ancien Régime* on the *monarch*, but in the

wake of the revolution came the sovereignty of the *nation* and the adoption of representative government—both developments significantly advancing the progress of humanity.

Still, despite the reservations one may have about the "master of Strasbourg" and the criticisms that can be directed at his *oeuvre*, and in particular at his legal analysis of the modern state, the questions it raises and the arguments articulated in addressing these questions show an incredible richness of thought that should not be underestimated.

12.5. François Gény (1861–1959) (*by Jean Louis Halpérin*)

The 1899 publication of François Gény's *Méthode d'interprétation et sources en droit privé positif, essai critique* (The method of interpretation and the sources of law in private positive law: A critical essay, Gény 1899) marks what is often regarded as a kind of revolution in French legal philosophy. This assessment can be justified from a twofold point of view. First, Gény—born in 1861, professor in Dijon since 1890, then in Nancy in 1901 until the end of his career in 1931: He lived to be almost one hundred when he died in 1959 (see Hakim 2007, 360–2)—was one of the leaders of the new generation whose members wrought a deep and ameliorative reform of French legal thought in the late 19th and early 20th centuries. With his older friend Raymond Saleilles (1855–1912)—and with Maurice Hauriou (1856–1929) and Léon Duguit (1859–1928), two specialists in public law—Gény is among the great theorists who took part in a larger movement of intellectual revival of legal scholarship during the Third Republic in France (1870–1940). By comparison with their mid-century predecessors, these young professors were all more aware of the contemporary scholarly debate and of the international literature, especially the German literature originating in the Lorraine province (Gény read the German lawyers and on this subject exchanged many opinions with his colleague Saleilles). Moreover, Gény wanted to break with the "traditional method" of French civil-law professors—as he called it, preferring that phrase to the all too familiar "exegetical school," later stigmatized by Bonnecase (1924)—and he was the spokesman for the dominant movement that until today has recognized a key role for legal scholarship (the opinions of legal writers) and legal doctrine (the case law, especially that of the Court of Cassation) in French civil law (see Halpérin 2001, 180–8).

Geny's reflection since the *Méthode* is importantly developed without sweeping changes in his second great work, the four-volume *Science et technique en droit privé positif* (Science and technique in positive private law: Gény 1914–1924). Old-fashioned, written in a rather elegant, sometimes innovative French style, impressionistic in its mood, very far from the German writers' precision in the use of philosophical categories, this work today is more difficult to appreciate in any detached manner. The same goes for Gény himself

as a conservative jurist, a Catholic unfriendly to the anticlerical governments of the Third Republic (see Jamin 2000, 13), and who was given to fits of anxiety in the face of socialist threats (at the end of his life he was rather sympathetic to the Vichy regime). To be sure, many positivists may be disappointed with, or altogether uninterested in, the work of what appears to be a consummate yet trivial proponent of natural law (as we will see in what follows) who has invited lawyers to question the nature of facts and our opinions about justice in order to adapt legal rules to social needs. Moreover, what Gény has called "free scientific research" runs the risk of coming across as a pseudo-sociology—something he never himself indulged in (see Jestaz 2000, 52)—or as a pale forerunner of the *Freirechtsschule* (which he criticized in the 1919 edition of the *Méthode*: Gény 1899). But it seems fairer to first situate Gény's masterwork in its historical context in late 19th-century France, so as to then draw differences between his global (and rather unoriginal) theory and some of his more acute analyses.

12.5.1. A Time for Renewing French Legal Theory

As is explained in the first pages of Gény 1899, the context in which the book was written was one of crisis in the French law schools, for there was a sense that the study of law was rapidly moving toward the new discipline of sociology, which at the time meant the discipline that was shaping up with Émile Durkheim's early work, as well as under the influence of Herbert Spencer; the Italian positivist criminologists, especially Cesare Lombroso and Enrico Ferri; the school led by Frédéric Le Play (1806–1882), the author of *La réforme sociale en France* (The social reform in France: Le Play 1864); and the books by Gabriel Tarde, especially *Les transformations du droit* (Transformations in law: Tarde 1896), and René Worms, especially *Organisme et société* (The organism and society: Worms 1896).[14] There came up a generation of law professors who turned out to be more knowledgeable and better qualified as a result of the new institutional framework set up from 1854 to 1856, under which professors were appointed on a competitive basis—the so-called *agrégation* (or "aggregation"). The curriculum was redesigned in keeping with the republican reforms: The new programs of 1880 and 1889 expanded the curriculum so as to include the history of law, as well as economics and a stronger grounding in public law. Then in 1896 the curriculum was divided into in four sections: private law, public law, economics, and the history of law. But at the same time these reforms also raised concerns among faculty, who were worried that students might "jump ship," finding the other social sciences more attractive. At fault for this situation, in the opinion of Gény and the other advocates of renewal, was the traditional method of writing and teaching law: The standard

[14] For an overview of this entire landscape, see Mucchielli 1998, 144–54.

practice at the schools had ossified into a kind of sclerosis—the traditional method, Gény commented coining a French neologism (and in translation an English one, too) "stagnifies" (*stagnifier*) law—this in contrast to the German ferment of ideas since the works of the late Jhering until the debates leading up to the enactment of the German Civil Code (1896).

Gény starts out by offering an analysis of the "traditional method," focusing (with some exaggeration, as he would on occasion admit) on its abuse of purportedly geometric deductions from the legal texts, and in criticising these aprioristic constructions he drew on Jhering. Is it only at a second stage (Gény 1899, 24)—a very short-lived one, and quite neglected in many accounts of his thought—that he took aim at the "fetishist" attitude toward statutory law on the part of the mid-century interpreters of the Code Napoléon: Exemplary in this respect is Charles Demolombe's slogan, "*les textes avant tout!*" (the texts before all else!) (Demolombe 1845, vol. 1, VI; see also Halpérin 2001, 67). According to Gény (1899, 57–129), this religious reverence for the legislator entails the drawback of freezing the law in time at the moment of its statutory enactment (with a vain quest in search of an elusive legislator's will), and it gives a false authority to engage in abstract reasoning, completely disconnected from real facts. So, as Gény (ibid., 147) argues, behind the exegetical method there is the arbitrariness of the interpreters and the illusion of a subjective dogmatics. Gény dares to attack the Strasbourg professors Charles Aubry (1803–1883) and Frédéric-Charles Rau (1803–1877),[15] translators of the German handbook on French civil law written by Karl Salomo Zachariae,[16] and often praised as the most abstract interpreters of the Code Napoléon, especially with their theory of *patrimoine* (or patrimony, the civil-law equivalent of the common-law estate). This "transcendental" method (perhaps an allusion to its Kantian roots) has isolated legal thought, imprisoned in fictions without any connection to social needs (see Gény 1899, 174). Still drawing on Jhering, Gény sets that method against that of the Roman lawyers, whom he praises for their mitigated use of logic and a pragmatic analysis of factual phenomena. Just as Jhering proposed going *through* Roman law so as to move *beyond* it, Gény suggests a new method that would go through case law so as to progress beyond the Code Napoléon.

12.5.2. The Fear of an Unbridled Judge-Made Law

The main thrust of Gény's analysis lies in his making it possible to appreciate the prominent role that case law plays in French civil law. Here the stage

[15] On Aubry and Rau, see Arabeyre et al. 2007, 22–3 and 653, respectively.

[16] See Halpérin 2001, 65–6. The first edition of Zacahariae's handbook was published in 1808 (Zachariae 1837 for the fourth edition); Aubry and Rau's *Cours de droit civil français* (Course on French civil law: Aubry and Rau 1839) was first published in 1839 and went through four increasingly revised editions.

for Gény's conclusions, enabling them to stand, had for the most part already been set. Indeed, the drafters of the Napoleonic Code, especially Jean-Étienne-Marie Portalis, themselves stated that codified law could not foresee all situations, and that many rules therefore had to be left to the courts' decision-making, that is, to their case law, or jurisprudence. For a long time, French lawyers had widely recognized that the published decisions of the Court of Cassation (the country's highest court) could fill the gaps in the Napoleonic Code (which, for example, was silent on the adoption of illegitimate children): In fact they accepted that the court could give new interpretations to much-debated articles of the code, and could even decide *against* the so-called plain meaning of the words used in the code. The court was established in 1790 (it was originally called *Tribunal de Cassation*, a name it retained until 1804), and starting from 1837, the courts of appeal were bound to follow the second of any two opinions the Court of Cassation may have rendered in deciding cases of the same kind (see Halpérin 2001, 52–4). For example, in three different opinions rendered from 1841 to 1846, the Court of Cassation interpreted a gap in the civil code in such a way that a child born out of wedlock could lawfully be adopted by either of the biological parents. French judges, as quoted by Gény, were of course aware that they played a role in the legislative power, despite their formal subjection to statutory law. French law professors increasingly took to citing the opinions of the Court of Cassation as authoritative even when they disagreed with what the court had said. As far back as thirty or forty years before Gény's *Méthode*, the practice of French lawyers in dealing with what they considered to be "bad" decisions had been not to attack those decisions frontally but to provoke modifications or inflections of the case law by writing critical commentaries, the famous *notes d'arrêts*, a legal genre originally developed by Joseph Émile Labbé (1823–1894), a professor of Roman law whom Gény quoted from different law journals (on Labbé, see Arabeyre et al. 2007, 441–2). In the years leading up to the publication of Gény's *Méthode* (Gény 1899), the innovating leaders of French legal scholarship (Adhémar Esmein, 1848–1913; Raymond Saleilles, 1855–1912; Étienne Louis Josserand, 1868–1941, all of them held in high regard by Gény) encouraged the Court of Cassation to develop a doctrine making employers strictly liable to workers for injuries caused by accidents on the job, and the way the court was to do this was by taking up a bold interpretation of the statutory language, and in particular of the phrase "liability because of things" contained in Article 1384 of the Civil Code (alluded through the words, "things which a person had under his care").

From then on the problem became that of finding appropriate limits for this influence of judicial jurisprudence (the case law) by removing any discretionary power of the judges and maintaining the legal scholars' monopoly on the interpretation of statutory law (Gény was not an enemy of codification and held on to the traditional primacy of statutory law in France). That is why,

contrary to Saleilles, Gény was not inclined to let judges "doctor" legal texts in order to support new interpretations. He preferred to insist that statutes had to be applied strictly, like in criminal matters, and that the space for "free scholarly research" was open only when the law was "silent" or failing (a view that today is regarded as nonsense by the advocates of heuristics: see Gény 1899, 232). Furthermore, he was sceptical about the burgeoning sociology—a science without clear directions, suspected of forsaking Christian morals (a veiled accusation directed at Durkheim and then at Eugen Ehrlich and Hermann Kantorowicz)—finding unpersuasive its claim to arrive at objective solutions with which to adapt legal rules to social needs.[17] The task of developing this new legal science was entrusted to the jurists, a class in which he appears to have included the judges, though he was especially thinking of legal scholars and commentators.

12.5.3. Natural Law as a Line of Defence Against Social Change

There is little doubt but that the legal theory defended by Gény—emerging as it does against the backdrop of the French situation as just analysed—implicitly entails a return to natural law. It must nevertheless be pointed out that the case for this legal philosophy (i.e., natural law) was not made with any dogmatism and that many of Gény's analyses were inflected with a savvy pragmatism. Very early on in *Méthode*, Gény quite straightforwardly sets out the mission of *jurisprudence*, a word he is probably using ambiguously in reference to both case law and *doctrine* (the French word for legal writing): *Jurisprudence*, Gény comments, is tasked with discovering and applying the rules most suited to maintaining harmony among men "in accordance with the aim assigned by God to humanity" (Gény 1899, 5; my translation). Having said that, Gény turns to (uppercased) *Justice*, suggesting (however much allusively) that that principles are needed with which to guide judicial interpretation. Rather than rejecting positivism and setting it against natural law, he finds that even the staunchest positivists use the concept of justice: In our own day we might call them crypto–natural lawyers. According to Gény, feelings of justice are an insufficient basis on which to fill gaps in statutory law, and free scientific research needs to be based on facts garnered through a serious study of history, statistics, or comparative law (see ibid., 492). As much as law may be linked to the social sciences, this does not mean that it should yield to sociology, but that it needs to rely on ethics, economics, and politics as objective tools with which to find solutions adequate to social needs (cf. ibid., 513–36).

Gény thus takes the view that the classical theory of natural law—as against the overly abstract conception of the modern school of natural law—needs to be modernized in light of new scientific ideals (see Villey 1969 and Cayla 1988).

[17] On Kantorowicz and Ehrlich see respectively Sections 3.1 and 3.3 in Tome 2 of this volume.

Although the method recommended by Gény undeniably bears connections to Roman jurisprudence and the work of the medieval commentators on Roman and canon law, it is not based on Aristotle's philosophy or on Aquinas's theology but is rather influenced by a nonconfessional (and rather vague) conception of social science. Despite his commitment to Christianity, Gény advocated a secular and changing natural law, comparable to the conception that Stammler was advancing, which was very influential on Gény's friend Saleilles.[18] Furthermore, in a distinctly French mode of thought, Gény's natural law is connected with the primacy of statutory law and a respect for codification. There come into view here the contradictions of the thesis: Gény is unable to *theoretically* explain why legislative power is not authorized to prohibit the use of other sources of law (like custom) and why the legislature has to be modest by not overstepping the bounds of its law making activity. The *political* explanation is, however, clear: Gény is trying to curb state interventionism—with a clear fear of a growing welfare state akin to socialism—and to ensure for conservative jurists an ability to control the evolution of law. That is also why Gény's work is limited to private law, with a clear-cut defence of individual rights (consistently with a concern to protect the interests of the bourgeoisie). In this sense, Gény can be seen as an archetypal member of what Pierre Bourdieu once called the "hypocrite keepers of the social order" (Bourdieu 1991, 95–9).

12.5.4. A Kind of French Pragmatism?

It would be too harsh to condemn Gény's entire *oeuvre* for this philosophically naïve theory of natural law. While acculturating the parlance and terminology of the German legal writers into French (*ordre juridique* for *Rechtsordnung* or *autonomie de la volonté* for *Willstheorie*), the *Méthode* develops in original ways the theme that law is not limited to statutes and that many legal problems have solutions outside the use of logic. The main examples of this pragmatism are found in Gény's analysis of custom as "spontaneous law," another modern-sounding expression taken up by Gény, seeing in it a force capable of counteracting the imperialism of statutory law (see Gény 1899, 230). Gény paid attention to legal practice, looking in particular at the impact of the legal instruments prepared by notaries,[19] and some of his sentences are surprisingly not very far from the notion of "living law" expounded by Ehrlich—surprising in view of the fact that Gény seems to have ignored Ehrlich at the time of the first edition of his *Méthode* (Gény 1899), and in 1919 even rejected his work as a hotbed of anarchism.

[18] On Stammler see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

[19] Herein lies another specificity of French law, in that notaries could influence the evolution of private law by drawing up marriage settlements (or separation agreements) and implementing rights of succession.

This importance accorded to the practice of non-lawyers is why Gény refused to consider case law as a direct source of custom. In order for a new rule of law to be created out of the solutions offered by the judges, it was necessary for those solutions to be known and accepted by laypeople. This was where the lawyers and practitioners had a role to play: They could work from custom in forging law, in effect using custom as an "engine" for the creation of law.

Another example of this pragmatism lay in the possibility, cautiously suggested by Gény, of judicial review of the constitutionality of law, contrary to a forward-looking French tradition that Gény judged to be open to new attitudes as they develop (see Gény 1914–1924, vol. 4, 92–100). Finally, Gény was convicted that the relation between law and fact was not at all simple: Lawyers were making a selection of social facts to construct some of them as legally interconnected or as legal concepts (see Gény 1899, 464–72). And the ongoing progress of law needed repeated recourse to facts. According to Gény, law was not a self-enclosed system, so lawyers needed to also look outside the legal world—something they were not accustomed to doing in France.

Paradoxically, as much as Gény's analyses may have been deeply rooted in German legal science, they turned out over time (even within the long arc of Gény's own life) to run completely opposite to the directions that German legal positivism would take with Kelsen's normativism as well as with the sociological developments (see Chapters 2 and 3 in this tome). Although Gény ignored the common-law tradition—he of course appreciated the importance of judge-made law, even if he probably considered it incompatible with French codification—his pragmatism can be likened to Oliver Wendell Holmes's hostility to abstract logic. It is no surprise that Gény's work became quite influential in the United States at the beginning of the 20th century (see Petit 1991). In France, Gény's *Méthode* is still regarded by legal scholars as the best philosophical work for the training of a future lawyer, but otherwise its destiny was perhaps less fortunate: Gény does not compare to Jhering, Jellinek, or Ehrlich, nor of course does he stand comparison with Kelsen. For these reasons, it is more fruitful to read Gény as a keen analyst of the problem of the sources of law than as a legal philosopher.

12.6. Michel Villey (1914–1988) (*by André Jean Arnaud*)

Michel Villey was Emile Boutroux's grandson and the son of Pierre Villey, an expert in the work of Montaigne. He taught Roman law, the history of law, and legal philosophy in that order at the Universities of Nancy, Saigon, Strasbourg, and Paris.[20]

Villey was above all a historian of legal thought. It is only through history that he came to philosophy, through his previous investigations and a per-

[20] On Villey see also Section 3.3 in Tome 2 of this volume.

sonal reflection on the causes and consequences of World War II. Indeed, he was close to some great German-speaking historians and philosophers of law, such as Franz Wieacker (1908–1994), Erich Fechner (1903–1991), and Hans Thieme (1906–2000), all of whom returned to natural-law theory, and he explained that as a reaction to Nazism.[21] Having embraced the vision of Aristotle and Saint Thomas Aquinas, he was labelled a neo-natural-law theorist.

12.6.1. A Specific Approach to Roman Law and Premodern Legal Scholarship

His conception of natural-law theory is based in the first place on a detailed analysis of Roman legal thought. At the very beginning of his career, in 1945, he published *Recherches sur la littérature didactique du droit romain* (Investigations into educational literature in Roman law: Villey 1946). Michel Villey always highlighted the importance of Roman law, devoting a large work to illustrating the fertility of the philosophical definition of law bequeathed to us by the Roman lawyers. As Bauzon and Delsol (2007) argue, when he proposes that law be conceived as a form of sharing, he is making the point that, as can be appreciated in Roman law, law cannot be reduced to the set of legal rules laid down by the state or to the set of past judicial decisions, because the allocation of goods and responsibilities forming the object of the law is rather something for the legislator and the judge to *discover*, in an endeavour to find out what the best such allocation must be. Law, in other words, is not a set of decisions issued from the top by a formally competent body that authoritatively determines the way relations among individuals are to be set up (see, for instance, Villey 1962b). Law lies not *outside* human relations but *in* them. The jurist's specific role is to find a fair scheme or balance for social relations. Rather than demanding that legislators be intervening on a permanent basis, we should be trying to *minimize* their role, turning instead to the jurist and the judge, who are entrusted with decoding what Villey calls natural equity (see Villey 1961–1962, Part 1). Law is rooted in reality and as such needs to be *discovered* by intellectual work. This legal art consists in understanding what can be qualified as right in social relations. This is why, in the preface to *Le droit romain* (Roman law: Villey 1957), we read that the old Roman laws are not foreign to our everyday problems: In large part they are still topical. It is in light of this background that he assigns a central place to the brocard *ius suum cuique tribuere* (to each his own), which runs like a leitmotiv throughout his work.

According to Villey, Roman law is most interesting in the context of ancient Greek and Roman thought. By investigating the principles of Roman law (cf. Villey 1961–1962, Part 1), he showed how important a study of the foundations of Roman law is for an understanding of the modern world. To him, there is nothing void or irrelevant about the maxim *ius suum cuique tribuere*

[21] On Fechner see Section 10.2.1.2 in this tome.

or about the idea of *iurisprudentia* as the *iusti atque iniusti scientia* or about the concepts of *pietas*, *bona fides*, and *humanitas*. In going back to the use of maxims, he is saying that always pertinent to law is the method of reasoning by *quæstiones* and *casus*.

It is by reexamining ancient Greek philosophy—while also reviving medieval philosophy and its effort to set religious faith on a rational basis, especially in the work of Aquinas, as well as in First and Second Scholasticism at large—that Villey laid the foundation on which his thought would be built. Greek and Roman civilization developed law as the art by which to organize society by allocating rights and duties to its members. The modern world fed on that creation. Where Villey in the *Philosophie du droit* (The philosophy of law: Villey 2001) speaks of the need to return to the basic foundations (ibid., sec. 26), he is saying that we need to go back to the Greeks. In the first volume of *Philosophie*, Villey addresses the purposes of the art of law in a discussion divided into three chapters, two of which are devoted to *Dikaiosunê* (rightness) and *To dikaion* (rights), while in the third he has a few remarks about his philosophical approach going forward.

On these bases, Michel Villey offers a detailed analysis of the medieval doctrine of Roman and canon law and traces out the birth of modern legal thought in Second Scholasticism by innovatively interpreting and extrapolating from authors classically considered as proponents of the natural law school (especially Hugo Grotius, Samuel Pufendorf, Christian Thomasius, Johann Gottlieb Heineccius, Christian Wolff, Jean Barbeyrac). Proceeding from a critical analysis of this current of legal thought, Villey went into philosophy, building his own theory by working on opposite set of premises pulled from Aristotelian and Thomist philosophy (see Villey 1962b and 1975).

12.6.2. A Trenchant Criticism of Modern Legal Thought

There is some caustic criticism that Villey levelled at modern legal thought in its formative period from the 16th to the 18th century, and some Spanish and Italian commentators have seized on the significance of that criticism, while also pointing out its shortcomings (see esp. Contreras Peláez and Pérez Luño 2009 and Punzi 2009 and their extensive bibliographies). So, for example, Villey blames on William of Ockham the appearance of "subjective rights" understood as real entities, a development out of which grows the conceptualization of so-called subjective rights by "modern" philosophers of the state and of rights. But some of Villey's commentators believe he does not give due weight to practices before Ockham, a period when the concept of a right as *potestas* (as a power or faculty) received a more sophisticated formulation. Here Villey brings Hobbes into the picture by attributing to him a methodological turn to individualism. Indeed, scientific knowledge, according to Hobbes, is built on a method on which any object we set out to investigate must in the first place

be broken up into its smallest constituent parts, whereupon the object can be reconstructed so as to arrive at a proper understanding of it. But when that object is society, the whole reconstruction turns hypothetical, and what comes out in the end is a scenario in which the protection of civil rights is entrusted to an omnipresent Leviathan under the social contract (Villey 2001, 77ff.).

Recognizing that law is by nature relational, Villey draws the conclusion that it can never be made to rest on the subjective rights accorded to each individual, for that would lead to the law defeating itself. But the soundness of his method in arriving at that conclusion has been called into question. This can be appreciated in his debate regarding the School of Salamanca, especially as he turns to Francisco de Vitoria, Francisco Suarez, and Gabriel Vázquez, criticizing the first two for understanding natural law in pragmatist and subjectivist terms, respectively, and the last one for altogether dissolving natural law. But commentators have seen Villey's analysis as too sector-specific and fragmentary, in that he pulls sentences and arguments out of context, and this makes it difficult to draw general conclusions about the School of Salamanca. So, on this view, Villey would have unjustifiably set the concept of subjective rights in a polemical context artfully selected to make his point that rights cannot serve as a foundation of law: He did this by linking the concept to metaphysical nominalism, to Christian personalism, and to the controversy between the Roman Church and the Franciscan order (Villey 1973, 53ff.).

The significance of Villey's inquiries was not lost on English-speaking commentators, either, but these scholars, too, have felt the need to point out some flaws in those inquiries. One example is Brian Tierney (1997, 13ff.), who also looks at Villey's discussion of Occam's work, questioning what Villey presents as the necessary connection between Occam's nominalism and the voluntarism on which basis Occam was led to exalt the will of the individual, reducing the role of reason to that of serving as a normative standard. Villey, in Tierney's view, would have neglected to draw a basic distinction among between two phases in Occam's thought—an earlier one where his essential contribution is in moral theory, and a second one in which he is essentially devoted to political thought—and it is not clear, Tierney argues, that a necessary relation obtains between the two.

What matters, on Villey's conception, is *justicia* (justice) and what is *justum* (just), such as justness in the words of Justinian's *Digest*: *Est autem a justicia appellatum jus*—law was named for justice. In this way, we can see that rights are not exclusively traceable to the law.

12.6.3. Going back to Aristotle and Thomas Aquinas

Must law be understood as a system of rules of conduct? Aristotle rejects such a conception. The art of law is aimed neither at the truth nor at utility but at a sharing of goods, so that under its rule we each have our own (Villey was very

fond of the motto *ius suum cuique tribuere*). He explains what this means by reference to the concept of *to dikaion*, arguing that law must strike a golden mean, a proportion or equality (*ison*) as this concept is understood in Greek mathematics. But this means that we must go out in search of the perfect order in the cosmos, the twofold assumption being that equity lies in the harmony of the world and that this harmony can be revealed to us; that is, the cosmos will reveal to us what is fair (*equitas*), but this concept is akin to that of the beautiful—nothing to do with egalitarianism.

Then, too, this natural law is nothing that anyone can arrive at by inherent knowledge: It is not a set of unchanging and definitive rules that we have here, but something that will arise out of experimentation. It is in this sense that Villey entrusts to lawyers, and especially to judges, the task of discovering where the right balance of interests lies in each of the cases before them, to this end reasoning from the rules of fair allotment. This will be achieved through a dialectical discussion. Villey regards as fundamental the notions of *dikaion* and *dikaiosunê*, recalling that in Greek the judge is *dikastês* and justice *dikaiosunê*. The task entrusted to the judge is to determine what is just. The way we now understand the words *judge* and *law*, they do not come from the same root; but before political and legal philosophy went through the transformation that ushered in the modern conception of rights, law, and the state, the law was what the *judge* said it was. Although this is a lesson we take from the premodern philosophers, the insight holds true everywhere at every time, even today. In deciding what was in accord with the *dikaiosunê*, the judge did not fill a "subjective right," something that according to the 16th-century theorists of law and the state attaches to each person as an "individual": Rather, the judge told us what is right, and did so by tracing everything back to the *dikaion*, to the "proportion." The judge thus determines the way in which something is to be shared (the *to autôn ekein*): We need to know what is fair in that regard, and the judge is the one whose role it is to make that discovery. Or, stated otherwise, the right lies in a proper allocation of goods and obligations, and we discover that allocation by turning to the jurist, specially the judge, and also to the legislator, should that prove necessary. So law, for Villey, remains rooted in the reality of things: It is an intellectual quest entrusted to specialists (first among whom the judge) tasked with finding out what is right by looking at what the nature of things is (see Villey 1981, 1987).

12.6.4. Natural Law as a Bulwark against Idealism

How can this intellectual quest be conducted? We proceed by *epieikéia*, a method enabling the jurist to adapt the written rule to each case. Through this adjustment, gaps are filled and the excesses of generalization avoided. What the interpreter must do here is not to apply orders issued by a government

authority but to rely on legal texts in finding a fair solution to the case at hand. Here, the *epieikéia* proves to be irreplaceable. On occasion, it will even trump the demands of justice, by injecting into the law elements of utility, opportunity, and "mercy" (see, for instance, Villey 2001, secs. 33–4, 41, 245.

In this way, natural law can steer clear of any idealism, all the while avoiding the discourse of rights, which in Villey's view would do nothing short of *killing* the law. Indeed, contrary to the conclusions of modern legal thinkers, Villey argues that if we ground the law in subjective rights, we will make it more difficult to find a fair solution to the conflicts arising from coexistence in society. This is because the claims that rights give expression to in any society are potentially unlimited, and when each of these claims is cast as an absolute subjective right, we will have a big problem on our hands trying to make all those claims compatible. So, the idea of a justice and a law rooted in the nature of things gives rise to contradictory rights, which in turn leads to intractable conflicts. For this reason Villey asks that we at least soften such an absolutism of so-called rights (see Campagna 2004). He rejects a social culture in which the individual is located at the very centre of the cosmos, and in this sense he makes a case against the development of individualism.

Social justice is nothing more than the result of such idealism. Absolute equality is illusory. It is unreasonable to believe that equality can be achieved by relying on the concomitant development of legislation and human rights. In a polemical book devoted to human rights (Villey 1983), he gives a critical reading of the history of the language of human rights. The target of this book is what rights would later develop into within the framework of the welfare state, namely, into entitlements. What he criticizes above all is the idea of history as a permanent process of dialectical breaks with the past. To adopt such an approach is to resign oneself to an aimless, soulless practice, a death certificate for the lawyer, while "classic" philosophy, with its speculative bent, shows itself to be indifferent to the various practices in its effort to seize the realities that different individuals share across time and space (cf. interview in *Le Monde*, 9–10 December 1984; Villey 1983).

In short, Michel Villey, adhering to what he considered to be the foundations of sound philosophical thinking, was sceptical of any gratuitous striving to innovate, for it was his belief that everything we need and might want to look for can be delivered by tradition: Everything our world has to offer, he thought, is foolishly lost by ignorance of the past.

12.7. Michel Troper (1938–) (*by Veronique Champeil Desplats*)

Michel Troper is the most important contemporary French legal theorist.[22] On the one hand, following in the footsteps his French teachers, such as Raymond

[22] On Troper see also Section 9.4 in Tome 2 of this volume.

Carré de Malberg and Charles Eisenmann, but to a greater extent than they managed to do, he was substantially responsible for introducing the foreign masters of legal theory to a French audience. Many of these authors were little known, if at all, until Michel Troper's teaching and works. That is the case, for instance, with Alf Ross, Georg Henrik von Wright, H. L. A. Hart, Chaïm Perelman, Norberto Bobbio, Uberto Scarpelli, Giovanni Tarello, Neil MacCormick, Carlos Santiago Nino, Carlos Alchourrón, and Eugenio Bulygin, and with all of Hans Kelsen's works other than the *Reine Rechtslehre*, translated by Eisenmann in 1962. Moreover, Troper is the first French scholar to have deeply analysed and discussed Kelsen's theses. While sharing his epistemology and his legal positivist posture, Troper proposes a critique of the Kelsenian ontology of norms based on a realist theory of legal interpretation.

On the other hand, Troper has developed a legal theory of his own that can be presented in two main points. First, he sets out a legal positivist epistemology and theory; and, second, he defends a strong version of the realist theory of legal interpretation, though the conception is tempered by a theory of legal constraints based on the interdependence of legal actors.

12.7.1. A Legal Positivist Theory and Metatheory

A well-known distinction by Bobbio (its fame in France is owed precisely to Michel Troper) is the one he drew identifying three different conceptions or levels of legal positivism: an ideological, a theoretical, and an epistemological one (Bobbio 1965). Troper is a positivist in the two last respects, whereas in the first sense, on account of his epistemological and methodological premises, he can be said to be neither a positivist nor a natural law theorist.

12.7.1.1. An Epistemological and Methodological Positivism

As an epistemology and methodology (or metatheory), legal positivism says how to do legal theory and legal science. And in this respect Michel Troper embodies the typical traits of a legal positivist metatheorist. Important in this connection is the central thesis of the separation between facts and values—a postulate with many implications.

At first, Troper thought like a moral noncognitivist. To him, this meant that, whereas facts can be known and verified or falsified by procedural mechanisms of proof, values lie beyond empirical knowledge. Values are reduced to sensations. It follows that the object of a legal science or theory cannot be values but only facts. Troper distances himself from the hyletic Kelsenian ontology of legal norms, where legal norms are conceived as special ideal entities, and considers law and legal norms to be facts. Legal norms are specific 'meanings' (*signification*) conferred on statements, and these legal meanings are expressed by an act of the will (Troper 1990, 518).

The separation between facts and values implies for Troper, too, that the object of a positivist legal theory lies in the law as it *is*, and not in the law as it *should be*, in light of an ideal conception of the legal order. There is no natural, moral, metaphysical, or true law over the law created by competent legal authorities acting in a given legal order. Above all, even if such an ideal law could exist, it would not be a criterion for the validity of the positive law. The only criterion of legal validity lies in a norm's having been enacted or created by a competent authority in a given legal order (Troper 1990, 526). The content of a norm, especially its morality or fairness, is not relevant in identifying it as a *legal* norm. On this point, Troper has repeatedly underlined that the Nazi normative order could properly be considered law, in spite of its iniquity (Troper 1989, 287). The only way to prove the contrary is to show that the Nazi rules fail to correspond to a previous definition the legal system, a definition that in Troper's view rests on formal and procedural criteria setting out the ways in which norms may be produced. The content of norms, that is, what they concretely prescribe, is not an essential criterion.

This posture carries another important consequence for Troper's metalegal theory, in that Troper sets out to describe the law as it is, without bringing in value judgments or prescriptions designed to make the law more efficient, equitable, or moral. In a word, he defends the axiological neutrality of scientific discourse. Such discourse does not pretend to *change* the law, prescribe how the law should be, or subject its content to critical scrutiny. Stated otherwise, scientific discourse on the law is something *other than* the law itself. The two serve distinct functions and aims. The only prescriptive propositions that can be made from a scientific standpoint are not political, ideological, or moral but technical. This consists in saying, in light of the knowledge and expertise available to the scientific investigator, "If lawmakers want this result, they will have to do this and that"; for example, "If one wants to drive back tyranny, one has to institute a separation of powers." These meta-statements, or propositions *about* law, are therefore logically and ontologically distinct from the legal statements which themselves form the object of legal science (Troper 2003, 26ff.).

If we go back now to Bobbio's description of legal positivism as an ideology as distinct from the ideology of natural law, we will see that Troper's claim for the neutrality of scientific legal discourse makes him neither a legal positivist nor a natural law theorist. Indeed, as an ideology, positivism basically requires obedience to whatever law is imposed by the state, while the theory of natural law requires obedience only to that law which is fair. But on Troper's epistemology, a scientist cannot say anything about the way individuals behave vis-à-vis positive law: The scientist must be indifferent. This posture has opened two epistemological debates in France. The first, still current, concerns the conditions for the possibility of an axiological neutrality of scientific discourse in law. The second—which, too, is still current as well as widespread in the French legal academic world—originated at the end of the 1980s in response

to Danièle Lochak's (1946–) criticism of the attitude legal scholars took to the anti-Semitic laws of Philippe Petain's government in World War II (see in this regard Lochak 1989, 1994). For Lochak, simply to *describe* these kinds of legal norms is to have a hand in "naturalizing" and legitimizing their contents. A purely descriptive work would implicitly justify the government that passed those laws. It follows that the French jurists of the time were complicit in passing the anti-Semitic norms: They were so in virtue of their framing those norms within legal categories comparable to other more traditional categories, thus contributing to an acceptance of the norms so categorized (Lochak 1989, 252–85; 1994, 296). Troper's answer consists in drawing a clear distinction between the various discourses one can engage in, a distinction that enables him to avoid giving up the claim to the axiological neutrality of scientific discourse. So, on the one hand, Troper presents scientific description as a kind of discourse that does not prevent one from engaging in other kinds of discourse where value judgments about the law are expressed, so long as these value judgments are not expressed in the name of science. On the other hand, Troper also concedes that, in such a difficult context, scientific discourse can be put "on hold" so as to avoid the risk that it should wind up legitimizing a perverse legal system (Troper 1989, 288).

Finally, Troper's metatheory deserves a few words on method. The structure of Troper's reasoning is very close to that of the Italian analytical school as well as that of Scandinavian legal theorists such as Alf Ross. It consists of two main intellectual operations: (*a*) We distinguish the different meanings of legal concepts and meta-concepts or the various presuppositions of legal reasoning; and (*b*) we reformulate legal problems in an appropriate theoretical language so as to solve them by way of very simple falsifiable or verifiable statements. For instance, Troper shows that the problems arising in connection with the notion of supra-constitutional principles emerge out of confusions among different levels of thinking: the political, the philosophical, the legal, and the jurisprudential. Thus, the proper question for legal theory is, "What are the criteria for recognizing principles and their superiority to constitutional norms?" (Troper 2001, 196). Troper then offers three meanings for the notion of principles and four conceptions of the superiority of a legal norm (ibid., 197–8). He analyses the conditions for the possibility of each of these hypotheses and explains their legal, theoretical, and ideological presuppositions. This is a method he uses in almost all his essays, using it to analyze the concepts of sovereignty (ibid., 283ff.), validity (ibid., 19), the separation of powers (Troper 1980), and the rule of law (Troper 2001, 267), as well as to analyze the distinction between legal science and legal dogmatics (ibid., 3) and the problems of interpretation (ibid., 69), among other examples.

12.7.1.2. A Positivistic Theory of Law: Law and the State

In Bobbio's distinction among three different meanings of legal positivism, the second meaning describes a theory of law that combines several common presuppositions about the legal concept of the state and its relation to the concept of law. In this meaning, positivists tend to recognize the legislator as having a monopoly on the production of legal norms. It follows that positivism as a theory of law rests on a particular theory of the sources of law on which the law is the expression of human will and not of a higher system of values. The law's validity does not depend on its conformity with a moral or natural order. Troper undoubtedly subscribes to such a set of theses, but he gives it a twist with his theory of legal interpretation, which wrests the monopoly on the production of legal norms from the legislator and hands it to the authentic legal interpreter (on which see the next Section 12.7.2).

Here Troper's legal theory is very close to Kelsen's thesis on the relation between law and the state (on which see Section 2.3.1 in this tome and Section 8.5 in Tome 2 of this volume). The state is conceived by Troper as no more than a set of legal norms (Troper 2001, 267). In other words, like Kelsen, Troper defends the *unity*, not the dualism, of law and the state: There is neither law without the state, nor the state without law. The state is a set of legal norms that define the procedures for the production of legal norms within a given legal order (ibid.). Such a formulation can appear circular. But it is not. For Troper, the starting point is the constituent (or constitution-making) process, which in the constitutional text defines the organs of the future state as well as their legal competences. Consequently, the powers of the organs of state are limited not on the basis of moral or natural rules but by virtue of their separation (Troper 2001, 147).

Two implications follow from such an identification of the state with the law.

On the one hand, Troper defends a *monist* theory of legal sources, not a pluralist one. In other words, a rule (be it religious or moral or a collective agreement) can be considered a legal norm only if an authority empowered by the legal system itself gives it the meaning of a legal norm. For instance, customs do not become legal norms until judges identify, formulate, and impose them as binding norms (Troper 2003, 89–91).

On the other hand, coming back to a point previously discussed, supra-constitutional norms are not understood by Troper as existing on their own. They are the highest *legal* norms. Therefore, when a supreme court invokes a supra-constitutional norm in assessing the validity of constitutional norms, it will not go looking for it in a previous and higher normative system but will instead *create* or produce it (Troper 2001, 205). This creation is allowed as long as other legal actors cannot act against it or otherwise refrain from doing so. Troper thus implicitly accepts a self-originating power to produce supra-constitutional norms (ibid.).

12.7.2. A Strong Realist Theory of Legal Interpretation

The second important feature of Michel Troper's legal theory lies in his theory of legal interpretation. Referring to the last chapter of second edition of Kelsen's *Reine Rechtslehre*—and particularly to the idea that "authentic" interpretation is an act of will and not, as in "scientific" interpretation, an act of knowledge—Troper defends a strong realist theory of legal interpretation that leads to a break with the Kelsenian ontology of norms and brings out the power of interpretation wielded by legal actors, that is to say judges as well as any normative authority. Two points bear mentioning in this regard: (*a*) This power is tempered or limited by a set of legal constraints. And (*b*), it is on these legal constraints that Troper focuses as a legal positivist.

12.7.2.1. The Deconstruction of the Ontology of Legal Norms and the Freedom of Legal Interpreters

Troper highlights a conceptual difficulty with the definition of legal norms previously offered at the beginning of Kelsen's *Reine Rechtslehre* where a legal norm is defined as the specific meaning attached to an act by which a behaviour is prescribed, obliged or permitted (Kelsen 1967a, 4). But, as Troper points out, if a legal norm is a specific meaning, and if the object of interpretation is a norm, then legal interpretation must consist in ascribing a meaning to a meaning (Troper 1990, 520), which is absurd. Consequently, the object of interpretation cannot be a norm but a text or a set of statements that legal interpreters recognize as sources of law.

On this basis, Troper takes up Kelsen's distinction between scientific and "authentic" interpretation, the former an act of *knowledge*-gathering, where every possible meaning of a statement is brought to light without giving special emphasis to any one of those meanings, the latter an act of *will*, where we do, by contrast, pick out one meaning as capturing the best understanding of the statement in question (Troper 1975, 133ff.; 2003, 98ff.). But in Troper's view, there is no set range of possible meanings. The authentic interpreter—or, in Troper's theory, the legal actor, referring especially to judges and their power of judicial review (see, for instance, Troper 2011, 153)—can give *any* meaning to a statement, including an absurd or unconventional one. Legal actors, in their capacity as subjects empowered to produce legal norms, and in virtue of their exercise of that power, are free to ascribe to a statement the meaning of their choosing. This conception of legal interpretation has several implications in Troper's work. Let us focus on five of these.

First, legal interpretation is the result of an act by which a text is given a meaning: This meaning is *created*, and so to interpret legal norms is to create them (legal interpretation is tantamount to the creation of legal norms). The meaning of a legal text does not *precede* its interpretation. There is no one true

meaning of a legal text but many possible meanings. Thus, for example, any search for the constitutional drafters' original intention is considered by Troper to be in vain, because many intentions are more or less well expressed in the constitution-making process, and it is often very problematic to single out the most relevant or the essential one (Troper 1987, 83).

Second, Troper's theory of legal interpretation necessarily entails a distinction between texts as *sources* of legal interpretation and legal norms as *products* of interpretation.

Third, when judges set about deciding or settling a case, they will interpret legal texts pertinent to the concrete situation at hand, but they will also interpret the legal texts that form the basis of their own interpretive competence. So, barring any overruling interpretations by other legal actors, they can be said to have competence over their own competence (Troper 2001, 215–49).

Fourth, insofar as interpreters are not bound by any purported true meaning of the legal text, the chosen meaning in light of which a case is decided is by and large going to be an *a posteriori* justification of a previous decision. The text contained in a source of law is in this sense a *pretext* (Troper 1987, 87). Legal actors interpret a text, not to find the right solution to the case in issue, but to ascribe the most convenient meaning to that text within a given legal system: the meaning that allows interpreters to justify their own will.

Fifth, many of the rules and principles that are supposed to structure legal systems do not preexist legal actors but are *created* by them. This is especially the case with the central Kelsenian legal concept of a hierarchy of norms. On several occasions, Troper reconsiders this concept in light of his realist theory of legal interpretation (see, for instance, Troper 1975, 134; 1978, 1523). As Guastini (2010a, 73) once observed, Troper, along with Tarello (see Section 11.6 in this tome), is among the rare breed of authors to have linked the question of the hierarchy of legal norms to that of interpretation. Indeed, Troper underlines that the hierarchical relations between legal norms are usually conceived as preexisting legal interpretation, with the consequence that legal interpreters would restrict themselves to recognizing and applying norms so arranged. And as Troper observes with Kelsen, "legal scholars usually reason on the basis of the postulate of the supremacy of the written constitution—and more generally the postulate of the hierarchy of norms—and they investigate the consequences that the existence of this hierarchy can have for the phenomenon of the interpretation" (Troper 1975, 135; my translation). But then, Troper goes on to argue, if we concede that any process by which the law is applied presupposes an interpretation of legal statements, the hierarchy between norms can no longer be analysed as an objective fact that precedes legal reasoning. It becomes an *outcome* of this reasoning. In other words, legal actors, and judges in particular, do not *preserve* the hierarchy of norms but rather *produce* it. Thus, it is not because norm N1 is superior to a contrary norm N2 that the latter can be declared invalid by judges, but it is because N1 is the

basis for a judgment on the legal validity of N2 that judges are led to confer on it the meaning of a norm superior to N2. The concept of a hierarchy of norms thus appears to serve as a means by which to justify legal effects whose rationale rests on other bases (Troper 2011, 139). On the one hand, this reversal of the concept of the function of the hierarchy of norms makes it possible to explain in some cases why the hierarchical relations by which legal systems are structured may not be aligned with Kelsen's ideal pyramidal model. These misalignments are simply owed to the plurality of possible interpretations that can be given to sources of law and to their normative relations (Troper 1990, 528). But, on the other hand, the same reversal should prompt us to investigate the reasons why the misalignment is weaker than one would expect in view of the legal interpreters' freedom. Here Troper invites us to work from a theory of legal constraints in explaining the importance of the hierarchical structure in legal systems and legal reasoning.

12.7.2.2. The Functioning of the Legal System Reconstructed on the Basis of a Theory of Legal Constraints

If legal interpreters are free to choose between several possible meanings of legal texts, and so if the text contained in a source of law does not bind those interpreters, then we must ask: Why and how do legal systems depend for their functioning on a certain coherent structure and a coherent body of legal decisions, and judicial ones in particular, that secure a relative continuity for those systems? (see Troper et al. 2005, 1–2).

Michel Troper readily acknowledges that numerous factors can explain the coherence that legal actors display in their behaviour and choices: sociological, political, economic, psychological, and conventional forces come to bear. The American legal realists, for example, had pointed out the role of psychological or moral factors in explaining or even predicting how judges decide cases. Judge Jerome Frank is famously reputed to have claimed that what a judge has had for breakfast will determine how he or she will decide the case at bar (J. Frank 1930, chap. 4).

What the theory of legal constraints does is to filter out these factors so as to focus on the *legal* ones, all the while holding on to the legal positivist claim that in law lies the object of legal science. Legal factors are the ones connected to the legal system itself, and they are often neglected by theories that, in the effort to explain legal decisions framed *within* the system, look for support *outside* the system by drawing on various social or human sciences (sociology, literature, psychology, or the like). The object of a theory of legal constraints thus lies in those factors whose nature is distinctly legal, in that these factors emerge from the configuration of the legal system itself and from the web of interdependencies the legal system sets up among legal actors, and in the menner represented and interpreted by the actors themselves (Troper et

al. 2005, 11–2). This representation is connected to the way legal actors understand (*a*) their own power and the power that other actors have over them (the power to overrule a decision, dissolve a legislative body, etc.) on the assumption that these other actors seek to preserve and even increase their power and advance their institutional position (ibid., 15–6), and, (*b*) legal argumentation and the functioning of the legal system (so, for example, much will depend on the weight the hierarchical principle is understood to carry or on the perceived need to justify a judgment so as not to be suspected of arbitrariness, showing that legal decisions do not depend only or even primarily on what the legal actor wills but that they are bound by the prior structures, norms, and principles of the legal system: Troper 2003, 139).

Consequently, "the legal constraint is a de facto situation in which legal actors are prompted to choose one solution or behaviour rather than another by reason of the configuration of the legal system they brings into being or in which they are acting" (Troper et al. 2005, 12; my translation).[23] A legal constraint can produce an action or an omission of action, as well as it can produce legal norms (a given interpretation of a legal text), a meta-norm (a criterion for hierarchically ordering legal norms), or a conception or theory, such as a particular conception of citizenship that excludes foreigners, women, or poor people (ibid., 45). Legal constraints come in a range of degrees, but they can broadly be grouped into two classes: stronger imperative ones, which do not allow the legal actor any discretion, whether it be in choosing an *end* or the *means* by which to achieve that end, and weaker hypothetical ones, which make it possible to choose ends but not the means to those ends. Constraints in this latter group are more frequent and can be expressed through a statement having the following form: "If a legal actor wants to do X, he or she must do Y" (ibid., 21). Legal constraints thus help us understand why, on a mainstream conception of the functioning of the legal system in a given context, some legal arguments or norms come into being that cannot be circumvented, and why legal actors cannot do whatever they want.

A theory of legal constraints can therefore bridge the gap between a realist theory of legal interpretation, which recognizes a range of reasons for action, and a legal positivist epistemology, on which it is best to focus on the study of law itself as the only proper object of legal science.

[23] The French original: "La contrainte juridique est une situation de fait dans laquelle un acteur du droit est conduit à adopter telle solution ou tel comportement plutôt qu'une ou un autre, en raison de la configuration du système juridique qu'il met en place ou dans lequel il opère."

Chapter 13

THE POLITICAL HISTORY OF 20TH-CENTURY SPANISH PHILOSOPHY OF LAW

by Benjamín Rivaya[*]

13.1. The First Three Decades of the 20th Century: The Neo-Thomist Academic Monopoly and Modernist Alternatives (1901–1931)

In Spain, during the 1900s, professorships in Fundamentals of Natural Law, the name of the legal philosophy undergraduate course at the time, were held by Scholastics of rather strict observance (see Gil Cremades 1969, 190). Oviedo and Madrid were exceptions, though not for long. At the University of Oviedo, in Asturias, there was a Krausist, Leopoldo Alas, but he would die the following year, in 1901, soon to be replaced by a thunderous catholic, Fernando Pérez Bueno. In Madrid, the chair of the doctoral program in the philosophy of law was held by a philosophical master of literature (with his many disciples), Francisco Giner de los Ríos, though his main work dated back to the 19th century. He would die in 1915. It is clearly false that Krausists were absent; it is rather the case that in the 19th century and at the beginning of the 20th, they had failed in their attempt to gain professorships in natural law, even though they did hold other positions. In any case, Krausist natural law theory had stirred up the waters of the philosophy of law. In order not to fall victim of simplifications, it is important to point out that, although this was far from the "other" natural law, i.e., the Scholastic one, such distance did not prevent the two from sharing basic ideas: "There is no doubt," Alas said, "that the theological school, in its recognition of divine law, and in the ethical basis it provides for legal science, is very close to what we consider the true doctrine" (Alas, 1878, 141; my translation). Perhaps what set the two apart was the "very liberal nature" of this true doctrine (see Díaz 1973, 59; cf. Pérez Luño 2007, 131) in comparison with a much more conservative tendency of the other—equaly true—doctrine (see Rubio Castro 1984, 133). However, legal philosophical Krausism was already a thing of the 19th century, and if we add that historicism, especially the Catalan variety, would not have anyone to renew or continue Hegelianism, and that positivism had failed to gain roots in our country, it is possible to understand the monopoly that Scholastics would have in the professional philosophy of law at the turn of the new century. Apart from the exceptions of Alas and Giner, the professors who crossed into the new century and lived during part of it were neo-Thomists, as were those who became professors at the turn of the new century.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_13

The memory of this natural law from the turn of the century is not a really good one, especially—it seems—due to the opinion of Recaséns, who issued a stern judgment against almost all the representatives of Catholic natural law theory *between centuries* (quoting in particular the clergymen José Mendive S. I. and Zeferino González O. P., Juan Manuel Orti y Lara, the priest Juan Urraburu S. I., Pedro López Sánchez, Francisco Javier González de Castejon y Elio, the Marquis de Vadillo, and Rafael Rodriguez de Cepeda), commenting that they "do not offer anything of interest" and that "they show neither an extensive nor a profound knowledge of the great classic authors of Scholasticism; rather, they merely repeat inert formulas and definitions they have received at second or third hand, showing a frenzy of fighting against anything that has to do with a different type of modern thinking, spewing out the most violent insults, calling it 'crazy,' 'absurd,' 'monstruous,' etc." (Recaséns Siches 1936, 450–1; my translation). And he went on to say that "many are inspired by sources of the lowest intellectual quality, as the Italian thinker Prisco, while they have never even read the works by Saint Thomas, Suarez, Soto, or the other great Schoolmen" (ibid.; my translation). Although, perhaps, such a harsh judgment should have been toned down—is it also reasonable to direct it at Cardinal Zeferino González?—it is true that it did bring about a consensus: The Spanish natural law theory of the late 19th and early 20th centuries would not present anything peculiar, as it would instead be devoted to restating what had already been said before, especially in line with Italian neo-Thomism. Only Luis Mendizábal Martín would be saved from the scathing remarks (see ibid., 451). Of course, Mendizábal was a staunch Thomist, although, on the one hand it seemed that he was not a popularizer, and on the other hand he was more open than others to new ideas, as is evidenced by the last edition of his *Tratado* (Treatise of natural law: Mendizábal Martín 1928), reworked with the help of his son Alfredo. Its interest increases when we consider that it resulted in the so-called Aragon school of natural law, to which belonged Miguel Sancho Izquierdo, Alfredo Mendizábal Villalba, Enrique Luño Peña, Luis Legaz Lacambra, and Ramón Pérez Blesa, all playing a major role in this history.

The neoscholastic monopoly lasted for a long time. Some of the old natural law theorists disappeared: Rafael Rodríguez de Cepeda died in 1918, and Francisco Javier González Castejón Elio died the following year, in 1919. Then new ones emerged: Miguel Sancho Izquierdo and Mariano Puigdollers would be appointed as full professors in 1920, followed by Wenceslao González Oliveros, in 1922. No changes can be observed in Scholastic legal and political thought. Although there are subtleties that can be pointed out, in general its followers maintained a conservative ideology, which at times could be described as more moderate, at others more radical. I do not think, therefore, that it would be a mistake to say that academic philosophy of law was clearly conservative at the time. On the one hand, its history is, to some extent, the

attempt of that philosophy, which we might call Catholic, to maintain an ideological dominance; at the same time, it is the determination of other ideologies, not always subversive or atheist, to break the monopoly, although it is also true that there were Scholastics who tried to prevent Thomistic thought from gaining momentum, adapting it to the modern world, as in the case of Alfredo Mendizábal. The new professors—the majority in Spain—thus followed the same philosophical direction. During this time, in my assessment, only one of these professors might have played a transformative role, Blas Ramos Sobrino, but he did not do so.

Blas Ramos belonged to the school of Laureano Díez Canseco, a school that, in addition to not having a common ideology, was characterized by its resistance to writing: All of its members were preliterate or almost preliterate, both the teacher and those who seem to have been his disciples, namely, Eduardo Callejo de la Cuesta and Blas Ramos Sobrino. As for Díez Canseco, in 1900 he obtained a professorship in natural law, in Valladolid, but he left it for another position teaching the history of law in Madrid. There is little that can be said of Eduardo Callejo except that he adhered to neo-Thomism and that the scarce theoretical work he wrote is of no major relevance. Finally, Blas Ramos, who obtained his professorship in 1918, could perhaps have been a transformer of Spanish philosophy of law from within; however, here too, that was not to be the case. He was a peculiar philosopher—confusing, I think—whose thought bore traces of Stammler and later of Dewey, and even of Pashukanis, although he did not publish anything in his lifetime.[1] What matters, in any case, is that in the early 20th century, professorships were still being mostly awarded to Scholastics, who kept a monopoly on legal philosophical academia.

This does not mean that during the early 20th century there were no legal philosophical alternatives to the prevailing Scholasticism, but they did have to arise outside the academic field of legal philosophy, which was dominated by that trend. Worthy of mention, however, are the legal political ideologies of the labour movement. Marxist socialism and, above all, anarchism had gained a foothold in Spain since the 19th century and had their own conceptions of law. Although the anarchists had a greater following (see Rivaya 2007), it is worth highlighting that among the Marxists there was an Austrian man who played a central role in this history, namely, Wenceslao Roces (cf. Rivaya 2000b). On the other hand, the main contribution to the development of theses challenging the dominant Scholastic philosophy of law no longer came from ideologues of the labour movement but rather from academic jurists, mostly university professors. This applies, for example, to Dorado Montero, an expert in criminal law, a unique personality, and a positivist in his philosophy of law, in the

[1] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume. On Pashukanis, see Section 17.3 in this tome.

sense that he applied the positive method to the study of legal phenomena and loathed natural law. Also worthy of mention is another specialist in criminal law, Quintiliano Saldaña, who advocated a pragmatic theory of law. He was interested not just in the theory of law but also in its practice, not merely in its validity but also in its efficaciousness. Outside academia, there is Luis Hernández Rico and his confrontational notion of law. I should also mention the two great thinkers in Spain at the turn of the 20th century. On the one hand, there was Unamuno, who began writing back in the 19th century, but whose main work would not be written until the 20th. Then there was Ortega, who began writing in 1902. The question is whether either of these great minds had any kind of philosophy of law.

As for Miguel de Unamuno (1864–1936), his legal ideology is often considered to be laid out in Chapter 12 of the first part of *Vida de don Quijote y Sancho* (The life of Don Quixote and Sancho: Unamuno 1988), in which he talks about the "liberation of the galley slaves." Unamuno's initial position can be summarized in his own words: "No human punishment is in any way fair" (ibid.; my translation). But he actually goes further, much further. Both natural and divine punishment are driven at the same time by the anger of the moment and by revenge, but after that comes forgiveness: "Any punishment that is not followed by forgiveness or that does not lead one back to the right path once inflicted," he argues, "is not punishment but hideous cruelty" (ibid.; my translation). Therefore, the criminal code is inhumane, and so it is intolerable that so-called justice be carried out in the name of God. For whoever believes in God and in salvation, "where, in the end, we are all to be forgiven" (ibid.; my translation), does not have a duty to administer justice, to repay evil with evil, but rather to forgive. "I see you here, timorous readers, putting your hands to your head, and I hear you cry out, 'What atrocities!' And then you talk about social order and security and other gibberish like that" (ibid.; my translation). How can we forget Prince Nekhlioudov, the protagonist in Tolstoy's *Resurrection*? Indeed, Unamuno sees legal matters roughly as Tolstoy did, through the lens of religious zeal, a radical evangelical Christianity focused on highlighting the sinful nature of law.

As for Jose Ortega y Gasset (1883–1955), who was destined to become *the* Spanish philosopher of the 20th century, he too played a key role in the history of legal philosophy. In his first work, the *Meditaciones del Quijote* (Meditations of Don Quixote: Ortega y Gasset 2005), he pointed out many suggestions and issues that would be readily applicable to the philosophy of law. Many of those suggestions would be expanded (albeit once again in a incomplete, fragmentary, and dispersed way) in the philosopher's next work, and after the 1930s they would have a huge influence on Spanish philosophy of law. Even so, the posthumous book in which his so-called sociological theory was expounded (note that the expression includes legal theory) appeared much later, in 1957, under the title *El hombre y la gente* (The man and the people:

Ortega y Gasset 1980), though it is true that it included ideas from a much earlier time. In short, Ortega followed in the footsteps of Durkheim in his understanding of society, which he defined as an "enormous conventional architecture," because the conceptual keystone of society lies in "use," understood as a standard and a pattern of behaviour that makes human action intelligible. When dealing with real life, during which everyone does what they wish, want, feel, or thinks on their own, another type of existence emerges: the inauthentic, in which individuals behave like civil servants of the group, carrying on with their business while rejecting any type of originality. These are the "uses": impersonal, coercive, and irrational guidelines—as long as they have meaning, though they lose such meaning as soon as they become customs. Ortega classifies uses into strengths and weaknesses, and the law, he says, is strong use par excellence, which uses maximum coercion, physical coercion—even in developed societies—through an organization, the state, specifically devoted to that end. I must say that Ortega had a high regard for both uses in general, and law in particular, as they made life possible at that particular time. This sociologism deeply influenced Spanish philosophy of law, to the point that if one can speak of a national legal philosophy in the 20th century, a philosophy not imported from abroad, it would have to be the one put forward by Ortega.

