[159] Pietropaoli similarly observes that "law, for Schmitt, can be a norm, a decision, or a concrete order. But in any historical phase, one of the three elements is bound to prevail over the others" (Pietropaoli 2012b, 9; my translation). Likewise, Croce and Salvatore (2007, 5) explain Schmitt as follows: "*Every* juristic system (and, *a fortiori*, every juristic thought) is composed of norms, a decision, and a specific legal order: the hierarchical, logical order between them is structurally decisive to such an extent that whichever is considered to be the leading element comes to determine the type of juristic system." And they also comment that "the decisionist contribution reflects the genuine particularity of Schmittian institutionalism: by means of it we can identify the social subject who is called upon to uncover among the whole set of interactions those which are juridically relevant, so as to leave aside the interactions which are to be considered to be inessential or dangerous owing to the fact that they are extraneous to the customs of a specific community. Here, this subject is the sovereign to whom is definitively reserved the faculty of deciding, namely of restricting social reality in such a way that normality is defined by excluding those social interactions which are at odds with the aimed homogenisation. Such a normal situation is the condition of possibility for any juristic regulation" (ibid.).

[160] Schmitt draws directly on Romano (1946, 13) in clarifying the relation between norms and the legal order: "'The legal order is a uniform essence, an entity that moves to some extent according to rules, but most of all itself moves the rules like figures on a gameboard; the rules

elements may be significant—witness their objection to both sociologism and normativism,[161] as well as their idea of an "overlap or correspondence between social organization and the legal order" (Pietropaoli 2012b, 3; my translation)— the differences seem to prevail.

The reasons why "Schmitt's institutionalism, or better *Konkretes Ordnungsdenken*, is […] quite different from Romano's doctrine" (La Torre 2010, 101) can be summarized in three main aspects. The first of these is that Schmitt's decisionism cannot be reconciled with Romano's anti-voluntarism: "Behind Schmitt's institutionalism one can fairly clearly discern the sinister shadow of decisionism, a conception that clashes with Romano's decisive anti-voluntarism and anti-imperativism" (ibid.). As was noted, what is central to Romano's institutionalism is the link between "*ius involontarium* and organization" (Catania, 1996, 97), a link contradicted by the strong decisionism present in Schmitt's vision. In the second place, it must be underscored that Schmitt does not embrace Romano's legal pluralism: "The most striking difference between Romano and Schmitt lies […] in the latter's fierce antipluralism" (La Torre 2010, 101). Schmitt's concrete order—which, as was noted, is modelled on the ancient guilds and on institutions such as marriage and the army (Catania 1996, 105)—invokes "a communitarian and essentialist version of the institutional model" (Croce and Salvatore 2007, 4). This is a difference that emerges in Schmitt's view of social relations, "which are judged to be relevant in juridical analysis": On the institutionalist view, "*every durable interaction is a juridical relationship*; in Schmitt's opinion, on the contrary, we should consider as juridical practices only the social practices contemplated by a preceding communitarian identity which has been taken for granted and presupposed in some way since the birth of a community" (ibid.). Schmitt's analysis presents a "monistic logic" that favours the vertical dimension over the horizontal one of social relations: "In this perspective, the whole set of single interactions does not shape but is shaped by a previous social identity, which gives it sense and social relevance" (ibid., 5). According to this monistic logic, "the political unity […] is the condition of possibility for and, at the same time, the real aim of the communitarian identification with *one* concrete legal order" (ibid.).[162] On this basis it can be shown, in the third place, that

represent, therefore, mostly the object or the instrument of the legal order and not so much an element of its structure.' He added correctly that a change in the norm is more the consequence than the source of a change in the order" (Schmitt 2004a, 57).

[161] According to Catania, Schmitt's opposition to normativism is "much more emphatic than Santi Romano's," and "on occasion it turns paradoxical," as when he criticizes normativism for offering a "normativist" interpretation of Pindar's *nomos basileus* fragment (Catania 1996, 89, n. 5; my translation).

[162] Catania notes that, in any event, the question "How does order arise in organizations and institutions?" is answered by Romano and Schmitt alike on the basis of an idea they both share, namely, that the legal order "concretely and historically exists only insofar as it is made up of

in Schmitt the distinction between law and morals melts away: "Schmitt is attracted by a vital, moralistic *Weltanschauung* that tends to confuse and combine the sphere of ethics and of law, which, on the contrary, remain quite distinct in Romano's doctrine" (La Torre 2010, 101).

So, in summary, as much as the idea of a concrete legal order acts in Schmitt as a device with which to arrive at what Pietropaoli (2012b, 9) describes as a "suprapersonal" conception of law, that conception is in many respects "at odds with the basic tenets of legal institutionalism" (M. Croce 2011, 42).

8.8. Legal Positivism and Totalitarian Regimes: Italian Corporativism

With the rise of totalitarian regimes in Italy and Germany came an effort to develop theories of law capable of justifying those regimes and expressing their ideology.[163] In Italy, this task was taken up in particular by the circle of jurists belonging to the school headed by Giovanni Gentile (1875–1944), a school that formed "around the minister Giuseppe Bottai at the Pisa University Faculty of Corporative Sciences" (Bobbio 1973, 229; my translation). This group was significant because, "even though it was philosophically lame," it sought to develop "a Fascist doctrine of the totalitarian state" (Ferrajoli 1999, 39; my translation). This they did by developing "a specific institutional model: that of the corporative state, based on a notion of organic solidarity among classes, as well as among interests and productive forces, and on their subordination to, and unification within, the state, which, contrary to what the liberal model called for, was no longer considered separate from society" (ibid., 40; my translation). The theoretical and legal framework for this model was developed in particular by Arnaldo Volpicelli (1892–1968), precisely in an effort to move beyond the distinction between society and the state (along with that between public and private law) and the liberal tradition (Costa 1986, 118–9).[164]

Volpicelli's work was part of a wider effort to renew a line of legal investigation based on transcending a series of theoretical antitheses distinctive to the liberal legal tradition. What Volpicelli (1932) sought in particular to supersede was the view that sets society against the individual, on the one hand, and the state, on the other: These contrapositions, he thought, needed to become correspondences: "The law is an institution; institutions are society itself, for

organizations that in the end are pre-given, preestablished orders" (Catania (1996, 105, 107; my translation).

[163] On the legal thought developed in connection with Nazism see Chapter 9 in Tome 1 of this volume.

[164] Here we find one of the main questions with which research on the history of Fascism is concerned, namely, the relation between Fascism and liberalism, with a "close scrutiny of the differences and continuities that mark the relation between the liberal and the Fascist side of Italy" as concerns both their institutional makeup and the theories espoused (Costa 1990, 125; my translation).

they represent its normative pre-ordination; society is the state; the state is the individual" (Costa 1986, 115–6; my translation).[165] The identification between society and the state leads to what is "perhaps the most striking thesis: that of the 'homogeneity between public and private law'" (ibid.; my translation). The construction of corporativism thus unfolds within a theoretical framework in which the state is not external to society, and from this thesis a series of traits derive that the corporative state must embody. These can be summarized in Volpicelli's view of the corporative state/society as a "homogeneous social organism" based exclusively on the corporations (in which there is no room for trade unions, and the party don't takes on the role of mediating between different interests), an organism governed by hierarchical relationships and in which there no longer emerge problems of representation or of conflict between the governed and the governors or between freedom and dominion (ibid., 202–4, 333, 343).

The idea of the corporative state as an element of legal Fascism thus brought to the centre of the debate a series of new theoretical questions that had previously been neglected in legal reflection in general. These include "the relation between law and the economy," a question brought into focus by the state's intervention "in economic life"; "the relation between statism and pluralism"; and "the public-private dialectic" (Grossi 2000, 183–4; my translation), a problem solved by "re-mythicizing the state" (Costa 1990, 134; my translation). Corporativism ("a ragged and complicated patchwork") depicts the (corporative) state as a "concretion and ultimate guarantor of the unity of the political, as a pivotal force in the process by which to achieve the unification of multiplicity (or social groups and organs)" (ibid., 134–5; my translation). Corporativism turns out to be no more than a "reframing" of the relation between society and the state and an attempt to fashion that relation in a dynamic way under the "political ideology of Fascism": On the one hand is the state, which turns "toward a corporately organized society"; on the other is the "surfacing of interests corporately represented by the state." Corporativism can thus be seen as an "apology for a political formula" (ibid., 132–8; my translation).[166]

In an attempt to install corporativism as the "general political principle permeating the whole of Fascist society" (Losano 2012, 35; my translation),

[165] Costa (1986, 32) points out that the criticism addressed at the contraposition between society and the individual took aim at the "liberal" view of humans as immediate subjects of needs, a view that, as Volpicelli argued, needs to be replaced with the idea of a "social" subject.

[166] It bears pointing out that a few theoretical advancements come not so much from corporativism itself (which does not innovate on legal thought in any significant way) as from the attempt to work out the issues involving the role of the "executive" and of the "party," which issues emerge as "an indirect consequence of the deep changes the 1920s and 1930s wrought both within legal theory and beyond it" (Costa 1990, 138; my translation). On these aspects, see also Fioravanti 1990).

Volpicelli turned to Kelsen.[167] This recourse to Kelsen plays a twofold role for Volpicelli: On the one hand, he uses Kelsen as a sort of prop in advancing certain theses in the general theory of law, and in particular in revising the framing of legal relations; on the other hand, he criticizes Kelsen's defence of parliamentarianism (and democracy) and his denial of the theoretical and institutional significance of corporativism. From the first point of view, Volpicelli tends to align himself with Kelsen, especially as concerns the effort to move beyond the distinction between public and private law: The idea is that the two thinkers are fighting "the same adversaries from opposite angles," even though Kelsen would be doing so working from the wrong side (ibid., 43–4; my translation). From the second point of view, as was just mentioned, Kelsen is heavily criticized for his support of democracy and parliamentarianism, and especially for rejecting corporativism.[168]

Volpicelli would later cease to engage with Kelsen, and his conception would not be taken up as the official doctrine of Fascist corporativism: He would continue to exert influence, to be sure, but for the problems he framed rather than for the solutions he offered.

[167] In the *Nuova rivista di diritto, economia e politica* (New review of law, economics, and politics), a journal edited by Volpicelli and Ugo Spirito, a series of articles came out translating different theoretical and political essays that Kelsen had written in the Twenties. These and other essays are published, edited by Volpicelli, in Kelsen 1932.

[168] Corporativism was criticized by Kelsen in *Das Problem des Parlamentarismus* (Kelsen 1925b). Costa (1986, 290, 203) makes explicit the premises behind the corporativist view, and in particular its being based on an understanding of society predicated on consent, to such an unrealistic degree that there no longer emerges the problem of the consent of the governed in their relation to those who govern.

Chapter 9

LEGAL POSITIVISM IN THE POSTWAR DEBATE

by Mauro Barberis and Giorgio Bongiovanni[*]

As was noted earlier, the central theme in the legal-philosophical debate after World War II was the relation between law and morals. This drew into a discussion two research traditions, natural law and legal positivism, that had hitherto tended to ignore each other: Exemplary in this respect is Kelsen's gesture in stating that no *reine Rechtslehre* could ever concern itself with justice. The discussion originated from those Continental countries that had known forms of totalitarianism or dictatorship, and it unfolded following these countries' return to democracy. This first happened in Germany and Italy, in the immediate postwar period; then in Spain, only after the demise of Francoism; then in Argentina, especially with the fall of the military dictatorship; and finally in the Eastern European countries, after the fall of the Berlin Wall.

The discussion often played itself out in terms of Hartian opposition between the separability and connection theses—an opposition set up by an author, Hart, who unlike many of his epigones at Oxbridge and in the United States, read the Continental scholars, too. In fact, we will see that every Continental country involved in this debate had developed important traditions in legal philosophy and also in legal theory. However, rarely had the natural-law investigation of justice and the legal positivist investigation of norms and the legal system engaged each other, except at the outset of books, where natural lawyers opt for a *normative* inquiry, and legal positivists for a *cognitive* one.

At the heart of the debate was so-called ethical legalism, which Bobbio renamed ideological positivism—the very old view, in truth rooted more in the natural-law tradition than in legal positivism, whereby the law must be obeyed or applied as such. This view finds itself more at home in the natural-law tradition, where law can be considered such only insofar as it is right, which justifies a presumption in favour of its binding force. Much more problematic, though, is law's obligatoriness in the legal positivist tradition, where Hume's law, coupled with the Separability thesis and a *Wertfrei* attitude, meant that no attempt could be made to infer law's obligatoriness from its mere existence. In any event, after Auschwitz and the criticisms that legal realists and natural lawyers[1] alike levelled at the German motto *Gesetz ist Gesetz*, a trend could be observed from ideological to methodological legal positivism.

[*] Sections 9.1 and 9.2 were written by Giorgio Bongiovanni; Sections 9.3, 9.4, and 9.5 were written by Mauro Barberis.

[1] Starting from 1945, the criticism of legal positivism would grow more robust, expanding as well to other topics (such as legal interpretation and argumentation) and taking new directions.

9.1. Law and Justice: Radbruch's Intolerable Injustice Argument

A major figure in the debate that unfolded in the wake of World War II was Gustav Radbruch (1878–1949), who as Paulson (2002a, 12) has commented is perhaps the "most important German legal philosopher" of the 20th century.[2] His 1946 article "Statutory Lawlessness and Supra-Statutory Law" (Radbruch 2006b) is among the "most frequently" cited writings in legal philosophy since the end of the war.[3] What makes Radbruch's analysis significant is that it emphatically brought back into the conversation the problem of the relation between law and justice (in this way contributing to the rebirth of natural law theory),[4] all the while offering a solution at once specific and comprehensive through which to address the problem of the conflict between law and justice. This last aspect would become universally known as Radbruch's formula, making his analysis an inevitable reference point for any investigation dealing with that conflict.[5]

This formula was Radbruch's attempt to address the legal problems that came to the fore at the end of the Nazi regime: In providing a tool with which to solve those problems, the formula also offers itself as a theoretical basis on which to work out the relation between law and morality (as well as justice). Indeed, there are two components to the formula. This can be appreciated in Radbruch's twofold statement of the formula:

> The conflict between justice and legal certainty may well be resolved in this way: The positive law, secured by legislation and power, takes precedence even when its content is unjust and fails to benefit the people, [1] unless the conflict between statute and justice reaches such an intolerable degree that the statute, as "flawed law," must yield to justice. It is impossible to draw a sharper line between cases of statutory lawlessness and statutes that are valid despite their flaws. One line of distinction, however, can be drawn with utmost clarity: [2] Where there is not even

Here we will point out the Scandinavian school, whose main thrust in reacting to legal positivism came from Alf Ross (see Chapter 16 in this tome); the rebirth of institutionalism, which came through the work done not only by Neil MacCormick but also by Ota Weinberger (see Sections 10.3.3 and 18.3.2 in Tome 1 of this volume) and Eerik Lagerspetz (see Section 24.3 in Tome 1 of this volume); the theory of legal argumentation, with Aulis Aarnio (see Section 25.5 in this tome) and Alexander Peczenik (see Section 25.6 in this tome and Section 21.4.2.2 in Tome 1 of this volume); the analysis of Kelsenian legal positivism by Kazimierz Opałek (see Section 16.3.1 in Tome 1 of this volume); and the work on legal reasoning done by Jerzy Wroblewsky (see Section 16.3.3 in Tome 1 of this volume).

[2] On Radbruch see also Sections 1.1.3.2 and 2.4.1 in this tome and Sections 1.8 and 10.2.2 in Tome 1 of this volume.

[3] On the standing of Radbruch's essay in that regard, see Paulson 2006, 17–8, speculating as well that the essay would actually rank at the very top in a study aimed at determining the most cited article in legal philosophy from the postwar period until today.

[4] On the rebirth of natural law theory in Germany and on Radbruch's role in that development, see Section 10.2.2 in Tome 1 of this volume.

[5] Saliger (2004, 69) points out the use of the formula by the Federal Court of Justice (*Bundesgerichtshof*) and the Federal Constitutional Court (*Bundesverfassungsgericht*) in Germany, while also highlighting the problems the formula can give rise to in criminal law.

an attempt at justice, where equality, the core of justice, is deliberately betrayed in the issuance of positive law, then the statute is not merely "flawed law," it lacks completely the very nature of law. For law, including positive law, cannot be otherwise defined than as a system and an institution whose very meaning is to serve justice. (Radbruch 2006b, 7)

As we can see, in the first part of the formula, Radbruch addresses the "question of legal validity, addressing 'flawed law' ('*unrichtiges Recht*') and calling for a judicial holding of invalidity" (Paulson 2006, 26), whereas in the second part the problem is that "of the very concept of law," and here the idea is put forward that if positive law should be completely devoid of justice (described as revolving around the core criterion of equality), it will not even qualify as law.[6] So Radbruch's formula can be analyzed as having two components: The first of these is the "*Unerträglichkeitsthese* ('intolerability thesis')" and the second the "*Verleugnungsthese* ('disavowal thesis')" (Saliger 2004, 68).[7]

Radbruch's thought and his formula, which as noted can be characterized as having had a major role in the rebirth of contemporary natural law theory, have been given different readings in the effort to apply them to certain branches of law (such as international criminal law) and to work out their implications for legal theory. From the first point of view, the formula has been widely used in national case law (especially in Germany) in addressing the question of fundamental rights,[8] whereas its use in international criminal law has met with some reluctance.[9] From the second point of view, Radbruch's analysis has given rise to two main questions: The first one (mainly historical) is whether, and if so how, he can be said to have forsaken legal positivism for natural law theory after World War II; the second is concerned with reconstructing and assessing his criticism of legal positivism and his use of the formula in grounding the thesis of an ontological connection between law and morals.

The thesis of Radbruch's "conversion" to natural law was advanced by H. L. A. Hart but has been denied by other scholars who point out the neo-Kantian foundation underlying Radbruch's theory from the start (the latter ar-

[6] Paulson (2006, 26) comments that in this latter case we would be looking at "a judicial holding of nullity."

[7] Saliger highlights that the first part of the formula in turn contains three theses: "First of all that the conflict of justice and legal certainty (*Rechtssicherheit*) could not be solved absolutely, thus allowing only a conditional priority. Secondly, that this conditional priority operates in favor of legal certainty; thirdly, that the primacy of legal certainty is revoked, when injustice becomes intolerable" (Saliger 2004, 68).

[8] As mentioned, the formula was directly invoked in Germany by the Federal Court of Justice and the Federal Constitutional Court (*BGHSt* 39, 1–1992; *BVerfGE* 95, 96–1996) in the so-called *Mauerschützen* cases, involving "border guards at the former border of the German Democratic Republic accused of shooting and killing East German refugees" (Saliger 2004, 69). On the *Mauerschützen* cases and the role that Radbruch's formula played in them, see Alexy 1993, R. Dreier 1995, A. Kaufmann 1995, Saliger 1995, H. Dreier 1997, Vassalli 2001.

[9] On the role that Radbruch's formula has had in international criminal law, see Bassiouni 2011, 72.

gument is set out in particular in Paulson 2006; cf. Klein 2007, 126ff.). In a well-known passage, Hart claimed that "Gustav Radbruch, had himself shared the 'positivist' doctrine until the Nazi tyranny, but he was converted by this experience and so his appeal to other men to discard the doctrine of the separation of law and morals has the special poignancy of a recantation" (Hart 1983b, 72). Working against that argument is the claim that "it is difficult to regard Radbruch as a straightforward legal positivist given the articulated position in his pre-war *Philosophy of Law* according to which 'justice' is an integral part of the 'idea of law'" (Mertens 2002, 187). It is difficult to settle on any definitive solution to this question. That is because Radbruch's theory offers elements supporting both sides in the debate. The theory contains in particular three main elements that support different interpretations of it depending on how they are weighed relative to one another. Radbruch draws on the value theory of the neo-Kantian Baden school so as to arrive at "the 'idea of law'" (Paulson, 2006, 31). This idea is built around a "triadic scheme" whose three components are "justice qua absolute value," "purposiveness (*Zweckmäßigkeit*)," and "legal certainty" (ibid.). As was just noted, these three elements can be balanced in different ways, and depending on the angle from which they are viewed, we will get a picture of Radbruch's pre-World War I thought as being either positivist or nonpositivist.[10]

In legal theory, Radbruch's conception touches two main issues: The first, concerning the relation between legal positivism and Nazism, is whether the positivist emphasis on obedience to the law favoured the advent of totalitarian regimes; the second, concerning the concept of law, is whether this concept can be defined independently of moral content. Radbruch takes a clear stand on both of these issues, arguing that the Nazi regime "contrived to bind its followers to itself," exploiting the "two maxims 'An order is an order' and 'a law is a law'" to enlist "soldiers and jurists respectively"; the latter of the two maxims, he argued, "knew no restriction whatever" and "expressed the positivistic legal thinking that, almost unchallenged, held sway over German jurists for

[10] In commenting Radbruch 1950, pars. 4, 7, 10, Paulson (2006, 29ff.) notes that these three elements making up the idea of law play different roles answering different needs: The element of justice as an "absolute value" is meant to capture the very essence of law; "purposiveness" answers the need to specify justice, offering a "standard of application for the principle of justice" as a basis on which to decide what is to be deemed equal or unequal (this element thus "reflects a political decision on ultimate values, on a *Weltanschauung*" and is thus "clearly and inevitably relativistic"); the element of "legal certainty" requires the judge to apply the law even if it should fail to conform to justice. As noted, different weighings of these three elements will lead to different interpretations of Radbruch's thought. The interpretation that makes him out to be a legal positivist keys in on the relativism emerging from the requisite of the purposiveness of law but lays even greater emphasis on the element of legal certainty, from which is extracted the requirement that the judge apply the law regardless of its justness. Radbruch (2006b, 6–7) invokes both of these elements in constructing the idea of law, and as indicated he points out that the main contrast is that between legal certainty and justice. On these aspects, see Leawoods 2000, 492ff.

many decades"; on the positivist approach, he claims, "'statutory lawlessness' was, accordingly, a contradiction in terms, just as 'supra-statutory law' was" (Radbruch 2006b, 1). In this sense, "Positivism, with its principle that 'a law is a law,' has in fact rendered the German legal profession defenceless against statutes that are arbitrary and criminal" (ibid, 6).

Similarly, in regard to the second question, Radbruch argues as follows:

> Positivism is, moreover, in and of itself wholly incapable of establishing the validity of statutes. It claims to have proved the validity of a statute simply by showing that the statute had sufficient power behind it to prevail. But while power may indeed serve as a basis for the "must" of compulsion, it never serves as a basis for the "ought" of obligation or for legal validity. Obligation and legal validity must be based, rather, on a value inherent in the statute. (Radbruch 2006b, 1)[11]

Radbruch thus held legal positivism in part responsible for the rise of the Nazi regime,[12] while also arguing that there is no way to establish the validity of law without invoking values (such as legal certainty and justice).

Radbruch's positions have found themselves at the centre of a wide and continuing debate. Specifically, the first question addressed in his theory (and the problem of obedience to unjust law) "was the focus of the 1958 controversy between H. L. A. Hart and Lon L. Fuller,"[13] while the intolerability thesis played an important role in the thesis of the connection between law and morals put forward by Alexy (1999a; 2002a; cf. Bix 2006).[14]

9.2. The Later Kelsen: From Transcendentalism to the "Sceptical Phase"[15]

The latter part of Kelsen's intellectual development—which can be said to stretch roughly from the second edition of his *Reine Rechtslehre* (Kelsen 2005)[16]

[11] Haldemann (2005, 163) comments that "this unequivocal statement was directed, in particular, at Kelsen's legal philosophy, one of the most influential theories of the 1920s." But it must be mentioned in this regard that if Radbruch was in fact taking aim at Kelsen here, he must have done so disregarding that Kelsen (a) has always recognized the constitution as a source of law superior to the statutes and (b) conceived the Austrian system of judicial review.

[12] Haldemann observes that this thesis "contains two elements—the 'causal thesis' (= the claim that the theory of legal positivism played a role in paving the way for the Nazi takeover) and the 'exoneration thesis' (= the claim that legal positivism, in virtue of ostensibly binding the judges in Nazi courts, might serve to exonerate them)" (Haldemann 2005, 163).

[13] On this debate, which takes its cue from the "grudge informer" case, see Paulson 1994 and Mertens 2002. According to Mertens (2003, 281), what compels Radbruch to reject legal positivism is his belief in "a difference between statute and law."

[14] In Alexy 2002a, 40ff., Radbruch's formula figures among the main normative arguments (next to the argument "from principles") for the view that law makes a claim to correctness and that this claim has a moral content. On Alexy, see Sections 10.3 and 25.4 in this tome, as well as Sections 10.3.2.2 and 10.4.3.1 in Tome 1 of this volume.

[15] This is a label suggested in Paulson 1998, XVII, XLIII.

[16] With the advent of Nazism and the passage of the anti-Semitic laws, Kelsen was removed from his post in Cologne and emigrated first to Switzerland and then, in 1940, after the outbreak

until his death in 1973—overlaps with the previous period at some places while going in new directions at others. In his later phase, "after a long period of work on the *Pure Theory of Law* […] Kelsen turned his attention to the theory of norms" (Paulson 1992, 266). This is a development that started out with his work on the applicability of logic to norms (Kelsen 1973a, 1973b, 1973c)[17] and came to a close with his *Allgemeine Theorie der Normen* (General theory of norms: Kelsen 1991).[18] In this process, Kelsen rethought some basic assumptions of his theory, so much so that the outcome has been described as a "dramatic change," for he abandons some core parts of that theory,[19] moving away from "logicism toward irrationalism,"[20] a view Beyleveld (1993) terms "normative irrationalism," and by changing the conception of the basic norm in his later writings, Kelsen dismantled the framework of his theory (Stewart 1990, 297).[21]

As Wiederin (2009, 352–6) suggests, just by looking at the *Allgemeine Theorie der Normen*,[22] we can identify three main innovations that Kelsen in-

of World War II, to the United States. After the first edition of the *Reine Rechtslehre* came out, in 1934, Kelsen continued to investigate the general theory of law. And after the 1920 work on sovereignty (Kelsen 1920), he returned to the question of international law, an area in which he advocates a legal pacifism, and in *Peace through Law* (Kelsen 1944) he calls for the foundation of both an international tribunal for deciding controversies among nations and an international criminal tribunal for individual war crimes.

[17] According to Wiederin (2009, 351), the Kelsen's second phase can be said to have begun in 1959 (after the second edition of the *Reine Rechtslehre*) with a March 6 letter he sent to the German legal logician Ulrich Klug asking for some clarifications on the applicability of logic to law.

[18] The book was posthumously published in 1979 in the German edition (edited by K. Ringhofer and R. Walter). Beyleveld comments that "the book reads like a set of preparatory notes under a number of headings: it is very much a 'work in progress' rather than a finished piece" (Beyleveld 1993, 104).

[19] See Paulson 1992, 273, 266, arguing that Kelsen's posthumous work "marks truly extraordinary changes in Kelsen's theory."

[20] Losano 1985, XVII, XXX, quoting Weinberger 1981.

[21] How much emphasis ought to be laid on the elements that introduce change in his theory depends in part on how one decides to interpret and periodize his oeuvre as a whole. On the question of periodizing his work, see Chapter 8 in this tome, footnote 17.

[22] Paulson singles out three main "units" of the *General Theory of Norms*: "First, there is a unit comprising the general part, as it were, of a theory of legal norms (chs. 1–27, and 59 at par. ii A). Kelsen gives a good bit of attention here […] to the act of will, to validity and efficacy, and to various interpretations of the distinction between 'is' and 'ought.' A second unit comprises related themes, with special attention to the distinction between legal norm and legal proposition or statement (chs. 28, 30–49, and 59 at par. i B–F). In addition, Kelsen […] examines rights, duties, and entitlements, the spheres of legal validity, the concept of sanction and the principle of retribution, positivity (*Positivität*), thinking *versus* willing, […] and the basic norm. Finally, bringing together from unit one the theory of the legal norm *qua* meaning of an act of will, and from unit two the detailed discussions of the distinction between legal norm and legal proposition, Kelsen in a third unit considers the role of logic in the law (chs. 29, 50–8, 59 at par. ii B, and 60–1). In this last unit, directed primarily to the question of the applicability of principles of logic to legal norms, Kelsen defends what has appeared to some writers in the field to be an utterly sceptical, even 'irrationalist' conclusion: logic has *no* application to legal norms" (Paulson 1992, 267).

troduced in his theory, and on this basis we can assess the changes made to the *reine Rechtslehre*. The first innovation lies in the "foundation" on which the opposition between *Sein* and *Sollen* is made to rest; the second lies in his conception of norms as a "given object of knowledge"; and the third lies in his attempt to work out a general theory of norms (a theory purporting to explain norms in general, and not just legal ones). Accordingly, the theory can be said to change under three main headings: the relation between norm and will ("the concept and function of norms" change); the basic norm and that the relation among norms; and the problem of the applicability of logic to law and to "conflicts among norms" (ibid., 356–60).[23]

The relation between *Sein* and *Sollen* came to be interpreted by Kelsen in light of the philosophy of language (Heidemann 1997, 163). At least until the first edition of the *Pure Theory of law*, of 1934 (see Chapter 8, Sections 8.2–8.4), the *Sein* and the *Sollen* were understood by him as transcendental categories, but subsequently he rested the distinction on a linguistic basis (Wiederin 2009, 352–3; Heidemann 1997, 163ff.). This linguistic account came at the end of a period in which he had been relativizing the same distinction in several respects. There is a deliberate way in which that can be said to have happened and a more contingent way. In the former sense, the relativization can be seen as bound up with a specific phase in Kelsen's thought, his realist phase;[24] in the latter sense, it can be seen simply as the outcome of his calling into question the transcendental basis of the distinction, a process as a result of which he wound up toning down the same distinction.[25] In the *General Theory of Norms* (Kelsen 1991, 58–61), the *Sein* and the *Sollen* are "no longer exclusively presented as basic primitive concepts" (Wiederin 2009, 353): They also figure as two linguistic "modes," or meanings. Which is to say that Kelsen embraces a "semantic conception" of them on which "statements" and "norms" are understood as "different senses or meanings" of a sentence (ibid., 353–4; Heidemann 1997, 164):[26] The *Sein* is expressed in "statements" that describe the

[23] Losano (1985, LVI ff.) singles out seven changes marking the transition from the early to the later Kelsen, who (*i*) "rejected Kant as the basis on which to interpret the underlying dichotomy of the pure theory of law, that between *Sein* and *Sollen*"; (*ii*) took "into account the empirical content of norms" in working out the relation among legal systems; (*iii*) embraced a voluntarist view and came to the conclusion that "the rules of logic do not also apply to the judge's activity"; (*iv*) came to think that legal thought "cannot be known simply on the basis of a logico-rational analysis"; (*v*) developed "a view of the basic norm as a fictitious norm"; (*vi*) highlighted the contradictions that emerge when the idea of the basic norm is applied to the system of moral norms; and (*vii*) took a nuanced approach in rejecting the applicability of logic to law (in fact there are places—such as Kelsen 1991, 264, 268ff., 271—where he seems to be holding the contrary view, namely, that logic does apply to law).

[24] Heidemann (1997, 103ff.) who distinguishes four phases in Kelsen's thought, identifies the third phase as *cognitive* realism.

[25] See Weiterin 2009, 353, commenting on Kelsen 1941 and 1973d.

[26] Heidemann (1997, 167) argues in this regard that the most likely interpretation of the later

way reality *is*, while the *Sollen* is expressed in norms that state the way reality *should* be. The sense or meaning of sentences can thus be either "descriptive" or "prescriptive," that is, it may be addressed at our "knowing" or at our "willing" (Kelsen 1991, 163–4). What in Kelsen's view makes a sentence descriptive or prescriptive does not depend on its content, which Kelsen accordingly characterizes as its "modally indifferent substrate" (ibid., 58). What makes a difference is instead the linguistic specification made by the *Sein* and the *Sollen*: These are markers of sense—making a sentence either prescriptive or descriptive—and they impart that sense as "distinct mental functions" (ibid., 164), thus "presupposing an intentional psychic act of one type or another" (Heidemann 1997, 167): In a declarative statement, this will be an "act of thought"; in a normative statement, it will be an "act of will" (Kelsen 1991, 164, 233).[27] There can be no declarations or norms without intentional acts that make them so. In other words, there can be "no norm without a norm-positing act of will" (ibid., 3).

From this perspective, a norm is qualified as an "ideal content of sense" (Heidemann 1997, 174; my translation), and in this way norms are put on the same footing as the "facts" referred to in declarations. Norms are thus understood as belonging in the "objectual" dimension (the world of the *Sollen*) and no longer as a creation of the method of knowledge: As Wiederin (2009, 355) has observed, "there is no specifically normative method but only assertions about normative entities, which assertions can be true or false." Two consequences flow from this conception, the first being that the *Sollen* winds up ontologically depending on there being an act of will (addressed at the behaviour of others), and so on a *Sein*,[28] and the other that a distinction needs to be drawn between norms and propositions about norms, that is, between the existence (i.e., validity) of norms and their scientific description, or the knowledge we can have of them (ibid.).[29] On this conception, a "legal norm emerges as the meaning of an act of will, and the validity of the legal norm is 'conditional upon the act of will of which it is the meaning'" (Paulson 1992, 266).[30] Finally, whereas Kelsen had so far been concerned with *distinguishing* legal norms from moral ones, now in the *General Theory of Norms* he was instead looking for the trait they have in common (Wiederin 2009, 356).

Kelsen is that the semantic account of norms prevailed over the pragmatic one. But Wiederin (2009, 353–4) finds that Kelsen's theory simply "lacks clarity" on this point and is thus amenable to different interpretations.

[27] Heidemann (1999, 162–3) points out that Kelsen (1991, 344 n.106) draws on Husserl's *Experience and Judgment* (Husserl 1973) in distinguishing different types of intentional psychical acts.

[28] In Bulygin 1998, 297ff., these awkward outcomes and shifting positions are set down to an unresolved tension between the two basic "ingredients" of Kelsen's pure theory of law: the "Kantian one" and the "positivist one".

[29] This is a distinction first introduced in the *General Theory of Law and State* (Kelsen 2006) and then fully exploited in *Pure Theory of Law* (Kelsen 2005). See Losano 1966, XLVI–XLVII.

[30] This can be an example of what Alchourrón and Bulygin (1981, 95ff.) call "the expressive conception of norms."