But let us now take another look at Krausism, since there are interesting legal philosophical movements to be observed. Although we already know that as an academic philosophy Krausism has run its course and fulfilled its mission, as a modernizing movement it could still promote the renewal of both Spanish science and, more interestingly, Spanish philosophy of law. I say this because this was the ideology of the idealist philosophers who inspired the project behind the Association for Advanced Studies and Scientific Research (*Junta para la Ampliación de Estudios e Investigaciones Científicas*), and since the importance of this kind of initiative can hardly be overstated in any area of knowledge, the same goes for legal philosophical thought. Note once again that it was mostly philosophers of law, pupils of Elías Díaz, who chronicled the work of the association. Let us also consider how many academic philosophers of law also benefited from scholarships from the association between 1907 and 1936, enabling them to travel abroad, especially to Germany, and study alongside the leading thinkers in the field: This was the case with Francisco Rivera Pastor, Blas Ramos Sobrino, Luis Recaséns Siches, Enrique Luño Peña, Luis Legaz Lacambra, José Corts Grau, and Felipe González Vicen, to name a few. The first outcome was an increase in the number of translations of legal philosophical works. Clearly, the history of translation is a fundamental part of Spanish philosophy of law (cf. Gil Cremades 2004, 17–60). The monopoly on professional Spanish philosophy of law was held by neoscholasticism, but now the door to neo-Kantianism was opened. José Castillejo, who was the crucial figure in the association, can be credited with having begun an interest-

ing chapter in Spanish philosophy of law, that of the reception of the Stammler's neocriticism in Spain. Castillejo was granted a scholarship in 1903 by the Spanish Ministry of Education; at the recommendation of the University of Oviedo, he went to Berlin, where he studied comparative law under the tutelage of Josef Kohler. Then, at the University of Halle, he met Rudolf Stammler and was impressed by his lectures. Although this would later influence the choice of destination that young scholars would make at the association, it is not surprising that many of those who came from the field of law would end up studying with the neo-Kantian thinker, whose major works would be translated by two scholars who studied with him: Francisco Rivera Pastor and Wenceslao Roces.

"Stammler in Spain" is a very important chapter in Spanish legal philosophy, and the expression can also be taken in a literal sense, as Stammler visited both the Central University and the University of Granada. While in Madrid, he gave several public lectures, later published as *Cuestiones fundamentales de filosofía del derecho* (Fundamental issues in the philosophy of law: Stammler and Rivera Pastor 1922), translated by Francisco Rivera Pastor, who also wrote the foreword. In turn, the lectures Stammler gave in Granada in the spring of 1922 were translated by Wenceslao Roces in a short book titled *La génesis del derecho* (The genesis of law), which has recently been republished (Stammler 2006). The aforementioned translators also published typical neo-Kantian works: Rivera Pastor wrote *Lógica de la libertad* (The logic of freedom: Rivera Pastor 1918), a book following the path of his teacher and read even by Ortega, who considered it to have superseded Stammler himself. Roces wrote several articles in which, despite the warning that Stammler's work warrants criticism, he closely followed his teacher, at least with regard to the concept of law (Roces 1924, 1925). Roces is credited with the translation of the *Tratado de filosofía del derecho* (Treatise of legal philosophy: Stammler 1930) and *Economía y derecho* (Economics and law: Stammler 1929), as well as with *La génesis del derecho* (The genesis of law: Stammler 2006). Thus, in a short time, the key works of the neo-Kantian professor were translated into Spanish. However, although Spanish legal philosophy at the time is mainly indebted to Stammler, its rigidly formalistic conjecture was already a thing of the past. In 1936, Legaz could comment that Stammler's legal philosophy was outdated (see Legaz Lacambra 1947).

Furthermore, in the early 20th century, the Italian philosopher Giorgio Del Vecchio, another neo-Kantian who would also take a stand against positivism, started to become well-known in Spain: At first, this happened especially through translations of his work, and later through his own work, although his legal philosophy was, in my opinion, less formalistic than Stammler's.[2] The first Spanish translation of a work by Del Vecchio, done in 1908 by the notary

[2] On Del Vecchio see Section 11.2.1 in this tome.

Mariano Castaño, was *Los supuestos filosóficos de la noción de derecho* (The philosophical assumptions of the concept of law: Del Vecchio 1908b). Thereafter, translations would continue to appear until his death, in 1970; and even afterward, his works continued to be reprinted. While Stammler was the philosopher of law with whom most Spanish philosophers had studied, Del Vecchio, I think, would be the most translated one in the 20th century (an honour he may share with another Italian legal philosopher, Norberto Bobbio). In April 1923, shortly before Primo de Rivera would come to power, Giorgio Del Vecchio visited Spain at the invitation of the Central University of Madrid and the University of Granada, where he gave several lectures that would later be published. The lectures he gave at the Central University were translated by Fernando Pérez Bueno (see Del Vecchio 1923). Del Vecchio was a respected philosopher of law, but by then he had already become affiliated with the Fascist Party and had accompanied Mussolini on his march on Rome. It was probably during this trip that he took advantage of the opportunity to found the Italian Fascio in Madrid, in 1923.

As for French legal culture, once very influential, it continued to make its way into Spain through translations and studies, even though these were not usually carried out by professional philosophers of law. At the turn of the century came the best example of the revolt against formalism in a neighbouring country: It came by way of Francois Gény's *Méthode d'interprétation et sources en droit privé positif* (Methods of interpretation and sources in private positive law: translated in Spanish as Gény 1902). In addition, Duguit and Hauriou would both later be translated into Spanish.[3]

13.1.1. Philosophy of Law under the Dictatorship of Primo de Rivera and the Crisis of the Monarchy (1923–1931)

There is a group of three legal philosophers who obtained their professorship around 1920 and who for one reason or another, not necessarily owing to their intellectual activity, they would become influential. They are Miguel Sancho Izquierdo (1890–1988), Mariano Puigdollers (1896–1984), and Wenceslao González Oliveros (1890–1965). If we add that in 1904, the aforementioned Fernando Pérez Bueno had already obtained a professorship at the University of Oviedo, and Eduardo Callejo de la Cuesta obtained his in 1912, there seems to be some relation between the philosophy of law and those who held key roles under the dictatorship. Pérez Bueno flaunted his role as the ideologue of the dictatorship (see Pérez Bueno 1925, 52); Sancho Izquierdo collaborated with the dictatorship, though in a technical organization (see Gil Cremades 1989, 445); Wenceslao González Oliveros was General Director of Higher Education at the Ministry of Callejo; and, finally,

[3] On Hauriou, Duguit, and Gény see Sections 12.2, 12.3, and 12.5, respectively, in this tome.

Callejo, in addition to participating in the creation of the Patriotic Union of Primo de Rivera, was Minister of Public Instruction at the Civil Directory (1925–1930). Thus, Callejo did not go down in history as a philosopher of law but as a minister; and indeed he changed the curriculum for the bachelor's degree in law, requiring that natural law be taught in the first year of the programme and philosophy of law in the last year. If we look at the Consultative Assembly created by Primo to legitimize himself, we will once again notice several of these philosophers along with others (see Hernando Serra 2004, 231–57).

However, it should be said that although Primo de Rivera initially managed to get some intellectuals to acquiesce, he ultimately lost the allegiance of almost everyone. From the beginning, the iconoclastic genius Unamuno himself took a confrontational position, representing the opposition to the dictatorship. His assistant in this endeavour was a lawyer previously mentioned, Wenceslao Roces, professor of Roman law at the University of Salamanca, though he so focused on the philosophy as to be recognized among those whose role was decisive in introducing the discipline as studied abroad, especially in Germany. When Unamuno was expelled to Fuerteventura, Roces accompanied him to Madrid, from where the wise man would continue to head toward his destination. As a result, the Romanist professor was punished by the dictatorship of Primo de Rivera.

As the years went by, the dictatorship came under increasingly intense criticism, and after 1928, with the Callejo reform of the universities, opposition became almost unanimous. That is why Eduardo Callejo de la Cuesta, professor of natural law and Minister of Public Instruction from 1925 to 1930, has received much criticism in history books, as he has the dubious honour of having been the cause of the *rebellion* mounted by the university and even of the resulting consensus against the dictatorship. Another previously mentioned philosopher of law was actually involved, one who held the position of General Director of Higher Education and who apparently was among the founders of such law, namely, Wenceslao González Oliveros. They both hold the dubious distinction of having made sure that virtually all the intellectuals in the late 1920s were allied against the regime, because they had no tact in solving the situation but, on the contrary, managed to make it increasingly worse. Once again, we find both philosophers of law holding relevant political positions under the Franco regime. I am not saying that the Callejo law of May 1928 did not try to tackle some of the problematic areas in the university, but rather that it would up ultimately achieving just the opposite. The provision that enraged students as well as many professors aimed to recognize private education, and it was interpreted as a step toward the privatization of schooling. At any rate, I think that never in the history of Spanish universities has there been such a revolt, which lasted about a year and resulted in a victory for the students and in a repeal of the law. Several professors participated

in the revolt, some of the most significant among them being professors of law such as Wenceslao Roces, Jiménez de Asúa, and Luis Recaséns. Among the jurists, as well as among the majority of intellectuals, there were numerous attacks levelled at the dictatorship. In fact, Tuñón de Lara acknowledged that one of the critical tendencies with Primo de Rivera lay in his censorship of "legal normativism" (see Tuñón de Lara 1982, 184–5), an acknowledgment that meant the existence of an opposition front constituted by lawyers—a front that actually existed. What arguments did the professionals and theorists of law use against the dictatorship? They had different approaches. There were those who appealed to the principles of natural law to attack the established political order, but there were also those who used Kelsenian legal instruments to that end. The arguments more often used by jurists against the dictatorship, however, came from Stammler.[4] On his conception of law, law itself was "an interlocking, autarchic, and inviolable will" (Stammler 1930; my translation). These characteristics could not be extracted from our experience of law but had to be logically formulated; they were prior to that experience and were precisely what made it legal. To put in simple terms what Stammler expressed in obscure language, the law was a way of ordering not the inner life of individuals but human society or community (the interrelation among individuals), characterized by its purpose (its will and desires); by the mandatory nature of its rules, which were imposed on the recipients even though they did not want them (autarchy); and by its permanence and uniformity (its inviolability) (see ibid., 63–122).

The most Stammlerian among Spanish professors of law at the time, the Romanist Wenceslao Roces, used his teacher's views to condemn the dictatorship, being himself an open and very active enemy. In a 1924 article devoted to the concept of law, he focused on the last of the elements of law, namely, its inviolability, which Stammler used as a criterion by which to distinguish a system of law from a system of arbitrary rules. Roces also used this article to clearly state that the Spanish dictatorship was not a legal regime (see Roces 1924, 416).

An example of the criticism by natural law theory was the one offered by Ángel Ossorio y Gallardo, a political conservative as well as a renowned jurist who introduced the Christian Democratic ideology in Spain. He was interestingly also a monarchist who, as a result of political events, would describe himself as having no king. Ossorio was among the most belligerent opponents of Primo de Rivera. In 1925, in an article titled *Retorno al absolutismo* (Return to absolutism: Ossorio y Gallardo 1925)—without making reference to Spanish but only to Italian absolutism—he said that we were living in a time marked not by a conflict among different conceptions of law but by the fact that the very existence of law was in a crisis, a position rejected by both Communists and Fascists. It seems clear that he was also referring to what was happening

[4] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

in Spain at the time, as he remarked that the dictatorship was a respectable political and legal system of government, provided it was "exercised for a set amount of time and in furtherance of a profound national need" (ibid., 543; my translation). In addition, law is characterized by its having authority, and if that was missing, law itself would disappear. But he asked, "What is authority if not a guarantor of freedom? If it were not that, it would simply have an arbitrary function" (ibid., 539; my translation). Behind that condemnation stood not only natural law, which is what granted authority to positive law, but clearly, and once again, Stammler.

During those years, Ossorio also directed an editorial project committed to fighting the dictatorship. I am referring to *Estudios políticos, sociales y económicos* (Political, social, and economic studies), a publisher that put out very interesting books. Suffice it to mention *Sentido democrático de la doctrina política de Santo Tomás* (The democratic meaning of Saint Thomas's political doctrine: Romero Otazo 1930), a book written by the clergyman Romero Otazo depicting Aquinas as espousing a quasi-Republican view. In academic legal philosophy, a representative of this trend was Alfredo Medizábal, professor at the University of Oviedo, who also challenged the dictatorship regime and the monarchy. In 1926, he secured a position at the University of Oviedo, where he participated in the anti-dictatorship movement. Given the serious events that took place at the Central University of Madrid and the closing down of the institution itself by government diktat, the law school in Oviedo decided to write a letter to the dictator with the unanimous support of all faculty members. Today, we know that the letter was written by the professor of natural law, who closed by saying, clearly referring to Primo de Rivera, that professors were "astonished by the intrusion of a certain policy evincing an absurdly military concept within the very heart of university life" (see the letter reported in López-Rey 1930, 179–83; my translation).

At this point, in the context of the universities' battle against the dictatorship, we should go back to a young man already mentioned in this work and whose commitment was to renew Spanish philosophy of law, Luis Recaséns Siches (1903–1977) (see Castro Cid 1974 and Rivaya 2001). I say this because he, too, as we shall see, was against the Primo de Rivera regime. Recaséns had been educated in traditional ideas but then, through the aforementioned for Advanced Studies and Scientific Research, he was exposed to the institutional mindset and ultimately became attracted to modern thinking, both foreign and Spanish. While abroad, he studied with the most prominent legal thinkers, but his philosophy would stem above all from that of Ortega. Recaséns was a faithful follower of Ortega, and his legal philosophy is, so to speak, a successful application of rational vitalism to the analysis of the legal phenomenon. In 1927, he was awarded a professorship at the University of Santiago de Compostela. There are two pieces of information that are of interest to us with regard to Recaséns. The first, as we shall see, is the role he played in renewing legal phi-

losophy; the second, as we shall also discuss, was his fight against the dictatorship, and later against the monarchy, in favour of a republican form of government. Let us start with his strong anti-monarchist militancy, with the quick remark—should anyone come under a different impression—that he was a politically moderate man who repudiated both Marxism and anarchism, as well as any type of ultra-conservatism and any form of fascism. He was recognized as being a personalist, that is, he claimed dignity, equality, and freedom to be the highest of values: He was sympathetic to anyone who shared these values, and that regardless of political persuasion, be it liberal, non-Marxist socialist, Christian democrat, or Christian socialist. There is evidence of his deep involvement in the protest, to which he lent his high intelligence and training: Suffice it to mention a book that includes a thesis he presented at the Academy of Law in Madrid under the title *El poder constituyente* (Constituent power: Recaséns Siches 1931), where he condemned the Alfonsin monarchy, repudiated Primo de Rivera and his immediate successors as arbitrary, he opposed those who wanted to return to the ante-1923 situation, and he appealed to natural law in forging a new regime. It was openly stated, as did the young professor, that Spain was going through a revolutionary time. In what sense? Recaséns's explanation, pointing to the opportunity to "delve into the entrails of the concept" (Recaséns Siches 1931, 23; my translation), is no longer relevant. Given that there was no positive law, that meant that the only existing law was natural law and that only a constituent power was justified.

However, not everyone agreed with the use of the Stammlerian argument to discredit the regime. Years later, another Spanish philosopher of law, Luis Legaz, expressed his surprise at this argument, on which Spain had no law to begin with under the dictatorship, an argument that in his view was based on the identification between the state and the rule of law and on the protection of personal rights. "It is otherwise unexplainable why he should question the legal status of the Spanish state under the dictatorship" (Legaz Lacambra 1934a, 14; my translation). Even more curious is that the dictator's son himself, José Antonio Primo de Rivera, also used Stammlerian arguments, but did so to instead defend his father (see Primo de Rivera 1964, 15–36). José Antonio illustrates that well-educated lawyers of the time (and he did fit that description) were familiar with the neo-Kantian thinker and deployed his arguments, however much in making different claims.

But let us go back once again to Recaséns, because in 1929, shortly before the aforementioned book on constituent power appeared (i.e., Recaséns Siches 1931), another of his works was published that would become greatly influential in academic philosophy of law in Spain. It was subtitled *La filosofía del derecho en el siglo XX* (Philosophy of law in the 20th century: Recaséns Siches 1929), and even with significant omissions, it was confined almost entirely to the German area. It served two objectives: First, it chronicled European legal philosophy during the thirty years that were about to come to an end, thus

offering an overview of the period; and, second, it laid out a plan for Spanish philosophy of law to follow, a research project calling on Spanish legal philosophers to study everything beyond their borders. It would not take young legal philosophers long to set their hands to that project and put their minds to work. This is what was meant at the time by doing philosophy or laying the groundwork for it. One need only scan through the index of authors cited in Recaséns's book, bearing in mind, too, that many of them he had worked with: Stammler, Del Vecchio, Kelsen, Lask, Radbruch, Münch, Smend, Heller, and Reinach. The approaches include, above all, variants of neo-Kantianism, but also the philosophy of values, sociology, and phenomenology. This flow of thought could classified pairwise by distinguishing between logicism and ethicism, formalism and anti-formalism, rationalism and sociologism. In addition, we should look at the appendix of the book, titled *The Scholastic Tradition*. Recaséns did not disdain that tradition, but on the contrary pointed out that the Catholic leadership remained strong and, opening to new horizons, not always Thomist or neo-Thomist in outlook. He even announced that he was writing a paper about in this regard and that he would hand it out to his students. This was the impressive *Recaséns Project*, otherwise adapted to the territory of Spanish philosophy of law, which at this point was basically going in two directions: a Scholastic one and a neo-Kantian one, the latter being dominant, and initially modelled after Stammler's conception, although new trends would soon spring up, both neo-Kantian and of the Scholastic type. If we add Ortega's influence, the map is drawn (cf. Gil Cremades 2002, 43). The monarchy then fell, thus ushering in a new era for the philosophy of law as well.

13.2. The Republican Era: A Pluralist Legal Philosophy (1931–1936)

The vast majority of Spanish intellectuals were against the dictatorship and the monarchy; many of them worked to establish a republic (see Tusell and Queipo de Llano 1990, 255). The legal philosopher who best embodied this ideal was, in my opinion, Luis Recaséns, who played an active role within the new republican government. Under the republican Pact of San Sebastian, Recaséns's political superior, Miguel Maura, was appointed by the general director of the local administration to the less than desirable Ministry of the Interior, a position through which the legal philosopher was given a voice in the process of consolidating the nascent republic. The appointment, however, did not last long, since Recaséns's fate was linked to that of Maura, who did not take long to resign. Recaséns was then elected representative in the province of Lugo, helped to draft the Spanish Constitution through various amendments and had an even more incisive role in shaping the law of the *Tribunal de Garantías Constitucionales* (Court of Constitutional Guarantees). He was not involved only in politics, however, but also continued to play a pivotal role in modernizing Spanish philosophy of law.

Accompanying the institution of the republic were several developments in the philosophy of law: Luis Mendizábal died; Luño Pena was appointed professor at the school that Mendizábal had founded; and Recaséns moved to the Central University of Madrid. Assuming that it is indeed possible to distinguish between teaching and research activities, there is something that ought to be pointed out in regard to the former (teaching), namely, that in 1930 the amendment that Callejo introduced in the curriculum was repealed, resulting in the elimination of the subject of natural law; however, the republic quickly established an "Introduction to Philosophy" as a foundational course and a "Philosophy of Law" course at the end of the educational programme. As concerns research, around 1933 a young legal philosopher, Luis Legaz, lamented a "lack of literature on legal philosophy" (Legaz Lacambra 1933a, 106; my translation) in Spain, although it is true that the number of books and articles devoted to the subject was increasing.

Let us now take a look at how the new philosophy of law established in Spain developed over the years and how the subject one might call traditional philosophy was developing. The former I have named the Recaséns Project, and many years later Recaséns would comment thus on the transformations the discipline was going through at the time: "A new generation of legal philosophers was cropping up, the majority of them trained in Germany, but with a critical mind enabling them to discern, reshape, renew, and even move beyond the lessons learned at the German universities" (Recaséns Siches 1964, 12; my translation); he also quoted Luis Legaz y Lacambra, José Medina Echevarría, Antonio Luna García, Felipe Eduardo González Vicén, Manuel García Pelayo, and José Corts Grau.

Interestingly, the first book enabling us to observe the ascendance of Recaséns is one not included in his project, which finds its starting point in the *Direcciones contemporáneas del pensamiento jurídico* (Contemporary directions in legal thought: Recaséns Siches 1929). I say this because the dissertation written by Felipe González Vicén, a legal philosopher who would subsequently gain enormous prestige, was published in 1932 under the title *Teoría de la revolución* (Theory of the revolution: González Vicén 1932), when Recaséns was stressing the need to study the concept used in reference to the establishment of the republic. Neo-Kantian influences were apparent in González Vicén's book—"Let us study the revolution apart from *any* revolution," he said (ibid., 21; my translation)—as were the influence of Kelsen in setting up the legal system and the influence and justification of socialism, though this did not prevent González Vicén from calling Thomas Aquinas a "productive personality and a gifted mind" (ibid., 102; my translation) or calling Francisco Suarez a "formidable natural law theorist" (ibid., 126; my translation). In the end, one inevitably questions whether or not the revolution is lawful, and basing his response on the theory, he bluntly replied: "It depends on just one factor, namely, whether the attacks against the essential principles of personhood are veri-

fied in a 'general' way and as a 'system.'" What matters even more is that at the beginning of the dissertation, he appealed to the ruling classes to change "all current legal structures" and establish a new law that in the first place would enable all citizens to have a better standard of life and, in the second place, would enable everyone to freely develop his or her personality (González Vicén 1932, 37, 149). This was a well-written work that would shortly thereafter come face to face with reality with the revolution of October 1934: Would the revolution be lawful under the policy implemented by Felipe González?

Few are the philosophers of law, to the best of my knowledge, who have analyzed this crucial event. One of these few is a man who suffered it firsthand, so much so that he nearly lost his life at the hand of the revolutionaries and was miraculously saved in the end. His name was Alfredo Mendizábal Villalba, a professor at the University of Oviedo, and the analysis he offered has struck many as surprising (see Mendizábal Villalba 2009, 123–30): He condemned the failed revolution as well as the excesses of repression, while warning that it was time to change everything, starting from "the attitude of the powerful toward the humble" (Mendizábal Villalba 1934b, 73; my translation). The others kept silent, but it is not difficult to imagine what their judgment was. In the Republican era, several philosophers of law had ties with intellectuals who opposed the republic on the journal *Acción Española* (these philosophers include Puigdollers, González Oliveros, and Corts Grau, who in that period was awarded a professorship); others, like Sancho Izquierdo, joined the *Confederación Española de Derechas Autónomas* (CEDA); others, however, belonged to right-wing Republican parties (they include Luis Recaséns, Alfredo Mendizábal, and Luis Legaz, who in the same year of the revolution published a study on the rule of law). As far as I know, none belonged to the *Partido Socialista Obrero Español* (PSOE) or to the *Partido Comunista de España* (PCE), with which Wenceslao Roces even fought in the revolution, or to any other left-wing party. Perhaps Blas Ramos espoused a leftist ideology, but as far as I know he did not advertise that fact. Perhaps the young and educated Medina Echevarría and González Vicén also took part in the revolution, but neither was affiliated with any particular party. Generally speaking, philosophers of law remained politically conservative, even though the label says little, as the distance between them was immense (as was the case, for example, between Recaséns and González Oliveros). Moreover, some key figures in Spain were involved in politics. I have already mentioned Recaséns, who was general director of the local administration, then became a representative for the Liberal Republican Right, and then, after the second election, switched to the Radical Democratic Party of Diego Martínez Barrio, which would subsequently become the Republican Union, where he became Secretary of Industry and Commerce in the administration led by the Popular Front. Sancho Izquierdo was a representative of CEDA, whereas Legaz ran for parliament as a Conservative Republican Party candidate but failed in his attempt to gain a seat.

It is important, however, to go back to the Recaséns Project and mention an event that was doctrinally crucial. In those years, Recaséns was tutoring a young man from Aragon affiliated with the school of Mendizábal, Luis Legaz, and recommended that he devote his doctoral dissertation to the Vienna school, and so he did. Recaséns also recommended the student to Kelsen himself, and so, in 1930, Legaz travelled to Vienna to complete his studies (Legaz Lacambra 1971–1972, 77–8). Shortly thereafter, his dissertation would be published, in which the young Spanish pupil's immense admiration for his teacher came through very clearly: "I consider the advent of Kelsen's doctrine to be an event no less important in legal philosophy than Kant's critique in pure philosophy" (Legaz Lacambra 1933b, 15–6; my translation). But he had the same weaknesses pointed out by Recaséns: He was not a complete philosopher, for he left ontological and axiological issues aside. It comes as no surprise that he would later acknowledge that his position was "close" line to that of Recaséns Siches (1964, 173).

Luis Legaz then came onto the scene, and it is worth mentioning him, since he would become the most prominent Spanish legal philosopher of the 20th century. Another issue is how to assess his political choices and his academic performance, even though there is no denying the enormous significance he had in legal philosophy. It should also be noticed that his biography (intellectual and otherwise) has yet to be written. Like Recaséns, Legaz was a very gifted young intellectual with outstanding academic training, even if his thinking revealed a certain tendency toward syncretism, a tendency that would become even worse over time. His career was brilliant: In 1935, he was awarded a professorship at La Laguna and then moved to Santiago de Compostela, where he worked as a professor. His doctrine was derived from Christian thought, so it was inevitable that he should have experienced an intellectual shock upon encountering German neo-Kantianism and that a certain disruption should have followed. He was also very attracted to sociology in the manner of Ortega and to the new Christian personalistic tendencies. In short, he was attracted to everything and knew how to extract some originality or some interesting ideas from everything he came across. It is even difficult to determine whether he ought to be considered a legal positivist or natural lawyer. I suppose it depends on how one looks at the question: The tradition he followed was that of natural law, but his later training was in legal positivism. In the documents of the examination through which he earned his professorship, he stated that he was neither. On the one hand he commented thus: "We do not deny the existence of ideals that form this complex set of rules that are traditionally called natural law; what we question is whether the term *law* actually designates a real notion" (Legaz Lacambra 1933c, 127; my translation). But on the other hand he also abhorred positivism: "The contempt elicited by positivism is owed not so much to its recognizing nothing other than positive law but to its denying all sorts of transcendent values and goals" (Legaz Lacambra 1933c, 127; my translation).

Another work I think can be included in the Recaséns Project was written by José Medina Echevarría (1903–1977), though he would eventually devote himself successfully sociology. He began his intellectual journey in the philosophy of law and was already a professor in Murcia when he came out with *La situación presente de la filosofía jurídica* (The present situation of legal philosophy: Medina Echevarría 1935), offering a new perspective on the most recent philosophy of law. At the time, philosophy was, in his words, a philosophy of crisis; in many ways, philosophy itself was in a crisis, as was life itself, the way we had hitherto known it: There was a political crisis of liberalism and the rule of law, followed by the rise of dictatorships, coupled with an economic crisis and the transformations of the capitalist system and a crisis of law itself as a form of life. This was the diagnosis, but we should take a look at the philosophical solutions that were being proposed. Medina distinguished several currents in legal philosophy: dualist idealism; normative idealism, whose main representatives he thought were the neo-Kantians, and also phenomenologists and the empiricists; objective idealism, best exemplified by the neo-Hegelians, even though in his view the institutionalists also fit this description; and naturalism, encompassing both Marxists and sociologists and philosophers whose approach was sociological. In a separate category he placed the irrationalists, whose last and most prominent representative in the philosophy of law was Hermann Jsay. Finally, Medina distinguished another current: legal philosophy grounded in politics, though using a different terminology to express this idea. In essence, his distinctions came down to that between communist and fascist tendencies or to that between liberals and socialists. The philosophy of law was, of course, no stranger to the worrisome political situation in Spain and throughout Europe.

Another extremely important doctrinal event took place in 1935. Enrique Gómez Arboleya (1910–1959) was a young man in whom none other than García Lorca had placed his confidence, in hopes that he would devote himself to literature; but such hopes would not be fulfilled, as he was sent away with a scholarship from the University of Granada in order to study in Berlin. He defended his doctoral dissertation on Hermann Heller, one of the greatest philosophers of law and of the state in the interwar period. Heller was particularly well known in Spain because, having fled the Nazis as a Jew, he ended up in Madrid, where he died a short time later. Gómez Arboleya's doctoral dissertation has been extensively studied (see Mesas de Román 2003), but two aspects need to be highlighted: his thesis that the formalism which had taken over legal theory was quite inadequate, and that it drew criticism from all sides, with Smend attacking it from a liberal viewpoint, Schmitt from a totalitarianian one, and Heller from the standpoint of socialism with a human face.[5] Heller was

[5] On Rudolf Smend, see Section 8.4 in this tome and Section 8.7 in Tome 2 of this volume. On Carl Schmitt, see Chapter 8 in this tome and Sections 8.7 and 8.8 in Tome 2 of this volume. On Hermann Heller, see Section 7.4 in this tome and Section 8.7 in Tome 2 of this volume.

especially opposed to ideological positivism, for no one today is in a position to believe that what is dictated by legislative power issues from "metaphysical predestination" (Gómez Arboleya 1982, 123; my translation). The odd thing is that Arboleya Gómez defended his dissertation in 1935, but he did not publish it until 1940, so even though there are some differences between the dissertation's original text and the published one, the work stands as a metaphorical bridge between the Republican period and the Franco regime.

Now that Nazism had entered the scene, a few words ought to be devoted to its legal philosophy and reception in Spain (see Rivaya 1998b). Just as the most recent Spanish philosophy of law was linked to German philosophy, the rise of Nazism transformed all aspects of life and even of thought, taking our main actors by surprise. Spanish legal philosophers were quick to discuss the coming to power of Nazism and its philosophy of law, which they generally judged to be negative. The first one to warn against what was happening in Germany was Alfredo Mendizábal Villalba, who found the new regime and its philosophy intolerable (see Mendizábal Villalba 1933). But a colleague of his, Wenceslao González Oliveros, writing on *Acción Española*, applauded both the new situation and the new ideology: he saw in it "an essentially anti-liberal movement," but also characterized it as "the rebellion of the physically and spiritually healthy people" (!) against the "sinister socialist degeneration" (González Oliveros 1934, 331, 333; my translation). In any event, German Fascism was so all-encompassing in its revolutionary zeal that it sought to transform everything, even the philosophy of law. Legaz, who was always alert to new developments, offered a description of the new legal thinking in a monograph (Legaz Lacambra 1934b) in which he defined it a racist theory of law; that is, he understood it as a spiritual product of the race aiming to satisfy its biological needs by preserving the purity of the People, regarded as racially pure. Spain would soon hear news of the measures adopted by the Nazis against the "other races," and this drove a well-known philosopher of law to declare himself an anti-Fascist activist. I am once more referring to Recaséns, who along with others in the Republican intelligentsia (Unamuno, Jimenez de Asúa, and Marañón) wrote a manifesto calling for the establishment of a committee of conscientious intellectuals to help "the victims of Nazi terror." Shortly after that, during the formation of the committee, in a ceremony held at the University of Madrid, Recaséns spoke with Jimenez de Asúa, specifically warning against the barbarism of Nazism (see Arrarás 1969, 182). Indeed, it is worth noting that at this point Recaséns had the honour of having been among the intellectuals most attacked by the Spanish Fascists. Just before the establishment of the republic, Ramiro Ledesma Ramos unleashed some particularly crude and malicious attacks against him (see Ledesma Ramos 1986, 73–4). As for the relation between Recaséns and the head of the Falange, José Antonio Primo de Rivera, the mutual respect between them (Recaséns even admired the latter for his deep knowledge) did not prevent Primo de Rivera from

threatening Recaséns within the Republican parliament itself: "Be very careful!" he said in a bitter debate (see Rivaya 2001; my translation). Such words were not to be taken lightly.

However, in the end, Fascism had little, if any, importance in the philosophy of law. Reference should be made, however, to Scholastic philosophy, which continued to grow during this time, although, as Legaz pointed out, it lacked "a figure with a resonance both popular and universal: There is no Balmes or a Donoso Cortés" (Legaz Lacambra 1947, 341). In the legal field, that trend maintained the traditionally implemented meaning and subject, both, though it seems to me that there were some attempts at reform. On the one hand, one can observe the attitude of José Corts Grau, a professor who in 1935 introduced the doctrine of institutions developed by Georges Renard (with whom he studied at the University of Nancy in 1930 and 1931), a doctrine that, in the words of Corts himself, "ultimately becomes the last legal rendering of the Thomist notion of the common good" (Corts Grau 1934, 100; my translation), observing law as a practical phenomenon, inseparable from morals, and geared toward the satisfaction of those human needs that lead to supra-individual realities, "such as the family, the nation, the business enterprise, the state, or the university" (ibid., 102; my translation). After the war, institutionalism would continue. Alfredo Mendizábal, who was more of a reformist, became the Spanish representative of a democratic and progressive Catholicism identifying with that of Jacques Maritain in France.[6] We already saw that under the dictatorship, Mendizábal focused on the doctrinal study of philosophy, which he identified with Thomist philosophy. He now began to put these ideas into practice, although I am sure many would think it was quite a peculiar application. Let us take a look at the subjects he dealt with and how. On the one hand, we know that he is among the first in Spain to have written about and explained German Fascist thought, which he strongly condemned; on the other hand, he also explained and criticized communist doctrine (see Mendizábal Villalba 1934a). At the same time, he translated Luigi Sturzo (1871–1959), the Italian philosopher (Sturzo 1935), with which he shared a democratic Christian ideology and the theory of totalitarianism, a concept that includes and shows what Fascism and communism have in common.

As has been observed up to this point, I think we can conclude that the legal philosophy developed during the Republican period was in good health. For one thing, speculation was characterized by pluralism (with positivist, neo-Kantian, and sociological influences, on top of more traditional influences). For another thing, access to academia was characterized by the same pluralism, considering that scholars of various political and philosophical tendencies were awarded professorships, as was the case with Medina, Legaz, and González Vicén, as well as Luño and Corts. The discipline at the time was very

[6] On Maritain, see Sections 1.3.2 and 3.2 in Tome 2 of this volume.

healthy: A phrase was coined, "the silver age of legal philosophy," that aptly fits this context (see Gil Cremades 1987, 564; my translation).

Just as this stage should somehow begin with Recaséns (*Direcciones contemporáneas del pensamiento jurídico*: Recaséens Siches 1929), so it can be made to end with his *Estudios de filosofía del derecho* (Studies in legal philosophy: Recaséns Siches 1936): This was the source of his textbook on legal philosophy (Recaséns Siches 1986), which was among the most representative of the 20th century, as it covered all trends, thus making it a very relevant book. Precisely at this point, Recaséns was the "main leader" of Spanish legal philosophy (see Gómez Arboleya 1982, 689), as Gómez Arboleya would rightly later say in his classic 1958 *Sociología en España* (Sociology in Spain: Gómez Arboleya 1958). A long career would still await him in Mexico, and as much as he would make new and interesting contributions, I think that from this point onward (and the political circumstances cannot be disregarded), Luis Legaz stepped into the role of witness and observer, even though Recaséns was ready to become the new engine for legal philosophical speculation in Mexico. As for Recaséns's *Estudios de filosofía del derecho*, which touched on the concept of law, especially apparent was his dependence on Ortega and Stammler, and as far as the issue of valuation is concerned, he was influenced by the philosophy of values and Scholasticism. He asserted the right of moderation against extremism. And then war broke out in Spain.

13.3. The Civil War and the Philosophy of Law (1936–1939)

The bloodiest and most unfortunate event to have happened in Spain in the 20th century, the civil war, affected all spheres of public life, right down to areas as specific as legal-philosophical thought. With some qualifications, it seems appropriate to say that from a legal-philosophical perspective, war was an inevitable rupture. As a general rule, those thinkers who can be described as Scholastics chose to take up arms against the republic. Thus, Miguel Sancho Izquierdo, Enrique Luño, Mariano Puigdollers, and Wenceslao González Oliveros were committed to the anti-Republican opposition. Conversely, and as a general rule, those who cannot be labelled traditional did not side with that camp: This applies to Luis Recaséns, Blas Ramos, and Jose Medina. But there were a few exceptions, two of them being Legaz and that Mendizábal, who belonged to the same group, the Aragon school of natural law.

Luis Legaz put himself at the service of the rebels and did an important ideological service (see Tuñón de Lara 1982, 252; Sueiro and Díaz-Nosty 1985, 51). So a question inevitably arises: Why did Legaz side with Franco? This question actually has a satisfactory answer. The question that does *not* have an explanation is: Why did Legaz become one of the most important ideologues of Spanish Fascism? Given that he was now a professor at the University of Santiago, the early days of the war posed a serious dilemma. In political terms, the

words that best describe him are that he was a liberal conservative, a defender of the state and of democracy: To the best of my knowledge, he never spoke out against the republic. He did campaign in a right-wing party, but it was a radical Republican one. As we will soon find out, some people very close to Legaz did not want to have anything to do with the uprising. By affinity of ideas, the cases that are most representative and closest to him are those of Luis Recaséns and Alfredo Mendizábal: Although their positions did not coincide, both refused to support either side and both certainly repudiated the rebels more than Republican loyalists, since, in the end, they were themselves Republicans. As far as other matters are concerned, Legaz was a Catholic, like the other two, and although the vast majority of Spanish Catholics took the same side, Recaséns and Mendizábal themselves showed, among others, that that did not necessarily have to be the case. Hence, despite the Catholic faith, the evidence points to a decision in favour of the republic, or, in any case, a decision adverse to the rebels. Perhaps his choice was to flee, as was that of Recaséns, who was unhappy with some of those on both sides, and who feared the worst. But Legaz decided to collaborate even so. Why? Luis Legaz was above all a scholar, a man of peace and moderation, not at all an extremist. I suppose that the direction taken by the regime as of February was not particularly to his liking, but he would not consider it serious enough to take up arms. That said, however, there were at least two circumstances that would prompt him to support the uprising: In the first place, he was in Galicia, where the uprising was an immediate success; and, in the second place, he was about to marry. In the decision that Legaz *had* to make (what he could not do was to make no commitment to any side at all), both factors tipped the balance in favour of an option he could not commit to with any sense of real conviction. But he became a supporter—and a radical one at that, contrary to what anyone might have predicted. Like all who had to choose one side or the other, the decision would mark his life.

The other exception was the aforementioned Alfredo Mendizábal Villalba, who was still a faithful Thomist and yet loathed the military, while also refusing to support the Republicans. His case is even more interesting, because his position was somehow heroic. He was abroad when the war broke out, and, luckily for him, he could not return, so he stayed in France. He survived with the help of Maritain and his contemporaries and in the meantime founded the Spanish Committee for Civil and Religious Peace in Spain, an organization that was involved in some interesting activities, including attempts to broker a truce or an exchange of prisoners or to have prison sentences commuted, but unfortunately none of these initiatives succeeded. These years are the subject of an important book he wrote discussing contemporary Spanish history titled *Aux origins d'une tragedie: La politique espagnole de 1923 à 1936* (At the origins of a tragedy: Spanish politics from 1923 to 1936: Mendizábal Villalba 1937). This is largely unknown in Spain (it was written in French and translated into English and Swedish shortly thereafter, but to this day it has not been

translated into Spanish): It is known only by reason of the important preface by Maritain, with whom he found himself in an area somewhere between the two sides when, as he put it, a "war of extermination" was underway (ibid., 50; my translation).

Let me now recount the circumstances of Legaz and Mendizábal, who as we have seen belonged to the same group, the school of Aragon, and had similar interests and perspectives. Philosophically speaking, Mendizábal was clearly a Scholastic; politically speaking, he was a Christian democrat. Legaz was himself in a way a Scholastic and a Christian democrat, though his position was more complex and included more tendencies. A sad event took place involving Emmanuel Mounier himself. Besides having several other things in common, Mendizábal and Legaz joined Friends of *Esprit* (the journal founded by Mounier), a group formed in late 1935 and headed by José María Semprún, professor of philosophy of law and a very close friend of Alfredo Mendizábal. And here we can see Legaz's about-face, from advocating Catholic personalism to fighting it. It is obvious that the young philosopher of law admired Maritain, as emerges from some of his works written before the war. But now he became a political as well as a philosophical enemy to Maritain, the most important Catholic thinker to have spoken out against the rebels. Mounier was also important, but certainly Maritain enjoyed greater prestige among Catholics. The unequivocal democratic and anti-Fascist nature of Maritainism made his conception especially loathsome in the eyes of the rebels, who had to live with the fact that Republicans put out a pamphlet with a preface that Maritain himself had written for Mendizábal's aforementioned book, i.e., *Los rebeldes españoles no hacen una Guerra santa* (The Spanish rebels are not fighting a "holy war": Maritain 1937). Legaz rightly thought that the attack should be directed against this very important Thomist who questioned the arguments of those who took up arms and, as we know, refused to consider the Spanish civil war a holy one. He would now devote his articles to this purpose (Legaz Lacambra 1937, 1938), attacking the Christian Democrats who criticized the uprising: Maritain, Mounier, Sturzo, Mendizábal, and Semprún. He accused these latter two—both friends of his—of following the path of the so-called Third Spain and of Christian peace-making.

To my knowledge, Mendizábal never responded publicly to his former friend, but Semprún Gurrea did; he sent a letter to Mounier, and this attracted even greater attention to his complaint, however much unwittingly, or so I would imagine. Part of Semprún's letter to Mounier was published in *Esprit* (see Semprún Gurrea 1938). In it, Semprún described the personalistic cause as "stained with blood and mud" ("because we are not angels but men," he said), equating that cause with the Republican one (in this way he incidentally answered Legaz's criticism of Maritain), while speaking of the others as "murderers of so many poor innocent people" (ibid.; my translation). The other part of the letter was private. Mounier, however, responded publicly to both

parts of Semprún's letter, and as for the second, referring to Legaz, he said that he did not want to judge him, but added: "It would be sufficient to show that no caricature is more dangerous than the one he drew of personalism, of the notion of a 'total' man in support of the totalitarian state, and in defence of war as a 'genuine factor of personalization.' I would only need to verify this in order to erase the term *personalism* from our community" (Mounier 1938, 246–7; my translation). Mounier's words bear witness to the rupture that had taken place between the more enlightened Spanish Catholics, as well as between academics in the philosophy of law. This incident paradigmatically illustrates the kind of environment that existed at that time.

Now, with the recent reference to Semprún, always a loyal supporter of the Republic, one might think that there surely had to be other supporters. But this was not the case at all: Although philosophers of law refused to cooperate with the rebels, they did not necessarily support the republican government. More to the point, only one philosopher of law chose loyalty to the established regime: José Medina Echevarría. In his case (as in the case of other university professors), such loyalty meant going on a diplomatic mission to Warsaw in 1937 as secretary of the Spanish Legation in the Polish capital. Recaséns, on the other hand, briefly worked for the Republic and then left for Mexico, no longer convinced of the Republic's neutrality. He undoubtedly did not identify with either of the two. As for Blas Ramos, he too was living abroad and wisely decided not to return to Spain. He did try to return after the war, but his attempt was unsuccessful.

Also exceptional, as well as bizarre, is the case of Felipe González Vicén. On July 18, 1936, he was in Germany and strangely he decided to return to Spain. The explanation, however, seems quite simple: His brother, Luis, was a senior official in the Falange, and so Felipe felt protected. But the protection he could count on was not so strong as to prevent a legal case from being initiated against him in Seville, under charges of being a left-wing extremist and with a motion to have him removed from professorship, leaving him unfit to fill any position of authority or trust. Faced with these circumstances, he had to flee with his family. But apart from his personal circumstances, which were of course dramatic, it can be observed that, while many philosophers of law chose to side with the rebels, only one was clearly allied with the Republicans, and this seems to bear out the traditionalist nature of Spanish legal philosophy or, if such political interpretations are worth anything, their majority anti-Republican militancy against abstention or the *third way* of others like Recaséns and Mendizábal, who would be labelled by some as conservatives.

With regard to ideological work, to my knowledge, among Spanish philosophers of law there was no significant doctrinal collaboration aimed at justifying the Republic. Instead, among those who sided with the rebels, some were devoted to what was more natural to them: writing books and articles in support of military action and the next hypothetical regime. It is sufficient to cite

the three most relevant of those philosophers, so as to bring out the diversity within the nationalist opposition: Wenceslao González Oliveros, supporting the radical right; Miguel Sancho Izquierdo, supporting the conservatives; and Luis Legaz again, who now embraced Spanish Fascism. No wonder that their programmatic speeches were different, sometimes even contradictory. As was to be expected, González Oliveros distinguished himself by writing some of the most combative wartime books (González Oliveros 1937a, 1937b). An active collaborator in Primo de Rivera's dictatorship and a declared enemy of the Republic, the professor at the University of Salamanca overtly stated that his writings were actual weapons primed for an assault in the "war of ideas," itself part and parcel of the war effort. He warned against the modernist spirit of the Falange and laid the groundwork for an environment that would unify the traditionalists in the war of ideas. Between unusual invocations of God and country, he spared no insults to all those he considered opponents of the national cause and enemies of Spain (Menéndez Pidal, and Fernando and Giner de los Ríos, Castillejo, Jimenez de Asua, among many others). More moderate, by contrast, was Sancho Izquierdo, even within the fervent environment that prevailed: He revealed his Christian democrat roots as well as praising the rise of Italian Fascism. It is no wonder, then, that the Aragonian's main concern was the question of society, on which he wrote several articles in which his dependence on papal speech was apparent (see Sancho Izquierdo 1936–1937, 1938). Finally, Luis Legaz was committed to a Spanish Fascism resting on modern political and legal theories that cut across Europe and with which he was very familiar: They included the theories put forward by Schmitt, Heller, Kelsen, Gurvitch, and Ortega, and so were not always Fascist but were sometimes liberal and even socialist. It is true that he also came from Catholic circles, but in his academic training he had been educated in the latest European philosophy, while choosing a personalistic liberalism that, as we have observed, he would now have to adapt to the totalitarian fashion. In fact, the problem for which Legaz tried to find a solution at the time—the problem of the type of regime that would have to be implemented—was not unrelated to the previous question. That he advanced a thesis of "totalitarian humanism" should in itself be enough to alert us to his impossible attempts to reconcile the two (Legaz Lacambra 1937, 1938).

Indeed, among legal philosophers, there were also those who played leading roles in the so-called technical board. Mariano Puigdollers, in particular, sat on the *Comisión de Cultura y Enseñanza* (Committee on Culture and Education), an organization devoted to the infelicitous task of purging the universities of unaligned professors. Sancho Izquierdo also took part in this effort. This is not the time to go into the intricacies of the purge, but it will be noted that all the philosophers of law forced into exile were sanctioned by the committee, which deprived them of their professorship and prevented them from holding public office. Recaséns, Mendizábal, Medina, Ramos, and González

Vicén thus had to try their luck and take whatever arrangement they could find.

13.4. Francoism and the Philosophy of Law (1939–1975)

Meanwhile, a new situation was shaping up in Spain: an anomalous political regime that would survive for nearly forty years in Spain's history, affecting various fields throughout that time, including that of legal philosophy. The extent of the Francoist regime makes it necessary to break it down into further periods from the standpoint of legal philosophy. And it is once again striking, in this regard, to see how the periods in the history of legal philosophy coincide with those of general and political history.

13.4.1. The Post-war Period: Reconstruction of Legal Philosophy (1939–1975)

The post-war period was marked by fierce repression as the foundations of the New State were being laid. This construction had to cover even the minutest aspects of life and so required the effort of all those who considered themselves part of the Franco project. Among philosophers of law, there were those who served in the highest bodies of the New State. Eduardo Callejo de la Cuesta, for example, became part of the *Consejo de Estado* (or State Council) shortly after the war ended, being appointed president of that council in 1945. After the war and for many years to come, Mariano Puigdollers would serve as general director of Ecclesiastical Affairs. But the one who held the highest responsibilities in the gruelling post-war period was Wenceslao González Oliveros, who was appointed civic governor of Barcelona in 1939; the following year, he would also be appointed president of the *Tribunal de Responsabilidades Políticas* (Court of Political Responsibilities) and vice president of the *Tribunal Especial de Represión de la Masonería y el Comunismo* (Special Court for the Suppression of Freemasonry and Communism). These two roles, coupled with his fanaticism, would cause him to become "one of the greatest executors of the regime's repressive policies of the regime," as Manuel Alvaro Dueñas rightly put it (Alvaro Dueñas 2006, 107, 127; my translation; cf. Alvaro Dueñas 1999).

If we focus on intellectual activity, we will see that after the war, even a sector as specialized as the philosophy of law would require the renewal that everyone was calling for. In addition, several professorships were now vacant, for obvious reasons, and needed to be filled. Loyal thinkers were needed, it was said, in order to develop an authentic Spanish thought. So, to begin with, a university academy was founded consisting mostly of professors of legal philosophy, along with some in other legal disciplines (examples being Castán, De Castro, and Hernández Gil, who all taught civil law). Since the post-war academy was clearly another result of the conflagration, there are two acad-

emies that can be spoken of: an "internal" one, in Spain, and one in exile, the "pilgrim" one. At the end of the war, the internal academy was composed of Callejo de la Cuesta (who rejoined the body of professors, even though he was hardly committed to the discipline, and then moved on to the State Council), Sancho Izquierdo, Puigdollers Oliver, González Oliveros, Luño Peña, Corts Grau, and Legaz Lacambra. The number of vacancies, however, meant that the university academy would have to be rebuilt over those years, and this explains why seven calls were put out between 1940 and 1945 to fill professorships. Political influences played a central role in deciding who would be awarded such professorships, but there is more. It is obvious that in the postwar period, those who passed the national exams for a professorship were those who had not been denied access in the first place, although this does not necessarily mean they lacked intellectual capacity. On the contrary, all the newly appointed professors were, I believe, intellectuals of the highest order: Enrique Gómez Arboleya, Ramón Pérez Blesa, Francisco Elías de Tejada, Joaquín Ruiz Giménez, Eustaquio Galán, Salvador Lissarrague, and Antonio Truyol.

But the two academies, the internal one and the exiled one, were not the only ones. There was a third academy, already established, that would now gain special importance, that of the clergy. We need not point out the significance the clergy gained in those years, nor need we make explicit what the modus operandi was for many of those who belonged to it: The clergy acted as the final arbiter of good and evil. As a logical consequence, those who were considered capable of developing a moral philosophy were also devoted to the philosophy of law, the latter being part of the former. They not only judged the academic philosophy of law already in existence but also wanted their conjectures to become orthodoxy. This trend is exemplified by Santiago Ramirez O. P., Teófilo Urdánoz O. P., Gabino Márquez S. J., Joaquín Iriarte S. J., and Marina Martín S. J., among others.

As previously noted, conflicts between the two academies did emerge, but often muffled. See, for example, the case of the pure theory of law (cf. Rivaya 2000a). Among the professors, there were two tendencies, I think: those who knew and admired Kelsen's work, though not sharing his ideological beliefs, and those who were older and more traditional, not the least bit interested in Kelsen. Those who condemned his legal thought were not university professors but part of the "clerical" academy. Legaz himself had been warned that his "Kelsenian leanings" were inconsistent with the purpose of helping to develop the new theory of the state, as the Catholic tradition was incompatible with Kelsen's doctrine (see Izaga 1941, 174). Legaz's response was of course strong, warning the "chorus of systematic critics" that many of the Kelsenian constructions had already been "permanently" incorporated into legal science, despite their "gross insults" at him (Legaz Lacambra 1942, 355, 371). But this did not concern only pure theory, as conflicts like these were not uncommon in those years.

There is no academia that can be spoken of in the case of another orientation in legal philosophy that sought to establish itself in Spain in that period: National Socialism (see Rivaya 1998b). A group of journals including *Investigación y Progreso* (Research and progress) and *Ensayos y Estudios* (Essays and studies) was dedicated to spreading German Fascist thought and, more relevantly here, German Fascist philosophy of law. Among the German legal thinkers whose work appeared in these journals were Schmitt—who deserves a separate chapter—as well as Larenz, Siebert, and Hedemann, along with other lesser-known authors.[7] The culminating point in the introduction of this racist philosophy was reached with the publication of a work by Karl Larenz translated by Eustaquio Galán and Antonio Truyol under the title *La filosofía contemporánea del derecho y del estado* (Contemporary philosophy of law and of the state: Larenz 1942), hinting at the great controversy the National Socialist ideology sparked among Spanish authors (see Rivaya 1998a, 177–84).[8] Although no one denied the kinship of ideals, it has been proved that Spanish and German thought at the time were incompatible, at least generally speaking. No wonder there were those who belonged to the "religious academy" previously referred to and the more traditional jurists, who reacted against a philosophy of law mainly predicated on the cult of race.

Given this scenario, the most striking aspect about the makeup of Spanish philosophy of law in those years is that it so faithfully reflected the political reality. That between "Catholics" and "Falangists" is perhaps too rough a division, but it is nonetheless necessary as a first approximation. The first category takes in both those who came from the radical right wing and those who were among the conservatives, as the similarities between the two outweighed the differences: They lay in a steadfast defence of Catholic dogma and the traditional social structure, a consummate anti-communism, and support for political authoritarianism. The second category takes in those who belonged to the Falange—and not just nominally at that—such as Legaz or Lisarrague. They seem to have come from a less diverse background, even though they were all conservative and propounded a modernism that was sometimes, though not always, repudiated. They swore allegiance to the Catholic dogma, of course, but did not give it as much importance as did the conservatives. In fact, we could even rank the philosophers of the period on the basis of their degree of tolerance for different doctrines: from Puigdollers, who is said to have rejected "materialism apriorism, formalism, phenomenologicalism, existentialism, vitalism [...] and all the *isms* that are not a clear and accurate Christian view of the world and of mankind" (Puigdollers 1942, 12), to Galán, Truyol or Arboleya, who accepted much of contemporary thought. However, that the period is characterized by complexity, within a limited pluralism, is demonstrated by a

[7] On Schmitt see Chapter 8 in this tome and Sections 8.7 and 8.8 in Tome 2 of this volume.
[8] On Larenz, see Sections 5.4 and 9.4 in this tome.

circumstance previously mentioned, namely, that even though one could think that the Falangists would import National Socialism—and indeed Legaz, but not Lissarrague, devoted himself to this task for a time—Karl Larenz's paradigmatic book of Nazi legal philosophy was translated by two young men, Galán and Truyol, who belonged not to the Falangist camp but to the "Catholic" one.

As for access to professorships in philosophy of law and natural law, the latent conflict between the two groups was settled from the outset in favour of the Catholics, and in particular in favour of the *Asociación Católica Nacional de Propagandistas* (National Catholic association of propagandists), to which belonged the majority of the main characters on the Spanish scene: Sancho, Puigdollers, Luño, Corts, Elías de Tejada, and Ruiz Giménez. Although Legaz used to belong to the association, he was no longer a member at this time. With the sole exception of Lissarrague, the National Catholic Association of Propagandists lent its support to all those who obtained a professorship in the post-war period. In any case, the Falangist group would have far less weight in the university system in shaping the school of legal philosophy in the post-war period (in fact this was true of all schools of law, where the National Catholic Association of Propagandists exerted greater control), a circumstance largely reflecting the lesser degree of Falangist influence in the National Ministry of Education, whose minister (and so those who had access to him) exercised direct control over the ministry as well as access to professorships.

From the standpoint of philosophical trends, we should talk about two basic tendencies: the Scholastic one and that of the followers of Ortega, even though it would perhaps be appropriate to call the latter the "modern" tendency, considering that Ortega was not the only one to have influenced it. There are in principle some parallels that can be drawn between this classification and the previous one: The "Catholics" could be considered Scholastics and the Falangists followers of Ortega, or modernists. In fact, I think that Lissarrague can properly represent the Ortegian Falange, while Sancho, Puigdollers, and Ruiz Giménez, for example, can be described as proponents of Catholic Scholasticism. But, as always, the distinction is not so clear. Leaving Legaz aside for now—as he deserves a separate chapter—we must not forget Lissarrague's effort to integrate Catholic philosophy into his thought, with his studies on Thomas Aquinas and Vitoria. As far as Gómez Arboleya is concerned, it has already been mentioned that he showed a certain personal affinity for "liberal Falangism" influenced by Laín, even though he was above all a Christian thinker, albeit a modern one, as evidenced by his studies on contemporary German philosophy or, more specifically, on Carl Schmitt. The same could be said of Galán, Pérez Blesa, and Truyol. Galán's case is interesting, especially because of his subsequent development, which pushed him over to the extreme right, and also because he was among the young and well-educated Scholastics, who at that time were influenced by historicist thought and, more

specifically, by Ortega. In addition, the post-war Galán is a good example illustrating that Recaséns's project to introduce contemporary philosophy of law in Spain had not failed; paradigmatic in this sense is his dissertation on Emil Lask, one of the leading thinkers of the Baden school (see Galán Gutiérrez 1944).[9] Truyol was undoubtedly more traditional, but something along the same lines could be said of him, too. Even with certain changes, therefore, the "Recaséns project" still had some followers.

Although philosophical reflection on law was subject to strict limitations, it was not all consistently homogeneous; in fact, as previously mentioned, a limited pluralism can be said to have existed in the early post-war period. Consider, for example, the concepts of law that were put forward, ranging from that of Sancho, who understood law as the "mandate of the supreme Chancellor and Governor of the Universe" (Sancho Izquierdo 1943, 10; my translation); to that of Ruiz Giménez, who was likewise a Scholastic thinker but whose conception was rejuvenated by institutionalist terminology (see Ruiz Giménez 1944); to Lissarrague's distinctly Ortegian concept of law, for whom the legal phenomenon consisted of a set of unique uses and applications, owing both to the impersonality of law and to its coerciveness and irrationality (cf. Lissarrague Novoa 1944, 1948); to the more complex Legaz, whose definition of law deserves to be quoted verbatim: Law is for him a "form of social life in which a point of view is developed on justice, a point of view which defines the respective areas of lawfulness and duty by means of a legal system, and which has a self-sufficient value" (Legaz Lacambra 1943, 161; my translation). A variety of very different influences can also be observed in Legaz's definition. Behind his "form of social life" stood Ortega, Recaséns, and Gurvitch, at least; behind the "point of view," Ortega once again; behind "justice," Thomas Aquinas or Suarez; behind the "point of view on justice," Ortega and Recaséns once again, but also Kelsen and perhaps Lask, Mayer, and Radbruch; behind "lawfulness and duty" was Kelsen, who was also behind the "system of lawfulness," of regulation, and of the order of law; and behind "autarky" was Ortega, Recaséns, or Stammler.[10] It was Legaz's perspectivism that drew attention, for it was understood that the several points of view were equally legitimated as law. That meant that the Catholic notion of justice was not the only one or, if you will, that there was not just one natural law, but as many as were the possible perspectives. I also believe that the interpretation is correct, as was shown *a contrario sensu* when Legaz later retained the terms but warned that they should not be interpreted like that (see Legaz Lacambra 1979, n. 288). At least during the war and the years

[9] On Lask, see Section 1.4 in this tome and Section 1.1.3.2 in Tome 2 of this volume.