As noted, these innovations entail three important theoretical changes. In the first place, they change Kelsen's conception of norms, which are now understood as dependent on acts of will, and so (on an imperativist model) as commands. Whereas in previous works, especially the *General Theory of Law and State* (Kelsen 2006, but see also Kelsen 1960a), Kelsen "is engaged in a running battle with *fin de siècle* representatives of the volitional or 'will' theory," he now "joins forces with the very 'will' theorists" and abandons his previous positions (Paulson 1992, 266). Kelsen (1991, 3) adopts Dubislav's (1937) motto: "No imperative without an imperator, no command without a commander."[31] Accordingly, in the *General Theory of Norms*, the general form of norms—previously the form of the hypothetical judgment—becomes that of the command or imperative (Kelsen 1991, 2, 32, 96ff.). This general command-form is understood to describe legal and moral norms alike (Wiederin 2009, 358), despite the fact that the latter not carry any penalty for noncompliance (Kelsen 1991, 97–8).[32]

In the second place, Kelsen's new conception affects his construction of the legal system. The most conspicuous change concerns the *Grundnorm*, which is now qualified as a "fiction" (Kelsen 1991, 255–6): "After years of referring to the basic norm as a *hypothesis*, Kelsen changed his mind in the beginning of the 1960s, suggesting instead that we think of it as a *fiction*" (Spaak 2005, 405). The basic norm, as we saw in Section 8.4 of this tome, was initially conceived as the ultimate condition on which depended the system's validity and the "objective" existence of norms: In that role it was considered "the meaning of an act of thinking," but now it is conceived in light of the relation between norms and act of will (ibid.). On this basis, Kelsen "explains that presupposing the basic norm involves presupposing an imaginary authority, over and above the 'fathers' of the historically first constitution, whose act of will has the basic norm as its meaning." But this all "means that the notion of the basic norm *contains a contradiction within itself*, as it involves presupposing the existence of an authority that *could not possibly exist*" (ibid.).[33] The basic norm thus becomes a simple fiction in the sense of the As-If (*Als-Ob*) of Vaihinger's (1935) philosophy; that is, it becomes "an *aid to thought* (*ein Denkbehelf*) to be used when one cannot reach one's aim of thought (*Denkzweck*) with the materi-

[31] This motto is set by Kelsen (1991, 29) next to the converse one, namely, "'no imperative without an *imperatus*,' i.e., a person (or persons) to whom the imperative is addressed."

[32] Kelsen (1991, 96ff.) does, however, distinguish four "functions of norms: commanding, permitting, empowering, derogating."

[33] Writes Kelsen: "For the assumption of a Basic Norm—for instance, the Basic Norm of a religious moral order 'Everyone is to obey God's commands,' or the Basic Norm of a legal order 'Everyone is to behave as the historically first constitution specifies'—not only contradicts reality, since there exists no such norm as the meaning of an actual act of will, but is also self-contradictory, since it represents the empowering of an ultimate moral or legal authority and so emanates from an authority—admittedly, a fictitious authority—even higher than this one" (Kelsen 1991, 256).

als available" (Spaak 2005, 405–6): The basic norm is in this sense a fiction aimed at founding the normativity of the legal system.[34] This conception not only gives rise to the problem of how norms can be derived from one another and how conflicts among norms can be solved, but also brings up the broader question of whether Kelsen's overall vision holds up. In this shift, in other words, Kelsen seems to be driving the logic of positivism to such an extreme as to enact its "swan song."[35]

And finally, in the third place, we have what is perhaps the most recognizable aspect of Kelsen's later thought, namely, his thesis that logic does not apply to law, and in particular that it cannot be applied in working out the problem of conflict among norms. This thesis, too, stands in contrast to Kelsen's earlier positions (Wiederin 2009, 356–7). In fact it represents a "sharp break" with his previous thinking on this question, for it says that "there can be no recourse to the principle of noncontradiction in law" (Losano 1985, XXX; my translation). Starting from *Derogation* (Kelsen 1973e), Kelsen denies that this principle "can be applied even indirectly by way of propositions that *describe* norms in conflict" (Losano 1985, XXV; my translation), and he instead points to another principle, that of the *lex posterior* (subsequent law, whether statutory or constructed), a principle whose application is entrusted to the judge's decision. In *Law and Logic* (Kelsen 1973a) he goes even further, arguing that the logic one cannot apply to law includes not only the principle of noncontradiction but also "the rules of inference" (Losano 1985, XXX; my translation). The argument boils down to the claim that while the rules of inference apply to propositions, including propositions about norms, they cannot apply to norms themselves, because (as we saw) these are essentially acts of will (in the later Kelsen), and as such they can neither be true nor false: Unlike the theoretical syllogism, the "normative one" therefore "rests on an act of will" (ibid., XXXI; my translation).[36] The very possibility of a specifically legal logic tied to the use of analogy or of the argument a fortiori is denied by Kelsen insofar as this is an act of will of the judge and not of a "logical deduction" (ibid., XXXI; my translation).

[34] Writes Kelsen (ibid.) in this regard: "The cognitive goal of the Basic Norm is to ground the validity of the norms forming a positive moral or legal order, that is, to interpret the subjective meaning of the norm-positing acts as their objective meaning (i.e., as valid norms) and to interpret the relevant acts as norm-positing acts. This goal can be attained only by means of a fiction. It should be noted that the Basic Norm is not a hypothesis in the sense of Vaihinger's philosophy of As-If—as I myself have sometimes characterized it—but a fiction. A fiction differs from a hypothesis in that it is accompanied—or ought to be accompanied—by the awareness that reality does not agree with it."

[35] But see Spaak (2005, 406), noting that for many commentators, such as Tur (1986) and Walter (1990), "the change [in Kelsen's understanding of the basic norm] is of little consequence."

[36] On these aspects, see the discussion that Kelsen (1973a, 229ff.; 1991, 194ff.) devotes to Jörgensen's dilemma (Jörgensen 1937–1938), denying that this dilemma can be solved. On Jörgensen's dilemma, see Section 26.4 in this tome.

The last phase in Kelsen's thought has given rise to many questions and has prompted many in-depth analyses (Wiederin 2009, 360–3). The main question, however, remains that of who the "real Kelsen" is (Losano 1985, LVI): the neo-Kantian, anti-voluntarist one or the voluntarist one that comes through in his later works.

9.3. The Italian Contribution: Legal Positivism Analyzed

As a country torn between a strong Catholic and natural-law tradition, on the one hand, and an Enlightenment and legal positivist tradition, on the other, Italy too became a stage where the legal-philosophical discussion thrust into the foreground the question of the relation between law and morals. The position developed by natural-law theory in Italy is covered as usual in the dedicated section; so in this section we will be considering the legal positivist position, which was closely associated with the Italian school of analytic legal theory—a systematic engraftment of Kelsen's *reine Rechtslehre* onto English analytic philosophy.[37] The leading figures of the Italian school, which influenced the discussion in the other "Latin" countries, were its founders, namely, Norberto Bobbio and Uberto Scarpelli. But as we will see shortly, a thriving legal-realist current flourished in their wake.

9.3.1. Bobbio and Methodological Legal Positivism

The work of Norberto Bobbio (1909–2004) exemplifies the increasing receptiveness of Italian culture to Anglo-American influences, after centuries of French and German hegemony.[38] Bobbio, a legal theorist with a background in phenomenology, was among the first scholars to apply philosophical analysis to law. In the seminal essay Bobbio 1950, he went back to a typical Continental question, much debated in Germany and also in Italy in the 1930s—the question of the scientificity of legal dogmatics—but this was only the start of his investigation of legal science (cf. Bobbio 1967). More importantly, maybe, this essay was considered the founding act of the Italian school of analytical legal theory.

The courses Bobbio taught at university in the 1950s, on the other hand, were devoted to the two most investigated topics in the legal positivist tradition, theory of norms and legal system (see Bobbio 1993). He reframed in strictly linguistic terms the Kelsenian theory of norms, by redefining *norm* (not as ideal entities, but) as prescriptions, that is, sentences used for prescribing. Bobbio also expanded Kelsen's theory of the legal system in two directions: On the one hand, he adopted Romano's institutionalist theory of the plurality

[37] For a selection of texts representing the Italian analytic school, see at least the two collections Jori and Pintore 1997 (in English), and Comanducci 2004 (in Castilian).

[38] On Bobbio, see also Section 11.4 in Tome 1 of this volume.

of legal orders (see Section 8.7 in this tome and Section 11.4 in Tome 1 of this volume), and on the other he recast Kelsen's normativism by bringing to bear Hart's concept of power-conferring rules.

But perhaps the main contribution Bobbio made to the (meta-)theory of law, before giving up it and taking up political philosophy, regards legal positivism. He distinguished three meanings of the expression *legal positivism*, in order to point out a still defensible form of legal positivism. Hart (1973) had already listed a number of meanings, and Ross (1961) similarly distinguished positivism from quasi-positivism, ascribing the latter stance to Kelsen. In the same period, Bobbio 1996 and 1965a introduced a distinction among legal positivism as a method, as a theory, and as an ideology—three meanings understood as logically distinct, without the first entailing the second or the third, but with the third presupposing the second and the second the first (Bobbio 1996, 246–7).

By *legal positivism as a method*—or *methodological* legal positivism—Bobbio meant a *scientific*, or value-neutral, approach to the study of law. This definition draws no distinction between legal theory, on the one hand, and legal dogmatics, on the other, both of them encompassed within the broad term *study*: an otherwise usual conflation in common-law culture, and maybe in Hart's Separability thesis itself. For several decades Hart's view was that law must to be known from an internal or hermeneutical point of view, but he lastly characterized his own jurisprudence as descriptive (Hart 1994b), reiterating Bobbio's methodological positivsm thirty years later.

By *legal positivism as a theory*—or *theoretical* legal positivism—Bobbio meant the views historically upheld by the 19th-century legal authors commonly ascribed to technical or theoretical legal positivism. These authors adopted a conception of law emphasizing 1) its factual, positive nature; 2) the direction of conduct by way of imperatives; 3) the sanctioned character of them; 4) production of them by the state; 5) deductive application by the judges; 6) unity, consistency and completess of legal normative systems; 7) the autonomy and scientific charachter of legal dogmatics. These are the same theses the antiformalist movements of the late 1800s and early 1900s attacked as formalist. To be sure, Bobbio himself regarded many of these theses as no longer viable, but this should not be taken to mean that *methodological* positivism had been surpassed.[39]

By *legal positivism as an ideology*—or *ideological* legal positivism—Bobbio meant the assumption, common until Auschwitz, that citizens and judges respectively have an obligation to obey the law and to apply it. He distinguished

[39] This last point, about the logical interrelation between theoretical and methodological positivism, is one that has not always been appreciated by later scholars, especially among nonpositivists and neoconstitutionalists. But that does not make the interrelation any less important: Theoretical legal positivism maybe *presupposes* but of course does not *imply* methodological positivism, whose effort to know the law can result in better theses than those of 19th century legal positivism.

a strong version of that thesis, ethical legalism, and a weak one, legalism without further qualification. Ethical legalism is the view, found in Thomas Hobbes as well as in Hegel, that positive law is *by definition* right, and that it must therefore always be obeyed. Contrary to Bobbio's apparent view, however, the late version of this third thesis does not *presuppose* the first one—i.e., methodological positivism and the Separability thesis—but rather seems to *contradict* it, by setting up a necessary connection between law and a morals that align themselves with law, rather than the other way around.

Legalism without qualification, for its part, states that law must be obeyed so long as it at least ensures social order. This weak version of ideological legal positivism was judged by Bobbio to be compatible with the rule of law and the *Rechtsstaat*, these being ideals he consistently defended, whereas the strong version became simply unpresentable after Auschwitz (Bobbio 1965a, 114–7; cf. Section 9.3.2 below). Here, too, Bobbio seems to have moved independently of Hart but in parallel to him, at least as far as concerns reinterpretation of legal positivism in Hart 1994b. Both authors, in other words, recognized that the attacks directed at legal positivism in the 20th century, especially after World War II, were clearly on the mark—but while various theses of *theoretical* legal positivism and the strong version of *ideological* legal positivism were thus undermined, no damage was done to *methodological* legal positivism, which in Hart's and Bobbio's assessment alike could still be defended as such.

9.3.2. Scarpelli and Ideological Positivism

Uberto Scarpelli (1924–1993), Bobbio's pupil and friend, in much the same way can be reckoned among those who pioneered the linguistic analysis of law, not just in Italy.[40] He always paid much closer attention than his friend to the specifically English sources of philosophical analysis, and in particular to the contemporary analysis of ordinary language, following the lead of Hart and Richard M. Hare (see Scarpelli 1959). With this philosophical background, Scarpelli developed an important account of normative language, thereafter extending his analysis to metaethics and normative ethics, too, taking part in the promotion of a laic bioethics. In the tradition of theoretical legal positivism, though, Scarpelli occupied himself in the first place with the theory of norms and legal system.

As to the theory of norms, Scarpelli picked up where his friend had left off: Bobbio had recast Kelsen's normativism in strictly linguistic terms, and Scarpelli integrated the outcome into a more general theory of normative language, as well as into an account of legal method. Among the most original theses to come out of this research is that the sentences formulated by legal dogmatics in order to construe the legislator's precepts are no more than *reiterated* pre-

[40] On Scarpelli see also Section 11.5 in Tome 1 of this volume.

cepts. The theory of the legal system, for its part, did not occupy Scarpelli as much as the theory of norms, for his interest in the legal system lay in its highest reaches, where law meets morals and politics.

Indeed, Scarpelli's most important contribution perhaps consisted in reviving ideological legal positivism. A weak version of it had already been defended by Bobbio, to be sure, but Scarpelli prefigured its present avatars, such as ethical legal positivism (Campbell 1996, Waldron 2001). His essential work in this regard (Scarpelli 1965) enters on the moral and political presuppositions of methodological legal positivism itself: an approach that Bobbio had only thematized (Jori 1997). Scarpelli argued that a decision to adopt the legal positivist method—a method purporting to be scientific and value-neutral—is in fact dependent on the prior political and evaluative choice consisting in accepting some positive system of law. More to the point, methodological legal positivism presupposes an ideological choice in favour of the positive law typical of the modern state.

This vindication of a weak ideological positivism yielded a unitary, explicative, and critical definition of *legal positivism* itself (Scarpelli 1965, chaps. 11, 12). Such a locution had been analyzed by previous scholars in terms of a set of scarcely related theses; Scarpelli shaped up legal positivism as that moral conception of law whereby law should be divorced from morals and be known in a nonevaluative way. In Scarpelli, then, legal positivism is concerned at its core with the relationship between law and morals and with legality understood as the fundamental value of law. Those who read Scarpelli in the 1960s, however, were not especially struck by the way he openly acknowledged the political character of law.

It is often remarked (Pattaro 1976, Jori 1987) that the effect of the criticism Scarpelli levied at methodological legal positivism was to precipitate the crisis of Italian analytical school, which split into Scarpelli's ideological positivism and methodological legal positivism advocated by a new and vivacious legal-realist movement (the subject of the next section). But Scarpelli's criticism did no more than register the double-faced vocation of the Italian school: On the one hand, a genuine cognitive concern with *knowledge* of law, working in favour of *Wertfrei* study of law and drawing Bobbio himself towards a sort of sociology of law; and on the other hand a *normative* calling, favouring a critical legal positivism more likely to develop itself into ethical positivism or neoconstitutionalism.

The affinity to ethical legal positivism can be found in Scarpelli's most direct pupil, Mario Jori (1946–), who configured legal positivism as a theory of law having two mutually conditioning aspects, a political and a scientific one. The political aspect lies in the conception's choice in favour of positive law (whether at large or with reference to a specific system of law), understood as a set of norms designed to introduce order into human conduct. The scientific aspect lies in the theory's acknowledgment that a positive law likely to achieve

its end must be al least *knowable*, even if only from an internal point of view, à la Hart, and only once the law has gained political acceptance, à la Scarpelli (cf. Jori 1992). On the affinity that weak ideological legal positivism has to neoconstitutionalism we must instead refer to an indirect pupil of Scarpelli, Luigi Ferrajoli (see Section 10.5 in this tome).

9.3.3. Italian Legal Realism

There developed within the Italian analytical school of law a line of inquiry that drew on the legacy of legal realism, this with an emphasis on American legal realism in the work of Giovanni Tarello (1934–1987), the founder of the Genoa School, and on Scandinavian legal realism in that of Enrico Pattaro (1941–).[41] Tarello worked out a theory of norms based on Ross's distinction between legal sentences or provisions, produced by legislators, and legal meanings or norms, produced by judicial interpretation and even by legal dogmatics (Tarello 1974a). From this Continental legal-realist perspective, Tarello worked out a theory of interpretation comparable to that which Hart calls interpretive scepticism, but of course more centered on statutory interpretation (Tarello 1980).

Tarello argued that every legal sentence or provision can always be given more than one meaning: more than one norm can be ascribed to it. Stated otherwise, the legal positivist or formalist doctrine of the sources of law which became dominant with the codification of law conceals a gradual shift in the power to produce the law from the legislators to the judges and even to legal scholars. This view could be viewed as more sceptical than all common law accounts of adjudication, and closer to the American legal realists, who were sceptical not about facts—those on which basis judicial decisions can be predicted—but about norms. On this radical sceptical reading, comparable only to the famous dictum by John Gray, legislators actually exhaust their function in the *writing* of laws, since the *meaning* of their statutes is then entrusted to the interpreters' creative work.

It fell to Riccardo Guastini (1946–) to reformulate the Genoa School's theory of interpretation providing a more moderate reading of Tarello's views. To this end he drew on Kelsen's *Rahmenslehre*, under which legislators produce texts not devoid meaning but having a frame of meanings within which the interpreter would normally choose: Only where this choice is made outside the frame is there any creation of law. Guastini then developed an influential account of constitutionalization processes, through which the entire legal system comes to be impregnated with constitutional principles. This account, however, is consistently realist and *Wertfrei*—very much unlike the neoconstitutionalist ones. Legal principles, for example, are understood by Guastini as positive legal norms, and not at all as moral values.

[41] On Italian legal realism see also Section 11.6 in Tome 1 of this volume.

The other major author who can be ascribed to Italian legal realism is Enrico Pattaro, whose work develops in three phases. In the first, in the wake of Scandinavian legal realism, he takes especially into account Ross's criticism of Kelsen's quasi-positivism; in the second phase, he went back to Hart, comparing him to Ross, and putting forward a theory of law he called normativist legal realism; in the third phase, he proposed a theory of law where the basic contraposition is no longer between *Sein* and *Sollen*, as in Kelsen, but between "the reality that is" and "the reality that ought to be" (Pattaro 2005). Terms like *reality* and *realism* recur in all three phases: This element of continuity in Pattaro's work may amount to a sort of naturalization of law in the sense explained in Leiter 2007.

9.4. The French Contribution: Michel Troper

In France, as in Germany, the philosophy and theory of law have rarely been taught as subjects in their own right but have instead developed as part of either a philosophical or a juristic study—for important examples of the second type of study, see Carré de Malberg's and Maurice Hauriou's contributions.[42] Oftentimes law would thus be studied by philosophers or historians of natural law, as in the case of Michel Villey (1914–1988) and Georges (Jerzy) Kalinowski (1916–2000).[43] By contrast, the principal French contribution to the strictly legal discussion in the legal positivist camp has come from a theorist of constitutional law whose work places him close to Italian legal realism, namely, Michel Troper (1938–), a pupil of Charles Eisenmann (1903–1980), a constitutional scholar and Kelsen's French translator.[44]

Troper's theoretical work, especially early on, bespeaks the influence of Bobbio and Kelsen: Where the theory of norms is concerned, we find Kelsen's normativism recast in linguistic terms; and as to the theory of the legal system, Kelsen's nomodynamic analysis of law is revisited underscoring the role of the judge's discretion. Given these premises, it only seems natural for Troper's work to have segued into the theory of legal and in particular *constitutional* interpretation, with his sceptical theory specifically accounting for France's highest judicial organs. The *Conseil d'État*, the *Cour de Cassation*, and the *Conseil Constitutionnel* do not just create law, as do all judges: They often also forge anew their own constitutional competence, sometimes even venturing into that territory which Maurice Hauriou had previously described as the supralegal part of the constitution.

[42] On Carré de Malberg see Section 8.5 in this tome and Section 12.4 in Tome 1 of this volume. On Hauriou see Section 1.1.4.2 in this tome and Section 12.2 in Tome 1 of this volume.

[43] On Villey see Section 1.3.3.4 in this tome and Section 12.6 in Tome 1 of this volume. On Kalinowski see Section 1.3.2 in this tome

[44] On Troper see also Section 12.7 in Tome 1 of this volume.

Troper's theory of legal interpretation, close to that of Tarello (see Section 9.3.3 above), appears sufficiently radical to give place to a deliberate paradox: Why should judges hold themselves bound to a competence they can stretch out into any direction? And why should they apply laws they could rid themselves of? Troper tackles this paradox in his recent theory of legal constraints, preventing judges and officials from just acting as they will (Troper et al., 2005). It is likely that he is thinking here about something analogous to the 18th-century conception of the constitution as a machinery, which he contrasts with the 20th-century conception of the constitution as a norm (Troper 2001): Legal constraints are conceived by him as factual constraints, a product of institutional engineering or of the mechanics of the situation.

9.5. The Argentinian and Spanish Contribution

Analytic philosophy of law in the Castilian-speaking world saw an extraordinary development whose groundwork was laid in Buenos Aires, the cultural capital of Latin America. Buenos Aires School was, along with Italian one, among the first in the world to apply philosophical analysis to law. In the late 1950s, when Ambrosio Gioja (1912–1971) was directing the Buenos Aires University Institute of Legal Philosophy, there gathered around him a group of scholars—among whom Genaro R. Carrió (1922–1997), Roberto Vernengo (1926–), Carlos Alchourrón (1931–1996), and Eugenio Bulygin (1931–)—who formed the core of the School's first generation. This group built fruitful relationships with Hart from the outset, with Carrió translating his chief work into Castilian.[45]

It is in particular Hart's "mixed" theory of interpretation that they adopted. Carrió (1965) investigated the question of judicial creation of law, supporting Hart's thesis that judges make law only when working in its penumbral or borderline areas or filling its gaps. Bulygin (1991) analogously showed how judges do not make law by *applying* it, that is, by rendering concrete decisions, but by *interpreting* it, that is, by formulating the very general and abstract rules from which to deduce the decisions they render. In another important work, Carrió (1970) suggested the argumentative line that Hart and his pupils would follow in countering Dworkin's argument from principles: Principles do differ in several respects from rules, but that does not make them alien to a legal positivist rule of recognition.

The most widely known Argentinian contributions, however, come from Alchourrón and Bulygin, concerning, as usual in legal positivist camp, theory of norms and of legal system. Alchourrón and Bulygin distinguished two conceptions of norms: a *hyletic* or semantic one, having greater currency among

[45] On Argentinian analytical philosophy of law see also Section 26.2.1.3 in Tome 1 of this volume.

deontic logicians, where norms are understood as normative meanings analogous to the propositions expressed by cognitive sentences but devoid of truth value; and an *expressive* or pragmatic one, more common instead among realist theorists of law, where norms are merely understood as normative uses of sentences. On both conceptions norms have no truth value, either because they are not propositions or because they are fact-like entities, which do not enter into any logical relations; on either conception, then, deontic logic—the logic of norms—could at best be a logic of normative propositions (i.e., propositions about norms: Alchourrón and Bulygin 1981).

But the two Argentinian theorists' best-known and most influential work is concerned with the legal system: It came out in 1971 under the title *Normative Systems* (Alchourrón and Bulygin 1971), followed in 1975 by a second and revised edition in Spanish (Alchourrón and Bulygin 1975). The theory of the legal system had hitherto evolved from a static or logico-deductive conception to a dynamic one where higher and lower norms bear no connection outside the organ empowered by the former to produce the latter: a view paradigmatically endorsed by the last Kelsen, who denied the possibility of any deduction between norms. Alchourrón and Bulygin, applying Alfred Tarski's conception of logic, instead conceived the legal system as the set of deductive consequences arrived at by reasoning from an axiomatic base composed of any set of positive norms—a set that only in principle can comprise all the norms making up a domestic legal system.

In this way, the term *system* winds up designating the result of choosing an axiomatic base, deducing logical consequences from it, and ordering these consequences—all activities characteristic of legal dogmatics, typically in the civil-law world. But Alchourrón and Bulygin also account for the *dynamic* dimension of law. They did so in two ways: implicitly, by construing each legal system as merely momentary, i.e., identified by the norms that at any given moment happen to make up its axiomatic base; and explicitly, by using the locution *legal order* to designate a legal system that changes over time (Alchourrón and Bulygin 1991a). We cannot devote any more of this chapter to this theory of the legal system.[46] Its authors' clear choice in favour of legal positivism would be made fully explicit in Bulygin's later work (see Section 11.1 in this tome).

Another Argentinian scholar who worked on the theory of the legal system, helping to make the theory known in the civil-law world, is Ricardo Caracciolo of Córdoba. In his most unitary work (Caracciolo 1988), he examines the possible combinations between static and dynamic criteria, opting for a mixed, static/dynamic model. The bulk of his essays is instead devoted to the theory of norms and to metaethics. Thus, in Caracciolo 2009, 241–49, he argues, con-

[46] Also deserving mention among those works in Castilian which develop a theory of the legal system along the same lines are Moreso and Navarro 1993, Rodríguez 2002 (the last of which is briefly discussed here in Section 11.4 of this tome).

trary to a widely held opinion, that legal positivism is not incompatible with moral realism, despite the fact that the former is a theory he subscribes to and the latter a metaethics he rejects.

Alchourrón, Bulygin, Caracciolo, and a number of other Argentinian authors taught courses in Spain, especially at the Pompeu Fabra University, and in this way—also thanks to Atienza 1984, originally written as a doctoral dissertation devoted to the Argentinian school—they helped to bring up a generation of analytic and legal positivist theorists who emerged after the fall of the Franco regime (1939–1975). The fathers of the new Spanish philosophy of law, however, have not concerned themselves with theory of law[47]: Elías Diaz (1934–) worked on the ways law, politics, and culture are interrelated; Gregorio Peces-Barba (1938–2012) focused on the question theoretical and historical of rights (Peces-Barba et al. 1995, from a critical legal positivist standpoint (Peces-Barba 1999).[48]

A classical legal positivist stance can instead be found in the work of Francisco Laporta (1945–). As in natural-law theory, the relation between law and morals "is where the philosophy of law *lies*": But natural law's "attempt to comprehend law morally is welded with the necessity of accepting an incomprehensible morality" (Laporta 1993, 7, 121; my translation). As early as the 1990s, Laporta was indeed taking issue with the precursors of neoconstitutionalism—scholars like Ernesto Garzón Valdés and Carlos Santiago Nino—for what he perceived as an effort on their part to bring back natural-law theory; then, too, in a specific move against neoconstitutionalism itself, Laporta (2007) makes it apparent that he considers legislation, more than the constitution, the best tool for *directly* guaranteeing the certainty of law, and so also, *indirectly*, for guaranteeing the citizens' personal autonomy.

A significantly different set of conclusions can be found in the work of Manuel Atienza (1951–) and Juan Ruiz Manero (1951–), the editors of *Doxa*, the most important legal-philosophy journal in Castilian. They are developing a general theory of law, the first part of which, on the theory of norms, is set out in Atienza and Ruiz Manero 1996.[49] Like Dworkin and Alexy, Atienza and Ruiz Manero distinguish between rules and principles, conceiving them as conditional norms connecting conditions of application (if *x* happens) to acts to be carried out (then do *y*). On this conception, rules and principles are distinguished depending on whether *x* and *y* are configured as having a

[47] An exception must be made in this regard for Capella: His 1968 work draws on a Marxist foundation, to be sure, but from the very outset—in its title, namely, in translation, *Law as Language: A Logical Analysis*—it proposes to analyze legal language.

[48] On Diaz, Peces-Barba, and more generally the development of Spanish legal philosophy see also Chapter 13 in Tome 1 of this volume.

[49] The 1996 edition is in Spanish, followed by a second one in 1998 in English. On the differences between the two editions, see Moreso 1997b, which is also a good place to start for a deep discussion of the work.

closed form—"If larceny, then imprisonment," in which case we are looking at a *rule*—or as having an open form, as in "Whatever else may be the case, do protect human dignity": Here we instead have a *principle*, in a broad sense.

Atienza and Ruiz Manero, however, criticize Alexy's conception of principles as optimization commands (i.e., commands which can only be carried out to a greater or lesser extent), for that is to confound principles, in a strict sense, and policies. Policies configure in an open form both their conditions of application and the prescribed behaviour (a case in point being consumer protection). Principles likewise configure their conditions of application in an open form, but they configure the behaviour they prescribe, as the discrimination on basis of sex, race, religion, and suchlike, in closed form (Atienza and Ruiz Manero 1996, chap. 1).

The point of these and other like distinctions (drawn with respect to other types of norms, too, as well as with respect to values) is to render more rigorous the theses of authors like Dworkin and Alexy—an effort that takes Atienza and Ruiz Manero closer to neoconstitutionalism. And the same goes for their more recent positions on the question of law and morals: The Separability thesis is cast into doubt on the basis of an assumption that can also be found in the neoconstitutionalists, namely, that constitutionalized law can no longer be separated from morality (Atienza 2001, chap. 4; Aguiló Regla et al. 2007). Today, Atienza and Ruiz Manero (2006), as well as many other Spanish authors, seem to consider legal positivism not so much *confuted* by neoconstitutionalism as *incorporated* and *overcome* by it—or by a postpositivist (see Chapter 11 in this tome) or pragmatist version of it, focused on legal argumentation (Atienza 2013).

Chapter 10

NEOCONSTITUTIONALIST CHALLENGES TO LEGAL POSITIVISM

by Mauro Barberis and Giorgio Bongiovanni[*]

Neoconstitutionalism is a new name, proposed by scholars of the Genoa School in order to criticize the theses so labelled: But a name after accepted by many "Latin" scholars in order to label their theories. *Neoconstitutionalism* has so far entered the mainstream of academia only in certain quarters of "Latin" theory of law, in Latino-America, Spain, and Italy:[1] It designates a family of cognitive and normative theses labelled by its supporters as nonpositivism or constitutionalism without further qualification. Neoconstitutionalism, however, first emerged in the English-language debate—more evidence still of the pivotal role this debate has played at least since Hart. Dworkin, in particular, views law and morals as connected by way of constitutional rights and principles (Dworkin 1977, 1986, 2006). In fact, the two main ingredients of the Continental constitutional state, namely, rigid constitutions and judicial review, appeared in the US before being imported to Latin America and Europe.

In fact, the view that law and morals are connected by way of principles, generalized by Dworkin into a normative theory of law as integrity or interpretation, became a direct inspiration for the first analytical Argentinian critics of legal positivism, Ernesto Garzón Valdés and Nino, who likewise proceeded from a reading of Hart, first recasting and then rejecting his Separability thesis. Then, too, the same view, along with John Rawls's theory of justice, also directly inspired Jürgen Habermas, Robert Alexy, and the Continental theorists of constitutional state's law: a law distinguished by them from legislative state's law, the former being increasingly *constitutionalized*, i.e., imbued with constitutional principles, conceived by the neoconstitutionalists as moral principles.[2]

[*] Sections 10.1, 10.2, 10.5, and 10.6 were written by Mauro Barberis; Sections 10.3 and 10.4 were written by Giorgio Bongiovanni.

[1] It would take a chapter apart to illustrate this assertion. The main sources in this regard are Pozzolo 2001, Comanducci 2002, Mazzarese 2002, Carbonell 2003, Bongiovanni 2005, Barberis 2006, García Figueroa 2006, and Barberis 2008. Authors like Prieto Sanchís (1999) et many other Spanish legal philosophers, Bongiovanni (2005), and Zagrebelsky (2008) prefer the term *constitutionalism*, but that strikes us as too generic a name for such a specific stance.

[2] What is meant by *constitutionalization*, as defined by Guastini (2006, 239–67), is not constitutional codification but a process whereby constitutional principles, via constitutional and statutory interpretation, among other means, are absorbed into the entire legal system—a process that can be observed in many European countries in the latter half of the 20th century, transforming them from legislative to constitutional states. For Guastini, the process can involve at least seven stages, the first two being the most important: (1) a rigid constitution; (2) a constitutional review

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_38

Civil-law neoconstitutionalism, however, cannot be reduced to an extension of Dworkin's constitutionalism: Its originary point was to know the law as it is in the constitutional state, an effort *in se* compatible with methodological legal positivism. According to the Separability thesis, on the other hand, to know the law as it is means to know it independently of how we should *want* it to be: But Continental neoconstitutionalism has gone so far as to upend that thesis, blurring the distinction between the law as it is and the law as it ought to be. It may be useful, in illustrating how that has come about, to distinguish three senses of neoconstitutionalism in parallel to the three senses of legal positivism distinguished by Bobbio (Comanducci 2004).

Theoretical neoconstitutionalism is a mere extension of theoretical legal positivism: Just as theoretical legal positivism was a set of theories about the law of the legislative state, so theoretical neoconstitutionalism is a set of theories about the law of the constitutional state. Hence, the only relevant difference here would lie in the different types of positive law the two sets of theories take as an object: a merely legislative law and a constitutionalized one, respectively. Which means that not only could there be there no contrast between the two theories, given their different objects, but the more recent theoretical neoconstitutionalism could be characterized as no more than a legal positivism for the 21st century.

Methodological neoconstitutionalism instead ends up adopting a different method from methodological positivism. Present-day positive law, the neoconstitutionalists argue, incorporates moral values in the form of constitutional principles, and our knowledge of positive law should accordingly be different, for it can no longer be nonevaluative. We will have to evaluate in our legal-dogmatic knowledge of particular domestic systems of constitutionalized law, for it won't be possible to interpret such law without relying on constitutional principles, and hence on moral values. But we will equally have to evaluate in framing a *general* theory applicable to constitutionalized systems at large, for such a theory will no longer be able to abstract from the moral ends by which such systems are guided.

Lastly, *ideological* neoconstitutionalism corresponds to ideological positivism in the sense, among others, that it seems to entail an upending of methodological positivism, the approach which called for an investigation of law as it is, rather than as it ought to be, and which formed the basis presupposed by theoretical legal positivism. Just as ideological legal positivism accepted the law of legislative state, so ideological neoconstitutionalism accepts the law of constitutional state—a seemingly more plausible stance, with reference to

of legislation; (3) the legal binding force of the constitution; (4) the constitutional text becoming the main object of interpretive battles; (5) constitutional principles directly applied by judges without waiting for their specification by ordinary legislation (*Drittwirkung*); (6) an interpretation of ordinary legislation conforming its meaning to that of the constitution (*Verfassungskonforme Auslegung*); and (7) the constitution exerting a real influence on supreme political powers.

moral values such as human rights. This position, however, may still seem actually plausible for Western constitutional states, but not for any formally constitutional states—that Nazi "values" become written principles enshrined in a rigid constitution is a real possibility, after all.[3]

Be that as it may, this shift from theoretical to methodological and ideological theses has caused neoconstitutionalism to increasingly become a view distinct from, and alternative to methodological legal positivism in particular. In fact, what marks out neoconstitutionalism is its rejection of the Separability thesis, and so its recognition of a connection between law and morals through constitutional values. It is not always clear, though, what the neoconstitutionalists take to be the logical status of this connection: Sometimes it appears to be merely *empirical*, for it could only be discovered within a constitutional state; other times it is presented as *analytical*, by definition of *law (in the constitutional state)*; still other times it shows itself to be a merely *normative* connection.[4]

However that may be, the first civil-law theorists who went the way of neoconstitutionalism took a path similar to that taken by Dworkin. We can see this with the Argentinian theorists Garzón Valdés and Nino: They started out from two theses forming the (dubious) core of Oxonian legal positivism—namely, Hart's internal point of view in the case of Garzón Valdés, and Raz's reasons for action in the case of Nino—only to turn them against legal positivism itself. Today's Continental neoconstitutionalism, instead, presents itself as an independent reflection on the constitutionalization processes, with Habermas and Alexy looking in particular at German constitutional state, and Ferrajoli and Zagrebelsky at Italian one.