[10] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume. On Mayer, see Section 1.10.3 in this tome. On Radbruch, see Section 10.2.2 in this tome, Sections 1.1.3.2 and 9.1, and Chapter 2 in Tome 2 of this volume.

that immediately followed, even though natural law theorists were in the majority, there were still positivists around.

Interestingly, any inkling of innovation on the philosophical mainstream would be nipped in the bud. It was not the powerful speculation of any thinker but the end of World War II and the downfall of Fascism that definitively laid the groundwork for the philosophy of both law and the state developed under Franco's regime. The rise of Catholicism, so-called humanism and natural law, the repudiation of communism and totalitarianism in general, and the defence of property and of a traditional social order, as well as that of a *sui generis* democracy, provided the foundation for the *new* edifice. This moment would result in a doctrine of unequal value. Let us cite two examples: Whereas in the *Sentido español de la democracia* (The Spanish meaning of democracy: Corts Grau 1946), Corts Grau purported to lay out "the real meanings of democracy" (ibid., 39; my translation) for the Franco regime; in *El derecho natural y su incesante retorno* (Natural law and its incessant return: Galán Gutiérrez 1945), Galán offered an interesting classification of natural law doctrines, while explaining why natural law kept coming back, and in particular why it was doing so at that particular time (ibid., 169).

13.4.2. Autarchy and Openness: Stabilization of the Philosophy of Law (1945–1959)

So, by 1945, the university academy of legal philosophy had already been stabilized, not only in the sense that all the professorships were filled and a new national exam would not be held until 1957, when Agustín de Asís was awarded a professorship, but in the sense that the dominant Catholic thought was imposed everywhere. The international political scene was innovative, which for Spain meant an almost complete isolation that would only begin to take shape in the early 1950s, though it would gradually ease up as the decade progressed, with developments such as Spain's concordat with the Vatican (1953), its agreements with the United States (1953), and its admission to the United Nations (1955). The qualifier that best describes this stage in the philosophy of law is probably *autarchic*. Aside from the aforementioned Agustín de Asís, there were no new additions to the discipline, nor was there—to my knowledge—any constant contact with legal philosophers from abroad. There were few translations of works. Again, this does not mean that there were no outstanding works in this period; there were indeed some, but they almost invariably leaned in the same direction. I am thinking of the magnificent book that Gómez Arboleya wrote on Francisco Suarez, S. I. (Gómez Arboleya 1946); of the first edition of Galán's masterpiece, the *Ius Naturae* (Galán Gutiérrez 1954); and of Truyol's *Fundamentos de Derecho Natural* (Fundamentals of natural law: Truyol 1949). Two exceptions are Lissarrague's Ortegan *Introducción a los temas centrales de la filosofía del derecho* (Introduction to the main issues in the philosophy of law*:* Lissarrague

Novoa 1948) and Legaz's *Filosofía del derecho* (The philosophy of law: Legaz Lacambra 1953), an updated reprint that filtered out the hyper-ideologization of his 1943 *Introducción a la ciencia del derecho* (Introduction to legal science: Legaz Lacambra 1943). This was the first edition of the most comprehensive treatise of legal philosophy written in Spain, which kept being updated by its authors with each new edition. It did not receive the reviews it deserves.

The key exception, the discordant note, in this academy which almost always leaned in the same direction, was Felipe González Vicén. As we know, following a series of complicated accidents, González Vicén had to flee Spain during the civil war. He returned—I believe before the end of World War II—and after that he resumed his position as a professor. In 1946, Truyol too left his position at the University of La Laguna, resuming his professorship at the University of the Canary Islands, which seemed a satisfactory solution for everyone. Indeed, although he could return as a professor, it is also true that as an intellectual he was quite inconvenient, so it was felt best to keep him far from the centres of power. For the 1947–1948 academic year, he gave the inaugural lecture at the University of La Laguna under the title "La filosofía del Estado de Kant" (The philosophy of the Kantian state: González Vicén 1952), which was certainly an inappropriate subject for the time. Then, in 1950, he published *El positivismo en la filosofía del Derecho contemporánea* (Positivism in contemporary philosophy of law: González Vicén 1950), again an outstanding achievement in his time, unique not only in its quality but also because it was common to treat natural law from a historical perspective rather than as legal positivism. He did not subscribe to the dominant trend. He did not write other works of his own in this period but was by and large busy translating those of others, especially historical ones but also, in the 1950s, little gems of legal thought by Austin, Kant, Bachofen, and Welzel.

Another important event was the death of Ortega. His influence on Spanish philosophy of law has already been highlighted, but it was especially after his death that many works explaining this thought—and, where appropriate, criticizing it—were published, some of them of great value, and they are still coming out today. Ortega also raised the question of existentialism, which at the time was fashionable even in Spanish legal philosophy. Indeed, it may be asked: Did any such legal existentialism exist in the Spanish intellectual landscape in those years, as Legaz and Elías de Tejada would say? Both claimed that there were two tendencies in Spain at that time—a Scholastic one and an existentialist one (see Legaz Lacambra 1947, 355; Elías de Tejada 1949, 10)—and that the traditionalist philosopher represented a combination of the two tendencies. This argument, however, is debatable. What did exist was Ortegaism and *ratio*-vitalism, and, as Legaz (1947, 342–3) says, if "*ratio*-vitalism is a product of the intellectual horizon within which all of modern philosophy, which is existence, moves," then existentialism did exist, more often diluted into a conjecture in a Christian mould.

During these years Pérez Blesa and Callejo de la Cuesta died (almost preliterate). In 1959, after forsaking philosophy of law for sociology, Enrique Gómez Arboleya tragically ended his own life, the same day that Eisenhower landed in Spain. There were also other philosophers who decided to change their field of study, two of them being Salvador Lissarrague, who took up social philosophy, and Antonio Truyol, who turned to international law. The first time someone turned shifted away from the subject of legal philosophy was in 1953, a particularly relevant year for two reasons: First, a new curriculum was created in bachelor of laws programme (which included natural law as a first-year course and philosophy of law in the fifth year); and second, the *Anuario de filosofía del derecho* (Yearbook of legal philosophy) came out, serving as a kind of organ for Spanish philosophy of law. A player in both events was Joaquín Ruiz Giménez, who was seeking the position of minister of education, and who was the philosopher of law that rose highest in the political hierarchy: He was president of *Pax Romana* between 1939 and 1946; from 1946 to 1948, he served as director of the *Instituto de Cultura Hispánica* (Institute of Hispanic culture); then, from 1948 to 1951, he served as ambassador close to the Holy See; and finally, from 1951 to 1956, he served as minister of education. No doubt, his reputation was exploited by the regime to strengthen relations with other countries.

13.4.3. Developmentalism and Late Francoism: The Demise of Francoist Legal Philosophy (1959–1975)

As a crucial watershed year in Francoism, 1959 is also important from a legal-philosophical standpoint; in fact, it can be considered the starting point of a series of fundamental developments. Of course, in this period we find a continuation of what went before, but there also came challenges to the status quo, as new ways of understanding natural law developed, and even positivist and Marxist positions took hold.

Starting in the late 1950s and continuing in the 1960s, the Spanish Church voiced criticism of the Spanish political system until the doctrine of natural law itself was changed, resulting in a natural law theory rooted in the Catholic tradition yet opposed to Francoism. Paradigmatic in this sense is the case of Ruiz Giménez; as much as he had been a good representative of natural law in the post-war era and was committed to the regime to the point of serving as ambassador to the Holy See and then as minister of education, as time went on he found himself alienated from Francoism and came to reject any rigid doctrine of natural law. Well into the 1950s, he warned the regime that the religious legitimacy it enjoyed was not going to last forever, and in the 1960s he openly advocated a democratic option, which found its most apt forum in the *Cuadernos para el Diálogo* (Notebooks for dialogue), a prescient journal that announced an upcoming liberation. Ruiz Giménez's aim,

I am sure, was to decouple the Scholastic doctrine of natural law from the Spanish political system. No wonder, therefore, that it would be a pupil of his, Gregorio Peces-Barba, who in the not-too-distant future would defend an interesting and important thesis on Maritain's thought (see Peces-Barba 1972), the best known anti-Francoist Catholic intellectual. This discussion should also include Díez Alegría, and to some extent, Aranguren, among the lesser-known intellectuals.

However, not all was a religious effort to counter the prevailing natural law theory that had been pressed into service as a tool with which to legitimize Francoism: The spectrum was broadened, and new natural law doctrines appeared in the Spanish landscape. It was Luis García San Miguel who mas mainly responsible for introducing existentialist natural law, the kind argued in various versions by thinkers like Heidegger, Sartre, and Maihofer. The theory of the nature of things, for its part, was embraced in the early 1960s by Elías Díaz, along with others, especially the criminal lawyer Cerezo Mir. Finally, the natural law of classical Christian philosophy was rejuvenated with the *new* philosophy of values by Rodriguez Paniagua, who at the same time argued that the controversy over natural law should not spill over outside philosophy, which seemed to be anchored to the political struggles that still accompanied it. Indeed, natural law theory would pay a high price for the ideological use that Franco made of it (see Delgado Pinto 1982, 11; Pérez Luño 1982).

But the transformation was even broader. On the one hand, there was an interest in legal methodology, and this brought thinkers like Heck, Kantorowicz, and Larenz into focus, with translations being done of many of the works they devoted to that question, even though no philosophers of law were involved in doing these translations.[11] Moreover, theories inimical to natural law were also emerging that took a radical stance to the status quo in both legal philosophy and politics. I am referring to Marxist theory of law, which would be cultivated above all by the Barcelona school. In 1963 an article came out by Manuel Sacristán, who would eventually gain enormous prestige as a legal philosopher even though his main interest was in general philosophy, and in this article, titled *Sobre la idealidad en el derecho* (On ideality in law: Sacristán 1984),[12] he attacked both natural law theory and legal positivism: Natural law theory he characterized as just another "medieval vogue" and as pure ideology, an involutional one at that; and positivism he attached because, even though it takes a "much more solid and discreet" position than natural law theory, it proceeds under the guise of scientificity to conceal the "advocacy for the bourgeois order" typical of that theory (ibid., 304, 311 and 314; my translation). Faced with the ideality of law, we must look for its reality, which in his view simply lies in the use of law as a device of class rule.

[11] On Kantorowicz, see Section 3.1 in this tome.

[12] Only a fragment of this work has been preserved in the reprint edition Sacristán 1984.

Now that Manuel Sacristán has come up, we should also mention his most significant disciple, Juan Ramón Capella, a legal philosopher who had already made an innovative contribution to legal philosophy in Spain by writing the first comprehensive work on the way the philosophy of language applies to legal phenomena (see Capella 1968), and who would also publish a radical pamphlet titled *Sobre la extinción del derecho y la supresión de los juristas* (On the extinction of law and the suppression of jurists: Capella 1970). Here, Capella began with "the conviction that all law is evil," because it neither answered current social needs at the time nor was impartial, and although it must be brought to an end, such an end must come about by means of law itself. As for natural law, it was an ideology of law "in the sense of its being partial or concealing" (ibid., 20–1; my translation).

Whether or not it was explicitly stated, however, scholars increasingly began to see in the natural law theory prevalent in Spain at the time the ideological appeal that Francoism had used to justify itself. Enlightening in this sense were the articles on natural law and public policy that Elías Díaz and Luis García San Miguel wrote in the early 1960s, even though, as Díaz (1962, 74) saw the matter, the initial proponents of natural law were "in general" conservative, whereas García San Miguel argued that "natural law theory is not necessarily conservative and static: A humanitarian, progressive natural law theory is possible" (García San Miguel 1964, 37; my translation). A short time later, these two scholars wrote two textbooks that brought innovation to the Spanish panorama: *Notas para una crítica de la razón juridical* (Considerations for a critique of legal reason: García San Miguel 1969), and *Sociología y filosofía del derecho* (Sociology and philosophy of law: Díaz 1971). However, natural law was criticized not only for political reasons but also as a matter of principle, because there was much scepticism about the actual existence of this supposed natural legal order.

I think the most important chapter in the fight against natural law at the time was the publication of a book that would become symbolic and that was curiously titled *Crítica del derecho natural* (Critique of natural law: Díaz 1966b). I say curiously because the original work, published in French, was simple titled *Le droit naturel*. The editor was Elías Díaz, who translated the articles for the book and write the preliminary study, titled *Introducción a la sociología del derecho natural* (Introduction to the sociology of natural law). The majority of the articles included in the book did not reject natural law, but neither did the most authoritative ones, those by Kelsen and Bobbio. The book as a whole did not lay out any common ground among the authors: It was rather for the reader to see in each of the articles a latent criticism of the regime's legal ideology. Thus, the critique of natural law would become the critique of the natural law of Francoism. I should also mention here another work that Elías Díaz wrote at the time: It was titled *Estado del derecho y sociedad democrática* (The rule of law and democratic society: Díaz 1966a) and became a classic.

In it he maintained, in short, that rather than speaking of the *Rechtsstaat* in the singular we should speak of it in the plural, since the liberal *Rechtsstaat* of the 19th century was followed by the welfare state typical of affluent societies; and in time we would reach another democratic *Rechtsstaat* that would remove the contradictions of the former. Finally, although no mention of Spain was made, it was clear that the Francoist state was neither a *Rechtsstaat* nor a democratic state. As we have begun to observe, Elías Díaz was playing a very important role in the renewal of Spanish philosophy of law, at the same time as he was also taking part in the fight against Francoism. It is also crucial to refer to his work in accounting for the introduction of a new issue in Spanish philosophy of law, that of human rights, an issue that is still relevant today (see García Manrique 1996). The focus on this issue was not just an academic exercise: It was the expression of a political choice critical of a regime that was trampling on human rights. At the school Elías Díaz belonged to (with Ruiz Giménez), the challenge was precisely to see who would work most intensively to introduce this topic. Ruiz Giménez himself published a work that was very representative of the Church at the time, titled *El Concilio Vaticano II y los derechos del hombre* (The Second Vatican Council and human rights: Ruiz Giménez 1968); and in 1973, Gregorio Peces-Barba published the first edition of *Derechos fundamentales* (Fundamental rights: Peces-Barba 1973), characterizing fundamental rights as "an indispensable element of a democratic society" (ibid., 12; my translation).

But going back to what I mentioned before, the Francoist legal ideology of Francoism was yet to suffer a blow from another resounding criticism of natural law: I am referring to the censorious thesis advanced by Felipe González Vicén (1969), seeking to deny nothing less than that natural law theories are theories of legal philosophy, claiming that the concepts deployed in those theories could be either historical or formal: historical when necessarily tied to a specific "historical structure," such that they could not be applied meaningfully to different historical moments (an example being the concept of *polis*); formal, on the other hand, when they were not to tethered and were used interchangeably to refer to a reality that could come into being at time in history (an example being the concept of a group). According to González Vicén, however, the concept "philosophy of law" was historical, as it bears a connection to a given historical structure: It originated in the late 18th and early 19th centuries, precisely when the old concept of natural law was beginning to be left out of the conversation. On the basis of these premises an unstated conclusion was easily drawn, namely, that students of natural law in Spain—that is, nearly all legal scholars in González Vicén's day—ought to be regarded, not as true philosophers of law, but merely as natural lawyers. This thesis generated some criticism, even harsh criticism, though without igniting any a public debate. In my view, however, there was a simple answer. What was amiss was the way González Vicén classified concepts into two types, for although some con-

cepts are actually historical and others actually formal, the majority are *both* historical and formal, depending on the use made of them. So as much as Felipe González may have been justified in claiming that "philosophy of law" was a historical concept, this can also be said to be a formal concept; and this last thesis could be supported with the same arguments as those used by González (see Rivaya 1998c, 41).

The previous reference to scholars in González Vicén's own day offers an occasion to mention who was awarded a professorship at the time. In 1960, a professorship was granted to José Delgado Pinto—who went on to play a particularly important role in renewing the discipline, as he respected tradition while working to open it to new ideas—and another was granted to Mariano Hurtado Bautista. In 1966, Francisco Puy and Nicolás María López Calera both obtained professorships; and in 1974, just before the end of the dictatorship, a professorship was granted to Juan José Gil Cremades and another to Elías Díaz, who in the previous year had started editing new journal, *Sistema,* that would stand the test of time. In 1974, Díaz also began to publish another journal, *Persona y derecho* (Person and law): This journal, based at the University of Navarra, was of a different ideological leaning and it, too, would also stand the test of time, since it is still published today. But what matters here is the issue of the way professorships were awarded. Since the end of the civil war, access to professorships in the philosophy of law was controlled by Mariano Puigdollers, but in the 1960s this role was taken up by Francisco Elías de Tejada, who created an absolutely anomalous and quite worrisome situation that rightly came to be referred to as "intellectual terror" (cf. Gil Cremades 1985, 233). Specifically, both Gil Cremades and Elías Díaz had previously been denied a place, but once the doctrinal monopoly was broken, so was control over the awarding of professorships, and both scholars thus managed to obtain a professorship. There would still be skirmishes when it came to determining the allotment of professorships, but the philosophy of law was inevitably entering a new era embracing new perspectives.

13.5. Democracy and Philosophy of Law (1975–2000)

Because the history of legal philosophy of the last quarter of the 20th century is so close, it is difficult to write about it. If we stick to the ordinary division in the timeline of political history, it is certainly easier to narrate what happened *during* the transition period than afterward, as it is generally accepted that the transition lasted until 1982, when the *Partido Socialista Obrero Español* (the Spanish Socialist Workers' Party, or PSOE) came to power for the first time, whereas what happened after that time slides into the present day, or, depending on how one chooses to look at it, is still in the making.

13.5.1. Transition and Philosophy of Law (1975–1982)

As happened in politics, there was also a transition in legal philosophy: The first section in academia was formed by the aforementioned opposition, a section in which both Gil Cremades and Elías Díaz were awarded a professorship. Obviously, around 1975, the atmosphere in the discipline was strained. This is probably because working in the philosophy of law was an activity closely associated with being involved in politics, too. Some legal philosophers who began working in the 1960s already knew this full well, two examples being Elías Díaz, who was exiled to Villagordo (Jaén), and Gregorio Peces-Barba, who was confined to Santa Maria del Campo (Burgos), both in 1969, once a state of emergency was declared. Then, with the imminent end of Franco, another philosopher of law, Manuel Atienza, was accused of the crime of illegal propaganda (he had delivered a lecture on human rights) and thus had to move to Argentina.

In this rarefied atmosphere, however, there were also relevant doctrinal developments that cannot be left out of this story. For the year that inevitably marks the line between what went before and what came after—that would be 1975—reference ought to be made to the special issue of the *Anales de la Cátedra Francisco Suárez* (Annals of the Francisco Suarez professorship), an issue published under the title *La filosofía del derecho en España*, which was the most serious collective up to that time attempt to elucidate what the philosophy of law is or should be. Because the work appeared at that specific moment, some authors pointed to the change the philosophy of law—as well as the concept of law—was going through in Spain. It is well known that an important part of the legal philosophy developed during the Franco regime was apologetic, seeking to legitimize an unacceptable state of affairs. As Atienza said, this showed that some legal philosophies were merely ideologies. The term was used in its most pejorative sense, pointing to the near absence of progress that according to Peces-Barba the discipline had made in Spain in recent years. Nor was that odd, given that others wisely made sure that all jurists, including legal philosophers, were politically committed (Ollero). This speculation was thus more or less openly political but not critical of the Franco regime. Against that view there was another one yet to be completed: "I think it is absolutely urgent," Manuel Atienza declared, "that we take on a renewal task that may have already begun" (Atienza 1975, 4; my translation).

In *La filosofía del derecho en España*, moreover, two issues were addressed that still have currency in Spanish legal philosophy, namely, the critical nature that Spanish legal philosophy has or should have, and that of its tripartition. Almost all legal philosophers declared that the role of legal philosophy was to criticize (see Rivaya 2006). Perhaps none exerted a greater influence in this regard than Laporta, Hierro, and Zapatero, who pointed out that there was still a need to develop a theory of values. Gil Cremades had also made it abundant-

ly clear that "criticism is impossible unless it is based on criteria" (Gil Cremades 1975, 70; my translation), and these criteria need be developed. These values or criteria could very well be those of natural law, but we have already seen that natural law was tainted: The dictatorship had benefited from a legitimation grounded in natural law, which as a result was not only widely disregarded but also blindly condemned. The other issue that gained prominence was that of the subject areas of legal philosophy: Almost everyone agreed these were legal ontology, epistemology, and axiology (even though different names were given to these areas). Upon reading the aforementioned issue of the *Anales*, one had the feeling that a horizon of hope would open, when everyone would recognize that the philosophy of law makes sense (not only that it does exist but that it *should* exist) and that it has an important function to play. Perhaps it was not the main function, but as Delgado Pinto claimed, it was also necessary to participate in the training of the jurists.

I have just quoted some young philosophers of law representative of a new generation. This detail is important: If we are to understand the transition to a new philosophy of law, we need to take into account not only the change in political coordinates but also the disappearance of a generation of thinkers devoted to the discipline, some of whom were of fundamental importance. Here, too, I will refer to Legaz, who in his later years found the time to call for restraint and lend support to the transition. For many reasons, the article titled *La lealtad política* (Political loyalty: Legaz Lacambra 1976), which he wrote shortly after the death of Franco, is extraordinarily important and contains core elements offered at the end of a life. Of course, he did not try to justify himself; in fact, he even acknowledged his loyalty to the *Caudillo*, but what matters now is that he justified the impending transition (ibid., 27 in the footnotes). In that transition the philosophy of law did of course play an important role. It is true that many have looked at the process years later with the benefit of hindsight, but there have also been those who committed to the change in practical terms: That goes for Ruiz Giménez, who led a Christian democratic project that would fail; Gregorio Peces-Barba, who won a seat in Parliament on the PSOE ticket for Valladolid; and Agustín de Asís, who ran for the senate with *Alianza Popular*. But it was not only through politics that change could be wrought: This could also be done by working from a different background, as is shown by some articles of Nicolás María López Calera (1992), Elías Díaz (1987), and Luis García San Miguel (1998), among others. In a short time, there even came a theory of transition developed by a philosopher of law (see García San Miguel 1981), and another legal philosopher offered a systematic survey of many of the theories of transition (see Díaz 1989).

The transition led to the most important event in all Spanish legal culture in the 20th century: the 1978 Spanish constitution, which under Article 1 and according to Elías Díaz, established a "social and democratic rule of law." One of the members of the constitutional committee entrusted with drafting

a constitutional text was Gregorio Peces-Barba, representing the socialist parliamentary group and, we might also say, Spanish legal philosophy. As far as the philosophical influences on the constitution are concerned, because Peces-Barba was in the committee that carried out the project, some have seen Maritain's influence (an example being Tusell 1985, 16), though this does not mean that Peces-Barba follows a religious orientation or anything of the sort. On the one hand, the ideological orientation of a philosopher of law who served as rapporteur, as well as his specialization in human rights, had to have had an influence in making for the plural nature of the constitution and also in the decision to include a social-democratic line; on the other hand, that ideological orientation had to influence the scheme of fundamental rights. The constitution ushered in political change, and with it a new legal culture and a new paradigm that made us rethink legal questions from new perspectives. Without a doubt, most important in this regard was the consolidation of an issue that had already begun to develop in Spain in the 1960s, namely, human rights, even though the issue did raise some controversy. Naturally, the new constitutional situation fostered a blooming of legal-philosophical thought.

But I would now like to mention another issue that was interestingly also bound up with the new constitution: that of the influence of Marxism in Spanish legal culture, an influence that was no less important. As it happened, the new constitution provided a valid argument in support of a current of legal thought rooted in the Marxist tradition (though it spilled beyond the narrow framework of classical Marxist theory of law): In that period Spain became receptive to a theory of Gramscian influence that was imported from Italy and stipulated an alternative use of law. In short, the constitution stated that the law had a conventional use that benefited the ruling classes, but there was also a different use protected by the constitution, a use that would benefit the subordinate classes. The law, in short, could play a role in the social struggle in favour of those who had traditionally been harmed by it. In Spain, "the movement for the alternative use of law originated in the last years of the Franco regime as a form of resistance to the regime, even though its real possibilities would not be seen until the immediate aftermath of the regime, that is, during the democratic transition" (Souza 2001, 107; my translation). Those who were involved in adopting the alternative use of law were, of course, judges. This is especially true of Plácido Fernández Viagas and Perfecto Andrés Ibáñez, perhaps the most representative jurist of that current in Spain. There were also Marxist intellectuals, leaders in the Communist Party, such as José María Laso. In academic philosophy of the law, the centre for the reception and development of the alternative use of law in Spain was, I believe, the Department of Philosophy of Law at the University of Granada, under the stewardship of Nicolás María López Calera (see López Calera et al. 1978).

But Marxism was also involved in a dispute whose origins are explained in an article published the year after the new constitution was enacted. Once again

the article was by González Vicén: It was titled *La obediencia al derecho* (Obedience to the law: González Vicén 1979) and had the unquestionable distinction of proving to be the most controversial article in the history of 20th-century Spanish philosophy of law. At first sight, the controversy does not seem surprising at all, given the thesis González Vicén defended: "While there is no ethical basis for obeying the law, there does exist an absolute ethical foundation for disobeying the law" (ibid., 388; my translation). There was an outpouring of criticism in the years that followed. Clearly, one may or may not agree with González Vicén's subversive thesis, but much of the confusion was due to the fact that those who debated it started out with a set of assumptions that were different from those used by the author: On the one hand was an assumption rooted in the existentialist tradition, namely, that only the individual coral conscience can give rise to obligations, and on the other hand was the Marxist premise that the law is an instrument that one social class uses to subjugate another.

In light of these uses of Marxist ideas, I think it is fair to say that in the final years of the Franco regime and the start of the democracy, Marxism also became fashionable within the philosophy of law. From this perspective, that is normal. After years of silence, of "*a priori* condemnation" and "a contempt for rejecting Marxist thought, the dignity and height of true philosophy" (Díaz 1983, 101; my translation), little by little, in the 1960s, Marxist thought began to recover, and by the 1970s and the 1980s, intellectuals and even legal philosophers had read Marx's essential works. To recognize the introduction of Marxism in Spanish philosophy, even in the philosophy of law, is not to embrace legal materialism: It is simply to observe that there was a great interest in Marxism and that many intellectuals, including some philosophers of law, became Marxists or were influenced by Marxism. There were many Marxist readings of legal theories. Two doctoral dissertations can be cited here whose authors subsequently followed different paths: Clear Marxist influences can be appreciated in the dissertation that Gregorio Robles wrote in a reading of Ortega (Robles 1977) and the dissertation written by Albert Calsamiglia (who has sadly since died) in his reading of Kelsen (Calsamiglia 1977). There were also translations: of Cerroni, Pashukanis, Stoyanovitch, Poulantzas, and others. Finally, studies appeared applying Marxist ideology to law, examples being the studies by Elías Díaz, Virgilio Zapatero, Carlos Eymar, Manuel Calvo, Nicolás López Calera, Manuel Atienza, and Juan Ruiz Manero. A critical rereading of Marxism was offered by Atienza and Manero in *Marxismo y filosofía del derecho* (Marxism and the philosophy of law: Atienza and Ruiz Manero 1993): This work can be seen both as the end of the Marxist trend in Spain and as the continuation of an approach that could and should serve a critical role in a plural legal-philosophical context, so long as it did not turn dogmatic. In any event, the decline of Marxism is from this standpoint a symptom of the end of the transition, marking as well the end of the transition in legal philosophy. Both Spain and Spanish legal philosophy thereafter ceased to be different.

13.5.2. The Philosophy of Law in Democracy (1982–2000)

The final stage we are going to look at is the present one. In fact there have been no major interruptions since 1982; there has rather been an evolution that led Spanish philosophy of law to gain considerable prominence in the European context, as is natural. I will point out what I believe to be the most important landmarks in this present context. Before that, however, let us begin by taking note of five features that characterize this period.

1. The reestablishment of political normality created an environment that also influenced Spanish philosophy of law, especially because Spain finally came out of isolation and joined the geographical area to which it belongs, namely, Europe.
2. There was a significant increase in the number of people who are professionally dedicated to the philosophy of law, and this has resulted in an increase in the number of professors of philosophy of law, not only male but also female professors: The inclusion of women has been an important novelty that has furthered developments in academic legal philosophy. This increased interest was undoubtedly due to the proliferation of law schools as part of a university expansion that is unprecedented in the history of Spanish universities.
3. As a consequence, the production of Spanish philosophy of law increased until it reached a situation of abundance (and some would say overabundance), by contrast to the dearth of literature that Legaz lamented in the early 1930s.
4. There has been an Anglo-Saxon pivot in the new legal philosophy of democratic Spain. German influences did not disappear, to be sure, but were no longer the main ones.
5. It is my assessment that the new political situation, a normalized one, has resulted in a trend in legal philosophy away from a critical attitude toward an analytical one that takes up the internal point of view of democratic procedure.

The new period opens in 1982 with the *Partido Socialista Obrero Español* (PSOE) coming to power, and here too a coincidence ought to be highlighted: That same year, in some famous national exams, there were five professors who were appointed to positions as attachés: Andrés Ollero, Juan Ramón Capella, Gregorio Peces-Barba, Marcelino Rodríguez Molinero, and Luis García San Miguel. The pluralism of this group—with the various philosophical and political tendencies it represented—was interesting in its own right. And just as the overall political landscape was being normalized—so much so that the socialists managed to form a government without causing the system to fail—so the philosophy of law was also beginning to enjoy a normalcy that made for

ideological pluralism, for example, a feature not at all common over the course of the 20th century, not even toward its end.

From an institutional point of view, the new course ushered in ways for sharing information, and these were undoubtedly necessary. The *Anuario de filosofía del derecho* (Yearbook of legal philosophy) reappeared in 1984, now edited by Juan José Gil Cremades, a role that he would play until 1996, when he replaced Javier de Lucas as editor in chief. Also in 1984, a new journal appeared on the Spanish legal-philosophical scene, namely, *Doxa: Cuadernos de filosofía del derecho* (Doxa: Notebooks on the philosophy of law), published by the University of Alicante and directed by Manuel Atienza. Its format included a bibliographic collection of the publications in the philosophy of law in Spanish as well as interviews with philosophers of law. In the following decade there emerged the Bartolomé de las Casas Human Rights Institute, editing a new journal called *Derechos y libertades* (Rights and freedoms), directed by Gregorio Peces-Barba. Along with the publications already in circulation, the new ones help to illustrate the present situation, the force of Spanish philosophy of law, finally integrated in the European legal-philosophical context. Moreover, a new academic curriculum for the study of law in democracy was established. In 1990, a law was enacted which established a curriculum for the bachelor of laws degree, modifying the previous one, which had been in place for almost forty years. The first-year compulsory course on natural law was replaced by a course on the theory of law, while the philosophy of law continued as a fifth-year course. In response to the legitimate demands of many legal philosophers responsible for the teaching of these subjects, the label "natural law" was removed, as it was associated with a specific legal ideological choice. Another important change was that the length of the course for new subjects was shortened from twelve to three months.

Let us now focus on a very broad doctrinal production which, precisely because of its size, needs to be put to order. At first glance the aforementioned tripartite scheme, which is already widely established in the philosophy of law, can perhaps be useful. It draws a distinction among the concept of law, legal methodology, and the theory of justice. To be sure, this classification is clearly inadequate, especially because the three branches of legal philosophy are inevitably intertwined. But if we start from the question of the concept of law, we should refer to the many studies that in this last stage were devoted to the philosophers of law that are globally considered most important: Kelsen, Ross, and Hart.

Although Kelsen had already died, he continued to be studied as the classic that he was. Perhaps there was no one willing to defend a Kelsenian notion of law in the legal-philosophical academy, but legal philosophers did take the pure theory into account; in fact they *espoused* that theory, having never ceased to take it into account, even though it was repudiated by scholars who embraced Francoist orthodoxy. Now research continued, but it seems that it took

on a different form; there were less general analyses (though they continued to exist), and more analyses focused on specific aspects: derogation, deontic logic, legal science, the principle of normative hierarchy, or the role of efficaciousness in the validity of law, among others, all within the context of the pure theory. But investigations also appeared analyzing the keystone of Kelsen's construction—the basic rule.[13] Spain also brought up specialists in Ross and the realist current he belonged to, and some seminal works were published on the topic. But the realist currents, in my assessment, have been scarcely followed in Spain. Far more enthusiastic was the reception of the third of the great thinkers previously mentioned, H. L. A. Hart. Important theses of his theory were defended, several studies were published (he was even interviewed by a Spanish magazine), and some of his work was translated, even though the Spanish edition of his greatest work, *The Concept of Law*, appeared in Buenos Aires. But before we take the path of Dworkin and the criticism directed at Hart, it should be noted that the most translated and discussed philosopher in democratic Spain was another great European philosopher who had a remarkable importance in Spain, Norberto Bobbio.[14] Two features bear mentioning in this regard. The first was the encyclopedic nature of his work, for which reason he wound up being quoted in many places; and the second is the moderation of his thinking, though it may have been too eclectic at times, inspiring those who have been nurtured by its sources. There are so many translations of works by Bobbio, as well as studies on his legal and political philosophy, that it would be difficult to mention them all. As for Hart's critics, who to a certain extent shaped the course of legal philosophy in the years that followed, even to this day, one cannot fail to mention Dworkin, who published works that made him arguably the most influential theorist of law in Spain, where these works were also translated. Again, it would be very difficult to draw up a complete list of his Spanish followers. The new theses that were being defended—such as the one on principles, under which law is not just a set of rules but also contains principles, or his thesis on rights, understood as battles won against the ambitions of the majority—open the door for further developments that make us view law not so much as a finished product but as a reality in a constantly developing process. This is probably the main difference between the notion of legal philosophy at the beginning of the century and that at the end of it. There were actually three tendencies in the 20th century: Law was initially viewed, and is still viewed, as a given object that has already been constructed and is to some extent a finished product amenable to description like any other reality; then law came to be perceived as a point of view, a perspective

[13] On Kelsen's *Grundnorm*, see Section 2.3.2 in this tome and Section 8.5 in Tome 2 of this volume.

[14] On Bobbio, see Sections 11.4 in this tome and Sections 9.3.1 and 24.2.1 in Tome 2 of this volume.

that transforms what is observed into law. Although this approach was made popular by Hart, the idea is a classical one in legal thought. In Spanish legal thought, the basic theory in which this idea is developed is that of Ortegan perspectivism, a theory that Recaséns further developed in his philosophy of law, for it is an idea that most aptly applies to the definition of law offered by Legaz, who begins precisely by stating that law is a point of view. Now the legal phenomenon is more akin to an activity carried out with a malleable material, one that can take on many forms and yield different outcomes (even if Dworkin curiously maintains the thesis of the one right answer). Purpose, perspective, and praxis can be criteria for classifying the different interpretations of the concept of law that developed over the course of the 20th century.

To some extent, principialist constitutionalism was developed into a path that many other thinkers would follow. Those who have proceeded along this path, which has been well received in Spain, include Robert Alexy, drawing on Habermas; Luigi Ferrajoli, building on the *uso alternativo del diritto* (The alternative use of law) and now a proponent of legal protection of human rights; Gustavo Zagrebelsky, in constitutional law, whose idea of *ductile law* would provoke considerable controversy in Spain; Joseph Raz and Neil MacCormick, in the Anglo-Saxon area, whose work has all been studied and conveniently translated, some of it in Spain and some in Latin America.[15] As a result of the new direction, some began to talk of post-positivism. There have also been those who asked out loud whether the eternal dialectic between positivism and natural law has been exhausted or whether we should at any rate move past it. But since the dialectic between natural law theory and legal positivism goes back centuries, and since it is useful in classifying the entire field of legal thought into two categories, one might wonder how convenient it really is to have it disappear. Indeed, if all legal ideology is either a kind of natural law theory or a form of legal positivism, post-positivism is a kind of natural law theory. In any case, this neoconstitutionalist principlism has also found opponents who, faced with all possible discretion, claim the rule of law. This is where we are now.

If that evolutionary line dealt primarily with the concept of law, it is clear that this depends on the methodology adopted, and the methodological question is now gaining a growing interest in Spanish thought. The shift toward Anglo-Saxon sources is being accompanied by a shift in the focus of speculation, with a greater emphasis on the question of method. Unlike those who believe in a rational procedure for endowing legal decisions with rationality, there have been sceptics who, by contrast, see subjectivism as an inevitable part of the decision-making process when interests and motives cannot be re-

[15] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3 and 25.4 in Tome 2 of this volume. On Ferrajoli and Zagrebelsky, see Sections 10.5 and 10.6 in Tome 2 of this volume, respectively.

vealed. After that came the argumentation theories introduced by Perelman and Viehweg.[16] Both would be called on to play an important role in present-day legal theory and legal methodology, both in Europe and Spain. If the purpose of law is to argue a point, then the question is how must reasoning be structured in order for a legal decision to be grounded, and so that result would be reasonable. Indeed, that word, *reasonable*, previously used by Recaséns, has come to encapsulate the purpose of law. The other methodological chapter, a smaller one, is that of hermeneutics, which has attracted the interest of Spanish philosophers of law exploring the possibility of applying it to the legal world. In this methodological section, reference ought to be made as well to the interest taken in investigating the way facts are brought to bear in the courtroom in the process of applying the law. Obviously, the jurist must not only know what rules to apply but also the cases to which such rules must be applied, and it is often forgotten that this task is also carried out by the jurist.

Finally, as for the theory of justice, the rule of human rights is clear, the rule that, as has been pointed out, is enshrined in the 1978 constitution. Nearly all Spanish philosophers of law have continued to write about human rights, and to some extent, as has been commented, rightly so in my opinion, they can all in this sense be regarded as inheritors of natural law theory. In this framework, there are books and articles that have already become classics, both on the general theory of human rights and on individual rights. The question of the foundation of rights has spawned a wealth of controversial literature that discusses the needs to the argument, from the great ideals to the objective and inter-subjective dialogues. In this chapter, reference should be made to the political trend in legal philosophy, a trend that clearly makes it political philosophy. Particularly noteworthy in this respect is the work of John Rawls, the topic of several doctoral dissertations in Spain, and also worthy of mention are the issues linked to human rights, examples being the issue of liberalism, the value of tolerance, and multiculturalism. Of course, the criticism of human rights, classical and modern alike, continues to be studied.

Clearly, the situation has not been sufficiently described. There are other issues, some general, some more specific; at any rate, we must point out the issues of our time, and these too have been addressed by Spanish philosophers of law. These issues include immigration and multiculturalism, globalization and the influence of postmodernism in law, nationalism, and bioethics, under whose scope, in turn, come some classic issues like euthanasia (which has been of huge bibliographical interest) and abortion. Reference should also be made to the reception of other movements that usually have Spanish proponents or at least scholars aware of what they do: These include the economic analysis of law, feminist jurisprudence, and critical legal studies. There are other in-

[16] On Perelman and Viehweg, see Sections 23.2 and 23.3 in Tome 2 of this volume, respectively.

vestigations that work from more or less novel perspectives. These range from the classic theme of the history of legal thought, which has been addressed by nearly all current philosophers of law, to the least charted territory, that of deontic logic, but they also include legal information technology and the cultural legal studies, especially in law and literature.

We should not get our hopes up too high too quickly. But if we look back at the history just surveyed—now that a new century has begun and at the same time Spain's turbulent 20th century has come to a close—and we look back at that turbulence, which gave a certain anomalous distinction to the philosophy of law developed over the course of much of that century, then I think that in the end there are reasons to be optimistic.

Chapter 14

20TH-CENTURY LEGAL PHILOSOPHY IN PORTUGAL

by José De Sousa e Brito, José Manuel Aroso Linhares, Luís Meneses do Vale, Ana Margarida Simões Gaudêncio, and Alessandro Serpe

14.1. Institutional Setting and Cultural Background

At the beginning of the 20th century there was only one school of law in Portugal. It was in Coimbra, where the traditional chair of philosophy of law has since 1901 been named General Sociology and Philosophy of Law. Under the influence of positivism and sociologism (Spencer, Durkheim, Tarde) the professor who held that chair, Avelino Calisto (1843–1910), considered philosophy of law a specific chapter of sociology (Calisto 1901, 226). The chair was suspended in 1911 and reintroduced as philosophy of law only in 1937, when it was awarded to Luís Cabral de Moncada (1888–1974). At the Lisbon School of Law, established in 1913 by the new republican state, philosophy of law was introduced in 1952: It was offered only as a graduate course taught by an invited Spanish professor, Antonio Truyol y Serra,[1] until the democratic revolution of 1974. In 1945, the same law school rejected an application for a professorship by António José Brandão (1906–1984), who had already published writings of high quality in the field. Only beginning in 1981–1982 would the philosophy of law be taught as a compulsory subject for undergraduate students at all law schools, not only at the traditional state universities in Coimbra and Lisbon (at the latter university it was lectured for the first time in 1981–1982 by José de Sousa e Brito) but also at the new state universities in Lisbon, Porto, and Braga, as well as at half a dozen private universities with faculty drawn from the two older schools.

The positivism and sociologism that dominated at the law schools in the first quarter of the century was influenced by the French and the Italian legal traditions. But in Coimbra it was the German legal tradition that prevailed: This was true starting from the beginning of the century in private law, under the influence of Guilherme Moreira, and starting from the 1930s in public law, under the influence of José Beleza dos Santos and Afonso Rodrigues Queiró. In Lisbon, German legal culture would not hold sway until the 1960s. In the philosophy of law after 1938, the main philosophical orientation espoused by Moncada and Brandão was German phenomenology (especially Husserl and Hartmann), which they brought to bear on law in original ways. In the last

[1] Truyol y Serra (1952) defended Aquinas's theory of natural law of against its critics. He wrote an excellent *History of the Philosophy of Law* that came out in three volumes: Truyol y Serra 1978, 1975, and 2004.

DOI 10.1007/978-94-007-1479-3_14

quarter century, the German philosophies expounded by Heidegger, Gadamer, and Habermas influenced João Baptista Machado (1927–1991) and António Castanheira Neves (1929–) and were combined with French and American postmodern trends by José Manuel Aroso Linhares (1956–) and with analytical philosophy by José de Sousa e Brito (1939–).[2] But it would be a mistake to underestimate the role played by the traditional Scholastic ideas (especially Thomist ones) cherished by the Catholic Church: This tradition was constructed as bearing a connection to the ideas advanced by the French institutionalists (Georges Renard), and in particular to Hauriou's *théorie de l'institution*, and in this way it influenced the theorists of constitutional and administrative law close to the dictatorship under António de Oliveira Salazar (a case in point being Marcelo Caetano).[3] Its influence can also be seen in the original theory of law put forward by Manuel Gomes da Silva (1915–1994), who taught private law in Lisbon, as well as in other theories.

The liberalization of culture and of the university that followed the revolution of 1974 explains the appearance of works in philosophy of law that remained marginal because the philosophy by which they were inspired had no following in the country's universities or in its intellectual life.[4] The same cannot be said of the philosophical constitutionalism of Paulo Ferreira da Cunha (2006), who teaches at the University of Oporto, or of the outstanding postmodernist sociology of law of Boaventura de Sousa Santos, even if he is probably more influential in the English-speaking world than in Portugal.[5]

14.2. Philosophy of Law under the Influence of Positivism and Antipositivist Movements: From Calisto to Delfim Santos

Avelino César Calisto (1843–1910) was not a coherent philosopher. He takes a positivist stand when he says that the philosophy of law is a chapter of sociology. Calisto (1902, 41) defines sociology as the science that studies the re-

[2] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume. On Gadamer and legal hermeneutics see Section 10.3.5 in this tome and Section 23.4 in Tome 2 of this volume.

[3] On Hauriou see also Section 12.2 in this tome, and Section 1.1.4.2 in Tome 2 of this volume.

[4] An example is the sociobiology of Neto de Carvalho (1992). This author will not be discussed here, and neither will some legal philosophers who have worked mainly on historical themes, such as Henrique Meireles (1990), José Lamego (1990 and 2014) and João Lopes Alves (1983, 2003, and 2005). The latter is a Hegel scholar who has also engaged in the contemporary discussion about justice, human rights, and democracy (Alves 2005).

[5] The innovative and insightful contributions to legal theory and philosophy (especially to the theories of the legal system and of revolutions) of Miguel Galvão Teles—who lectured on Constitutional Law at the University of Lisbon before and after the Portuguese revolution of 1974—are now collected in his *Escritos Jurídicos* (Legal writings: Teles 2014). They are important building blocks of a greater architecture and could not be integrated in our text.

lations of man to man, the causes that produce those relations, and the laws that regulate such facts and govern the conditions for life in society. But when he specifies the elements in virtue of which legal facts are distinguished from other social facts, he includes nonfactual elements of an ideal, teleological, or evaluative nature: The elements of law must be a condition of social cohesion, subordination, and harmony, capable of perfecting, developing, and harmonizing the individual and the society, while at the same time providing a guarantee of external social coercion (ibid., 233). He defends human rights as natural rights—as powers inherent in human nature—that we each use in satisfying such conditions as are dependent on free will and are necessary for the realization of our rational, individual, and social aim, independently of the arbitrary opposition of others (ibid., 239). These rights are claimed by him to be the result of persistent instinctive forces (ibid., 240), but that is not in itself an argument sufficient to support such a set of rights.

Despite the dominance of legal positivism, the theory came under criticism by many of the best minds of the new generation in the first quarter of the century. Legal positivism in general—and particularly its French version propounded by Duguit and its application to crime by the Italian *scuola positiva*, or positivist school (Enrico Ferri)[6]—was criticized by Manuel Paulo Merêa (1889–1977) in light of the work done by William James, Henri Bergson, Raymond Saleilles, Maurice Hauriou, and even Rudolf von Jhering, all of them regarded as anti-materialists, and to that extent as idealists (see Merêa 1913). At the same time and in the same sense, but with much greater philosophical sophistication, Leonardo Coimbra (1883–1936), the best Portuguese philosopher of the same generation, offered a profound refutation of positivism (see Coimbra 1912). However, the influence of positivism remained pervasive, especially in the law schools. In 1938, Delfim Santos (1907–1966), the best-trained philosopher of the next generation, began his philosophical career with a critique of neopositivism on its own terms (see D. Santos 1971).

14.3. The Phenomenology of Law: Moncada

The final result of thirty years almost exclusively dedicated to research and the teaching of legal philosophy is Moncada's *Filosofia do direito e do Estado* (Philosophy of law and the state), which came out in two volumes: a *Parte Histórica* (or Historical part: Moncada 1955) and a *Doutrina e Crítica* (Theory and criticism: Moncada 1966). According to Moncada, the philosophy of law and the state has to ask and answer the same (essentially philosophical) questions as general philosophy, only relating them to its own object: (1) What do we or can we *know* about law and the state and *how* do we or can we know it?

[6] On the Italian positivist school see Section 11.1.1 in this tome.

(2) What *are* they? (3) What are they *for*, or what ends and values should they seek? And (4) what is their *ultimate meaning* within a global conception of human life? (Moncada 1955, 3; 1966, 14). So the second volume has three chapters: the first deals with the theory of knowledge, that is, with legal and political knowledge, working from the concepts of the "legal" and the "political" to the different degrees and types of knowledge of law and the state; the second deals with ontology, that is, with the being of law and the state as objects of experience in the domain of social life and history; and the third deals with axiology, that is, with legal and political values from the perspective of a philosophy of value. There is no fourth chapter on metaphysics because Moncada rejects classical metaphysics and thinks that metaphysical questions fall outside the limits of reason and so of philosophy.

Moncada brings Husserl's phenomenology to bear in describing the content of the concept of the "legal" (the same would apply to the phenomenology of the "political"), that is, in describing the content of the concepts that are thought by the intentional act whose object is law. This is a kind of intuition of essences obtained by a reduction or bracketing (*epoché*) of questions about the reality (i.e., the being in itself) of the object, of the thinking subject, and of the individual psychological act of thinking. In this way, we have the constitutive elements of cogitations insofar as they are cogitated, an *ego cogito cogitatum* inspired by Descartes's *ego cogito*, but more radical. Applying this method, we discover a set of concepts or a phenomenological field of relations that make up an anatomy of what is thought when thinking of law: "ought," "free will," "value," "norm," "person," "ego" and "other," "order," "justice," and "political community" are simultaneously meant as objects of related intentional acts. The concept of law so obtained is *a priori*, and as such it acts as a *condition* of knowledge, not yet true knowledge of something given in experience (see Moncada 1966, 32–46).

The experience of law is cultural experience, and in it there are different types of knowledge of law: spontaneous, legal, scientific, and philosophical knowledge of law. It is important to compare the legal knowledge of law with the scientific and the philosophical. Legal knowledge consists of value judgments of two kinds: We have imperative judgments ("Someone under certain circumstances shall act or not act thus") and normative and evaluative judgments, the latter based on the first (cf. ibid., 53). Such judgments refer to the facts of experience: to historical and cultural facts of a special kind that constitute positive law. Legal science or jurisprudence takes the same facts as the object of its operations: the interpretation, construction, systematization, and application of law. The interpreter is more insightful than the lawmaker as author of the text to be interpreted: One thing is the lawmaker's psychological will, another is the broader will of the spirit and the cultural meaning objectively inherent in law and in the legal system (see ibid., 81, n. 2). The jurisprudent—as judge, legislator, or writer on law—is always cooperating in the

ongoing creation of living law. Jurisprudence is in this sense a normative and practical science characterized by the creativity that is the hallmark of all the arts, and it contributes to making positive law, as it is one of its sources (see Moncada 1966, 76–86). The philosophical knowledge of law includes the epistemology or theory of legal science as the less problematic of its parts. More problematic are its other parts, where legal philosophy seeks a knowledge of questions other than truth. Nevertheless, philosophy has important functions for lawyers, enabling them to (*i*) locate different questions through a global view of the law, (*ii*) avoid applying the categories and methods of some areas of knowledge to others where they do not belong, (*iii*) be conscientious of their responsibilities and proper role and aims in contemporary society, and (*iv*) deal with the moral challenge of believing in the true worth of their profession in the face of serious doubts about it (see ibid., 97–103).

In the ontology of law, Moncada follows Nicolai Hartmann by acknowledging different spheres of being, and he empirically analyzes positive law as a kind of real nonsensible being, since it is a part of culture, a manifestation of the objective spirit. There is no law other than the positive law (see ibid., 111–3). Positive law is temporal, historical (as a uniquely human projection of the past onto human existence), imperative, normative (setting forth an imperative aimed at an addressee), valid, efficacious,[7] morally obligatory, and coercive (see ibid., 120–7).

The central part of Moncada's axiology lies in his treatment of legal value, or the value inherent in the law: Is it possible to rationally determine or to construct the law that ought to be? Which, in other words, is the problem of natural law. For that we have to distinguish in the law its formal value, namely, justice, from its material value, namely, the values pertaining to its content. But there is very little that can be said in that regard on the basis of universal value: that human personality should be respected; that there are vital and spiritual values, the former subordinate to the latter; that there is an ethical minimum for the law to respect. Beyond that, it is *life* that has to impart content to a natural or ideal law. We arrive in this way at a natural law with variable content similar to the conceptions expounded by Francisco Suarez, Rudolf Stammler, and Giorgio Del Vecchio.[8] We can call it a natural law made positive in the various legal systems: It is a certain interpretation of such values made positive—in combination with the requirements of the fundamental conditions of social life—that constitutes the basis for the general principles of law in each legal system. This basis cannot be derived from any metaphysics: It can *aspire* to a metaphysics, to be sure, but such an aspiration exceeds the limits of philosophy (see ibid., 289–92, 298–307).

[7] Validity and efficacy at the present time characterize current law as opposed to past law (Moncada 1966, 123).

[8] On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume. On Del Vecchio see Section 11.2.1 in this tome.

Moncada had some early students who published before he gave shape to his systematic philosophy of law. One of them was a professor of public law in Coimbra named Afonso Rodrigues Queiró (see Queiró 1989, 2000a, and 2000b),[9] who was influenced by the neo-Hegelianism of Karl Larenz and Julius Binder and the ordinalism of Carl Schmitt.[10] Another former student of Moncada who would go on to develop a neo-Hegelian conception was António José de Brito, and from that standpoint he would much later criticize Moncada (see A. J. Brito 2006 and the preface to Moncada 2004). In the same generation, but educated at the Lisbon School of Law, was José Hermano Saraiva (1950), who started out from a neopositivist approach and then moved into phenomenology (see Saraiva 1963, 1964–1965, and 1986).

14.4. The Ontology of Law: Brandão

In 1942, Brandão published *O direito: Ensaio de ontologia jurídica* (The law: An essay on legal ontology, Brandão 2001a, 69–260).[11] As main influences he names Augustine, Aquinas, Pascal, Hegel, Scheler, Heidegger, and Nicolai Hartmann (ibid., 69). The dominant influence for his ontology of law is clearly the last of the authors just named. Brandão accepts Hartmann's theory of the different ontic strata, whereby the categories of the inferior strata are constitutive elements of the superior strata. The law is a special being within the objective spirit: It belongs to the stratum of the spirit, which is superior to that of conscience; it therefore pertains to autonomous categories, but it is nonetheless ontologically dependent on the conscience, which is a constitutive element of the spirit. Likewise, the conscience is dependent on the organic and the organic on the material.

Justice is not, for Brandão, the supreme value of the law but the common good. The common good is not an end that absorbs and nullifies other ends: It is the ideal form for realizing other ends. Because law is the normative criterion on which basis to live together in society, its supreme value is the value of generality and equality. All persons are equal before the law: They have the same secured space of freedom to act and also the same duties. That is the good common to everyone, the common good. However, values are always values for *someone*. Only the individual person is a conscious subject, capable of choosing intentional objects and of visualizing and supporting values. Only the individual benefits from and makes real the common good. Therefore, justice stands to law not as the idea or supreme value that renders law valuable, but as

[9] On Queiró, António José de Brito, Hermano Saraiva, and other figures of Portuguese legal philosophy in the 20th century, see Sousa 2005 and Braz Teixeira 2005.

[10] On Larenz see Sections 5.4 and 9.4 in this tome. On Binder see Section 5.3 in this tome.

[11] On Brandão, see António Braz Teixeira's preface to his edition of Brandão 2001a and 2001b.

the moral value of imposing a certain definition of the common good through force. From the point of view of the individual person, the law is just if in its definition of the common good it tends as much as possible to what has value for an individual's life. When we obey the positive law, pay taxes, or are being coerced by a decision of the courts or by the armed forces of the state, we are not accepting to be reduced to instruments of the community but are acting as means of our own realization in life as persons. For otherwise we would all be living under an oppressive feeling of injustice. How the law envisages the common good varies over time and depends on the community's spiritual level. But the imposition of the common good through the law must satisfy one requisite: It needs to be just (see Brandão 2001a, 86–94).

We have been considering the axiological aspect of law, or how law is related to value, which is only one of the ways in which law appears or one of its modes of existence. To that extent, law can be described under the ontic categories of essence. For example, law is timeless and not conditioned by the person who visualizes it. There are, however, two other modalities of law. In human life, law appears as part of the objective spirit of a certain national community and is historically situated in space and time: It changes over time, it is valid as positive law, and it continues to be a cultural object after losing validity. Finally, law appears in a third modality as objectified spirit in the written text of a statute, for example. To the positive law belongs heteronomy as an ontic category insofar as the will of the state has such a content. In order for law to be valid, however, it must harmonize with the visualizations of legal value and of justice that at any given time seize the minds of the people (see Brandão 2001a, 217–56).

The theme of the validity and temporality of law was extensively developed by Brandão in a long essay of 1943 which bears that same title *Vigência e temporalidade do dreito* (Validity and temporality of the law: Brandão 2001b, 261–329) and which draws on the previously mentioned methods and categories set out by Hartmann.

14.5. The Ontology of Law and "Portuguese Philosophy": Braz Teixeira

In Lisbon, António Braz Teixeira (1936–) carried forward the same type of ontology and axiology of law that Moncada and Brandão had developed before him. Like Brandão (2001b, 59ff.), he does not accept Moncada's idea of a variable natural law that sets out general principles of law for various legal systems (A. Teixeira 2000, 210–1, 219). In his view, the different theoretical attempts to justify or secure the idea of natural law are insufficient or cannot be maintained (see ibid., 220). Like Moncada, Braz Teixeira holds that justice is the value, principle, or ideal of law. But he goes further than both Moncada and Brandão by asserting that justice is a sufficient reason of law and so is the reason of its validity, and that since law exists only as long as it is valid, it is

justice that makes law what it is (see ibid., 223, 278–9). On the other hand, Braz Teixeira sees justice as always concrete: Persons and situations are always different, and its criterion therefore cannot be equality; the written general law as a legal source does not adequately express justice, and there is no distinction between justice and equity. Here Braz Teixeira follows Delfim Santos,[12] a Portuguese disciple of Hartmann and Heidegger who comments on Plato's definition of justice as "the act of giving to each his own," arguing that justice is not what is given but what makes us give what cannot be given in reality, because it already belongs to those to whom it ought to be given. There is nothing that justice actually *gives*, but this nothing gives "meaning" to things and determines to whom they belong. It is therefore not possible to determine what justice is, because justice is the act of determining thought and appears as a value that cannot become an object. Only *injustice* reveals the need for justice: Only injustice is real. Justice is sought after because it does not exist, and if it did exist, it would not manifest itself as justice (see D. Santos 1973, 58–9). So far goes Delfim Santos. Braz Teixeira extracts further the conclusion that justice is an intention or intentionality, a never-completed struggle for its own realization. Justice can neither be defined by nor be derived from reason: It can only be the object of an intuition in a concrete case through emotion or evaluative feeling. The reason you can give for it is a reason of the heart, of the immediate experience of value (see A. Teixeira 2000, 287). Being based on justice, the law is equally concrete in its essence—it becomes real in the hands of the judge deciding a case and not in the hands of the legislator. Braz Teixeira (ibid., 130–2, 282–5) thus defends a concrete normativism.

Braz Teixeira diverges from Moncada and Brandão in his conception of philosophy. For Teixeira philosophy is dependent on language and other characteristics of a national identity and much closer to literature and religion than to science or to legal science. The philosophy of law should resolve itself into a metaphysics of justice, implying a general metaphysical vision and an investigation of problems such as the idea of God, the reality of evil, the relation between justice and charity, and the ontological foundation of freedom, whose answer is to be worked out within what Teixeira (ibid., 290) calls "ontoteology." He includes himself in a movement named Portuguese philosophy (initiated by Álvaro Ribeiro, José Marinho, and Agostinho da Silva, all disciples of Leonardo Coimbra), since that movement embraces the same conception of philosophy.

[12] Delfim Santos was professor of philosophy and of pedagogy and wrote two short articles on the philosophy of law: *Psychology and Law*, of 1948 (collected in D. Santos 1977, 11–9), and *Law, Justice and Freedom*, of 1949 (D. Santos 1973, 51–62), and he also wrote a review of Brandão's previously mentioned essay on the validity and temporality of law (D. Santos 1944).