10.1. Garzón Valdés and the Internal Point of View

Ernesto Garzón Valdés (1927–) may be located, along with Nino, within the first generation of the Buenos Aires School (on which see Section 9.5 in this tome and Section 26.2.1.3 in Tome 1 of this volume), but his personal story contributes to making his stance somewhat anomalous, by virtue of his particularly taking up the question of the relation among law, morality, and politics (Garzón Valdés 1993). He started out as a diplomat under the military dictatorship in Argentina, was then exiled to Spain, and was finally awarded a professorship in Germany—a background that enabled him to play a mediat-

[3] To be sure, neoconstitutionalism's main advocate, Dworkin (1986), rules out the possibility of providing the best interpretation of Nazi law, which was not strictly speaking a constitutionalized law.

[4] There is in fact a variety of ways in which the neoconstitutionalist connection thesis has been formulated. But in a strict sense, neoconstitutionalists seeking to rebut the legal positivist Separability thesis have to argue for a *necessary* connection, the legal positivists having always acknowledged, starting from Hart, countless *contingent* connections between law and morals, and even, in the case of Raz, many (spurious) *necessary* (definitional) connections between them.

ing role among Latin American, Spanish, and German philosophers of law, especially through a long series of translations from German into Castilian. As to the relation among law, morality, and politics, it is to morality that he ascribed the primary role, but a single critical morality (as distinguished from different positive moralities à la Austin) pretending to universal validity.

Indeed, this critical morality, with respect to which Garzón declares himself to be moderately objectivist, wound up monopolizing the ethical universe, on the basis of what Raz, Nino, and Alexy referred to as the unity of practical philosophy, the unity of practical reasoning, and *Sonderfallthese*, respectively. As these names suggest, this family of theses conceives legal reasoning as being, at best, a special case of moral or practical reasoning—maybe a version of the metaethical stance named value-monism as opposed to value pluralism (Raz 1986). Legal norms, far from enjoying the inherent binding force ascribed to them by ideological legal positivism, need to themselves be morally justified—at least lastly—if they are to justify the actions of citizens and the decisions of judges.

Ignoring the distinction between ideological and methodological legal positivism, Soper (1989) had already levied against legal positivism at large the charge of contradicting itself: it could not consider law a fact (as in truth only methodological legal positivism does) and at the same time consider law to be authoritative (as in fact only ideological legal positivism does). Garzón Valdés (1990) directed this same line of criticism at Hart's thesis of the internal point of view. Hart held that law can be applied and even known only by adopting an internal, or participant's, point of view. But, Garzón remarks, only on condition of considering this a *moral* point of view could it serve to justify actions and decisions. The Separability thesis would thus be refuted: There is at least one *necessary* connection between law and morals.

In reality, Hart always rejected this reduction of the internal point of view to a moral point of view: Witness Hart (1982, 160–1), where he clarifies that applying and knowing the law does not imply morally accepting it; and Hart 1994b, reiterating that a descriptive theory of law—a theory adopting an external, or observer's, point of view, as required by methodological legal positivism—would have no need to postulate a moral acceptance of the law. But for theorists who systematically ignore the distinction between ideological and methodological legal positivism (as is the case with Soper, Garzón Valdés and the neoconstitutionalists), Hart's internal point of view, interpreted as a moral point of view, entails what Goldsworthy (1990) has called the self-destruction of legal positivism.

10.2. Nino's Justificatory Connection

Moved in the same direction Carlos Santiago Nino (1943–1993): an exponent of the Buenos Aires School who, along with Garzón Valdés, distinguished himself for the attention devoted to moral and political issues (Blanco Migué-

lez 2002, Roca 2005).[5] There are two moments in Nino's work. In the first, the legal positivist definitional Separability thesis is coupled with the natural-law justificatory connection—a thesis named by Nino the Fundamental theorem of legal philosophy. This third position between natural law and legal positivism is still qualified by him as methodological or conceptual legal positivism, because of his rejection of ideological legal positivism, and despite his endorsing the unity of practical reasoning. In a second moment Nino moved beyond the Separability thesis and adopted a stance closer and closer to Dworkin's and Alexy's neoconstitutionalism.

In the *first* of these two phases, Nino seems to be following the lead of Raz and other Hartian scholars: Nino upheld the Separability thesis, along with a justificatory connection thesis not alien to Razian Authority of law argument. Indeed, the early Nino held that law is a mere fact, whereas morals is a value: the only value, indeed. In terms of Hume's law, consequently, no acknowledgment of the existence of law can be taken as the only ground for obeying and applying it: Existing law cannot make any claim to validity, understood as binding force. In fact, Nino's fundamental theorem overemphasizes the justificatory Connection thesis and underemphasizes the definitional Separability thesis (Nino 1980b, 1985, 1993).

There finally emerges that third position between legal positivism and natural-law theory called by Alexy nonpositivism, by others constitutionalism without any qualification and here neocostitutionalism. The early Nino was still presenting himself as a methodological or conceptual legal positivist: *methodological* because, like Bobbio, he understood the term *law* as designating no more than a fact, to be investigated as such; *conceptual* because, maybe like Hart, he upheld a definitional Separability thesis, ruling out any conceptual connection between law and morals. The Fundamental theorem, in other words, recognizes that Nazi law (the usual example from Radbruch to Alexy and Nino) can well be called law; but what really matters is not definition but justification: Nazi law was not worthy of obedience, not without any moral justification for it.

In the *second* phase, corresponding to his posthumous work, Nino abandoned the Separability thesis and moved beyond methodological or conceptual legal positivism. In his most important posthumous work (Nino 1994), he framed the relationship between law and morals on the basis of a threefold Connection thesis—definitional, justificatory, and interpretive—three dimensions that in Dworkin's (1986) theory of law as integrity are instead conflated. Even Raz has acknowledged many different conceptual connections between law and morals, by distinguishing them carefully, however, from identifying ones (Raz 2007)—as it will even happen in the next debate, but as was not the case in Nino's and even in Hart's work.

[5] On Nino see also Section 1.4.5.2 in this tome and Section 26.2.2.1 in Tome 1 of this volume.

In any event, as to the strictly *definitional* or conceptual connection, Nino moved beyond the Separability thesis by arguing that if we reject essentialism and adhere to linguistic or conceptual conventionalism, then we must grant many different concepts or definitions of law, some of them merely cognitive, configuring law as separable from morality or only contingently connected with it, others normative, configuring law as necessarily connected with morality (Nino 1994, chap. 1)—a very simple and sound dissolution, one could comment, of the old metaphysical riddle called the definition-of-law problem. Here, it all depends on the interests of the theorist framing the definition; and when, as with Nino, the interests in question are mainly practical or normative, then law can well be defined in terms of morality—a connection seemingly necessary only because established by definition.

As to the *justificatory* connection, concerning the binding force that law exerts on citizens and its applicability by judges, Nino reiterates that no law can be obligatory that is not backed by a moral justification (ibid., chap. 2). As Nino had already held in his first phase, in terms of Razian theory of reasons for action (Raz 1975, 1990), the law cannot provide citizens and public officials with *operative* and *complete* reasons for action but only with *auxiliary* ones: Reasons pointing out means by which to satisfy the ends set out by operational reasons (Nino 1984). The thesis of a necessary justificatory connection between law and morals, a thesis that Nino shares not only with the neoconstitutionalists but also with many post-Auschwitz legal positivists, has been the object of various criticisms since the early 1990s: Among them is the objection that it confuses true logical necessity with an alleged moral necessity.[6]

As to the *interpretive* problem, finally, Nino appears to marry a sceptical, and in any event nonformalist, conception of interpretation with the thesis of a necessary interpretive connection between law and morals. Every legal provision would lend itself to different interpretations, but the only reliable criterion on which to rest the choice among them would have to come from a reasonably objective critical morality (Nino 1994, chap. 3). The difficulty with this third thesis, as with the previous ones, lies above all in the necessary character of the connection between law and morals: In a constitutional state, that law ought be given a moral reading à la Dworkin could be normatively convincing, not necessary—unless, here too, a relation can become analytic rephrasing it by means of a stipulated definition.

[6] Moreso, Navarro, and Redondo (1992) have observed that a judicial decision proves logically justified even if derived from a law by mere deduction, without any moral justification (for a reply, see Nino 1993). Comanducci (1998, 9–10), for his part, argued that current legal systems ask judges to apply only the law, and not also morality. And Caracciolo (1999), finally, has objected that the auxiliary-reasons argument truly risks rendering the law practically or morally irrelevant—just as we will see Nino himself suspect.

In Nino's own assessment (1996) such a connection between law and morals risks making law superfluous: If legal systems can guide action only insofar as they are morally justified, then why not rely exclusively on morals? To this self-addressed objection Nino replies with the Deliberative democracy argument: When law is produced democratically, it is epistemically presumed to be morally obligatory—so goes the argument—and hence to enjoy a sort of autonomy within the practical sphere. This thesis, ironically enough, has been challenged as a form of ethical legalism (La Torre 1999): even granting that the presumption in question is only epistemic and theoretical, and not immediately practical, indeed, the democracy so supported is not simply procedural but deliberative in Habermas' sense—i.e., differing from a procedural one just by virtue of its justifying its own decisions.

Finally, the problem must be raised of the extent to which Nino may be labelled a neoconstitutionalist—say, a supporter of a third stance between natural law and legal positivism. On the one hand, he starts out from methodological legal positivism in search of such a third position. On the other hand, like the early Dworkin, he refers not to constitutional state but only to democratic state—i.e., to legislative state, as opposed to the constitutional one—not to mention that in Nino 1996 he expresses many reservations about judicial review, due to its old adoption and wicked application in Latin America in general and Argentina in particular. Perhaps the generic expression *nonpositivism*, which Alexy uses for his own theory, more aptly captures Nino's stance.

10.3. Robert Alexy's Nonpositivist Concept of Law

A fundamental aspect of Robert Alexy's thought lies in his effort to develop a nonpositivist conception of law (see Alexy 2002a, 2008, 2009, 2010, 2012): That can be considered the common denominator to his various works (which, incidentally, have made a decisive contribution to the theory of legal reasoning).[7] His nonpositivism is grounded in his thesis of a conceptual connection between law and morals,[8] a thesis he substantiates by proceeding from the pragmatic approach to language.[9] What in particular Alexy (1989a; 2002a, 34–9, 77–81)

[7] On Alexy see also Sections1.5.4.1 and 25.4 in this tome and Sections 10.3.2.2 and 10.4.3.1 in Tome 1 of this volume. See in particular Section 25.4 in this tome for his contribution to the theory of legal reasoning.

[8] See Alexy 2002a, 21; 2008, 285. What it means for the connection to be conceptual is that there is no way to define law (or identify what law is) without resorting to morals: The former task *necessarily* entails the latter.

[9] See Alexy 2002a, 35–9, and esp. 38; 1989a, 47ff., 104ff., drawing on Austin's *How to Do Things with Words* (Austin 1962) and on its interpretation offered in Habermas 1971 and 1979. As is known, this is an approach to language that takes into account not only its semantics but also its uses. Austin (1962, 108–9), for example, claims that a speech act can have three types of uses: "the locutionary, the illocutionary, and the perlocutionary" (Alexy 1989a, 54ff.). This accordingly brings into the foreground the rules on which basis language is used—these are called

develops on this approach is the idea of a claim to correctness (*Anspruch auf Richtigkeit*), understood as the general (and inescapable) presupposition of all practical discourse. This claim, he argues, is what practical discourse has in common with law—"the claim to correctness is indeed also raised in legal discourse" (Alexy 1989a, 220; 1999b)—and on this basis he can treat legal discourse as a "special case [*Sonderfall*] of general practical discourse" (Alexy 1989a, 15, 212ff., 289ff.).[10] As Alexy has underscored on several occasions, the thesis of a connection "between law and morality" can be argued to have its "source" in the claim to correctness (Alexy 2008, 294; 2010, 168).[11] This claim is analyzed by Alexy (2009, 152) in three stages, clarifying first its meaning and traits; then its necessity (in law); and finally its content, which consists in its moral import. The claim is advanced in law by lawmakers and judges, and "its meaning is that accompanying each of the *institutional* acts they perform—and so the laws they enact and the judicial decisions they issue—is a *noninstitutional* act that consists in asserting that the jural act is correct as to its content and procedure" (ibid.; my translation). So the claim to correctness means that whenever a norm or a ruling is issued, that issuance comes with the idea (whether implicit or explicit) that the norm or ruling itself is correct. An essential trait of the claim to correctness so understood, Alexy argues, is that it always entails an "assurance of justifiability," that is, it always keeps open the possibility of justifying the assertion: The claim to correctness always brings with it a claim to justifiability; in short, correctness entails justifiability (ibid.; Alexy 2002a, 78).

"pragmatic rules," and they include rules stating the presuppositions involved in performing illocutionary speech acts, an example being the claim to truth assumed to be at work in the use of assertions (ibid., 56)—while making it possible to bring out the contradictions that an incorrect use of the language will give rise to. The most important of these is the *performative* contradiction, which takes place when the speaker makes a speech act that contradicts its pragmatic presuppositions (Alexy 2002a, 38), a classic example being the assertion "The cat is on the mat but I do not believe it is" (Austin 1962, 15, 39ff.). Klatt (2012, 5) investigates the claim to correctness in light of Brandom's (1994) analysis of language.

[10] Legal discourse, however, is subject to constraints that do not also apply to practical discourse at large. This is because in practical discourse there "remains a wide range of discursive possibilities in which both a particular normative statement and its negation may be justified" (Alexy 1989a, 287–8). Practical discourse, in other words, is too open-ended: "It is only rational to introduce special forms and rules of legal argumentation" in order to narrow "the range of discursive possibilities in the area of uncertainty left by legal norms" (ibid., 288).This does not mean that "general practical reasoning is […] superseded by legal reasoning": The latter "remains dependent on general practical arguments" (ibid., 288, 289). Alexy also claims that there is a "structural correspondence between the rules and forms of legal discourse and those of general practical discourse" (ibid., 289ff.).

[11] This way of grounding the connection thesis has given rise to a broad debate that can be said to have gravitated around two main views (Alexy 2008, 294–5; Bertea 2009, 15–6). On one side of the debate are ranged those, like MacCormick (2007b), who doubt that law makes any claim to correctness to begin with; on the other we find those, like Raz (2007), who recognize that law does make such claims but that they are morally inconsequential. On these arguments, see Gardner 2012.

The next step consists in demonstrating that the claim is necessary. As hinted at, this is something Alexy attempts by seizing on the pragmatic dimension of language, which is accordingly understood as an activity through which a range of acts are performed (such as asserting, promising, and enacting), and which consists in giving and asking for reasons. Once language is viewed on the pragmatic approach just mentioned, we will be able to bring out the contradiction, and hence the error, inherent in an act done by a constituent assembly saying, for example, "X is a sovereign, federal and unjust republic," or an act done by a court saying "The accused is sentenced to life imprisonment, which is an incorrect interpretation of prevailing law" (Alexy 2009, 153; my translation; see also Alexy 2002a, 36, 38). Errors of this sort are neither conventional nor moral (Alexy 2002a, 37; 2009, 153), but rather arise out of a contradiction between what is said (the explicit aspect) and what one wants to do with the language (the implicit aspect). As Alexy points out, where the constitutional norm is concerned, "the contradiction lies in the fact that the act of adopting the constitution implicitly brings in an assertion that contradicts the content explicitly asserted through the constituent act itself" (Alexy 2009, 153; my translation); likewise, where the court ruling is concerned, the contradiction arises between the "implicit" understanding that "a ruling ought to apply the law correctly" and the "explicit description of the ruling as an incorrect application of law." The contradiction is thus between "the implicit and the explicit," and that explains the "absurdity" of the two examples (ibid., 154; my translation).

For Alexy (ibid.) there is no merit to the objections that the law essentially amounts to power relations: That is what Alexy (ibid.) argues, pointing out that the claim to correctness is based on a "practice essentially defined through the distinction between correct and incorrect, and so through normativity" (ibid.), and that to exclude these categories (of correct and incorrect) is to conceive "our speaking and acting" as "something essentially different from what in fact it is" (ibid.). That would be a grave error, for it would amount to stepping outside what might be called the "most general form of human life" and denying "our discursive possibilities" (ibid., 162; my translation). For this reason, "the foundation explaining why the claim to correctness is necessary" does not just "explain a settled practice" but also works as an "existential" account of the human being as a "discursive" creature (ibid., 154; my translation).

The third and final stage is devoted to the *content* of the claim to correctness, by which is meant the idea that this claim can entail a claim to *moral* correctness. The argument (Alexy 2002a, 74ff.; 2008, 295–6) is articulated in a twofold passage, laying out the view that law's claim to correctness (*a*) has a moral dimension and raises moral problems and that (*b*) these problems are amenable to an objective moral solution. These two arguments are complementary: If the argument that there are moral choices in law is to entail a necessary connection between law and morals, it must also show that these choic-

es can be objective. If that were not the case, in any situation involving different moral options (as when a judge is faced with competing interpretations of the law carrying different moral consequences), the choice among those options would simply turn on the judge's discretion (as legal positivism holds) and would thus amount to injecting moral content into the law by a lawmaking act (Bongiovanni 2005, 68ff.). So Alexy shows in the first place that many legal issues bring out the inadequacy of institutional arguments alone (whether based on statutory provisions or on judicial precedent) and thus make it necessary to resort to moral reasons. These stem from three types of cases, namely, hard cases, arising out of the "open texture" of legal language, that is, to its being amenable to different interpretations (Alexy 2002a, 68–9); cases involving "intolerable" violations of rights, or otherwise requiring the application of Radbruch's formula (ibid., 40ff.); and cases making it necessary to balance principles and choose a prevailing one (ibid., 69 ff.). In all these cases, there will be some recourse to moral reasons (or to some morality), lacking which it would not be possible to settle on a decision in solving the issue at hand. And, in the second place, Alexy argues that these cases can be given a rational, and hence objective, moral solution. In his view, the thesis of a necessary connection between law and morality is based on the possibility of resorting to a "correct morality as a justified morality" (ibid., 80) in satisfying the claim to correctness. This possibility—that there exists a "justifiable and therefore correct morality" (ibid., 78)—is demonstrated by Alexy by relying on the rules of practical discourse and on a procedural ethic. By identifying a set of rules enabling rational discussion among free and equal participants in an "ideal" argumentative situation, we can arrive at argumentatively correct outcomes, that is, outcomes the participants themselves can agree on. The criteria are those of discourse theory: The rules for constructing arguments and taking part in argumentation define the framework for a rational discussion and make it possible to arrive at a correct and shared outcome.[12] This possibility of an objective outcome (as opposed to a subjective one) grounds the connection thesis, and with it Alexy's nonpositivism.

10.4. Jürgen Habermas and the Complementarity of Law and Morality

Jürgen Habermas's analysis of law—which takes as its reference point the problem of "the opaque and perplexing reality of the constitutional state"

[12] Alexy (1989a, 177ff., 297ff.) has developed a system of rules of practical discourse comprising rules grouped under five categories ("basic rules," "rationality rules," rules "for allocating the burden of argument," "justification rules," and "transition rules") that, in combination with a single set of argumentative forms, yields a system of twenty-eight rules. These can in turn be regrouped under two broad classes: One comprising rationality rules, governing the structure of arguments, and the other justification rules, governing discursive procedure. Together they outline an "ideal speech situation" in which participants can arrive at objective judgment.

(Habermas 1996, 5)—puts forward the thesis of a "complementary relation between morality and law" (ibid., XL, 104ff.).[13] This analysis proceeds from two main premises, namely, that for an adequate understanding of law we need to (*a*) identify the function of law from a sociological perspective and the traits that distinguish it from morality,[14] and that, in parallel, we need to (*b*) consider the transformations of practical reason deriving from social evolution (Rehg 1996, XIIff.) enabling society to evolve. On the basis of these premises, Habermas puts forward a view of law as a tool with which to stabilize contemporary societies, and at the same time he analyzes the mechanisms for legitimizing law in such a way as to make sure that this task can be fulfilled. The analysis brings to light the limits of both legal positivism and the views purporting to show a connection between law and morality.[15]

The stabilizing function of law is understood to bear a connection to social evolution, described as a "process in which the lifeworlds of modern societies are rationalized under the pressure of systemic imperatives" (Habermas 1996, 5), and in which there emerge conflicting interests. According to Habermas, "the *problem* that emerges in modern societies" is "how the validity and acceptance of a social order can be stabilized once communicative actions become autonomous and clearly begin to differ, in the view of the actors themselves, from strategic interactions" (ibid., 25).[16] The integration a normative system can produce as a consequence of these processes of social evolution and differentiation must make it possible to fulfil three tasks (Rehg 1996, XIX): First, it must stabilize social expectations, which—as the lifeworld evolves and as authoritative systems break down—become increasingly unstable and exposed "to the risk of dissension." Second, it must guarantee the "unhindered play" of communication, that is, it must ensure the possibility of critical communicative action in the matter of norms and values.[17] And third, it must be capable of

[13] On Habermas see Section 25.3 in this tome and Sections 10.3.5 and 10.4.3.2 in Tome 1 of this volume.

[14] For an analysis of the relation between sociology and law in Habermas, see Deflem 1996, 2013; Baxter 2011, 148ff.

[15] Habermas (1996, 3) believes in this regard that we need to move beyond the kind of thinking that sees law through the lens of its "exclusive relationship to moral issues."

[16] Habermas (1996, 17, 25ff.) identifies two main modes of social action: The "communicative" mode, geared toward achieving agreement, and the "strategic" or instrumental mode, geared toward making an enterprise successful. Communicative action plays a central role by making it possible, in most interactive processes, to achieve *social integration*. Indeed, Habermas takes the view that if "complexes of interaction cannot be stabilized simply on the basis of the reciprocal influence that success-oriented actors exert on one another, then *in the final analysis* society must be integrated through communicative action" (ibid., 26). On the role that Habermas ascribes to action in his analysis of law, see Baxter 2011, 10ff.

[17] Here "a system of rules could be invented that both binds together and assigns different tasks to the two strategies for dealing with the risk of dissension found in communicative action, that is, the strategies of circumscribing communication and giving it unhindered play" (Habermas 1996, 17ff., 37).

relating communicative action to instrumental action, that is, it must provide for mechanisms with which to regulate systems, such as money and administrative power, that have become autonomized and are regulated under different codes.[18]

These three main tasks can be fulfilled through the positivization of law as a post-traditional method of integration (Habermas 1996, 31–3, 37; 1998, 89): The law stabilizes expectations through "the state's guarantee to enforce the law" (Habermas 1996, 37), that is, by replacing "convictions" with "sanctions"; the law enables us to suppose that its rules issue from the rational acceptance of those who make and subscribe to them (ibid., 38) because law is "completely […] enacted" (ibid.), that is, fully dependent on the will;[19] law can protect its "autonomy" against "legally uncontrolled social power" (ibid., 39) and against the imperatives coming from structurally differentiated systems, making sure that "markets and governmental bodies" subject to "private and public law" will develop "inside the forms of law" (ibid., 40).[20]

This reconstruction makes it possible to highlight the tensions deriving from the plural functions of law. Habermas (ibid., 28ff.) summarizes these tensions under the oppositional pair of "facticity and validity,"[21] pointing to the need to secure two conflicting interests inherent in law, namely, "coercion and freedom."[22] More to the point, law must ensure that norms made effective

[18] Habermas (1996, 39) underscores that "modern societies are integrated not only socially through values, norms, and mutual understanding, but also systemically through markets and the administrative use of power. Money and administrative power are systemic mechanisms of societal integration that do not necessarily coordinate actions via the intentions of participants, but objectively, 'behind the backs' of participants."

[19] This state of affairs can be achieved only on the assumption that norms are forged by agreement. In other words, the "members of a legal community must be able to assume that in a free process of political opinion- and will-formation they themselves would also authorize the rules to which they are subject as addressees" (Habermas 1996, 38). Habermas speaks of "law's peculiar mode of validity," where "we find the facticity of the state's enforcement and implementation of law intertwined with the legitimacy of the purportedly rational procedure of lawmaking," and he underscores that in regard to these "two moments" there emerges the question "How can we ground the legitimacy of rules that are always able to be changed by the political legislator?" (This is a question that emerges with regard to the constitution as well) (Habermas 1998, 88–9).

[20] See also Habermas (1996, 56), on "law's peculiar dual position and mediating function between, on the one hand, a lifeworld reproduced through communicative action and, on the other, code-specific subsystems that form environments for one another."

[21] This tension is claimed to originate in the connection between discourse and communicative action. Here Habermas comments thus: "With the use of language to coordinate action on the basis of mutual understanding, and thus at the level of communicative action, this tension enters the world of social facts" (1996, 35). On this connection, see Rehg 1996, XVff.; Bayer 1995, 204.

[22] "Legal norms must be so fashioned that they can be viewed simultaneously in two different ways, as laws that coerce and as laws of freedom. It must at least be possible to obey laws not because they are compulsory but because they are legitimate. The validity of a legal norm means that the state guarantees both legitimate lawmaking and de facto enforcement. The state must en-

through "the imposed force of external sanctions" can at the same time be recognized as legitimate on the basis of the "rationally motivated beliefs" held by those to whom they are addressed (ibid., 26). This tension can be appreciated in the concept of legal validity (Baxter 2011, 60ff.), for this concept is at once social and normative: It answers the needs of both acceptance and legitimacy, expressing both "de facto validity as measured by average acceptance" and the "legitimacy of the claim to normative recognition" (ibid., 30).[23] For this reason, Habermas (1998, 87) argues, law "requires more than mere acceptance," or "de facto recognition": It also "claims to *deserve* […] recognition" from "its addressees." The problem is thus to understand how law can acquire an "ideal validity," that is, how it can assert its "claim to legitimacy" (Habermas 1996, 69).[24]

This is a problem to solve which, Habermas (ibid., 107, 105) argues, we need to consider "postconventional" criteria of legitimacy and the distinction between law and morality: The criteria cannot be content-based but must instead rely on "impartiality in practical judgments," while the distinction between law and morality must be predicated on the different functional needs served by law and morals, that is, on whether the norms in question are issue-specific (law) or whether they aim for universality (morality).[25] The first

sure both of these: on the one hand, the legality of behavior in the sense of an average compliance that is, if necessary, enforced through penalties; on the other hand, a legitimacy of legal rules that always makes it possible to comply with a norm out of respect for the law" (Habermas 1998, 88).

[23] See Habermas (1996, 28ff., 38), arguing that if the validity of law were based solely on contingent and "arbitrary" decisions backed by the threat of sanction, then its "its capacity for social integration" would be at risk, undermining the ability of norms to be accepted not only as a matter of fact but also on the basis of their rational and communicative dimension: "Law," Habermas (ibid., 38–9) notes, "borrows its binding force […] from the alliance that the facticity of law forms with the claim to legitimacy." It can thus be claimed that "law […] comes under the *secular* pressure of the functional imperatives of social reproduction; however, it is simultaneously subject to what we might call the *idealistic* pressure to legitimate any regulations" (ibid., 40–1).

[24] The same problem is framed in Rasmussen 1996, 21ff., by asking "How is valid law possible?"

[25] Habermas (1996, 105, 108–9) argues that "at the postmetaphysical level of justification, legal and moral rules are *simultaneously* differentiated from traditional ethical life and appear *side by side* as two different but mutually complementary kinds of action norms." Law and morality are distinguished in three important ways. In the first place, "the moral principle" requires "norms that can be justified if and *only* if equal consideration is given to the interests of all those who are possibly involved," that is, moral norms need to be grounded in universal reasons. Legal norms, by contrast, "can be justified by calling on pragmatic, ethical-political, and moral reasons—here justification is not restricted to moral reasons alone." This is because, in the second place, in Habermas's view, "the required kinds of reasons result from the logic of the question at issue in each case": Whereas "moral questions," where the aim is to have "regulations that lie in the equal interest of all," take "humanity or a presupposed republic of world citizens" as their "reference point," the "reference point" in "ethical-political questions," where participants are engaged in "justifying decisions that are supposed to express an authentic, collective self-understanding," is given by "the form of life of the political community that is 'in each case our own'." That goes double for "oppositions between interests," that is, for pragmatic questions, which "require a rational balancing of competing value orientations and interest positions. Here the totality

concern is addressed by Habermas by recourse to the so-called discourse or D principle, under which validity can be ascribed only to those norms, be they legal or moral, "to which all possibly affected persons could agree as participants in rational discourses" (ibid., 107). In the positive law, this criterion takes the form of the democratic principle (ibid., 110, 108–9).[26] Under this principle,

> only those statutes may claim legitimacy that can meet with the assent (*Zustimmung*) of all citizens in a discursive process of legislation that in turn has been legally constituted. In other words, this principle explains the performative meaning of the practice of self-determination on the part of legal consociates who recognize one another as free and equal members of an association they have joined voluntarily. (ibid., 110)[27]

So this solution, crafted in keeping with the criteria of procedural rationality on which rests consent, takes the form of a conception of the democratic principle requiring that sovereignty and rights coexist. Post-conventional societies have to supersede the alternative "twofold answer" that political theory has offered in addressing the problem of legitimacy, requiring both "popular sovereignty and human rights" (Habermas 1998, 89). The tension between these two aspects, present in rationalistic natural law theories, can be worked out on the basis of the discursive foundations of the legitimacy of law. On this approach—based on cofoundation, that is, on the inherent link between democracy and rights—"human rights institutionalize the communicative conditions for a reasonable political will-formation" (ibid.). That holds not only for "political rights, that is, the rights of communication and participation," but also "for the classical human rights that guarantee the citizen's private autonomy," absent which rights, and "in particular the basic right to equal individual liberties, there also would not be any medium in which to legally institutionalize the conditions under which citizens could participate in the practice of self-determination" (ibid., 90–1). The legitimation of political systems, and so of law, rests on the connection between rights and democracy and thus requires that they be co-original.[28]

of social or subcultural groups that are directly involved constitute the reference system for negotiating compromises." And, in the third place, whereas moral norms are directly dependent on a specific argumentative rule, namely, the "universalization principle," legal norms, based on the democratic principle, come in as many varieties as are the problems they are designed to address. On these questions, see Thomassen 2010, 93ff.

[26] That, of course, entails a need to distinguish "between the discourse principle and the moral principle. The discourse principle is only intended to explain the point of view from which norms of action can be *impartially justified*." On the D principle, see Rehg 1996, XXVIff.

[27] "Thus the principle of democracy," notes Habermas (1996, 110), "lies at *another level* than the moral principle."

[28] As Habermas (1996, 95) comments, this requirement has its counterpart in the "modern ideas of *self-realization* and *self-determination*" asserted after the crisis of traditional ethicity: These are the ideas of public and private autonomy, respectively, and law is justified to the extent

That takes as to the second concern, relating to the distinction between law and morality, for it is on that basis that rests the complementary relation between law and morality: If law is to be legitimate, rights must extend universally to everyone and sovereignty must express the community's specific ethico-politcal contents. Habermas believes that for this reason "modern legal orders must find their legitimation, to an increasing degree, only in sources that do not bring the law into conflict with those post-traditional ideals of life and ideas of justice that first made their impact on persons and culture" (Habermas 1996, 99). Therefore,

> reasons that are convenient for the legitimation of law must […] harmonize with the moral principles of universal justice and solidarity. They must also harmonize with the ethical principles of a consciously 'projected' life conduct for which the subjects themselves, at both the individual and collective levels, take responsibility. (ibid.)

As noted, this analysis enables Habermas to criticize both legal positivism and the views that make law subordinate to morality. As Habermas says, one of the aims of the "discourse-theoretic concept of law" is to avoid "the twin pitfalls of legal positivism and natural law": While in legal positivism the validity of law and the complex process through which law is legitimized are reduced to a "blind *decisionism*," natural law theory denies an essential aspect of law by striving to remove law "from the vortex of temporality by a moral *containment*," failing to recognize the necessary distinction between law and morality (Habermas 1996, 453). Habermas notes in particular that on the legal positivist approach, "the validity of positive law appears as the sheer expression of a will," and that within "this voluntarism of pure enactment […] the validity of legal regulations is measured solely by the observance of legally stipulated procedures of lawmaking," failing to take into account "extralegal principles" and the "justification of a norm's content." Yet that amounts to "forfeiting" the law's "capacity for social integration" (ibid., 38).

10.5. Ferrajoli's Garantism

Luigi Ferrajoli (1940–) defends a position that styles itself as critical legal positivism, in opposition to traditional legal positivism, the difference consisting in the legal paradigm change brought about by constitutionalization. The argument is set out in two books: Ferrajoli 1989, offering a very broad theory of criminal garantism, and Ferrajoli 2007, an axiomatized theory of law and a more ambitious proposal of constitutional and social garantism too. Neither work devotes much attention to the relationship between law and morals, both limiting themselves to espousing two versions of the Separability thesis:

> that they can be seen to be embodied in its norms. The same two concepts map onto those of sovereignty (self-realization) and individual rights (self-determination).

a cognitive one and a normative one. The most appealing aspect of Ferrajoli's stance, however, is his understanding of his own stance—not as a neoconstitutionalist one, but—as an updated version of legal positivism: as a legal positivist theory extended to a new object, namely, the law of the constitutional state.

In terms of the preceding distinctions, Ferrajoli's stance is essentially a theoretical legal positivism extended to the law of constitutional state—a stance, however, that would make it necessary to abandon or at least supersede many theses of classical legal positivism, better suited to the legislative state. Indeed, unlike what we will find in Zagrebelsky, there is certainly in Ferrajoli an allegiance to the legal positivist research tradition, the point being to avoid sliding from positivist theories to neoconstitutionalist methodologies or ideologies. Notwithstanding Ferrajoli's intentions, as well as his recent explicit refusal of neoconstitutionalism (Ferrajoli 2011), such a double shift does seem to occur.