14.6. Neo-Thomism and Personalism: Gomes da Silva

In a book titled *Esboço de uma concepção personalista do direito* (Outline of a personalistic concept of law: M. da Silva 1965), Manuel Gomes da Silva (1915–1994) reflects on the use of the human corpse for therapeutic and scientific aims. His point of departure is not philosophical but theological: He starts out from what he describes as an "objective exposition of the Christian doctrine," conceived along the lines of the Catholic theologians Bernhard Häring, Romano Guardini, and Michael Schmaus. On this conception, humans are dominated by the *ontological demand to realize their ultimate end*, which is to glorify God; humans are endowed with the *autonomy* needed to pursue that end, but at the same time they have a *duty of fidelity* to the same end, on the basis of a principle that links autonomy to a predetermined end. This duty is an essential element of the structure of human personality and expresses natural law, which applies divine law to human acts (see ibid., 116–7). But natural law contains only universal principles that can be intuited by every right conscience, so the life of the community and the realization of its common good need positive laws that will specify those principles of natural law. Natural law must therefore act as a guide in the interpretation and scientific study of such positive laws and in the making of new positive laws (see ibid., 119–20). With Aquinas, Gomes da Silva holds that the universal natural laws and the general positive laws are not the law proper but only express the *ratio* of law, that is, its form and underlying rationale. The law is real or actual only as *concrete* law. Law, properly speaking, is constituted by three elements: the objective legal order as a set of laws or legal "forms," the subjective or concrete order resulting from the application of such laws through human acts, and the life of the law as the dynamics of such action. If we are to have an accurate picture of the situations of those who are subject to the law, we have to determine the general types of forms through which law becomes concrete: These forms consist in the individual situations that aggregate the diverse powers and duties established by law. Individual legal situations may be classified into (*a*) situations of autonomy, as in the case of *in personam* and *in rem* rights, and (*b*) situations of cooperation, as in the case of the legal relations involved in contracts and institutions or communities (ibid., 142–66). The resulting analysis of legal concepts is often illuminating and can usefully be considered on its own merits, apart from its theological foundation.[13]

[13] It must be noted that Aquinas is also the main source of inspiration for the legal philosophy of Mário Bigotte Chorão (2008). A more eclectic natural-law theory, by contrast, can be found in Soares Martinez (2012).

14.7. Critical Theory and the Global Social Project: Orlando de Carvalho (*by José Manuel Aroso Linhares*)

The subsequent generation of scholars in Coimbra takes us to Orlando de Carvalho, João Baptista Machado, and António Castanheira Neves, who all made important contributions, each in his own way.

For a long time, Orlando de Carvalho (1926–2000), a distinguished scholar in private and commercial law, was responsible for a course on legal theory. Although his written texts on this subject area (mainly Carvalho 1996 and 1997) account for only a small portion of his overall *oeuvre*, they do lay out a powerful holistic conception of critical theory, a conception that couples the heritage of the jurisprudence of interests (*Interessenjurisprudenz*) with a very selectively reconstructed view of dialectical materialism. The core of this conception is what Carvalho describes as "the global social project," a reconstitution of present social reality simultaneously understood as an interpretative task and as an autonomous "performative potential." When we reconstitute this project, we are in fact acknowledging "a cluster of values at once juridical and not juridical, ethical and not ethical." If the normative "force" attributed to this "cluster" depends mainly on a process of rationalizing universalization (see Carvalho 1996, 8; my translation), its "dynamic promotional ideal"—discovering society as a promisingly thriving "melting pot" of "values and counter-values," and even of "chrysaline values" (ibid., 9)—acts decisively upon law in "systemic" and "counter-systemic modes" alike (Carvalho 1997, 16; my translation). Why in a "systemic" mode? Certainly because this interpretive reconstitution confers on the intertwinement of judicial jurisprudence and legal scholarship the status of a *conditor juris*. Why also in a "counter-systemic" one? Certainly because this intertwinement is performed in such a way that an irreducible politically and ethically relevant social "insubordination" (permanently challenging the conservative stabilisation praxis of the *communis opinio*) can pursue "human emancipation" and its indispensable *liberté d'épanouissement* (the freedom to flourish). By this *freedom* is as a matter of fact meant "the realization of each person in the community and the realization of the community in each person" (ibid., 16–7; my translation).

14.8. Hermeneutics and Discourse: Baptista Machado (*by José Manuel Aroso Linhares*)

Baptista Machado (1927–1991) and Castanheira Neves (1929–) explore the common ground that can be said to lie in the *"rehabilitation" of practical knowledge or practical philosophy*, but also in an effort to resist rule-centered formalism and legal scientific instrumentalism (and its calculating forms of reason). The common task is not only to free legal discourses and practices from the dominance of *episteme-techné* or *techné-episteme*, but also to return to an autonomous experience of praxis-*phronêsis* and to reconsider legal validity as insepa-

rable from the specific construction of communitarian meaning. In pursuing this project, however, the two authors proceed along two markedly different paths.

Baptista Machado gave us two main contributions in two short periods of creative activity, the first revolving around *Antropologia, existencialismo e direito* (Anthropology, existentialism, and law: Machado 1991b), written in 1965, the second one culminating in the first published version of *Introdução ao direito e ao discurso legitimador* (Introduction to law and legitimizing discourse: Machado 1983). At first these contributions will look like separate nuclei, corresponding to independent (discrete) developments, engaging with significantly different interlocutors.[14] But the conception does have unity, as can be appreciated by considering two remarkable *pairs* (and the productive tension or even the unresolved wavering that these pairs produce). The first of these (see point A below) lies in the counterpoint created between *natural law* and *(constitutive) historicity*, where one could also see the need to experience the "permanent openness" and the "radical disquietude" of *Dasein*, our "being there" (see Machado 1991b, 144), without abandoning the "possibility" of taking the question of "natural law" seriously (ibid., 120–1); the second (see point B below) lies in the experience of the discursive polarity (but also the convergence or at least the overlap) between two translations of *phronêsis*, namely, the topical-rhetorical one (see Machado 1965) and the *existential*-hermeneutical one (Machado 1991b; 1983, 314ff.).

(*a*) The counterpoint between the *quest for the natural law* and the *cultural "openness to Being"* suggests the possibility of approaching juridical validity in two different reflexive steps that can be understood as complementary stages in a work in progress where the effort is to overcome traditional ontic (ahistorical) substantialism or essentialism (see Machado 1991b, 78–9, 84ff.).

The first reflexive step enables us to discover legal validity by adopting a participant's perspective. This perspective, however, is a *specific* one—no doubt because the practices to be internally considered (the practices that construct the relevant point of view) are exemplarily related to the radical possibilities (but also to the risks) associated with a personal "responsible" ("non-arbitrary") "existential decision" (ibid., 109–13; my translation). From this perspective, Baptista Machado aims to resist theoretical essentialism, while simultaneously resisting the dangers of relativistic historicism and voluntarism (ibid., 116ff., 121ff., 137ff.). As a result, natural law may be experienced as "a

[14] In the first period, these interlocutors were Heidegger, Fechner, Welzel, and Max Müller (in Machado 1991b), but also Engisch, Esser, and Viehweg (Machado 1965). In the second period, they were Gadamer, Hruschka, and Larenz, but also Apel and Habermas (Machado 1983). Kelsen is present in both periods as the unsurpassed example of a "logico-structural" theoretical thinking (cf. Machado 1991a, 1991b, and 1983). On Viehweg see Section 10.3.2.2 in this tome and Section 23.3.1 in Tome 2 of this volume. On Gadamer and legal hermeneutics see Section 10.3.5 in this tome and Section 23.4 in Tome 2 of this volume. On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

human task" with "a content *to come*" (a content whose fullness is always deferred to the future) (ibid., 111; my translation). This understanding (as a kind of "pre-reflexive knowledge") involves in fact not only an irreducible dialectics between an "evaluative cultural tradition" and "constitutive free participation" (ibid.,137–42; my translation), but also a *nexus moralis* between *man* as an "agent of History" and the "concrete" singular circumstances or "relations" (ibid., 97, 143–56) in which people find themselves. It is as if the historical (permanent) "transcending of man by man" (that constitutes *humanity*) could be seen to correspond to the awareness of an autonomous validity, that is, a validity not dependent on arbitrary contingent decisions (ibid., 137ff., 143).

The second reflexive step (Machado 1983) sets out the previously unconsidered ambition to explore the connection between natural law (or natural-law thinking) and the experience of the community, the latter conceived as a socio-historical form of life, the former as a normative (regulative and justificatory) axis (if not as an ensemble of reflexive standards). Natural law is in fact presented here as a kind of immanent "law of life and evolution" (ibid., 209, 212, 213; my translation), but also as a global supra-statutory reference point or standard, setting out an *idea of law* as order and system, if not directly making a claim to coherence or integrity (see ibid., 212ff., 320). Exploring this supra-statutory reference, natural-law thinking installs in communitarian praxis an unsurpassed dialectical transaction between positive and extra-positive (or trans-positive) polarities (ibid., 208ff.), which means consecrating the "postulate of Natural Law" as an unsurpassed "structure of thought, inherent in the language of legal validity" (ibid., 260; my translation), but also concluding that "the problem of legal Justice" still *is* "the problem of Natural Law" (ibid., 287; my translation). With this conclusion Machado confirms the universality and the anthropological necessity of the supra-statutory standards (ibid., 208) as direct normative expressions of *die Sache Rechts* (the *quid* Law), paying simultaneously attention to the risks of disintegration involved in a radically pluralistic conception of the communitarian connection. As previously noted, the answer to this demand (and its difficult challenges) is constructed under the explicit influence of Apel's and Habermas's universal (transcendental) pragmatics. Baptista Machado recognizes a necessarily constitutive *tie* that intertwines three diverse components, making them reciprocally inherent: "The regulative principle of Justice," the form of life "man" (the superior way of life that can be called *human*), and the transcendental (meta-institutional) conditions of "communicative community" (see ibid., 272–84, 286ff., 293–307). It is precisely this *tie* that hermeneutical existential discourse will be able to reveal: on the one hand recognizing that nature (or *naturalness*) means culture—i.e. a cultural dimension which escapes the contingencies of arbitrary *voluntas* (or deliberate constructive programs), thus revealing itself to be a product of spontaneous communitarian evolution (see ibid., 288ff.); on the other hand, reconstituting a complex of supra-positive normative principles, or supra-contingent ethical

commitments (to responsibility, veracity, or justice). As an expression of "unitary regulative wisdom" (i.e. as plausible transcendental aprioristic presuppositions), these principles and commitments "emanate from the (symbolic) structures inherent in a communicative community" and enable humans to evolve toward a superior *Lebensform*, or form of life (see ibid., 302–3; my translation).

(*b*) The constructive wavering between topical and hermeneutical discourses finds a plausible promising solution in the unitary celebration of a *total human* anthropology. This celebration presupposes a certain "epistemological conversion" (i.e. a reflexive discourse providing a "more adequate understanding of human reality": Machado 1991b, 135; my translation). According to Baptista Machado (1991b, 143ff.; 1965, XIVff., XXIII), this reflexive discourse will provide not only the conditions for recognizing the bonds of the *Lebenswelt* (or life-world) from the participant's perspective of a "situated self", but also provide the possibility of revealing this "self" as an interpretive *existence* (with the relevant affective-emotional and volitive dimensions and a genuine sensitivity to concrete and unrepeatable contexts). Accepting this possibility means in fact rejecting (avoiding) a certain theoretical (empirico-explicative and technological) "forgetting." Which "forgetting"? The one which refuses to take into account that decisive "anthropological difference" that makes the "interpreting subject's identity" dependent on historico-communitarian "interaction and communication" (and on its meta-institutional principles) (see Machado 1983, 342–55).

This global reinvention of *phronêsis* as the core of practical reason opens the path to an understanding of legal dogmatics as an authentic "hermeneutical science" (ibid., 359–75) and justifies an eloquent rejection of Kelsen's understanding of legal norm as a "frame" (*Rahmen)* (Machado 1965, XXVII, LXII–LXIII), it does not however produces a specific legal methodological thinking. Machado (1991b, 115; 1983, 307–11) did not rethink legal principles in an autonomous way (which would have broken their continuum with the presuppositions of the "communicative community" and its "universal pragmatics"), nor did he take the opportunity to develop a genuine understanding of the case (and its legally relevant "concreteness") as a plausible methodological perspective. He rather contented himself with a global reinvention of the interpretive problem, or, one might say, with the possibility of concentrating the process of juridical concretization on the level of generalisation and in the "operating formula" that legal norms self-sufficiently provide. This means that Machado's existential-dialectical hermeneutics—pursued under the *modus* of an indispensable legitimating discourse—allows us to reduce the "legal order" to two main constitutive layers, or strata, both of them concentrated on the intelligibility of the legal norm, the first one corresponding to this norm's "logical" ("notional or denotative") "dimension" (referring through the *hypothesis* of the *conditional program* to real-life historical situations), the second one translating the norm's "intentional" (or "spiritual") understanding and building a plausible interpretation of the extra-positive *quid* (Machado 1965, XXVI–XXIX, LX–LXV; 1983, 205ff.). It is precisely this

interpretation—invoking the previously mentioned meta-institutional presuppositions—that, from the perspective of the judge qua participant, will be in a position to overcome the problems of (extensional and intensional) indeterminacy that the experimentation of a norm's "logical dimension" unavoidably provokes.

14.9. Jurisprudentialism: Castanheira Neves (*by José Manuel Aroso Linhares*)

Castanheira Neves has put forward an unmistakably original conception of law and legal thought from the outset. This can be appreciated in his first major work, *Questão-de-facto-questão-de-direito* (Matter of fact matter of law: Neves 1967), as well as in his *Introdução ao Estudo do Direito* (Introduction to law: Neves 1968–1969, rewritten as Neves 1971–1972). In both of these works his voice can already be fully recognized and the components of his reflection are already maturely articulated, and he has since developed a continuous and powerfully integrated (albeit no less demanding) reflexive path. In contrast to Baptista Machado's approach, this path can be said to overcome the constructive hesitation between natural-law thinking and practical philosophy, not only because it conclusively rejects the former, along with its weak equivocal vestiges (see Neves 1967, 693ff.; 2003a, 35–52; 2008a, 107ff.), but also, and especially, because it takes up the challenge of a radically problematic (constitutively immanent) practical thinking. This challenge is in fact concerned with an autonomous reconstitution of *juridicalness* as validity, taken in earnest as a self-transcendental communitarian normative context and as a correlate of an open historical *praxis* (see Neves 1995a, 32ff., 51–239; 1997, second lecture; 2003a, 140–7; 2008a, 84–91). To follow this path is essentially to make a wager (Pascal's *pari*!), i.e. to "bet" on the plausibility of a contextual reinvention of the problem of law, a reinvention through which we may be able to rethink and critically experience law's constitutive cultural-civilizational *originarium* in a limit-situation like our own. This means rejecting an unproblematic presupposition of universality (see Neves 2008a, 1–41, 101–28) but also the possibility of a previous (pre-juridical) definitive global discussion about the practical world or the community, i.e. a discussion whose alternatives and results could somehow be predetermined *without* law (abstracting from the specific experience of law) and then externally and unilaterally projected or specified (in such a way that juridical discourses and practices could content themselves with a pure passive assimilation) (see ibid., 74ff., 91ff.).

Castanheira Neves follows this reflexive path by exploring a specific model of legal discourse on different levels and facing different problems.[15] This

[15] Which means that he is revisiting (rethinking) some central meta-dogmatic problems, such as the problem of the legal system and of the sources of law (see Neves 1995b, 7ff., 109ff.), but also considering the decisive normative implications of several dogmatic tenets, such as *nullum crimen sine lege*, private and criminal responsibility, *question-of-law* versus *question-of-fact* (see Neves 1995, 349ff.; 2008a, 129ff., 321ff.).

model is one that he distinguishes from two other alternative contemporary perspectives (formalistic normativism and pragmatic functionalism) and that he identifies as *jurisprudencialismo*, or jurisprudentialism (Castanheira Neves 1998, passim; 2008a, 161–318; 2008b, 56–68). To explore this model is immediately to recognize an autonomous (institutional) understanding of legal rationality. According to this conception, the presupposition of a communitarian validity—fully understood as the assumption of a material axiological compromise—cannot be experienced without paying attention to a circularly constitutive praxis of realization, a praxis whose prius (a basic generative component, in its permanent novelty and uniqueness) lies in practical controversy (a concrete situated problem of inter-subjectivity), and whose performative development demands the degree of attention that only an internally plausible methodological reflection can offer. However, the trans-subjective validity and the practical controversy cannot be recognized as basic polarities of legal rationality (corresponding to the axiological and the problematic dimensions) without bringing two other dimensions into the foreground: the third one (the dogmatic dimension)—which pertains to the experience of the legal system and confers a stabilizing objectifying role on validity—and the fourth one (the judicative one), which responds to the novelty of controversy with an adjudicative prudential mediation (or assimilation). To recognize the complex intertwinement of these four dimensions is ultimately to conclude that legal rationality corresponds to an irreducible main dialectic, the one we identify by invoking the perspectives of *system* and *problem* (along with the constitutive circle, if not "methodological unity," that they produce). And we should not forget here that this system is conceived as being dynamic and open, with a regressive permanent recomposition and with several different strata that are not methodologically equivalent—normative principles (taken seriously as *jus* and as foundational *warrants*), legal norms, precedents, dogmatics, legal reality (cf. Neves 1993, 77ff., 155–9; 1995b, 109ff.; 2009, 18ff.). It is the methodological priority of controversy that gives this recomposition its unmistakably specific meaning. This is so because, on the one hand, the perspective of concreteness restores *interpretatio* to its fully normative (not hermeneutical) "integral sense" of "realization of law," an integral sense incompatible with any methodologically plausible scissions or divisions between the interpretation of law and its application, between interpretation and the filling of gaps (see Neves 1992, 78ff.; 1993, 74–7, 83–154; 2003b, 45ff.), and, on the other hand, the immediately constitutive juridical relevance of the mentioned controversy (distinguishing concreteness from pure singularity) enables us to go beyond a pure topical assimilation of legal materials (Neves 1993, 71–4), thus not only introducing a decisive counterpoint between foundational warrants (*fundamentos*) and rules or criteria (*critérios*)—i.e., distinguishing the systemic layers that should be assumed and treated as such—but also attributing different presumptions of bindingness or normative force to these layers, in such a way that principles

benefit from a presumption of communitarian validity, legal norms from a presumption of political-constitutional pedigree or authority-*potestas*, precedents-*exempla* from a singularly contextualized presumption of correctness, and legal dogmatic models from a presumption of rationality or rational conclusiveness. Indeed, all of these presumptions are treated as explicitly or implicitly rebuttable, their refutation entailing a special burden of counter-argumentation (see ibid., 154ff.; 1995b, 82–90; 2008b, 66–7). This perspective also allows us to fully experience the two faces of legal norms, on the one hand as decisions and commands (giving way to a reconstitution of the *ratio legis*) and on the other as legal criteria, as plausible objectifications of principles-*fundaments* integrated into a multilayered open system, demanding an autonomous interpellation of the *ratio juris* (see Neves 1993, 149ff.). These elements also presuppose the importance of a normatively productive "jurist's law" that is meant to integrate the reciprocally constitutive contributions of judicial jurisprudence and legal scholarship, without forgetting a plausible dialogue with meta-dogmatic legal discourses (see ibid., 157, 184–6; 1995b, 89–90; 1997, 54F–54Q; 2008a, 71–2), and it is on this basis, using the same elements, that Castanheira Neves (1993, 30ff., 159–286) constructs a powerful developed methodological scheme revolving around the judge's adjudication (treated as a paradigmatic case of *judicium*), without forgetting that if this judgment is to be taken seriously, it will require an urgent internal reflection on the material intentionality of jurisdictional power (see Neves 1983; 2008a, 161ff.).

It is indispensable to have a final remark so that we can go back to the core of a specific legal philosophy, for it is on this basis (conceived of not as a tranquilizing exposition of traditional themes but as a true reflective reconstruction of problems) that, according to Castanheira Neves (2003a; 2008a, 73ff.; 2009, 3ff.), we can cope with the crisis presently affecting the European civilization. It was previously mentioned that Neves rejects law's unproblematic universality. Now we must qualify that stance, for according to Neves (2008a, 9ff., 101ff.) such a rejection should prompt us to recognize that the quest for law—a quest first stoutly articulated with the jurisprudential *Isolierung (isolation)* accomplished in the Roman *civitas*—is only a plausible (continuously renewed) civilizational answer (among other possible answers) to a socially and anthropologically necessary problem. This recognition is indeed built under the reflexive urgency of a radical (Heideggerian) question—"Why Law [...] in the *human world* [...] rather than Law's absence?" (Neves 2008a, 10–1; my translation; 2003a, 140ff.)—and leads us to an inevitable reconstitution of the conditions under which law emerges. Three conditions are listed by Neves: (*a*) the worldly-social condition, delimiting an objective relational (intersubjective) performative space and the parcelling relationships by which it is constituted; (*b*) the anthropological-existential condition, which lies in the incompleteness and openness of humans and in the corresponding invention of their cultural and institutional second nature against the backdrop of an irreducible

dialectic between subjective autonomy and communitarian integration; and (*c*) the ethico-juridical condition—the decisive one—where a person (a specific legal *subject-person*) figures as a foundational axiological acquisition, constitutively illuminated by the supra-positive principles of equality and responsibility, a responsibility that institutionalizes itself in a materially and formally limited way (see esp. Neves 2008a, 9–41; cf. 2009, 11–5).

If we can suppress this last (culturally possible) condition, then we will be able to answer the first two (necessary) conditions with the institutionalization of a social order from which law (as an autonomous order of validity) remains absent. In a word, we will be able to critically address the problem of alternative orders, meaning those orders that are not juridical in the strong civilizational sense demanded by (claimed for) this conception of juridicalness. What are these orders? Neves lists three: the order of necessity justified by pure power, the order of possibility illuminated by techno-science, and the order of finality supported by politics (see esp. Neves 1997; see also 1995a, 287–310). And we should not forget that the radical Heideggerian question is only the first step in addressing the urgent need to revisit the central problem of law's autonomy (for a time unencumbered from the formalist claims): Having asked that question, we must turn to a problem constitutively intertwined with it, that is, we must reconstitute the tasks of law in its different historical cycles (the problem of the functions of law) and then we must turn to the decisive question of the foundations of law by engaging in an autonomous discussion of specifically juridical self-transcendentality (see Neves 1999; 2003a 145–7; 2008a, 94–100; and 2009, 16–8).

14.10. In Neves's Footsteps: Bronze, Linhares, and Marques (*by Luís Meneses do Vale and Ana Margarida Simões Gaudêncio*)

Following the trails blazed by Castanheira Neves, Pinto Bronze (1947–) devoted his best endeavors to a thorough reflection on *jurisprudentialism*'s core assumptions, assertions, and projections (Bronze 2006), with a focus on its methodological dimensions or implications (Bronze 1994): These are aspects whose relevance he had originally become aware of (and to the unpacking, interpretation and communication of which he was consequently led to) in his earlier research on international private law and comparative law. Meanwhile, throughout all his writings and lectures, he has always cultivated a distinctive style that elegantly combines scientific *gravity* with aesthetic *grace*. Indeed, without detriment to the theoretical rigour and practical intentionality expected from legal discourse, his texts bristle with cultural references—especially literary ones—bearing witness of his exquisite sensibility to the intricate relations between Law and the Humanities.

Acknowledging law's autonomous meaning from a properly juridical perspective (practical and normative), Bronze (1993 and 2006) offers a complete

account of its inherent *mode of existence* (a synthesis of validity and efficacy), of its *constitution* (through multiple sources), and of its *precipitation-objectification* in a dynamic, open, and incomplete system of principles (foundations) and criteria (legal norms, judicial precedents, doctrinal models, professional standards, etc.). This way he winds up recognizing the nuclear relevance of studying law's mode *of realization*, which is precisely the object of methodology, more aptly coined, in his own words, as a "methodonomology." What is meant by this neologism is the practically and normatively rationalized realization of law through "judicative decisions", or, to put it more analytically, through the specific *logos* (or reason), which reflexively and critically reconstructs the *odos* (path), deemed necessary in order to achieve the *meta* (end) of law conceived as *ius*, that is, as a material normative validity concretely enforced and realized through the adjudication (by means of a decision-making judgment) of concrete juridical problems (*nomos*).

This peculiar mode of reasoning purportedly displays a complex set of features:[16] As a *practical* enterprise (as against a theoretical or logical one) it is said to be *material*, but it is also inevitably *argumentative* (cf. Bronze 2000, 2003, and 2008b), *axiological*, and *teleological*,[17] and, most importantly it is deeply rooted in, and intertwined with, analogical ponderations (see Bronze 1994; 2006, 933ff.; 2007, and 2012a). This is where we find Bronze's most significant and original contribution to the Coimbra jurisprudentialist school (Bronze 2012b). In fact, since law is understood as a specific axiological-normative validity with an inner practical problematical intention—the drive to respond to juridical problems, thus making itself real, i.e. realizing its own existence and therefore affirming and projecting those values which simultaneously constitute its material foundations, substantive content, and ideal-regulative orientations—its way of facing the concrete juridical problems arising from reality can be conceived as an analogy, that is, as a search for juridical similarities between the specific juridical problematicity (merit) of the problems and the intentional problematicity of law (in all its principled or regulative expressions and dogmatic positivations).

Hence, juridical analogy comes to light as a mode of thought (a way of reasoning) that proceeds argumentatively, comparing particular problems (the *relata*) through the mediation of a *tertium comparationis* (the meaning of law) on the grounds of the universal principle of justice (and its demand for material equality), while also pragmatically relying on the inertial force of the praxis—therein lies the entire method of law's realization, interweaving its different moments.

Jurists, for their part, are regarded as true subjective mediators between juridical problems and the law, and, for that reason, obliged to engage in a per-

[16] For specific dialogues with other types of rationality see Bronze 1997, 1998, 2006, and 2012a.

[17] This is so in a sort of *teleonomology* or intrinsically dialectic *archeoteleology* committed to a teleological jurisprudence of ends and values.

manent "intersubjectivization" of their subjectivity. This requires them to pay adequate attention both to the *rationality* (so as to understand how to act) and to the normative system of law (making it possible to figure out what has to be assumed), while accurately appealing to the *judícia* or faculty of judgment (*judicium, Judiz*) as well as to the ancient virtue of *phronesis* or *prudentia* (cf. Bronze 1994, 95ff.; 1998, 2008a), with a view to the intended *just judicial decision*.

Explicitly exploring the possibilities and challenges of Castanheira Neves's jurisprudentialism, Aroso Linhares (1956–) has specifically privileged two main themes. The first one lies in the *urgency* of an autonomously understood approach to legal theory developed as a specific (permanently *open*) *critical testimony* of our present *différend* about law and juridical discourses[18] (and the *need* to discuss the plausible *idiom* of this theory, or its claim to find a perspective-*visée* that may be in a condition to recognize and constructively interpret this heterogeneity). The starting point for this first theme, already present in two main monographic studies (Linhares 1986, 2001), lies in the consideration of the problem of juridical proof, treated as an inter-discursive limit question, whose explicit developments justify a systematic reconstitution of contemporary trends in the philosophy of law and legal theory (see Linhares 2006c, 2009), from communitarianism to the postmodern jurisprudences.[19] Deeply intertwined with this theme is the second one, the radical questioning of the *plausibility* of the *project of law* (as an *invention* of a culturally specific *homo humanus*) in a cultural-social circumstance like our own, divided between the *celebration* of *plurality and difference* and the *promises* of a *new practical undifferentiated ethical holism*. This second theme emerges in specific discussions on different subjects, from animal rights (Linhares 2003) to cosmopolitanism (Linhares 2006b), to explicitly concentrate on a systematic exploration of the proposals presented by Habermas (Linhares 1984 and 2006b), Levinas, and Derrida (Linhares 2006b, 2007a, 2007b, and 2008), essentially diverging from an *"acultural" experience of modernity* and, therefore, proposing an *axiologically autonomous* construction for the *civilizational experience* of law (Linhares 2006a, 2006b, 2009, and 2012).

Also in this school, Mário Reis Marques (1950–), from a more historico-philosophical perspective, develops a critical reflection in legal philosophy and legal reasoning, having as its starting point the historical evolution of law's

[18] In this diagnosis of *plurality* (using Jean-François Lyotard's categories in a deliberately different context of intelligibility), Linhares mainly considers the "multiplication of concepts of Law (and practical discourses) which the so-called *academic house* (on a certain meta-dogmatic level)—reacting to the unrecoverable *Detruktion*-loss of a dominant methodic paradigm—has been producing in recent decades (creating esoteric incommensurability and other cognitive dissonances)" (Linhares 2012, 492).

[19] Having as privileged interlocutors the Critical Legal Studies, Law and Economics (Linhares 2002), the systems theory, the argumentation theory, the semiotics of law, Law and Literature (Linhares 2001, 2004), and the ethics of alterity (Linhares 2007b).

foundation, in a reconstruction that goes from classical antiquity to our days, through the Middle Ages and, mainly, the Modern Age (see Marques 1987, 1998, 2002, 2003, and 2007a).[20] In his main monographic studies (Marques 1987, 2003), he specifically considers the modern codification processes, mostly in civil law—and its paradigm, the French Code Civil—, relating them, as positive law constructions, to their philosophical and political origins, axiological foundations, and practical projects (Marques 1987, 1998, 2002, 2003, 2005b, 2005c, and 2006). On that basis, Marques reflects on the present problems of law in human society, from human rights to the relationship between, on the one hand, the meaning and role of law and, on the other, the increasing pace of change in society (Marques 2007b, 2008, and 2009). He thus states the possibility of a "third way," a *tertium genus* beyond positivism and natural law, albeit not dismissing their contribution, in thinking the material foundations of law, a *way* based on the primary values of a community—liberty, equality, solidarity, and security—resulting from the idea of *human dignity*, which imposes itself on and supports every juridical rule (Marques 2005a, 2007a, and 2010). At the same time he rejects the idea of law as a strict *urgency management*, to affirm it as an authentic *material normativity*, with its *proper time* (Marques 2008, 2009).

14.11. Analytical Philosophy of Law: Brito (*by Alessandro Serpe and José de Sousa e Brito*)

Sousa e Brito (1939–) studied with Heidegger and Gadamer in Germany and with Hart at Oxford. He sought to link the Continental philosophical tradition with analytical philosophy by pursuing hermeneutic philosophy with analytical methods. In his early work, as a student of Gadamer, Brito studied the 19th-century historical school of German legal science and its legacy (see J. Brito 1987; 2011, 163–98).[21] It was in particular Savigny who, according to Brito (J. Brito 2011, 163–4), exerted much influence on current legal interpretation and adjudication. Characteristic of Savigny's *System des heutigen Römischen Rechts* (System of Contemporary Roman Law: F. Savigny 1840) is its twofold view of legal interpretation, for on the one hand interpretation applies to particular laws, but on the other it involves a reconstruction undertaken through the dialectic of part and whole.[22] This distinction, in Brito's language, sheds light on the use of

[20] The privileged interlocutors in this historical analysis are, mainly, Thomas Aquinas, Francisco Suarez, Hugo Grotius, Thomas Hobbes, Samuel von Pufendorf, Gottfried Leibniz, Christian Thomasius, Christian Wolff, Montesquieu, Jean-Jacques Rousseau, Immanuel Kant, Cesare Beccaria, Friedrich Karl von Savigny, Friedrich Krause, Gustav Radbruch, and Hans Kelsen (Marques 1987, 1998, 2002, 2003, and 2007a).

[21] The original articles quoted in the text have an Italian version revised by the author in (J. Brito 2011).

[22] On Savigny's theory of legal reasoning see also Section 21.3 in Tome 2 of this volume.

the sources of law as the basic starting point for interpretation. But in recognizing this fact, Savigny goes contrary to the spirit of the Enlightenment, for in his view the theory of the sources of law is not separate from that of legal interpretation; rather, the two interact (see ibid., 165–7). This perspective enables Brito to look closely at the ways the common-law system and the Continental legal system are related. Indeed, Brito maintains that the case-to-case reasoning by analogy typical of the common-law system is compatible with the Continental legal tradition: The only difference, as Esser previously showed, lies in the degree to which interpreters are aware of their recourse to inductive and deductive reasoning, which in reasoning by analogy coexist (see ibid., 187, 192–3).

In *Wahrheit und Methode* (Truth and Method: Gadamer 1960, 295ff.), Gadamer underscored the "hermeneutic actuality of Aristotle," referring to Aristotle's analysis of ethical knowledge. In Brito's opinion, Gadamer was thinking of the Aristotelian practical syllogism (cf. J. Brito 2011, 195–6). The crucial importance of the practical syllogism as a method for the human sciences has also been recognized by analytical philosophers, such as G. E. M. Anscombe and G. H. von Wright. Against the background of the distinction between analytical and Continental philosophy, which in practice is less useful than is often thought, Brito groups hermeneutical philosophers into two main camps: "dialectically oriented" ones and "analytically oriented" ones. On the one hand, this soft distinction enables Brito to use the label "hermeneutical philosophy" as a common designation for both orientations and to arrive at a better understanding of current philosophical positions (ibid., 196–7). On the other hand, by recognizing Aristotle's methodological importance, Brito can bring the hermeneutical structures of legal subsumption and legal interpretation back into the fundamental and formal structure of the practical syllogism.

The way in which the concept of law is conceived depends on how its relation to facts and to ethics is framed. Brito answers both questions by engaging with the two main theses that define legal positivism: that of the conceptual separation of law and morals and that of the social sources of law (see J. Brito 2011, 141–60). According to the first thesis, law neither depends on nor is determined by morals (or ethics, in the sense of a set of moral principles), in that there is no implication or conceptual necessity from law to morals or from morals to law: The law can be unjust or immoral and still count as law. According to the second thesis, the validity and content of law depend solely on social facts: The content of law is determined by the content of certain social facts, the social sources of law. The second thesis entails the first: If the validity of law conceptually depends on social facts, then law must differ from ethics.

According to Brito, it is true that once you ascertain certain facts (such as legislative acts, customs, judicial decisions, or the efficacy of the norms that form the content of such acts), you can ascertain the validity of certain norms: This validation happens when those facts are recognized by judges and other agents entrusted with applying the constitutive rules of law, for it is on the

basis of these rules that facts are linked to norms. But these rules do not licence us to pass from an *is* to an *ought*, that is, they cannot be used in a logical deduction from what *is* the case to what *ought to* be the case, for that would amount to a violation of Hume's law. Otherwise stated, the facts constitutive of law do not logically entail the law: They are just the *condition* for the validity of law; that is, norms cannot exist unless facts exist, and once the facts are ascertained, then the relative norms ought to be applied (J. Brito 1982, 264; 2002, 917–18; 2011, 150–1). However, in Brito's view, contrary to the claims of legal positivism, validity depends not only on facts but also on rightness, that is, on the morality or rationality of the law. To what extent? That depends on recognition. The constitutive rules of law have evolved from a system of recognized subjection—arguably always limited by some kind of divine law or natural law—to a system of recognized rationality. Therefore, the self-definition of law is itself not fixed but evolves with the very constitutive rules that define what is law. In a rule-of-law state, the validity of a legal norm does not depend only on a combination of supporting facts, namely, (*a*) the social facts of its creation in accordance with the sources of law, coupled with (*b*) the facts on which rests the norm's efficacy—absent which the norm is revoked by derogative custom—and (*c*) the facts on which rests the efficacy of the entire legal system: It also depends on normative content. It certainly depends on the content of the norms that rank higher in the hierarchy, since the norm at issue must be in conformity with them. But it also, and no less importantly, depends on the rationality of the norm's content, and so on its conformity with ethics or at least with a minimal ethical standard. That is because of the constitutive rules recognized in the legal system (see J. Brito 2011, 153–4). The law contains ethical concepts like human dignity and guilt, which carry enormous consequences reflected in systems of legal theory, such as the theory of human rights, or in the general principles of criminal law. These systems aspire to a rational or ethical foundation and are developed or criticized through ethical reasoning. When criteria discovered by reason are recognized by positive law as having legal validity, the validity of law ceases to depend on its positive recognition, which thus retreats, withdrawing from its own role as a criterion of validity. In the sphere of rationality so created, the rules and principles of ethical reason will eventually contradict positive law and then prevail over it: They are logically and normatively superior, so much so that even constitutional rules may become unconstitutional. Therefore, in a rule-of-law state, recognition is to some extent self-effacing. And since legal positivism is based on recognition, it must be self-effacing without being self-defeating (see ibid., 159–60).

For Brito, the conceptual failure of the social-sources thesis brings with it the failure of the positivist ground for the conceptual separation of law and morals. It remains true, in his view, that if we examine the arguments generally considered correct in the practice of law, and if we compare these arguments with those generally considered correct in ethics, we will notice that the former

show limits not present in the latter. Indeed, legal argument is from the outset limited by the obligation to refer to the sources of law, i.e., to statutes, custom, and the case law. A legally correct argument must be justified in light of the entire body of the sources of law. Every sentence or proposition in that corpus which bears a positive logical relation to the issue to be decided must be integrated into the overall argument on which the legal decision is based. But this must be done recognizing the authority and consequent hierarchy of the sources of law. In legal argument, we have to take into account not only that the sentences contained in the sources have the logical priority that premises have in relation to the conclusion but also that those sources are hierarchically arranged—e.g., the constitution ranks above acts of Parliament, which in turn rank above executive orders, and so on—in such a way that if two sentences (propositions) should contradict one another, the hierarchically superior one will prevail. Likewise, all sentences that are sources of law will have an authority or force not recognized for any other sentence in the same argument. This authority endows them with hermeneutical priority: It is from these legally authoritative sentences that one has to start in the argument, demonstrating step by step that the logical system constructed on their basis is indeed compatible with them. It will be noted that hermeneutical priority is not the same thing as logical priority: Even if authoritative sentences must be used as starting points in setting out the logical system within which a decision is justified, they may not figure as principles or axioms within that system. So, too, there are other constraints imposed on ethics in the law. For example, the law uses decision-making procedures that limit the range of sentences admitted in legal argument in the courtroom or in parliamentary debate. The limits the law imposes on ethics are justified on a variety of ethical grounds: They save time and make law more practical and secure, but above all they protect the democratic process. But such limits are themselves limited on ethical grounds that form the basis for theories of civil disobedience and of the right of resistance and revolution (see J. Brito 1995, 1996, 1998; 2011, 154–8). Thus, "law is rationally limited ethical reason or a just limitation of justice" (J. Brito 1995, 38; my translation).

In *Falsas e verdadeiras alternativas na teoria da justiça* (False and true alternatives in the theory of justice: J. Brito 2008; 2011, 15–101), the complex relationship between law and justice is investigated from the standpoint of the foundations of ethics. Utility, duty, rights: Are these alternative foundations of theories of ethics and politics, as Dworkin (1977, 171) would say? Or are they instead reducible to one another, thus representing false alternatives? According to Brito, a rights-based theory can be reduced to a duty-based theory. This can be done by applying the paraphrase method with which Bentham anticipated the analytical theories of definition expounded by Russell and Carnap: In this way, statements that contain terms referring to rights can be reduced to statements that contain terms referring to duties (J. Brito 2011, 21–31). Ben-

tham did propose more than one way of paraphrasing, or reducing sentences containing the word *duty* to sentences about other things, namely, about possible forms of pleasure or pain acting as a particular kind of motive or source of action. But he went some way toward demonstrating why such proposals could not succeed (see ibid., 33–7), this by defending a kind of transcendental proof of the principle of utility, a proof in which utilitarianism and Kantianism are each transformed into a variant of the other (see ibid., 49–52). Indeed, Brito argues, "the rational reconstruction of the foundations of ethics offered by Bentham, Kant, and Aristotle shows that they are false alternatives" (ibid., 101; my translation). Bentham's proof of utilitarianism can be aligned with Kant's categorical imperative, and when it comes to the development of applied ethics, neither offers any alternative to Aristotle's practical syllogism. By contrast, the complex web of relations between ethical and legal reason previously described can give further development to Kant's and Rawls's theories of public reason and to Aristotle's original theory of natural law. It follows that the different legal systems of states governed by the rule of law can be a basis on which to proceed in constructing alternative ethical systems from the law. From a hermeneutic point of view, philosophical ethics cannot start out from a normative vacuum: It has to start from the normative preconceptions underpinning the normative language of social morality, religious law, or positive law, building on that basis by developing a critique of those normative languages. In this way we can have developments alternative to the law which at the same time make up ethical systems for the kinds of justice that may be appropriate to the circumstances distinctive to each state. So we can proceed on the basis of a prudential Aristotelian method—constructing ethics from the bottom up by progressively harmonizing maxims for action and resolving conflicts between principles—so as to arrive at truly alternative theories of justice and of law (see ibid., 101).

14.12. Postmodern Philosophy of Law: Santos

Boaventura de Sousa Santos (1940–) began his academic career as an assistant lecturer of criminal law at the law school in his native Coimbra. He then became professor at the Department of Sociology of the Coimbra University School of Economics in Portugal, and from September to December he teaches at the Institute for Legal Studies at the University of Wisconsin Law School in the United States.[23] His main book is on the sociology of law (see B. Santos 1995, 2000, 2002), but it takes a distinctively philosophical angle. Santos begins with a theory of history: Our time is a time of transition between the paradigm of modernity and

[23] See his autobiography in B. Santos 1995, 155–249.

another emergent time, of which so far we have only signs. The signs are unmistakable, and yet so ambiguous that we don't know if the paradigm of modernity will give rise to one or, rather, to more paradigms, or indeed if, in lieu of new paradigms, we are approaching an age whose novelty consists in not being paradigmatic at all. (B. Santos 2002, XV)

According to Santos, this paradigm transition has two main dimensions: an epistemological one and a sociopolitical one. The epistemological transition is between the dominant paradigm of modern science and an emergent paradigm he would call "prudent knowledge for a decent life" (B. Santos 2002, XVI).[24] The difficulty in picking up the signs of the coming time seems attributable for the most part to the sociopolitical transition

between the paradigm of global capitalism—broadly conceived as a mode of production, a system of norms and institutions, a model of consumption and lifestyles, a cultural universe, a regime of subjectivities—and the signs of a different future contained in the alternatives to this paradigm that are emerging variously in various fields of social activity. (B. Santos 2002, XVI)

This helps us understand Santos's "oppositional postmodernism" as a conception positioned against modernist critical theory (modern solutions for modern problems, as in Habermas and Roberto Unger) and against celebratory postmodernism (as in Duncan Kennedy). Modernism is "subparadigmatic," in that it seeks to develop a potential for social emancipation within the dominant paradigm itself. Oppositional postmodernism, by contrast, takes the view that the dominant paradigm of modernity has long exhausted all its potential for emancipation.

Critical thought must therefore assume a paradigmatic stance for a radical critique of the dominant paradigm from the standpoint of an imagination sound enough to bring forth a new paradigm with new emancipatory horizons […]. Otherwise the critique will lose all efficacy and tend toward Phyrronism, closing all gateways and choking itself to death in the confined space thus created by itself. This has been the tragic (or farcical) destiny of the critical legal studies movement in the U.S.A. (B. Santos 2002, XVIII)

And in its stance against modernist critical theory, oppositional postmodernism once again

does not wish to stop at the oppositional, centrifugal and vanguardist moment. To be sure, all critical thought defamiliarizes. But the mistake of modernist vanguardism was to indulge in the belief that defamiliarization is a goal in itself, whereas on the contrary defamiliarization is but the moment of suspension necessary to create a new familiarity. To live is to become familiar with life […]. The goal of postmodern critical theory is, therefore, to turn into a new common sense, in this particular case, into a new legal common sense. (B. Santos 2002, XVIII)

[24] This the title of a conference organized by Santos. The corresponding proceedings (Santos 2003) also bear the same title.

Bonaventura de Sousa Santos (2002, 85) puts forward a sociological conception of the legal phenomenon as "a constellation of different legalities (and illegalities) operating in local, national and global time-spaces." But the concept of law espoused by liberal political theory and by legal positivism recognizes only one of those time-spaces: the national one. Santos's conception needs a concept of law that is "broad and flexible enough to capture the sociolegal dynamics in such different frameworks of time and space" (ibid., 86). So he defines law as

> a body of regularized procedures and normative standards that is considered justitiable—i.e., susceptible of being enforced by a judicial authority—in a given group and contributes to the creation and prevention of disputes as well as to their settlement through an argumentative discourse coupled with the threat of force. (B. Santos 2002, 86)

Law has three structural components acting as three different forms of communication and decision-making strategies: rhetoric, bureaucracy, and violence. Rhetoric is based on persuasion, which it seeks to achieve by mobilizing an argumentative potential, and it is present in such legal practices as the amicable settlement of disputes and retributive (as against repressive) criminal justice. Bureaucracy is based on authoritative impositions effected by mobilizing the demonstrative potential of regularized procedures and normative standards. Bureaucracy is the dominant component of state law and is present in such legal operations as the adjudication of cases by courts and the passing of laws by legislative authorities. Violence is based on the threat of physical force. Violence can be used either by state actors (e.g., the police) to enforce the state's law or by illegal groups (e.g., organized crime) to enforce the code by which they operate (see B. Santos 2002, 86). So conceived

> law has both a regulatory or even repressive potential and an emancipatory potential, the latter being much greater than the model of normal change has ever postulated. The way law's potential evolves, whether towards regulation or emancipation, has nothing to do with the autonomy or self-reflexivity of the law, but with the political mobilization of competing social forces. (B. Santos 2002, 85)

How law can be emancipatory can best be seen by considering human rights. In Europe, human rights lay at the core of the emancipatory developments of modern law from the reception of Roman law toward rationalist natural law and the theories of the social contract (see ibid., 280). Like any other dimension of Western modernity, human rights in the 19th century were exclusively gauged to the needs of capitalist development. They were then regauged to solidify Western capitalism as a global endeavour, that is to say, as imperialism. The Western discourse on human rights has justified unspeakable violations, and these violations have been evaluated and dealt with under revolting double standards. But this is not the whole story. Millions of people and thousands

of nongovernmental organizations across the world have been victimized by authoritarian capitalist states. The political agendas underpinning the struggles against such victimization are typically explicitly or implicitly anti-capitalist. In sum, alongside the dominant discourse and practice of human rights conceived as a globalized Western localism, there has been developing a counter-hegemonic human-rights discourse and practice conceived as a cosmopolitan politics. According to Santos, the central task of emancipatory politics in our time consists, in this domain, in transforming the conceptualization and practice of human rights from a globalized localism into a cosmopolitan project (see ibid., 270–1).

> A post-imperial cosmopolitan politics must start from what exists. What exists is, on one hand, the nation-state as the still prevalent political form vis-à-vis which human rights politics seems to be the most adequate one to trim off the excesses of authoritarian rule; on the other hand, an interstate system that has adopted human rights as a kind of international code of moral conduct. The contractions in the regulatory function of human rights must therefore be taken as the starting point for an emancipatory politics. Because they are experienced worldwide, albeit very differently, such contradictions bear the seeds of translocal intelligibility and the formation of cosmopolitan global coalitions. In their conventional conception, human rights are falsely universal because they are oblivious to the inequalities in the world system, the double standards, the multiple forms of gender domination and the different ways and degrees in which human rights are embedded in different cultures. It is up to cosmopolitan politics to transform such false universality into the new universality of cosmopolitanism. Human rights are a political Esperanto, which cosmopolitan politics must transform into a network of mutually intelligible native languages. (Ibid., 282)

It is clear that this "must" is a political imperative, not a philosophical necessity. Santos's treatment of the "conditions for such a transformation" reveal how philosophy is placed at the service of the political agenda:

> First of all, it is imperative to transcend the debate on universalism and cultural relativism. The debate is a inherently false debate, whose polar concepts are both and equally detrimental to an emancipatory conception of human rights. All cultures are relative, but cultural relativism as a philosophical posture, is wrong. All cultures aspire genuinely to ultimate, universal concerns and values, but cultural universalism, as a philosophical position, is wrong. Against universalism, we must propose cross-cultural dialogues on isomorphic concerns. Against relativism, we must develop cross-cultural procedural criteria to distinguish progressive politics from regressive politics, empowerment from disempowerment, emancipation from regulation. Neither universalism nor relativism must be argued for, but rather cosmopolitanism, that is to say, the globalization of moral and political concerns with and struggles against social oppression and human suffering. (Ibid., 271–2)

A further condition for cross-cultural dialogue is, in Santos's view, the development of rhetorical devices such as diatopical hermeneutics. Diatopical hermeneutics is based on the idea that the *topoi* of an individual culture are as incomplete as the culture itself. Incompleteness in a given culture must be assessed through the lens of another culture's *topoi*. The objective of diatopi-

cal hermeneutics is to make cultures cognizant of each other's incompleteness through a dialogue with one foot in one culture and the other in another, as by looking at the human rights *topos* in Western culture in comparison with *dharma topos* in Hindu culture or the *umma topos* in Islamic culture. In this way, diatopical hermeneutics makes it possible to see that the weakness of Western culture lies in its establishing too strong a dichotomy between the individual and society, thus becoming vulnerable to acquisitive individualism, narcissism, alienation, and anomie. The weakness of Hindu and Islamic culture, on this same analysis, lies in their failing to recognize that human suffering has an irreducible individual dimension that cannot adequately be addressed in a hierarchical society (like that of the Hindu caste system) or in a society (like the Islamic society) that does not recognize equality between men and women or between Muslims and non-Muslims (ibid., 272–4). As a consequence, "the cross-cultural reconstruction of human rights must involve some measure of *mestizaje* of alternative cultural meanings and conceptions of human dignity" (ibid., 286).[25]

[25] It should be mentioned here that also inspired by philosophical postmodernism is the critical legal theory advanced by the legal historian António Manuel Hespanha (2007).

Chapter 15

A HISTORICAL SURVEY OF LEGAL REASONING AND PHILOSOPHY IN GREECE DURING THE 20TH CENTURY

by Constantinos Stamatis

15.1. New Insights into Legal Reasoning and Philosophy

At the twilight of the 19th century, legal thinking in Greece was primarily premised on positivistic tenets, at times embroidered with law-of-nature ideas and idealistic beliefs. However, at the dawn of the 20th century some remarkable signs of rejuvenation in Greek legal science came into sight.

This is explained by the fact that the obsolete legal order in Greece was incapable of facilitating a modernization of social life, in the slow transition of Greek society into the industrial era (see Triantaphyllopoulos 1923, 219ff., and Zepos 1934, 1978). Similar issues of institutional revitalization had already preoccupied legal science in more-advanced European countries, after the famous revisionary breach of Rudolf von Jhering (1865). So these themes could stir themselves into a flurry in Greece by benefiting from a broader debate that was then unfolding in European legal thought (see Sourlas 1990, 785ff.).

In some writings that Elias Anastasiadis (1879–1949) published in the early 20th century, we can sense an innovative spirit in the matter of legal interpretation.[1] For him, formally logical, deductive justification is nugatory if it brushes aside the substantive aspects of the case in dispute. By contrast, he can be characterized as having propounded the view of the social conditioning of legal reasoning, placing him very much off the beaten track. Nevertheless, he was not yet in a position to articulate an alternative methodological model in any fairly consistent manner. In a disorderly and indiscriminate fashion, his work strung together completely divergent trends of thought, from Auguste Comte's positivistic social theory and claims of "legal socialism," to neo-Kantianism and metaphysics (in small traces), to the intuitionist philosophy of Henri Bergson.

He was mainly inspired by the anti-formalistic vogues of legal thinking on the European continent, spearheaded by François Gény in France and Joseph Kohler, Eugen Ehrlich, Hermann Kantorowicz, and Philip Heck, in Germany.[2]

[1] This is especially the case with *Nomika filosofimata* (Studies in legal philosophy: Anastasiadis 1927), originally published in 1910, with a second edition in 1927. Particularly noteworthy in this book is the chapter "I thetiki, elefthera ermineia tou dikaiou" (The positive or free interpretation of law).

[2] On Gény, Kantorowicz, Ehrlich, Kohler see respectively Sections 12.5, 3.1, 3.3, and 5.2 in this tome.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_15

In contraposition to the formalistic grounding of legal judgments, he proposed an "inductive" method for finding the applicable rule, a method proceeding by "observation" of related social phenomena. Somewhat vaguely, he suggested that in every legal matter the relevant source of law is ultimately to be sought not only by resorting to various kinds of legal texts or to deductively drawn syllogistic schemes, but also, and especially, by considering the social utility ascribable to the resulting legal solution (ibid., 60).

This kind of thinking perhaps bespeaks some confusion about the normative nature of law and of legal interpretation. Be that as it may, Anastasiadis ushered in a fresh perspective in legal reasoning. He declared himself in favour of an "objective" interpretation when it comes to determining the regulative purpose of the applicable statute, in a way that is receptive to the contribution of other social sciences.

A few years later, however, he grew sceptical about the rationality of legal reasoning. Under the influence of Bergson's vitalistic philosophy, he suggested that legal interpretation be carried out not only through the intellect but also through a reliance on intuition (see Anastasiadis 1927, 121). He regarded this suggestion as recognition that the application of law cannot be severed from the various manifestations of social life. In the same text, he expressed serious doubts as to whether legal methodology is at all possible (ibid., 115).

Anastasiadis's approach thus resulted in an inchoate view about law and legal reasoning, a view informed by the erroneous notion that society as an object of knowledge is inescapably enveloped in indeterminacy. In this frame of thought, it proved epistemologically quite impossible to find ways in which the social equivalent of legal rules or their social framework could be understood by the use of reason. Thus his attack on the rigidly positivistic legal thinking of his time remained incomplete and assailable.

15.2. The Free Interpretation of Law

In 1916 came a work that was much better conceived: Its author was Constantinos Triantaphyllopoulos (1881–1966) and its title *Elefthera ermineia tou dikaiou* (The free interpretation of law: Triantaphyllopoulos 1916). The thrust of his doctrine was that jurists needed new methodological insights on which basis to deal with the rapid social and economic developments of the time, as European societies were advancing toward industrialization (for a detailed analysis, see Stamatis 2002, 243–72). He placed special emphasis on the emergence of the "social question." Affirming the need to gradually reform bourgeois society, he urged judges to play a part in restraining the propensity of overly powerful enterprises toward "antisocial" behaviour (ibid., 30).

Triantaphyllopoulos rightly maintained that a modern legal system cannot be complete or gapless but will inevitably contain discontinuities and normative antinomies. He repeatedly underlined that the methodological core of the

free interpretation of law is mostly focused on filling legal gaps. Like Anastasiadis, he entertained an expansive view of the concept of a legal gap, including cases where the law is amenable to doubtful or contentious interpretation.

The interpreter is still bound by the law as long as the meaning of the rule is clear enough (ibid., 13). But whenever argumentation shows that the semantic content of the applicable norm is ambivalent or gives rise to some regulative gap, the judge must adopt the interpretation that leads to a practically useful outcome, congruent with the needs at stake in social life. The judge should not just analyze notions in the legal text but should also resort to ethical reasons, thus acting in a "crypto-sociological" guise (ibid., 6).

This original position remained unclear in Triantaphyllopoulos's thinking: It hadn't become clear to him that a sociological understanding of legal phenomena seeks a *descriptive* account of them, while recourse to "ethical reasons" for action is necessarily a *normative* undertaking. The question of how one can legitimately shift from one level to the other without committing a naturalistic fallacy as to the discrepancy between "is" and "ought" was left unaddressed by him.

Triantaphyllopoulos also argued that when a text is ambiguous, the interpreter ought to follow the solution most in keeping with "correct law" (Triantaphyllopoulos 1922, 23), following a neo-Kantian line of thought suggested by Rudolf Stammler.[3] In cases of legal gaps or of interpretive doubt, the judge is to proceed to free, unrestricted interpretation of the law, except in the proper qualification of acts under criminal law (ibid., 8). The interpreter, then, is to some extent freed from the putative preestablished legislative will if the conceptual core of that will happens to be difficult to pin down. Yet, even then, the judge should try to stretch the abstractly stipulated terms of the rule so that they can fit the specific social parameters of the case at hand. Indeed, the judge is not supposed to administer justice merely by reasoning on a case-by-case basis, for that would amount to sheer ad hocism (Triantaphyllopoulos 1916, 22).

The interpreter is in principle committed to applying the rule, unless that rule has fallen into disuse, as can happen with old legal rules that have turned out to be incompatible with currently valid law. Otherwise, legality would be severely undercut. Triantaphyllopoulos recognized that more intricate is the case where the interpreter stumbles on a law that seems *conceptually clear but substantively unjust*. He claimed that the remedy in this case lies in a duty for jurists to critically assess the unjust law, in order that the injustice may be tempered or dispensed with. Anyone, jurist or citizen, intent on pursuing such an unjust provision should expect to do so meeting at some point in that quest the so-called right to resistance, or even a right to revolt, if the circumstances are desperate enough (Triantaphyllopoulos 1922, 23).

[3] On Stammler, see Section 1.3 in this tome.

In the opinion of Triantaphyllopoulos, the appropriate method of legal interpretation is one that grasps the "common sentiment" about the law and to this end recognizes the importance of intuition. The judge must carefully weigh the conflicting interests at stake by taking into account all the relevant *bona mores* and economic, social, and moral features of the case at issue. The judge must in this sense aim for the solution that might have been adopted by the legislator (Triantaphyllopoulos 1916, 4–5). Since legislators rely on social considerations of public policy in framing the law, the judge would do well to fashion these considerations into legal criteria on which basis to interpret the rules they support.

Triantaphyllopoulos was fully aware of the criticism the *Freirechtsbewegung* (or free law movement) attracted in Germany and even in France.[4] The thrust of the criticism was that even if we acknowledge the shaping hand of the judiciary in construing the meaning of legal rules, this is not tantamount to acquiescing in "free" legal interpretation. A theory of "free" interpretation can in this sense be seen to bring with it a whole host of intractable difficulties, but two stand out. For one thing, the free interpretation of law claimed for judges would empower them to create new law, and that is inconsistent with the separation of powers. And, for another, it was claimed that the theory would translate into a practice dangerously close to unfettered judicial discretion; so the allegation was that free interpretation would morph into interpretive arbitrariness, which in turn would lead to legal uncertainty in social life.

To assuage such misgivings and rebut such objections, Triantaphyllopoulos responded that the objectivity of legal interpretation can in any event be secured so long as the interpreter is *committed to finding an appropriate solution* (Triantaphyllopoulos 1922, 22ff.). This means that judges must make sure their decisions hew to the overall spirit of a good legal order and are socially justifiable as well. Indeed, legal issues are at bottom *social* issues. And since jurists and judges are themselves participants in social life, it takes a combined use of the social sciences to work through those issues. So, what the author is suggesting, quite reasonably, is that the rightness of legal judgments ultimately lies in their historical embeddedness, in the advancement of modern societies toward social justice, beyond the formal equality of all before the law.