Both shifts, toward methodological and ideological neoconstitutionalism too, are exemplified by his distinction between the mere *being in force* of legal norms and their genuine *validity* (Ferrajoli 1989, 351–6). Legislative norms that comply with the constitution in a formal way only, i.e., statutes produced by the organs of state in keeping with the procedures set forth in the constitution itself, can only be said to be *in force*; by contrast, norms that comport not only formally but also materially with the constitutional principles are said to be *valid*. Statements in terms of validity are accordingly conceived by Ferrajoli as genuine value judgments, different from moral judgments only because referring to values internal and not external to the legal system. The law of the constitutional state, in turn, is presumed to incorporate moral and political values—thus becoming itself not a fact to be described by legal dogmatics, but a set of values to be adopted by lawyers and judges, if not by citizens. The constitutional state itself would be the solution to the natural-law problem of justice.

Nevertheless, Ferrajoli always confirmed his allegiance to the positivist tradition, and recently criticized neocostitutionalism, explicitly disavowing neoconstitutionalist interpretations of his own theory. On the one hand, as to allegiance to the positivist tradition, he thinks that the constitutionalization of law deprives of any practical significance the old dispute between natural law and legal positivism—but without undermining the Separability thesis, in both of the versions distinguished in his two main works. First, the cognitive Separability thesis recognizes the autonomy of validity judgments from moral and political ones (Ferrajoli 1989, 204–6). Second, the normative Separability thesis sets out a few lines of conduct for the legislator and the judge, especially in criminal law (ibid., 207–9). Both theses are reiterated in Ferrajoli 2008, vol. 2, 309–13, the last axiomatized version of his theory of law and democracy, where the originary criminal garantism is expanded into a full-fledged social garantism, in order to protect social rights no less than civil rights.

On the other hand, as to the criticism of neoconstitutionalism, the later Ferrajoli not only rejects once again the Connection thesis, insisting on the

(critical) positivist character of his stance, but also directly attacks two of the more distinctive neoconstitutionalist theories—the rules/principles dichotomy, and balancing, or ponderation, as a characteristic feature of constitutional interpretation. The rules/principles dichotomy is rejected not just because of its dichotomic nature—indeed the cognitive Achilles heel of the distinction—but because of the normative weakness attributed to principles, unfortunately a mere ideological flaw of the same distinction. Ponderation or balancing are analogously criticized not as false theories of constitutional interpretation but because they undermine legal certainty—another, somewhat paradoxical sign of methodological and ideological shifts toward neocostitutionalism in Ferrajoli's professed critical positivism.

10.6. Zagrebelsky's *Diritto Mite*

Gustavo Zagrebelsky (1943–) holds a theory of law that bears strong analogies to Alexy's; in fact, both teach constitutional law in countries with rigid constitutions and constitutional courts and both criticize legal positivism from a perspective internal to their discipline. Moreover, Zagrebelsky draws on his experience as a constitutional judge, having served in the past as president of the Italian Constitutional Court. Unlike Alexy, still, he does not attempt to build a general theory of law; his very criticism of legal positivism seems to ignore the distinction drawn by his own teacher Bobbio, among theoretical, methodological, and ideological legal positivism. Yet his criticism can be explained as a result of the same shift, just found in Ferrajoli, from a theoretical neocostitutionalism as an updated form of theoretical legal positivism, to a methodological and ideological neoconstitutionalism, both overtly in conflict with the corresponding positivist stances.

Zagrebelsky contends that theoretical legal positivism has been superseded by theoretical neoconstitutionalism: theories of legislative state and of constitutional state respectively. His argument, more to the point, is that present-day constitutionalized law, and *a fortiori* constitutional law itself, can no longer be qualified as *hard* positive law, e.g., ordinary or constitutional legislation: It must instead be qualified as a soft or "mild" positive law (*diritto mite*), subject to legal interpretation and rational argumentation as a condition for its application (Zagrebelsky 1992). We have to do here with a "principles-centred law", distinguished as much from the "rules-centred law" of legal positivism as from the "values-centred law" of natural-law theory, along the following lines. While rules are *conditional* norms, suited to being formulated in Kelsenian logical form, and values *absolute* norms claiming an overarching normative status, principles would be norms different from rules because unconditional, devoid of the premise "if *x*," and different from values too because always to be balanced against one another in order to produce rules in their turn suited to being applied (Zagrebelsky 2009, 85–116; 2008).

His theoretical neoconstitutionalism might stil be considered an extension of methodological legal positivism to the law of constitutional state; much more than Ferrajoli's dubious stance, however, it triggers two similar shifts: first to a methodological neoconstitutionalism, and then to an ideological one. Zagrebelsky's methodological neoconstitutionalism owes in particular a debt to the dualist theory advanced in Alexy 2008: in the manner of Radbruch, law and justice would indeed stand in a relation of potential conflict, but they nonetheless cannot be decoupled from each other; and in any event, this impossibility of decoupling the two is such that mild law, or law operating on principles, cannot be studied in any nonevaluative way.

This methodological neoconstitutionalism, however, is itself always at risk of sliding into a form of ideological neoconstitutionalism: "The constitutional state deserves our apology" (Zagrebelsky 2009, 146; my translation), needing a delicate equilibrium among constitutional principles, as well as between these principles and legislative rules. In reality, even the constitution can be viewed as positive law—a law, to be sure, made up above all of principles protecting rights, in such a way as to bring about an equitable compromise among the competing values having currency in society. There can be little doubt that these arguments are at least in part designed to defend the Italian constitution of 1948, which still ranks among the most advanced constitutions in place, but they could equally serve to justify *other* constitutions as well, if not *all* constitutions as such.

Chapter 11

LEGAL POSITIVISM'S ANSWERS TO THE NEOCONSTITUTIONALIST CHALLENGE

by Mauro Barberis

The rebirth of legal positivism we have seen over the last two decades in the theoretical debate among English-speaking scholars, or at least in the Oxbridge mainstream, can be considered an answer to the challenge that Dworkin aimed at Hartian positivism (Leiter 2003). In response to this challenge, the legal positivists have wound up multiplying their views, by refining and making more and more subtle their theses, and in any event putting out a growing amount of admittedly positivist literature, despite an increasing tendency to question whether the use of such traditional labels still makes sense. The common-law legal positivist replies to neoconstitutionalism have been of three sorts, namely, inclusive, exclusive, and normative legal positivism; and at least the first two bear comment, if only to clarify the way they have been received by Continental and Latin American legal positivism.[1]

The first of these replies is known as *soft* or *inclusive* legal positivism, but also as *incorporationism*.[2] On this view, the connections between law and morals invoked by Dworkin are certainly recognized but are held to be merely contingent, rather than necessary, and hence compatible with the Separability thesis (see Coleman 2001a, 2001b; Redondo 2003). Specifically, it is Hart 1994b, the posthumous reply to Dworkin's objections, that qualifies its own view as soft legal positivism—a move enabling Hart to consider Dworkin's theory as akin to his own view, on the one hand, and as incommensurable with it, on the other. Hart's soft positivism bears an affinity to Dworkin's stance by recognizing a contingent inclusion of morality in law by means of principles—a stance the later Dworkin considers as merging into his own (Dworkin 2006). But Hart's descriptive and general jurisprudence seems to Hart himself so different from Dworkin's normative and particular jurisprudence as to not even be susceptible of being contradicted by it (but see Raz 2007).

The second reply has been labelled *hard* or *exclusive* legal positivism, especially by supporters of the first one. Its main exponent, Joseph Raz, considers it

[1] Although Scarpelli 1965 can be considered an anticipation of normative positivism as paradigmatically set out in Campbell 1996 and Waldron 2001, this conception has not yet had any significant developments in continental Europe, except maybe for Hierro 2002, Pintore 2003, and Celano 2012.

[2] The qualifiers *inclusive* and *soft* are used in Waluchow 1994 and Hart 1994b, respectively. The label *inclusive (or soft) positivism* can in turn be considered synonymous with *incorporationism*—but see Kramer 2003 for a distinction.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_39

to be no more than legal positivism as such, without any qualification (Escudero 2004, Jimenez Cano 2008). Indeed, the conception looks like a reply to Dworkin as well as a criticism of inclusive legal positivism, the two having been assimilated, for different reasons, by Raz as well as by Dworkin himself. Inclusive legal positivism is held to be incoherent: Either constitutional principles are considered legal rules, or law will end up being identified on the basis of morals alone. In fact, the criterion Raz adopts for identifying legal positivism is more demanding than the Separability thesis: i.e., the Social sources thesis, by which law could be identified only on the basis of social facts, not by any recourse to morality.

If we now turn our focus from the jurisprudence of the common-law tradition to the general theory of the civil-law countries, we will find that legal positivism comes under fire from Continental nonpositivism or neoconstitutionalism *a fortiori*, as it were. In fact, the main legal systems on the Continent can be much more readily traced to the model of the constitutional state—a system where a rigid constitution coupled with judicial review wind up constitutionalizing the entire positive law, i.e., irradiating it with constitutional principles. On the Continent, then, neoconstitutionalism can present itself as the legal theory of the constitutional state—thus reducing legal positivism to the legal theory of the legislative state.

Civil-law general theory of law is thus analogous to Anglo-American jurisprudence in one respect and different from it in another. First the similarity: Continental and Latin American authors often take up themes from Hartian scholastics, the discussion still primarily revolving around the relationship between law and morals, occasionally taking up distinctions such as that between inclusive and exclusive legal positivism. Then the difference: Continental and Latin American authors autonomously theorize constitutionalization, internationalization, and integration processes referring to their own legal systems—and what these legal theorists do here is to carry forward the Continental theories of norms, of the legal system, and of legal interpretation.

In what follows, we will only be able to look at one main issue and a handful of authors. As to the *issue*, it is the relationship between law and morals that will continue to enjoy pride of place—other matters, like the distinction between rules and principles, the defeasibility of legal norms, and legal interpretation, including constitutional interpretation, will mainly be touched on in connection with that first issue. For the same reason, preference will be given to those legal positivists who address head-on the challenge posed by neoconstitutionalism as a theory connecting law and morals *via* constitutional principles.[3]

[3] The term *constitutionalism* can mean the *theory* of constitutions or the constitutions themselves, and it is only in the first of these two acceptations that the term will be used in this chapter, in its variant *neoconstitutionalism*. For the post-World War II constitutions, instead, sometimes the term *new constitutionalism* comes up in the literature. On this subject, see Comanducci 2007 and Barberis 2012.

And so, as concerns the *authors* taken into consideration, emphasis will be laid on those from the Spanish and Argentinian areas, who indeed have greater visibility today in the international debate.

With these premises in place, and the usual disclaimer on the difficulty involved in outlining the contours of an ever-evolving debate, the discussion can be described as having so far progressed as follows. Even civil-law legal positivists authors initially tended to take an approach that held itself out as purely methodological, or nonideological (see Bobbio 1996), or descriptive (see Hart 1994b). It is the Separability thesis that was at first defended, but its simplicity—which Hart (1973, 55) still alluded to—turned out to be illusory, eventually finding itself replaced in the debate with the Social sources thesis.[4] Even the latter, however, has often been understood not in Raz's more demanding sense but in a generic sense as a conception of law as a human product—in truth a conception that could well be accepted not only by exclusive legal positivists but also by inclusive ones and by neoconstitutionalists, if not by many modern supporters of natural law (see, e.g., Finnis 1992).

It is with an eye to these developments and their representatives that the authors considered below have been selected. Thus, the later Bulygin will represent traditional legal positivism's standard reply to Alexy's and Nino's neoconstitutionalist challenges; José Juan Moreso will illustrate the effort to work the neoconstitutionalist objections into a legal positivism sufficiently inclusive to itself result in a form of neoconstitutionalism; Juan Carlos Bayón will exemplify legal positivism's openness to neoconstitutionalist themes like defeasibility of legal norms; and Jorge Rodríguez, for his part, will show the effort to *resist* this receptiveness, by going back to arguments that make explicit some of legal positivism's deepest presuppositions.

11.1. Bulygin's "Simple" Positivism

As we saw in Section 9.5, Bulygin is especially known for his work on norms and normative systems: a work providing the logical toolkit for much of legal theory in the Castilian-speaking world. In the last article Bulygin wrote with his friend Alchourrón, before the latter's untimely passing (Alchourrón and Bulygin 1996), an effort is made to resist the tendency, fostered by Nino but originated with Raz, to replace the concept of a norm with that of a reason for action; in the same work, however, the authors seem to subscribe to the view

[4] The same happened in the Anglo-American debate: See at least Fußer 1996, Gardner 2001, Green 2003, Morauta 2004. But Social sources thesis is no less beset with problems than Separability thesis as a criterion by which to classify legal theories. On the one hand, in Raz's specific version, it rules out inclusive legal positivism, including Hart and his followers; on the other hand, it makes it even more necessary to confront the methodology problem, i.e., the *vexata quaestio* of the relation between knowledge and evaluation (see Dickson 2001, Burge-Hendrix 2008).

of norms as defeasible conditionals, namely, as conditionals subject to implicit exceptions, i.e., exceptions not explicitly stated in their premises. Defeasibility would subsequently be the subject on which Bulygin's pupil, Rodriguez, would engage with Bayón in the discussion treated later on in Sections 11.3 and 11.4.

As we have also remarked, all of Bulygin's work proceeds from a set of unmistakably legal positivist premises. His theory of the legal system as a systematization process, to take only one example, presupposes that the axiomatic basis of systematization can exclusively consist of positive legal norms. For the influence exerted by the ongoing discussion in the Anglo-American and Spanish context, Bulygin increasingly made explicit this originary legal positivist stance. Specifically, he staked out a position on the relation between law and morals in a series of essays later collected in Bulygin 2006, where he criticizes the neoconstitutionalist theses advanced by Garzón, Nino, and Alexy, insisting in particular that law and morals are not bound by any necessary (analytic, conceptual) connection.

Contra Garzón Valdés 1990, to begin with, Bulygin makes explicit the latent ambiguity inherent in the assertion "Every legal order must necessarily conform to morality." Depending on whether this proposition is made subject to universal or to existential quantification, it can be taken to mean two markedly different things: Every legal system must conform either to *some* morality (a positive one) or to a *single* morality (a critical morality). In the former case, the proposition would amount to a truism: There is no doubt that any legal order hoping to be effective must accord with prevailing positive morality or moralities. In the latter case, by contrast, the thesis sounds unconvincing, precisely because it would postulate a single objective morality, one that all the officials in a given legal order either *can* share or even *do* share (Bulygin 1996).

Contra Nino, Bulygin challenges the thesis that in order to fully or ultimately justify a judge's decision, you have to resort to a moral norm. Taking up the arguments found in Moreso, Navarro, and Redondo 1992, Bulygin 1996 observes that if what is meant by *justify* is to "*logically* justify" (by deduction), then legal rules can very well justify legal decisions, thus figuring into the judge's ruling as operating reasons rather than as merely auxiliary ones. Nino, as Bulygin reads him, rests his thesis on a stipulated definition of *justification* as a sound or ultimate justification—but a stipulated definition, as the objection goes, does not make for a good argument in favour of a necessary connection between law and morals.

Contra Alexy, finally, Bulygin criticizes the Rightness (*Richtigkeit*) argument, finding it to be undermined by a notion of performative contradiction lacking logical stringency, and he criticizes the Connection thesis (*Verbindungsthese*) itself. On this latter subject, the objection made by Bulygin (2000, 136) is that while necessary connections do exist in a logical, analytic, or conceptual sense, none exist in a normative sense—and in fact Alexy concedes that "something being normatively necessary means no more than its being obligatory," and that "normative necessity is only a necessity in a broader sense"

(Alexy 1989b, 169 n. 4; cf. also Alexy 2000). For Bulygin, by the same token, it is simply by virtue of a moral, contingent norm that law must respect morality, and this moral norm cannot be made into an analytic sentence just by virtue of a stipulated definition of *law*.

Bulygin's legal positivism has been hypothesized to be of a "simple" variety, meaning it is logically independent of the dispute between inclusive and exclusive legal positivism—his later positions, therefore, could be ascribed to inclusive or to exclusive legal positivism alike (Redondo 2007). Certainly, one can speak of his legal positivism as simple in the sense of its being classical, pure, or unqualified—classical, i.e., akin to Kelsens's and Hart's theoretical tradition; pure, i.e., having only a logical or semantical dimension, as opposed to a practical or pragmatic one; and finally unqualified, i.e., viewing the tedious debate between inclusive and exclusive legal positivism as an unnecessary and self-feeding detour from the straight path of the logical analysis of law.

11.2. Moreso from Soft Positivism to Neoconstitutionalism

In the past, José Juan Moreso (1959–) has cowritten works with pupils of Bulygin and Caracciolo like Pablo Navarro and Cristina Redondo—thus witnessing the deep influence exerted by these Argentinian scholars on the new Spanish jurisprudence. Subsequently, however, he developed a form of inclusive legal positivism described in his own words as "latitudinarian" enough to embrace Dworkin's stance itself and to ultimately wind up in a sort of neoconstitutionalism. The theory of law set out in Moreso 1997a uses Alchourrón's and Bulygin's logical toolkit—especially in the first three chapters, devoted to the theory of norms, to propositions about norms, and to the legal system, respectively. The last two chapters are instead devoted to the primacy of the constitution and to constitutional interpretation, these being typically neoconstitutionalist issues, further developed through the essays collected in Moreso 2009, representing a further step in his way out of legal positivism.

Moreso has contributed to clarifying the Oxonian discussion on the relationship between law and morals, especially by distinguishing in a rigorous way the three more common varieties of legal positivism and arguing in favour of inclusive legal positivism (2004). These three common varieties correspond to as many interpretations of the Identification thesis, a corollary of the Social sources thesis whereby "the determination as to what is law does not depend on moral criteria or arguments" (ibid., 47; my translation).[5] Even Moreso, in other terms, tends to replace the Separability thesis with the Social sources thesis, and the latter with the Identification thesis, as criteria by which to dis-

[5] Moreso himself refers us to Dyzenhaus 2000 and Kramer 2001 for the Identification thesis and for its three interpretations, respectively. But this has now become a standard reformulation of the Separability thesis itself. See, e.g., Marmor 2001, chap. 4.

tinguish legal positivism—which criteria, however, continue to be about the relationship between law and morals.

The three varieties of legal positivism are identified by giving three different interpretations of the ambiguous phrase "does not depend" in the passage just quoted. *Exclusive* legal positivism takes this phrase to mean "*cannot* depend" (i.e., the identification of law necessarily does not depend on morals); *inclusive* legal positivism takes the phrase to mean "does not necessarily depend" (i.e., the identification of law, in fact, does not *need* to depend on morality); and *ethical* legal positivism takes the phrase to mean "*ought* not to depend" (i.e., the identification of law ought not to depend on morals). Whereas in Moreso 2001 the choice for inclusive legal positivism was justified by criticizing the main arguments in support of *exclusive* legal positivism, in Moreso 2004 the justification is provided by criticizing *ethical* legal positivism.

Ethical legal positivism does presuppose the truth of inclusive legal positivism, but it pretends to convert exclusive legal positivism from a conceptually false theory into a normatively valid one. The sense in which ethical legal positivism is found to presuppose inclusive legal positivism is that if it were in fact conceptually impossible to include morality in law, as exclusive legal positivism claims, then it wouldn't make sense to even discuss whether such an inclusion is normatively acceptable. Ethical legal positivists argue that such an inclusion, though implicitly considered by them to be logically possible, is normatively unacceptable, because that would make law too uncertain—a thesis that Moreso rebuts by arguing that morality can sometimes be objective, at least when it relies on thick concepts (rather than on thin ones), as constitutions often do.

Inclusive legal positivism thus remains the only position in the running—a stance that Moreso 2009 further works into a form of neoconstitutionalism. To be sure, neither in this work nor elsewhere does he label himself a neoconstitutionalist, arguing, on the contrary, that labels such as "legal positivism," "nonpositivism," and the like are only labels loose enough to warrant our replacing them with the various theses so labelled (cf. Raz 2007). Yet he seems to accept the Separability thesis even in his latest book (Moreso 2009, 245), at least in the sense of denying, *contra* Alexy (and Raz too), that there can be any necessary connection between law and morals. Still, as much as these connections are reckoned to be contingent, their increasing number suggests to Moreso that therein lies the distinctive trait of the modern state: Of the legislative state at first, and *a fortiori* of the constitutional state.[6]

[6] "Constitutionalism is only a special case of the inclusion of morality into modern law" (Moreso 2009, 47, n. 47; my translation). The Spanish original: "El constitucionalísmo es unícamente un caso especial de la incorporación de la moralidad al derecho de la modernidad." Thus Moreso cannot be classified as an orthodox neoconstitutionalist, if such a stance exists: What sets the constitutional state apart from the legislative state is for him not a *qualitative* difference but a *quantitative* one.

The observation that the law of the constitutional state incorporates morals—an observation typical of theoretical neoconstitutionalism, but which could still be compatible with Hartian methodological legal positivism—gave start to the shift from theory to methodology found in other forms of neoconstitutionalism (see Chapter 10). The methodological status of legal theory changes in such a way that the theory was now thought to stand to legal dogmatics as normative ethics stands to applied ethics—a typical methodologically neoconstitutionalist view (see Moreso 2008). But a further shift took place, this time toward ideological neoconstitutionalism: Jurists and even legal theorists were to adhere to the constitutional state, even though an attitude of epistemic servility should still enable them to distinguish, within the constitution, the law as it is from the law as it ought to be (see Moreso 2009, 251–3).

11.3. Juan Carlos Bayón's Arguments for Defeasibility

Like Moreso, Juan Carlos Bayón (1957–) analyzes the relation between law and morals on both a theoretical and a metatheoretical level, extending such analysis to the question of the defeasibility of legal norms. He first concerned himself with the question of the normativity of law; then he systematically mapped out the meanings of the Separability thesis, which he, too, replaced with the Social sources thesis; next he criticized inclusive legal positivism by deploying a notion of deep conventionalism more apt to shed light on legal positivism's background assumptions (its metaphysics, in the well-known Peter Strawson's sense of the term); and, finally, he put forward a theory of the defeasibility of legal norms.

The first problem Bayón (1991) addressed is that of law's normativity (cf. Postema 1987, Delgado Pinto 1996). If we take up the standpoint of methodological legal positivism, we will come to know the law as a *fact*, at the risk of getting law to cast off all legal normativity. Bayon attempts to rectify this consequence by recourse to Raz's concept of reasons for action (Raz 1975, 1990), precisely as had earlier been attempted in Nino 1984—a move which consequently led to a stance similar to that of Nino's fundamental theorem. When it comes to *identifying* the law, in other words, Bayón adopts the Separability thesis such as it is understood by exclusive legal positivism; but when it comes to *justifying* the law, he instead espouses a version of the Connection thesis similar to that proposed by Nino and Alexy (and Raz too), arguing that law *claims* moral normativity without necessarily possessing it.

Just like Moreso, Bayón (2002a) subsequently laid out a map of the meanings assumed by the Separability thesis—a label that in the recent debate has come to cover nearly as wide a range of positions as those falling within the reach of the expression *legal positivism* analyzed by Hart and Bobbio in the 1950s. Of all these definitional, justificatory, and interpretive stances, there is at least one that Bayón singles out as peculiar: the Social sources thesis, more

broadly construed as conventionalism, which at once *entails* the Separability thesis and is *presupposed* by it. This point, where all the legal positivist theses intersect, is named by Bayón "the minimum content of legal positivism."

Conventionalism is taken up again in Bayón 2002b, where the term *law* is argued to designate a complex of social conventions, and *morality* the rational tribunal before which such conventions are judged. But what are *convention* and *conventionalism* supposed to mean? Like Dworkin,[7] and on the basis of M. Moore 1986–1987, Bayón distinguishes superficial conventionalism, typical of imperativist legal positivism, from deep conventionalism, this being the view that certain interpretive conventions exist which could regulate the identification and application of the law even by recourse to morality. Dworkin understands such conventionalism as no more than an underdeveloped form of his own interpretive theory—exactly the converse of what Bayón believes to be the case, for in his view it is instead Dworkin's interpretive theory that shows itself to be an underdeveloped form of conventionalism.

Finally, in a discussion with Rodríguez subsequently collected in Bayón and Rodríguez 2003, the same Bayón defended a theory of the defeasibility of legal norms, by attempting to drive into legal positivist territory a suggestion taken up from neoconstitutionalism. More to the point, he argued, at least at the outset, that in identifying the law, judges often recognize exceptions implicit, i.e., not explicitly stated in the premise of a norm. Now, in at least some of these situations, it would be useful to conceive of legal norms as defeasible conditionals, rather than as classic conditionals subject to the laws of *modus ponens* and reinforcement of the antecedent. Legal norms so conceived are defeasible conditionals, whose premises state necessary but not sufficient conditions for the consequences to be realized.

It has long been a contention among jurists that law is governed by a logic of its own. It is in particular in neoconstitutionalist theories of principles that such a nonclassic, defeasible, nonmonotonic logic is often invoked, arguing that principles cannot simply be applied deductively but only once they have been duly balanced against one another. Bayón holds that such defeasibility of norms is in some forms compatible with legal positivism, for it would bring about that partial, rather than total, legal indeterminacy that has always been acknowledged by legal positivists like Kelsen, Hart, and Raz. As we will see in the next section, however, Bayón wound up granting many of the objections raised by Rodríguez in the course of the debate between them, especially as

[7] Dworkin had distinguished two varieties of conventionalism, a strict one and a soft one, referring in the former case to overt *stated* conventions (such as they are understood in game theory, or otherwise in the form of commands à la Austin) and in the latter case to any *consequence* (including implicit ones) deriving from such explicit conventions. But he went on to conclude that soft conventionalism is only "a very abstract, underdeveloped form" of his own interpretive theory of law (Dworkin 1986, chap. 4).

concerns the central role played by classic, monotonic logic in a legal positivist theory of law and of the legal system.

11.4. Jorge Rodríguez's Arguments against Defeasibility

Jorge Rodríguez (1964–) was trained under Bulygin and expanded on his theory of the legal system by honing and defending its original deductivist and legal positivist premises. This happens formerly in Rodríguez 2002, which to this day stands as his major work, notwithstanding the more recent and updated Ferrer Beltrán and Rodríguez 2011. In the first part of the former book, Rodríguez sharpens and defends the nomostatic system worked out by the classical Alchourrón and Bulygin (1971), supplementing it with the nomodynamic theory the same two authors elaborated subsequently. In the second part of the same book, Rodríguez instead defends legal positivism from the related objections centred on principles and defeasibility, arguing in particular that the theory of the legal system has at its disposal all the tools it needs to rebut such criticisms, without needing to accept the Defeasibility thesis or abandon its legal positivist background assumptions.

Rodríguez occasionally claims that the theory of the legal system expounded in Alchourrón and Bulygin 1971 can incorporate and deal with such criticisms of legal positivism as Dworkin's principles-based objection. That is what would happen, to take just one example, if we further developed Alchourrón and Bulygin's distinction between prescriptive and descriptive relevance, or that between axiological and normative gaps (see Rodríguez 2002, 77–87; Atria et al. 2005). Rodríguez thus worked out in particular a notion of descriptive relevance that would make it possible to consider relevant for the legal system such properties as are not expressly stated in any norms but can only be identified by reference to the legal principles underlying those norms. This extension of Bulygin's theory, though accepted by him, is still open to debate (see Ratti 2009, chap. 4)—but in any event it certainly points out one direction in which the theory could be developed.

The greater part of Rodríguez's discussion, also in the essays collected in Bayón and Rodríguez 2003, is given over to showing how the positivist theory of legal system is immune from many familiar external and internal criticisms alike. We would count among the external criticisms Dworkin's principles argument, and among the internal ones that same argument if principles were understood to consist not of moral values at all but of the legal norms belonging to the system itself. And that happens as well with the theories of defeasibility that Rodríguez adversarially discusses with Bayón. To be sure, these theories—prefigured by the early Hart, fleshed out by the later Alchourrón, and then again defended by the same Bayón—are backed up by a respectable legal positivist pedigree, but they are nonetheless found by Rodríguez to be at odds with some core tenets of legal positivism.

In Bayón and Rodríguez 2003, chap. 3, as well as in Rodríguez 2002, chap. 4, Rodríguez distinguishes ten senses of *defeasibility*, thus breaking down the problem of defeasibility into a plurality of heterogeneous issues needing to be treated in different ways. But he makes the case that a good part of these issues—for example, those relative to the vagueness of legal language, to the applicability of norms, and to the changes they undergo by the hand of judges and lawmakers—can be solved by simply bringing to bear the distinctions adopted by Alchourrón and Bulygin. Three distinctions in particular would be worth mentioning: that among a norm, a normative proposition, and a norm's formulation; that between a norm's belonging to the legal system and its applicability; and that between legal system and legal order, the former static and the latter dynamic.

It is sometimes claimed that norms contain implicit exceptions, and are therefore defeasible, only when expressed in vague language, and in this case the problem can be solved ex post facto by *constructing* such language. Other times it is claimed instead that norms contain implicit exceptions, and are therefore defeasible, only *after* their language has been interpreted and it comes time for the courts to apply them, and in this case the problem can be solved ex post facto through the judge's discretion. Still other times it is claimed that norms contain implicit exceptions, and are therefore defeasible, only in the sense that their judicial interpretation and application changes over time, or in the sense that the language itself may change by legislative action—and in this case too the problem is solved through a dynamic theory of the legal order as a succession of momentary systems, in the Razian sense.

The only real problem for legal positivism, as the argument goes, comes when defeasibility is predicated of norms themselves, that is, when the claim is that you cannot apply basic deductive logic to them, or that the theory of the legal system cannot identify them without resorting to moral evaluation. In response to the first claim, Rodríguez invokes what Bayón (1991, 360ff.) has called the Trojan Horse defence, arguing that you cannot acknowledge the defeasibility of *some* norms without recognizing the same with respect to *all* norms. In response to the second claim, Rodríguez argues that the legal positivist theory must *by definition*, i.e., on pain of metamorphosizing into a *different* sort of theory, exclusively accept evaluations *internal* to the system, thus taking only legal principles into account, and not also moral values (cf. Nino 1985, 145–73). In such a theory, accordingly, we would only have room for a marginal defeasibility of beliefs about whether or not a norm belongs to the legal order.

In a nutshell, Rodríguez makes the point that if legal positivism is to fulfil its objective—which is to explain how law can guide human conduct through general norms, rather than just case by case—it must concede that though momentary legal systems are by definition always subject to change, they can at any time in principle identify nondefeasible legal norms: *nondefeasible*, on the

one hand, in the sense that they can be used to deduce the solution to specific cases, *legal*, on the other hand, in the sense of their being nonmoral, positive legal norms. Rodríguez thus makes explicit some of the conceptual assumptions on which legal positivism is built. And in doing so he shows how the theory could prove coherent, even if it would turn out to be less attractive than theories built on different kinds of assumptions, closer to the lawyers' common sense.[8]

11.5. Conclusion on Legal Positivism

As we have noticed, legal positivism has been on the defensive for the last few decades, albeit more so in the civil-law debate than in the common-law debate; and what accounts for this defensive stance is especially the criticism coming from the constellation of theoretical positions referred to in this chapter as neoconstitutionalism, but otherwise labelled constitutionalism, nonpositivism, antipositivism, and suchlike. There is also another name, however, a label that has begun to gain ground in the Anglo-Saxon world, too, and that captures an important aspect of neoconstitutionalism. Such a name is *postpositivism*,[9] and the important aspect it captures is that neoconstitutionalists say they in no way intend to go back to natural law: They rather seek to *supersede* legal positivism, absorbing and developing the theoretical ground it has gained.

Neoconstitutionalists, especially on the Continent, and postpositivists, in the Anglo-American world, often proceed from the claim that they are updating theoretical legal positivism to the developments of the constitutional state—a claim which *in se* would be perfectly in keeping with methodological legal positivism. Indeed, as has often been said, if *theoretical* neoconstitutionalism confined itself to that aim, it could not be regarded as anything more than the legal positivism of the 21st century. Yet, as we have seen, neoconstitutionalism does not stop here. Its pretence to update legal positivism triggers a long train of methodological and ideological shifts, which may or may not be justified in view of their premises, but which, regardless, produce a conflict between such a stance and methodological legal positivism, often also reintroducing forms of ideological legal positivism.

What comes out having to defend itself, oddly enough, is not so much the Social sources thesis—which neoconstitutionalists or postpositivist authors are usually happy to take on board, albeit in a much less demanding version than

[8] The same idea has been expressed by Jonathan Dancy in a remark that Bayón chose as an epigraph in Bayón and Rodríguez 2003, 154: "It is the job of a philosopher, so far as possible, to give an account of our practice rather than to tell us that we all ought to be doing something else. To the extent that this cannot be done, it is normally a fault in the philosophy rather than in the practice."

[9] The term was introduced by Villa (1997), and was then taken up by MacCormick (2007a, 278) to designate his own position.

in Raz's original statement of it. Indeed, this criterion by which to distinguish legal positivism from natural law is certainly at least as ambiguous as the old Hartian Separability thesis entailed by it. Yet, as often happens in the history of ideas, Separability thesis does not so much get refuted as it gets emptied and pushed aside: Neoconstitutionalist and postpositivist theorists simply find more interesting, here and now, the many connections between law and morals—the question of the necessity or contingency of such connections becoming less important or even irrelevant. At least from this point of view, neoconstitutionalism shows itself to be not a somewhat puzzling return to natural law but a form of postpositivism, superseding legal positivism by incorporating some of its premises.

Let us just take the three connection theses distinguished by Nino: the interpretive, the justificatory, and the identificatory one. The *interpretive* connection between law and morals is admittedly contingent—Nino and Moreso both argue it increasingly holds for *modern* law, a law distinguished from morality only in Western and modern culture, as opposed to non-Western and ancient and medieval cultures. At any rate, the process toward the moralization of law is a historical and a contingent one, as is the complementary process toward the legalization of morals (see Habermas 1992, chap. 3). The only way in which the interpretive connection thesis can appear necessary, i.e., true by definition, is if *interpretation* is defined in Dworkinian terms, with the ascription of meaning to legal texts collapsing into their moral justification—a very idiosyncratic definition of *interpretation* indeed.

The *justificatory* connection between law and morals, for its part, is something the legal positivists recognize: Law can make a *moral* claim such that citizens will obey it and judges will apply it only if it is morally just (cf. Raz 2004), or else if it is not intolerably unjust. Yet such a connection works itself out as an empty tautology (if something is morally binding, then it is morally binding), or as a mere truism (for who could deny that the law has to be morally just?), or still as a merely normative connection, necessary only in a broad, normative sense, as Alexy concedes to Bulygin (see Section 11.1 above). In fact, it is not only by virtue of a stipulated definition of *law* and *morality* that their justificatory connection can appear necessary, but also on the basis of the unity of practical reasoning, subordinating law to morals (cf. Raz 1990, 10–1; Marmor 2006)—the latter, however, proving to be only a naive form of value monism, a metaethical stance open to objections of value pluralism.[10]

[10] See Raz 1986, 395–7, and paradigmatically Berlin 1958. Oddly enough, the neoconstitutionalist theory seems to presuppose a form of value pluralism when it admits that constitutional values and principles are not arranged according to any stable hierarchy, a circumstance making necessary the constitutional argument called balancing or ponderation. Contrariwise, the neoconstitutionalist authors unproblematically adopt the Unity of practical reasoning, as most legal positivists do, too, except for Raz and, more recently, for Redondo (1996, 1998) and Barberis 2008b.

The *identificatory* connection between law and morals, finally, does not appear to be necessary, either, at least not in most of the senses in which the terms *law* and *morals* are commonly used in Western or developed societies today. Of course, and again, the two terms could by stipulation be defined in such a way as to render analytic the propositions entailed by such definitions—but a stipulated definition does not make for a solid basis on which to rest an argument aimed at demonstrating a necessary connection. And if, as is much more common today, we speak not of a definitional connection but of an identificatory one—a connection serving to identify the law in order to apply or study it—then this connection will appear *a fortiori* contingent: After all, the end of the constitutional state could well be that of extending the empire of law to a growing part of morals (Barberis 2012).

The foregoing connections may be contingent, to be sure, but that does not rule out for them a role important enough as to make it possible to build upon them an entire theory of law, be it neoconstitutionalist or postpositivist or even positivist. Especially in the civil-law tradition, constitutionalized law is often identified, justified, or interpreted by recourse to principles setting forth or deriving from moral values. But how to reconstruct these practices theoretically? How to define the relative concepts? What methodological rules to adopt? What ideological or moral assumptions to make, if any are to be made at all? Here the contemporary common-law discussion revolves around the so-called methodology problem, and in particular around the possibility of a morally neutral theory of law, but the broader discussion remains completely open-ended.[11]

The same facts—the multiple contingent connections between law and morals instituted by constitutional state—could be depicted in many ways, on the basis of different methodological and axiological premises. The legal positivist theorists, for example, could stay true to Weber's idea that a theory could remain *Wertfrei*, or value-*neutral*, even as it must inevitably be value-*oriented*, and depict these connections in terms of a *positivized morality* incorporated by constitutional principles. Conversely, the neoconstitutionalists theorists, having dismissed from the outset the idea that legal and moral theories can really be neutral and *Wertfrei*, could continue to consider such connections in terms of *moralized law*, in such a way as to make legal theory a province of the empire of morals. In these new, constitutional terms, perhaps, goes on the old, seemingly outdated, and in fact never-ending, debate between legal positivism and natural law: a debate where it would be time to get rid of its stereotypical positivist formulation, e.g., by rediscovering features of the natural law tradition misrepresented by Hart and his followers.

[11] To appreciate this fact, one need only think about the vaguely paradoxical solution offered in Raz 2004: The judges should always apply morals, and the alleged incorporations of morals into law—as through the constitution—would serve the peculiar function of modulating such application, expressly ruling out any and all possible exceptions.

Part Three

Legal Realism

Chapter 12

INTRODUCTION: CONTINENTAL LEGAL REALISM

by Edoardo Fittipaldi[*]

12.1. The Problem of Defining the Main Tenets of Continental Realism

In this introduction I shall attempt to sketch out the main tenets of Continental, or psychological, realism. To this end I shall chiefly refer to the positions of Axel Hägerström and Leon Petrażycki, who are the founders of Scandinavian and Polish-Russian legal realism, respectively.[1]

The convergence between the positions of these two authors has often been pointed out (see, for example, Banakar and Travers 2013, 16; Peczenik 2005a, 294; McCoubrey and White 1999, 179–81; Opałek 1973, 65).[2] This convergence between Petrażycki's and Hägerström's positions is all the more striking if we consider that neither knew the other's works and that they had completely different backgrounds: Petrażycki was a jurist trained in Germany during the last years of the *usus modernus pandectarum*; Hägerström was instead a general philosopher who took Boström's dogmatic idealistic philosophy as his point of departure (see Pattaro 2005, 335).

Their convergence, in my opinion, is not accidental, and it should be explained by noting that (1) the main tenets of Continental realism are closely connected to one another and that (2) Petrażycki and Hägerström were both consistent enough to drive these tenets to their *prima facie* most paradoxical consequences, without accepting compromises with the scientific or philosophical vogues of the day.

The same cannot be said of all their pupils. As regards those who studied under Petrażycki, Krzysztof Motyka commented that it "is difficult to remove the impression that almost all of Petrażycki's pupils, even Lande, sought to contain the radicalism and at the same time the amplitude of the conception of law [*prawo*] developed by the creator of the psychological theory of law" (Motyka 1993, 198; my translation). To some extent, this seems to hold also for Hägerström's followers, with the exception of Karl Olivecrona and A. Vilhelm Lundstedt.

[*] I wish to thank Corrado Roversi, Elena V. Timoshina, and Filippo Valente for their extremely valuable suggestions in critiquing an earlier version of this essay.

[1] On Hägerström see also Chapter 13 in this tome. On Petrażycki see also Chapter 18 in this tome and Section 16.2 in Tome 1 of this volume.

[2] Olivecrona's criticism of Petrażycki's theory (Olivecrona 1948) can be explained by the fact that Olivecrona did not have direct access to Petrażycki's writings. See, in this regard, Fittipaldi 2012a (12 n. 9). For a comparison between Petrażycki and Olivecrona, see Timoshina 2011.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_40

Therefore, I will not contend that *all* the authors presented in this section subscribe to *all* the tenets of Continental realism. I will sometimes point out some divergences, but my focus will be on convergences, so as to justify the concept of a *Continental, or psychological, legal realism*.[3]

To this end I will be referring not only to the positions of Petrażycki and Hägerström, but also to those of Jerzy Lande, on the one hand, and of Karl Olivecrona, A. Vilhelm Lundstedt, and Enrico Pattaro, on the other, since I consider all of them as consistent developers of these two different strands of Continental realism.[4]

These are the authors I will bear uppermost in mind in this attempt to characterize the *ideal type* of a Continental legal realist, thus introducing the present part of this Treatise.

12.2. *Realism*: A Term with Several Meanings

The term *realism* has many meanings in philosophy. In order to understand the sense in which it is used in the phrase *Continental*, or *psychological*, *realism*, we will first have to devote a few words to this possible range of meanings.

The broadest sense that can be given to *realism* is the following: *The assumption on the part of the Subject*[5] *that some objects*[6] *exist independently of the current experience he has of them* (cf. Külpe 1923, 186).

Different kinds of realism can be distinguished according to the kinds of objects the Subject assumes to exist independently of himself. These may be, among others,

1. physical objects;
2. psychic (or spiritual) objects;[7]

[3] The terms *Continental* and *psychological* are here understood as co-referential. A third option could have been to refer to these approaches by the term *Baltic legal realism*, but this term would have ruled out Enrico Pattaro's contribution.

[4] On the convergences between the conceptions of Leon Petrażycki and Enrico Pattaro, see Section 20.1.5 footnote 19 in this tome, and Timoshina 2011, 68–71.

[5] In this discussion the term *subject* will be uppercased when meaning "each of us as a solipsistic ego"; it will instead be lowercased when referring to the object of predication in a judgment.

[6] The term *object* or *object of thought* will be used here in the sense of "intentional object." The term *object* is to be understood as meaning "what is being experienced and/or represented by the Subject," regardless of whether the Subject believes that experience to be a perception—or an impression, in Hume's language (Hume 1985, sec. 1.1.1)—or a mere representation (what Hume would call an idea). The existence proper of some object lies in its being experienced by the Subject. This existence is to be kept apart from the independent existence being talked about in the text. Moreover, the term *independent existence* is not synonymous with *external existence*, considering that a psychic experience I have may be independent of me and yet not be external, as in the case of my sadness, my recollections, etc. As we will see below, Petrażycki and Hägerström both make use of some concept of object understood as an intentional object.

[7] Examples of philosophers for whom the whole of reality independent of the Subject is re-

3. historical events;
4. mathematical objects;
5. *langue* (as opposed to *parole*);[8]
6. universals;
7. moral values; or
8. norms, deontic objects (such as rights, obligations, and powers), or institutional objects (such as corporations, scriptural money, or Verdi's *Traviata*).[9]

Closely related to realism is the idea of *truth*, understood as *correspondence* between the representation of some object on the part of the Subject and its independent existence (Albert 1978, 39).

All legal realists, Continental or American, assume the *physical* existence of some objects (e.g., people, chairs, etc.).[10]

Continental legal realists also hypothesize the existence of *psychical* objects, but in so doing they claim that these objects should be ultimately explained in the terms of *physical* objects. According to them there is no *res cogitans* that cannot be explained in the terms of some *res extensa*. Some of them (like Petrażycki and Lande) also recognize the *historical* existence of physical and psychical entities. None of them, to my knowledge, addressed the issue of the independent existence of mathematical objects and language.[11] As for universals or moral values, virtually all of them rejected the view of their existence independent of the Subject. *Finally, and most importantly, all legal realists reject the view that there exists some realm, distinct from that of physical and psychical realities, where norms, deontic objects, and institutional objects exist*.

The rejection of this last view puts Continental realists at odds with the way jurists and most philosophers think about law. Hans Kelsen (1979, 90), for example, believed that norms belong to a special *Bereich der Normen* (domain of norms). Adolf Reinach (1989, 149; my translation) explicitly spoke of *Gegenstände einer außerphysischen und außerpsychischen Art*, meaning "objects of an extraphysical and extrapsychical kind."

ducible to psychical (or spiritual) realities are Leibniz (cf. Section 13.1.1 in this tome) and Berkeley (cf. Albert 1987, 47 n. 7).

[8] "In linguistics as in chess […] there are rules which survive all events. [These rules] are general principles *existing independently* [*existants independamment*] of concrete facts" (de Saussure 1916, 135; my translation, italics added). To be sure, this assumption that de Saussure (1916, sec. 1.1) makes can be understood as purely methodological, but a strict Continental legal realist will be suspicious of any careless use of terms such as *to exist*, let alone a phrase like *to exist independently*.

[9] On the possibility of analyzing musical works in much in the same way as institutional objects, see footnote 40 below.

[10] This is not to say that realists assume the physical existence of *any* object no matter what it may be. Thus, as far as I know, no legal realist has ever assumed that there exists an enormous cake, five kilometres across, floating on the Baltic Sea.

[11] But Petrażycki (1939, 62) seems to believe that objects of thought such as triangles do not exist outside the Subject.

The legal realist Enrico Pattaro (2005) has thoroughly described the *dualist ontology* of legal nonrealists in chaps. 1–4 of *The Law and the Right*, stressing that this ontology is typical of the civil-law tradition. But traces of this way of thinking can be found also in the common-law tradition. For instance, in a way that to a legal realist would sound utterly careless, Hohfeld speaks of operative facts that *call legal relations into being* (Hohfeld 1964, 27), or of *duties* that *continue to exist* (Hohfeld 1917, 743), or of *privileges* that *really exist* (Hohfeld 1964, 58), in this last case even making a double somersault, considering that in Hohfeld's construction privileges are supposed to be *inexistences* of duties.[12]

Continental legal realists could be also termed *legal reductionists*, but only so long as this term is properly understood. As will be shown below, Continental legal realists are far from erring on the side of a dismissive reductionism, by which term I mean the attitude where the philosophical or scientific problems raised by certain phenomena are dismissed simply by stating that they amount to "nothing other than" some other phenomenon. Continental legal realists are *careful reductionists*, not dismissive realists. This is why I prefer to use the phrase *to explain in the terms of* rather than the phrase *to reduce to* when speaking of the method used by Continental legal realists. By *explanation* continental realists understand *causal* explanation in a strict sense, be it deterministic or probabilistic.[13]

For Continental realists there is no other kind of explanation than causal explanation. In particular, no Continental realist would water down the concept of *causal explanation* to the ambiguous idea of *giving an account of something by pointing to its purported logical form*.[14] To a Continental realist, this talk of *accounts* and *logical forms* is simply nonsense if unrelated to causality.

[12] Indeed, it could be argued that the dualist ontology Pattaro refers to is a side effect of the development of legal formalism and is not necessarily restricted to Western societies (on the conditions for the development of legal formalism, see Weber 2010, 599ff.).

[13] The way Continental realists speak of causality seems to me to be compatible with a relaxed model of causation that, next to determinist causation, allows for *probabilistic causation*. According to the model of probabilistic causation adopted in social and biological sciences, in order for there to be a probabilistic causal connection, the following must hold: (α) $p(E|C) > p(E)$ or (β) $p(E|C) > p(E|\neg C)$. These formulations are reciprocally equivalent and can be read as follows: (α) the probability of effect-E if cause-C obtains is higher than E's general probability, and (β) the probability of effect-E if cause-C obtains is higher than its probability if cause-C does not obtain. For example, the probability of lung cancer is higher in smokers than in people in general, or in non-smokers in particular. This model can be used not only to predict future events but also to explain past ones. From this model it follows that deterministic causation is a limiting case of probabilistic causation where $p(E|C) = 1$. For an example of a Continental legal realist speaking in the terms of probabilistic causation, see Section 12.6 below.

[14] Here is an example of a such an "account": "In spite of the stunning variety of human forms of institutional social existence, I am convinced that there is a single logical principle that underlies all of the structures and a small set of ways in which the principle is implemented in actual institutions. The basic, and simple, idea is that all nonlinguistic institutional facts are created and maintained in their existence by speech acts that have the same logical form as Declarations" (Searle 2010, 122). I will be giving further reasons why John Searle's method can hardly be regarded as similar to that of Continental legal realists.

I said that to my knowledge no Continental legal realist ever claimed that language—understood as *langue*—exists independently of physical reality. A corollary of this contention is that language cannot be used to explain norms, deontic objects, or institutional objects. Since language is itself made up of norms, at least to some extent,[15] such an explanation would be circular.[16] What a legal realist can do with linguistic phenomena is compare them to legal phenomena (as in the case of Lande, see Section 19.5 in this tome). What instead *cannot* be expected of legal realists is that, in order to explain or reduce legal phenomena, they should make use of language as a sort of *deus ex machina* (this is a point I will come back to in Section 12.5).

12.3. Continental vs. American Legal Realists

As noted, Continental realists assume only the existence of physical objects. This is a feature they share with American realists, but that is where the similarities end.[17]

Continental realists assume that next to physical objects there also exist psychical ones. *These psychical objects exist exclusively within each individual's brain* and should ultimately be explained in terms of physical objects. This is not to deny, however, that psychical phenomena are organized according to their own *laws of organization* not immediately reducible to physical phenomena; or, stated otherwise, this should not be taken to mean that psychology is immediately reducible to neurology. In order to avoid misunderstandings, we should be clear that this contention is perfectly compatible with a monistic metaphysics that only recognizes the existence of physical objects. This holds even within the hard sciences. For example, to hold that chemistry is not immediately reducible to physics is not to deny that what exists *ultimately* comes down to atoms, quarks, and other such entities.[18]

Now, while according to Continental realists norms and deontic objects are in the first place *psychical* phenomena, according to American realists they can

[15] To the extent that language is not made up of norms, it is still made of psychical dispositions located within each individual's brain.

[16] Cf. Roversi 2007, 192ff., for a discussion of John Searle's claim that language is a special institution.

[17] On the alleged resemblance between Scandinavian and Americal legal realism, see Mindus 2009, 137 n. 9.

[18] In the same way, it can perfectly be argued that *the contention that sociology is not reducible to psychology is fully compatible with methodological individualism*. Hayek made that argument by drawing on the unintentional consequences of intentional actions and on the laws of organization of the former as against the latter: "If social phenomena showed no order except in so far as they were consciously designed, there would indeed be no room for theoretical sciences of society and there would be, as is often argued, only problems of psychology. It is only in so far as some sort of order arises as a result of individual action but without being designed by any individual that a problem is raised which demands a theoretical explanation" (Hayek 1955, 39).

be immediately reduced to *physical* phenomena. American realists do not contend that norms and deontic objects are located within each individual's brain: They rather contend that these entities are made up of the behaviours of qualified sets of individuals such as judges or officials.

For example, according to the founder of American realism, Oliver W. Holmes, to state the existence of a person's legal duty is tantamount to predicting that if this person does behave in a certain way, he or she "will be subjected to disagreeable consequences by way of imprisonment or compulsory payment of money" (Holmes 1897, 461). Holmes seems to make this point in order to distinguish law from morals, but the roots of his approach can be traced to the influence of Charles S. Peirce's pragmaticism, according to which, when considering objects in general, we are to "[c]onsider what effects, that might conceivably have practical bearings, we conceive the object of our conception to have," and "our conception of these effects is the whole of our conception of the object" (Peirce 1931–1935, 5.402). American realists do not ascribe any role to psychic phenomena when it comes the metaphysical question of the mode of existence of norms or deontic objects. Norms and deontic objects are made up exclusively of such physical phenomena as the taking of someone's goods or one's being locked up in a building for a while.

From a Continental realist's perspective, this approach contains two mistakes: (1) It fails to take the individual's *psychology* duly into account;[19] and (2) it reduces legal phenomena to the *activity of the courts* or of other officials.[20] As regards (2), I should anticipate that, as much as Petrażycki's and Hägerström's psychological conceptions of rights are quite different from each other, both contend that even though rights are illusions or fictions, they play a key role both in everyday life and in revolutions, and that they cannot in any way be reduced to the activity of some court. I will return on this point shortly.

12.4. Norms and Deontic Objects as Psychical Phenomena

If norms and deontic objects—such as rights, powers, and obligations—cannot be reduced to behaviours, what can they non-dismissively be reduced to?

Now, both Petrażycki and Hägerström held that a crucial role in the ontology of norms and deontic objects is played by emotions. But this is not to say that norms and deontic objects can be *directly* reduced to emotions.

[19] To be sure, Jerome Frank (1963) did take psychology into account, but not at a legal-metaphysical level.

[20] These two "mistakes" are not necessarily connected. Theodor Geiger, for example, made the first one without making the second (1964, 57ff.). On the other hand, Alf Ross, to take another example, made the second one without making the first (see Chapter 16 in this tome). An author who, at least to some extent, seems to have made neither of the "mistakes" mentioned in the text is Hart (1961). However, Hart cannot be viewed as a Continental realist *honoris causa*, and that is because of his "attitude of caution, and maybe even of suspicion, toward psychologism" (Pattaro 2005, 392).

As to Petrażycki, he holds that ethical emotions are a subclass of emotions. He defines norms as the contents of ethical judgments, and judgments for him are psychical acts (which as such are not necessarily linguistic). Ethical judgments have as their "minimal structure the representation of an action […] + an appulsive or repulsive […] emotion" (Petrażycki 1909–1910, 45; my translation; see Section 18.5 in this tome). As the *contents* of ethical judgments, norms cannot be identified with those judgments. I think that norms, in Petrażycki's conception, should be reconstructed as intentional objects.[21]

Hägerström's view is in many respects different from Petrażycki's. What Hägerström's conception has in common with Petrażycki's is that Hägerström also views norms as psychical phenomena. Hägerström identifies norms, not with feelings of duty, but with "states of consciousness of duty" (Pattaro 2005, 135). Moreover, according to Hägerström "the consciousness of an obligation […] results from a combination of *föreställning* ('representation') and a *viljeimpuls* ('conative impulse')" (ibid., 138). As for Hägerström's conception of *axiological acts*, they again resemble very much Petrażycki's *ethical judgments*, since Hägerström's axiological acts "appea[r] to be a combination between conceptions (*föreställningar*) and emotions (*känslor*)" (Mindus 2009, 99).[22]

Now, the similarities between Petrażycki and Hägerström are already striking enough to justify setting up a contrast between a psychological or Continental realism and a behaviourist or American one. And that is not where the similarities end.

First, even though Petrażycki and Hägerström both deny that norms can be reduced to commands, they both hold that the experience (or state of consciousness, in Hägerström's terminology) of the receiver of a command is akin to the experience of obligation (see Sections 18.3 and 13.3.4 in this tome). A difference between Petrażycki and Hägerström is that, while Petrażycki used this similarity as an *explicans* for other phenomena—and in particular the phenomenon of the folk belief that law is made up of commands (Petrażycki 1909–1910, 330; 1955, 158)—Hägerström viewed this very similarity as an *explicandum* (thus pointing to the mechanisms of primary and secondary socialization as possible explanations: see Section 13.5.1.2 in this tome).

Second, according to both thinkers, normative experiences are enshrouded in an aura of sacrality (see Sections 18.3 and 13.3.4 in this tome), with

[21] On the concept of an intentional object, see footnote 6 above. On the conception of norms as intentional objects, consider the following passage by Jerzy Lande (though he doesn't use a term like *intentional object*): "Norms do not belong to reality. […] They […] become an element of reality if they manifest [*się odbija*] themselves in the consciousness of the individual [*świadomość człowieka*]—if they are experienced by him. In this case a norm becomes the content [*treść*] of the individual's state of consciousness [*stan świadomości*], and this psychical state (psychical act, psychical experience) is a real phenomenon" (Lande 1959c, 913–4; my translation).

[22] See Mindus 2009, 35 n. 15, on why she prefers to translate *föreställning* with *conception* rather than with *representation*.

the minor difference that for Hägerström this is *often* the case, whereas for Petrażycki the mystic-authoritativeness of ethical emotions makes up their *differentia specifica* as against aesthetic emotions (ethical emotions and aesthetic emotions were both understood by him as normative emotions).

Third, and perhaps most important, both Petrażycki and Hägerström viewed legal phenomena as moral phenomena: In a Petrażyckian framework we could say that legal phenomena are a subclass of ethical phenomena (see Chapter 18 in this tome); in a Hägerströmian one we could say that the law in force is made up of norms and that the very idea of a right is a moral idea (see Sections 13.4.1 and 13.5.1.1).

For all these similarities, it bears mentioning here two slight differences between Petrażycki's legal realism and Hägerström's.

First, we saw that Hägerström talks of *viljeimpuls*. Now, Petrażycki would never have referred to ethical emotions by a term meaning anything like "will" (as does the Swedish *vilja*), for in his view ethical phenomena have nothing in common with volitional phenomena.

Second, according to Hägerström the idea of having a right conjures up feelings of moral empowerment and force (see Section 13.5.1 in this tome). From a Petrażyckian perspective, it could be argued that something close to the opposite is true. From this perspective, the experience of a right can be constructed as made up of the disposition of an individual (the so-called "right-holders") to react aggressively if some other individual (the so-called "duty-holder") behaves in a certain way (a behavior constructed as a "non-fullfillment" or "infringement").[23] In other words, while from a Hägerströmian perspective aggressive behaviour is a possible side effect of our experiences of rights, from a Petrażyckian one, it is our stable disposition to become aggressive under certain circumstances (i.e., when we construe those circumstances as a wrong done to us) that could be perhaps viewed as the very core of our experience of a right. For example, if a slave feels he has earned his right to freedom, the core of this phenomenon is not some belief in some supernatural power he earned but rather his novel disposition to behave aggressively toward his master in the case he claims his services.

At the end of the day, this difference is a minor one, as it did not prevent Lundstedt from investigating the conflict-producing nature of legal phenomena (see Chapter 15 in this tome) in a way that is quite compatible with Petrażycki's (see Section 18.8.6 in this tome).

Moreover, Petrażycki and Hägerström developed quite similar ideas regarding the way revolutions take place. For example, according to Hägerström, "American colonists were convinced that they had natural rights" (see Section 13.4.1 in this tome). According to Petrażycki (1909–1910, 498) the very same colonists were having intuitive legal experiences. But of course nei-

[23] See the longer discussion in Fittipaldi 2012a, 167ff., 176.

ther Hägerström nor Petrażycki held that rights as such exist in some reality external to, and independent of, the Subject.

12.5. From Projections, Objectifications, and Hypostatizations to the Epistemology of Continental Realists

If norms and deontic objects are psychical phenomena within the Subject, we may want to ask why they are experienced and linguistically referred to *as if they were something external to and independent of the Subject*. Petrażycki and Hägerström answer this question in more or less the same way as was done more than one and a half century earlier by David Hume (and subsequently by several other supporters of emotivism[24]). They contend that norms and deontic objects are experienced in this way because, in Hume's own words, "the mind has a great propensity to spread itself on external objects, and to conjoin with them any internal impressions, which they occasion, and which always make their appearance at the same time that these objects discover themselves to the senses" (Hume 1985, 217).

To my knowledge, David Hume did not use any specialized term to refer to this psychological phenomenon, while Petrażycki and Hägerström did: The former used *proekcija*, meaning "projection",[25] while the latter used *objektivering*, meaning "objectification" (see Sections 18.4 and 13.2.3 in this tome).[26] It is remarkable that Tore Strömberg uses the term *emotionell projection* (emotional projection: Strömberg 1980, 48; cf. Section 17.1 in this tome)—a term that perfectly coincides with Petrażycki's *ėmocional'naja proekcija*.

In this way most Continental realists attempted to explain the naive belief in the external existence of such deontic objects as obligations, rights, powers, etc.

Continental realism's explanation of deontic objects in terms of psychic processes should not be understood as a dismissive reduction as previously defined. To use Pattaro's words, "Hägerström is too careful a realist, in considering concepts that have no correspondence to effectual reality, to simply replace them with factual or empirical notions. He rather examines these concepts and develops their implications so as to come at the function they fulfil, however empirically unfounded these concepts may be" (Section 13.5.2 in this tome). This approach proved very fruitful from a heuristic point of view, as it enabled

[24] See Mindus 2009, 97 on the narrow sense in which Hägerström can be called an emotivist.

[25] In addition to the term *proekcija*, Petrażycki also used the *illjuzija* (illusion). See Fittipaldi 2012a, 18 n. 19.

[26] Hägerström would sometimes also use the term *fiktion* (see Section 13.5.1.2 in this tome), a term never used in this context by Petrażycki. Mindus (2009), in her discussion of Hägerström's ideas, uses the term *reification* (cf. 44 n. 59). As an original developer of Scandinavian realism, Enrico Pattaro uses the term *hypostatization* (Pattaro 2005). It is worth pointing out that the terms *hipostaza* (hypostasis) and *gipostatirovanie* (hypostatization) were used by Lande and Lazerson, respectively (see Sections 19.2 and 20.1.3 in this tome).

Scandinavian realists (first among them Hägerström and Olivecrona) to investigate the connections between legal thinking and magical thinking—a connection that had already been hinted at by that "Continental" legal realist that was David Hume, if Scotland can be considered as part of the Continent! (see, e.g., Hume 1985, sec. 3.2.4).

Unlike Hägerström, Petrażycki has a more resigned attitude to the non-scientific terminology of traditional legal science.[27] According to Petrażycki, there has been such a complete adjustment to the projective point of view that to start an examination of the problems of law and morals (i.e., ethics, in his terminology) from the teaching of scientific psychology would be to raise difficulties of thinking and of language and in substance to "talk in an incomprehensible language" (see Section 18.5 in this tome). Using the projective terminology, from a Petrażyckian perspective, seems to be a necessary evil.[28] But the fact that Petrażycki did not insist on getting rid of the projective terminology is perhaps closely related to the way he conceived the very process of thinking as something that takes place within the Subject and is detached from external reality. This might also explain why he does not seek to explain legal beliefs by recourse to the hypothesis of magical thinking among people.

Petrażycki sharply distinguishes the psychic reality internal to the Subject from the reality external to the Subject, be it psychical or physical. According to him, if the Subject represents Zeus to himself and attributes to Zeus the predicate of being king of Olympic gods, thus producing a judgment (in a philosophical sense), then *Zeus does exist somewhere*—namely, within the Subject's psyche—and Zeus's external existence or inexistence is totally irrelevant when it comes to assessing the meaningfulness of the statement expressing that judgment (Petrażycki 1908, sec. 2; 1955, sec. 2).[29]

Unlike Hägerström Petrażycki did not adopt a specific *terminology* to the goal of distinguishing the internal reality of an object of thought within the Subject from its external reality. Depending on the context, Petrażycki used the noun *dejstvitel'nost'* and the adjective *real'nyj* to refer to Hägerström's *Realität* and *Wirklichkeit* alike, the former denoting the internal reality of an object of thought, the latter its external existence (see Chapter 13 in this tome).[30]

[27] Still another attitude can be found in Lundstedt (see Section 15.1, footnote 18).

[28] On Znamierowski's criticism of Petrażycki's theory in this connection, see Section 18.4 in this tome.

[29] Petrażycki does not use any term meaning "meaningfulness." He refers exclusively to the sphere of existence of the subject of some judgment.

[30] I am following Pattaro. Contra Mindus 2009 (32 n. 6; 55–9). As for Petrażycki, consider the following passage: "следует избегать ошибки, состоящей в принятии за реальное того, что представляется существующим во внешнем по отношению к переживающим такие процессы мире, и иметь в виду, что соответственные реальные феномены имеются в психике того, кто переживает такие, вводящие в заблуждение, психические процессы и только в его психике" ("the mistake should avoided of taking for *real* [*real'nyj*] what is represented as existing in the world external in reference to the experiencer of cer-

Even so, when Petrażycki uses terms like *object of thought* (*przedmiot myśli*, *predmet mysli*) or simply *predstavljamoe* (i.e., the present passive participle of the verb *predstavliat'*, to represent), he means "intentional object" (see Timoshina 2012, Sec. 3.3).

Since a distinction like the one Hägerström draws between *Realität* and *Wirklichkeit* plays a central role in Petrażycki's thought, too, in order to better compare Petrażycki's thought with Hägerström's I will henceforth use the terminology Enrico Pattaro uses to render Hägerström's distinction in English: I will thus use *logical reality* (*Realität*) in contrast to *effectual reality* (*Wirklichkeit*). This is all the more justified because, when Petrażycki discusses the judgment expressed by the statement "Zeus is king of the Olympic gods," he repeatedly stresses that the issue is where the *logical* subject (*logičeskij sub"ekt*) of the judgment lies (*nahoditsja*).[31] Since Petrażycki ascribes some sort of reality to logical subjects—a reality that is not the reality external to the Subject—it is not too long a stretch to call this reality a *logical* reality.[32]

With that said, we can now go back to Petrażycki's example of Zeus as king of the Olympic gods.

According to Petrażycki, Zeus logically exists within the Subject's psyche.

Now, Petrażycki seems to conceive the Subject's projective fantasy as more powerful than Hägerström does, and that—it bears stressing—may be why he did not go the way of the hypothesis of magical thinking to explain deontic and institutional objects.[33]

In order for a merely logically real object to be experienced as effectually real by the Subject, it suffices that the Subject believe in its existence, even

tain processes; it should be borne in mind that the corresponding *real* [*real'nyj*] phenomena take place only in the psyche of him who experiences the psychical processes conducive to mistake, and only within his psyche": Petrażycki 1908, 24; my translation, italics added). Here, the first *real'nyj* means "external to the Subject," whereas the second one means "internal to *that* Subject" but external to Leon Petrażycki—understood as the Subject producing the corresponding judgement.

[31] He also distinguishes the logical subject of a judgment from the grammatical subject (*grammatičeskoe podležaščee*) of a statement through which that judgment may be expressed (e.g., Petrażycki 1908, 27).

[32] It should be recalled in this connection that Elena Timoshina has hypothesized a possible influence on Petrażycki by Brentano, Husserl, and Meinong (Timoshina 2012, sec. 3.3; see also Section 20.1 in this tome), while Enrico Pattaro has advanced the nearly perfectly parallel hypothesis of a possible influence on Hägerström by Meinong (Pattaro 1974b, 43; Mindus 2009, 50). Of course, neither Timoshina's hypothesis nor Pattaro's can be ruled out. But I think that neither is strictly necessary. Hägerström and Petrażycki might have arrived at the same conclusions independently of each other as well as independently of anyone's influence, considering that the reality of intentional objects is a problem every philosopher inevitably faces as soon as he or she gives serious (nondismissive) thought to the issues raised by negative judgments or by such nonexternally existing objects as norms, deontic objects, and institutional objects.

[33] See, for example, the way Petrażycki addresses the issue of juristic persons (Section 18.7 in this tome).

if that belief is mistaken.[34] This seems to imply that if the Subject realistically endows some objects of thought with certain properties, these *merely logically real* properties must be taken seriously even if they are not also *effectually* real. This is why among the many objections Petrażycki raises against the attempt to reduce obligations to volitional phenomena, there is the objection that "the will is a psychic transitory phenomenon, while obligations [are represented by the Subject] as something continuous that does not exist only when the obligated person is thinking about them" (Petrażycki 1909–1910, 358–9; my translation).[35]

The consequence is that, while from a Petrażyckian perspective legal illusions must be explained by drawing on the general laws concerning the functioning of the human psyche, from a Hägerströmian one, legal illusions must be explained by recourse to more specific laws concerning magical thinking or the role that legal illusions play in the functioning of society.[36]

These differences, relevant as they may seem at first glance, become suddenly negligible if we just recall the American realists' dismissive realism discussed in Section 12.3.

A different kind of dismissive realism that bears mentioning here is the linguistic reduction of analytic philosophy of law that Enrico Pattaro (2005, sec. 9.1) called *Analytical Emasculation*. To Hägerströmians and Petrażyckians alike, the very idea that legal phenomena can be "accounted for" in terms of prescriptive propositional contents, or at any rate as linguistic entities, is simply incomprehensible. Indeed, "[i]f legal norms were *merely* the propositional contents of enacted texts, that is, mere linguistic entities, they would not and could not be motives of human behaviour" (Pattaro 2005, 188–9).

Moreover, for Continental realists there are plenty of legal phenomena that are not expressed linguistically. Legal phenomena are not made up of linguistic phenomena.[37]

The linguistic conception of legal phenomena typical of analytic philosophy of law is probably the fallout of the *desperate quest* of logical positivism for something directly observable to which to dismissively reduce legal phenomena. The legal philosophers who did not adopt the behavioural approach con-

[34] This is what Petrażycki calls a *realistic representation*, as opposed to a fantastic one (see Section 18.6.1 in this tome).

[35] A different reconstruction of this passage can be found in Motyka 1993, 111.

[36] The difference between Petrażyckians and Hägerströmians as regards the possible connections between magical thinking, the functioning of the human psyche, and legal thinking may appear slighter if we adhere to Sigmund Freud's hypothesis that magical thinking stems from the child's omnipotence of thoughts (*Allmacht der Gedanken*) (Freud 1966, 85; Fittipaldi 2012a, 76 n. 29).

[37] This makes Continental realism more compatible with the methodology of comparative law developed by the Italian jurist Rodolfo Sacco (1991) than with analytic philosophy of law. In particular, Petrażycki's concept of a normative fact is similar to Sacco's concept of a legal formant.

sisting in reducing legal phenomena to behaviours accessible to direct observation decided to instead reduce them to linguistic phenomena. In this way, analytic philosophers often immunize the investigation of legal phenomena from potentially fruitful cross-contaminations with psychology, sociology, anthropology, ethology, etc. (on the origin of this attitude in analytic philosophy, see esp. Albert 1991: 146, 174). Closely related to this attitude is the anti-psychological bias of analytic philosophers: If legal phenomena must be reduced to something observable (such as spoken or written words), it goes without saying that they cannot be explained in terms of psychical phenomena, since these phenomena are not *directly* observable.