However, a few years later Triantaphyllopoulos would no longer deal with the problem of legal interpretation specifically but would content himself with a programmatic thesis no longer in tune with his initial methodological radicalism. He adhered to a crudely positivist conception of legal rules on which laws

[4] Two years later (in 1918), when Triantaphyllopoulos was appointed professor of civil law at the Athens School of Law, a similar line of criticism was directed against his own thesis. As we will see, the most powerful critical assessment of this movement in Greece is the one offered by Constantinos Tsatsos.

in general set forth imperatives understood as commands.[5] He claimed that in interpreting law, jurists should engage in *reproductive* (rather than creative) work. They should merely seek to ferret out a normative thought previously expressed by someone else, the legislator, and they are fully committed to the imperative baked into that thought. Jurists do not really find out anything new that has not already been textually spelled out by legislative volition, whether directly or indirectly.

This positivistic outlook sits poorly with his earlier view on correct law.[6] Indeed, as Rudolf Stammler illustrated, if laws are envisaged as commands, then too little room is left for the interpreter to meet the demands of justice.

15.3. The Formative Function of Jurisprudence

In 1932, Alexander Litzeropoulos (1903–1988) published a remarkable work, *I nomologia os paragon diaplaseos tou idiotikou dikaiou* (Jurisprudence as a formative factor of civil law: Litzeropoulos 1932). The book managed to resourcefully bring into a coherent view the best arguments developed by currents critical of legal positivistic reasoning, which by that time had become outmoded. His central idea was that judicial authority should properly play a significant ancillary role, next to the legislature, in shaping the general principles of law, in that judicial authority is entrusted with co-promoting, in the best possible manner, the general interests of society at large (see Litzeropoulos 1932, 8). According to Litzeropoulos, the judiciary may exceptionally deviate from legislative volition when it finds that the applicable rule hinders freedom of transaction or offends society's shared understanding of law and justice.

Litzeropoulos held a moderate view in comparison with the German free law movement or even with his own earlier theses. He argued that the judge must interpret the law by closely adhering to the fundamental principles underlying the legal order. As much as judges must still rely social (material or moral) utility as the principal criterion on which basis to frame legal solutions, they cannot discount the values embodied in existing legislation. The judge, in other words, must craft solutions that the legislature would itself enact as law (ibid., 9).

Subsequently, having satisfied that condition, the judge qua interpreter must evaluate the anticipated social consequences of the solution to be adopted, placing those considerations in the major premise of the syllogism. How-

[5] This is a view he set out in a short commentary titled *Dikaion* (law: Triantaphyllopoulos 1932).

[6] See especially Triantaphyllopoulos 1926. The very same year, Panayotis Kanellopoulos published a book titled *Peri tis ennoias tou diethnous dikaiou apo criticofilosofikis apopseos* (On the concept of international law from a critical-philosophical point of view: Kanellopoulos 1926), which, too, was cast in the mould of Stammler's neo-Kantian philosophy of law.

ever, the teleological argumentation deployed to this end must cohere with the aims of the legislation at issue, and must be interwoven with the overarching aims of legislation at large. In Greece, where Roman law was still formally in force, and yet was historically defunct, the ethos of the country was much better reflected in the recent laws, the ones passed by the parliament. For this reason Roman-Byzantine legislation was being abundantly complemented or deeply revised (see Papachristos 1975, 15–20).

In borderline cases, the interpreter must also take into account a complex of elements that lie beyond the legislative realm *stricto sensu*, such as society's shared consciousness in the matter of law and morality and the potential social utility of one solution relative to another (Litzeropoulos 1932, 100). Reasoning along these lines, Litzeropoulos held back from a wholehearted espousal of the free law movement, in Greece or abroad. He would definitely not subscribe to the vague and politically contentious view that the law is simply a regulatory device for judges and interpreters to use at their own discretion, so long as they head the people's shared understandings about law and justice.[7]

It bears mentioning that when Litzeropoulos appealed to society's shared consciousness about law and morality, he had a narrower purpose in mind, which was to legitimize the lawmakers' effort to bring *urgent* changes to the legal system. Indeed, the cliché in the interwar period was that Roman-Byzantine law had by then grown so outdated, it proved utterly ill-equipped as a basis on which to provide a contemporary and flexible corpus of rules, in a rapidly growing society,[8] with an outward-looking market economy dependent on the global market. Litzeropoulos's appeal to society's shared consciousness about law thus served an ideological reformative purpose: It was functional to the view that the state, and in particular the legislature, ought to be responsive to social needs and expectations, especially in light of the consideration that these went unanswered by the country's legal system.[9]

15.4. A Teleological Model of Legal Interpretation

In 1932, a veritably compelling book came out that enriched Greek legal reasoning by introducing an unquestionably original conception for its time: Its author was Constantinos Tsatsos (1899–1987), who in *To provlima tis ermineias tou dikaiou* (The problem of legal interpretation: Tsatsos 1932) offered a robust model departing from both formalistic legal reasoning and the free law movement.

[7] This view can be found, among other places, in the work of the Greek legal thinker Georgios Daskalakis, who in those years followed the *Freirechtsschule* (see Daskalakis 1940, 456ff.).

[8] This phenomenon is aptly described in Lampiris 1923.

[9] Not all authors, however, supported that reform agenda. See, for instance, Balis's quite restrictive account of gaps in the law (Balis 1937, 23ff.).

Running all through Tsatsos's thought are the themes developed by the vast neo-Kantian current, though he was especially influenced by the neo-Kantianism of Heinrich Rickert.[10] Legal science is set in contrast to the natural sciences by virtue of its being "historical, practical, and spiritual," and to the (descriptive) social sciences—such as economics, sociology, and psychology—by virtue of its being normative (Tsatsos 1932, 32).[11] Positive law does not *describe* social reality: It normatively sets out the way the latter *ought to* be fashioned by law. And since embedded in positive law is the aim of its own application over time, positive law gains a normative autonomy from the volition of the historical legislator.

But humans are prone to violate their own freedom—incapable as they are to act enduringly in compliance with imperatives of reason that they themselves select—and the legal order must therefore constrain that freedom. This makes the legal order heteronomous, but Tsatsos saw this heteronomy as a rational response to that human weakness, and so as a morally and politically justified response (ibid., 53–61). Positive law is in this sense legitimized in marking out spheres of freedom mediated by the state as a way to ensure social coexistence, using the state's coercive powers if the occasion calls for it.

The work of the legislator and the legal interpreter alike requires in every instance some interpretation of existing law (ibid., 88). Either the lawmaker or the interpreter (the judge or jurist) has to identify proper ends for the regulative content of legal norms by looking at their systemic entwinement within the legal order. The interpretive assumption is that the legal order is axiological and teleological through and through (ibid., chap. 2). It follows that legal reasoning is underpinned by *a deeper nexus unifying all fields of positive law*. The interpreter must make sense of the enacted statutes in light of the regulative ends they encapsulate, and there is no way to appreciate those ends without taking into account the crowning values (or principles) overtopping the given legal order (ibid., chap. 3).[12]

The meaning of laws lies in the regulative purpose they each have in their interplay with the ends served by rules of higher rank, in virtue of which concrete rules can be meaningfully justified. Tsatsos subscribed to an especially broad concept of "teleological" legal interpretation: This wasn't just another method of interpretation next to the others—the grammatical, the historical, the logical, and the systematic—but was rather legal interpretation itself, period (ibid., 24, 131, 141). Indeed, the legal order as a whole was conceived

[10] This can be appreciated from the outset, in his doctoral dissertation, which he defended in Heidelberg: See Tsatsos 1927. On Rickert see Section 1.1 in this tome.

[11] See also Tsatsos 1929, 201–39. This was in contrast to Frangiscos Valindas, whose unbending philosophical nominalism and sociological positivism led him to embrace a conception of legal science as a *positive* science (see Valindas 1930).

[12] See also the useful comments in Sourlas 1978.

by him as a stratified web of legislative ends endowed with coercive authority: It was the historical concretization of the "idea of law." Encapsulated in this idea, as he understood it, was an objective value, figuring as a rational prerequisite of any legal judgment (ibid., 28–30).

But Tsatsos's "idea of law" appears to be philosophically ambiguous, since it has all the makings of a postulate of *practical* reason, and yet he introduced it as an idea of *theoretical* reason. What is more, this conception carries conservative overtones, since it foregrounds legal coercion as the single most significant element in which to ground the external regulation of freedom in society. It bears pointing out that such external regulation of freedom within a polity was *itself* the thing he called "heteronomy": He took no broader view of that concept. Totally absent from this account was the Kantian foundation of a modern republic grounded in the united will of the people as *co-legislating* subjects—the most highly valuable form of political self-determination for the people. So, as much as Tsatsos may have been right to make the case for legal coercion as a general condition for the possibility of freedom in a political community, he neglected to say anything about the basis on which such coercion (the exercise of state power) can be legitimized.

It is perhaps for this reason that Tsatsos's thought subsequently swung in quite the opposite direction, away from Kant's critical idealism to Plato's dogmatic metaphysics.[13] Exemplary in this regard—arguably the moment that best illustrates Tsatsos's philosophical and ultimately political disaffection with Kantian critical philosophy in the post-war years—was his espousal of the premodern idea, unreservedly conservative and distinctly Platonic, of a polity helmed by enlightened "royal men"[14] not bound by the rules of positive law. This stance sparked the trenchant criticism of an eminent constitutional law scholar, Aristovoulos Manessis (1921–2000),[15] who approached the question from the angle of the fundamental principles of liberal democracy, defending the lawful exercise of state power under the citizenry's constant oversight.

One of the precious insights that Tsatsos left to posterity in legal reasoning lies in the distinction he introduced between, on the one hand, code law (enacted statutes) and the principles underpinning the legal order and, on the other, the specific norms *inferred* through interpretation (Tsatsos 1932, 117 and 235). Although Tsatsos took up in the main Savigny's classic set of four methods in legal reasoning, he reformulated it in a quite inventive and coherent manner (ibid., 110–45).[16] Neither the putative literal interpretation (or

[13] An extensive account of this transition can be found in Stamatis 1984, 259ff.

[14] That designation comes from an article by Tsatsos that bears that very title, *Oi Vassilikoi Andres* (Royal men: Tsatsos 1963). See also the lecture he delivered at the Academy of Athens under the title *Oi antinomies tou praktikou Logou* (The antinomies of practical reason: Tsatsos 1962).

[15] The criticism is laid out in a famous pamphlet by Manessis (1963) titled *Kai palin peri Vassilikon Andron* (On royal men once again).

[16] On Savigny see Section 21.3 in Tome 2 of this volume.

"plain meaning") of the law nor the legislative intent (the will of the actual legislator) suffice as a basis on which to arrive at an adequate understanding of the statutes. Interpretation makes it necessary to *systemically* integrate valid rules into the teleological fabric of the legal order. Jurists ought to interpret the law *as a whole*, as if the existing legal order were coherent and complete (even while recognizing that it is not): Solutions offered in legal matters must be congruent with the systematic articulation and *teleological integrity* of the legal order (ibid., chap. 4).

Defending the idea of a "deontological completeness of law" (ibid., 214; my translation), Tsatsos suggested that to interpret the law is generally to arrive at a *more concrete norm not explicitly laid down by any legislator*. As he keenly observed, the interpretive process imparts to rules the shape of regulative enclosures within which each rule finds its place in multiple alternatives corresponding to various subcategories of cases.

And yet, as he correctly pointed out, this work is carried out by interpreters relying on an intermediary norm whose meaning, by contrast, can only be one: It needs to be univocal. If we rejected this rationale, we would foreclose the possibility of reaching anything like the best solution, by which he means the solution that is best *relative to the ones put forward*. That is the import of the view defended by Tsatsos that for every legal problem under any system of positive law there can only be a *single correct solution*: It means that there must be a solution which turns out to be better than any of the ones that suggest themselves as plausible (Tsatsos 1932, 200 and 257). As was previously noted, a similar view had previously been expressed by Triantaphyllopoulos, arguing that the interpreter has to look at all possible solutions and identify the one offering the best rendition of "correct law." This turned out to be a particularly prescient thesis, considering that it would be made famous several years later by Ronald Dworkin, among others.

In contrast to Triantaphyllopoulos, Tsatsos rightly held that the law constrains the judge even when the task at hand is to fill *gaps* in the law: Judges are bound by the general principles of law or by a statute that is to be applied by analogy, or both. So, under no circumstances is it correct to speak of a "free interpretation of law" or of the judges' discretionary authority, since legal interpretation is an inherently rule-bound activity. Accordingly, Tsatsos held that legal reasoning properly understood should not resort to "extralegal" criteria (ibid., 236–7). Whenever the law invokes economic and social yardsticks (moral standards, business ethics, and the like), usually tacitly, these already form part of the normative range of the existing legal order.

15.5. A Positivist Marxist Theory of Law and Legal Reasoning

Although Yanis Kordatos (1891–1961) studied law, it is especially for his work in history that he gained renown. His thought on legal theory is less known.

The most significant work in this area is *Eisagogi eis tin epistimin tou dikaiou* (Introduction to legal science: Kordatos 1939), published under the Metaxas dictatorship (which ran from 1936 to 1941).

It is commonly accepted that science pursues objective truth. Kordatos took this to mean that we must look for the laws of movement governing the objective world, and that we must do so from a materialistic worldview, understanding the manifold intellectual manifestations as reflections of material relationships. It also means that we must try to understand and classify social phenomena by reference to causal relationships. To do science is essentially to correlate cause and effect, through a knowledge of nature and society alike. These tenets situate Kordatos in the *positivist* Marxism of the Second International, the predominant Marxist current in the first half of the 20th century.[17]

Kordatos was influenced by the Russian Marxist Nikolai Bucharin (1888–1938) and came to view sociology as the queen of the humanities. Therefore, when it comes to the study of legal and political phenomena, only the history and sociology of law can rise to the rank of authentic science. The rest of legal science, by contrast, is reduced to a *philological* understanding of existing statutes. The subject matter of legal science is not freely determined by jurists but is produced by authority of the legislative will. The implementation of law is a simple empirical endeavour (Stamatis 1989, chap. 1). It is aimed, not at discovering the truth of things, but simply at carrying out the legislator's will in a given legal order. It follows that what is described as "legal science" is at bottom *devoid of scientific credentials* (ibid., 15).

It is rather odd, in light of Kordatos's Marxist background and outlook, that he should have gone to great efforts to find a "pure" definition of the object of legal science (ibid., 40–1). And he located that object in the idea that law and the state constitute a legal and political superstructure erected atop the economic and material infrastructure in every class society. However, in the superstructure of society he included both law and legal thought without distinguishing between the two, on the premise that they share a focal feature, in that both are merely ideological: No less than positive law, theories of law express ideas reflecting the material substratum of each society (ibid., 17–8). Kordatos wholly neglected the *normative nature* of both law and legal science. Indeed, following his reasoning, if the humanities can be regarded as scientifically sound only to the extent that they set out to uncover chains of causes and effects, then no science worthy of that name can have a normative or deontological bent.

Kordatos held that in any class society with private ownership, law and the state will remain firmly ensconced in their essential nature, since they function as complex *instruments of domination* serving the interest of the ruling class (ibid., 19). This explains why he was chasing after a "pure" definition of law

[17] For further commentary, see Stamatis 1989, esp. chap. 1.

and the state. That endeavour evinces a latent crude historicism, viewing social processes in the abstract through the lens of a grand conceptual scheme in which to fit them. Thus, for example, he summarily projected the modern categories of legal thought onto the pre-bourgeois past, a case in point being the distinction between the public and private spheres of society (ibid., 23) or the concepts of rights and of a subject of law (i.e., a legal person or a subject of rights). More to the point, he lacked an adequate understanding of the historical conditions for the formation of bourgeois societies, thus failing to appreciate the relative separation of the state machinery from society.

Kordatos saw law and the state as integral to an apparatus of oppression. For this reason there was no point in looking for the conditions that would *legitimize* them in the eyes of the oppressed classes. But this attitude set the stage for other problems; thus, for example, he attached next to no significance to individual and political freedoms, all the while ignoring the role of a modern legal system in providing basic safeguards, just as he failed to recognize the import of equality and freedom for all citizens irrespective of class or status (ibid., chap. 2). The judge, on his conception, is bound to closely implement the legislator's will, but the content of that will, at its bare essence, comes down to what the ruling class wills in social and legal matters (ibid., 208–10).

Also discounted by Kordatos was the *argumentative* nature of legal interpretation, with the result that, in his view, the very possibility of reaching legal judgments by any *rational* process was out of the question. Working away in the background here was the view that justice and rationality are no more than illusory bourgeois conceits. Even in this light, his analysis did not avoid some glaring contradictions (ibid., chap. 3).

So on the one hand he embraced a formalistic approach to legal reasoning, incorrectly believing that judges should go about interpreting rules solely on the basis of a philological and quasi-mechanical analysis of legal concepts (ibid., 15). But on the other hand he surprisingly nudged the judiciary toward catering to the needs of society (ibid., 202), yet this would prove to be an idle exercise in light of his previous definition of legal interpretation as a merely philological enterprise. Indeed, if the interpretation of legal rules is strictly philological, it will likely be insensitive to their fairness or to the way they might shape their social surroundings.

Similarly, having ascribed to judges a role as mechanical reproducers of the legislator's will (ibid., 29), Kordatos denied that they can be held morally or politically accountable for the judgments they render. But then he invested judges with just such a responsibility (ibid., 30), and that without offering any indication as to how such responsibility was supposed to play out in concrete terms. The problem here is that a deeper contradiction is lurking behind the explicit one just pointed out, in that from the outset he had contended that genuine science can only concern itself with *explanatory* schemes purporting to relate causes and effects: It cannot dwell on *practical* principles in light of

which to guide human action, and yet that is precisely what the idea of the judge's responsibility involves. Not to mention that Kordatos came to believe that the judge acts as an agent of the dominant social system and is thus committed to carrying out the will of the ruling class (ibid., 25, 96). But that view can hardly be reconciled with Kordatos's exhortation—a justified one this time—that the judge should not cave in to the wealthy elite (ibid., 30).

In short, Kordatos's *Eisagogi eis tin epistimin tou dikaiou* clearly conveys a dire pessimism about the law of bourgeois society and its historical development. In fairness to him, it must be pointed out that he was writing at a time when dictatorial or fascist regimes had risen to power across much of Europe, including Greece. And so his profoundly bleak outlook no doubt came in response to the destructive historical development he witnessed in the interwar period.

Even so, this awful tract of history cannot fully account for the weaknesses of his theory: His thinking simply echoed the theoretical shortcomings of the prevailing Marxist current of the time, namely, "scientific" socialism. His sociological viewpoint committed him to an *external* critique of law as having no role other than as an organ of class rule. And this analytical lens limited his field of vision in such a way as to prevent him from seeing or accommodating any other function of law, much less a positive one.

15.6. The Period after World War II

In the years following World War II, Constantinos Tsatsos abandoned academia and devoted himself to politics, rising to prominence in the country's conservative political establishment.[18] As to legal philosophy, however, he did introduce some considerations of note in the epilogue to the (unchanged) second edition of the previously discussed *To provlima tis ermineias tou dikaiou* (The problem of legal interpretation: Tsatsos 1978).

More to the point, while he held on to the "idea of law" as central to his thought, he did make that idea more perspicuous by remarking that it was to be understood as coinciding with the idea of justice. On the latter idea,

> everyone ought to be in command of the self, being free to act rightly, so that all can creatively develop various capabilities in society. No one should be deprived of this primary *facultas agendi*, not on account of their background or (fragile) economic status or, more generally, on account of the material aspects of social coexistence (Tsatsos 1978, 265; my translation).

Two elements here need to be singled out for praise: first, the inherent link between moral autonomy and acting rightly, as opposed to just doing whatever the agent happens to choose, and, second, the correlation between autonomy

[18] Just after the fall of the military dictatorship (1967–1974), he served as one of the framers of the new constitution, enacted in 1975: see Tsatsos 1988.

and some supportive material foothold in life for all, suggesting that the social product ought to be redistributed as a condition for social welfare.

In the post–World War II era, legal reasoning in Greece began to branch out into various areas of law, endowing them with a certain methodological awareness. And even though this appreciation was slow to develop and bear fruit, there are some outstanding figures, notably Themistocles Tsatsos, Emmanuel Michelakis, Constantinos Despotopoulos, Georgios Michailidis-Nouaros, Yanis Aravantinos (see Aravantinos 1974, 1983), and Georgios Mitsopoulos. All of the authors in this group were to a greater or lesser extent influenced by Constantinos Tsatsos's neo-Kantian teaching, the only exception being his own brother, Themistocles Tsatsos, whose intellectual background was instead neo-Hegelian.

This situation has been appreciably improving since the 1980s: The landscape in legal reasoning in Greece has since been growing richer with a good many law-review articles and studies, published either as original research (in Greek) or as translations from other languages, in an effort to connect anew with contemporary developments in legal methodology internationally (see especially Sourlas 1989, 1995, and 2011 and Stamatis 1995, 1999). In parallel, philosophical reflection on law is again picking up steam, with authors of Kantian persuasion like Pavlos Sourlas, Yanis Strangas, Constantinos Papageorgiou, and Constantinos Stamatis.[19]

[19] Following is a selection of recent books by Greek legal theorists, published in English, German, or French: Chanos 1994, Despotopoulos 1983, 1997; Douzinas 2000, Mitsopoulos 1967, Paparrigopoulos 1993, Papageorgiou 1994, Paroussis 1995, Roumeliotis 1994, Sourlas 2011, Stamatis 1995, Stavropoulos 1996, Strangas 1988.

Chapter 16

20TH-CENTURY LEGAL THEORY AND PHILOSOPHY IN POLAND

by Tomasz Gizbert-Studnicki, Krzysztof Płeszka, and Jan Woleński

16.1. Introduction[1]

In general, Polish philosophy has gone through the same phases as has the rest of the Western world. This does not apply to antiquity, of course, but it does hold true for the Middle Ages, the Renaissance, the Reformation, modernity (the 17th century), the Enlightenment, and the 19th and 20th centuries.[2] Philosophy in Poland saw similar problems and currents as those dominant in the mainstream of philosophy in the Western world. However, there have also been some distinctive features. For example, due to the peculiarities of Polish social and political history, Scholasticism and Renaissance thought appeared in Poland later than in Western Europe. This delay was characteristic in further phases, too. Thus, for example, the Enlightenment and Romanticism flourished in Poland later than in France, Germany, or England. The situation changed in the 20th century, when Polish philosophy engaged fully with world philosophy. However, the specific situation just mentioned caused Polish philosophy to be always fairly pluralistic, with several ideas simultaneously at work, very often in conflict.

Many Polish philosophers of the 15th century were interested in political-legal issues. Since many Poles studied in Prague at that time, they were strongly influenced by Prague's late Scholasticism, very sympathetic to views of John Wyclife. In particular, Mateusz of Kraków (ca. 1345–1410), Paweł Włodkowic (Paulus Wladimirus, ca. 1369–ca. 1443), and Benedykt Hesse (ca. 1389–1456) took a very active part in the debate between curialists (defending the supremacy of the Pope over the Council) and conciliarists (arguing

[1] Since the preceding volumes of this *Treatise* do not discuss legal thought in central and eastern Europe, we will be making some remarks about the development of legal theory and philosophy in Poland before the 20th century, but only covering the most important points.

[2] For an overview of the history of Polish philosophy, see Jordan 1963 (post-1945), Krzywicki-Herburt 1967, Szaniawski 1980 (post-1945), Kuderowicz 1988, Gogacz and Ślipko 1996, Coniglione 1996, Czerkawski, Stępień, and Wielgus 1998, and Woleński 2003. Unfortunately, there is no survey of the history of Polish legal theory and philosophy available in any Western language. People familiar with Polish can look at Opałek and Wolter 1948 (its first part written by Opałek)—in fact, this is the only work entirely devoted to this subject. Some information can be found in Wagner 1970. Further, I will not quote secondary writings on legal philosophy in Poland published in Polish. Moreover, with only very few exceptions, works published before 1900 are mentioned in the running text without full bibliographical information.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_16

that the Council is the highest authority in the Roman Catholic Church). The mentioned Poles (and other as well) belonged to the concilliarist camp. The most important Polish contribution to legal philosophy in the Middle Ages was connected with Poland's conflict with the Teutonic Knights, who were defeated at the Battle of Grunwald in 1410. The knights accused the Polish king, Władysław Jagiełło, claiming that he should not bring pagans into his troops: They argued that the enlistment of pagans to fight against Christians violated the rules of *bellum iustum* (just war). The case was brought before the Council of Constance (1414–1418). The Polish arguments were first presented by Stanisław of Skarbimierz (?–ca. 1431) in his speech *De bellis iustis* (1410), and then in Paweł Włodkowic's 1415 treatise *Tractatus de potestate pape et imperatoris respectu infidelium* (Treatise on the Pope's power with respect to pagans). Włodkowic very painstakingly fleshed out the concept of *bellum iustum*. Following in the footsteps of Stanisław of Skarbimierz, he argued that every war in defence of one's homeland is just and every aggression unjust. Furthermore, military force cannot be used to convert people to Christianity. Włodkowic also defended the principle of tolerance and said that pagans should be left in peace if they lived by the general rules of Christian morality. His treatise was very important to the development of international law.

The 16th century is usually referred to as the golden age of Polish culture. This remarkable period was a result of favorable political and social circumstances. Poland—or, more precisely, the Polish-Lithuanian Commonwealth—was a large, rich, and strong country. The Reformation was another important factor. A considerable part of the Polish nobility adopted Calvinism, but Lutheranism became popular in the towns. The 16th century was a period of outstanding toleration in Poland, greater than in other European countries. The Polish people, nobility and burghers alike, had a free choice of religion. This was the context for the rise of the Polish Brethren (*Fratri Polonori*, also called Socians or Arians), the most radical Calvinist group in Poland. Their philosophy rejected violence and defended tolerance. The Polish Brethren were expelled from Poland in the 17th century. They emigrated to the Netherlands and became very popular there as well as in England. In particular, they strongly influenced Grotius, Spinoza, and Locke. Although Poland flourished in the 16th century, this is also the time when the first signs of political crisis began to emerge. Several authors accordingly proposed reforms of the state and society. Andrzej Frycz-Modrzewski (1503–1572) was the most important Polish political writer and theorist of the state in the Renaissance period. He wrote a treatise called *De Republica emendanda* (On the improvement of the Republic, published in Basel in 1554). This book diagnoses the social structure of Poland and puts forward a program for reform. The points are as follows: equality before the law for all citizens, tolerance, the legal protection of peasants, privileges for burghers as concerns trade and the crafts, the separation of Church and state, conciliarism in both institutions, a stable tax system, educa-

tion as a starting point for public activity, and a peaceful foreign policy. Modrzewski's program was well known in Europe, especially in Switzerland and Spain.

The Counter-Reformation triumphed in Poland in the 17th century, even though the country was still more tolerant than most of Europe. The political and economic crisis was becoming increasingly palpable: Poland gradually waned as a political power, and education and philosophy were entirely post-Scholastic, so much so that the great systems of rationalism and empiricism were almost unknown in Poland. The situation changed in the second half of the 18th century. Since the country was facing the threat of the aggressive policies of Russia, Prussia, and Austria, the leading representatives of the Polish Enlightenment, influenced by French, German, English, and Scottish thought, focused on political philosophy, social ethics, and the theory of the state. At least two authors deserve mention here. The first of these is Hieronim Stroynowski (1752–1815), who in 1785 published a book titled *Nauka prawa przyrodzonego politycznego, ekonomiki politycznej i prawa narodów* (The science of natural law, of political economy, and of the law of nations). This work is an attempt at summarizing the problems singled out in its title. Stroynowski followed the French doctrine in its deistic version. He proceeded from the economic theory of physiocracy and accordingly viewed moral and physical principles as parallel and necessary; legal rules must be consistent with universal morality. The second of the authors, Hugo Kołłątaj (1750–1812), was perhaps the most original Enlightenment thinker in Poland. His book *Porządek fizyczno-moralny* (The physical-moral order, of 1810) contains a very extensive philosophical system. Although Kołłątaj was also a deist, his conception was more radical than Stroynowski's. In particular, he considered the physical order to be genetically more basic than the moral one. Relying on physiocracy, Kołłątaj deduced the priority of nature from the fact that the earth and its fruits are ontologically basic. Thus, the moral and legal orders—moral and legal duties and rights—are constituted on the basis of the physical structure of reality. Kołłątaj was a social optimist. He believed in an automatic progress of humanity. This view anticipated positivism.

Poland eventually lost its independence in 1795, when it was partitioned among Prussia, Russia, and Austria (earlier partitions took place in 1791 and 1793). The annexation period (lasting until 1918) was very hard on academic life in Poland.[3] Poland had three universities before 1795: in Kraków, Vilna, and Lvov.[4] In broad outline, these universities were either closed (Vilna) or

[3] Poland is actually a misnomer here, we should rather speak of the Polish territories in the period from 1795 to 1918. But since it is customary to refer to them by the name of the country (even for that period), we too will follow that practice.

[4] There is a problem here when it comes to the proper way to spell the name for these last two cities (a problem with political undertones). The Polish spellings are *Wilno* and *Lwów*, the

Germanized until the 1870s (Kraków and Lvov); the University of Warsaw was established in 1816, closed in 1831, reopened in 1857 as the main school, and closed once again in 1869; the Prussian (later German) government almost completely blotted out Polish intellectual life in its territory. Another factor that slowed down the development of legal thought in Poland lay in the fact that the country lacked a legal system of its own. The occupiers introduced their own law, and part of the country adopted the Code Napoléon. In some works by Polish historians of law, one can find traces of the German historical school. The situation improved after 1870, particularly in the Austrian part of the country (where Kraków and Lvov were located). The liberalization of the Habsburg monarchy resulted in a re-Polonization of the universities and in systematic investigations even in legal philosophy. In 1887, in a book called *Zadanie filozofii prawa i jej stanowisko w dziedzinie nauk prawnych* (The task of legal philosophy and its place in jurisprudence), Franciszek Kasparek (1844–1903) offered a typical example of legal positivism. He thought legal philosophy should set out general concepts for the doctrinal study of law. Ludwik Gumplowicz (1838–1909), associate professor in Graz, developed an innovative theory of the origins of the state, a theory he set out in several writings, including the 1883 *Der Rassenkampf* (The racial struggle). Philosophically, Gumplowicz was a positivist and a social determinist: He thought individual life is determined by people's participation in social groups, and that society develops by a mechanism of conflict among races. But races were understood by him as sociological constructs, not biological ones. On this theory, states arise as results of conflicts between races.[5] Edmund Krzymuski (1852–1928), professor of criminal law in Kraków, worked in the tradition of legal Kantianism and through his lectures popularized legal philosophy.

16.2. The Period from 1900 to 1939[6]

The situation of Polish intellectuals gradually improved during the last thirty years of the 19th century; even the German territory had some Polish research institutions, such as societies and libraries. The best conditions were in the

Lithuanian spelling is *Vilnius*, and the Ukrainian is *Lviv*. We have decided to use the English-sounding words *Vilna* and *Lvov* because they tend not to stir up nationalistic sentiments. We do understand that using Polish words can sound offensive to Lithuanian or Ukrainian speakers, but neither the Lithuanian nor the Ukrainian spelling would be justified here, because we are reporting on times when Vilna and Lvov were Polish cities.

[5] Gumplowicz's ideas are discussed from different angles in the articles in Brix 1986.

[6] We are dividing the 20th century into two periods, namely, 1900–1939 and 1945–2000. Although this division is obvious and particularly important in the case of Poland, it is perhaps interesting that not everyone perceives it that way. Consider, by way of example, that the National Library in Warsaw once received from a South American country a complaint that subscriptions to Polish scholarly journals were unavailable for the period from 1939 to 1945.

Austrian part. Both universities (in Kraków and in Lvov) were completely Polonized, and the Polish Academy of Science and Letters (located in Kraków) became another academic centre. Warsaw was in worse shape because it had no Polish university. The Russian Imperial University was not very popular among Poles and did not contribute to Polish culture in any significant way. On the other hand, Warsaw had an advanced system of quasi-academic teaching, as well as remarkable publishing activities; the Warsaw Scientific Society, established in 1907, became the most important academic centre in the Russian territory before World War I. However, these institutions did not suffice for a normal development of science and the humanities in Poland. Legal philosophy was in even worse shape than other fields, this owing to the lack of any national legal system. We can note two works in the philosophy of criminal law, namely, *Einführung in der Philosophie des Strafrechts auf Entwicklungsgeschichtlicher Grundlagen* (Introduction to criminal law on the basis of its historical development), published by Juliusz Makarewicz (1880–1955) in 1906 (Makarewicz 1906), and *Podstawy filozofii prawa karnego* (The foundations of the philosophy of criminal law: Makowski 1917), published by Wacław Makowski (1880–1942) in 1917, who subsequently also published a treatise devoted to the theory of state (Makowski 1939). Makarewicz successfully used the comparative method, but Makowski's treatment sought to integrate criminal law, psychology, and sociology. These works, addressing some rather specific problems of jurisprudence, are the first Polish attempts to apply neoscholasticism to law, and together they practically accounted for the whole of legal philosophy in Poland (or rather, *within* Poland) before 1914.

It was Leon Petrażycki (1867–1931) who gave Polish jurisprudence international recognition.[7] According to Petrażycki, legal theory (a label he preferred to *legal philosophy*, especially in his later works) needs to be set on new methodological and theoretical foundations. In particular, legal theory should serve what Petrażycki called legal politics, a practical science of his own devising that deals with the social effects of law. He justified the need for legal politics relatively early on, in his analysis of the *Bürgerliches Gesetzbuch* (or BGB, the German Civil Code), an analysis presented in his work *Die Lehre von Einkommen: Vom Standpunkt des gemeinen Civilrechtes unter Berücksichtung des Entwurfs eines bürgerlichen Gesetzbuches für das Deutsche Reich* (The theory of income. From the perspective of common civil law taking into account the draft of civil code of German state: Petrażycki 1893). Although the BGB would be completed only later, in 1896, and would not be promulgated until 1900, the debate had

[7] *Petrażycki* is the Polish spelling. One can also find *Petrazycky* and *Petrazhycki*. He was born to a Polish family and studied medicine and law in Kiev and law in Berlin. He was professor in St. Petersburg from 1898 to 1917 and in Warszawa from 1919 to 1931. Petrażycki belongs to the history of Russian as well as Polish legal philosophy. On Petrażycki, see also Chapter 18 in Tome 2 of this volume.

been going on for a long time. This civil code was considered extremely important, serving as the national compact and as a symbol of Germany's unification. Petrażycki argued that this project to codify and unify German civil law was too abstract and ignored economic needs. This criticism was partly accepted, partly strongly rejected, but its young proponent became famous in German legal circles. Petrażycki was an expert in Roman law, but his views were rather influenced by civil law. He maintained that Roman law satisfied economic needs very well, due to its spontaneous conformity with social facts, but this was by and large impossible in the reality of the late 19th century, its economic and social fabric being much more complicated. Petrażycki criticized the legal theory of his time for being unable to fulfil its principal task, that is, to serve as the basis of legal politics. This, he thought, is because legal theoreticians have no scientific concept of law. They use a notion that can be called "law juristically understood," a notion which may well be suitable for some practical purposes and is accepted by most jurists, but which cannot play a role as a correct theoretical category. For example, if we define law as a system of norms issued in accordance with a legal procedure, we will have a circular definition.

Having set out his criticism of the *Bürgerliches Gesetzbuch*, Petrażycki went on to elaborate his own legal theory. This was done in his two main books: *Vvedenie v izučenie prava i nravstvennosti: Osnovy emocjonaln'oj psychologii* (Introduction to the science of law and morality: The foundations of emotional psychology, Petrażycki 1905) and *Tieorija prava i gosudarstva v svjazi s teoriej nravstvennosti* (The theory of law and the state in connection with the theory of morality: Petrażycki 1907a).[8] His project comprised the following parts: (*a*) the logical and methodological foundations of science, (*b*) the identification of law as a real phenomenon, (*c*) the relation between law and morality, (*d*) general sociology, and (*e*) legal politics. Parts (*a*) through (*c*) were developed by Petrażycki himself; parts (*e*) and (*d*), by contrast, must be reconstructed from various sources, bearing in mind that we have much more material pertaining to the former than to the latter. Petrażycki held certain definite general philosophical views.[9] He was a radical empiricist in epistemology. His ontology posited the category of reality as basic. On the basis of these views,

[8] These two books form the basis of our account of Petrażycki's views. None of Petrażycki's major writings are accessible in English in full. Some fragments are translated in Petrażycki 1955, which also contains a useful introduction by N. S. Timasheff. A summary of some of Petrażycki's views about law and morality is outlined in German in Petrażycki 1907b. The methodological part of Petrażycki 1905 has been translated in German as Petrażycki 1933. A Polish translation of Petrażycki 1905 was published in 1930. Polish translations of several other of his works appeared after 1956. For the secondary literature (books only), see Baum 1967, Górecki 1975, and Motyka 2007.

[9] To be sure, Petrażycki did not publish any extensive philosophical work in his lifetime, but his major books contain many philosophical fragments. Moreover, he left many philosophical manuscripts in Polish, published after his death, including ones on Kant and the categories.

Petrażycki strongly rejected all forms of transcendentalism, especially in the Kantian sense. The two main ontological theories, for Petrażycki, are materialism and idealism. Both are presumably possible, but materialism offers a better ontology. Since the category of the real comprises the physical and the psychical, materialism implies that the latter can be reduced to the former. The theory of reality exhausts theoretical philosophy. Practical philosophy is the second philosophical field, and it formulates various norms.

This distinction between the theoretical and the practical is connected with two kinds of propositions: one kind Petrażycki calls objective-cognitive (*obiektywno-poznawcze*) and the other subjective-relational (*subiektywno-stosunkowe*). Whereas propositions of the former sort assert the existence of objects and their properties, those in the latter group expresses the attitudes (such as likes and dislikes and acts of will) that one may have to something existing or imagined. Petrażycki identified the practical with the normative, and so he spoke of normative sciences. On the other hand, he distinguished between fundamental norms (*normy zasadnicze*) and teleological norms (*normy celowościowe*). Only teleological norms can be validated in a scientific way, so we cannot proceed on that basis in grounding the basic values, such as goodness or justice. On the other hand, teleological norms—having the form "If you want to accomplish task *C*, you should act using means *M*"—do admit of scientific validation. Consequently, if a life task has been set out, we can show how to carry it to completion. Like many other legal and moral theorists, Petrażycki wanted to avoid relativism putting forward the highest ideal of social life. According to him, history shows that the social actions accepted in most societies give rise to certain regularities. In particular, there can be observed a tendency toward human solidarity and universal love. Petrażycki derived further values from this observation, especially equality (including between races and genders) and justice.

Petrażycki devoted careful analysis to the methodological foundations of science. Although he argued his ideas by drawing on examples taken from social science and psychology, he understood his method to be valid across all areas of inquiry. Theories, for Petrażycki, are universal and based on concepts referring to classes (class concepts); they are in this sense single universal statements. Since theories identify essential causal connections, their basic function is to explain and predict. Class concepts are our own creation. Although class concepts are grounded in experience, inductive methods for creating them are not effective, because we cannot set out in advance how many instances of a concept will suffice to complete the conceptual work required to define that concept. We should render concepts independent of the terminological customs of natural language and of practical tasks. For example, the concept "greens" and the concept "game" are very important in cooking and hunting, respectively, but completely useless in botany. The creation of class concepts is parallel to their functioning in theories. The requirement of truth is too weak

Leon Petrażycki (1867–1931)

for theories. For instance, we can formulate several true propositions about greens or game, but this does not mean that such assertions thereby constitute theories. The main attribute of a correct theory, in Petrażycki's view, is adequacy (*adekwatność* in Polish). Since a theory has the form (*) "Every *K* is *P*," (*) is adequate if *P* can be predicated of the entire class *K*. Incorrect theories can be described as limping (*kulawa*), leaping (*skacząca*), or absolutely erroneous. A limping theory *T* is one in which *P* is attributed to too narrow a class. For example, if we say that all planets move according to the laws of gravitation, this assertion can be described as limping, because the principles of motion also apply to other phenomena. A leaping theory, by contrast, is one in which *P* is (unjustifiably) ascribed to a range of phenomena wider in scope than *K*. This second error is characteristic of various sociological theories that identify a single force or attribute, such as religion or religious belief, as the one and only relevant factor. One can correct limping or leaping theories by suitably narrowing or widening their scope of predication. This is impossible with absolutely incorrect assertions, since their entire scope is erroneous and the relations they record are only apparent. There are various causes leading to incorrect theories, but the main one lies in the failure to preserve the conditions necessary to create class concepts. In general, theories do not afford a picture of reality, or at least this is not their only function. Theories are rather constructions aimed at finding correct explanations and predictions. As concerns the need to justify the adequacy requirement, Petrażycki proposed an analysis that combines deduction with eliminative induction in Mill's sense.

Legal theory must be adequate in the sense previously indicated. The way to go about constructing such a theory presumably consists in properly identifying law as an empirical phenomenon. For Petrażycki, law in the juristic sense is not a proper class concept and leads to either limping or leaping theories. This is where legal psychologism enters the scene. Generally speaking, Petrażycki regarded law as something of a psychical entity, but this view required a new approach to psychology. Petrażycki replaced the traditional classification of psychic phenomena with a new one. The traditional account distinguished sensation (cognition), will, and feeling as three basic factors of the psyche. Petrażycki saw the matter differently and added the emotions as a fourth category. But the change was more than just classificatory. Indeed, for Petrażycki, it was a very deep difference that separated the emotions from the other factors of the psyche: Whereas these factors are one-sided—sensation and feeling are exclusively sensitive and the will exclusively impulsive—the emotions are sensitive-impulsive (*doznawczo-popędowe*) and can in this sense be described as two-sided. This view suggested to Petrażycki that the emotions are genetically prior, whereas sensations, feelings, and acts of will arise as a result of our mastering one side and removing the other over the course of evolution. Petrażycki thus considered the emotional level of the psyche as fundamental to the whole of mental life.

Petrażycki identified both law and morality (ethics) as emotions of a certain kind. More to the point, ethical emotions are the kind we experience when faced with imperatives: They consist in a reaction to an external signal (an imperative) experienced as a duty (or obligation). Now, the ethical emotions can only be either imperative (that is, duty-creating) or imperative-attributive (in which case they connect duties with rights). Thus follow the definitions of morality and law, respectively: morality is the class comprising the imperative emotions; law, the class comprising the imperative-attributive emotions. With these definitions in hand, it is very easy to show that typical theories of law are incorrect, usually limping. Take, for example, the theory under which law is defined as a coercive order. This can lead us to ignore that a coercive order must be guaranteed by the state (for otherwise we would have a vicious circle), and in that case our predications about what is law will be attributed to only part of the class concept in question (the concept "law"). There are important consequences that can be seen to follow from this approach. Petrażycki radically changed the concept of a legal norm, a concept designating not linguistic entities or propositions but also psychical entities. In order to make this view more coherent with tradition, Petrażycki considered the sentences contained in legal codes to be, not norms per se, but projections of norms. This led him to a radical noncognitivism, even if he did not use that label. It also follows from this conception that the positive law accounts for only a fraction of the full class of legal phenomena. For Petrażycki, the class concept "law" is broad enough that we can, and indeed should, use that term when speaking of the law of gangs or of groups of children, because every imperative-attributive emotion is legal regardless of its origin. Thus, we have distinctions like that between official (positive) law and unofficial law or that between intuitive law (*prawo intuicyjne* in Polish, or law as a complex of natural emotions) and the law imposed by the authorities. The same signal can give rise to either law or morality. So, for example, I might see a man begging on the street and give him food or money: My emotion will be moral if I experience that signal as a duty of support, but legal if I think my duty is correlated with the beggar's right to have food or money from me.

Petrażycki saw that his theory could be criticized as overly subjectivist and individualistic. In anticipation of such an objection, he maintained that legal emotions have a tendency toward uniformization. This means that whereas law is relatively concise and comparatively homogeneous, morality is much more individual. Although morality and law both play a central role in guiding human behaviour, law is much more pervasive and essential in that role. As he once remarked, morality is the champagne of daily life, but law is "goose wine" (water), and we may well be able to live without champagne, but certainly not without water. This circumstance is of utmost significance for legal politics. In order for the legal systems put in place by government authorities to be effective as tools of social life, they must be coherent with intuitive law.

Petrażycki illustrated this point with a very interesting example. He argued that forcing people to sell their private property, especially their land, can lead to a wasteful use of economic resources, with dire consequences. This prediction was borne out by the Soviet Union after the country collectivized agriculture. Petrażycki accordingly held that his legal theory could be used to make predictions about how law will affect social life, thus making it possible to formulate teleological rules about how to achieve a given social ideal.

Petrażycki's general philosophical tenets were consistent with philosophical positivism and psychologism. In this sense, he was a child of his age, or at least of one of its currents. This resulted in the naturalistic scientific method he proposed. Petrażycki rejected the idea that the humanities and the social sciences require their own special methods. In his view, the lack of successful theories in social and natural sciences is owed to methodological underdevelopment. On the other hand, his method moves beyond the bounds of typical positivism, especially as concerns the creation of concepts and the status of theories. Petrażycki can be said to have anticipated some of Popper's ideas about how scientific concepts are to be formed and how theories relate to the world.

Although Petrażycki was a positivist in philosophy, his theory of law was very far from typical legal positivism. The main difference consists in a completely different account of legal phenomena. What legal positivists, such as Hans Kelsen, consider to be the reality of law, namely, valid statutes or solutions to particular cases, constitutes for Petrażycki a secondary phenomenon showing only *part* of law. Petrażycki's approach anticipates various forms of realism, and in particular the Scandinavian legal realism of Axel Hägerström, Alf Ross, and Karl Olivecrona.[10] But there are two important differences here: First, the scope of law in later legal realism is narrower than in Petrażycki's theory, and, second, Petrażycki's psychology is based on introspection, while "Scandinavian" psychology looks more like a kind of behaviorism. Parallels can also be observed between Petrażycki's legal politics and the project of social engineering by law advocated by the American functionalists, particularly by Roscoe Pound. Petrażycki's theory of the social ideal is often likened to Rudolf Stammler's idea of natural law with changeable content.[11] Regardless of how we might evaluate Petrażycki's theory as a whole (a task beyond the scope of this exposition, for we are concerned with its *historical* significance), it seems that he was the first to attribute such an important role to legal consciousness and to the social functions of law.

Poland regained its independence as a state in 1918. The new state devoted many resources to building the academic system, especially at the university level, and organizing research across all fields. Activities were resumed at two

[10] On Scandinavian legal realism, see Chapters 13 through 17 in Tome 2 of this volume.

[11] In fact, Petrażycki claimed that Stammler had plagiarized his views. On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

existing universities, namely, Jagiellonian University in Kraków and Jan Kazimierz University in Lvov (the name of the latter university was adopted after 1918). The Universities of Warsaw and Vilna were reopened in 1915 and 1919, respectively. Two new universities were established, one in Lublin (Lublin Catholic University, or KUL, in 1918) and the other in Poznań (Adam Mickiewicz University, in 1919). All universities had law schools and professorships in legal theory or legal philosophy.[12] The curriculum typically comprised the so-called encyclopedia of the legal sciences (or introduction to the legal sciences, what in Polish is referred to as *wstęp do nauk prawnych*) and legal philosophy, mostly confined to historical issues. Petrażycki came from Soviet Russia in 1918 and became professor of sociology in Warszawa in 1919; he turned down several offers from abroad, including one from Oxford. Since Poland inherited several legal orders from the annexation period (five systems in all), it became a policy priority to unify law, and jurisprudence was considered essential to that end. Many professors of law were appointed in the Codification Commission, and among them was Petrażycki, owing to his idea of legal politics. Makarewicz wrote the Polish Criminal Code, introduced in 1932 and usually referred to as the Makarewicz Code. Legal theory and philosophy did not have quite the same practical import as the specialized fields of jurisprudence, but they were nonetheless perceived as worthy of study and development. Even though Petrażycki was not very productive after 1918, his lectures in Warszawa were very popular, and his presence stimulated other people. The influential Polish analytic and logical school known as the Lvov-Warsaw school did not work much in legal philosophy, but its main representatives—especially Kazimierz Twardowski (1866–1938), Kazimierz Ajdukiewicz (1890–1963), and Tadeusz Kotarbiński (1886–1981)—did take an interest in some specific problems at the intersection of philosophy and jurisprudence (and so they investigated, for example, the concepts of action, free will, and justice). This school stressed the importance of clarity in thinking, speaking, and writing and underscored the need for law to embrace these values.[13] This sort of thinking lay behind the first Polish works on legal logic. In the interwar period, then, there was a range of factors that conspired to favour the development of legal theory and philosophy.

An important event took place in Kraków in 1924. The Kraków Philosophical Society held a special conference on legal theory with a variety of participants, including philosophers, legal theorists, and scholars representing specific areas and currents in the study of law. The proceedings of this conference appeared as Jaworski 1924 and documented the state of this area of study in

[12] With very few exceptions, we will only report on works of legal theory and legal philosophy written by Polish scholars who have taught at law schools.

[13] For further discussion of the Lvov-Warsaw school and its role in Polish philosophy, see Woleński 1989.

Poland in the 1920s, especially with regard to its internal and external links. The discussion at the Kraków conference, along with other facts, shows that Polish legal philosophy and legal theory were very pluralistic in the interwar period. We should mention the main influences. Petrażycki's position was strong but not dominant. His idea of legal politics was widely embraced, but his psychologism was criticized by many Polish writers for its subjectivism and its departure from some strong juristic intuitions. Kelsen became very influential in Poland at this time. His main works, namely, the *Hauptprobleme der Staatslehre* and the *Reine Rechtslehre* were translated in Polish. Kelsen's role in Poland can be explained by his success as a framer of law in Austria. He was thus regarded as a model to look to as a theorist who succeeded in legal practice. Other influences came from the briefly discussed Lvov-Warsaw school, as well as from the French sociological mode of legal interpretation and from neoscholastic philosophy.

Let us move on to specific persons and circles. Jerzy Lande (1888–1954) was the most important follower of Petrażycki in Poland.[14] He gained his professorship in 1929, teaching in Vilna and then Kraków, popularizing Petrażycki's theory while also developing it. Under Kelsen's influence, Lande came to see that Petrażycki had neglected important theoretical problems pertaining to legal norms: He thus proposed that his teacher's ideas be supplemented in order to fill this gap. Lande developed these ideas more extensively after 1945, and we will come back to them in the next section.

In Vilna, Lande and Bronisław Wróblewski (1988–1941) trained a group of young legal theorists, also influenced by the Vienna Circle and the Lvov-Warsaw school.[15] The most promising members of this group were perhaps Sawa Frydman (1907–1981, who changed his name to Czesław Nowiński) and Józef Zajkowski (1900–1945). Frydman developed a sociological theory of the doctrinal study of law (his interests shifted focus after 1945), and Zajkowski offered an approach to the concepts of civil law based on radical nominalism and physicalism. This group's writings are collected in B. Wróblewski 1936, 1939.

Particularly interesting from a contemporary perspective, as concerns the output of the Vilna school, is Frydman's constructive concept of legal interpretation (Frydman's 1936). His idea was to build a theory of legal interpretation through a description of the activity of lawyers. The approach to this description was realistic, cast in sociological terms, corresponding to his treatment of legislation, which he regarded as a kind of social engineering, a way to steer social life by suggesting certain modes of behaviour to the members of society, or otherwise *imposing* those modes. Frydman's realism led him to treat law as

[14] Lande studied with Petrażycki in St. Petersburg. His works are collected in Lande 1959. On him see also Chapter 19 in Tome 2 of this volume.

[15] B. Wróblewski was professor of criminal law; his son was Jerzy Wróblewski, himself a distinguished Polish legal theorist.

a social phenomenon, and this in turn led him to postulate the need to build an empirical—and hence, in his view, scientific—theory of interpretation. The empirical nature of the theory of interpretation was to be shaped through the application of an ideal-type construct in Max Weber's sense. Frydman sought to apply the idealization procedure to create ideal types for legal interpretation.

What makes Frydman's theory of legal interpretation descriptive is his reliance on the concepts of realism in approaching law, coupled with his empiricism in building a theory of interpretation and with the idealization procedure as a convenient methodological tool for constructing descriptive models of practical legal interpretation. Moreover, the theory can be seen to be clearly constructive. These premises also enable Frydman to envision the role of the lawyer qua interpreter, a role that consists in constructing modes—of behaviour and transferring them to social reality so as to shape the behaviours of members of society.

The interpretation of law is a constructive process by which we as interpreters "comprehend" certain modes of behaviour expressed through signs (i.e., objects perceivable through the senses, such as a statute printed in an official journal). A mode of behaviour is freely constructed by the interpreter and results from various factors which influence the interpreter in the process of comprehending—i.e., interpreting a legal text—and which also influence the aim of the interpretation. The meaning of a legal text is the outcome of these interpretive activities. The legal text itself is just printed matter, an object that can be observed by the senses and can function as a sign. It is only the interpreter who provides the sign with meaning by relating a mode of behaviour to it. Each legal text must therefore be interpreted, for otherwise it would only be printed matter, a string of signs set to paper.

In arguing the thesis that modes of behaviour are freely constructed, Frydman assigns an important role to the notion of directions of interpretation (*kierunki wykładni* in Polish), by which he means that certain relevant classes of facts are taken into account which either precede the creation of a statute or coexist with them, an example being the classes of facts by which economic or social processes are formed. Frydman does not understand directions of interpretation as a matter of sensory perception but rather treats such constraints as belonging to the cultural sphere, which is their ontological realm. Directions of interpretation are indispensable in deriving valid interpretive conclusions via arguments used in the process of interpretation. Directions of interpretation either determine the content of a legal text (and nothing else besides) or express the *consequences* of adopting a given interpretation. Interpretive arguments (directions of interpretation) are freely chosen, in the sense that this choice is determined not by any objective factor but by practical reasons. Practical reasons, also termed by Frydman as the needs of interpretation (*potrzeby wykładni* in Polish), are in fact the interpreter's evaluations (regardless of whether these are witting or unwitting). Hence, the different conditions and

the different roles played by interpreters—that is, the different interpretive situations—will determine the choice of specific arguments for interpretation. Different interpretive situations will influence the way in which the needs of interpretation are shaped, which may be the outcome of a single interpretive situation or a combination of such situations. In this sense, the construction of a mode of behaviour as an outcome of interpretation is a free construction, since this mode is constructed on the basis of freely adopted premises. No objective or commonly accepted method exists for selecting the premises of interpretation. The only constraint on the freedom to construct a mode of behaviour lies in the interpreter's interpretive situation, a situation determined by the needs of interpretation.

In the process of constructing a text and relating it to a corresponding mode of behaviour, the interpreter is forced to determine and rely on (*a*) empirical premises, (*b*) linguistic premises, and (*c*) judgments and assessments, and must then draw correct conclusions from those premises and judgments.

As concerns the freedom to establish the meaning of sentences in a legal text, the question arises as to whether such an approach does not entail that the law is, as a matter of fact, created by the interpreter. This may be the case, but Frydman sees certain limits to such freedom. He explains this by drawing a distinction between a legal text and a law: A legal text is nothing but printed matter (printer's ink on paper), while a law is a mode of behaviour developed by interpretation. As there is no such thing as a single exclusively correct, i.e., "objective," legislative meaning of a legal text, this meaning is created through interpretation. The only limitation on the freedom to ascribe a meaning to a legal text, it seems, lies in the cultural community of values. In certain situations, the cultural community of values can act as an interpretive community. And so, as much as meaning is freely ascribed to a legal text, there are certain limits to this freedom.

Quite similar to Frydman's views are those of the postmodernist deconstructionists associated with Jacques Derrida, especially if we consider Frydman's position on the role of legal interpretation and method for interpreting a legal text. In more-general, philosophical terms, Frydman can be said to seek a rationality that transcends Enlightenment reason. On the other hand, certain ideas of Frydman's seem to be close to the New Rhetoric, the argumentative theory developed by Chaïm Perelman.[16] Frydman would probably have agreed with the proposition that interpretive arguments provide a certain sociolinguistic means of persuading a certain audience.

Eugeniusz Waśkowski (1866–1942) was another scholar who approached legal theory from the standpoint of a specific branch of law (civil law in his case). Waśkowski's theory is considered a form of legal positivism, mainly because he implicitly adopts a positivist definition of law. His theory is derived

[16] On Perelman's New Rhetoric, see Section 23.2 in Tome 2 of this volume.

from the identification of the tasks and aims of legal interpretation set out in his work *Teoria wykładni prawa cywilnego* (Theory of the interpretation of civil law: Waśkowski 1936). He held that the aim of legal interpretation is to discover the true meaning of a legal text. But then interpretation is understood by him as the entirety of the methods through which one comes to an understanding of the creations of the human spirit. He emphasizes at the same time that these products of conscious human activity—the written provisions of law—require much more interpretation than literary works.

These conclusions led Waśkowski to describe the task of legal interpretation as follows: Interpretation should reconstruct the concepts and notions associated with an author's provision. Because these concepts and notions constitute the meaning of the provision, while at the same time expressing the author's idea and intention in writing the provision, the task of interpretation can further be specified as that of identifying the contents of a provision, or extending its meaning, or explaining the legislator's idea and intention. This is the direct task of interpretation. In addition, interpretation encompasses the task of drawing conclusions from the interpreted text, or, in other words, establishing the logical consequences deriving from the legal provision. This operation is called by Waśkowski the "logical development of provisions."

So, on Waśkowski's account of legal interpretation, this activity comprises both interpretation in the strict sense, which is reduced to explaining the meaning of a legal provision, and the extraction of *consequences* from that provisions. These consequences are understood to have the same binding force as the provision from which they are drawn. In this approach to the tasks of interpretation lies the basis on which to distinguish the operations that make up interpretation in the strict sense.

Waśkowski distinguishes between the verbal (*słowny*) stage of interpretation (treating this stage as primary) and the factual (*realny*) stage (treated as secondary), and on this basis he distinguishes between verbal (linguistic) and factual (nonlinguistic) interpretation. Only after we go through these stages of interpretation will it be possible to proceed to extract a provision's logical consequences, that is, its "logical development."

As we have noted, what Petrażycki taught at the University of Warsaw was not legal theory but sociology. He trained a group of younger scholars who in the 1930s established the Leon Petrażycki Society. Its main purpose was to publish Petrażycki's *Nachlass*. This activity resulted in several volumes based on Petrażycki's manuscripts, mostly of a general philosophical character. People involved in the Petrażycki Society also did their own research in various areas of legal theory, but the war interrupted this momentum. Eugeniusz Jarra (1881–1973; he lived outside Poland after 1939) was professor of legal theory in Warszawa. He published a long treatise, *Ogólna teoria prawa* (General theory of law: Jarra 1920), which is conceived as a textbook. This work was rather eclectic, and the same qualification applies to the whole of Jarra's views.