To such an objection a Continental realist could probably reply by asking whether anybody has ever been able to observe neutrons. For although neutrons are not *directly* observable, this does not prevent us from hypothesizing their existence in order to explain *other* phenomena, ones that do lend themselves to direct observation.

Now, if one does not accept logical positivism and its subsequent degeneration into the analysis of *Sprachspiele* (language games) Popper and Albert's critical rationalism provides an alternative under which to hypothesize entities not amenable to direct observation, provided that experiments are *looked for* by which to prove their hypothesization wrong: Albert (1991) calls this the *Prinzip der kritischen Prüfung* (the principle of critical testing). In the framework of critical rationalism, first come the hypotheses, then the search for ways to test them.

This is one of the many reasons why the epistemological ideas of Continental legal realism—despite their "home-made" nature—are definitely more compatible with Popper's and Albert's critical rationalism than with any other epistemology proposed in the 20th century.[38] American legal realism is instead more compatible with (and indeed stems from) American pragmatism/pragmaticism, while analytic legal philosophy is obviously more compatible with logical positivism and its subsequent linguistic turn.

Critical rationalism has nothing to object to the conjecturing of psychical entities, inaccessible to direct observation.[39] This epistemology only recommends that we *search for* ways to test conjectures, thus making them into full-fledged testable scientific hypotheses. But according to critical rationalism, that a way to test a conjecture has not yet been found does not imply that the conjecture is in any way unimportant, insignificant, or nonsensical (Popper 1969, 50ff.; Albert 1987, 107). If we are to find a way to test a theory, we have

[38] In this connection it is worth recalling that Hägerström and Petrażycki criticized induction with similar arguments. These arguments, in turn, are quite similar to Popper's (on Hägerström and Popper see Mindus 2009, 64; on Petrażycki and Popper see Timoshina 2013a, 87–8, in particular n. 31).

[39] On this matter, see also Fittipaldi 2012a, sec. 3.7.

to first be able to understand it. That is to say that before a way can be found to test whether a theory corresponds to any effectual reality, that theory must exist in the Subject's logical reality.

Moreover, hypotheses about phenomena external to the Subject (and possibly internal to some other Subject) should be capable, not of verification, but of falsification. This means that it suffices to state certain conditions under which those hypotheses would be proven false (conditions of falsehood). It is hardly necessary to stress why this epistemology is the only one that is compatible with the sometimes wildly adventurous way Continental legal realists address normativeness as a psychical phenomenon and refuse to dismiss the illusions resulting from such phenomena with some "nothing other than" formula.

12.6. Caution and Suspicion Toward Performatives

The Continental legal realists' quest for causal explanations makes them very cautious when it comes to performatives.[40] No Continental legal realist would ever subscribe to the statement that it is possible to do things with words. For example, according to the scientific view of the world—to which Continental legal realists adhere—no supersensible, spiritual bond between a man and a woman is really established through the utterance of a few words before an official (Olivecrona 1971, 238). As Pattaro writes in regard to Hägerström, "a realist like [him] cannot regard words capable of creating (or modifying or extinguishing) anything, much less any 'mystical powers' (such as rights) and constraints (such as duties)" (Section 13.5.2 in this tome; see also Pattaro 1981). This holds for whatever *legal effects*. According to Scandinavian legal realists, legal effects as such do not exist, so there is nothing that performatives can, as such, call into being. As Torben Spaak has pointed out, Olivecrona "maintains, in keeping with his belief that there is no such thing as binding force, that there is no legal effect to be found—there is only the psychological fact that people tend to *believe* that there is a legal effect, and, of course, the (sociological) fact that they tend to *act* accordingly" (see Section 14.2 in this

[40] Closely related to the issue of performatives is the phenomenon of constitutiveness. From a Continental-realist perspective, constitutiveness amounts to bringing about *types* by means of hypotheses (*Tatbestände*) of normative convictions, or norms (Pattaro 2005, 18; cf. Lande 1959c, 934 as regards the rules concerning the drafting of valid wills). Of course, there is no reason to restrict *types* to hypotheses of hypothetical norms. For instance, even Verdi's *Traviata* can be understood as a type capable of instantiation. See in this regard Pattaro (2005, 18ff.), who makes the example of Shakespeare's *Romeo and Juliet*, as well as Znamierowski (1922, 47ff.), who extensively likens musical pieces to legal objects (*przedmioty prawne*). As for Znamierowski, an issue that cannot be discussed here is whether he was successful in explaining the alleged continued existence of musical pieces and legal objects without betraying his realist metaphysics (cf. Section 20.2.1 in this tome).

tome). Very much in line with Hägerström, Olivecrona further connects this tendency to a belief in magic.

Petrażyckian legal realists never explicitly addressed the phenomenon of performativity, to be sure, but their attitude to these phenomena can easily be illustrated by reading what Petrażycki and Lande maintained in regard to the precise moment when a newly "promulgated" statute comes into force or when a "repealed" statute ceases to be in force. According to Petrażycki,

> [t]he usual pieces of information concerning the being in force of statutes—the moment when they come into force, their further continuation in force until the moment of their repeal […]—are […] nothing other than information about what is *prescribed* by the current legislation as *obligatory*, and the corresponding provisions are taken as theoretical truths. From a factual-theoretical point of view it is absolutely impossible to state that provisions duly enacted and published necessarily and everywhere begin to be binding from that precise moment, that they are binding everywhere until the moment of their repeal, etc. (Petrażycki 1909–1910, 539; my translation adapted from Petrażycki 1955, 257)

As Jerzy Lande would subsequently maintain, there is nothing to prevent some statute from not being experienced as binding by the whole of society or in certain milieus thereof despite its having been formally enacted in accordance with the constitution, or some other statute from being still experienced as binding by the whole of society or in certain milieus thereof despite its having been formally repealed in accordance with the constitution (cf. Lande 1959b, 865).[41]

The difference between the Hägerströmian and the Petrażyckian view of legal performatives can be summed up as follows. Hägerströmian legal realists emphasize the superstitious beliefs that make it possible for performatives to produce social effects. Petrażyckian legal realists instead emphasize that to claim performatives to produce social effects with infallible regularity is simply to confuse ought with is. "Promulgated" statutes do not unfailingly begin to be experienced as binding everywhere in society immediately upon being "promulgated." By the same token, "repealed" statutes do not unfailingly cease to be experienced as binding everywhere in society immediately upon being "repealed." To hold otherwise is simply to take an ought for an is.

The difference here lies in the scientific focus rather than in the conceptions being put forward. Hägerströmian realists stress that the valid enactment or repeal of a statute affects the *probability* of its being experienced as binding (cf. Pattaro 1974b, 101; 2005, 141),[42] while Petrażyckians stress that there can be plenty of cases where legal-dogmatic statements about a statute's being in force or its no longer being in force *diverge* from the scientific statements in this very regard.

[41] Of course, Lande is adopting Petrażycki's definition of *statute*, a definition that is independent of its possible *Verfassungsmässigkeit* (its having been passed in accordance with the constitution). See Section 18.10.1 in this tome.

[42] On probabilistic causation, see footnote 13 above.

These two approaches are perfectly compatible: The Hägerströmian approach enriches the Petrażyckian one by calling attention to the way that using certain formalities may affect the probability of certain psycho-sociological phenomena—an aspect that Petrażyckians tended to overlook; the Petrażyckian approach, for its part, enriches the Hägerströmian one by calling attention to the role of legal dogmatics as a science at the service of the principle of legality, a science aimed at providing cognitive tools with which to assess whether or not officials and people at large are complying with a certain constitution.[43]

To conclude this section, I think it is in order to recall Olivecrona's argument that "*from a modern point of view* it would seem absurd to assert that words could have the power of creating effects of any […] kind [other than] psychological effects" (1971, 238, italics added). Elsewhere Olivecrona remarked that "[i]n the ideal world of law, the effects take place according to the law with infallible regularity. In the empirical world of facts, the effects of legal rules, transactions between individuals, the attitudes of people in general, etc. are varied and more or less uncertain" (ibid., 253). Among these empirical-world effects there may also be the psychological coming into force (or repeal) of some statute in some individual's brain as a consequence of an act of promulgation by a head of state.

As for the perspective of Polish-Russian realism, to maintain that performatives can produce their effects immediately and everywhere (within a given country, or even all over the world) would amount to maintaining that it is possible to violate an important principle of physics—that of *locality*—, under which an externally existing entity is influenced directly only by its immediate surroundings. This principle excludes that a promulgation by a head of state can produce any effect anywhere any earlier than the time that light would take to get there. This kind of strict physicalist argument—if not fully explicit—is typical of both Petrażycki and Lande (see Section 19.4 in this tome).

Now, Continental legal realists are committed to the hard sciences.[44] This means that if the hard sciences rule out that such phenomena as "spooky actions at a distance" (*spukhafte Fernwirkungen*)[45] are at work when a head of state promulgates statutes, they will refuse to adopt such hypotheses.

[43] No need to stress that this different focus may have been owed to the different socio-legal situation in Russia and the Scandinavian countries in Petrażycki's and Hägerström's time. See in this regard Section 18.12 in this tome.

[44] In this connection it is worth recalling the different stances of Hägerström and Petrażycki towards Einstein's theory of relativity. Hägerström appreciated its importance but was critical of it (see Mindus 2009, 220 ff.). Petrażycki instead accepted it and discussed whether it provided arguments for Wundt's *generalisierende Abstraktion* and against his own theory of classes (Petrażycki 1939, 66).

[45] I am hinting at Einstein's scorn for the hypothesis of quantum entanglement, the phenomenon where a pair of particles interacts in such a way that one particle's quantum state (e.g., a clockwise spin) always correlates with that of the other (e.g., a counterclockwise spin), and vice versa—regardless of their distance. That is the case even when the measurements of these quantum states are taken more quickly than light can travel between the sites of measurement.

But since, as just noted, Continental legal realists are committed to the hard sciences, if phenomena of spooky actions at a distance were shown to occur even in realms *other than* quantum mechanics, a Continental realist would be ready to consider such spooky phenomena in order to *explain* the action of performatives.[46] In the meantime, however, Continental realists prefer to explain the action of performatives by recourse to the more conventional tools provided by psychology, anthropology, sociology, and the neurosciences.

12.7. Truth vs. Correctness

It was previously said that closely related to every sort of realism is the correspondence theory of truth. *A certain representation within the Subject is true if the external reality corresponds to it.* In other words a representation is true if it exists not only within the internal reality of the Subject but also in the reality external to him. This holds as well for the proponents of Continental realism.

As for Petrażycki, his adoption of the correspondence theory of truth is explicit. He explicitly defines truth and falsity as *zgodność* and *niezgodność z rzeczywistością* (accordance and nonaccordance with reality: Petrażycki 1939, 36). According to him truth and falsity can be predicated exclusively of *objective-cognitive judgments* (*sądy obiektywno-poznawcze*). That is how he calls judgments about what exists outside the Subject and how it exists, regardless of the Subject's attitude to it. This kind of judgment he set in contrast to the subjective-relational kind. *Subjective-relational judgments* (*sądy subjektywno-stosunkowe*) concern the Subject's attitude to something externally existing or imagined.[47]

According to Petrażycki both normative and legal-dogmatic judgments are subclasses of subjective-relational judgments and so are not capable of truth (ibid., 111). Moreover, according to Petrażycki, normative and legal-dogmatic judgments are often not just devoid *of truth-capability* but are also plainly *false*. That is the case when they are formulated as if they concerned the reality external to the Subject, thus conveying the erroneous information that they are about something existing outside the Subject himself.[48] Petrażycki is

[46] Another possibility would be to hypothesize a sort of *quantum legal theory* that, instead of hypothesizing *new kinds* of spooky actions at a distance, would *directly draw* on quantum entanglement to explain the effects of performatives, much as has been attempted in quantum biology in order to explain the ability of birds to navigate the planet's magnetic fields (magnetoreception). But there would still be a huge difference between performatives and birds. While it is true that birds have the ability to navigate the planet's magnetic fields, it is simply false that performatives produce their effects immediately and everywhere. Therefore, according to the Continental realist view, there is simply no phenomenon whatsoever requiring an explanation.

[47] On this distinction, see Sections 19.2 and 20.1.2 in this tome.

[48] "It should be observed that subjective-relational judgments and statements are often for-

thus close to the so-called error theory (cf. Mackie 1977b), but in making that comparison we have to be clear that in Petrażycki's view subjective-relational judgments themselves are not false: They are just incapable of truth (cf. Lande 1959a, 828 n. 11). What is false, according to Petrażycki, are those subjective-relational judgments formulated *as if* they were objective-cognitive ones.

Jerzy Lande, too, explicitly maintained that subjective-relational judgments and in particular legal-dogmatic ones are not capable of truth. But he showed that, despite their truth-incapability, they have conditions of foundation (*uzasadnienie*) or correctness (*słuszność*),[49] which conditions *indirectly* connect their being-founded or correctness to the reality external to the Subject (Lande, Sec. 4).

As for Hägerström, he seems to have espoused a conception of truth quite compatible with the correspondence theory of truth. Truth is where the content of a representation not only is logically real (i.e., existing within the Subject) but also belongs to that wider complex that is spatiotemporal reality (see Section 13.2.2 in this tome).[50] Unlike Petrażycki, however, Hägerström did not hold that normative judgments are incapable of truth or that they are false: He instead held that they are contradictory (see Section 13.2.3 in this tome).

More in general, Hägerström rejected any attempt to define judgments without taking effectual reality into account (see Section 13.2.1, footnote 12 in this tome). He would therefore have rejected Petrażycki's concept of a subjective-relational judgment.

The question of whether legal-dogmatic statements are capable of truth or correctness received careful analysis by Karl Olivecrona. As a legal realist he rejected their truth-capability, but then he asked what kind of information is conveyed by a statement such as *Mr. X is president of the republic Y* (Olivecrona 1971, 256).

mulated as if they were [*jakby to były*] objective-cognitive ones, such that […] errors [*błędy*] are possible" (Petrażycki 1939, 36; my translation).

[49] In Lande 1925a, 343, this term (*słuszność*) is used in more or less the same way as Olivecrona does. On that very page Lande also uses the adjective *słuszny* (correct), but within quotation marks. Even Petrażycki, in his posthumous notes on the foundation of logic, maintained that *subjective-relational statements and judgments* (which, it bears reiterating, include *legal-dogmatic* ones) are capable of *słuszność* (correctness) and *niesłuszność* (incorrectness), despite their truth incapability. But we do not know what Petrażycki meant by these terms. As for Lande, it should be observed that he was less consistent than Olivecrona in using the terms *słuszność* and *niesłuszność* (e.g., Lande 1925a, 342). Indeed, Lande preferred to use the general term *uzasadnienie* (foundation) and then point to different kinds of foundation. The contention that norms are not capable of truth or falsity, but are instead capable of *słuszność* and *niesłuszność*, was made explicitly by another pupil of Petrażycki, Jerzy Sztykgold (1936, quoted in Conte 1993, 108).

[50] Mindus (2009, 61) seems to contend that the question of whether Hägerström held a correspondence theory of truth "misses the point." Nonetheless, it seems to me that the way Hägerström understands truth is more compatible with the traditional correspondence theory of truth (*adaequatio rei et intellectus*) than with any other theory of truth that I know of, such as the coherence theory, the pragmaticist theory, the consensus theory, or the all too broad conception adopted by Hart (see Section 12.7 below).

As a typical Continental legal realist, Olivecrona rejects any kind of dismissive reductionism, and in that spirit he shows that the meaning of *Mr. X is president of the republic Y* cannot be reduced to the fact that Mr. X has been elected in accordance with certain procedures, nor can it be reduced to his having certain powers under the constitution. Since Olivecrona takes naive legal thinking seriously, it is easy for him to show that we can naively *believe* that (B) someone's being president is the *effect* of (A) his having been duly elected, and so that the former circumstance (being president) cannot be reduced to the latter (having been elected), for one thing is to believe that B is the effect of A, quite another is to believe that B *is nothing other than* A. By the same token, we can naively *believe* that (C) Mr. X has certain powers, because (B) he is the president. But, similarly, we cannot equate (B) the cause of something with (C) its effect, for one thing is to believe that B is the cause of C, quite another is to believe that B *is nothing other than* C. Olivecrona also observes that in these cases an important role is played by the "mediating idea that words signify super-sensible entities and qualities" (ibid., 258). This statement makes room for a conception on which, even though legal-dogmatic terms are devoid of extension (that is, they lack reference: ibid. 255), they are not thereby meaningless: They *do signify*, even though what they signify is incompatible with modern scientific knowledge. (It goes without saying that this is compatible with both the Scandinavian approach, which is to explain these beliefs in terms of magical creeds, and with the Petrażyckian approach, on which all these phenomena are normal denizens of the internal, or logical, reality of the Subject.)

Now, according to Olivecrona, as much as descriptive legal-dogmatic statements may be incapable of truth, they are capable of correctness.

> The correctness of [descriptive legal-dogmatic] statements cannot be empirically ascertained. It is no empirical fact that I own a certain house, that A owns a car, that M and W are married, that C is a judge, or that D is president of a country. All such statements are based on the assumption of a system of rules regulating among other things the mode of acquiring a right of property, concluding marriage, appointing judges, and electing a president. The statements can only be judged as correct or incorrect according to these rules. Without reference to the rules the question about correctness would be meaningless. (Ibid., 259)

According to Olivecrona, "*the distinction of truth and correctness is of vital importance*" (ibid., 265, italics added).[51] Indeed, this distinction pertains to the very core of Continental realism, be it Hägerströmian or Petrażyckian.

Now, explaining how different Subjects can have similar opinions about the correctness or incorrectness of the same legal-dogmatic statement is a serious challenge for a self-consistent Continental realist. Since this issue is crucial, I will go into some detail.

[51] But see Spaak 2011, sec. 9; 2014, chap. 13.

Consider descriptive legal-dogmatic statements like the following:

1. Madman$_1$ is emperor of China (ibid., 266).
2. Madman$_2$ is king of the moon (Lande's example, see Section 19.4 in this tome).
3. Barack Obama was president of the United States in 2010.

What does the correctness or incorrectness of these statements consist in? How is it possible to arrive at some *intersubjectivity* about their correctness or incorrectness? This is a serious question because these statements do not refer to anything existing outside the Subjects that—thanks to its *objectivity*—may bring about some convergence of opinion. That is the way we usually explain how (*pace* Feyerabend 1975) Copernicus eventually convinced the world that it is the earth that revolves around the sun, and not the other way around. But how are we to explain that some degree of social convergence obtains in regard to the correctness and incorrectness of (1), (2), and (3)?

To answer this question Olivecrona has recourse to the *deus ex machina* of the *regularized use of language*, in this respect coming close to John Searle (though without the latter's further disputable *deus ex machina* of collective intentionality). In other words, in Olivecrona the social phenomenon of convergence about the correctness or incorrectness of certain descriptive legal-dogmatic statements is explained through other social phenomena, prominent among which is the aforementioned regularized use of language.

Lande's answer (quite sketchy, to be sure) is instead based on the idea that the correctness of a truth-incapable statement, such as a legal dogmatic statement[52], depends on a combination (*konjunkcja*) of two truth-capable statements: A semantic one and a historical one (see Section 19.4 in this tome). Lande thus presupposes both (1) the *existence of linguistic regularities*[53] and (2) *historical realism* (i.e., the objective historical existence of past events).[54] This is to say that the social phenomenon of convergence in regard to the correctness or incorrectness of certain legal-dogmatic statements is explained by Lande not only through other social phenomena, such as linguistic regularities, but also through an extended realism inclusive of historical realism.

[52] To be sure—as previously noted in this section—from a Petrażyckian perspective legal dogmatic statements, if formulated in a "projective" language, are not simply truth-incapable but completely false. Nonetheless this does not deprive them of the capability of being founded in some way.

[53] To avoid misunderstandings it should be stressed that Olivecrona's *regularized use of language* seems to be something different from *linguistic regularities*. By this latter term I mean such basic phenomena as the ability of certain terms to bring about more or less similar representations in different Subjects. Such hypotheses can be empirically tested in several indirect ways (see, for example, Rosch 1975 as regards terms such as *vehicle*—a term the readers of Hart will be familiar with).

[54] The term *historical realism* is mine, but the concept can be found as early as in Külpe 1923, 187, where *Realismus* is characterized as resting on the assumption of a *reale Außenwelt* (a real external world), a *reale Innenwelt* (a real internal world), and *historische Begebenheiten* or *geschichtliche Ereignisse* (historical events).

Despite these differences between Olivecrona and Lande, Olivecrona's distinction between truth and correctness is vital to Continental legal realism, be it Scandinavian or Polish-Russian. This is one more reason why Hart cannot be considered close to Continental realism. In "Definition and Theory in Jurisprudence" Hart contended that what I call legal-dogmatic statements are capable of truth, *provided that the conditions are specified under which the statement is true* (Hart 1983a, 33 and passim)—and this contention was roundly criticized by Olivecrona (ibid., 262ff.).

Continental legal realists take reality seriously, and with it they also take seriously the concept of truth as correspondence. Reducing truth to the fulfilment of truth conditions is one of the main tenets of logical positivism, pragmatism, and instrumentalism, and so on.[55] But these tenets are hardly compatible with the epistemological conceptions of Continental realists. The concept of truth is independent of the conditions of truth, because without the former it would be impossible to set out the latter: We must first understand what the truth of a judgment is (where a judgment is understood as a process taking place within the Subject); only then can we devise ways to test whether that judgment is true or false (that is, whether it corresponds to some external or effectual reality).[56]

This is one more reason to argue that the homemade epistemology developed by Petrażycki and Hägerström is more compatible with Karl Popper and Hans Albert's than with any other 20th-century epistemology.

12.8. The Main Tenets of Continental Realism and How They Are Reciprocally Connected

We can sum up the foregoing by stating that an ideal-typical Continental legal realist supports the following tenets:

1. physicalist monist realism;
2. the distinction between internal (or logical) and external (or effectual) reality;
3. the correspondence theory of truth;
4. the distinction between the concept and the criteria of truth;
5. the stance against dismissive reductionism of normative phenomena, and in particular against

[55] Closely connected to, though not identical with, the reduction of truth to the fulfilment of conditions of truth is the contention that "to know the meaning of the descriptive expressions is to know under what objectively ascertainable conditions the statements which contain them are true or false" (Searle 1964, 53). From the perspective of critical rationalism, instead, to know the meaning of descriptive expressions is only a *preliminary step* to the goal of inventing ways to test the truth of the statements which contain them.

[56] See, e.g., Albert 2001, 59, where he sharply distinguishes the concept of truth (*Wahrheitsbegriff*) from the concept of *criterion of truth* (*Kriterium der Wahrheit*).

5.1. reducing normative phenomena to linguistic phenomena;
5.2. reducing normative phenomena to external behaviours;
6. the quest for detailed causal explanations based on empirical nomological regularities—a quest translating in particular into a suspicious attitude to
6.1. the use of performatives as explicative shortcuts,[57] and
6.2. the use of language as an explicative shortcut.
7. the explanation of legal phenomena, at least partially, in terms of moral phenomena;[58]
8. the explanation of moral phenomena in terms of psychical phenomena (ultimately to be reduced to physical phenomena);
9. the reconstruction of traditional legal thinking as naive;
10. the denial that normative statements and legal-dogmatic statements are capable of truth;
11. the contention that normative and legal-dogmatic statements may be capable of correctness;
12. a non-dismissive, but rather anthropologically oriented, investigation of traditional and naive legal thinking.

Which of these tenets the legal theorists discussed in this section espouse, and to what extent, is a question that I would gladly leave to the reader. I hope to have been able to illustrate in a compelling enough way the striking convergence that can be found between Petrażycki and Hägerström in regard to these tenets, so much so that, as noted, we can speak of a Continental, or psychological, legal realism.

But there is one last question that suggests itself: Are these tenets interconnected? In my opinion they are, and in this introduction an attempt was made to show how so. But let me summarize that interconnection simply by pointing out what I believe to be the two themes that run through all these tenets: the first is a *strict physicalist realism* and the second a rejection of *dismissive reductionism*, the latter simply amounting to a *sincere curiosity about the astonishingly rich and unpredictable multifacetedness of legal phenomena*.[59]

[57] On performatives in connection with constitutive "rules," see footnote 40 above.

[58] Petrażycki would call these *ethical* (not moral) phenomena.

[59] As can be seen, the historiographical conceptualization of Continental (or psychological) legal realism proposed in this introduction is completely different from the one proposed above, in Section 9.3.3 (see also Section 24.4.2 of this tome).

Chapter 13

AXEL HÄGERSTRÖM AT THE ORIGINS OF THE UPPSALA SCHOOL

by Enrico Pattaro[*]

13.1. Consciousness and the Reality of Things

13.1.1. A Five-Hundred-Year-Long Debate

The problem of consciousness became thorny from Descartes onward. His infamous interactionist dualism (Seager 2007, 9) between *res cogitans* (mind) and *res extensa* (matter) was at the origin of a host of philosophical problems and eventually gave rise to a number of different trends in epistemology and ontology, among which the two basic, all-embracing, and opposite kinds of monism, that is, philosophical idealism and philosophical realism.[1]

In answer to Descartes's dualism, Leibniz—with his metaphysical theory of monads—resolved the reality of things into atoms or elements having a spiritual nature. Berkeley and Hume traced the reality of things to their being perceived. Immanuel Kant gave back to the reality of things a crucial importance, but he could not found the grounds for their knowability on anything other than the transcendental consciousness of the "I think" (Kant 1913, B 136–9). In this way, he reinstated the primacy and all-inclusiveness of the consciousness, and at the same time he allowed his grand construction to incubate the germ that would eventually make for its own dissolution into German philosophical Idealism. Thus, in the 19th century, Hegel and his followers in various countries overcame the limitations of Kantianism by tracing external reality (the reality of things) to the productive activity of self-consciousness, thus shifting from a transcendental to an idealist and metaphysical conception of the Self.

[*] I'd like to thank Uta Bindreiter for providing me with some Swedish texts that cannot be easily got hold of, as well as for making some useful linguistic suggestions. It goes without saying that responsibility for any error or imperfection rests solely with me.

[1] Later, during the empire of analytic philosophy, the problem of consciousness like a karstic river went underground, and like such a river it has reemerged over the last three decades—in this case with the impetuousness of a spewing geyser, this owing to the rapid advances made in cognitive neurobiology and to their impact on the philosophy of mind (see Zelazo, Moscovitch, and Thompson 2007).

13.1.2. The Revolt against German Idealism in Europe at the Beginning of the 20th Century

Against the backdrop of post-Kantian and idealist philosophies, which characterized much of philosophical thought in the 19th century, Bertrand Russell, in 1928, in his *Sceptical Essays*, described the philosophy of the early-20th-century by singling out in it three main orientations. The first of these is the philosophy of Kant's and Hegel's followers. The second is the philosophy of pragmatism and of Bergson. And the third one is the philosophy often described as "realism," which Russell credits with promoting the severely technical revolt against German idealism (see Russell 1960, 68–9).

13.1.3. The Escape from Subjectivism at Uppsala through Axel Hägerström

Especially relevant for the philosophy of law—and to be supplemented in the framework of the revolt against idealism as sketched out by Russell in 1928—was the escape from subjectivism that took place in Sweden at Uppsala, where around 1910 philosophy came at a realist stand following a long predominance of idealist philosophy. Axel Hägerström (1868–1939) was the initiator and most prestigious figure in the philosophical realism of Uppsala, as well as its leading exponent in practical philosophy.[2]

As a realist, Hägerström reaches the conclusion that the assumption that an object of consciousness can only be a determination of consciousness itself involves a contradiction because to be conscious is to be conscious of something, and since consciousness and the object of consciousness can be distinct, there must be something like a relationship between them. In answer to the question What does this relationship consist in? Subjectivism replies that it consists in consciousness itself. Here is where the contradiction lies: If the two terms of the relation are consciousness, on the one hand, and the object of consciousness, on the other, then the former term is paradoxically made into the relation itself (Hägerström 1929a, 114–5, 121–3; cf. Hägerström 1957, 117–18, 128–31).[3]

[2] Adolf Phalén (1884–1931), on the other hand, was perhaps its most representative exponent where theoretical philosophy was concerned. There is a sort of institutional academic continuity that links up the opposing camps of philosophy at Uppsala, a continuity which took roughly a century—from the first half of the 19th to the early decades of the 20th century—to make the transition from the idealism of Christopher Jacob Boström (1797–1866) to Axel Hägerström's realism, by way of four thinkers who in succession held the chair in practical philosophy: The first of these was Boström, who held this chair beginning in 1842; next came Carl Yngve Sahlin (1824–1917), in 1864; and he was succeeded in 1896 by Erik Olof Burman (1845–1928), an exponent of so-called critical Boströmianism, who introduced Hägerström to Kant; and so, finally, came Hägerström in 1911. On Hägerström's life and work, see Mindus 2009, a book that offers a rich overall picture of this topic.

[3] Hägerström's argument resembles the one Moore expounds in his essay *The Refutation of Idealism* (G. Moore 1903; cf. Marc-Wogau 1968, 16–7, 19–20) and it turns up as well in other re-

Hägerström's inaugural lecture, *Om moraliska föreställningars sanning* (On the truth of moral representations),[4] delivered on 18 March 1911 from the chair of practical philosophy, was memorable (Hägerström 1966, 35–57): It was the first time in the 20th century that a metaethical noncognitivist emotivist view about moral values and duties was clearly presented.[5]

The early-20th-century realist philosophies played a precursory role with respect to logical empiricism. The realism of Uppsala did not directly influence logical empiricism, but some of the epistemological theses developed at Uppsala can be said to represent the stage immediately preceeding that which the logical-empiricist philosophies reached. And other theses developed at Uppsala, as in metaethics, for example, anticipated what would later be upheld by analytical philosophy. On the relationship between the realism of the Uppsala School and logical empiricism, the following statements by the Danish logical empiricist Jörgen Jörgensen (1894–1969) are to be fully accepted:

> Although the reasoning and the views of the two movements are not identical, there is a far-reaching agreement between the Uppsala school and logical empiricism, in that they are both decidedly antimetaphysical and for both the main task of philosophy consists in the analysis of concepts. Further, both are opposed to epistemological idealism ("subjectivism," the nature and existence of that which is conceived depends on our conception thereof) and are adherents of the theory that statements of valuations are not true statements but merely expressions of certain feelings and, accordingly, have no factual meaning. Especially with regard to the two last points, the Uppsala school has performed a comprehensive and commendable piece of work which historically anticipates the work of logical empiricism without, however, having influenced it. (Jörgensen 1960, 58; cf. Pattaro 1974b, 58–76)

13.1.4. Hägerström against the Backdrop of Kant

At the basis of Hägerström's metaethics there were a realist epistemology and a realist ontology that Hägerström had worked on from 1904 to 1908, at once proceeding from Kant and extricating himself from Kant (Pattaro 1974b, 29–58). In 1908 Hägerström presented his escape from subjectivism in a work whose very title suggests, from the outset, an ambiguous wealth of Kantian themes

alist approaches that set out to refute the subjectivist philosophies' approach. Hägerström wrote: "Subjectivism I refuted by showing that in no consciousness can the same consciousness be given. What is apprehended (*das Aufgefaßte*, *det uppfattande*) is always something other than the apprehension (*die Auffassung*, *uppfattningen*). Hence it is impossible at all to consider consciousness as 'immediately' given to itself and therefore as ultimate ground of knowledge, as Descartes, Hume and Kant have done, to say nothing of the general trend of the modern theories of knowledge" (Hägerström 1929a, 116; my translation; cf. Hägerström 1957, 120–1).

[4] For the reasons specified in Pattaro 1974b, 52 n. 29, the German *Vorstellung* and the Swedish *föreställning* are translated throughout as *representation*.

[5] Hägerström's view anticipated by twelve years the emotivist conception of values which was later advanced in Anglophone countries by Ogden and Richards (1972; 1st ed. 1923), and which would then have also been maintained by Barnes 1933, Ayer 1952 (1st ed. 1936), and Stevenson 1944, among others.

coupled with realist outcomes. That title was *Das Prinzip der Wissenschaft. Eine logisch–erkenntnistheoretische Untersuchung.* I. *Die Realität* (The principle of science: A logical-epistemological inquiry. I. Reality: Hägerström 1908).[6]

If we are to understand Hägerström's epistemology and ontology, we will have to take him in earnest: He wrote that his theory of knowledge issued from Kant both in the positive and in the negative (*positivt och negativt utgå från Kant*: Hägerström 1951, 83). It is as if the pages where Hägerström sets out his realistic philosophy were watermarked: They must be held to the light, in our reading of them, and this way we will see in them the relevant Kantian ideas that Hägerström processed and transformed by fashioning them into a realist mould.[7]

Just as German idealism drew on Kant himself in working to overcome Kant's transcendental philosophy with an *idealist* ontology and theory of knowledge, so did Hägerström draw on Kant in working to overcome Kant's transcendental philosophy with a *realist* ontology and theory of knowledge. So much so that Hägerström explicitly, and indeed ambitiously, locates his thought in that mainstream of grand modern speculative philosophies that begins with Descartes and continues through Hume and Kant, ultimately to come at his *own* theory of knowledge and reality. Hägerström was neither a repeater nor a commentator. He was instead an original thinker: He took up the problem of the relation between consciousness and the reality of things where Kant had left it (after Descartes's dualism between *res cogitans* and *res extensa*, and with a view to overcoming Hume's subjectivist and sceptical empiricism) and worked out that problem by hatching a complicated, monist, realist, and materialist conception. More on Hägerström and Kant about reality in Section 13.7.

13.2. Judgments and the Reality of Things; Pseudojudgments and the *Unreality* of Value and the Ought

13.2.1. Logical Reality, Judgments, and Effectual Reality

A clear distinction should be introduced between *logical reality*, for the Swedish *realitet* and the German *Realität*, on the one hand, and *effectual reality*, for the Swedish *verklighet* and the German *Wirklichkeit*, on the other. This

[6] It has been a subject of debate whether Hägerström 1908 was innovated in Hägerström 1929a (see, for example, Marc-Wogau 1968, 53ff.). Hägerström himself (1929a, 115ff.; cf. Hägerström 1957, 119ff.) prefers to say in this regard that what he has done differently from Hägerström 1908 is simply to tweak his own terminology. There is no need, where we are concerned, to deepen the relation between Hägerström 1908 and Hägerström 1929a, and so I will mainly refer here to Hägerström 1929a (with parallel references throughout to the Swedish version subsequently published by Martin Fries: Hägerström 1957).