Szymon Rundstein (1876–1942) was a distinguished lawyer. Because he was Jewish, he could not hold any academic position, but he was admired for his huge stock of knowledge. At the beginning of his carrier he followed the so-called *Freirechtsbewegung*, or free law movement. He then switched to Kelsenism and published a book titled *Zasady teorii prawa* (Principles of legal theory: Rundstein 1924), in which a radical version of the pure theory of law is expounded. Władysław Leopold Jaworski (1865–1930), professor of administrative law in Kraków, was another proponent of Kelsenism in Poland. He sought to combine this theory with elements of the Christian tradition of natural law. Neoscholastic legal philosophy was dominant at the Catholic University of Lublin (KUL), and Czesław Martyniak (1906–1939) became the leading scholar in this circle. He published an extensive monograph on Kelsen (Martyniak 1939), as well as a posthumous programmatic booklet (Martyniak 1949): The monograph offers a detailed analysis and criticism of Kelsen; the booklet develops the principle of neo-Thomistic legal philosophy. As much as Martyniak was wholeheartedly Thomist, he tried to combine this philosophy with ideas borrowed from other philosophical schools. Lvov had no distinguished legal theorist in the interwar period. Makarewicz, previously mentioned, became professor of criminal law at the University of Lvov. He lectured in the history of legal philosophy but was not active as a researcher in the theory of law. Antoni Peretiatkowicz (1884–1956) organized the school of law in Poznań and became a professor there in 1919. He was also active as a politician of moderate rightist persuasion. Peretiatkowicz's views were eclectic and worked together Kelsenism, sociologism, and the natural law tradition.

Last, but not least, we should mention Czesław Znamierowski (1888–1967).[17] He was trained as a philosopher and a lawyer and was appointed professor of legal theory at the University of Poznań. He published two books before 1939, namely, *Podstawowe pojęcia teorii prawa*, *Układ prawny i norma prawna* (Fundamental legal concepts, Part 1: Legal construction and legal norms, Znamierowski 1924) and *Prolegomena do nauki o państwie* (Prolegomena to the theory of the state: Znamierowski 1930). In these books, as well as in numerous papers, he strongly criticized some contemporary theories, especially Petrażycki's psychologism and Leo Duguit's social solidarism. Znamierowski's own theories were set on definite methodological, philosophical, and sociological foundations. He objected to confining legal theory to a purely conceptual and formal analysis, and stressed the need to investigate the social functioning of legal systems and their social genesis. His idea was to offer a grand synthesis of the theory and sociology of law.

From the perspective of legal theory, certain conception of Znamierowski's are particularly valuable (cf. Czepita 1988). He lay great emphasis on conceptual clarity and the need to avoid conceptual confusion, so his works were in

[17] On Znamierowski see also Section 20.2 in Tome 2 of this volume.

good part devoted to conceptual analysis. Partly under the influence of G. E. Moore, he introduced an important distinction between thetic norms (*normy tetyczne*), the basis of whose validity is that they are issued by an authorized power, and axiological norms (*normy aksjologiczne*), which instead appeal to values. This distinction allowed him to present an interesting analysis of the differences between law and morality and exerted a sizable influence on Polish metaethics. Even more important is his concept of so-called constructive norms (*normy konstrukcyjne*), which are thetic norms but stand in opposition to imperative norms (*normy imperatywne*). Although this concept is influenced by the work of Hans Kelsen and Adolf Reinach,[18] it is very similar to the concept of constitutive rules introduced in the post-war period in British analytical philosophy, and in the context of legal theory it resembles H. L. A. Hart's concept of secondary rules. Constructive norms in Znamierowski's sense have the function of ascribing a "conventional meaning" to certain actions and things: They create (or construct) new actions that would not otherwise be possible, and these actions belong to single class, that of "thetic actions" (*działania tetyczne*). Constructive norms so understood can be observed in various spheres of human activity, such as games, the rules of social organization, and law. Each action, to which such conventional meaning is ascribed by a constructive norm, is underpinned by a psychophysical substrate. The performance of such an action triggers an effect that Znamierowski calls a "thetic state of affairs" (*tetyczny stan rzeczy*). In this sense, Znamierowski can be said to have anticipated J. L. Austin's theory of performative utterances. He further analyzed various types and levels of constructive norms. His analysis of legal systems clearly demonstrated the significance of constructive norms in each legal system, anticipating Hart's view of the nature of legal orders (see Czepita 1988). Particularly interesting is his analysis of competence norms. He argued that, even though constructive norms do not order or prohibit anything, a conventional action constructed by such a norm can sometimes be required or prohibited by other norms in a legal system. The concept of constructive norms strongly influenced Polish legal theory in the post-war period, and in particular Zygmunt Ziembiński and his school of legal theory.

Znamierowski used the concept of a constructive norm in his theory of the legal system. He introduced the idea of a "legal constellation" (*układ prawny* in Polish), understood as a coupling of constructive and coercive norms (this certainly anticipates Hart's views), and held that this properly counts as a *legal* constellation only if the coercion is at least to some extent effective (this introduces a realistic component in his theory). But although this is a necessary condition for something to count as law, it is not sufficient: To this end a constellation must also regulate the whole sphere of activity of the addressees of norms and must define the boundaries of these addressees' freedom.

[18] On Reinach see Section 4.2 in this tome.

16.3. The Period after 1945

Poland's situation after World War II was extremely difficult. The country lost six million citizens, as well as 60 billion U.S. dollars' worth in material resources (in today's equivalent of 1938 prices). Industry and agriculture were ruined, and so were many cities. For example, in the Warsaw Uprising of 1944, the city lost 200,000 residents and 80 percent of its buildings and infrastructure. This huge toll also affected Polish academic circles. Just by looking at the dates provided in the previous section, one can easily estimate how many legal philosophers lost their lives from 1939 to 1945. The youngest generation, consisting of students or scholars starting their work, was hit the hardest. Moreover, Polish universities (and secondary schools as well) had been shut down by the Nazis in 1939, and the occupiers prohibited the publication of scholarly and scientific works and journals. Although Poles organized a powerful system of clandestine education, this activity could not fill the gap resulting from the interruption of regular teaching at universities and high schools. Polish scholars had no access to foreign academic literature. Many libraries and private collections were destroyed. Several works remained unfinished or perished during the war. This brief and very simplified report shows that Polish academic life had to start almost from scratch in 1945.

The organization of Polish academic life was also dependent on territorial changes and the resulting great migration of academic milieus, even more far-reaching than those witnessed after 1918, in the aftermath of World War I. Due to changes in Polish borders, the universities in Lvov and Vilna now fell outside Poland (both previously in the Soviet Union, now in Ukraine and Lithuania, respectively). Four new universities were established in 1945 or shortly thereafter: the Universities of Lublin (a state university), Łódź, Toruń, and Wrocław.[19] Perhaps the most influential factor was that Poland was included in Europe's Communist Bloc. The consequences of this inclusion were not immediate for academic life. But three sub-phases can be distinguished in tracing out the role of Communist ideology in shaping Polish research and scholarship. The first sub-phase went from 1945 to 1948–1949 and carried forward the prewar model, at least in principle. The second sub-phase, from 1950 to 1956, was characterized by the domination of orthodox (i.e., Stalinist) Marxism, coupled with severe restrictions on the freedom of education and research. The third sub-phase began in 1956 (with Polish October, when political changes in Poland led to de-Stalinization of the regime) and ran to 1989, that is, to the end of Communism in Poland and in other countries of the Soviet Bloc. Generally speaking, this was the period of liberal Marxism, allow-

[19] Several other universities were established in the 20th century: in Białystok, Gdańsk, Katowice, Opole, Rzeszów, Szczecin, Warszawa (the University of Cardinal Stefan Wyszyński, a Catholic university), and Zielona Góra (the order is alphabetical).

ing compromises with other intellectual currents, and also making it possible to do purely analytical research. To be sure, a more nuanced picture would reveal that the period from 1956 to 1989 was not uniform: Academic policy could be more or less liberal depending on the political situation domestically and abroad. But in any event, the government sought to more or less intensively control intellectual and academic life, especially the humanities and the social sciences. The situation radically changed in 1989, with the fall of the Berlin Wall, whereupon full freedom of research was introduced. However, one should note the remarkable fact that Polish Marxism was fairly pluralistic even before that time, with plenty of discussions on the foundations of law and state.

We can skip the first sub-phase (from 1945 to 1948–1949) and go straight to the second (from 1950 to 1956), where the situation of legal theory and philosophy in Poland can be described roughly as follows. Except for Lublin Catholic University (KUL), where neo-Thomistic legal philosophy continued to be taught, legal theory was introduced into the social sciences, mainly understood through the lens of historical materialism (in the Marxist sense).[20] A problem arose as to how to treat scholars who were not of Marxist persuasion and did not convert to this philosophy: Some were suspended from teaching, as happened with Znamierowski (though he was readmitted in 1957), while others, like Lande, were tolerated and could lecture according to their own standards, provided that they did not express openly anti-Marxist views. The situation changed considerably after 1956, because several scholars declaring themselves to be Marxist claimed that legal theory should be problem-oriented, not ideology-driven. This attitude created some tension between orthodox Marxists and those whose approach to legal theory was by comparison modernist. Departments in general jurisprudence were set up as departments in the theory of law and the state (the term *general jurisprudence* replaced *legal philosophy*, which ceased to denote a discipline, and its use was restricted as a term referring to philosophical problems and investigations in law), and so the situation could roughly be described as follows (this is clearly only a snapshot, and so is not without exceptions): Theorists of law were either non-Marxists or modernist Marxists, but theorists of the state were more orthodox.[21] In general, openly anti-Marxist views were suppressed (including by censorship), whereas non-Marxist views were tolerated (though not encouraged). Although

[20] Note, however, that the KUL School of Law was shut down in the 1950s and reduced to the teaching of canon law, and legal philosophy thus became a specialization within general philosophy. The situation changed in 1989. The main legal philosopher at KUL was Father Antoni Kość (1949–2011), a specialist in comparative legal philosophy, particularly knowledgeable in Far Eastern thought.

[21] We are not reporting on the theory of the state in Poland. It added nothing particularly interesting to typical Marxist doctrine as presented in this volume in the chapter on Russia: See Chapter 17 in the tome.

the line between anti-Marxism and non-Marxism was vague, and hence could not be clearly drawn every time, this division worked quite well as the background against which to strike compromises among different theoretical attitudes. In any event, Polish legal theory and philosophy remained pluralistic in spite of the official position of Marxism as the ruling ideology.

Polish legal theorists in the period after 1956 worked on many different topics. In our view, the following problems and topics can be regarded as distinctive, considering how they attracted most of the Polish scholars' attention: (*a*) the multilayered conception of law, (*b*) the question of how to integrate investigations of law, (*c*) legal interpretation, (*d*) the theory of lawmaking, (*e*) the problem of rationality in law and legal science, (*f*) legal language, and (*g*) legal positivism and the antipositivist turn after 1989. Let us consider each of these in turn.

16.3.1. The Multilayered Conception of Law

Beginning in 1945, a new approach to the study of law was developed by Lande (1959) which became very useful as a basis for identifying the problems of legal theory. Lande distinguished three levels on which to investigate the legal phenomenon: a normative level, a sociological one, and a psychological one. This idea was further developed by Lande's students, namely, Kazimierz Opałek (1918–1995, professor in Kraków), Jerzy Wróblewski (1926–1990, professor in Łódź), and Wiesław Lang (professor in Toruń).[22] The standard version of the so-called multilayered theory of law can be described as follows. Three levels are distinguished: a logico-linguistic level, a psychological one, and a sociological one. These layers are understood either ontologically or methodologically. On the ontological understanding there arises a very difficult problem as concerns the unity of legal phenomena as existing entities. We can consider the law a complex ontological structure composed of language, psychical phenomena, and social factors, or we can regard each level as existing independently of the others. Both hypotheses were developed in Poland, but here we cannot go into detail (see Opałek 1962, Opałek and Wróblewski 1960, J. Wróblewski 1989, and Ziembiński 1974). The second understanding, the methodological one, is more straightforward. It concerns the types of investigations into law. If we are investigating norms, we will use methods derived from logic and linguistics; hence the name for this layer (logico-linguistic). We can also investigate legal consciousness or the social causes and effects of law: Investigations into legal consciousness lie on the psychological level and are obviously related to Petrażycki's ideas, while investigations into the social causes and effects of law will form a sociology of law. In this way, Lande

[22] For the period after 1945, we will only mention scholars who studied law as professors. This is certainly biased, but there is no way to include other people without being likewise biased.

sought to integrate various theories of law. On this approach, Petrażycki was working on the psychological and sociological levels, but again, his psychologism neglected the normative level. Lande's pupils thus argued that legal theory should integrate all these layers rather than focusing on specific legal theories. Of course, they very much appreciated Petrażycki, but thought that account should be taken of several other traditions, such American functionalism or Scandinavian legal realism. Marxism figured in this picture as contributing to the sociological layer. Hence, Polish legal theorists published many books and papers ranging across the contemporary landscape, addressing thinkers and currents that included Kelsen (who has traditionally been a focus of analysis in Poland), American jurisprudence, natural law theory, Duguit, Scandinavian legal theory, Hart, and egological philosophy of law (for examples of this literature, see the bibliographies in Opałek 1962 and Opałek and Wróblewski 1969). In general, Western legal theory was well known in Poland.

16.3.2. Integrating Inquiries into Law

Starting from the early 1960s, two problems arose in Poland concerning the integration of inquiries into law. A distinction needs to be drawn in this regard between external and internal integration: Internal integration seeks to synthesize results achieved over the course of inquiries carried out on a particular level; external integration, by contrast, brings other disciplines into the picture, including logic (one might recall here that Poland has a strong tradition in logic), general sociology, general psychology, and other technical disciplines, among which cybernetics, communication sciences, and economic sciences. In any event, successful integration, internal and external alike, was considered a condition *sine qua non* of a good legal theory. These methodological principles were extensively fleshed out in Opałek 1962, Opałek and Wróblewski 1969, J. Wróblewski 1989, and Opałek and Wróblewski 1991. Yet a contentious issue remained, namely, what was to be the proper place of legal axiology. Wróblewski (J. Wróblewski 1989) even proposed a separate axiological level but ultimately abandoned this idea. Lande's followers took a positivist line and argued that an axiological evaluation of law falls beyond the province of science. Of course, several authors investigated in various ways the relation between law and morality, but they usually confined their investigations to descriptive accounts (Ziembiński 1972, J. Wróblewski 1973, and Lang 1989). Let us add that these problems have since resurfaced, their importance recognized anew with the recent discussions on the death penalty, abortion, euthanasia, and other, mostly bioethical, problems. Perhaps symbolic of the development after 1989 is that the term *legal philosophy* regained its institutional place as the name for the discipline, and several departments changed their designation from "Department of Theory of Law and the State" to "Department of Legal Philosophy" or "Department of Legal Theory and Philosophy."

16.3.3. Legal Interpretation

Problems of legal interpretation have become a focus of particular interest in Polish theory of law since the mid-1950s. The discussion, still ongoing, was opened in 1959 with Jerzy Wróblewski's publication of the book *Zagadnienia teorii wykładni prawa ludowego* (The problem of the theory of interpretation of the people's law: Wróblewski 1959).

World War II cut short any wider discussion on Waśkowski's "traditional" conception of legal interpretation or on Frydman's realist conception (on which see Section 16.2). The redefinition of values brought about by the war itself and its aftermath—the ensuing territorial, political, and ideological transformations—were all factors that played an important role in shaping attitudes and philosophical views, and in particular philosophico-legal views. This did not leave the concept of interpretation unaffected, either. The totalitarian experience of the war and post-war years did much to influence the concepts of interpretation formulated in the Polish philosophy of law. But there were other influences, too. One of them, difficult though it may be to quantify, was a certain tradition in legal philosophy that goes back to the interwar period and shaped the way scholars engaged in this sort of reflection, laying emphasis on psychological and sociological concepts rooted in philosophical positivism: This approach informed the theory and philosophy of law in the post-war period, which accordingly took an anti-speculative turn after World War II. Much support for this traditional approach came from the burgeoning analytical philosophy and the related linguistic studies: In a 1953 article titled *Definition and Theory in Jurisprudence*, H. L. A Hart (1953) explained the need to build an analytical philosophy of law, thus confirming that there was a range of possibilities to be exploited in applying analytical methods to the philosophy of law. Here it seems one cannot overestimate the impact the Lvov-Warsaw school had in bringing analytical philosophy to bear on legal philosophy (see Woleński 1989). What also needs to be taken into account, however, is the role of external factors, especially political and ideological ones, whose force was particularly strong until 1956, and which tended to lead scholars to abandon axiological problems (occupying an important place in the philosophy of law), and also to discontinue in part their research in the social theory as it relates to legal analysis. This philosophical minimalism limited the risk of formulating statements in conflict with the officially recognized Marxism, even if this sometimes came at the cost of excessive formalism. As a consequence of all these factors, which conspired to shape the academic environment and atmosphere, the first post-war concepts of interpretation were formulated in the spirit of analytical philosophy of law: It is only since the beginning of the 1980s that research could be observed to shift its interest toward less formalized, primarily hermeneutical and argumentative concepts of interpretation (Stelmach 1995).

Wróblewski's theory of interpretation (J. Wróblewski 1959, 1990) has played a very important role in the development of contemporary Polish ideas in legal theory, becoming a reference point for almost all research in legal interpretation. This concept of legal interpretation was qualified by Wróblewski himself as "clarificatory," and only later, over the course of subsequent discussion, was it termed a *semantic concept* (*semantyczne pojęcie interpretacji*), due to the essential role played in it by the notion of meaning. Still later, it came to be called *intensional*, primarily because, on account of the then-prevailing concept of meaning, the need arose to distinguish it from the semantic concept of legal interpretation that Woleński formulated in 1972, where an extensional conception of meaning was used.

The meaning of the term *norm* in Wróblewski's concept of interpretation is approached by analogy to the meaning of non-normative sentences, and in particular of sentences in the logical sense. Wróblewski explicitly refers to the concept of meaning put forward by Kazimierz Ajdukiewicz (1985). The meaning of a sentence is defined by Ajdukiewicz as a judgment *w* in the logical sense (*sąd w sensie logicznym*). The distinction between meaning in a psychological sense and meaning in a logical sense makes it possible to accordingly distinguish a judgment in the psychological sense and one in the logical sense: In a psychological sense, a judgment lies in mental phenomena, which Ajdukiewicz also describes as "processes of judgment"; in a logical sense, by contrast, a judgment is understood as the "meaning attributed to a sentence in a language."

Norms are treated by Wróblewski by analogy to the way sentences are treated in the logical sense. Wróblewski considers it useful to distinguish sentences in the logical sense and to refer to their meanings as judgments. It therefore becomes necessary to correspondingly distinguish norms as linguistic expressions from their meanings. The meaning of a norm is a mode of required behaviour. What is characteristic of a mode of behaviour constructed as the meaning of a norm is its being an obligation. Legal norms treated as linguistic utterances of a certain kind form a semantic category apart from descriptive sentences and therefore require a specific "sense directive" (*dyrektywa sensu*) adequate to normative utterances. Wróblewski's notion of sense directive refers to the directional concept of language advanced by Ajdukiewicz (1985). In this concept, three types of sense directives are identified, that is, axiomatic, deductive, and empirical. Sense directives make it possible to attribute to sentences the meanings appropriate to the language concerned. On Wróblewski's semantic theory of interpretation, Ajdukiewicz's directional concept of language is accepted as the analytical basis for the normative construction of the sense directive, a construction whose function for the semantic category of norms corresponds to the function the sense directive serves for descriptive sentences. This sense directive is based on the notion that a norm is realized by the way person behaves in specific circumstances. Assuming that a legal norm

is an utterance of the form "Under conditions *W*, person *O* should behave in manner *Z*," the normative sense directive will be as follows: "Anyone who sensibly uses a norm construed in the aforementioned manner will deem the norm realized when, under conditions *W*, person *O* behaves in manner *Z*" (see J. Wróblewski 1959).

The meaning of a norm is a mode of behaviour, and so, on this approach, the interpretation of law can be said to consist in our attributing a certain mode of behaviour to a norm as its meaning. The structure of the mode of behaviour is set by the structure of the norm. Since the structure of a norm in Wróblewski's sense is relatively conventional, that structure should be analyzed as consisting of a minimum range of elements, which might, for example, have us specify the norm's addressees, the conditions of its application, and the behaviour it requires. Clearly, the question arises as to whether every time we interpret a legal text we have to establish the meaning of (i.e., interpret) all these elements making up the norm's structure. There are two further issues that need to be considered before this question can be answered: The first of these is the situationality of our understanding and interpretation of law (the idea that norms cannot be understood outside the context or situation in which the relative language is used) and the other (which in a way follows from the first) is how to delimit the scope of the interpretive practice in such a way as to formulate an adequate concept of interpretation. Wróblewski constructs a concept of interpretation making reference to the interpretive practice of the institutions entrusted with applying the law, and he is thinking in particular of the courts.

For Wróblewski, the rationale behind this choice lies in the aforementioned situationality of our understanding and interpretation of law. The situationality of our understanding, as he understands this expression, consists of the language's semantic contextuality, such that we have to link the meaning of expressions in the language to the situations in which those expressions are used. The semantic contextuality of natural language is an outcome of the relationship between the semantics and the pragmatics of that language. This relationship is strong in the case of natural language, and as a consequence we wind up having a close connection between the meaning of expressions (semantics) and the different ways they are used in various situations (pragmatics). When we adopt the perspective of interpretive practice in applying the law, we will need to formulate a model on which basis to engage in interpretive activity, so as to establish a mode of behaviour unambiguous enough for the purpose of deciding on specific facts (a specific case). In the process of interpretation, in other words, only those ambiguities of a legal text need to be eliminated that can affect the resolution of the case at hand.

Hence, those who espouse the semantic concept use a notion and model of operative interpretation. Interpretation comes into play when we need to legally qualify specific elements of the case under consideration. The range of

interpretive activities will vary, depending as it does on the elements of the case and the difficulty involved in qualifying them. In extremely difficult cases, *all* the elements of a norm's structure have to be subjected to interpretive activity.

The critical discussion that followed Wróblewski's presentation of the semantic concept of interpretation led, *inter alia*, to the development of an extensional version of this concept by Jan Woleński (1972). For Woleński, Wróblewski's semantic concept of interpretation is substantiated by the concept's relation to semiotics, a relation emphasised in expressions of legal interpretation that make reference to the term *meaning*. Because *meaning* is a basic term in semantics, Wróblewski's conception may be described as an *intensionalist* semantic approach to interpretation (since Wróblewski equates the meaning of an expression with its intension). This particular notion of meaning, however, gives rise to numerous difficulties.

Woleński refers to opposing concepts of semantics: According to one of them—intensionalism—semantic considerations cannot do without the notion of meaning. According to the other concept—extensionalism—all semantic problems can be worked out within the framework of a theory of reference. Woleński stresses at the same time that legal theories of interpretation usually do not refer to any particular concept of meaning, but rather content themselves with the intuitive, lay understanding of the word *meaning*. One consequence to flow from this circumstance is that legal theories of interpretation aspiring to be described as semantic do not in fact go beyond pragmatics, and if they do they must accept intensionalism. Woleński thus seeks to define an adequate semantics for deliberating on norms, a semantics free from pragmatics and intensionalism. This means that the everyday term "the meaning of expressions" should be conceived as a notion belonging to the pragmatics of language and not to semantics, from which it follows that the semantic theory of legal interpretation should abandon its use of this term.

Woleński's aim is to explicate the notion of legal interpretation by applying the methods of logical analysis. This explication consists in transforming a given notion of legal interpretation, more or less imprecise, into a precise one—or in replacing one with the other. Thus the *explicandum* is the notion of legal interpretation to be explained, while the *explicatum* (the resulting notion) is the logical semantic notion of interpretation in its extensional version.

As a consequence of applying this logical notion of interpretation, Woleński formulates an extensional conception of legal interpretation. On this conception, the object of legal interpretation is not the meaning of a legal text: Legal interpretation rather consists in determining the *scope* of legal norms. This conception of legal interpretation links directly to the logical notion of semantic interpretation. In everyday speech, legal interpretation is about specifying the *class of situations* in which the sentences distinguished by the legislator hold true, and not about the *meaning* of those sentences.

Competing with the semantic concept of interpretation (in both its intensionalist and its extensionalist version) is an idea that has played, and continues to play, a major role in the discussion, not only the theoretical discussion but also the scholarly and judicial ones: That idea is the is the so-called derivative conception of interpretation (*derywacyjna koncepcja wykladni* in Polish).

The derivative conception was developed in 1960, when Zygmunt Ziembiński introduced a strict conceptual distinction between a legal norm (*norma prawna*, a sort of norm of conduct) and a legal regulation (*przepis prawny*), understood as a grammatical sentence contained in a legal text. It is on the basis of that distinction that Ziembiński (1966) presented his derivative conception of interpretation, a conception which was subsequently developed in detail in 1972 by Maciej Zieliński (Zieliński 1972), and which he continued to develop thereafter (Zieliński 2002).

According to the derivative conception, all that is termed "legal interpretation" in jurisprudence makes reference to two notions: that of the interpretation of regulations, on the one hand, and legal texts, on the other. To interpret a legal regulation is to rely on a set of rules R to replace a legal regulation P with an expression N that under R is equivalent to regulation P, where N is a norm of conduct or an element of that norm. To interpret a legal text, on the other hand, is to rely on R to replace a legal text T with a set of norms of conduct that under R is equivalent to that legal text.

On the derivative conception of interpretation, the distinction between a regulation and a legal text has the status of an axiomatic assumption, and can be stated as follows: A legal regulation is a grammatical sentence contained in a statute; a legal text, on the other hand, is an aggregate of regulations, and in particular of all the texts contained in the statutes enacted and promulgated up to a given point in time.

The derivative conception of interpretation has been revised many times. One of these revisions concerns the number of interpretive stages and the method for carrying out these stages. In the contemporary version of the derivative conception of interpretation, the first interpretive stage is called "organizational interpretation" (*faza porzadkujaca*), which consists in the activity of eliminating the consequences flowing from the variability of legal texts. This is done by establishing both (*a*) the validity and (*b*) the wording of the regulation at the time it is being interpreted.

A central task around which the activities of the organizing stage revolve is that of validation. This, coupled with the recognition of the notional distinctness between validating and interpretive findings, was the argument on which basis the organizing stage was qualified as preinterpretive. At the same time, however, in setting out the validating-derivative conception of interpretation, Leszek Leszczyński (2001) suggests that the activities undertaken to establish the legal status of a text, and to reconstruct the normative grounds for a decision, ought to be straightforwardly referred to as "validating interpretation,"

in distinction to the next phase, which he terms "derivative interpretation" (*wykładnia derywacyjna*).

The activities by which the contents of legal norms of conduct are reconstructed make up a process appropriately referred to as the "reconstructive" stage (*faza rekonstrukcyjna*) of interpretation. These activities, as well as the directives requiring that they be performed, aim to reconstruct the norm-setting expression with its syntactic structure, and the process through which this structure is reconstructed comprises the activities of identifying (*i*) the addressee A (the agent or entity to which a requirement or a prohibition is addressed) and (*ii*) the circumstances O in which a specific behaviour Z will be required or prohibited. The expression so reconstructed, on the basis of the regulations contained in legal texts, can be ambiguous and is thus treated as a norm-setting expression rather than as a legal norm. As a sort of norm of conduct, a legal norm is understood on the derivative conception of interpretation as an expression that *unambiguously* requires or prohibits a clearly specified behaviour in clearly specified circumstances by a clearly specified addressee. The main reason why the reconstructive stage of interpretation is necessary lies in the features of legal texts, and in particular their multilayered structure, the grouping of norms into regulations, and the division of norms into regulations. This means that, on the one hand, a given legal provision may contain elements of various legal norms and, on the other, that the elements of one norm may be (and usually are) contained in more than one legal provision. Therefore, a legal norm must be reconstructed from the legal text.

The final stage in the interpretation of a legal text is called perception (*faza percepcyjna*). On the derivative conception of interpretation, a distinction is made between primary and final perception. Primary perception is the preliminary, intuitive, *prima facie* understanding of a legal text. This understanding constitutes the preliminary part of the perception stage of interpretation. Final perception, on the other hand, is the crowning of interpretation, since it consists in attributing sense to an expression in a legal text by applying the rules that make up the classic canons of legal interpretation, namely, the linguistic, systemic, and functional canons.

The perceptive stage of interpretation gives us the final perception of a norm-setting expression. The derivative conception of interpretation assumes that the activities by which the meaning of a norm-setting expression is established are undertaken only upon completing the activities in the reconstructive stage of interpretation, for only then will the interpreter have fully reconstructed the norm-setting expression—one that is logically and normatively complete—as having the structure "A (addressee), O (circumstances), n/z (requirement or prohibition), Z (behaviour)." Even if a norm-setting expression so reconstructed contains all the necessary elements, it is still ambiguous. Hence, the interpreter will have to apply the aforementioned interpretive canons in order to make the norm-setting expression unambiguous. The canons used in

the derivative conception of interpretation are applied in the traditional order: we first strive to make the expression unambiguous by using linguistic rules of interpretation, and if that does not work, the interpreter will apply the systemic canon and then the functional one in that precise order (Zieliński 2002). However, regardless of whether the norm-setting expression can be made unambiguous by applying the rules forming any one of the canons in the perceptive phase of interpretation, it will still be necessary to apply the rules making up all the other interpretive canons.

The derivative conception of interpretation is a valuable contribution to the theory of legal interpretation, for it underscores the need for interpretive activities that are usually neglected, and in particular those aimed at reconstructing a legal norm from the elements contained in the various fragments of a legal text. In this sense, legal interpretation is not confined to removing ambiguities by the use of classical canons of interpretation. If the final purpose of interpretation is to answer the question "Who should do what and in which circumstances?" then we will need the reconstructive stage of interpretation that precedes the use of those canons.

16.3.4. Theory of Lawmaking

Research on the theory of lawmaking was successfully initiated by Leon Petrażycki (1995), who developed a conception of lawmaking referred to as legal politics (*polityka prawa*). According to Petrażycki, the task of legal politics is to predict, in a scientifically justified manner, the consequences to be expected when certain legal regulations are introduced, and to design regulations whose introduction into the system of law would yield the desired effects. Legal politics so described can be classified as a practical science based on an empirical theory of law. Petrażycki's theory of law combines with the practical legal politics in such a way as to make it possible to predict the consequences of the legal regulations introduced, all the while formulating directives stating the way in which to attain the desired goals by the most rational legislative means. The objectives to be attained by legislators are characterized by Petrażycki in maximalistic terms: The final goal of legislation is to achieve the ideal of love (*ideał miłości*). The achievement of this ideal—the ultimate good—crowns the lawmaker's legislative activity. What it means for society to achieve the ideal of love (as Petrażycki understands this ideal) is to achieve a high ethical level, where the members of society can act altruistically, while being conscious of their own dignity and rights. This condition can be realized by developing psychic motivations to engage in specific activities. Various cultural factors are involved in developing these psychic dispositions, but a central role is played by law. Hence the importance of framing an appropriate legal politics.

When Poland had regained its independence in 1918, the need to build the legal order from scratch set off an animated discussion on the quality of

legislation and on codification and legislative technique. In the late 1920s and early 1930s, several studies were published on legislative and codification techniques. Especially worthy of mention in this regard is Roman Hausner, who in Hausner 1932 mostly concerns himself with technical issues, but who also points us to research of a more general, theoretical nature, such as Eugeniusz Jarra's *Ogólna teoria prawa* (General theory of law: Jarra 1920), analyzing, among other things, the problems of codification.

After World War II, Adam Podgórecki (1957) developed the conception of legal politics by construing it as a certain legislative and codification technique. On his view, legal politics should take a minimalist approach, meaning that it should aim for axiological neutrality. Podgórecki understood legal politics as a form of social engineering. The starting point for building the conception of legal politics lies in an analysis of the existing system of acts of law from the standpoint of their legislative correctness. This critical representation makes it possible to draw up a catalogue of legislative defects in the system of law and an accompanying catalogue of legislative and codification directives whose application is supposed to make it possible to eliminate these defects in the future. The causes of legislative defects in the legal system are both objective (independent of the quality of legislative work) and subjective (owed to a lack of accurate knowledge on the legislator's part or to legislative mistakes). They can be eliminated by applying legislative directives—and in particular codification directives—in a methodologically correct manner. The attainment of optimal lawmaking depends on the ability of lawmakers to apply legislative directives in a duly organized norm-making process that comprises (*i*) the use of directives on the diagnosis, substantiation, and construction of a normative act, (*ii*) a retrospective assessment of the consequences of that normative act, and (*iii*) an evaluation of the act itself (Podgórecki 1957).

Podgórecki's research set in motion a broader discussion that was carried on in the 1970s and 1980s, at different levels of intensity, generating results in the form of several conceptions of lawmaking and theories of legislation. In particular, theoretical accounts of rational lawmaking were developed in Poznań, Łódź, and, Toruń.

In Poznań, critical analysis was devoted to studying the lawmaking process and the mechanisms governing acts of law, and this work encouraged Ziembiński to address issues in the theory and policy of lawmaking. In particular, he offered a theoretical account of the lawmaking process (describing how laws are constructed) and of policy-making: This twofold theory he conceived as a practical science whose task is to construct teleological directives of social engineering setting out the way to achieve specific social, economic, or political objectives through an appropriate enactment of laws. He emphasized the interdependence between these two research areas, all the while highlighting the theoretical and methodological shortcomings of the theory of lawmaking. The construction of a methodologically correct, coherent, and complete theory of lawmaking makes

it necessary to systematize two types of statements (Ziembiński 1980). Statements of the first type describe how statutes are actually created, that is, they describe (*i*) what motivations and other reasons drive the people who actually decide about the contents of legislation, (*ii*) what social factors shape legislative decision-making, and (*iii*) what legislative principles are needed to ensure that legal texts and the system of law are both rational and free of technical defects. Statements of the second type describe what makes legislative decisions in the legal system effective and why these decisions may fail to gain social acceptance. Only in combination, as a duly organized set, do statements of these two types provide the basis on which social engineering can show the best way to frame laws so as to achieve the proper policy objectives. Lawmaking theory and policy proceeds on the assumption that legislation is a rational process. Ziembiński accordingly considers it necessary to construct a model of rational lawmaking.

The analysis of rational lawmaking was significantly developed and expanded in Poznań by Sławomira Wronkowska (Wronkowska 1982), whose primary objective was precisely to build a rational model of lawmaking. In pursuit of this objective she draws primarily on the views presented in the works of Wróblewski, Podgórecki, and Ziembiński. The starting point for Wronkowska is the positivist definition of law as a set of "general and abstract norms of conduct established in appropriate forms by competent state institutions" (Wronkowska 1982, 11; our translation). The critical elements of her theory are a conceptual analysis, a method, and an account of the status of research on lawmaking. On this basis she outlines both the normative principles and the regulations that govern the lawmaking process in Poland, and she also describes lawmaking practice, especially as concerns the drafting of normative acts. What follow are two models she constructs, one for rational lawmaking and the other for drafting normative acts. The first of these is particularly interesting, distinguishing the following stages in the process of rational lawmaking: (*a*) we identify and describe the objectives to be reached, as well as (*b*) the legal and/or nonlegal means by which to reach those objectives; we then (*c*) choose a specific means, (*d*) accurately set out the objectives the proposed normative act is supposed to achieve—while also pointing out alternative ways of framing texts of law aimed at the same purpose and (*e*) evaluating both the consequences and the costs of these alternative modes of regulation, so as to choose the best of these modes—at which point we can (*f*) draft the normative act and (*g*) formally enact it (Wronkowska 1982, 150). The investigation of lawmaking initiated by Ziembiński and carried on by Wronkowska, and later also by Zieliński (Wronkowska and Zieliński 1993), has turned out to be of practical significance, having made it possible to bring the principles of lawmaking technique to bear on the legal system so as to give that system the form of generally applicable legal rules.

In constructing a model of rational lawmaking, Wronkowska drew in part on Wróblewski (J. Wróblewski 1973, 1978a, 1978b, 1979, and 1980). Wróblewski's work on the way to optimize the lawmaking process by making it ra-

tional is crowned in J. Wróblewski 1985, which is not confined to setting out a rational model, for it also brings into the picture a much wider range of considerations. More to the point, Wróblewski builds his theory of lawmaking on the basis of assumptions about lawmaking policy, the lawmaker, and the legal system, as well as on the basis of assumptions and typologies that come into play in building a model representation of the lawmaking process.

The methodological organization of the problems involved in lawmaking makes it possible to present both theoretical and normative models of lawmaking. A distinctive feature of the former of these models lies in their cognitive nature, through which they put us in a position where we can actually take rational legislative decisions. Normative models, on the other hand, are characterised by practical functions, such as their setting criteria by which to evaluate the lawmaking practice and the enacted normative acts this practice results in. These models also point out the values for the lawmaker to use in setting out the aims of lawmaking activity.

The rational lawmaking model (*model racjonalnego tworzenia prawa*) makes it possible to combine these two functions. We can thus use this model according to its cognitive function—approaching lawmaking as a process through which to make rational decisions—or we can use it according to its practical function, making it possible to give normative guidance in lawmaking. On Wróblewski's model of rational lawmaking, we are asked to (*a*) set out objectives clear enough that we can then select appropriate means to those ends, (*b*) establish the links between the classes of phenomena that may be described as means and the classes that may be taken as objectives, (*c*) identify the legal means by which to attain the chosen objectives, and (*d*) choose the most appropriate means and write the text for the relative normative act. Wróblewski's approach to the rational lawmaking model is universal enough to make it possible to present the various relations the lawmaking process brings into play, considering in particular the relation of lawmaking to (*i*) legal validity, (*ii*) legal interpretation, (*iii*) axiology, (*iv*) procedural values, and (*v*) the effectiveness of lawmaking itself.

16.3.5. Rationality in Law and Legal Science; the Methodology of Legal Dogmatics

Discussion on the problem of legal rationality was initiated in Poland by Leszek Nowak (1944–2009). In his doctoral dissertation (the revised version is Nowak 1972) he presented an original and illuminating conception to some extent based on the ideas on scientific method put forward by the Poznań school (Kmita 1971). For Nowak, the fundamental assumption which necessarily must be adopted in the process of interpreting and applying the law is that of the legislator's rationality. Rationality is understood by Nowak in its epistemic-technical sense. On the principle of rationality, someone having non-contradictory knowledge, and whose preferences are asymmetric and transi-

tive, will choose the course of action that, in light of said knowledge, will bring about the desired effect. In the process of applying and interpreting the law, we must assume the legislator to be rational in the sense just specified. In fact, there is an even stronger assumption we must make, namely, that the legislator is perfect. A perfect legislator is one who (*i*) is rational in the aforementioned sense, (*ii*) has perfect linguistic competence, (*iii*) knows all the relevant facts and legal rules, and (*iv*) has the best possible moral justification for his or her preferences. Obviously, this assumption (as its name suggests) is empirically false, since no actual legislator can meet those requirements. But it is an assumption that jurists interpreting the law have to adopt even so, for otherwise the applied rules of interpretation would have no basis. As a matter of fact, jurists frequently ascribe their own knowledge and preferences to the legislator, both, since they believe that knowledge to be accurate and those preferences to be morally justified.

Nowak believes that the assumption of rationality is a necessary assumption in the human sciences. The specific feature of legal science is that it makes the stronger assumption that the legislator is perfect and that this assumption can never be falsified. On this basis Nowak embraces a naturalistic position in the method of science. The human sciences (including legal science) are empirical sciences and have the same basic structure as natural science, and their role is to provide explanations. The assumption of rationality in the *explanans* is an empirical assumption and is therefore subject to falsification. The specific feature of the human sciences is that no one is going to set about falsifying this empirical assumption in that area of knowledge.

The conception of rationality as the fundamental assumption of legal interpretation strongly influenced not only Polish legal theory (and in particular Zygmunt Ziembiński's Poznań school) but also the practice of Polish courts, which frequently refer to the assumption of the legislator's rationality in providing reasoned arguments for their rulings. Ziembiński (1974) concedes that the assumption of rationality is something of a fiction (since actual legislators are never fully rational and certainly not perfect), but it is a fiction that plays an important role in legal science and legal practice. The task of legal science is to present the law as a consistent system of norms having an axiological justification and as based on an adequate knowledge of the relevant facts. The fiction of a "rational legislator" serves to justify the jurists' rules of interpretation, validation, and inference. Disputes and controversies relating to questions of interpretation and validation can be explained by pointing out that different jurists ascribe different beliefs (about what is the case: knowledge) and different preferences to the legislator.

Nowak's conception (further developed by other members of Ziembiński's Poznań school) is still widely accepted in Polish legal theory, but it has been come under criticism. This goes in particular for the thesis that the law must be based on epistemic-technical rationality, a thesis challenged by Lech

Morawski (1988), who compared three conceptions of rationality: epistemic-technical, rhetorical-topical, and communicative. Morawski argues that those three different conceptions are not only different techniques for justifying decisions but also different ways of rationalizing the social relations created by law. The first conception is focused on ensuring that social processes can effectively be controlled, the second on ensuring that the legal order commands general acceptance, and the third on ensuring that communication through social interaction is free of repression and force. As can be appreciated, Morawski's sympathies (under influence of Jürgen Habermas) lie with communicative rationality.[23] Similar objections against epistemic-technical rationality as the exclusive basis of law have been raised by Marek Zirk-Sadowski (2000), who describes a wide range of possible approaches to rationality in law. It can be observed that the conception of communicative rationality has become increasingly popular in Polish legal theory over the last decade, even though other approaches are also present (Brożek 2007).

Polish legal theory has not widely embraced Nowak's conception of legal science as an empirical science: It is rather an anti-naturalistic approach that prevails, even though it must be mentioned that a broad spectrum of views exists (see, for example, Stelmach 1995, Pulka 2005, and J. Leszczynski 2010).

16.3.6. The Language of Law

Bronisław Wróblewski's 1948 book *Język prawny i prawniczy* (Legal and juristic language: B. Wróblewski 1948) initiated research on the language of law in Poland. As the very title of the book suggests, Bronisław Wróblewski distinguished "legal language" (*język prawny*)—the legislator's language such as it appears in the statutes—from "juristic language" (*język prawniczy*), the language used by the jurists. Further distinctions were later introduced in juristic language, which was made to also include the language of legal practice and the language of legal science. Research on the language of law has focused on a number of general and particular topics. The two most important general topics are discussed below.

(*i*) *The specificity of the language of law in comparison with ordinary language and its linguistic natur*e. Bronisław Wróblewski stressed the specificity of the language of law by reason of its vocabulary and semantic rules. Further research, partly by use of sophisticated statistical methods, made it possible to more accurately characterize those features of the language of law as a stylistic variety of ordinary (natural) language. It has also been argued, contrary to what Bronisław Wróblewski held, that the language of law is also marked by certain important *syntactic* peculiarities.

[23] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

The relation between ordinary language and the language of law has been accounted for in various ways. Accounts made through the lens of the distinction between natural and artificial language have proved to be unsatisfactory (Gizbert-Studnicki 1986). The same goes for the traits peculiar to the language of law as an idiolect (individual language) of the legislator, as a dialect of the juristic community, or as a specialized language. The view has been expressed, taking up the famous distinction introduced by Ferdinand de Saussure, that the language of law ought to properly be classified not as *langage* but as *parole* (ibid.). This means that the language of law cannot be conceived of and analyzed as an abstract system composed of a vocabulary coupled with syntactic and semantic rules, in such a way as to make it possible to generate an infinite set of sentences. The language of law belongs to the domain of *parole*, or linguistic performance, and it can be characterized only as a *finite* set of *actual* (as opposed to potential) utterances (ibid.). Therefore, the language of law—to be viewed in the context of the variety of ethnic languages—bears the status of a linguistic register, as opposed to being a dialect. This means that the specific linguistic features of legal texts are determined by the sociolinguistic situation in which those texts are formulated.

The relationship between legal language (the language of statutes) and juristic language has also been characterized in various other ways: juristic language as a meta-language, juristic and legal languages as performing distinct illocutionary functions, etc. (ibid.).

(*ii*) *The method of research*. Initially, the main methodological controversy when it came to investigating the language of law mirrored the fundamental controversy in Anglo-Saxon philosophy of language: that between descriptivism and formalism. At issue was the usefulness of logical methods and formalisms in analyzing the language of law. Both approaches—the descriptivist and the formalist—have been defended and implemented in Polish legal theory. Those who advocated the formalist approach stressed the ambiguity, vagueness, and context dependence of the utterances and sentences making up the language of law and saw logical analysis as a way to correct those defects. On the other hand, those who advocated the descriptivist approach held that any formalist analysis is bound to dismiss important semantic intuitions linked to the analyzed text, in such a way as to change its meaning. The purpose of analysis should rather be to grasp as many intuitions and possible: Legal theory should be concerned, not with improving the logical features of the language of law, but with *describing* that language as it is. If legal theory is to be useful to legal dogmatics, it should abandon the formalistic approach, since legal dogmatics needs to be descriptive if it is to perform its functions (Ziembiński 1974). This dispute gave rise to an intermediate position between formalism and descriptivism: It came to be known as moderate formalism, and its point was that formalization ought to be introduced only when necessary, that is, not for the sake of logical correctness as such but in an effort to grasp as many

linguistic and juristic intuitions as possible (Ziembiński 1974). It is worth noting that closely bound up with the descriptivist approach was an interest in the *pragmatics* of the language of law, with a focus on performative utterances, the theory of illocutionary acts, etc. (as can be seen in Ziembiński 1966 and Opałek 1986).

Until the late 1970s, analytical philosophy (mostly Anglo-Saxon) held sway as the dominant theoretical framework for research on the language of law (crowding out other approaches). The rapid development of linguistics (as an empirical discipline) began to influence Polish legal theory relatively late. Research based on the methods and conceptions of contemporary theoretical linguistics was focused on specific problems rather than on the general theory of the language of law. Noteworthy in this regard is a book by Wojciech Patryas (2001) where Noam Chomsky's transformative-generative grammar is applied to the analysis of the structure of legal norms. As previously mentioned, the language of law was later also analyzed by bringing to bear the methods of sociolinguistics (Gizbert-Studnicki 1986) and of linguistic statistics (Malinowski 2006). This shows that the interest of Polish legal theory in the language of law is multidimensional and integrative.

16.3.7. Positivism and the Anti-Positivist Turn after 1989

As previously mentioned, Polish legal theory before 1989 can be characterized as being overall positivist. This does not mean that all the positivist theses from the English-speaking countries and the Continent were accepted across the board. The positivist attitude of Polish legal theory can be rather encapsulated in six theses as follows.

(1) The law is created by the legislator (this does not also hold for customary law, but its role is marginal).
(2) The task of legal science is to *find* the law (such as it already exists), not to *make* law.
(3) The courts apply *existing* law: They do not create *new* law.
(4) Legal science (as a descriptive discipline) should be distinguished from legal criticism: It is not the role of legal science to evaluate existing law in light of criteria of justice or fairness or on the basis of any other values.
(5) Legal theory is an analytic-descriptive enterprise and should accordingly remain axiologically neutral: It should not be in the business of morally evaluating the law.
(6) Legal theory does not ask practical questions about what *ought* to be done, nor does it seek to answer such questions.

The natural-law approach was almost universally rejected, with the exception of Christian legal philosophy, taught at Catholic universities, and of the neo-

Kantian approach, though its influence was marginal (in which regard see, for example, Szyszkowska 1970, 1972).

On the other hand, however, emphasis has been laid on the need to evaluate law by recourse to values as part of the process of interpreting and applying the law, and an effort has been made to analytically describe that process. The evaluative component of legal interpretation and application is highlighted in all theories of interpretation and application. On Ziembiński's (1980) so-called "expanded doctrine of the sources of law" (*rozwinięta koncepcja źródeł prawa*), the question What is law? cannot be answered simply by identifying the social facts recognized to be law-creating (such as a parliament's enactment of a statute) and by describing and analyzing the powers of government authorities (see above Section 16.3.4). A theory of sources of law must also include, as necessary components, the rules of interpretation and inference current in the legal culture, as well as the rules designed to eliminate inconsistencies between legal norms. These components of the doctrine of the sources of law are independent of the legislator, since they are embedded in the prevailing legal culture. The legal culture, however, does not contain a fully consistent set of rules of interpretation and inference: Some of these rules contradict one another. One needs to do some evaluating in choosing the rules by which to interpret and state what the law is. And the rules themselves frequently make their own application dependent on values.

Even Wróblewski's theory of the interpretation and application of law—an analytic-descriptive theory—highlights the need for evaluation in the interpretive process (J. Wróblewski 1959; see Section 16.3.3). Specifically, Wróblewski introduces the concept of a "normative theory of interpretation" (*normatywna teoria wykładni*), a theory that any legal interpreter needs to adopt as a method by which to solve conflicts between competing rules of interpretation. The choice we make in committing to one normative theory of interpretation rather than another is by nature axiological. Wróblewski argues that it is not for legal theory to make such evaluations: Legal theory must only concern itself with identifying and analyzing the areas and problems of legal reasoning where the need for evaluative judgment arises.

There appear to be at least two reasons for the dominance of the positivist approach in Polish legal theory until 1989. The first one lies in the strong influence analytical philosophy exerted in that period on legal theory, especially at the Lemberg-Warsaw school. Also, the achievements of English analytical philosophy in the post-war period almost immediately attracted the attention of Polish legal theorists. And, second, although Poland was much more liberal than other countries in the Communist Bloc, it was practically impossible under Communist rule to do political philosophy and develop moral and legal ideas departing from the official ideology: A retreat into purely descriptive analytical legal theory and philosophy was the only way to avoid ideological connotations.

The analytic-descriptive attitude of Polish legal theory held sway until the political turn that took place in Poland in 1989. After this date, legal positivism ceased to dominate as the prevailing attitude of Polish legal theorists. This turn can be ascribed in the first place to the radical change in the political environment and the concurrent need to establish the moral grounding for the new democratic and pluralistic system and to develop the idea of the rule of law. In the second place, this turn to some extent mirrored the development of Western legal theory, and in particular it was influenced by the theories of Ronald Dworkin, and later of Robert Alexy.[24] Although in our assessment the positivistic attitude as just described is still strong even today, new approaches have begun to take hold. Here we will only mention three developments (fully aware that the list is not exhaustive): (1) a critique of positivism from a hermeneutical standpoint (Stelmach 1995); (2) a critique of positivism from the standpoint of the theory of argumentation and communicative rationality (Morawski 1999); and (3) an increasing interest in the German debate, looking, for example, at Alexy's nonpositivist concept of law or at Radbruch's formula (Zajadło 2001, Grabowski 2009).[25]

16.4. Epilogue

The foregoing overview of the main topics and discussions in Polish legal theory after 1956 is by no means exhaustive. It only covers those topics with which legal theorists were in our opinion overwhelmingly consumed: By no means does it give a full picture of the achievements of Polish legal theory, for it leaves out important thinkers and works. So in this epilogue we are going to pass in review some of the other scholars who we think have made significant contributions to Polish legal theory.

We begin with Józef Nowacki (1923–2005), who taught in Łódź and thereafter in Katowice and devoted himself to a variety of topics, including the *analogia legis,* presumptions in law, the distinction between private and public law, and the rule of law. See Nowacki 1966, 1976, and 1995. His work is carried on by Zygmunt Tobor, his successor in Katowice (see Tobor 1998).

Wiesław Lang (1928–2012), who taught in Toruń, made an important contribution to the problems of legal validity and the relation between law and morals, among other important topics (see Lang 1962, 1989).

The department of legal theory at Lublin State University was founded after 1945 by Grzegorz Leopold Seidler (1913–2004), a pupil of Jerzy Lande,

[24] On Alexy, see Sections 10.3.2.2 and 10.4.3.1 in this tome, and Sections 1.5.4.1, 10.3 and 25.4 in Tome 2 of this volume.

[25] On Radbruch's Formula see Section 10.2.2 in this tome, Sections 1.1.3.2 and 9.1, and Chapter 2 in Tome 2 of this volume.

and very much influenced by Marxism. His indirect successor is Leszek Leszczynski, who teaches in Lublin and has written important books on general clauses in law, on the axiology of law, and on legal interpretation, among other topics (see L. Leszczynski 2000, 2001). Also affiliated with the same department are Andrzej Korybski, whose research is focused on alternative dispute resolution, and Roman Tokarczyk, who has written numerous books on the history of legal philosophy, the theory of comparative law and bioethics, among other topics (see Tokarczyk 2008, 2009).

An important school of legal theory was founded in Wrocław by Stanislaw Kazimierczyk. The members of this school are Andrzej Bator, Włodzimierz Gromski, Zbigniew Pulka, Adam Sulikowski, and the late Artur Kozak (1960–2009). They have written important books on a variety of topics including the method of legal science, the instrumentalization of law, the autonomy of law, and the theory of legislation, as well as on discretion in law (see Kazimierzyk 1978, Kozak 2002, Bator 2004, Pulka 2005, Sulikowski 2008). An important feature of the Wrocław school is its interest in postmodernist thought.

The successor to Jerzy Wróblewski in Lódz is Marek Zirk-Sadowski. In the period after 1989 his research focused, among other topics, on the problem of legal culture in the context of Poland's accession to the European Union (Zirk-Sadowski 1998). His colleagues in Lódz (Małgorzata Król, Bartosz Wojciechowski, Jerzy Leszczynski, and others) contributed importantly to the discussion on various topics in legal theory, including the finality of legal decisions, discretion in law, the philosophical foundations of criminal law, and the functions of legal dogmatics (see Król 1992, Wojciechowski 2004, and J. Leszczyński 2010).

The head of the department of legal theory in Szczecin is Stanisław Czepita, a pupil of Zygmunt Ziembiński and Maciej Zieliński. He has made valuable contributions on the legal philosophy of Czeslaw Znamierowski (Czepita 1988) and on constitutive rules in law (Czepita 1996).

Zygmunt Ziembiński had also a strong influence on the department of legal theory in Poznań, where his pupils teach. Among them is Sławomira Wronkowska, who was previously discussed in the context of the theory of legislation (see Section 16.3.4), but who also works on other problems, such as subjective rights and conventional acts in law. Also in Poznań are Wojciech Patryas, who has significantly contributed to the problem of definitions and performatives in law, as well as to the concept of action and to the problem of the structure of norms (see Patryas 2001); Marek Smolak, who has written on various topics, including institutional legal positivism (see Smolak 1998); and Stanisław Świrydowicz, who has successfully worked on deontic logic and later moved to the School of Mathematics in Poznań.

The successor to Kazimierz Opałek in Kraków is Tomasz Gizbert-Studnicki. In 2008, the department of legal theory and legal philosophy was split into two departments, one devoted to legal theory and the other (directed by

Jerzy Stelmach) to the philosophy of law and to legal ethics. The research out of Kraków is focused on legal hermeneutics (Stelmach 1991, 1995), law & economics (Stelmach, Brożek, and Załuski 2007), legal argumentation (Brożek 2007), the validity of law (Grabowski 2009), liberal political philosophy (Polanowska 2008), the interpretation of law (Płeszka 2010), and the application of the theory of evolution in law (Załuski 2009), among other topics. In the 1970's and 1980's, Franciszek Studnicki (1914–1994, professor of civil law in Kraków) pioneered the study of legal informatics in Poland. Also teaching in Kraków are Jan Woleński (with a focus on deontic logic and analytical philosophy), though he later moved to the Kraków University Institute of Philosophy, and Tadeusz Biernat (at the Akademia Frycza-Modrzewskiego, a private university in Kraków), who works on various topics relating to legal and political theory (Biernat 2000).

Legal philosophy in Warsaw is focused on constitutionality and the theory of the state (Piotr Winczorek) and on neo-Kantian legal philosophy (Szyszkowska 1970), as well as on the theoretical problems connected with public registers and on various aspects of legal argumentation (Stawecki 2005).

The department of legal theory and philosophy in Gdansk, headed by Jerzy Zajadło, focuses on a range of issues in law, with an interest in its ethical implications: the topics of investigation include Radbruch's formula, the moral aspects of international law, human rights, and bioethics (Zajadło 2001).

We have made no reference in this chapter to Polish sociology of law. This discipline developed at a rapid pace after 1956 (the year of Polish October) and gained an international reputation.

Quite a lot of important Polish legal philosophers have worked or are still working abroad: We should mention here Aleksander Peczenik (1937–2005) who taught in Lund; Wojciech Sadurski, who teaches in Sydney; and Krzysztof Grzegorczyk, who teaches in Paris.

It was a remarkable development that legal theory and philosophy went through in Poland in the 20th century. This was due to a combination of factors: a very good start with Leon Petrażycki and his ideas; a serious effort to support science and its organization in Poland after 1918, and then again after 1945; a strong philosophical background, considering not only the Lvov-Warsaw school but also phenomenology, Thomism, and even Polish Marxism (a more open strand of Marxism than in other Communist countries); a plurality of interests, owed in part to the multifaceted investigations undertaken in philosophy; a practice of close cooperation with sociologists and specialists in other fields; and the high regard in which legal philosophy and theory has been held by students of law and practicing lawyers (as can be illustrated by sharing this anecdote, that one of the coauthors of this chapter was browsing through the shelves of a second-hand bookshop one day when he chanced upon a copy of one of Jhering's works, an on it was stamped the name and business address of an attorney practicing in a small town in Poland). Polish legal theorists and

philosophers, like Opałek, Wróblewski, and Ziembiński, or who have a Polish background, like Peczenik and Sadurski, have played an important role on the international intellectual scene, and the same could be said of the present generation. This was attested by the fact that the 23rd IVR World Congress IVR took place in Kraków in 2007.

Chapter 17

RUSSIAN LEGAL PHILOSOPHY IN THE 20TH CENTURY

by Mikhail Antonov

17.1. Introduction

The 20th century seems to be the most fruitful time for the philosophy of law in Russia, considering the contribution that Russian and Soviet legal thinkers have made to this discipline, and the role they have each played in the development of the international debate, despite the severe political impact that legal studies have suffered in Russia, not only in the Soviet period but also before the Revolution. It was impossible to find in 20th-century Russia a lawyer engaged in pure theoretical investigations without thinking of their ramifications in the contemporary political situation. As elsewhere, there has been a certain discrepancy between, on the one hand, the theories the local (Russian and Soviet) jurisprudence popularized for their political content and, on the other, the theories that revealed their importance on theoretical grounds alone. The overpowering ideological background of Soviet science could not but contribute to this effect and deeply conceal the state of affairs in national legal theory. Much less could Soviet science keep from defining evaluative criteria that largely depended either on the view of this or that accredited theorist—witness the crucial influence of Lenin's views or those of Vyshinsky, who was attorney general under the Stalin regime and set out a naive command theory of law that could hardly be taken to have any real explanatory value—or on the compatibility of a theorist's conceptions with Marxist dogma. Although true Marxists disdained law, the role their legal theories played in official ideology and in political practice cannot be ignored. That is why the selection that follows is made from both a theoretical and a practical perspective, considering each conception not only on its own merits but also in light of its relevance for the further development of Russian debates and practices as concerns the law. Some of the philosophers discussed here belong to both the 19th and the 20th century, and the decision to include them was made by taking into account the period when their principal works were published and influenced the scholarly community. Two main periods will be distinguished: (1) the prerevolutionary period, where the conceptions developed by the Russian emigrants will also be studied, because they are the natural continuation of the discussions initiated before 1917; and (2) the Soviet and the post-Soviet periods, which yielded different outcomes in contemporary Russian philosophy of law. I am aware of the impossibility of covering all aspects of legal philosophiz-

ing in Russia, and so I will focus on the most prominent actors of Russian legal philosophy in the 20th century. For the sake of brevity, I will leave out minor details, and where advisable I will refer the reader to the research available in English, French, or German.

17.2. The Prerevolutionary Period

Russian legal philosophy traditionally developed in the mainstream of natural-law conceptions. But at the end of the 19th century the powerful impact of secularization splintered Russian academic culture and turned it into a struggle among liberals, radicals, and traditionalists in all branches of social science, including the science of law. The threadbare labels "positivism" and "idealism" can be applied only on condition that this distinction does not necessarily denote any definite political affiliation, even though almost all thinkers tended to bring their theoretical findings to bear on the political debates. The disputes centred on the question of the development of society, culture, and religion; and quite often, those who sought legal and political reforms were idealists (like Pavel Novgorodtsev), while those who stoutly argued for the immutability of the existing system were positivists (like Gabriel Shershenevitch).[1] It is true, on the other hand, that the imperial government of Russia promoted idealism combined with traditionalism and mysticism as the basis of its official ideology, and tended to banish the positivist philosophy, which challenged the sacred official ideological formula "Orthodoxy, Autocracy, Nationality" (*Pravoslavie*, *Samoderzhavie*, *Narodnost'*). However, the effect seemed to go exactly in the opposite direction: The tsarist censure, surveillance, and reprimands could not but contribute to the ever-growing popularity of the positivist ideology in Russian society.

The overall situation in Russian legal philosophy at the turn of the 20th century was marked by this polemic among several groups of scholars and thinkers. Powerful political offices were held by the monarchists, who espoused traditionalism but did not initially fall into the extreme nationalism and anti-Semitism characteristic of the *tchernosotenniki* (the Black Hundred).[2]

[1] Pavel Novgorodtsev (1866–1924) took up Rudolf Stammler's idea of a "natural law with changing contents" by laying emphasis on the problem of political and social ideals and their crucial role in the development of law. After emigrating to Czechoslovakia, he worked on the correlation between law and religion, examining specific traits of the Russian people's legal consciousness. Gabriel Shershenevitch (1863–1912), for his part, is controversially famous for his thoroughgoing positivist account of law. For Shershenevitch, as for John Austin, law is nothing but a command of the sovereign, and on this premise he pursued (before Hans Kelsen) a program intended to purify legal science of all values and ideologies. In this sense, Shershenevitch can be considered a theoretical antipode to Novgorodtsev and his school. More information on these two authors will be given in what follows. On Stammler, see Section 1.3 in this tome and Section 2.2 in Tome 2 of this volume.

[2] This is a collective name for a variety of small conservative groups that resisted the revo-

Among the partisans of the monarchist ideology two authors can be singled out: Konstantin Pobedonostsev (1827–1907) and Lev Tikhomirov (1852–1923).[3] Pobedonostsev was prominent as the author of several important papers, but he was also influential as Ober-Procurator of the Russian Orthodox Church (serving in that capacity for twenty-five years) and as the tutor of the young Nicolai II. Pobedonostsev opposed liberal reforms in Russia, for in his opinion they were contrary to the Orthodox canon (cf. Pobedonostsev 1965). After the first Russian Parliament was summoned in 1905, Pobedonostsev resigned from his post in protest and thus lost most of his influence (cf. Byrnes 1968), but he did remain the principal theorist of traditionalism at the beginning of the 20th century. Tikhomirov, for his part, initially opposed the tsarist regime, even taking part in several terrorist attacks against its officials, but afterwards he authentically adhered to monarchism (Tikhomirov 1888). In 1905 came his voluminous book *Monarkhitscheskaja gosudarstvennost'* (Monarchic statehood: Tikhomirov 1905), which marked the highest point of development of official monarchist theory in Russia, and which is thought to be its most representative statement. In it Tikhomirov ardently criticizes the liberal ideology as chanting slogans (equality, universality) that contradicted its actual practices (inequality, oligarchy), and as originating from Western legal psychology, which favours "the power of quantity" (Tikhomirov 1905, 23; my translation). Against this psychology Tikhomirov sets the Russian Orthodox mental outlook, which instead appreciates "the power of quality" (ibid.) and makes no distinction between power and a tsar, the latter being a symbol of political unity in the eyes of people, and at the same time the guarantor of civil rights and liberties (see Tidmarsh 1961). Another important representative of monarchism was the Belorussian philosopher Ivan Solonevitch (1891–1953), who emigrated to Argentina and took a more rigid nationalist stance, making anti-Semitic and anti-Western assaults and thus demonstrating how, in Russian legal philosophy, the monarchist ideology degraded into nationalism (see Solonevitch 1952).

This monarchist mainstream was opposed by its natural opponent: liberalism. The ideas of liberal ideology were being developed in the numerous works of its fountainhead, Boris Chicherin (1828–1904). Chicherin was re-

lutionary upheavals of the first Russian Revolution in 1905 and in the following years. As revolutionary propaganda was mostly associated with the Jewish *intelligentsia*, the *tchernosotenniki* turned mainly against the Jews, organizing pogroms in fits of collective anger; and they also attacked the members of opposing political parties. The *tchernosotenniki* positioned themselves as defenders of orthodoxy and monarchism. The name "Black Hundred" is a historical allusion to 1612, when the Russian national hero Kuz'ma Minin gathered a militia from the "black hundred" (peasants and craftsmen) to drive the Polish troops from Moscow.

[3] The second author's given name is so transliterated (as *Lev*). This is different from the way Tolstoy's given name is transliterated (as *Leo*), even though their spelling and pronunciation in Russian is in both cases the same: *Lev*.

garded as the most knowledgeable specialist in the political doctrines of Western Europe and Russia, and as the originator of Russian liberal legal philosophy (cf. Gamburg 1992; Walicki 1987, 105–64). This thinker followed the outlines of Hegelian legal philosophy but stressed the "absolute and indefinite dignity of the human being" (Chicherin 1998b, 60; my translation). The deepest nature of each human being resides in liberty, whose external manifestations are administered by legal regulation, and the internal ones by moral regulation. It is on the notion of legal (and moral) personality, and on the distinction between law and morals, that in the 1890s his famous dispute took place with Vladimir Soloviev,[4] who supported an organic and holist conception of social regulation (cf. Gurvitch 1922). This credo of Chicherin led him to affirm liberal values and ideals, and it is by this contribution that his significance in Russian legal philosophy is to be measured (see Chicherin 1998a).

Alongside these two mainstreams in Russian legal philosophy there existed two other approaches which from a theoretical standpoint cannot be treated as significant as the liberal and conservative ones, but which proved to be of utmost importance in political life. They are Marxism and anarchism, whose subversive ideologies were the main inspiration of the October Revolution in 1917 and of the ensuing Civil War. In the second half of the 19th century, anarchist ideology exercised a quite remarkable influence on the political life of Russia. The activity of Mikhail Bakunin[5] and his followers stoked the Russians' traditional scepticism of the state and the law. The chasm between the religious ideological background of power and of the laws issued by it, on the one hand, and the actual content of these laws and their practical implementation,

[4] Vladimir Soloviev (1853–1900) was the most prominent figure in Russian philosophy in the second half of the 19th century (his family name can take any of several spellings in English: *Soloviev*, *Solovjov*, *Solovyov*, *Solov'ev*, or *Solovyev*). He criticized what was then a commonly accepted tenet of neo-Kantian philosophy, namely, the separation between the empirical and spiritual worlds, but at the same time he also rejected the Hegelian push to spiritualize the material world. For Soloviev, these "Abstract Principles"—his doctoral thesis is titled *Kritika otvletchennykh natchal* (Critique of abstract principles: Soloviev 1880)—must be merged by cognition into an All-Union (*Vseedinstvo*) where opposing and conflicting principles are worked together into a higher synthesis. Proceeding from this highest reality, Soloviev (1897) then sets out to develop a system of social philosophy with which to explain social cohesion and interaction by virtue of a spiritual unity of mankind (*sobornost'*). In this system, law was conceived as a "moral minimum" (*minimum nravstvennosti*) necessary to promote such "hyperempirical" unity at every stage of social development. See Soloviev 1897, 328. Cf. D'Herbigny 1918, Sutton 1988.

[5] Mikhail Bakunin (1814–1876) is one of the founders of anarchism. After emigrating from Russia in 1840, where he was persecuted for his anti-étatist beliefs and revolutionary propaganda, he still remained influential among the Russian intelligentsia. In 1851 he was extradited to Russia from Saxony and spent ten years in prison and in exile. He fled from Russia again in 1861. His political aim was to have the means of production collectively owned, and to have the state abolished in favour of many independent social groups (see Bakunin 1971). He and his supporters strenuously criticized Marx's ideas about the ways to implement the social revolution and establish a new social order.

on the other, was fertile ground where anarchism could stir up various popular movements. These movements, and the idea of repudiating the legal sphere as incompatible with moral and religious beliefs, found powerful support in the literary work of the Russian novelist Leo Tolstoy (1828–1910). Tolstoy had a great impact extending beyond Russian literature: His moral indictments and criticisms against the state and the law became one of the main factors in the development of Russian legal philosophy at the turn of the century. Most of the works he wrote at that time expressed a resolute rejection of any power (political, legal, etc.) other than the power of God. Even though in his illustrious literary works Tolstoy aimed his attacks at the Russian legal system, his actual target was not just this or that particular regime or set of laws but the very idea of coercion incarnated in the state and the law (see his famous philippics against state coercion in Tolstoy 1970, 1989). Many became the followers of his anarchist doctrine (*tolstovtsvo*) of noncoercion (*nenasilie*), who gathered in communities claiming freedom from any legal regulation. Even if Tolstoy's criticisms revealed plenty of inconsistencies and contradictions in his doctrine, his anti-law and anti-state ideas remained widespread and influential in Russia until the 1917 Revolution.

Another ideologist of anarchism, Peter Kropotkin (1842–1924), developed a different strategy, suggesting that the state and the law would *inevitably* melt away under the pressure of social revolutions. In the first quarter of the 20th century, Kropotkin became the intellectual and political leader of the "militant" Russian Anarchists,[6] and his ideas about the aim of revolution (to destroy all coercive mechanisms in society) acted during the Civil War as a powerful intellectual counterpoise to Lenin's doctrine of dictatorship of the proletariat (see Kropotkin 1927; cf. B. Morris 2004). During the Civil War, which began to really batter Russia in 1918, anarchism became a political and military power to be reckoned with, so much so that black (the colour of the Anarchists' flag) became the war's third colour, along with red (the Bolsheviks) and white (the Monarchists and Republicans). Defeated by the Bolsheviks in the Civil War, the Anarchists lost the people's support, and their doctrine ceased to play any significant role in Russian legal philosophy.

The first steps of Marxism in Russia did not give promise of any extraordinary success, nor did they give any hint of the influence this ideology would later exercise in Russian history. The Russian Marxist Party—called *Osvobozhdenie truda* (Liberation of labour) and headed by George Plekhanov (1857–1917)—was born in the 1890s as a branch of the *Narodnik* (Populist) movement. It was not initially a numerous and powerful party, however, since the few industrial workers and radical intellectuals who joined it made up too narrow a social base by comparison with the nobility, peasantry, clergy, and other

[6] This was in contrast to the "peaceful" anarchism of Tolstoy, who eschewed all contact with political life.

influential social strata in Russia. Convinced of the unavoidability of social revolution, Plekhanov advocated progressive, step-by-step reformative groundwork through legislation, a process destined to lead to industrial and political development in Russia and to the consequent growth of the working class: This, in turn, was bound to change society's production system and to eventuate in subsequent social changes. That is why Russian Marxism at its inception espoused many liberal principles, and the protection of liberties by law was regarded by the first Marxists as an indispensable mechanism for achieving their political objectives. This position was not unanimously shared by all of the party's members, and at the very outset of the 20th century a schism took place among the Legal Marxists headed by Plekhanov, the Mensheviks, and the Bolsheviks[7]—the latter being persuaded of the futility of any bourgeois liberal legal reforms, which would accomplish nothing but to divert the working people from revolutionary activity.

This Leninist mainstream in Marxism was counteracted by another trend started by a group of philosophers guided by the ideas of Vladimir Soloviev: They came forward with their credo in 1902 (Askol'dov et al. 1902), pointing out the weak theoretical points of Marxism. Several years later, in 1909, a new book came out under the ambitious title *Vekhi*—or "Landmarks" (Berdyaev et al. 1994)—where the criticism against Marxism was renewed with even greater insightfulness and resonance.[8] First and foremost, the authors accused the revolutionary intelligentsia of a contemptuous attitude to law, criticizing the legal nihilism of Lenin and his followers. This book gained widespread support among Russian intellectuals and contributed to further discussions on law's importance for social development, becoming the Russian revolutionists' most dangerous ideological opponent (see Brooks 1973, 25ff.). When the Russian social system collapsed in 1918, the authors of *Vekhi* published another book (Askol'dov et al. 1918), this time making known their negative attitude to the events of 1917 and expressing strong traditionalist convictions.

When the Civil War was over, several younger philosophers put out a bold new work titled *Smena Vekh*, or "Change of Landmarks" (Kluchnikov 1921).[9]

[7] See the debates listed in *Protokoly Vtorogo Kongressa Rossiiskoi sotsial-demokraticheskoi partii* (Protocols of the Second Congress of the Russian Socialist-Democratic Workers' Party), July–August 1903 (Moscow: Gospolitizdat, 1953).

[8] Contributing to this work were Nikolai Berdyaev (see below), Sergey Bulgakov (1871–1944, who started out as an active Marxist and then, in 1909, turned to religious conservatism and developed a social philosophy based on the Orthodoxal dogma), Semen Frank (see below), Peter Struve (1870–1944, a politician, member of the Constitutional Democratic Party, and an economist who initially espoused the Marxist theory but then did a complete turnabout in 1909 and sharply criticized it), Bogdan Kistjakovsky (see below), Alexander Izgoev (or Aron Lande, 1872–1935, an ardent Marxist as a student, he later joined the People's Party of Liberty and became a political adversary of the Bolsheviks), and Mikhail (or Meilikh) Gershezon (1869–1925, a famous literary critic, though not involved in politics).

[9] Contributing to this work were Juri Klutchnikov (1886–1938, professor of international

They asserted that the Revolution occurred because of the cosmopolitism furthered by the previous regime, which tried to introduce Western legal values in Russia without questioning whether these values are compatible with the Russian people's ethos. These authors considered Bolshevism a natural reaction against such Westernization, believing it would be overcome by a strong state consolidated through customary law. This logic was followed by Eurasianism (see Suvtchinsky et al. 1921), which insisted that Russia belongs to neither Europe nor Asia, and continues the legal practices of Byzantium and of Tartary, all the while creating its own legal reality based on cultural patterns inherited from history and geography (cf. Halem 2004, Laruelle 2008). The most remarkable legal thinker among the Eurasianists was a disciple of Novgorodtsev at Moscow University by the name of Nikolai Alekseev (1879–1964) who developed a phenomenological conception of law seeking to combine phenomenology with Soloviev's ideal-realist conception of law (see N. Alekseev 1924).

Nikolai Berdyaev (1874–1948) took an active part in the development of *Vekhi* principles, criticizing the radicals for advocating a rejection of legal regulation in the name of greater human prosperity. But as early as 1918 Berdyaev changed his position and vehemently denounced democratic, liberal values as the philosophical background for extreme cruelty and for the inhumanity of revolutions. In this book (Berdyaev 1990) Berdyaev viewed law as playing a new role—that of establishing and maintaining inequality among the different strata of society. He exploited the evangelic hyperbole "Kingdom of God" and "Kingdom of Caesar" to illustrate the unbridgeable gap between "internal" and "external" ways of regulation, claiming that law is impuissant without recourse to religion, and will sooner or later turn into theocracy. In his later works Berdyaev turned his attention from political and legal issues to existentialist philosophy, stressing on the importance of liberty as the primary fact of existence (see Berdyaev 1935, 1939) and trying to reassess the Communist ideology from the vantage point of the realization of human liberty (see Berdyaev 1937).

Also a participant in the *Vekhi* movement was Semen Frank (1877–1950), stressing that the rejection of legal regulation could not result in a higher moral regulation but would inevitably bring society to collapse and disintegration. In

law and a member of the People's Party of Liberty), Nikolai Ustrjalov (1890–1937, professor of public law and an active member of the Constitutional Democratic Party), Sergey Luk'janov (1888–1938, a philologist and journalist), Alexander Bobrizsev-Pushkin (1875–1937, a lawyer and a member of the "Union of October 17th" Party), Sergey Chakhotin (1883–1973, a biologist and physician), and Juri Potekhin (1888–1937, a literary critic and member of the Constitutional Democratic Party). These thinkers all left Russia after the Bolshevik Revolution but in 1923 returned to the Soviet Union (all of them except Chakhotin, who served on trade missions of the USSR in 1923–1927). They believed that the Bolsheviks could realize the Russian people's national ideals, and this is why they came back and tried to cooperate with the Soviets. All of them except Chakhotin were declared "enemies of people" and executed in 1937–1938, as were more than 100,000 other returnees who in the 1920s followed the ideological call of *Smena Vekh*.

1915 Frank published his principal epistemological work (Semen Frank 1915, translated in French as Semen Frank 1937), arguing that consciousness and being form a unity secured by the world's ideal dimension, a dimension which human beings perceive intuitively, and which (following Soloviev) he labels *Vseedinstvo* (All-Unity). After emigrating (to Germany, then to France, and finally to England) Frank applied his epistemological findings to some basic problems of social regulation. Developing the ideas of Émile Durkheim, he concluded that social regulation can work in two ways: as a mechanical community (*obzhnost'*) or as a spiritual communion (*sobornost*). The task assigned to law is to combine these two ways of social regulation into a synthesis suited to each distinct society (see Semen Frank 1930). Later, reflecting on World War II, Frank changed his views and revealed profound scepticism in regard to the concept of a natural law, believing that positive law is endowed with its own spiritual value and does not need any moral or religious justification (see Semen Frank 1949). In so doing, Frank criticized natural law theory for setting forth supra-positive criteria on which basis to evaluate positive law, thus undermining the latter's validity. Natural law, on this view, threatened to destroy the minimal guarantees of legality for the sake of the unclear spiritual values of a "higher law." In his later writings, in an effort to preserve these guarantees, Frank blamed this "higher law" for its role in the resurgence of formal law. It is remarkable that this apology of positive law was offered from the standpoint of religious philosophy.

Another outstanding scholar who took up the "Vekhi idiom" was the Russian-Ukrainian lawyer and philosopher Bogdan Kistjakovsky (1868–1920). He recognized that Russian legal nihilism, i.e., the failure to understand and recognize the social significance of law, can very well be explained by pointing to the Russian authorities' long history of despotism. The way out of this situation, however, is not to take down the legal system; rather, the first task of the intelligentsia is to nurture the people's legal consciousness, thereby contributing to perfecting legal and social structures. Kistjakovsky's legal ideas were extensively developed in *Sozialnye nauki i pravo* (The social sciences and law: Kistjakovsky 1916), which set out a project for the "integration" of legal philosophy. Kistjakovsky advocated a pluralistic approach in the legal sciences, where an integrative method could combine the various methodological tools—some of them seemingly irreconcilable—proper to the natural-law, psychological, normative, and sociological approaches to law. As a foundation for this integrative methodology, he suggested a critical analysis of normative communication, believing that this could integrate different aspects of law (see Kistjakovsky 1916, 195ff.). Kistjakovsky insisted that sociological and psychological approaches only make it possible to discover *causal* relations in law, this in contrast to the normative approach, which makes it possible to see the *teleological* element, providing the ultimate aims of law. He thought that this normative approach shows law to be something valuable and reasonable in itself, and thus sought to find an *a priori* foundation for this axiological element

of law. He saw this foundation in social communication, a practice viewed as based on the idea of justice. The content of this idea varies from society to society, but its form remains the same, resolving itself into an imperative requirement to balance the interests of the individual against those of the social, a balancing reflected in the idea of human rights. So, the ultimate validity of the positive law is predicated on its congruence with human rights (or with natural or divine law, however one might choose to call this *a priori* foundation). In their turn, human rights are dependent on there being forms of social communication. These forms are examined from a twofold perspective, for on the one hand we rely on transcendental methods to arrive at a *normative* formulation of justice as an idea reflected in the legal consciousness, whether individual or collective, while on the other hand we look to empirical methods (ibid., 615–23), taking the route of sociology or psychology, or any other causal science, and seeing how the same idea finds expression in *concrete* human interaction. This combined approach to law is described by Kistjakovsky as "integral."

Alongside these "idealist" legal theories there grew the Revived Natural Law movement (*vozrozhdennoe estestvennoe pravo*), which became prevalent at Russian universities before the Revolution. This movement in Russian legal thought was associated for the most part with Vladimir Soloviev's school of legal philosophy. Pavel Novgorodtsev (1866–1924) was the most distinguished representative of the Revived Natural Law School in Russia. Like Soloviev, Novgorodtsev understood natural law as an equilibrium of private and public interests, and hence as a prerequisite for the free development of personality on both an individual and a collective level (see Novgorodtsev 1909). The political and social turmoil of his time he imputed to what he called the "demise of the idea of paradise on earth," the dream of arriving at a perfect model of social organization. The basic misconception, for him, lay in considering this perfect model an end in itself, rather than a means to other ends. In fact, the problem for him is precisely that of striking an interim equilibrium, a relative balance between the conflicting values of individualism and collectivism, liberty and equality. This equilibrium cannot be regarded as anything concrete or substantial, with a formula that holds good once and for all: Humankind will always be making and remaking this equilibrium anew, gauging the ultimate end in light of the circumstances specific to each situation. Human rights, constitutionalism, democracy, and other values are only relative, intermediate remedies, acquiring their spiritual meaning only if viewed as conducive to the "attainment of human dignity" (ibid., 13ff.; my translation). Novgorodtsev's most important research appeared in 1917 (*Ob obzhestvennom ideale*, On the social ideal: Novgorodtsev 1917), with a detailed and insightful criticism of the utopian ideals underpinning socialist ideology, which is found guilty of confounding absolute and relative values. This confusion, according to Novgorodtsev, leads to social cataclysms similar to that of 1789 in France or that of 1917 in Russia. After 1917 Novgorodtsev criticized as utopian not only *socialist* legal

philosophy but also its *democratic* counterpart (with its ideals of a liberal, egalitarian regulation), arguing that there cannot exist any absolute ideals in the legal domain, because the only authentic values and ideals are religious (see Novgorodtsev 1917). Whereas, in his prerevolutionary works Novgorodtsev gave evident primacy to individuality as the sole bearer of freedom and moral dignity, after emigrating he took a position closer to Slavophiles's traditionalism, focusing especially on the role of religious and communitarian values in law (see Novgorodtsev 1922, 1926). With the experience of the revolution and the ensuing war, Novgorodtsev grew sceptical of the moral forces of humankind, no longer seeing the ultimate basis of law in the "attainment of human dignity," and turning instead to a theological conception of law: "Instead of autonomous morality we posit theonomous morality, instead of democracy and self-government we posit hagiarchy, or the authority of the holy shrines" (Novgorodtsev 1926, 70; my translation). This sliding from liberal ideals to conservative views was characteristic not only of Novgorodtsev but also of many other proponents of idealist philosophy of law, whose works are described below.

Another illustrious disciple of Soloviev was Evgeny Trubetskoy (1863–1920).[10] Trubetskoy's legal conception became one of the last versions of Revived Natural Law in Russia. In his view, natural law should be understood as "ought" in the legal sphere, as a criterion for evaluating the positive laws. This "ought" is equivalent to human freedom, such as is acceptable in a given society at a given time, and measured against existing norms—in such a way that "law is a freedom offered and delimited by norms" (Trubetskoy 1911, 102; my translation). Natural law thus preserves the core of the human being, namely, the liberty which cannot be suppressed without simultaneously suppressing legal regulation. Similar ideas were developed by Alexander Jazshenko (1877–1934), who taught at Saint Petersburg University, and after emigration to Kaunas University in Lithuania, and who in 1912 published another masterful investigation of Soloviev's legal thought (Jazshenko 1999a), this along with *Teoria federalisma* (The theory of federalism: Jazshenko 1999b), presenting his own research. These two books proceeded from the same premise: that the philosophical understanding of law hinges on a synthesis of different approaches to law, and that in this way the equivalence will be recognized between individuality and society (see Jazshenko 1999b, 56). He stressed that empirism is reconcilable with assertion of a higher morality, they can be built into

[10] Trubetskoy brilliantly laid out his teacher's ideas in the two-volume work *Mirosozertsanie Vladimira Solovieva* (Vladimir Soloviev's worldview: Trubetskoy 1913). And since Soloviev was the brightest philosophical star of Russia's cultural Silver Age (the last and first quarter of the 19th and 20th centuries, respectively), his ideas, including his legal conception, exerted great influence on philosophical development in Russia. This was the reason why many thinkers would refer to Soloviev's intellectual heritage to frame their own conceptions.

the ultimate principle of interindividual cooperation, which as its supreme goal has to create "normal social conditions" (Jazshenko 1999a, 50; my translation).

Jazshenko argues that morality can never be constrained by human subjectivity, for it necessarily transcends one's personal life and subjective feelings: Each member of society is to implement the objective values this society pursues. That is why, in Jazshenko's opinion, we each intuitively cherish some ideal model of society (a blueprint framing a view of "normal social conditions"). We thus rely on our insight to put together provisional schemes of interaction through which this ideal model is implemented, but this can be done only insofar as we can agree on, and consequently pursue, a common set of aims achieving which realizes our social being. Of course, no such agreement can ever be unanimous: It can at best be partial. But Jazshenko does not take this to mean that human interaction is arbitrary. Quite the opposite: No interaction can happen without first securing the social participants' mutual agreement and engagement—the very basis of law. And, what is more, there is an intuitive and unconscious drive that induces us to agree and interact, seeking to communicate with others in such a way that the individual and the collective (Me and the Other) will be in equilibrium and on an even keel. Law is produced through a synthesis of shared feelings in the collective psyche; these feelings coincide—because directed at the same ideals—and as a result they can be framed into standard normative forms (see Jazshenko 1999b, 78–101).

The same overall goal—that of applying Soloviev's philosophy to law—drives the conception of the Russian-Ukrainian philosopher Evgeny Spektorsky (1873–1951), who greatly contributed to the historical analysis of law, arguing that such analysis can provide a tool of social control (see Spektorsky 1939). Spektorsky makes a compelling case that each legal system exists in the first place as a cultural environment where human beings communicate through signs, symbols, and concepts. Humans for the most part behave in keeping with cultural models and patterns, such that we need not threaten sanctions to bring into line those who stray from the model: We need only provide a context where their behaviour will cohere with the basic patterns of interhuman relations (where "basic" is understood by reference to the prevailing mores in a concrete society in a given epoch). A paradigmatic example, for Spektorsky, lies in European legal culture: "A European is for us a 'jural man,' one who has developed a legal consciousness and strongly protects his rights and liberties. [...] This kind of man could not have appeared without the impact of Christian anthropology [...], which spiritually brought into being the very idea of legal personality" (Spektorsky 1925, 37; my translation). In this book, Spektorsky offers an accurate account of how normative constraints prove ineffective as a means by which to shape society, for they act as impediments to cultural development: Sweeping legal and political reforms would be much easier if only their proponents would take the cultural patterns of their society into account. Though strongly influenced by American legal

realism and European sociological jurisprudence, his ideas were also rooted in the Russian legal discourse of the early 20th century, thus characteristically combining a metaphysical approach to law with certain realist tendencies (cf. Walicki 1979, 371ff.).

Idealism in law does not necessarily lead to the assertion of democratic values, and this has been the case with Russian legal philosophy, too (cf. Pribytkova 2009). Thus, pursuing the idealist premises of Hegelianism, Ivan Iljin (1883–1954) developed an autocratic legal conception in many respects similar to the conception of Carl Schmitt.[11] Iljin's approach to law initially proceeded from the aim of refuting Leo Tolstoy's anarchist and nihilist conception, thereby protecting law from a nihilist intrusion that might undermine the value of legal regulation (see Iljin 1995). Iljin asserts that law is propped up by communitarian spiritual values that bring individuals together in legal communions. This conception was developed in Iljin's most remarkable book, *O suzhnosti pravosoznanija* (On the essentials of legal consciousness: Iljin 1994a), investigating the nature of legal consciousness. In his opinion, this consciousness coincides with the will to obey the authorities' commands, so long as these commands are legitimated. The legitimization of these commands can be achieved in either of two ways: through equality or through hierarchy, a distinction that Iljin accounts to be essential in distinguishing two main forms of government, namely, the republic and the monarchy, the subject matter of his book *O monarkhii i respublike* (On monarchy and the republic: Iljin 1994b). In the former case there appears a "republican legal consciousness" (ibid., 440–87), which favours individual independence and is distinctive to Western civilization; in the former case we instead have a "monarchic legal consciousness" (ibid., 488ff.), which in Iljin's view supports collective harmony and perfectly matches the Russian cultural archetypes. Praising this latter form, Iljin claimed that limitations must be placed on liberal rights and freedoms until a people fully integrates its cultural values and grows into a spiritual entity capable of making a wise use of its freedom: "Until we go through a spiritual regeneration, any attempt to introduce a coherently democratic regime in the country [Russia] must be regarded as inevitably leading either to mob rule or to a new rightist totalitarian tyranny" (Iljin 1993, 24; my translation).

Alongside the "idealist" current in Russian legal philosophy—and competing with it—there also existed a "positivist" current, in which there can be distinguished several approaches: a normative one, a sociological one, and a psychological one, among others. A typical representative of the normative approach in Russia, as well as its most illustrious representative, was Gabriel Shershenevitch (1863–1912), who followed the ideas of John Austin and other advocates of the command theory. He insisted that the basic characteristic of legal norms lies in the state's coercion and in the sanctions the state's officials

[11] On Schmitt, see Chapter 8 in this tome and Section 8.8 in Tome 2 of this volume.

may impose, and so that the state logically and historically precedes law. Law is the people's reaction to uncertainty, in that they guard against uncertainty by issuing obligatory norms and directives; from which it is inferred by Shershenevitch that the ultimate criteria of law lie in its predictability and openness (see Shershenevitch 1911, 290ff.). Although Shershenevitch and his followers did not bring forth anything original by comparison with their Western European counterparts, they did mark an important phase in Russian liberalism.

The sociological approach caught on particularly well in Imperial Russia. Sociological thinking was looked upon by the authorities as revolutionary thinking, and for this reason the teaching of sociology was officially banned until the fall of the political regime in 1917. Thus, it was only in Paris that the famous Russian-Ukrainian sociologist Maxim Kovalevsky (1851–1916) could open his Russian Institute of Sociology (*Institut Russe de Sociologie*), as it was then impossible to open a sociological institution in Russia. Internationally recognized as a leading legal anthropologist at the turn of the century, Kovalevsky followed Emil Durkheim's philosophy of solidarism and masterfully demonstrated how legal regulation in human societies slowly develops patterns, and how these become relatively uniform. This process of "legal expansion" does not come to an end with the appearance of the state—social groups do not cease to form such patterns, continuing to independently develop them vis-à-vis the authorities (see Kovalevsky 1938). The sociological approach was carried on in the work of Veniamin Khvostov (1868–1920), a professor at Moscow University. Following evolutionism, Khvostov argued that social life is based on a plurality of different regularities (psychological, economic, etc.) producing conflicts which are to be settled through law, the latter being a mode of spiritual coordination of human behaviour (see Khvostov 2011). Given the unpopularity of tsarism among intellectuals, many were attracted by the possibility of studying law not as a divine command or as a government-issued command (such was the official legal ideology), but as a result of the way the social powers combine, a process that follows the objective laws of social evolution.

A vital contribution for the development of legal positivism in Russia was made by Leon Petrażycki (1867–1931) and his school. We will not consider here Petrażycki's own psychological conception of law, since that subject is thoroughly examined in this volume by Jan Woleński and Edoardo Fittipaldi,[12] but we will consider three illustrious disciples of Petrażycki. Pitirim Sorokin (1889–1968) began his carrier at Saint Petersburg University as a professor of criminal law, and after emigration he gained prominence as a professor at Harvard University. His first investigation in 1913 (Sorokin 1999) secured for him a good standing in Russian legal science, and the publication of his textbook on legal theory (Sorokin 1919) only strengthened that position. In this period

[12] See Section 16.2 in this tome and Chapter 18 in Tome 2 of this volume.

Sorokin was mainly engaged in fighting in the Civil War with the Socialist Revolutionaries, and after the Bolsheviks captured him, only personal amnesty by Lenin saved him from a death penalty in 1921. Having expatriated from Soviet Russia in 1922 aboard the famous "ship of philosophers,"[13] Sorokin continued his research in Europe and the United States: It is in this latter country that he came out with his brilliant study *Social and Cultural Dynamics* (Sorokin 1937), where the law is considered from the standpoint of social mobility. Georges Gurvitch (1894–1965) started out as a lecturer at Petrograd University, and after emigration achieved fame as a professor at the Sorbonne. After several interesting articles in Russian (cf. Antonov and Berthold 2006, Gurvitch 2006), he published *L'idée du droit social* (The idea of social law: Gurvitch 1931), which was his French doctoral thesis. Gurvitch insisted that existing alongside positive and natural law is a social law: a particular legal reality residing in collective intuitions. This masterly investigation was followed up with several supplementary studies and summarized in English in 1942 under the title *Sociology of Law* (Gurvitch 1942). In his subsequent works Gurvitch worked for the most part on the problems of general sociology, and only in this context did he return to law (see Gurvitch 1960, 173–206). The third famous disciple of Petrażycki was Nicolai Timasheff (1886–1970), who taught at Saint Petersburg University (from 1914 to 1917) and at the Petrograd Polytechnic Institute (from 1916 to 1920), and who after emigration pursued a successful career at Fordham University (in the United States). He started studying the sociological perspectives of law simultaneously with his Petrograd colleagues Gurvitch and Sorokin, and launched his lectures on the sociology of law immediately after the February Revolution of 1917 lifted the ban against the teaching of sociology. In these lectures, Timasheff anticipated the conclusions reached in his opus magnum, which appeared in 1939 under the title *An Introduction to the Sociology of Law* (Timasheff 1939).

17.3. The Soviet and Post-Soviet Period

The first years of the new Bolshevik regime could be characterized as tumultuous in all spheres of social life, including that of intellectual debate. Bolshevism was nominally committed to suppressing such tools of class exploitation

[13] The ships were in reality two, the *Oberbürgermeister Haken* and the *Preussen*, both of them German. In October and November 1922 they set sail from Petrograd (now Saint Petersburg) in Soviet Russia, carrying about two hundred Russian intellectuals who had been rounded up and accused of "supporting the counterrevolution." Aboard the two ships were prominent figures of international fame, and the Soviet Union therefore stood to lose credibility if it decided to execute them. It was under Lenin's orders that they were expelled, and they were sent to Stettin, in Germany. In Leo Trotsky's words, it was a "humanitarian action that made it possible to save the lives of people who otherwise would have had to be shot" (Interview published in the newspaper *Izvestija*, August 30, 1922; my translation).

as the law and the state, but in reality, after the 1917 coup d'état, it sought to reinforce the state's powers and its administrative machinery. It was in order to work out this contradiction that in 1918 the Bolsheviks' leader, Vladimir Lenin (1870–1922), wrote his famous *Gosudarstvo i revoljutsija* (The state and revolution: Lenin 1974), which provided the blueprint for the development of Marxist-Leninist legal philosophy for many years to come. Lenin maintained that in order to overcome class exploitation, it is necessary to first suppress the competing classes by setting up a strong and powerful state controlled by ideological authorities. The authorities' commands had to replace the legal machinery of the former tsarist regime. Lenin did not overestimate the virtues of law, which "imposes a common measure on different people [...], and so, while aiming at the accomplishment of justice, results in inequality and injustice" (Lenin 1974, 93; my translation). For Lenin, there was no room for law in the Soviet state, the reason being that law was reckoned among the superstructures typical of economic formations based on private property. As soon as the means of production are nationalized, law remains applicable only in the narrow sphere of private relations and will fade away (see ibid., 96–7).

This rigorous line of thought was diligently developed by Evgeny Pashukanis (1891–1937), famous for his "exchange conception of law" (*menovaja teorija prava*). This conception was first set out in outline in 1924 in his work titled *Obzhaja teorija prava i marksism* (The general theory of law and marxism: Pashukanis 1926), where Pashukanis asserted that law is intrinsically bound to the exchange of goods and cannot exist apart from this exchange. Moreover, between the logic governing commodities as a form of exchange and the logic governing the form of law there exists a homology that makes it possible to describe law in economic terms: "The basic legal abstractions—produced through the development of legal thought, and most accurately defining the legal form—generally reflect specific and very complex social relationships" (Pashukanis 1926, 33; my translation). What explains this homology is that the fundamental legal abstractions inevitably reflect social relations and at the same time solidify these relations into legal categories. Pashukanis accepted law only as civil law: Public law for him was a contradiction in terms because it bears no connection to any exchange relations. Legal relations are always formed by written or oral contracts that set out rules for private transactions, and there is no legal reality outside of these contracts. Even a statute issued by the public authorities is nothing but a symptom on which basis one can predict what the law will be. For Pashukanis, law lies in the coordination of the conflicting volitions of sellers and buyers; he was convinced that bourgeois law is flawless and perfectly fulfils the exigencies of the flow and exchange of goods. As the socialist state does not seek to promote exchange relations, there is no need for law. Law can be tolerated by the Soviets only as long as private property exists, and will disappear once the state takes full control of economic relations. There will be no proletarian, Soviet socialist law

in lieu of the capitalist, bourgeois law bound to die away: Legal norms will then turn into pure administrative regulations, effecting a "direct, i.e., technico-administrative, management by a procedure of subordination to the general economic plan" (ibid., 78; my translation), and because these regulations do not coordinate independent volitions, they do not amount to genuine law (see Sharlet 1978).

The Russian-Latvian thinker Peter Stuchka (Pēteris Stučka, 1865–1932)—one of the ideologists of the New Socialist Legality (*Novaja sotsialistitcheskaja zakonnost'*), as well as the chief justice of the Supreme Court of Soviet Russia (1923–1932)—studied law from the standpoint of class theory. He stressed that the function of law is to furnish an ideological background for the commands of the governing class, and hence to justify the de facto inequality among the classes (see Stuchka 1964, 58). As long as there is more than one class in a society, society is bound to have law. This explains why even Soviet Russia has its own "proletarian law," which reflects the dominance of the proletariat over the other classes (see Stuchka 1931, 70). Claiming that it is the will of the governing class which shapes the contents and the form of the positive law, Stuchka sought to demystify law as nothing but the domination of one class over another. Liberty, equality, and other values of bourgeois legal philosophy are just fetishes serving to control the dominated classes (ibid., 79). This understanding of law as a tool of class suppression underpinned the practice of the revolutionary tribunals and explains other extreme coercive measures taken during the Civil War.[14] In the 1920s Stuchka led the normative approach in Soviet jurisprudence: As the head of the Justice Committee (*NarKomJust*), he promoted a definition of *law* as "a system (an order) of social relations which corresponds to the interests of the governing class and which is protected by the organized power of this governing class" (Stuchka 1964, 58; my translation).[15] Stuchka's ideas deeply influenced the development of the Soviet legal system, and particularly the judicial doctrine that established class interest as the main criterion for civil adjudication and penal proceedings.

A psychological version of Marxist legal theory was elaborated by Mikhail Reisner (1868–1928).[16] A professor at Petrograd University and a follower of Petrażycki, he tried to "engraft psychological theory of law onto a Marxist foundation" (Reisner 1908, 45ff.; my translation). After 1917 Reisner rose to

[14] It is precisely this understanding of the law that informs, among other decrees, the one issued on 5 September 1918 under the title "On Red Terror" (*Postanovlenie SovNarKom RSFSR "O krasnom terrore"*), authorizing the extermination of people solely on the basis of class membership.

[15] This definition was officially recognized during the *NarKomJust* session of December 1919, and it became legally binding once it was included in the Consolidated Statutes of the Russian Soviet Federative Socialist Republic (1919), no. 66, article 590.

[16] These ideas of Stuchka were severely criticized by Mikhail Reisner for their ideological and untheoretical character (Reisner 1922, 175–91; see Stuchka's reply in Stuchka 1923, 120–71).

prominence as a leading Soviet legal theorist, using the psychological theory of law to justify the lawless practices of the new political regime. His main idea was that each class intuitively defines what is just and appropriate with regard to its position in society and to its objectives in the class struggle. These intuitions give rise to a specific class law which is a product of the collective legal consciousness. It is vital that Reisner marks his distance from Petrażycki's conception by emphasizing that what he calls for is "not an intuitive law [...], but a genuine class law which under the guise of intuitive law is formed by the subjugated and exploited masses without regard to any official frameworks" (Reisner 1925, 20; my translation). In Reisner's opinion, there are two basic aspects of law: The volition of the classes, which reflects the classes' subjective laws, and contraction among these classes, which creates an objective law. Both aspects are coordinated into the overall system of law through the classes' struggle for fairness and equality in society, these values being themselves the relative products of class consciousness. The dominant class imposes its legal consciousness and hence its law on the subjugated classes by taking control of the ideological mechanism, which influences formation of the overall legal consciousness. As legal consciousness can directly affect social relations, without the intermediation of positive law, the new proletarian law will not need any statutes, regulations, or edicts, for it will be able to govern by psychological suggestion alone. In light of this ideological background, such psychological suggestion will make individual legal intuitions uniform and will result in a single prevailing "revolutionary consciousness"[17] capable of determining the shape of legal relations and resolving legal conflicts. Reisner agrees that legal regulation will cease when the class struggle will come to an end and Soviet society will accordingly become a mono-society consisting of a single class, that of the proletariat (Reisner 1923): "The history of law is therefore nothing but the history of its fading away" (Reisner 1925, 274; my translation)—and the same also goes for proletarian law.

Another disciple of Petrażycki at Petrograd University was Jacob Magaziner (1882–1961), who in his lifetime was known by and large as civil-law researcher, since his main theoretical works (Magaziner 2006) have been kept in private archives and were first published only several years after his death. The key idea that Magaziner developed in the context of the psychological theory was that of distinguishing two forms of law depending on two kinds of psychological realities: collective and individual. Individual psychological representations can give rise only to subjective law based on beliefs and intuitions, and

[17] This idea of Reisner informed the first decrees issued by the Soviet Government in 1918 (Decree No. 1 of 29 January 1917, and Decree No. 2 of 15 February 1918), abolishing all the laws of the previous regime and ordering revolutionary courts and commissars to thenceforth decide all cases without reference to any laws, being guided only by their "revolutionary legal consciousness." This antilegist practice persisted until the end of the Civil War.

so they have no support in objective reality: This is what Magaziner calls intuitive law, in a sense quite different from that used by Petrażycki.[18] Only collective ideas and representations are real, since they produce legal consciousness, which pulls society together and can properly be called law (see Magaziner 1997, 104ff.). It is symptomatic that although Magaziner did not subscribe to the conception of class law, he did agree that the ideals of the dominant social groups often shape the legal consciousness. A similar though essentially different approach was developed by Isaak Razumovsky (1893–1937). This philosopher argued that law is a form of collective consciousness which through a given ideological framework reflects the relations among social classes. This reflection results in the creation of abstract legal sentences and propositions, in such a way that "the order of social relations [...] becomes differentiated from the material conditions of life and obtains its complex ideological development in a system of legal norms" (Razumovsky 1925, 50; my translation). Razumovsky shares the conviction that law is bound to perish as soon as the ideological class dominance will cease and "communist society becomes rationally regulated through a system of reproduction of social behaviour" (ibid., 23; my translation). In general, the psychological approach was favourable to the economic reforms of the mid-1920s, but after the collapse of the New Economic Policy (*Novaja ekonomitcheskaja politika*: NEP) it was banned as antisocialist. The earliest conceptions of socialist law were antiformalist in outlook, rejecting bourgeois legal bureaucracy: Law, or rather "proletarian law," was conceived as fundamentally different from bourgeois legality, that is, as having an innate quality, something that could be grasped by intuitive feeling, open to human understanding without the mediation of legal constructs, even without any textual form (for otherwise this understanding could not be properly called a "proletarian legal consciousness"). The legal form was found to be an illusory, unnecessary tool, somewhat in sympathy with Plato's conception according to which humans need not have any formal laws to be righteous and govern themselves and others accordingly. Petrażycki's psychological theory was fully congruent with these ideals, and in the years of the NEP millions of people, defying the official stance against private property and entrepreneurship, took part in commodity exchange and intuitively created *ad hoc* norms to govern their mutual relations. It seemed that formal law (law *stricto sensu*) was on the point of withering away, with the state about to dissolve into society. But the "antibourgeois" reaction of the mid-1920s showed that public authori-

[18] For Petrażycki, intuitive law was a part of a real basis for legal relations. He distinguished this reality from the beliefs of people bound to obey the law. Unlike what Petrażycki thought, it appeared to Magaziner that this psychological reality could not in itself give rise to law: The intuitive understanding of rights and obligations we come to have in the course of daily life do form a web of psychological links, but these cannot rank as legal until they grow into a "legal consciousness of the people."

ties were unlikely to loosen their grip over society, and the new ideology of "protecting the achievements of the Revolution" (*zashita zavoevanij revoljutsii*) required a different understanding of social control: a directorial mechanism incompatible with the psychologist negation of central regulation.

At the end of the 1920s Soviet legal science saw a period of flourishing: Several alternative approaches to law had developed that not only competed on theoretical grounds but also vied for influence in politics and in legal practice. The theoretical discussions had an evident impact on the implementation of political programs such as collectivization and the NEP. One of the principal issues concerned the rule of law: The question was whether there is a special rule of socialist law (as Stuchka and his followers argued) or whether there can be no rule of law in the socialist state, which is governed by the new authorities without recourse to any actual law, as Pashukanis and his school claimed (cf. Engle 2010). These debates received a certain amount of feedback from the political regime, which was becoming increasingly practical-minded about the prospect of realizing true communism in Russia, and so tended to revert back to the traditional ways of governing, including through the legal machinery. The groundwork for a monist theoretical approach to law was laid during the First Congress of Marxian Legal Theorists in 1931.[19] The aim of this congress was to establish a united approach to law that would echo the general policy of the Communist Party. This objective was not reached immediately, and the debates continued until the mid-1930s.

But as was suggested by the official ideology adopted by the Communist Party of the URSS, the philosophical background for each investigation had already been laid out in the classics (those of Marx, Engels, Lenin, and Stalin), and legal scientists were thus "exempted" from philosophical speculation and reflection: They were just expected to apply the Marxist-Leninist dogma to legal reality. This explains why the philosophy of law in the 1920s was completely displaced by the theory of law, which was intended to have an exclusively instrumental function. Broad philosophical reasoning about law had been condemned by Lenin and other political leaders as hallmarks of the decadent bourgeois legal science (designed to deceive the working class and divert its attention from class struggle)—and so it was that the philosophy of law saw its last days in Soviet jurisprudence. The new socialist legal science was to take only one aim as its object: To help design the laws and decrees that would implement the will of the working class. There evidently was no point for a lawyer to reason about what exactly the will of the working class was and whether it coincided with the will of the governing Soviet elites.

[19] The official consolidated position of the academic community was first set forth in the proceedings of this congress (cf. *Rezolyutsia Pervogo Vsesoyuznogo s'ezda marksistov-gosudarstvennikov i pravovikov*, Resolution of the First United Congress of Marxist Theorists of Law and the State. *Sovetskoe gosudarstvo i revolutsija prava* 4 [1931]: 129–33).

Characteristically illustrating this pragmatism are the writings of an influential Soviet jurist of the time, Dmitry Magerovsky (1890–1939), who in a 1920 article titled *Sotsial'noe bytie i nauka prava* (Social existence and the science of law: Magerovsky 1920), in a realist manner insisted that with the new socialist era came the exigency to transcend objective idealism—a rubric under which he subsumed a range of jurisprudential orientations: the normativist, the sociological, the psychological, and natural law—and move toward a dialectical materialism in the science of law. In contrast to the idealism of traditional philosophy of law, the new Soviet theory of law must be pragmatic, instrumental, and free of any metaphysical speculation. It must include "positive reasoning," analyzing the norms of positive law; "axiological reasoning," assessing positive legal norms in light of the objectives of class struggle; "coercive causation," evaluating norms by their capacity to bring about the desired changes in the social reality; and "political reasoning," examining the different legal orders distinctive to different types of societies, e.g., proletarian, capitalist, colonial (Magerovsky 1920, 1–45). But even this limited discretion allowed for lawyers seemed too bold, and two years later, in a paper titled *Sovetskoe pravo i metody ego izutchenija* (Soviet law and methods for its study: Magerovsky 1922), Magerovsky insisted that jurisprudence must take Marx's dialectical materialism for granted, so as to focus on questions of practical implementation following the axiomatic blueprint of Marxist philosophy. In Magerovsky's view, when lawyers set out to examine jural relations, interpret and create legal norms, and carry out similar other operations in legal thinking, they must completely remove their subjective selves from what they are doing and apply the rules of legal dogmatics, turning to political organs whenever an uncertain case comes up that calls for any interpretation (Magerovsky 1922, 24ff.). This anti-discretionary stance was typical of other Soviet lawyers, too, who dared not challenge the philosophical (ideological) foundations of the new social order.

The Stalinist regime could not tolerate intellectual diversity in any field of thought, including legal philosophy, and dissenting theorists had to join the mainstream of legal theory as shaped by Stuchka and carried on by his disciples. As early as 1927 Pashukanis was forced to acknowledge his "political errors" and to agree that there must be a socialist law which would supersede the previous forms of legal regulation (see Pashukanis 1926), a view that he would reiterate in 1936 (see Pashukanis 1967, 320ff.). Many other theorists faced the same necessity to revise their "erroneous and deficient" conceptions, although even this revision did not spare them from tribunals and camps. The integrated legal ideology was summed up in 1938 during the "Colloquium on Some Issues concerning the Soviet Science of Law and the State" (*Sovezhanie po voprosam nauki sovetskogo gosudarstva i prava*), held from July 16 to 19 of the same year, and summoned by the attorney general of the URSS, the Soviet theorist of Polish origin Andrei Vyshinsky (1883–1954). Having condemned the "counterrevolutionary findings" of Pashukanis and his followers—accused

of plotting against the URSS together with Trotsky and Bukharin—this colloquium proclaimed the official legal ideology of the Soviet state (see Fuller 1949, 1157–66, for an analysis of this ideological and conceptual opposition between Pashukanis and Vyshinsky). This ideology was based on the narrow-minded command theory of law summarized in Vyshinsky's famous definition of law: "Law is an embodiment of the rules of behaviour which implement the will of the ruling class—as well as an embodiment of the customs and rules of community life—and which are laid down by lawmaking or are sanctioned through the state's authority, and whose implementation is guaranteed by the state's coercive force, designed to protect, consolidate, and develop such social relations and structures as favour and serve the ruling class" (Vyshinsky 1938b, 37; my translation).[20] This definition would persist as the indisputable benchmark in Soviet legal science for many years to come. Only during Khrushchev's Thaw could this approach be challenged by some legal theorists. Naturally, in this situation of conceptual clarity and certainty about what is law and how it works there was no great need for reflection about law, and theoretical thinking became sparse (let alone that it was extremely dangerous). Two remarkable lawyers of the time—Mikhail Strogovitch (1894–1984) and Sergej Golunskij (1895–1962), both professors of criminal law—insisted that it made no methodological sense to engage in a theoretical science of law, since there could only be one method, the dialectical materialism of Marx and Lenin, applied to different spheres of social life (Golunskij and Strogovitch 1940). So the theory of law had no raison d'être: It had to give way to the different "branches of legal science" (*otraslevye diszipliny prava*), such as criminal or labour law. This idea was then proffered even more outspokenly in 1961 by two outstanding professors of civil law, Olimpiad Ioffe (1920–2005) and Mikhail Shargorodsky (1904–1973) (see Ioffe and Shargorodsky 1961), who were persuaded that the theory of law was not in any way a *science* of law, but simply consists in extracts of philosophical ideas culled from the "classics" of law (which means, in the view of these authors, "classical authors of the Marxist philosophy"). Under such pressures, the theory of law came to rest on shakier and shakier ground (see another assessment of the innovative trends of the Soviet legal theory in Quigley 2007).[21]

The watershed moment came in 1963, when the 22nd Congress of the Communist Party proclaimed that the dictatorship of the proletariat had run

[20] This definition differs slightly from that announced during the colloquium (Vychinsky 1938a, 6). Essentially, this approach reveals an understanding of law as an instrument of coercion, as an "accelerator pedal for innovation" (Vychinsky 1938b, 165; my translation) designed to extirpate classes and ideologies in competition with the dominant ones.

[21] It is worth noting, en passant, that this line of argumentation, dating from the 1940s to the 1960s, can still be observed to persist in the interdisciplinary debates among contemporary Russian lawyers discussing the practicality of theoretical thinking about law. One authoritative example is Kozlikhin (2006), who does not hesitate to claim, "We must concede this undoubtable fact, that the general theory of law and state has become obsolete" (ibid., 40; my translation).

its course and that socialism had thereby already been built in the URSS.[22] This implied that there was no longer a need for too rigorous a command regulation, and that some limits would be established by Soviet law against repressions like those of Stalinism. The groundwork for this declaration was laid in the debates initiated in the late 1950s between, on the one hand, those who advocated a "wide approach" to law, arguing that law cannot be reduced to the state's authoritative commands, and, on the other hand, those who embraced a "narrow approach," insisting that there is no law outside the rules and regulations enacted by the state. The former were quite numerous and urged a definition of law that would also take into account legal relations and the legal consciousness, thus going back to the ideas of Pashukanis, Reisner, Razumovsky, and other thinkers of the 1920s. Thus, Stepan Kechekjan (1890–1967) considered law a norm realized through an actual legal relation (see Kechekjan 1958), and consequently maintained that legal relations precede legislation, which recognizes only such norms as have already been created through these relations. Another version of the "wide approach" was put forward by Alfred Stalgevitch (1897–1983), who considered law a unity of legal norms, legal relations, and legal consciousness, and who thereby contested the prevailing command theory (see Stalgevitch 1957). The discrepancies among the "wide" and "narrow" approaches found their expression during the 1979 colloquium "On the Understanding of Soviet Law," where the "wide" approach gained a greater following than the command theory of law.[23] A Professor at Leningrad University, Lev Javitch (1919–2004) was the first who dared to criticize the class theory of law, insisting on the priority of the rights of individuals over the law of the country (see Javitch 1976). This vision of law led the thinker to conclude that the state, even the omnipresent socialist state, is not empowered to create law at its discretion and is bound by the citizens' rights (see Javitch 1985). This was the first affirmation of human rights in official Soviet legal philosophy, an affirmation that was carried forward in the following years under *Perestroika*, which began in 1986.

Instead, as sociology seemed to be compatible with Marxism, whose traditional orientation called for an investigation of social structures, socio-legal studies could begin to develop without going against any ideological taboos. So, the 1970s and 1980s saw much sociological research being applied to law (particularly in criminology), and two strong socio-legal schools appeared in Leningrad (with Lev Spiridonov, Yuri Grevtsov, and others) and in Moscow

(with Vladimir Kazimirtchuk and Vladimir Kudrjavtsev, among others). Peter Nedbajlo (1907–1974) worked out an interesting vision of law as the normative nexus of economic relations (see Nedbajlo 1971), a vision that would further be developed by his Ukrainian disciples (Peter Rabinovitch, Alekej Surilov and Sergey Maksimov, among others).

The political and economic changes did not translate into corresponding changes in legal theory. The dominant approach in contemporary Russian jurisprudence is still the command theory, with no more than some slight modifications and amendments by Mikhail Baitin (1921–2009) (see Baitin 2005, 2006)[24] and Valerij Lazarev (1940–) (Lazarev 2001), among others. Quite many are those who carry forward the "wide approach to law," enriching it with some elements from Western legal thought and from prerevolutionary Russian legal philosophy. A noteworthy example is Leonid Mamut's (1929–) reciprocal theory, an attempt to understand law as a set of exchange relations based on a footing of equal social wealth among members of society. Taking up Pashukanis's ideas, Mamut argues that this exchange in turn becomes possible only if the members of society can address to one another reciprocal claims to a share of the social wealth necessary for them to continue engaging in social activity. It is this set of exchange relations, coupled with the relative reciprocal claims, that for Mamut (2011) properly constitutes law, something he sharply distinguishes from legislative law as a system of enactments. A similar conception—similarly sociological but devoid of the reciprocity of exchange envisioned by Mamut—is the one put forward by Yuri Grevtsov (1942–) (Grevtsov 2001) and Lev Spiridonov (1929–1999). Spiridonov insists that the main function of law is to permit or prohibit certain modes of behaviour in the sphere of exchange relations, the latter understood as the existential basis of any society. Spiridonov argues that law serves to integrate society through its members' self-referential normative organization. What distinguishes this kind of organization is its ability to secure social cohesion by consolidating basic social values such as fairness and equality of outcomes under the law (Spiridonov 2002). Also worthy of mention is Anatoly Vengerov's (1928–1998) synergetic theory, underscoring the probabilistic and stochastic elements in law and suggesting that it would be useful to study law as a special kind of social energy (Vengerov 1998, 313–31).

There is still another tendency in Russian legal theory, a revival of natural law. Examples can be found in Georgy Mal'tsev (1931–2013) (Mal'tsev 2008)—offering a sociocratic theory where the attempt is to integrate the moral dimension of law with its social function—as well as in the work of Sergey Alekseev (1924–2013) and Roman Livshits (1929–1997). In a somewhat out-

[24] Given that we are writing in the second decade of the 21st century, the Russian legal philosophy of the 20th century is being discussed here by taking into view the latest ideas and works developed both before and after the turn of the 21st century.

dated way of conceiving natural law, Alekseev locates the existential mainstay of law in the idea of human rights and depicts law as a system with which to safeguard individual freedom (S. Alekseev 1998), this function serving as the basis for the distinction between law and nonlaw (S. Alekseev 2002). Similarly, but from a different sociological angle, Livshits examines law's integrative function, understanding law as the complex of all the mechanisms of social control conducive to an arrangement among interacting individuals and groups united by a common understanding of justice (Livshits 2001). An outstanding figure of post-Soviet Russian legal philosophy is Vladik Nersesjants (1938–2005), who laid the foundation for a libertarian conception of law and inspired a group of many talented scholars, among whom Vladimir Grafsky (1938–), with his integrative theory of law (Grafsky 2000), and Valentina Lapaeva (1952–) (Lapaeva 2012) and Natalia Varlamova (1952–), both of whom continue to defend the libertarian conception, which has now gained quite some momentum in Russia. Nersesjants's conception of law was based on the thesis of the formal objectivity secured by the principle of legal equality—the principle that free and independent subjects of law enjoy the same quantum of liberty (they do so in a sense both descriptive and normative, for it is Nersesjants's view here that the *Sein* coincides with *Sollen*). This equal quantum is established by law, which provides everyone with the possibility of social action, thereby replacing the arbitrary power of each with the legal power of all. Such equal distribution of liberty among subjects of law embodies the idea of justice, which forms the basis of law (Nersesjants 1998, 40–9).