[7] In Section 13.7.1, I will comment on some passages from Kant 1913, B 189–91 and B 347–9 that it is useful to take into account for an adequate understanding of Hägerström.

distinction is being introduced so as to mirror a difference in linguistic usage which occurs in Hägerström's original texts, but which the English language cannot express with the single word *reality*, and which Hägerström's translators and commentators, even those who are native Scandinavian speakers, regularly ignore, thus posing serious obstacles to an understanding of his thought.[8] *Realitet* (or *Realität*) is the reality of possibility, and so is a logical reality. *Verklighet* (or *Wirklichkeit*) is the reality of an actualized possibility, and so, whatever be the actualized possibility, even that actualized in a fiction, this reality will be an effectual reality. More on these issues in Section 13.7.

According to Hägerström, through a judgment, the knowing subject (*a*) *attests* (*aussagt*, *utsäger*) the logical reality (determinateness, consistency, noncontradictoriness, *Realität*, *realitet*) of the content of a representation,[9] and (*b*) *judges* (*urteilt*, *omdöme fällas*) whether or not the logically real content of this representation also occurs as effectually real in a wider effectually real complex to which the knowing subject refers the content of the representation attested as logically real (Hägerström 1929a, 116, 120; cf. Hägerström 1957, 120, 126–7).

We may call first-order judgments those judgments that according to Hägerström are about *things*, and second-order judgments those that according to Hägerström are about *other judgments* (including pseudojudgments).[10]

The logically real content of a representation is the object which a first-order judgment is about.[11]

According to Hägerström, any first-order judgment must take into account the effectual reality (*verklighet*, *Wirklichkeit*) of the complex with respect to which the logically real content of a representation, namely, the object of the judgment, is judged as being or not being effectually real.[12]

Hence a first-order judgment unfolds as follows.

A knowing subject apprehends in his consciousness a representation whose content is, for instance, men-who-breathe-through-gills (Hägerström's example).

[8] That is the case, for instance, with Hägerström 1953a, a translation by C. D. Broad, and with Petersson 1973.

[9] Here we can recognize Kant in the background of Hägerström's thought because attesting the logical reality of the object of a judgment is equivalent to attesting the subsistence of what Kant calls the *conditio sine qua non* of any judgment, this condition being the absence of contradiction. More on this in Section 13.7.

[10] I will not enter into second order judgments here, but see Pattaro 2010, sec. 13.5. Bear in mind that *first-order judgment* and *second-order judgment* are my own terms, not Hägerström's.

[11] Hägerström does not use *object* to designate the subject matter of a judgment but prefers to speak of a logically real something. Therefore, when in referring to Hägerström's thought I speak of the "object of a judgment," the word *object* is to be understood as meaning any "logically real something."

[12] He rejects any attempt to define judgment without taking effectual reality into account: "das Urteil ohne Berücksichtigung der Wirklichkeit zu bestimmen" (Hägerström 1929a, 118; cf. Hägerström 1957, 123).

The knowing subject attests this content as logically real (as determinate, consistent, noncontradictory), and the same content (so attested) will be the object of an affirmative or negative judgment by the knowing subject.

If the knowing subject refers the content of the representation to a wider effectually real complex where men do *not* breathe through gills, then this judgment will be a negative one: The knowing subject judges that the content of his representation (the object of his judgment) occurs merely as represented, merely as logically real, and not as effectually real in the wider effectually real complex where men do *not* breathe through gills (Hägerström 1929a, 120; cf. Hägerström 1957, 126–7).

If instead the knowing subject refers the same representation (men-who-breathe-through-gills) to a wider effectually real complex where men do breathe through gills, then this judgment will be an affirmative one: The knowing subject judges that the content of his representation (the object of his judgment) occurs not merely as represented (not merely as logically real) but also as effectually real in the wider effectually real complex where men do breathe through gills, as in fictions, I would say (Hägerström 1929, 120; cf. Hägerström 1957, 126–7; more on this in Section 13.7).

Hence, with both judgments, the negative and the affirmative one, the object (men-who-breathe-through-gills) is the same. What changes is the effectually real complex with reference to which this object (which is logically real and is attested as logically real by both judgments) is *judged*: with the negative judgment the effectually real complex is one where men do not breathe through gills; with the affirmative judgment the effectually real complex is instead one where men do breathe through gills.

13.2.2. The Primacy of the External Spatiotemporal World

Hägerström (1908, 76–7) brought to completion a Copernican bouleversement (*kopernikanische Umwälzung*) of Kantianism with reference to the question of spatiotemporal experience. For Kant, spatiotemporal experience lies in the transcendental "I think." For Hägerström, by contrast, the thinking being, in its there-being, lies in the world of spatiotemporal experience: What distinguishes one conscious being (Descartes's *res cogitans*) from another is the position of each such being in the world of spatiotemporal experience. This is so, Hägerström maintains, because a conscious being (*bewußtes Wesen*, *medvetet väsen*) cannot conceive his own there-being (*Dasein*, *tillvaro*), along with its representations (*Vorstellungen*, *föreställningar*), as a mere representation present in himself or in other like beings (Hägerström 1929a, 131ff.; cf. Hägerström 1957, 143ff.).

The widest effectually real complex to which the content of any representation may be referred is the spatiotemporal world of experience. The effectual reality of the world of experience cannot be demonstrated, because any at-

tempt to demonstrate the truth of something (of a representation) *presupposes* the effectual reality of that world. We can, however, demonstrate that anyone attempting to define the world of spatiotemporal experience as a mere illusion will only produce a collection of senseless words (Hägerström 1929a, 131ff.; cf. Hägerström 1957, 143ff.).

Hägerström's presupposition of an external representation-independent spatiotemporal world is a transcendental presupposition similar to that on which Searle (1995) bases his well-defined ontological realism regarding the external world of brute facts. I should recall in this regard a few statements by Searle:

> It is now time […] to defend the idea that there is a reality totally independent of us. (Searle 1995, 149)

> The world (or alternatively reality or the universe) exists independently of our representations of it. This view I will call 'external realism.' (Ibid., 150)

> *Realism is the view that there is a way that things are that is logically independent of all human representations. Realism does not say how things are but only that there is a way that they are*. (Ibid., 155; italics in original)

> The only argument we could give for external realism would be a "transcendental" argument in one of Kant's many senses of that term: We assume that a certain condition holds, and then try to show the presuppositions of that condition. (Ibid., 183)[13]

13.2.3. Pseudojudgments in General

We may call pseudojudgments those sentences that according to Hägerström are apparent judgments whose subject matter is an *impossible thing*, and so is logically unreal, or contradictory, a non-object. Their subject matter is a non-entity, a non-thing (*intigt*: see Hägerström 1951, 84): It is indeterminate, and therefore cannot be represented, and cannot be a possible object of judgment. The sentences in which pseudojudgments are framed as judgments are only strings of words: Despite their misleading formulation as judgments, they do not express cognitive acts of consciousness.[14]

Among the pseudojudgments are not only the statements of metaphysics but also sentences framed in the form of value judgments and ought judgments, neither of which express authentic judgments but only hypostatizations (or *objektiveringen*, as Hägerström says: Hägerström 1917, 69) of feelings or of

[13] The question of realism, institutional facts, and brute facts with reference to Searle I treated in Pattaro 2005 under the heading of nature and culture, in sec. 15.2.4, devoted to the social construction of reality and the construction of social reality. I wish to thank Corrado Roversi, who in discussing this text with me spotted the just-mentioned consonance that can be found between Hägerström, as I reconstruct him, and Searle.

[14] It should be borne in mind that *pseudojudgment* is my own term, not Hägerström's.

conative impulses arising within us in a simultaneous association with representations of things or of behaviours (Hägerström 1917, 64 ff.).

We conceive value and duty as instances of objective determinateness (*objektiva bestämdheter*), that is, of logical reality, because a simultaneous association occurs in us between a feeling or a conative impulse and a representation of a thing or of a behaviour, and a sentence expressing such an association is framed in the form of a judgment (*omdömesform*). (Hägerström 1917, 69–70). And the associations between feelings or conative impulses and representations are expressed in sentences framed in the form of judgments because the representational element prevails in giving rise to a linguistic expression, and it draws the expression of feeling or of a conative impulse into the expression of the objective determinateness (logical reality) of that which is represented, be it a thing or a behaviour.

13.2.4. Ought Judgments as Pseudojudgments

We must not forget here that in Hägerström's conception, a judgment does not coincide with the linguistic formulation expressing it but is a knowing subject's act of consciousness, and even a representation is an event in the knowing subject's consciousness: As cognitive acts of consciousness, both first-order judgments and representations are *things*—they are not words—just as feelings and conative impulses, which are *non*cognitive contents of consciousness, are things and not words. By contrast, *words*, or linguistic formulations, merely *express*, appropriately or not, both cognitive acts of consciousness and noncognitive contents of consciousness.

Hägerström shows that ought judgments are pseudojudgments; he does so with arguments that are compelling if viewed in light of his ontology and his distinction between judgments (cognitive acts of consciousness) and pseudojudgments (or, in Hägerström's usage, impossible judgments): meaningless strings of words framed as judgments, expressing a simultaneous association between a conative impulse and the representation of a behaviour.

He shows that a sense of duty is not a duty. "It is a fact that I am experiencing a sense of duty" is a first-order judgment and does not mean "It is my duty." The latter sentence is instead a pseudojudgment by which we mean to say that a duty subsists, or that a certain behaviour is required by duty *irrespectively* of whether we *feel* bound to perform the behaviour at issue (Hägerström 1917, 65; see Pattaro 1974b, 144–6).

He further shows that a duty cannot be reduced to a sense of duty. It is a contradiction to maintain that a duty is reducible to a sense of duty. Since a sense of duty is a feeling *we* have, it cannot be a characteristic (*egenskap*) of anybody's behaviour, and much less anybody's behaviour *tout court*. In my own words, "This behaviour *has* the characteristic of being a sense of duty of mine" and "This behaviour *is* a sense of duty of mine" are pseudojudgments

because it is impossible to represent something like a behaviour-that-*has*-the-characteristic-of-being-a-feeling or like a behaviour-that-*is*-a-feeling (Hägerström 1917, 65–6; cf. Hägerström 1963, 6–8; Pattaro 1974b, 146–8).[15]

On the other hand, he shows as well that not even a modal ought is something that may be inherent in a behaviour. What we seemingly represent to ourselves through a modal ought judgment is "a certain modification (*modifikation*) of the very being of a behaviour as a real determination (*bestämning*) in the behaviour itself" (my translation). And a modification is not something a thing *has* but something a thing does *not* have, just as a limitation of black is something that black does not have: It is a nonblack (Hägerström 1917, 66–7).[16]

Hägerström finally shows that if we conceive duty as a nondescript something that we believe to be "out there," then what we represent to ourselves with the word *duty* lacks any perceptibility (*åskådlighet*): It is only a determinateness (a logical reality) in the abstract (*en bestämdhet in abstracto*). It is something which we assume (by hypostatization) is present in what is thought—in the behaviour we are thinking about—but which, despite the presence we assume, does not enable us to form a representation of what it is.[17]

[15] This flies in the face of those who, failing to understand Hägerström, maintain that he reduces duty to the sense of duty. Hägerström in reality does not collapse duty into the sense of duty, but rather maintains that duty is an objectification (hypostatization) of the sense of duty. It bears pointing out here what Hägerström means by *determination* (*bestämning*), so as distinguish this word from *determinateness* (*bestämdhet*). The concept of determination is used by Hägerström to avoid a multiplication of entities. Thus, for example, solubility in water is a determination of sugar (my example), but there is no independent effectual reality the word *solubility* can designate as an effectual reality existing apart from sugar and all other soluble substances; similarly, an inner experience (*upplevelse*), such as the experience of feeling a sense of duty, is a determination of a certain person or subject, but there is no independent effectual reality the expression *sense of duty* can designate as an effectual reality existing apart from someone feeling a sense of duty. Cf. Hägerström 1929a, 121ff.; cf. Hägerström 1957, 128ff.; Marc-Wogau 1968, 117–8. The examples of sentences equivalent to "This behaviour is my duty" are mine. Hägerström says that if ought judgments are conceived as expressions of the sense of duty, then duty (*plikt*) cannot be understood as a behaviour's determinateness or logical and effectual reality (Hägerström 1917, 66).

[16] Modal ought judgments, along the lines of "This behaviour ought to be (*bör*)," will have to mean either "This behaviour *has* for its determination something that is not a behaviour" or "This behaviour *is* something that is not a behaviour," but it is impossible to represent a behaviour which *has* for its determination something that is not a behaviour or a behaviour that *is* something which is not a behaviour. In both cases, the apparent modal-ought judgment takes a non-logically real, contradictory or inconsistent subject matter: an impossible subject matter. And for this reason the modal-ought judgment is in both cases a pseudojudgment (see Pattaro 1974b, 149–52).

[17] Hägerström 1917, 71–2. Hägerström maintains that *duty*, as this word may occur in a sentence expressed in the form of a judgment, only represents a visual image or sound image: It is an expression that we understand as caused by an indeterminate "something," by an indefinite logical reality. It is interesting to compare this point of Hägerström with what he maintains in general in regard to the fact that in a contradictory judgment we find a representation of *words*, not of things (cf. Pattaro 2010, 143ff., 147–8). To put this otherwise, we can say that the word *duty* does not connote: It lacks any intension. With the argument here considered, Hägerström maintains that

13.3. The Ought, the Right, and Norms Explained

13.3.1. Right versus Just: The World of Duty

Ought judgments are pseudojudgments, mere strings of senseless words, but in spite of this they unconditionally reflect a (noncognitive) state of consciousness, so that far from being idiosyncratic, or specific to this or that individual person, they are standardly used by everyone within a language community to express similar states of consciousness: They are supraindividual (*öfverindividuella*). As a consequence, from the pseudojudgment that a behaviour is a duty for all (as in "It is everyone's duty to refrain from stealing") we readily infer that the same behaviour is a duty in this or that case ("It is *my* duty not to steal the apples growing on my neighbour's apple tree"), just as from the authentic judgment that certain properties belong to certain things (as in "Apples contain sugar") we infer that the same properties must be predicated of any instance of the same thing (as in "The apples growing on my neighbour's apple tree contain sugar").[18] Using ought judgments leads us to conjure up a world of duty as existing in distinction to the world of facts but parallel to it.[19]

When we think of a behaviour as required by duty we conceive it as having a particular character (*karaktar*): We think that the behaviour at issue is, in the given circumstances, right (*rätt*). Here the word *right* is to be kept quite distinct from the word *just* if we are to have an adequate understanding of Hägerström's thought concerning the idea of duty: "Rightness" (*rättheт*) or "correctness" (*riktighet*) are not the same as "justice" (*rättvisa* or *rättfärdighet*). This question I will come back to in Section 13.6.

The word *right*, when used to qualify a behaviour one of whose properties is assumed to be its being required by duty, means none of the following: "in accordance with a given will," "in accordance with the agent's autonomy (*självständighet*)," "suited to avoiding punishment," "suited to gaining an interest," "suited to realizing a value," or "suited to maximizing pleasure." Indeed, Hägerström shows that none of these meanings provides a satisfactory account

duty (*plikt*) lacks intensional meaning, and that sentences about duty expressed in the form of judgments are pseudojudgments, since there is nothing that they say: In a strict sense, the sentence "This behaviour is my duty" is simply equivalent to "This behaviour is" (see Pattaro 1974b, 152–5).

[18] My examples.

[19] The way in which, through this hypostatization, we come to understand a behaviour as logically real and effectually real in the world of duty is, however, different from the way we do with any other representation of behaviour (in the world of facts). In the latter case, we understand a behaviour to be logically and effectually real insofar as it belongs to the complex of effectual reality (*verklighetssammanhang*), whose elements are concrete (*konkreta*) and perceptible (*åskådliga*), while in the former case, we understand a behaviour as logically and effectually real (*verkligt*) insofar as it possesses an essentially unperceptible determinateness (*bestämdhet*), which is duty. And in this way, we run into undeterminateness because an unperceptible determinateness is not an authentic determinateness. See Hägerström 1917, 70, 67–68, 71–72, 73–74; cf. Pattaro 1974b, 155–9.

of the idea of rightness and hence of the property of being required by duty. Therefore, he says, we need to take a different approach to the idea of rightness: We will have to look at the way the sense of duty is elicited in us. That different approach we will turn to in the next section.[20]

13.3.2. How the Idea of Right Develops within Us

Because commands and prohibitions accompany us from childhood, because they are frequently repeated, and because they are aimed at bringing forth some relatively uniform modes of behaviour—no matter what the source of such commands and prohibitions is: family, school, religious power, secular power, the social environment at large—our thinking about certain modes of behaviour, Hägerström argues, will bring with it an accompanying perception of an "ought to take place" (*skall ske!*) or a "must necessarily take place" (*måste ske!*).

Since these modes of behaviour have always been commanded or prohibited from a variety of sources—from different persons and authorities—and since we have regularly learned these modes of behaviour by way of commands and prohibitions, we no longer associate these behaviours with the command or the prohibition of this or that person or authority in particular. The sources of commands and prohibitions have lost their individual specificity: What appears before us is just the visual or sound image of an expression of command or prohibition. Still, even though such imperative expressions have been depersonalized, they do maintain, when connected with the behaviours they refer to, a suggestive force that elicits in us a conative impulse to have the required behaviour or avoid the prohibited one.[21]

All this happens not with a single person but with all those in the community one lives in. The association of behaviours and depersonalised imperative expressions—such as "This ought to take place!" (*skall ske!*) and "This ought not to take place!" (*får icke ske!*)—is produced in all or nearly all members of a community, and each member can and does see the association in the way others speak and behave. It is little wonder, then, that people come to make the hypostatization whereby "ought to take place!" and "ought not to take place!" become objective characters of certain behaviours: We come at the idea of a system of modes of behaviour at one with an imperative expression, a system of modes of behaviour that unconditionally "ought to" or "ought not to" take place. The idea of this system of modes of behaviour is the idea of a system of norms, and the idea of right is connected with the idea of such a system of norms.[22]

[20] Hägerström 1917, 74–8; Hägerström 1963, 9–14. See Pattaro 1974b, 159–65.

[21] It is interesting to compare this explanation by Hägerström with the theory of the generalized other developed by Gerth and Wright Mills (1961). Cf. Pattaro 2005, secs. 15.3 and 15.4.

[22] See Hägerström 1917, 82–4. In Hägerström 1953a, 154 (p. 83 in the Swedish text), Broad

Something along the same lines happens with custom.

Custom determines the behaviour of people in an almost mechanical way, in the sense that certain behaviours, Hägerström argues, are brought into being by force of custom, mostly without any psychical volition on the part of the acting subject. Yet, despite this way of functioning, there are several other respects in which custom can be viewed as functioning like a system of modes of behaviour which, through the effect of education and the other concurrent factors mentioned earlier, we are led to think of as an objectively subsisting system intrinsically connected with certain imperative expressions: as a system of norms. When we behave in disagreement with what custom requires we will perceive the behaviour we are straying from as the right way to behave. In primitive societies custom prevails. In advanced societies custom is instead gradually replaced with the system of modes of behaviour inculcated through political and religious powers and social forces.[23]

Right behaviour is the behaviour that ought to, or must, take place (*ske*): It is the way of acting that we understand to objectively subsist and by its own nature to be intrinsically linked to an imperative expression such as "ought to, or must, take place! (*ske*)."

13.3.3. What Is Right in the Abstract (Norms) and in the Concrete (Subjective Positions)

Saying that a behaviour ought to *take place* does not imply a reference to a concrete person who ought to *carry out* that behaviour. In the presumptive world of the ought, a right behaviour's subsistence consists in its having to *take place* even if the circumstances should never occur (in the world of the is) under which somebody ought to *carry out* the behaviour that ought to *take place* (in the world of the ought).

translates *skall ske!* to "shall be done!" This translation is misleading (Broad should have translated *ske* as "to happen" or "to take place"). Indeed, in Hägerström's analysis it is fundamental to characterize right behaviour as that which "ought to take place," while a person's duty to carry out a behaviour that "ought to take place" (the duty to have the behaviour that is right in the given circumstances) is not identical with an "ought to take place" of a behaviour—that is, with the behaviour's rightness—but is rather a *consequence* of such rightness: What ought to take place ought to be carried out by those referred to by "what ought to take place" (more on this in Section 13.3.3). Collected in *Inquiries into the Nature of Law and Morals* (Hägerström 1953a) is a series of essays by Hägerström translated into English by C. A. Broad and edited by Olivecrona. This work has been essential in spreading Hägerström's thought outside the Scandinavian countries. However, despite the authority commanded by both the translator and the editor, the work contains numerous mistranslations that have contributed to various misreadings of Hägerström, not only in non-Scandinavian countries but in Scandinavia itself, where scholars, apparently struck by some form of idleness, sometimes rely on the English translation rather than on Hägerström's original writings (for various examples of mistranslations of Hägerström 1953a, see the footnotes in Pattaro 1974b).

[23] See Hägerström 1917, 82, 84–5. Cf. Hägerström 1963, 9–12 and Pattaro 1974b, 165–70.

By contrast, saying that a behaviour ought to be *carried out* on the one hand does presuppose that the behaviour which ought to *be carried out* is the behaviour that ought to *take* place, on the other hand it does imply a reference to an actual person who ought to *carry out* that behaviour.

However involute Hägerström's thought may be as to its form of expression, it is clear, when it comes to comparing the idea of right behaviour (*idéen om det rätta handlandet*) with the idea of behaviour required by duty (*idéen om handlandet såsom plikt*), that the latter presupposes the former and that the former ultimately presupposes the idea—arrived at by hypostatization—of a system of modes of right behaviour whose objective reality is an "ought to take place! (*ske!*)." To state this conversely, the system of modes of behaviour sets forth what is right in the case at hand (*i föreliggande fall*) in that the system has preestablished in the abstract what is right in a case *like* the one at hand (*i ett sådant fall*); that is, in my own words: A mode of behaviour is a type of behaviour (an abstract type) that ought to take place (norm); the right behaviour in the concrete is an instance of the type that ought to take place and that is right in the abstract. An actual person's duty does not concern a behaviour in general (*öfverhufvud*) but a behaviour in particular (*särskildt*) which gets specified in accordance with the idea of what is objectively right *in abstracto* (Hägerström 1917, 93; Hägerström 1963, 9–12; Pattaro 1974b, 171–3).

In Hägerström's view as expressed in my words, a norm is a hypostatization we are induced to make by the powers that in society command and prohibit and by custom. Norms are the modes of behaviour that, under the influence exerted by these factors, we come to conceive of as objectively subsisting and as connected, by their nature, with an imperative expression like *ought to take place!* (*skall ske!*). The word *norm* thus designates these modes of behaviour so conceived.

13.3.4. Norms versus Commands

Norms are crucially different from commands, even if the state of consciousness experienced by someone receiving a command and the state of consciousness of someone experiencing a sense of duty (a sense caused by the idea of a norm) are akin: In both cases there is an unmotivated conative impulse associated with the agent's representation of a behaviour. Further, in either case the conative impulse is brought about by an imperative expression: One uttered by an actual person in the case of a command; one impersonally connected with a model of behaviour in the case of a sense of duty. However, the affinity between commands and norms ends here. The differences, by contrast, are such as to prevent us from reducing the idea of a command to that of a norm or, conversely, the idea of a norm to that of a command.

In the case of a command, the imperative expression that brings forth a conative impulse requires an appropriate relationship between the command-giv-

er and the command-receiver; in the case of norms, by contrast, the imperative expression works by its own force, that is, it works independently of any actual commanding person. This outward difference is a reflection of the crucial difference whereby commands, unlike norms, do not presuppose a hypostatization about there being any objectively subsisting modes of behaviour connected by their nature to an imperative expression: Commands imply no reference to an objectively right mode of behaviour.

Linguistically, this crucial difference is manifested in the fact that the state of consciousness experienced upon feeling a sense of duty (a sense elicited by the idea of a norm) is conveyed by way of sentences about duty which take the form of judgments, that is, by ought judgments (or, better yet, pseudojudgments). Not so with the state of consciousness experienced upon receiving a command. In this case, the relevant state of consciousness is conveyed by way of a sentence, such as "I *will* do that," which expresses a purpose and cannot be framed in the form of a judgment.

On the other hand, the idea of a norm carries along a number of psychological implications not entailed by commands.

The system of modes of behaviour that we conceive as objectively subsisting and intrinsically connected with imperative expressions is a system—a system of norms—that we conceive as having a general validity (*allmängiltighet*) on the members of the group the system refers to. We hold, therefore, that a behaviour that in certain circumstances is required of us by duty is also required by duty, under the same circumstances, of every other person. By contrast, we do not hold the same view when it comes to commands.

The moral indignation we feel for certain behaviours of others stems from our belief that these are not right behaviours, or that the persons who behaved thus failed to fulfil their duty, to comply with norms. By contrast, when we are given a command we do not care whether other people have been or will be given the same command, unless for some contingent reason we wish or not wish that such other people receive the same command.

Further, where norms are concerned, the idea of duty induces us to regard as right a penalty that may have been established for failing to behave as required (by duty), and so to regard it as a duty to submit to the same penalty (see Section 13.6 below). But where commands are concerned, any penalty threatened for noncompliance will be regarded as merely a factual consequence of such noncompliance, a consequence that we will not feel bound by duty to submit to, and that we will attempt to avoid whenever possible.

In fine, the idea of duty, however much it cannot be logically explained by recourse to the idea of personal autonomy, is nonetheless often associated with autonomy. In fact, the idea that certain behaviours are intrinsically proper to our true self (to our autonomy) means ultimately that such behaviours *must* unconditionally be carried out. Be that as it may, the idea of duty is in any event often enshrouded in an aura of sacrality: Respect and esteem are often

connected with the right way of behaving; disrespect and disesteem, with the wrong way of behaving. By contrast, none of these feelings accompany behaviour that simply conforms to a command (Hägerström 1917, 115–7, 85, 86, 89, 97ff.; Hägerström 1963, 13–4; cf. Pattaro 1974b, 173–8).

13.4. Law

13.4.1. The Law in Force Is Made up of Norms, and the Role of the Constitution

Norms have neither a logical reality nor an effectual reality. By contrast, our belief that they exist beyond ourselves and are objectively binding belongs to our psyche: It is a determination of our psyche (see footnote 15 above). Norms are a normative ideology, as Ross would later call it, more or less compact and coherent, operative and effective in maintaining human collectivities alive.[24] This means that a legal system rests on a normative attitude of those who are subject to the system rather than on the commands or on the declarations of will of those who are in power.[25]

According to Hägerström, without a constitution which the members of society regard as binding, and which is regularly observed by those in power, no lasting factual power would obtain in society: Power does not precede norms but instead is created and kept into being by norms. A clear-cut distinction exists between the decisions that sovereigns take in a private capacity and those which they take in their capacity as officials: Only in the latter case will a decision carry the force of law (*rättskraft*), and this is so because, unlike the decisions that sovereigns take in a private capacity, their *official* decisions rely on previously accepted constitutional norms. The expression *force of law* designates in Hägerström an effectively operating force capable of binding people concretely (psychologically), thereby determining their behaviour.[26]

[24] On Ross see Chapter 16 in this tome.

[25] Hägerström 1961, 70–72; cf. Hägerström 1963, 120ff., 147ff. The power of those who are in power rests on the normative attitude of those who are subject to the legal system. In this regard, Hägerström makes a sharp and many-faceted criticism of the voluntaristic theories of law (see Pattaro 1974b, chap. 2). On this and a number of other points, Hägerström anticipated views later upheld by Hart. See Pattaro 2005, 123–44, 172–85, where I argue that in regard to various topics Hart's *Concept of Law* (Hart 1961) is influenced by Hägerström and Olivecrona, so much so as to be realist (and non-conventionalist). Those who make out Hart to be conventionalist even before the *Postscript* (among them is Postema 2011, 297) take exception to the thesis I expound in Pattaro 2005, but they do not address the arguments I have laid out.

[26] The constitution is in turn observed by the bulk of the citizens out of historical, psychological, and social reasons, such as require historical, psychological, and sociological inquiry. In making the existence of power conditional on the prior existence of a norm, Hägerström is not looking to set up a formal legitimation; he is rather establishing a cause-effect connection between norms (the cause) and power (the effect). But even here, in this empirical framework, a violation of constitutional norms by the people placed through these norms in the highest powers remains

For insight into Hägerström's view of the constitution, we can consider a criticism he made of Salmond (1862–1924).

Salmond held that when the American colonies rebelled against England and needed to enact their own constitutions, they did not rely on any preexisting law, because the only law then in force was the English law they were violating: The colonies were enacting new constitutions "by way of popular consent, expressed directly or through representatives," that is, on a factual basis, and not on a legal or normative one.

Hägerström argues that Salmond cannot conceive of any law except the law produced by the state and that for this reason he holds that law which forms outside and in contrast to state-enacted law (as in the case of the American revolution) cannot be founded on law but can only be founded on nonlegal facts. To be sure, Hägerström notes, the revolting American colonists and the founding fathers did not ground their new constitutions in the English law they were violating, yet they did ground them in norms of some kind: As a people, the American colonists were convinced they had *natural* rights, and that the English crown, having violated these rights, had thereby lost its right to govern the colonies. The American colonists believed that, because of the crown's violation, the right to govern had reverted to its original holder, the people. On the basis of this believed natural law, the revolting American colonies gave themselves a constitution. This natural law they believed in held sway (*berhärskade*) over their minds and therefore acquired factual validity (*faktisk giltighet*); this natural law supplied rules for the use of power (*regler för maktutövning*); such rules possessed a factual ideal force (*faktisk ideell kraft*); and thanks to these believed rules the founding fathers were endowed with the factual power to enact a constitution; the same believed rules of natural law served as the basis of the new legal system; so there is no reason to deny them their status as legal rules in force (*gällande rättsregler*) logically prior to the constitutional provisions enacted by the founding fathers.[27]

A norm in force is one that in a given social group is believed to be in force and hence felt to be binding and is observed, especially by the persons whose job it is to administer justice. Even though legal norms so construed character-

a violation of law, with the consequences that this violation of law may give rise to depending on circumstance, which consequences range from a widespread popular uprising to a complete acquiescence in the violation until a new practice (a new constitutional norm) is in place, and there are of course the intermediate possibilities of disobedience of or alignment with the single provision found to be contrary to the constitutional norms. See Hägerström 1961, 72–3, 75–7. Cf. Hägerström, 1963, 127ff., 223ff.

[27] The terms *giltighet* and *gällande* I have translated to *validity* and *in force*, respectively, and suggest doing so in Hägerström's case: In Hägerström, as a rule, the former term carries a normative connotation (or better yet it records a normative attitude toward the law or toward a given rule of conduct); the latter term carries no normative connotation but simply records a fact (that the law or a given rule is in force).

ize themselves as a general psychological phenomenon that we can sociologically observe, they cannot be equated with the behaviour through which they are followed, because a cause cannot be equated with its effects. A legal norm in force is a cause, and the behaviour of the addressees who believe in it is its effect (cf. Pattaro 2005, chap. 6).

From the standpoint of the function of the law, namely, the function of having people do something, it makes no difference whether legal rules have actually been enacted or whether the citizens at large simply believe them to "exist" and be binding.

However, the way in which legal rules are issued, or the way they are believed to have been issued—that is, consistently with norms that are felt to be binding and to be the norms establishing who can issue norms by enactment—is a determining factor in bringing about the belief that these legal rules "exist" and are binding and, consequently, in having them complied with.[28]

13.4.2. Judge-Made Law

Hägerström shows that the law as interpreted and applied by the judge is not anybody's will (the will of legislator, the judge, the legal system, or the like). His analysis is laid out in this order: (*i*) The judge's judgment does not declare the content of the legislator's will; (*ii*) in settling a dispute, the judge considers several factors in addition to the text of the law; (*iii*) this is not to say that judges, when cases are brought before them, base their judgments on their own will; (*iv*) nor does it mean that the legislator's will has authorized judges to take extralegal factors into account; (*v*) the legislators' intention to formulate the text of the law in a certain way cannot be separated from their intention to regulate social relationships in a certain way; (*vi*) there is no such thing as a will of the legal system; (*vii*) the application of the law cannot be construed as the activity of actualizing a will which is always identical with itself and which commands or declares its own content.

I will not dwell on the arguments Hägerström uses to support these points. These arguments are intended in the first place to criticize the voluntaristic theories of the judge's activity (Hägerström 1917, 16–51).

[28] See Hägerström 1961, 70–7 (cf. Hägerström 1963, 120ff., 127ff., 147ff., 223ff., 244ff.). The quoted passages by Salmond are found in Salmond 1930, 154–6, 39; cf. Pattaro 1974b, 87–102. Olivecrona (1939, 57), in the lead of Hägerström, would describe the relation between the constitution and legislation by using the following metaphor: "The legislative machinery may be compared with a power-plant in a river. The common attitude towards the constitution corresponds to the water in the river. In the power-plant the energy of the current of water is transformed into electricity, which is distribute round the countryside to give light and heat and to set hammers and looms in motion. The power-lines are the particular laws, promulgated according to the constitution. The significance of the act of legislating is that a new power-line is attached to the power-plant."

In summary, Hägerström does not doubt that when judges settle disputes, they also take into account the textual provisions of the law, among other things, but he does deny that this amounts to actuating or declaring the legislator's will: "What for the judge is law in force [*för domaren gällande rätten*] cannot be identical with the legislator's will [*lagstifarens vilja*]." Law in force is, for Hägerström, the law that judges apply. This law, however, is not identical with the judges' decisions, either, because the judges themselves understand the law in force to consist of norms that precede and justify their decisions in concrete cases (ibid., 16–8; the quotation is from p. 17).

As Hägerström observes, in order to understand the judge's *modus operandi*, we have to take into account that the common legal consciousness (*allmän rättsåskådning*) includes the principle under which, whereas the legislator frames rules for social relations to come, the judge issues judgments on relationships existing *before* such judgments: The judge's judgment is understood as stating the truth (*pro veritate accipitur*), not only with regard to matters of fact but also with regard to matters of law and its correct application.

To appreciate how widespread this assumption is we need not confine our view to orthodox legal positivism, which obviously does share this assumption. We can also look elsewhere, to the praetor in ancient Rome, for example: The praetor did *make* law (*ius gentium* and *aequitas*), to be sure, but he was regarded (and regarded himself) as someone authorized to merely *declare* what the law in force (*gällande rätt*) was. We can also consider common law judges: Even if they have much more leeway than their civil law colleagues, they nevertheless feel constrained by precedent and custom, and in addition they view themselves as committed to declaring the legal situation which they believe to objectively (*objektivt*) exist between the parties to a lawsuit.

Not only when interpreting the law, but also when integrating it or passing judgment contrary to the law, do judges believe they are proceeding in accordance with objectively valid norms (*objektivt giltiga normer*). There is a powerful emotive drive in the need for judgments conforming to justice (*rättvisa*); that is, in the demand that the judgment declare rights and duties as they objectively subsist on the basis of a *super partes* norm. Our confidence that the judge will follow this norm is deeply rooted in the history of civilization and still constitutes a cornerstone in the edifice of social peace: Because the judge represents an external and inexorable power, our sense of law will react against any act of the judge that appears to amount to nothing more than the use of brute force.