Also worthy of mention—as we follow the theme of how Russian legal theory has grown with elements drawn from contemporary philosophy—is the communicative theory of law developed by Andrej Polyakov (1954–) (Polyakov 2003), who teaches at Saint Petersburg State University and has offered a restatement of legal theory based on the ideas of Jürgen Habermas, Niklas Luhmann, and other contemporary thinkers in communicative philosophy.[25] Polyakov considers communication a dynamic force holding people together in society, a force mediated by texts (both written and unwritten). If communication is structured by correlated mutual duties and obligations, if it is based on generally recognized texts, and if it is coherently realized in social practice, it will then acquire a normative dimension, and the texts in question will be validated as sources of law (Polyakov 2003, 274–85, 674–87). This is the way law is created and exists. Working in the same direction, but with a different emphasis, is Ilia Chestnov (1964–), a legal theorist also based in Saint Petersburg, who offers a dialogical theory of law positing three basic dimensions of legal reality: legal rules, their perception in human cognition, and their effectuation in human behaviour. These three dimensions are not a closed sys-

[25] On Habermas see Sections 10.3.5 and 10.4.3.2 in this tome, and Sections 10.4 and 25.3 in Tome 2 of this volume.

tem but rather form an open emerging system of interaction, reciprocity, and synchronization, all of which attest to the dialogical nature of law (see Chestnov 2008). This intellectual pluralism and diversity contributes to overcoming the Soviet legal heritage, which still carries weight in Russian legal thought (see Antonov 2007).

17.4. Conclusion

Of all the social sciences in modern society, jurisprudence seems to be the most ideologically laden (because it serves a regulative function that political authorities can seize on), and of all legal disciplines, legal theory is by far the one most amenable to intellectual innovation (because it is not so bound to existing systems of law, such as civil or criminal law). This place that legal theory occupied in imperial Russia explains why all important social issues at the beginning of the 20th century became a subject of investigation in legal philosophy and were also importantly discussed as legal issues from the perspective of legal philosophy. This philosophy offered insights and ammunition for those on either end of the sociopolitical spectrum: for those who wanted to bridle social development, fearing its unpredictability (this was the conservative wing of *intelligentsia*), and for those who sought to bring about change in society, either through legal reform (this was the majority view of the time among intellectuals), or through a social revolution (the Bolsheviks and the Anarchists), or again through an ideal of personal perfection (Leo Tolstoj). In the first years after the October Revolution of 1917, legal theory continued to play an important role in the country's intellectual life, and many important social developments were closely tied to developments in legal philosophy, one example being the new system of social control influenced by the psychological theory of law, and another the NEP, influenced by the exchange conception of law. But the rigid ideological control owed to the political realities of the USSR led to catastrophic sequences for this discipline, which was pressed into service as a tool of communist ideology beginning in the early 1930s. In the following sixty years of Soviet rule, legal theory thus existed in isolation, through the action of an ideological iron curtain that kept it forcibly cut off from the rest of the world (except for the Soviet Union's satellite countries). The discipline became a mishmash of contradictory precepts and scattered idioms sourced from the "classics" (Marx, Engels, Lenin), stewing in their own juice and seasoned with some schemes and conceptions derived from prerevolutionary legal science. This stew would take a variety of flavours, and in fact it was given to many terminological nuances understood to have far-reaching implications in the intellectual debates of the time. But the inevitable ideological confines of the Marxist-Leninist social philosophy were such that nothing methodologically or conceptually new could come out. The trouble with this situation became apparent to legal theorists even in the 1980s. The *perestrojka*

of the 1990s spurred a true flurry of intellectual activity among Russian theorists of law, who rushed to package conceptions of their own. Some of these theorists took into view the development of legal philosophy across the world and unwittingly repeated the commonplaces: Their "new" schemes therefore turned out to be ineffectual, failing to contribute anything either original or useful to a worldwide debate. The majority of legal philosophers instead chose not to stray from their course, discarding the precepts of Soviet ideology but keeping the rest, thus working on traditional Soviet dogmatic jurisprudence. This strategy is still apparent in most of the textbooks on legal theory, which reproduce the theoretical schemes of the Soviet era and invest them with new ideological content (human rights, freedoms, democracy, and the like). In the 2000s, it was the latter trend, the "traditionalist" one, that still held sway in academia (and no discussion has been devoted to the authors in this camp, precisely because they keep reiterating threadbare schemes, with no theoretical innovation to offer). As concerns the theorists in the other camp, those who have embraced the new, their numbers are growing, and they are striving to keep pace with the development of legal science across the world. The most important of these thinkers were selected for discussion in the part on post-Soviet jurisprudence.

Chapter 18

20TH-CENTURY LEGAL PHILOSOPHY IN CZECHOSLOVAKIA, THE CZECH REPUBLIC, AND THE SLOVAK REPUBLIC

by Alexander Bröstl

18.1. The State and the Legal Framework

At the beginning of the 20th century, the territories of the contemporary Czech Republic and the contemporary Slovak Republic were parts of the Austro-Hungarian Empire. With the empire's dissolution after World War I, on October 28, 1918, the Czechoslovak Republic was established.

After the Munich Agreement of September 30, 1938, Czechoslovakia could no longer freely shape its future constitutional history. Under this agreement, part of the territory and its people were ripped from Czechoslovakia and annexed to Germany. The country was subsequently forced to cede further territories to both Hungary and Poland.[1]

A so-called independent Slovak state was later declared (on March 14, 1939) with the support and influence of Hitler's Germany. On the same day, Hitler forced the president of the Czechoslovak government to sign a document accepting a German protectorate over the remainder of Czechoslovakia (which was named the Protectorate of Bohemia and Moravia).

After World War II, in 1945, Czechoslovakia was almost restored to its prewar borders, and after the coup d'état in February 1948, the Communist Party seized power and established its monopoly and the dictatorship of the proletariat. Following the occupation of Czechoslovakia by the armies of the Warsaw Pact on August 21, 1968, a constitutional act for the Czechoslovak Federation was passed which went into effect on January 1, 1969.

The breakdown of the communist regime after November 17, 1989, was accompanied by a peaceful revolution (the so-called Velvet Revolution, or *Nežná Revolúcia*).

In 1990, a specific name was chosen for the newly joined country: It was called the Czech and Slovak Federative Republic. But soon, following the outcome of the general elections of 1992 and the further development in negotiations, the process by which to dissolve the federation was begun, and in January 1, 1993, two separate countries were established, namely, the Czech Republic and the Slovak Republic.

Since 1918, the legal order of the Czechoslovak Republic operated under a principle of legal continuity providing for the temporary validity of Austrian

[1] Greater details in Pavlíček and Kindlová 2006, Bröstl 2006.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_18

and Hungarian laws. This state of so-called legal dualism meant that the civil law of the *Allgemeines Bürgerliches Gesetzbuch* (ABGB)[2] would be valid in the Czech lands, while Hungarian customary law would be in force in Slovakia. In criminal law, the Criminal Code of 1852 would be valid in the territory of the Czech Republic, while the Hungarian Criminal Code of 1878 was valid in the territory of the Slovak Republic during the period of the first Czechoslovak Republic.

At the end World War II, in 1945, the two separated parts of the previously liberated Czechoslovakia came together again, and thus began the programmatic destruction of private law, which was considered an evil. There came a new Civil Code and a new Code of Civil Procedure, both enacted in 1950, focusing on revolutionary changes and on "socialist property with its two forms (state socialist property and cooperative socialist property), which differ only quantitatively. State socialist property has nothing in common with the property law of a bourgeois state and its organs" (*Občiansky zákonník* [Civil Code], 218; my translation).[3] This enactment was followed by the introduction of more changes both *into* these codes, in 1963, and *through* them, in 1964, with the aim of strengthening economic and other social relations and the unity of the socialist economy.

In criminal law, the Criminal Code and the Code of Criminal Procedure were adopted in 1950, later renewed in 1961 (with no further changes until 1990). The first code was heavily influenced by Stalin's theses on class struggle in the transitional period in which socialism would be constructed, and it expressed the class-centric character of criminal law, meaning that the purpose of criminal law was to protect the people's democratic republic, its socialist construction, and the interests of working people and individuals, as well as to educate them to obey the rules.

After the breakdown of communism, real changes took place in the period from 1990 to 1992, first with the adoption of a new *Grundnorm* in 1991 and a Charter of Fundamental Rights and Freedoms (a constitutional act), and then with two constitutions for two independent states in the second half of 1992.

18.2. Two Main Legal Journals Survived

The oldest Czech legal journal, called *Právník* (The Jurist), was established in 1861 in Prague, which at that time still lay within the territory of Aus-

[2] ABGB of 1811 became valid law in Czechoslovakia on October 28, 1918, and was called *Československý obecný zákonník občanský* (Czechoslovak General Civil Code). See in this regard the insuperable commentary Rouček and Sedláček 1935–1937. Indeed, this can also be considered a great work of legal philosophy dealing with basic concepts in the theory of private law. From that point on, the theory of civil law became the source and "driving force" of legal theory in the 20th century in Czechoslovakia (codes of positive law were used as textbooks in teaching legal concepts).

[3] The text is drawn from *Občiansky zákonník* (Civil Code). Bratislava: Martinus.

tro-Hungary. This initiative was realized through the effort of a group of intellectuals led by the great 19th-century Czech writer, lawyer, and historian Karel Jaromír Erben (1811–1870); the patriot Rudolf, Prince of Thurn-Taxis (1833–1904); and the representative of a young generation of practicing lawyers, Jan Jeřábek (1831–1894).[4] The aim of this new legal journal was to help rejuvenate Czech legal science and contribute to the development of Czech legal research and discussion. In 1864, *Právník*'s editorial board joined forces with *Jednota právnická* (The Unity of Lawyers), a newly established professional association of lawyers, and the journal began to reflect modern approaches to law and legal science. The journal's editorial activity was subsequently linked to two men: Jakub Škarda (1828–1894), a practicing lawyer, and Antonín Randa (1834–1914), a professor at Charles University in Prague (*Karlova Univerzita*) and one of the great Central European experts in private law who influenced the development of the Czech and Czechoslovak school of civil law.

In the 1950s, the journal was taken over by the Ministry of Justice, which became its publisher. It was then published by the *Ústav státu a práva Československé akademie věd* (Institute of State and Law of the Czechoslovak Academy of Sciences) in Prague, and then, after the dissolution of the Czech and Slovak Federal Republic, in 1993, it was put under the control of the *Ústav státu a práva Akademie věd České republiky* (Institute of State and Law of the Academy of Sciences of the Czech Republic), also located in Prague.

In July 1917, the oldest Slovak legal journal, *Právny obzor* (Law Review), put out its first issue in Budapest. The journal was established by Emil Stodola (1862–1945), a lawyer who also served as its editor-in-chief. In 1918, this journal moved to Bratislava, where it continued to be published until 1920 thanks to the support of the previously mentioned association *Právnická jednota* (The Unity of Lawyers). The aim of this journal was to create a Slovak legal terminology and use it in practice, while helping to spread knowledge of (valid) positive law and to cultivate jurisprudence.

Právny obzor went through peaks and valleys, with a period stagnation linked with apologetics and service to the party in power, the Communist Party of Slovakia. But the journal also stands as testament to the fact that in difficult periods for the freedom of ideas there have always been streams capable of carrying progressive European legal thought.

18.3. On the Brno Normativist School of Law

At the beginning of the 20th century there existed various streams in legal science in the later territory of Czechoslovakia (this in a similar way to what

[4] For greater details, see Krupar 2006, recently expanded in Krupar 2011.

was happening in other countries). Even with the traditional schools in place, several attempts at legal modernism gained ground (this time in the direction of sociological jurisprudence).[5] The sociological school's theoretical approach was considered unsatisfactory when it came to the problem of dealing with the concepts of normativity and teleology: A new theory directed against the two streams just mentioned, the traditional one and the modern one, was constructed on the foundations laid by two great theorists of law, namely, Hans Kelsen in Austria and František Weyr in Czechoslovakia (see Kubeš 2003).[6]

18.3.1. František Weyr as the Leading Intellectual in Czechoslovak Legal Philosophy

Even though several basic ideas of Kelsen's pure theory of law were first expressed by František Weyr (1879–1951) in two works dating to 1908—namely, *Příspěvky k teorii nucených svazků* (Contributions to the theory of forced relationships: Weyr 1908a) and *Zum Problem eines einheitlichen Rechtssystems* (On the problem of a unified legal system: Weyr 1908b)—it is Hans Kelsen (1881–1973) who is generally acknowledged as the real founder of this theory, the first thinker to have elaborated and presented the blueprint for this school (normativism). From 1919 to 1948, Weyr was among the founding fathers of Masaryk University in Brno, the first dean of its law school, professor of constitutional law, and the leading intellectual of the *brněnská normativní škola právní teorie* (the Brno normativist school of legal theory). He was a friend of Kelsen, and the contacts between them as heads of the Vienna and Brno School, respectively, were intensive.[7] Both had a prominent role in the framing of the first constitutions of their respective countries: As a member of parliament, Weyr took part in the preparatory works and the writings of the Czechoslovak Constitution of 1920, and, in parallel, Kelsen became the founding father of the Austrian Constitution of 1920 and the *spiritus agens* for the model based on constitutional review with a constitutional court. Weyr also founded the legal journal *Revue international de la theorie du droit* (International review of legal theory), published in Brno and beginning in 1926.

According to Vladimír Kubeš (2003, 9), the common features between Kelsen's and Weyr's theories can be essentially appreciated in the following:

[5] A Czech professor of legal philosophy and international law from this period was Josef Trakal (1860–1913), whose first interest lay in the relation between legal history and natural law. See Trakal 1904.

[6] On Weyr see also Section 2.1 in this tome.

[7] On the *Wiener Rechtstheoretische Schule* see Chapter 2 in this tome.

- Both are influenced by Immanuel Kant's critical theory.[8]
- Both posit a dualism of two worlds, i.e., that of the *Sein* and that of the *Sollen*.
- Both draw a strict distinction between the cognitive sphere and the volitional.
- Both subscribe to value relativism, with a consequent anti-ideological stance.
- Both posit a requirement of "purity."
- Both have a positivist tendency.

The basic problem and starting point for both Weyr's and Kelsen's normativism is that it is impossible, proceeding from a scientific method, to prove the absolute validity (normative existence) of norms, whether ethical or legal: This validity can only be assumed. In this way the normative theory relativizes the importance of its own knowledge, but at the same time it rationalizes this knowledge in the sense of making it equal to that of the natural sciences. Norms become the strong Archimedian point of legal theory conceived as a normative theory, a theory that cannot create norms simply on the basis of its knowledge but can only *recognize* those norms.

The central concept of the normative view so far is therefore the concept of a norm (Weyr 1920, 18; my translation). A norm, to begin with, can generally be described as an expression of something: of something that *ought* to be. In Weyr's opinion there have been no successful attempts to define legal norms in terms of other norms (*moral* norms in particular) on the basis of the criterion of content (that is, of that which they set forth), because it is clear that legal norms can take any content, in that *anything* can be set forth in them: Anything can become the content of a legal norm.[9] Thus, for example, a definition of legal norms as norms regulating people's outward life cannot be satisfactory, since this life can also be regulated by accepted ethical (moral) norms. Moreover, according to Weyr, "it is not enough to use coercion as a decisive conceptual criterion for legal norms." He thus maintains that

> in order for any norm to be legal, it must be equipped with a sanction (i.e., with the threat of a penalty or sentence that is then carried into execution), since there is a class of norms that are considered to be legal even though they cannot be enforced that way (these are the so-called *leges imperfectae* of Roman Law). (Weyr 1946, 30; my translation)

The exponents of the Brno normativist school do not agree with Kelsen's doctrine on the sanctionative structure of the legal proposition (*Rechtssatz*).[10]

[8] It must be stressed, however, that in Kubeš's view, Kelsen was influenced by Hermann Cohen's interpretation of Kant's philosophy, while Weyr was looking at Kant by the "lenses of Arthur Schopenhauer": see Kubeš 2003, 12–3.

[9] Incidentally, this also means that, in Weyr's view, the concept of an "act in the law" (a behaviour carrying legal consequences) has no reason to exist without any relation to a legal norm.

[10] On Kelsen's theory of sanction see Section 8.3 in Tome 2 of this volume.

Weyr objects that, on this view, only the state would be a subject of duties. Citizens would have *no* duties: They would simply be left with an option between two kinds of behaviour—a prescribed one and a proscribed one—only one of which (the proscribed one) gives rise to a duty of the state to issue sanctions (Weinberger 2003, 41). He resists the notion that backed into the substance of a norm there needs to be the threat of sanctions or the promise of a reward. That is why, in contrast to Kelsen, he does not consider sanctionless norms to be *leges imperfectae*, or imperfect norms.[11] It is Weyr's view that because it is not possible to use the criterion of content (and there is no third possibility: *Tertium non datur*), it is necessary here to turn to the *formal* criterion, and so we must consider legal those norms that originate from a certain norm-creating subject, which in this case is the state. In conclusion, the specificity of a legal norm—what distinguishes it from other kinds of norms—lies not in its structure (as in Kelsen's view) but in its dependence on the state as a norm-creating subject. According to Ota Weinberger (2003, 43), Weyr's efforts led to an attempt to reduce the traditional distinctions among kinds of norms (such as the distinctions between public and private law, cogent and dispositive norms, or constitutive and declaratory norms) to a basic, unified structure.

Weyr also tried to define the concept of a norm by relating it to other, very similar concepts, first among them those of *zákon* (a causal law of nature), *pravidlo* (a rule), *imperativ* (an imperative), and *maxima* (a maxim) (see Weyr 1920, 18–30).

The difference between a norm and a law in the aforementioned sense is generally known. A law of nature can be understood as an instance of the general law of causality: as the application of such a general law to a certain occurrence. The idea is that the same consequences follow from the same premises, and real occurrences in the outside world are interpreted accordingly. That is why the method where a single natural law is brought within the scope of the general law of causality is called the explicative method.

According to Weyr, the concept of a rule in the sense of a *Regel* has nothing to do, methodologically, with the concept of a norm. But a norm does overlap with a law of nature (in the sense just described), in that neither admits of any exception to its own validity. The logical consequence of isolating both points of view—the causal and the normative—is that no event in the outside world can have any influence on a norm's validity: Only its *effectiveness* can change as a result of such an event. According to Weyr, noncompliance with a norm is an exception not to its validity (*Geltung*) but to its effectiveness (*Wirkung*). The

[11] Another criticism of Kelsen's sanction theory of norms by a Czech author can later be found in the work of Ota Weinberger, who in this regard writes that "Kelsen's structural definition of a legal norm as a sanctionative norm is not very successful. His opinion that a norm of conduct (a secondary norm) is superfluous is logically untenable" (Weinberger 1973, XXIII; my translation).

importance of a norm from the causal point of view is exhausted by its function as a motive of behaviour, that is, by its capacity to affect the human will.

As concerns the relationship between norms and imperatives Weyr notes that, when we consider a norm as an object of recognition, we can first of all consider it as an *expression* of that which ought to be. In this way we remain exclusively within the normative point of view. An imperative is instead one of the *forms* through which it is possible to express a normative imagination, that is, a normative idea. But an imperative is not the *only* such form, so it would be a mistake to conceptually equate a norm with an imperative.

A norm can also be compared with a maxim, which is an imagination (an idea) by which we are considering (judging) the world as it is: It is possible to have an imagination of a false *maxim*, but not of a false *norm*. The importance of a norm lies entirely in its causal effects in the outside world.

In his considerations on legal science and sociology, Weyr criticizes the attempt to deduce what *ought* to be from what *is*, for in his opinion a norm's existence, i.e., its validity, is dependent on whether a real consequence follows from it. But this goes against the basic logical formula that the existence of a norm (i.e., its validity) ultimately lies exclusively in the existence of *another norm*—never in the fact that something actually *is the case*. An example of this methodological error can be found in a famous maxim in Paulus, "*Non ex regula jus sumatur, sed ex jure, quod est regula fiat*", if the phrase "*jus, quod est*" is interpreted to refer to real behaviour in relation to norms. Weyr underlines that just the opposite holds for a true normativist view: "*Non ex jure regula sumatur, sed ex regula jus fiat*."

The noetic essence of the concept of a norm does not include among its defining traits its having an *real* effect as a motive of behaviour (as having a force of an imperative). The real effect of a norm is rather *psychological.* In other words, the question whether, why, and how a norm will gain recognition depends on whether there are any means by which that norm can have a psychological effect. But, even more importantly, the question depends on the *sanction* built into a norm.

Weyr then proceeds to consider one of the most important antinomies involved in the endeavour to attain a normative knowledge of law, namely, the antinomy between law in an *objective* sense and law in a *subjective* sense. *Objektivní právo* (objective law, or simply law) is generally understood as the set of legal norms that make up the legal order as a whole, whereas *subjektivní právo* (subjective law, a right) is generally defined as the set of concrete rights and duties arising under objective law. But, according to Weyr, on closer investigation this distinction reveals itself to be trickier than it may appear at first sight. He did not consider the concepts of a right and of a duty to be equally important in the realm of the normative: He took the concept of a duty to be the necessary foundation of all normative considerations, whereas the concept of a right is of secondary importance. Moreover, as Weyr points out, the

concept of a duty (*povinnost*) has no place in the realm of causal-explicative knowledge: It always presupposes a normative view, and so it is a typical element that needs to be taken into account in normative recognition, that is, in recognizing something as a norm. The imagination of a duty without the concept of a norm has no sense.

18.3.2. Later Generations in the Brno School: Jaroslav Krejčí, Adolf Procházka, Zdeněk Neubauer, Ota Weinberger, and Vladimír Kubeš

There are many important Czech legal theorists and lawyers, aside from Weyr, who belong to the Brno normative school or who have been influenced by it in some way. In fact, Czech jurisprudence, especially in the period from 1918 to 1948, is largely the product of this school. Of course, the influence of the Brno normative school was not restricted to the Brno School of Law (Masaryk University, based in Brno): It has also reached Bratislava and Prague.

Jaroslav Krejčí (1892–1960) and Zdeněk Neubauer (1901–1956), together with Adolf Procházka (1900–1970), to whom Weyr attributed the epithet "the Czech Merkl," can be situated in the "middle generation" among the exponents of the normative theory of law. Krejčí was basically interested in two problems in normology (understood as the logical analysis of norms): material error in the *content* of legal acts (acts *of* the law) and *formal* defects in legal proceedings. One of Krejčí main works, *Právní jevy v čase* (Legal phenomena over time: Krejčí 1937), attracted great attention. The author used the term *legal phenomena* in a broader sense than "legal norm," "act of the state," or "act of the law." He argued that legal phenomena include general legal norms—issued in the form of a statute or a decree, or any provision issued in the same form as a general legal norm—but they also include individual administrative and judicial acts of any nature, concrete facts that carry legal consequences in the legal order, acts of individuals (subjects), and even any fact deemed relevant under the legal order (Krejčí 1937, 6–7).[12]

Neubauer's basic work is *Problém vůle v normativním a teleologickém poznání* (The Problem of the will in normative and teleological knowledge: Neubauer 1930), after which he published *Státověda a theorie politiky* (The Science of the state and the theory of politics: Neubauer 1947): This is considered to be an important amendment to Weyr's theory (a theory primarily concerned with the question of the state as a legal order), and it offers the first Czech contribution to the science of the state. It deals not only with traditional topics in the theory of the state (the topics discussed by thinkers like Plato, Aristotle,

[12] Compare this position with that of Adolf Merkl: "Without addressing the foregoing terminological controversy, I should point out that the term *legal phenomena* [*Rechtserscheinung*] seems to me a suitable expression for any process or event [*Geschehen oder Geschehnis*, i.e. *fieri et factum*] of legal relevance" (Merkl 1923, 218 n. 1; my translation).

or Jellinek) but also with problems that had arisen in the decades leading up to World War II and in the period immediately thereafter. By connecting traditional and modern approaches he came to a new systematization in which a range of basic concepts—the state as a legal order, political and state ideologies, forms of government—are tied in with the main issues in democracy.

Adolf Procházka dealt with problems concerning the intertemporality of law and of law making and law-finding. His research on the dynamics of law may attract some interest in legal theory. In *Základy práva intertemporálního* (Foundations of intertemporal law: A. Procházka 1928) he demonstrated that a derogating posterior norm (*lex posterior*) and a derogated prior norm (*lex prior*) do not stand in the contradiction they may at first appear to be in. But probably more important is his theory of so-called automatic law making, which has often been discussed. Procházka's view is based on a broad framework for law making understood as the overall realization (or unfolding) of the procedures through which legal norms are created. These procedures can be divided into two groups: procedures in which a decisive role is played by human acts and those in which that is *not* the case. Here is Procházka in his own words:

> Such making of norms that is realized without human participation can be described as automatic. [...] It is evident that in many cases there are outside causal processes, and there are not human actions. These procedures are usually merged with substantive human behaviour (with acts and omissions), but there are cases in which a higher norm attaches binding legal consequences to these processes alone. This means that the derived norms become "members of the legal order," and so, even though these are norms whose legal existence we may not become aware of, they can still be recognized: They are discovered by subsuming their content under an objectively given creation norm. (A. Procházka 1937a, 107–8; my translation)[13]

Two outstanding thinkers who were closely associated with the Brno normative school but then turned away from it are Karel Engliš (1880–1961) and Jaroslav Kallab (1879–1942).

Engliš developed an account, known as *teorie myšlenkového řádu* (theory of ordering ideas), on which all our mental creations are historically conditioned (and hence variable) purpose-oriented means that help us to explain and understand reality. Norms and postulates are different from judgments (which result from causal cognition) expressing the human will in a certain manner. Engliš introduced a "trialism" of the ways of thinking (orders of ideas), identifying a sphere of teleological rationality understood as a third sphere different from the two spheres recognized by the representatives of the Brno normative school (that causal rationality and that of normative rationality).

This is how Engliš introduces his three spheres of thought:

[13] Procházka also presented and discussed Weyr's theory internationally: see A. Procházka 1937b.

A. ONTOLOGICAL ORDER OF THOUGHT	B. I. TELEOLOGICAL ORDER OF THOUGHT Subject of the will
Basic Knowledge: **Something is**	Basic knowledge: **Something is wanted** (postulate)
Understanding: **Cause - effect**	Understanding: **Purpose - means** (finality)
	II. NORMOLOGICAL ORDER OF THOUGHT Subject of duty
	Basic knowledge: **Something ought to be (norm)** Understanding of validity: **Lower norm - higher norm** (normological reason)

(Engliš 1992, 24; my translation)

Kallab, a professor of criminal law and legal philosophy, contributed to the methodology of the normative theory with his *Úvod ve studium metod právnických. Základní pojmy: Kniha první. Hlavní směry: Kniha druhá.* (Introduction to the study of legal methods. Book 1, Basic concepts. Book 2, Main directions: Kallab 1920–1921). The main difference between Kallab and Weyr is whether, aside from *právní věda* (legal science) in Weyr's sense, aimed at recognizing the positive law, there also exists a legal science understood as an endeavour aimed at offering an objective knowledge of what ought to *objectively* be.

The first normativist in the theory of civil law was Jaromír Sedláček (1885–1945): His philosophical treatise *Občanské právo československé: Všeobecné nauky* (Czech Civil Law: General theories), published in 1931, clearly bears the mark of Kant's philosophy. A true achievement was his previously mentioned commentary on the Czechoslovak General Civil Code (a commentary cowritten with František Rouček: Rouček and Sedláček 1935–1937).

Ota Weinberger (1919–2009) was a disciple of Weyr and Engliš, and the question most closely associated with his professional life was the Jörgensen's dilemma, the question of the logical analysis of norms, namely, how can norms be subjected to logical analysis if they can neither be true nor false?[14] After the Soviet occupation of Czechoslovakia in 1969, he left the country for Austria, where he became chair at the Institute of Legal Philosophy in Graz (from 1972 to 1989). In 1990, he went back to Czechoslovakia many times and helped to restore legal philosophy in the country.

According to Weinberger, one possibility in solving Jörgensen's dilemma is to distinguish between cognitivist (descriptive) and noncognitivist (prescrip-

[14] On Weinberger see also Section 10.3.3 in this tome.

tive) concepts of norms.[15] What distinguishes *cognitivist* concepts is that in them lies a connection between the concept of a norm and that of truth, a connection that by contrast is absent from noncognitivist concepts. What defines a noncognitivist norm is its connection to a norm-creating authority, understood as an authority empowered to command a certain conduct on the part of those who are subject to it. Weinberger further divides noncognitivist theories of norms into those theories which assert the possibility of a logical description of normative thinking (normologic optimism) and those which reject that possibility (normologic scepticism), a distinction that according to Holländer (2010) he was concerned to draw because he was himself an adherent of normologic optimism.

Weinberger's logical analysis of norms quite significantly influenced European legal theory and philosophy. Already exceptional in this respect was his 1958 *Sollzsatzproblematik in der modernen Logik* (The problem of ought statements in modern logic: Weinberger 1958). Instead of offering ideological arguments, he laid out a program for rational discourse stripped of any politically apologetic context, emphatically claiming that "*ex autoritate* arguments should be left out!" (Weinberger 1967, 864; my translation). As Holländer underlines, he was the first one in Czech legal theory to have replaced the concept of truth with that of practical certainty.

He was inclined toward legal positivism, and in his polemic against *ius naturale* he objected that "simply *stating* that natural law exists is completely meaningless: Only a *justification* of valid principles of natural law—principles that can be used as arguments in legal argumentation—is relevant for legal philosophy and legal methodology" (Weinberger 1993, 193; my translation, italics added). The solution offered by Weinberger is as follows:

> However, neither in ethics nor in law is the enactment of norms a matter of arbitrariness. As Hart has shown, in society under the modern state, law must in any case frame certain relationships and perform certain functions. But this functional determination of law is not a natural-law element of the legal order, because it is not cognitively determined [...]. There exist certain natural reactions and modes of behaviour that I would consider natural rudiments of justice. But this is not natural law: It is rather a reference to a natural basis that forces us to create norms and institutions in that way, since they arise from natural anthropological reactions and structures, and since, at the same time, we always make evaluations in light of the postulates of justice. (Weinberger 1993, 201–2; my translation)

Weinberger's formally finalistic theory of action (a theory developed in Weinberger 1996), is based on the view that action is behaviour determined by information, meaning that agents act by processing this information, which thus acquires structure, and it is on the basis of that structure that their action can be explained. So, in his view, this formally defined concept of action can be applied to the actions of individuals, and hence to the actions of institutional entities. Institutions create the framework for our actions. Forms of action and

[15] On the Jörgensen's dilemma see Section 26.4 in Tome 2 of this volume.

human interaction thus depend on institutions: While institutions are *created* by humans, human behaviour is in turn *determined* by institutions. Institutions can be normative and pertinent (they are institutions-as-things). They are each characterized by a guiding idea (*idée directrice*),[16] and they define institutional facts and the roles of people in social institutions, and over the course of history they also retain a certain stability and dynamism.

On the neoinstitutionalist theory of law, which Weinberger developed with Neil MacCormick, law is understood as a system of pieces of practical information that determine the structure and behaviour of the state and of its institutions (MacCormick and Weinberger 1986). What imparts validity to the legal order is that its system of norms determines the organization and functioning of legal institutions.

Neoinstitutionalism can be identified as a kind of legal logicism. It investigates the structure of legal norms and their dynamics, distinguishing between different types of legal rules: rules of behaviour, legal principles, conferring rules, etc. Legal dynamics is understood as a set of norms, facts, and actions (first among which are legal transactions).

In his theory of argumentation,[17] Weinberger compares established theories and underlines the difference between two "types of argumentation": the relevant validity of a thesis and the processes of intersubjective motivation. The motivating effect of argumentation depends not only on relevant reasons but also on other circumstances. That is why it is greatly important to be able to subject eristic methods to critical scrutiny,[18] because marketing and false methods of motivation make their way into political life and begin to threaten the functioning of the open society.

Finally, there is the theory of democracy (Weinberger 1996; 1993, 257–80). According to Weinberger, democratic life cannot be guaranteed only by way of formal rules: Democracy should be constructed within the framework of an open system of substantive principles on which basis to arrive at principles for democracy as an institution.

In 1945, when the University in Brno reopened after World War II, a new *Institute of civil law and legal philosophy* was established under the chairman-

[16] Weinberger is using the concept of *idée directrice* in the sense in which it had been used and explained by Maurice Hauriou (1856–1929), the best-known representative of the theory of institutions (institutionalism): See for example Hauriou 1965. On Hauriou see also Section 12.2 in this tome and Section 1.1.4.2 in Tome 2 of this volume.

[17] Weinberger explains his overall approach to the theory of argumentation in a very detailed manner in Weinberger 1995, an article based on a lecture delivered at Karl Franzens University in Graz on April 19, 1995.

[18] Eristic (from the ancient Greek word *eris*) refers to argumentation where the contending parties quarrel without any reasonable aim, just for the sake of argument itself, rather than to seek to resolve the issue in dispute. It is also seen as the ability to argue for any position just by way of logical dexterity, and also as the art of arguing in such a way as to preserve the truth of the premises (*per fas et nefas*).

ship of Vladimír Kubeš (1908–1988). Kubeš is sometimes described as the most influential Czech legal philosopher in the second half of the 20th century after Weinberger. As a disciple of Weyr and Sedláček, his starting point was the pure theory of law, but in the late 1930s he was strongly influenced by the critical ontology of Nicolai Hartmann. After his unsuccessful attempt to join Marxism in March 1948, and a later attempt to leave the country, he was imprisoned (from 1949 to 1956). During the Prague Spring (1968–1969) he was for a short period (from 1968 to 1969) professor of legal philosophy and of civil law, and then he retired early (1971). Afterwards he became a visiting professor of legal philosophy at the University of Vienna (1976–1981).[19]

Two stages can be identified in Kubeš's theory in connection with his philosophical development. At the first stage, when he was focusing mainly on civil law, he subscribed to the views of Weyr and Sedláček, and his conception thus fell within the pure theory of law.

He clearly distinguished two questions as concerns legal validity: the question of the validity of a norm as a part of a system of norms known to be valid, and the question of *pozitivní sekundární právo* (secondary positive law), a concept he introduced in the pure theory of law to explain the legal nature of a judicial decision based on principles of natural law (referring to Article 7 of the *Allgemeines Bürgerliches Gesetzbuch*, as well as to other similar provisions).[20]

The second stage in the development of Kubeš's thought begins with his landmark *Právní filosofie XX. století* (Twentieth-century philosophy of law: Kubeš 1947), addressing Kantianism, Hegelianism, phenomenology, and Engliš's theory of the tripartite order of ideas. He gradually moved beyond the narrow confines of the pure theory of law, shifting his focus to systematic philosophy, influenced in the first place by the critical ontology developed by Nicolai Hartmann (whose lectures he had attended in Berlin in 1932).

Legal philosophy is understood by Kubeš (2003) as a strict science, a system of ideas aimed at truth and correctness. Legal philosophy should in his view perform five tasks as follows:

[19] In 1980, during his Vienna period, Kubeš published *Die Brünner Rechtstheoretische Schule (Normative Theorie)* (The Brno school of legal theory [The normative theory]: Weinberger and Kubeš 1980; see also Weinberger and Kubeš 2003) with Ota Weinberger, and he also published a work on legal duty titled *Die Rechtspflicht* (On legal obligation: Kubeš 1981). His last work, *Theorie der Gesetzgebung* (The theory of legislation: Kubeš 1987), was also published in Vienna. A selection from his unpublished material on legal sociology was edited by Pavel Hungr in 1991 for use at the law school in Brno (Kubeš and Hungr 1991). In 1994, the law school also published a biography of Vladimír Kubeš titled *... A chtěl bych to všechno znovu* (... And I would like to make all happen again: Kubeš 1994).

[20] Article 7 of the ABGB reads as follows: "Whenever a legal case cannot be decided on the basis of the literal meaning of a statute or on the basis of its commonsense understanding, then it will be necessary to look to similar cases clearly adjudicated in a previous decision, as well as to the grounds for decision set forth in other related statutes. If the case still remains doubtful, it must be decided in light of carefully collected and thoroughly balanced circumstances on the basis of natural legal principles" (my translation).

1. To identify the essence of law, a legal-ontological and legal-noetic task.
2. To explain the normative idea of law (the ideas of justice, certainty, purposiveness, and freedom).
3. To determine the concept of law and other legal concepts. This is a logical task, laying the foundation for the logic of law and the philosophy of legal concepts. But ontology must take precedence over these concepts. Legal-ontological research is important in noetic and logical research (as well as when investigating the logic of norms).
4. To explain the sense and purpose of law.
5. To interpret the legal view of the world as an open system, a gradual construction of ideas, a construction atop which lies the real idea of law. This real idea of law is a dialectical synthesis of a concrete individual's ideas of justice, legal certainty, purposiveness, and freedom, expressing what that individual—an actually thinking person living in the real world—believes about the components of the real idea of law, or how that person understands and specifies that idea.

18.4. Forty Years on, after 1948

Soon after the coup d'état in February 1948, the normativist school was dismantled, and then in 1950 the Brno School of Law was closed on ideological grounds. Among the leading Czech legal theorists of that period was Viktor Knapp (1913–1996), whose authority has sometimes been compared to that of Antonín Randa, and whose career in law was linked to Prague.

Knapp considered the Brno School of Law "philosophical" and normativist (at times neo-Kantian), and he contrasted it with the Prague School of Law, which he characterized as *non*-philosophical and close to positivism (sometimes sociological, sometimes historical),[21] in the spirit of the dictum *Dura lex, sed lex*. He became professor of civil law but also studied philosophy, sociology, and history, and in 1951 he joined the law faculty of Charles University in Prague, teaching there until the 1990s. In his early *Problém nacistické právní filosofie* (The problem of Nazi legal philosophy: Knapp 1947), he offered a systematic interpretation of Nazi legal philosophy, in what he characterized as a logical but not a sociological analysis of this phenomenon after World War II.

In the February 1948 coup d'état Czechoslovakia was enveloped within the Soviet zone as a "people's democracy," and especially in the early years the country adopted official textbooks on legal theory. So, for example, in 1949 the Institute of Law of the Academy of Sciences of the Soviet Union published in Moscow a theory of law and the state, and these books were translated into Czech and Slovak and introduced into academic institutions such as universities and the Slovak Academy of Sciences (cf. Aržanov, Kečekjan, et al. 1950)

[21] This opinion was expressed by Viktor Knapp (1998, 18–21).

Under Soviet influence, the Marxist-Leninist theory of law and the state was presented as the only true, scientific theory of law and the state, on a par with the revolutionary turn in that field. The definition of law from this period read as follows:

> Law is a set of rules (norms) of behaviour determined and enforced by power of the state, expressing the will of the ruling class, and whose compliance is secured through the state's coercive power, their purpose being to protect, strengthen, and develop social relationships and orders for the convenience and advantage of the ruling class. (ibid, 109; my translation)[22]

As an expert in civil law, Knapp was among the main authors of the "middle version" of the Civil Code (the 1950 version), which was also based on the new concept of property (ownership) in a Soviet-style people's democracy. In 1967, he published his second work on legal philosophy, *Filosofické problémy socialistického práva* (Philosophical problems of socialist law: Knapp 1967). Apart from discussing the possibility of framing a Marxist concept of law, the work also, and for the first time in a Marxist context, took on topics like gaps in the law and civil disobedience.

In the same year Jiří Boguszak (1927–) came out with a textbook titled *Teorie státu a práva* (Theory of state and of law: Boguszak 1967), published in two volumes. Volume 1 offered a systematic and analytical interpretation of all important general questions relating to law and the state—the state's power; state sovereignty; the forms of state; law and legality; the sources of law; legal norms; the structure, types, validity, and effectivity of law; legal relations; the application and interpretation of law; and the legal system—while Volume 2 dealt with contemporary types of state and law, emphasizing their sociological aspects.

After 1968 and in Czechoslovakia's period of normalization (mainly in the Czech Republic), the standard textbook in use was by Eduard Kučera (1928–2010), chair in the general theory of law and the state at the Charles University School of Law in Prague. The book, published in two volumes, was titled *Obecná teorie státu a práva* (General theory of the state and of law: Kučera 1976–1977), and it also included studies on the criticism of the bourgeois theories of law and the state, including the normativist theories.[23]

[22] The definition goes with the definitions that Andrei Januarjevitsh Vyshinsky set out in Vyshinsky 1938c, 36–7; 1950, 36. On Vyshinsky, see Section 17.3 in this tome.

[23] The textbook draws inspiration from the Soviet *Marksistsko-leninskaja obščaja teoria gosudarstva i prava* (The Marxist-Leninist general theory of the state and law), published in four volumes from 1970 to 1973 by Viktor M. Čchikvadze and others (Čchikvadze, Aleksandrov and Bratus 1970–1973). Among the critics of normativism was Lubomír Kubů, professor of legal theory at the Purkyně University, School of Law in Brno. See, for example his work from 1977 *Ryzí náuka právní v kontextu buržoazního právního myšlení* (The pure theory of law in the context of bourgeois legal thought: Kubů 1977).

18.5. The Story of Slovakia (1919–1989)

The Czechoslovak State University in Bratislava was established on July 11, 1919, replacing the previous Hungarian University, and on November 11 of the same year its name was changed into Comenius University. Under the act by which it was established, lectures had to be delivered either in Czech or in Slovak. The Comenius University School of Law was established in 1921: Bohuš Tomsa (1888–1977) was appointed as the first professor of legal philosophy at the law school, but without tenure. He was in charge of a seminar in legal philosophy from 1922 to 1938 (and was subsequently dismissed, being a Czech professor). The legal status of Comenius University was then changed, principally in 1940, when the new act regulating Slovak universities repealed the previous act (the one under which the Czechoslovak State University was established in 1919): This meant that Comenius University would henceforth no longer be classed as Czechoslovakian.[24] To mark the "new beginning," the Slovak University in Bratislava (*Universitas Slovaca Istropolitana*) announced that it would accept Slovak and Latin as its official languages for teaching and exams. The *seminár právnej filozofie* (seminar on legal philosophy) was reshaped into the *Inštitút právnej filozofie* (Institute for Legal Philosophy), and beginning in 1942 it was headed by Vojtech Tuka (1880–1946), who also served as president of the Slovak University (from 1939 to 1942). His main work on legal philosophy was published in 1941 in Berlin and Vienna: It came out in German under the title *Die Rechtssysteme: Grundriß einer Rechtsphilosophie* (Legal systems: Outlines for a legal philosophy, Tuka 1941), and in it he laid out his own typology of systems of law.[25]

In the same wartime period, in 1941, Jozef Ratica (1906–1960) published *Súd a tvorba práva* (The courts and the making of law: Ratica 2009), which criticizes the normativist view of law. In this book, Ratica looks for a unified concept of law useful to the courts' decision-making practice, and in summarizing the features of normativism he asserts what follows:

[24] In the so-called Slovak state (which as mentioned was established in 1939), this step also expressed the attitude to the former common Czechoslovak Republic and to the ideology of "Czechoslovakism," the view that there is only one uniform Czechoslovak nation across the territory, and no Slovak nation at all. The Czech professors initially invited in 1919 (most of them recruited from Charles University in Prague) to help establish the Czechoslovak State University (which would soon continue as Comenius University) were dismissed on the ground that they were not well-disposed to "Slovak affairs," and that they even sought to hold back the development of Slovak culture. In 1954, the Slovak University changed its name back to Comenius University.

[25] Tuka's classification includes (left as in the German version, because it is, in my opinion, impossible to translate this epithets explicitly into English) "the karmine, domine, merzine, artine, tumultine und vizine Rechtssystem." Tuka described his own work as a study in the *sociology* of law (*Rechtssoziologie*) rather than in the philosophy of law (*Rechtsphilosophie*) (Tuka 1941, IX). Tuka served as prime minister of the Slovak Republic throughout its existence (from 1939 to 1945): In a post-war trial he was sentenced to death as a war criminal and was executed in 1946.

From the fact that the normative theory has put an insurmountable abyss separating the world of what is from the world of what ought to be, it self-evidently follows that in the effort to understand what is generally considered to be law, that theory proceeds from assumptions and concepts drawn from the nature of the norm as a form. As is clear from the foregoing, the concepts so obtained are too narrow, and even their pure formality is overall doubtful. [...] The pure theory of law starts out by recognizing as law only what is generally considered to be such, and it sees the plurality of norms in the law [but] it cannot seize their content. The variability of content hinders the effort to create a set of norms on the basis of the principle of content itself: That is why [on the normative theory] only a formal principle can be taken into account. (Ratica 2009, 74; my translation)

In 1939, Štefan Luby (1910–1976) joined the university again as an untenured professor with the work *Obyčajové právo a súdna prax* (Customary law and judicial practice: Luby 1939). For his tenure he later produced his famous *Dejiny súkromného práva na Slovensku* (History of private law in Slovakia: Luby 2002)—the general part came out in 1941 and the completed version in 1946—and then he came out with *Prevencia a zodpovednos* (Prevention and responsibility: Luby 1958), a work addressing theoretical problems in civil law. Then, in 1959, he left the university for the Academy of Sciences, where he worked at the Institute for Law and the State.

In 1963, a chair in legal theory was established at Comenius University in Bratislava. At that time, Slovak legal theory was essentially the work of Ján Bakiča (1925–2012). After the Prague Spring of 1968, Pavol Dojčák (1928–) published a textbook titled *Teória štátu a práva* (Theory of state and law: Dojčák 1977). It was like the earlier, similarly titled (and previously mentioned) textbook by Eduard Kučera, in that it was likewise modelled on the same Marxist-Leninist general theory of law and the state, and in many respects it copied the existing mainstream theory developed by Jiří Boguszak in Prague, for it was aimed at preserving the unity of the entire legal curriculum in Czechoslovakia, and in practice it survived until the Velvet Revolution of 1989.

18.6. Shortly after 1989: Again Two Stories from the Philosophy of Law

Recently, over the last two decades—after the 1993 dissolution of Czechoslovakia into the Czech and Slovak Republics—the theory and philosophy of law have seen a revival in both countries' universities and law schools, and seminars have also sprung up dealing with a range of issues in these two disciplines.

18.6.1. The Slovak Republic

The first attempts in legal theory are linked to Jozef Prusák (1942–), who first served as professor at Comenius University in Bratislava (1989–1999) and then as the first dean of the newly established Trnava University School of

Law (2000–2007). He is the author of *Teória práva* (The theory of law: Prusák 1995),[26] which is a standard textbook in the Slovak Republic and covers the theory of public and private law alike, while also serving as an introductory overview of the discipline.

In the 1990s, Alexander Bröstl (1953–), of the Košice School of Law,[27] published *Právny štát: Pojmy, teórie a princípy* (The *Rechtsstaat*: concepts, theories, and principles, Bröstl 1995), and Eduard Bárány (1955–), of the Institute for Law and the State of the Bratislava Academy of Sciences,[28] came out with *Moc a právo* (Power and law: Bárány 1997). Bárány also wrote *Pojmy dobrého práva* (Concepts of good law: Bárány 2007), presenting concepts which make for good law (or which designate four values inherent in the idea of goodness in law): These are natural law, human rights, legal principles, and justice/equality. One of the theses the book argues is that "legal positivism, on a par with the theory of natural law, can strive for good law, and their concepts equip them with appropriate means by which to do so" (Bárány 2007, 7; my translation). Alexandra Krsková (1942–), who came to be known as the "first lady of Slovak legal philosophy," has investigated the psychological aspects of law, working with Pavel Hungr of the Brno School of Law (Krsková and Hungr 1985). She then published *Štát a právo v európskom myslení* (State and law in European thought: Krsková 2002), which was also translated into Czech.[29] Shortly thereafter Radoslav Procházka (1972–), a member of the younger generation of legal theorists, came out with a book that develops his dissertation: It is titled *Dobrá vôľa, spravodlivý rozum* (Good will, just reason: R. Procházka 2005). And he recently also came out with *L'nd a sudcovia v konštitučnej demokracii* (People and judges in a constitutional democracy: R. Procházka 2011).

18.6.2. The Czech Republic

In the 1990s, important contributions to various areas in the theory and philosophy of law were made through a number of works published in the Czech Republic: Prominent among these are the essential works of Pavel Holländer

[26] Another work by Jozef Prusák (from the 1980s) is *Právo v spoločnosti* (Law in society: Prusák 1980), which takes more of a sociological angle to the study of law. Essays in honour of professor Prusák were published in 2012 by his students and colleagues in R. Procházka and Káčer 2012b.

[27] Two textbooks also written by Bröstl and others are *Základy štátovedy* (Foundations of the science of the state) and *Teória práva* (Theory of law), both in the Košice School of Law since 1991.

[28] Another Slovak legal philosopher, and former director of the same institute is Peter Colotka (see Colotka 1993).

[29] She later came out with an expanded version in Krsková 2011. In 2012, her students and colleagues published a collection of essays written in her honour to mark her anniversary (R. Procházka and Káčer 2012a).

(1953– , who was initially teaching at the Comenius University School of Law in Bratislava),[30] starting from *Rechtsnorm, Logik und Wahrheitswerte: Versuch einer kritischen Lösung des Jörgensenschen Dilemmas* (Legal norm, logic and values of truth: A critical solution of Jörgensen's dilemma, Holländer 1993) and continuing with *Základy všeobecné státovědy* (Foundations of the general science of the state: Holländer 2009), *Nástin filosofie práva: Úvahy strukturální* (Outlines of legal philosophy: Structural considerations, Holländer 2000; with a German edition of 2003), *Filosofie práva* (Philosophy of law: Holländer 2006, 2012), and many others. All these works combine to offer a coherent philosophical theory on the central questions and structures of law (legal principles and legal norms): Treating a range of questions from the concept and structure of law to the fundamental assumptions in legal thought, the author sets out to look for solutions to the problem of justice.

Holländer believes that Jörgensen's dilemma has played a positive role in the effort to investigate the logical properties of norms and the distinguishing features of legal thought, and that the dilemma has also shown the need to answer the question of the peculiar features of logical conclusions in the normative sphere.[31] There are two questions the dilemma can give rise to: Are there logically describable thought processes in which norms are contained? And can logic describe mixed, heterogeneous conclusions containing both norms and sentences, of statements of fact (as in the example of conclusions obtained by subsumption)? Holländer proposes a possible solution in developing his ideas on sentences and the truth, on the theory of legal norms, on the drawing of logical conclusions, and on norms and normative contradiction. He also discusses the question of broadening the concept within which to fit the drawing of logical conclusions, and he reconsiders the logical value of validity and compliance. His final considerations concern the question of reducing duty to necessity and to the problem of truth: truth as compliance with a norm, truth as a norm's alignment with the will of the norm-maker, and the truth of norms as a reflection of reality. In coming to a conclusion on the last problem, he agrees with Chaïm Perelman:

> The question of truth in our behaviour (its principles) is meaningless, because our actions and decisions cannot be true. They can be described as reasonable, just, thoughtful, in accord with moral norms or enactments of law. [...] They are self-evidently based on information containing facts. This information may be true or false, and its truth or falsity can influence our modes of behaviour. (Perelman 1972, 49; my translation)[32]

The second edition of Holländer's *Filosofie práva* (Holländer 2012) focuses on crucial questions like the concept of law, legal norms, legal principles, the lan-

[30] Pavel Holländer has been a justice of the Constitutional Court of the Czech Republic since 1993, serving as its vice president since 2003, until 2013.

[31] On the Jörgensen's dilemma see Section 26.4 in Tome 2 of this volume.

[32] On Perelman's conception of legal reasoning see Section 23.2 in Tome 2 of this volume.

guage of law, and the problem of justice. The main idea behind his work is expressed as follows:

> My aim is to link considerations on partial questions with two basic connecting moments—namely, (*i*) a rejection of reductionism and (*ii*) an acceptance of the (ontological) claim asserting the plurality and nonreducibility of basic principles—while endorsing the (noetic) need to find the right measure for things. (Holländer 2012, 15; my translation)

He draws attention to the relationship between natural-law theory and legal positivism in what concerns the social concept of the legitimacy of power (ibid, 14).[33] In dealing with the open texture of law, he comes to the problem of judicial law making as a consequence of the uncertainty of normative premises. He finally turns to the so-called Böckenförde thesis—the view that the "liberal secularized state is living on premises that it cannot itself guarantee"—discussing the ultimate consequences of that thesis and its impact on the concept of justice (ibid, 110).

In the 1990s, the law schools of the Czech Republic used Viktor Knapp's textbook *Teorie práva* (Theory of law: Knapp 1995) or other versions of it like *Základy teorie práva a právní filozofie* (Foundations of the theory and philosophy of law), by Vladimír Veverka, Jiří Boguszak, and Jiří Čapek (1996). These were then displaced by the revised *Teorie práva* (Theory of law: Gerloch 2007), written by Aleš Gerloch (1955–), dean of the Charles University School of Law in Prague. The law school hosted international conferences like *Právní principy* (Principles of law: Boguszak et al. 1999), *Problémy interpretace a argumentace v současní právní teorii* (Problems of interpretation and argumentation in contemporary legal theory and legal practice: Gerloch and Maršálek 2003), and *Zákony v kontinentálním právu* (Statutes in continental law: see Gerloch and Maršálek 2004), and the debates held within that framework wound up significantly contributing to the overall development of the theory and philosophy of law in the Czech Republic.

Jiří Přibáň (1967–), also affiliated with the Charles University School of Law in Prague, has been working at the Cardiff Law School, University of Wales, since 2001. He has gradually expanded his work on many questions in the philosophy and sociology of law. A few examples are *Sociologie práva: Systémově teoretický přístup k modernímu právu* (Sociology of law: The system-theoretical approach to modern law, Přibáň 1996), *Hranice práva a tolerance* (Frontiers of law and tolerance: Přibáň 1997), *Rule of Law in Central Europe* (Přibáň 1999), *Disidenti práva* (Dissidents of law: Přibáň 2001), and *Systems of Justice in Transition* (Přibáň 2003), along with numerous other writings on law and justice.

[33] It was Holländer who took exception to Přibáň's essay on legal positivism published in 2010 in the Czech newspaper *Lidové noviny* (People's daily), and who thus initiated the first debate after the fashion of that between Hart and Fuller, a debate dealing with the "never-ending story" of the legitimacy of legal positivism or natural-law theory (see Přibáň and Holländer 2011).

Zdeněk Kühn (1973–) is a member of the law faculty in Prague.[34] His thesis—titled *Aplikace práva ve složitých případech: K úloze právních principů v judikatuře* (The application of law in hard cases: On the role of legal principles in adjudication, Kühn 2002)—was followed by another work titled *Aplikace práva soudcem v éře středoevropského komunizmu a transformace: Analýza příčin postkomunistické právní krize* (The judges' application of law in the era of central european communism and transformation: An analysis of the causes of the post-communist legal crisis, Kühn 2005). The system of law is understood by him as

> something continuously created through predictive system-based techniques by working from the presently existing body of law (inclusive of statutory and judge-made law; traditional law and developing components of relatively autonomous legal reasoning; legal values; principles; other legal elements; and an aggregate of relationship between the legal system and extra-legal systems), all this occurring through a continuing practice carried out by the implementing bodies as well as by the addressees of legal norms. (Kühn 2002, 390; my translation)

Kühn further focuses on the normative impact of decisions handed down by courts in continental Europe, looking for answers to two important questions: Whether a hard case ceases to be a hard one if an essentially similar case has been decided by the supreme court in the same hierarchy, and whether a prima facie easy case can become all things considered a hard one, in light of relevant factors and on the basis of established continental European case law that seems to offer a straightforward, noncontroversial solution to a case once thought to be complicated (ibid, 394).

After 1989 the law faculty of Masaryk University in Brno reestablished its traditional connection with the normativist school, a connection that had been severed under communism, and even in recent debates the faculty has taken up some fruitful suggestions coming from this school. The textbook in use in the classroom is *Teória práva* (Theory of law: Harvánek 2008), written by Jaromír Harvánek (1955–). Miloš Večeřa (1949–), holder of the chair in legal theory at Brno, addresses the problems of the social state in *Sociální stát* (The social state: Večeřa 1993), where he also discusses justice in law and certain topical aspects of the teachings of Weyr, Weinberger, and Kubeš.[35] Tatiana Machalová (1959–), who also works under the same chair, has regularly contributed to the effort to interpret the teachings of Weyr and Kelsen, in part working in cooperation with the Hans Kelsen Institute in Vienna (see Machalová 2003, Machalová and Horák 2010). She asks in particular, proceeding from Niklas Luhmann's systems theory of law, whether the *Grundnorm* could

[34] He has recently been appointed as a judge of the Supreme Administrative Court of the Czech Republic in Brno.

[35] Večeřa has published a series of articles concerned with these teachings (see Večeřa and Miloš 2008).

work itself out into an autopoietic concept of law. She has also investigated the concepts of the legal subject and of legal duty in Kelsen's pure theory of law.

Further, and finally, there is a young generation of legal theorists and philosophers from Brno and Prague—among whom Tomáš Sobek, Filip Melzer, Libor Hanuš, Radim Polčák, Martin Škop, and Jan Tryzna—who are mainly focused on the methodology and theory of legal argumentation (see, for example, Hanuš 2008, Melzer 2010, Polčák 2012, Sobek 2008, 2010, 2011, Škop and Macháč 2011, and Tryzna 2010).

Chapter 19

20TH-CENTURY LEGAL PHILOSOPHY IN HUNGARY

by Csaba Varga

19.1. Introduction

The first half of the 20th century in Hungary is marked by the prevalence of neo-Kantianism and its development into an almost exclusive jurisprudential orientation (Jakab 2008, 2010). This came as a backlash against legal positivism, which stood as a stronghold in the background, exerting a dominant influence throughout most of the 19th century and replacing the earlier breed of natural-law doctrines, mostly of Austrian origin.

Hungary did experience a brief recovery after World War II, but it was derailed and brutally cut short by the Communist dictatorship, which spread into the country by way of the Soviet expansion, and whose main conclusion lay in the accords of the Yalta Conference. The Marxism that came to be imposed by Moscow—a Marxism reduced to Soviet Russian use—could only be superseded by the fall of the regime. The new initiatives that have formed since then are attempts at synthesizing some abiding theoretical experiences with the international mainstream.

19.2. The Period before World War I: Bódog (Felix) Somló (1871–1920)

Somló's oeuvre greatly influenced the development of neo-Kantian legal philosophy to become the dominant trend in Central Europe, thus also prevailing in Hungary, under the impetus of the modernization of domestic legal theoretical thought (cf. Somló 1999).