If this is the typical attitude informing our common legal consciousness with respect to the judge's task—that is, if judges are, as it were, in the public eye of public legal opinion—it follows as a matter of fact that judges are constrained in their judgment, regardless of whether they identify with the role they are entrusted with, thus acting from a sense of duty (*pliktkänsla*), or whether they simply act out of fear of the way the public might react. It makes no sense to hold that judges freely determine (however much within the tex-

tual framework of the law) how to decide the cases brought before them, and so it makes no sense to assume that the law, which for such cases holds by virtue of the judges' judgments, is identical with their will (*vilja*). Judges typically want to declare only (what social conditioning leads them to believe is) the *objective* meaning of the law (*den objektiva rättens innebörd*) with regard to the concrete case at hand: They want the judgments they pronounce to be materially correct (*materiellt riktig*).

Judges are not computing machines (*räknemaskin*); but still, the realist Hägerström warns us, we should not exaggerate the subjectivity of their convictions. At least where the law is prevalently statutory law, objective factors (*objektiva faktorer*) exist that secure regularity (*regelbundenhet*) in carrying out the judicial function, in such a way that court judgments become predictable, thus supporting the certainty of law (*rättssäkerhet*). The rules of conduct that through these factors judges bring into effect (*till verkställighet*) constitute law in force (*gällande rätt*). These objective factors can be listed as follows: the text of the law (*laguttryck*), the generally accepted rules of interpretation and integration (*utläggnings- och ut-fyllningsregler*), and the dominant orientations in legal scholarship and practice (*inom rättsvetenskapen och rättspraxis*).[29]

Hägerström observes that judges sometimes resort to analogy even when the law prohibits its use, as happens in criminal law. For example, when judges in Austria punished intentional damage of the telephone network, they did so on the basis of a law (enacted before the telephone was introduced) that punished intentional damage of the telegraph network, and of course made no reference to telephones. The Austrian judges justified their judgments by arguing that the telephone is a kind of telegraph: In other words, they presented a clear analogical application of criminal law as merely an interpretation of it. Still, it in not unusual to find cases in which analogy has a converse use: A judge should in theory apply a law whose scope plainly covers the case in question,

[29] See Hägerström 1917, 25–31, cf. 1ff., 10ff. With regard to *justice* and *rightness* or *correctness*, on p. 85 Hägerström qualifies as follows the idea of a just judgment (*rättvis dom*): A just (*rättvis*) judgment is the exact statement of the behaviours that in a given case are right (*riktiga*) for the parties under a system of modes of behaviour conceived as having the objective characteristic whereby the system ought to (*böra*) be enforced. Hägerström's view is that we will keep within the bounds of a scientific conception of the law only so long as our investigation focuses on ascertaining the rules actually (*faktiskt*) applied in the life of the law (*i rättslifvet*); failing which we spill over into practical philosophy or into social theory, two disciplines that Hägerström considers to be prescriptive. And in Hägerström's opinion, this happens whether the basis on which to regulate social relationships should be found to lie in the lawmaker's "true" intention as ascertained through a historico-philological method, or whether this basis should be found to lie in the lawmaker's intention or in the common legal consciousness (*rättsmedvetandet*) as normatively understood and ascertained through a sociological method taking into account the interests of society. The "lawmaker's intention," the "ultimate aim of the law," and any other like criteria may be useful in formulating *de lege ferenda* statements (that is, statements of legal policy, as Ross would later put it), but not in formulating legal statements having scientific validity. Cf. Hägerström 1917, 38–42, and Hägerström 1961, 64ff.

but in practice it may happen that he or she will still resort to analogy and will apply a provision other than the one directly applicable to the case. In both cases the strict application of the law (the law directly applicable to the case) would stand in contrast to some widely accepted moral, economic, or social values, and the judge chooses to uphold these values rather than the law (see Hägerström 1917, 31–36, 22).

Hägerström holds that when interpreters resort to analogy, far from keeping to the lawmaker's intention (*afsikt*), they necessarily part from it, because such intention can only be confined to the cases the lawmaker was thinking about when enacting a law: By definition, all cases the lawmaker does not anticipate are foreign to his concrete intention. It might be said here that, by resorting to analogy, interpreters adhere not to the lawmaker's concrete intention (*konkret afsikt*) but to the purpose (*syfte*) or aim (*ändamål*) the lawmaker demonstrably pursued in regulating certain cases in certain ways. With this argument, however, we have already abandoned our claim that the law applied by recourse to analogy expresses the lawmakers' will, because the lawmakers, whatever the rationale behind the laws they make, cannot be found to have wanted what they have not represented to themselves as objects of their volition. We cannot argue that interpreters have the ability to reconstruct the true aim inspiring the lawmaker. Most often, the rationale used to justify recourse to analogy results from the interpreter's own value judgments as influenced by the objective factors mentioned above (see Hägerström 1917, 18–25; cf. 32–4 in the footnotes, 154–7).

13.5. Rights and Transactions

13.5.1. Rights

13.5.1.1. Rights versus Interests

When we think that someone has a right (*rätt, rättighet*), Hägerström observes, we understand this person to be determinative (*bestämmande*) for the rightness (*riktighet*) of the behaviour of one or more other persons.

If we consider a holder of a property right (*äganderätt*), we understand this person to be in a position relative to a thing in such a way that he is determinative for the rightness of the behaviour of every other person with respect to the same thing.

If we consider a right holder's right to obtain a duty holder's performance (*obligatorisk rätt*), we imagine the former in a relation to the latter such that the former is determinative for the rightness of the latter's behaviour in carrying out the performance in question.[30]

[30] Hägerström 1963, 15; cf. Hägerström 1917, 62, 86–7.

Needless to say, Hägerström does not understand these remarks as framing his own definition of a right: He is rather describing the meaning that the common legal consciousness ascribes to the term *a right*. According to Hägerström, the idea of a right (*rättsidé*) is a variant of the idea of duty: It is a moral idea framed as a duty (and not as a value), in the sense that we understand a right as the right to expect others to do their duty and not as the right to expect them to act in conformance with our own values or interests.

If the idea of a right were an idea referring to interests and values, that would mean that the right-holder's interests and values should rise to the status of a value norm (*värdenorm*) which the duty-holding counterpart has to follow. But if that were the case, the rightness of a duty-holder's behaviour would be determined by the right-holders' interests. Hence, there would be no reason to respect other people's property if such property had no value for its owner (such as the value some small change would have for a billionaire), and so much the more if the property at issue were potentially harmful to its owner (as would be the case of a loaded gun in the hands of someone not trained in the use of firearms). There would be no reason to fulfil an obligation due to a creditor who had no interest in being paid back, or who would incur damage as a result of such repayment. And, in fact, that is not how the idea of a right works: We think it right to do what a right-holder's right requires, even when this does not work to his advantage, and even when such a course of action should work to his *disadvantage*.

This peculiarity concerning the idea of a right comes across in a complementary manner in the fact that the duty-holder is not required to fulfil the right-holder's interest in full. For example, we believe a property owner entitled to have others respect his property, but not to have them help him enjoy it proficiently; likewise, we hold creditors entitled to the money they are owed, but not also entitled to be advised on the best use of that money; and so on.

So the idea of a right can be said to rest on the idea of a general rule that is in force independently of any value (*allmän regel, som gäller omutligt*), in such a way that the right-holder grounds in this norm the rightness of the duty-holders' behaviour, even if the right-holder does not value the behaviour at issue. A right is commonly held to determine an obligation (*förpliktelse*) for a duty-holder, and according to "the idea of duty (*pliktidé*) the rightness of certain behaviours depends on a fixed rule of conduct (*fix handlingsregel*); and this rule is blind to the real consequences a behaviour will have with respect to one value or another" (Hägerström 1963, 18; my translation).[31]

[31] See more in general Hägerström 1963, 15–8. The word *omutligt* (cf. ibid., p. 17) properly means "incorruptibly," which in this context suggests that the rule in question must not suffer from contamination with any value; Hägerström adds to this that the ancient Romans used the expression *strictum jus* to express the concept of an incorruptible rule. Cf. Hägerström 1917, 75–6.

This is the sense in which the idea of a right is conceived by Hägerström to be a moral idea framed as a duty and not as a moral idea framed as a value. Hägerström examines in this regard the question of damages with respect to the interests of the parties concerned and the idea that law consists in a balancing of different interests, showing that in neither case do we have a basis for concluding that a right is a moral idea framed as a value, for even in these cases it is instead a moral idea framed as a duty (Hägerström 1963, 19–20, 27–9, 33–5).

13.5.1.2. The Idea of a Right in Its Connection with That of Norms and Claims, and the Idea of a Right Understood as a Power

In Hägerström's view, if we think that a right-holder's position grounds the existence of certain duties—grounds the rightness of some behaviours by others—then rights can be substantially understood in two ways: These, however, cannot be severed from each other, except in the abstract, because both stem from the hypostatization involved in the idea of a norm, and from the psychological mechanisms that concur in shaping this idea.

According to the first way of understanding the idea of a right, the right-holder determines the rightness of other people's behaviour (the right-holder determines the duty-holder's duty), because we believe there exists a rule (*regel*) which is in force (*gäller*) for both right-holder and duty-holder, and which frames the duty-holder's duty by reference to the right-holder's right. Here it is a norm that, strictly speaking, determines a duty, and the norm does so by linking the duty-holder's duty to the right-holder's right, and so this right in turn appears indirectly determinative for the rightness of the duty-holder's behaviour.

According to the second way of understanding the idea of a right, the idea of a norm is kept pretty much in the background, because we understand the right-holder himself as directly determining—by way of a command issued to the duty-holder—the rightness of this person's behaviour. Here we are led to attribute the commanding will, so imagined, in the first place to the right-holder.[32]

However, it is only in the abstract that this second understanding of the idea of a right can be separated from the former; in fact the two get confused in the common legal consciousness, in that the first understanding really amounts to nothing more than a reflection of the phenomenon by which we are readily brought to imagine a commanding will (*befallande vilja*) backing a

[32] As was noticed in Sections 13.3.2 and 13.3.4, the idea of a norm cannot be equated with the concept of a command, and yet this idea takes shape through the psychological conditioning exerted by the commanding powers in society (and through custom), a circumstance that readily leads one to imagine a commanding will behind norms: For example, we can be led to regard moral norms as commands issued by the voice of our conscience, or by God, and we will similarly regard legal norms as commands issued by the state or by the so-called sovereign organs.

norm (or otherwise accompanying or replacing it). On both understandings of the idea of a right, Hägerström remarks, it is thought that the right-holder can (*kan*) make a request (*kraf*) or assert a claim (*anspråk*) against the duty-holder; and on the second understanding, it is thought that what is essential to a right is instead the claim, and that the claim itself is what determines a duty. The burden of Hägerström's remarks is as follows: Invariably entailed in the idea of a right is that a right-holder can make requests or assert claims against a duty-holder; and sometimes the same idea entails that a right essentially amounts to a claim, in such a way that the duty-holder's obligation to behave as requested springs directly from the right-holder's claim.[33]

This way of rendering the current idea of a right makes it necessary to clarify the sense in which we say that a right-holder can (*kan*) assert claims.

Hägerström remarks that if we understand a right-holder as someone who advances claims (*såsom krävande*), then we will ascribe to this person a power to advance claims (*en makt att kräva*). This point bears on the way in which we commonly say that a right-holder can (*kan*) advance claims, and so it takes us to the core of the problem as to the "nature" of a right.

It is a matter of fact, in Hägerström's view, that we have no power (*makt*) to make a claim to something unless we consider ourselves capable of influencing others by way of imperative utterances addressed at them, and unless we actually *can* exert such influence. A power to make claims does not flow simply from the possibility of speaking certain words, because the words so spoken will have to be backed by instruments of power (*maktmedel*), for otherwise we cannot hold ourselves capable of influencing other people's behaviour through a claim—at best we can hope a plea (*bön*) will do the job.

It follows from this that the idea of a right as a power is mere fiction (*ren fiktion*)—unless, that is, a functional legal system equips right-holders with those instruments of power that alone can secure the necessary firmness for these people's capacity to influence others (Hägerström 1963, 57–8).

A right understood as a power to assert a claim to something would not be a mere fiction if we conceived of this power as consisting in a de facto power issuing from the normal functioning of the legal system. Indeed, in a functional legal system, a right-holder's claims will largely be fulfilled without duty-holders challenging those claims—at worst the matter is referred to a court of law. The question now is whether this factual or empirical notion—whereby we have a good chance of enjoying certain advantages, failing which we can seek a remedy by recourse to a court proceeding that will make up for our loss—comports with the way we actually represent to ourselves the idea of a right understood as a power.

With plenty of examples to hand, Hägerström has no problem making a case for his view that no lasting power is possible without the backing of a

[33] Hägerström 1917, 86–7; Hägerström 1963, 54–6.

minimally functional legal structure—for otherwise each person would fall prey to the aggression of others—nor need he show that the power found by natural-law theorists to lie in rights is an ideal power, one foreign to this earthly world, because these theorists themselves somehow concede that a right has no factual or empirical nature (Hägerström 1963, 36–52; cf. 1927, 35ff., 236ff., 348ff.; 1941, 301ff., 64ff., 107ff.).

The conclusions that Hägerström draws from analysing the natural-law conception of rights throws light on his critique of the concept of a right as generally understood by legal practitioners and legal positivists. Indeed, this critique as we find it, that is, scattered about in different writings, can leave us wondering what Hägerström is driving at: If, on the one hand, he foils every attempt at reducing rights to de facto powers, on the other hand he brands as scientifically untenable the theory that presents rights as ideal powers.

In fact Hägerström is trying to make two points here: One is that the idea of a right cannot be reduced to a de facto power, and the other is that legal practitioners and jurists themselves cannot completely rid their discourse of this idea, with the consequence that their aspirations to scientific rigor are regularly thwarted.

Modern legal scholarship, Hägerström observes, cannot find common ground when it comes to framing the concept of a right, nor can it reach any such agreement, because it strives to reduce this concept to a factual or empirical notion—an impossible undertaking. In fact the (natural-law) idea of rights as ideal powers crops up abundantly in the language of jurists, lawmakers, judges, and private citizens having rights under the law: True enough, rights are no longer made to spring from natural rights, but the idea lingers of a "supernatural" power that logically precedes and justifies de facto power.

Hägerström is not just presenting the idea of a right as irreducible to an empirical concept: He is also arguing that legal dogmatics cannot offer an account of the law without embracing the idea of a right. As with Hägerström's concept of a norm, so also in regard to the idea of a right his realism comes out in full. For, on the one hand, Hägerström points out that certain legal concepts are not scientific, as some pretend them to be, and, on the other hand, he states that such concepts cannot be discarded despite their not being scientific.[34]

Hägerström shows in this regard that even the theory of rights as legally protected interests, a theory supported by Jhering and before him by Ahrens, cannot avoid using the notion of a right as an ideal power.[35]

A connection exists between ideal power so construed (the idea of a right) and the de facto power secured by a functional legal system, and that is an

[34] See Hägerström 1934b, *passim*; Hägerström 1927, 1ff. On the possibility of explaining the concept of a right solely on the basis of the idea of a norm, see Hägerström 1917, 133–6, and Hägerström 1963, 79–81.

[35] Hägerström 1963, 81ff.; Hägerström 1961, 120–31.

empirical connection. The idea of a right is not an idle entity in the realm of the law; quite the contrary, it plays a key role (as do the ideas of a norm and of duty with which it is closely linked): It carries out an important imperative or directive function, by affecting individual and collective attitudes, and so also the behaviour of law courts, whose task it is to protect the factual advantages people are "entitled" to.

Plus, the idea of having a right conjures up feelings of moral empowerment and force: If people know they are putting up a fight to secure their rights, they will be more disposed to undergo sacrifices and will also be more confident they will win out; depending on the circumstances, our sense of dignity, honour, and autonomy gets associated with the idea of a right, making this idea more effective and more charged with ideological and emotive import.

In sum, the idea of a right belongs to the complex of factors that operate in society and concur in keeping the legal system alive and well. But the converse is also true: When the same idea acts contrary to the ends the legal system is designed to achieve, it can ultimately undermine the system and contribute to making it fall apart. Hägerström devotes some discussion to the question of what feelings the idea of a right elicits, and does so looking to international relations as a paradigm of a context in which legal ideas exert a good deal of suggestive force. Lundstedt took up and elaborated on Hägerström's hypothesis that the idea of a right can undermine the stability of a legal system and contribute to its downfall when the contents of the ideal powers inherent in that idea act counter to the aims pursued by a legal system. The idea of a right as connected with its directive, technical, and emotive functions would be analyzed in great detail by Olivecrona.[36]

13.5.2. Transactions

Hägerström takes up the subject of transactions from the standpoint of the history of ideas no less than from a theoretical standpoint. In his historical studies he considers a number of transaction-like forms in ancient Roman law and the promise in natural-law theory. A theoretical account is set out in his 1935 *Begreppet viljeförklaring på privätrattens område* (The concept of a declaration of will in private law), now in Hägerström 1961, which is praiseworthy for laying out and bringing to fruition the results of his three fundamental lines of research on law: his critique of the voluntaristic theory of law, his critical analysis of the concepts of a right and of duty as referring to imaginary entities, and his investigation into the historical origins of the fictions and hypostases typical of legal positivism. This essay, combined with some points made

[36] Hägerström 1963, 58ff., 71ff. In this regard, see esp. Lundstedt 1925; cf. Lundstedt 1932c, 93ff., 119ff.; Hägerström 1966, 182–3, 193; Hägerström 1927, 16–7. Cf. Olivecrona 1939, 79ff. On Olivecrona and Lundstedt see Chapters 14 and 15 in this tome, respectively.

in other writings, can be regarded as setting out a theory of Hägerström's on the transaction, a theory whose overall cast turns out to be quite analytical and modern: Hägerström rejects the common opinion that a transaction consists in a declaration of will; he argues that it consists instead of imperative sentences, and he essentially frames the same problem posed by what J. L. Austin later termed "performative language."[37]

A transaction, Hägerström observes, involves our speaking or writing about rights and duties. But how exactly are these rights and duties spoken of or written about? We do not refer to them as things that already exist (or have already changed or ceased to exist), nor do we refer to them as things that will come to exist (or will change or cease to exist): We make a legal transaction not to *declare* that certain rights and duties already exist, since the transaction is made precisely to get rights and duties to exist; nor do we make a legal transaction to *declare* that those rights and duties will exist, for it is not by declaring that something will exist that we bring it into existence.

Hägerström further specifies this point by noting that a transaction is not a judgment (*omdöme*) about the present or future reality of certain rights and duties and that, even so, a transaction does express (*uttrycker*) a representation—an imaginational representation (*fantasiföreställning*)—of certain rights and duties. Here Hägerström is not using "imaginational representation" to refer to the metaempirical nature of rights and duties (as the word *fantasi* might suggest in connection with his overall understanding of rights and duties); rather (as *föreställning* suggests in connection with his theory of knowledge

[37] See Hägerström 1961, 100–1, 111ff. Cf. Hägerström 1927, 25ff., 35ff.; Hägerström 1934b, *passim*; and the 1935 essay in Hägerström 1961. Cf. Olivecrona's introduction to Hägerström 1961, 27–56. Hägerström does not use any Swedish expression equivalent to *legal transaction* (he will occasionally use the German term *Rechtsgeschäft*). Instead, he uses *viljeförklaring* and *förklaring av vilja* in *two* senses, referring to both a declaration of will and a transaction (and he continues to do so even after arguing that a transaction is not a declaration of will). Hägerström maintains that the theory of transactions as declarations of will is traceable to the natural-law idea of a *signum*, or *declaratio voluntatis*, to explain which he proceeds from an account of an absolute monarch's prerogative to rule as he likes. In an absolute monarchy, the imperative laid down by the law seems to serve the sole purpose of notifying the subjects of the sovereign's desires (*önskan*, *önskning*): What is essential is not the law (the way such desires are formulated), but the desires themselves. If we as subjects should learn of the sovereign's desires from a source other than the law (supposing we have come to know that the sovereign has changed his mind about a decree he has issued), we will then be bound to comply not with the law or the official order, but with the sovereign's real desires. A law creates obligations. The sovereign's desires are, strictly speaking, the law. It is the sovereign's desires that give rise to an obligation of the subjects: The sovereign need only desire to obligate his subjects, and the subjects are ipso facto obligated; the expression of a desire is entirely secondary and instrumental to the desire itself. From this standpoint, a sovereign's desire has the inherent power to fulfil itself, working in the same way as an act of will does with respect to ourselves, an example being my purpose (*föresats*) to move my arm, in which case all I will have to do is simply *want* to move my arm. From here Hägerström argues that the absolute sovereign's laws communicate not merely a desire but the sovereign's will: *Sic volo, sic iubeo*. It is in this sense that law is said to be the sovereign's will. Cf. Hägerström 1961, 113–4, 109.

and reality), he is referring to the existence of a descriptive element in the non-descriptive (or nondeclarative) language in which a transaction is expressed.

Hägerström put his finger here on what R. M. Hare would later call the *phrastic* of a sentence, namely, the part of a sentence that, in Hare's words, "points out or indicates" something, whether the sentence is descriptive or prescriptive. In fact, Hägerström observes that our imaginational representation of certain rights and duties does not by itself suffice to establish a transaction: An additional something will have to come into play, because similar representations also appear in what are only the drafts or plans for a transaction. But, as Hägerström comments with an analytic mind, if we are to understand what needs to be added to a mere representation of certain rights and duties, so that there may be a transaction, it becomes "absolutely necessary" to consider that language (*språk*) not only expresses (*uttryck*) and communicates (*meddelar*, "informs us about") representations, but also expresses and serves to elicit (*väcka till liv*) practical or emotive attitudes (*praktiska inställningar eller känslor*).[38]

Hägerström argues that transactions are formulated in a language having an imperative function, which language is one among various kinds of nondeclarative language. Language whose function is imperative is what must be added to the representation of certain rights and duties in order to have a transaction: A transaction "imperatively expresses [*i imperativisk form*] an imaginational representation about the coming into existence of rights and duties"; what is being said in carrying out a legal transaction is that certain "legal rights and duties […] must come into existence [*skola inträda*]" (Hägerström 1961, 106; my translation).[39]

Hägerström examines *ex professo* what, using Hare's terminology, I called the phrastic of a transactional imperative: He asks what it is that we represent to ourselves (what we refer to) when making a legal transaction. He finds that the parties to a legal transaction do have in mind certain effective advantages (for themselves or for others) as well as certain concrete behaviours (their own or those of others), and they always assume that these advantages and behav-

[38] Hägerström uses the interrogative "Who's there?" as an example of a sentence that neither expresses nor communicates representations but merely expresses the speaker's desire to know something unknown; he uses the optative "If only it were sunny" as an example of a sentence expressing a representation (of sunny weather) connected with a feeling of pleasure; and in imperative sentences generally he sees a type of language aimed at eliciting practical attitudes. See Hägerström 1961, 101–4. On Hägerström's research on interrogative language, see Marc-Wogau 1968, 181–94. On the phrastic, see Hare 1952, 18.

[39] I choose to translate *imperativisk form* to *imperatively* and *imperative function* because Hägerström's examples of transactional formulas (like "I offer" and "I accept") make it clear that when Hägerström describes such formulas as having an *imperativisk form*, he cannot be referring to their grammatical form, but to something else, and this something can only be their function. On this point—and on the assumption that imperative language serves to influence behaviour—see Hägerström 1961, 104–6.

iours ultimately constitute the content of rights and duties, more or less consciously understood as ideal powers and constraints that precede and justify the enjoyment of those advantages and the performance of those behaviours. These *ideas* of right and duty come into full view and reveal their imperative function when a controversy arises and a judge is called on to decide who is entitled (has a right) to a certain advantage and who is obligated (has a duty) to have the behaviour that will bring about or secure the advantage in question (Hägerström 1961, 120–9).

Hägerström is too careful a realist, in considering concepts that have no correspondence to effectual reality, to simply replace them with factual or empirical notions. He rather examines these concepts and develops their implications so as to come at the function they fulfil, however empirically unfounded the concepts may be. Hence, adducing examples of transactional formulas, he rephrases them from the indicative mood (in which they are commonly used) to the imperative mood (which more accurately reflects their real meaning), and he never translates them to commands aimed at having people behave one way or another but rather frames them as imperatives about the ought of rights and duties (their having to take place). Thus, the formula "I am transferring my property right" means [not "Have this thing!" but] "This thing ought to be (*skall vara*) yours"; likewise, the formula "I am offering this to you" means [not "Take what I'm offering to you!" but] "The rights and duties this offer refers to ought to come into existence (*skola inträda*)"; lastly, the formula "I accept" means [not "Give me what you're offering to me!" but] "The rights and duties the offer refers to ought to come into being (*skola gälla*)" (Hägerström 1961, 105; my translation).[40]

Further, Hägerström (1927 and 1941) examines some imperative formulas, similar to the ones just considered, occurring in ancient Roman law and in what we would now call transactions in ancient Roman law (examples being the formulas *familiam habeto, ius potestasque esto*, *ei ius esto*, *sacer esto*, *heres esto*, *liber esto*), and in so doing makes the claim that these imperatives were addressed not to people or gods but, strictly speaking, to the world of law itself (or, better yet, the world of the right itself: *an die Welt des Rechtes selbst*), and that if we are to understand them we must consider them as if they created certain rights (*Rechte*). In the 1935 essay (now in Hägerström 1961), which this discussion proceeds from, Hägerström equates transactional activity with legislative activity: The parties to a legal transaction behave as if they were enacting a law (*som stiftande lag*) between them; and laws "are not imperatives (*imperativer*) in the common meaning of this term: [They are not] commands (*befallningar*)."[41]

[40] The alternative formulas enclosed within square brackets are mine.

[41] My translation. See also Hägerström 1927, 586; Hägerström 1941, 22ff., 35–6; Hägerström 1961, 104, 112. Among the most important investigations carried out by Hägerström are

It is necessary to distinguish in this regard a legal transaction's legal effect (*rättslig effekt*) from its psychological effect or influence (*psikisk effekt* or *påverkan*).

The legal effect of a legal transaction derives not from the legal transaction itself but from the laws and customs establishing the conditions under which the transaction acquires legal relevance (*juridisk relevans*), these being the conditions under which the legal apparatus will use force to exact compliance with the commitments undertaken: Anyone making a legally relevant transaction "is backed by the power (*makt*) represented by the laws that regulate the effectiveness (*effektivitet*) of legal transactions." Clearly, Hägerström uses *legal effect* to refer not to the presumed coming into existence of rights and duties, but to what results from the activity of judicial bodies acting to enforce the transactional clauses. This he does despite listing the ideas of a right and of duty as factors that help make the legal apparatus work: These ideas are not the legal effects of legal transactions but the psychological causes of such effects.

A legal transaction's psychological effects or influence (as opposed to its legal effects) are owed instead, says Hägerström, to the use in transactions of language having an imperative function. No doubt, the psychological effect is reinforced by the parties' awareness that their transaction has legal relevance, and so that the apparatus of the law can bring force to bear in enforcing the transactional clauses; yet the psychological effects in question cannot be equated with the parties' fear that the state may so intervene, so much so that even some nonlegal promises (known by the parties to be nonlegal) nonetheless exert a psychological influence on those who make them and those they are made to (Hägerström 1961, 104–6).

It follows from the above that the questions How does the imperative function of a legal transaction work itself out? and Does a legal transaction create, change, or extinguish rights and duties? must be answered disregarding a legal transaction's legal effects and taking instead into account its psychological ones.

In fact, Hägerström proceeds in his analysis on the assumption that a legal transaction—and so a promise—is an imperative but not a command. Several things urge this conclusion: Hägerström's definition of legal transactions as imperatives regarding the coming into being of certain rights and duties; his framing transactional formulas, which commonly occur in the indicative

indeed the historico-anthropological ones, and specifically noteworthy among these are the ones he devoted to Roman law (see, among others, Hägerström 1927, 1929b, 1934, and 1941). There is no room to enter into these investigations here, but see Faralli 1987. Karl Olivecrona edited the posthumous edition of *Der Römische Obligationsbegriff*, vol. 2 (Hägerström 1941), and in his own turn conducted some historico-anthropological investigations following the trail blazed by Hägerström. Olivecrona's "Editor's Preface" to *Inquiries into the Nature of Law and Morals* (Olivecrona 1953), a little-read or mentioned preface, figures among the most perspicuous short introductions to Hägerström's philosophy of law, and in it Olivecrona briefly and masterfully presents as well Hägerström's investigations into Roman law.

mood, as imperatives stating that certain rights and duties ought to come into being; his observations on the imperative formulas in Roman law that prefigure today's transactional formulas; his equating transactional activities to legislative activity, this in connection with his thesis that even statutes are imperatives but not commands; his explicit unwillingness to accept that it makes any sense to address a command to oneself; and, finally, his considering the psychological function of transactional imperatives to be the same in legal and nonlegal transactions alike.[42]

Hägerström writes that "whoever declares that he *is binding himself* to another person, who thereby acquires a claim, is aiming at an imperative: I *must* perform this or that for you" (Hägerström 1961, 104–5; my translation; italics in the Swedish original).

Hägerström here is not stating, "the promisor aims to *say*," but "the promisor aims to *do* something, namely, to set up or create an imperative *I must*." And this *I must* is not so much the meaning as the product of the words "I am binding myself to another."

Hence, in a promise, the words *I am binding myself to another* mean "an imperative *I must* (i.e., a duty) ought to come into existence," and in the promisor's mind they effectively create the *I must*, or duty, under consideration. And that is so independently of whether the promise is legally recognized.

"If a promise is legally recognized," Hägerström points out, "this adds no more [with respect to a nonlegal promise] than a declaration that certain special legal rights and duties *must* come into existence [*skola inträda*]" (Hägerström 1961, 105; my translation). Hence, it is not by virtue of being legally recognized that a promise (its wording or the language it is expressed in) can be endowed with its presumed capacity to create duties. A promise (as commonly conceived) has this meaning in itself, and it produces powers and duties on its own; what happens when a promise is legally recognized is no more than that the powers and duties it creates acquire a "special" legal status whereby they become enforceable under the law.

A transaction does not really create (or modify or extinguish) rights and duties. A realist like Hägerström cannot regard words as capable of creating (or modifying or extinguishing) anything, much less any "mystical" powers (such as rights) and constraints (such as duties): You cannot do things with words, as I would put it (*pace* J. L. Austin). There is, however, a general belief that the use of certain sentences can have this ability: Hägerström's historical inquiries provide an account of the way this belief originated as concerns the theory of law. It is through this belief that a transactional sentence—understood in the first place as meaning that certain powers and constraints (certain

[42] Hägerström (1961, 63) states that a command directed at oneself makes no sense (it is *orimlig*); Hägerström (1917, 59 and 132) states that issuing commands to oneself is something that may, by self-suggestion, play a role in reinforcing a previously formed purpose.

rights and duties) must come into existence—acquires an imperative function, namely, a psychological efficacy mediated by the idea that the powers and constraints (the rights and duties) referred to in the transactional sentence effectively come to exist, and that they do so by virtue of the transaction itself.

When people make promises, Hägerström says, they aim to create an imperative *I must* that is in force in the first place with respect to the promisors themselves, who are influenced in a passive way (*i passiv riktning*); the effect (*effekt*) on the promisees is that these persons feel they have the power to demand (*känner sig äga makten at kräva*) the performance of the promised behaviour, and they do so on the basis of a "You *shall* be able to demand" (*du skall kunna avfordra*), which influences them in an active way (*i aktiv riktning*) (Hägerström 1961, 105; my translation).

A legal transaction is not a command: It does not directly prescribe behaviours and does not exert an immediate suggestion comparable to the suggestion exerted by one who authoritatively orders someone, "Do this!" A legal transaction functions through the idea of the rights and duties the transaction is believed to create (or modify or extinguish). The idea of our having rights or duties has a directive function and guides our behaviour.

Olivecrona, who was clearly drawing inspiration from Hägerström, would later say that sentences meant to create (or modify or extinguish) legal relationships or statutes are imperatives devoid of addressees, and that these imperatives belong to (and perhaps even count as prime examples of) that type of language that J. L. Austin said is used to "do things with words," and which he accordingly termed performative language.[43]

Rights and duties are ideas and hence are not legal but psychological effects flowing from a transaction and are elicited—by the use of a certain type of language—in individuals duly conditioned by the upbringing they have received and by the social environment around them.

Legal effects, by contrast, are factually determined situations that the legal apparatus ultimately imposes in accord with statutes (and with custom, case law, and so on) regulating transactional activity. A legal transaction's psychological influence is made more efficient by the parties' awareness of the trans-

[43] The example "Do this!" is mine. See Hägerström 1961, 104–5, 110ff.; cf. Hägerström 1934b, 617ff. The imperative function that here Hägerström attributes to transactional formulas takes effect through the idea of rights and duties, and for this reason this function seems clearly akin to the imperative function that Hägerström attributes to norms. It is Hägerström's view that norms, too, are *ideas* (of norms): They are ideas associated with imperative expressions (for example, with the sentences contained in a statute); that, however, does not make them the same thing as these imperative expressions, for norms spring instead from a psychological conditioning, as discussed in Sections 13.3.2 and 13.3.4. For this reason, Hägerström cannot be understood as saying that a transaction *is* a norm; rather, a transaction can *create* (better yet, can be *believed* to create) a norm (a legal norm when the transaction is legal and a nonlegal norm when the transaction is not legal).

action's legal effects: After all, these effects are mediated by the idea that a legal transaction, once completed, creates (or modifies or extinguishes) certain "real" rights and duties; the legal transaction's psychological effects (the ideas of a right and of a duty) thus act on the parties and on judges and contribute to bringing about the transaction's legal effects.[44]

13.6. How Rightness and Justice Figure into Coercion

A distinction is in order that Hägerström uses but fails to call attention to. On one side of this distinction is rightness or correctness (*rätthet, riktighet*) and on the other is justice (*rättvisa* or *rättfärdighet*). In Hägerström's view, coercion under the law (*tvång*) is founded on an idea of justice which in many ways is bound up with the idea of rightness, and so with the idea and the sense of duty, but which is also connected with other ideas: Among these is the primitive idea of justice originating from a feeling of vengeance (*hämndkänsla*), an idea under which suffering must be repaid with suffering. A punishment consists in inflicting suffering.

The idea of a behaviour's rightness is connected with the idea that it is just (*rättvis*) for someone who has failed to behave rightly (*rätt*) to be forced to perform an action equivalent (*ekvivalent prestation*) to the right behaviour not performed.

As we saw in Sections 13.3.2 and 13.3.3, right behaviour is the behaviour which must *take place* and which for this reason ought to be *carried out*. It is right, for example, that property owners should not be deprived of the property they own; consequently, we ought on our part to stifle every impulse that may prompt us to appropriate other people's property. If we fail to behave in this right way, we will have to perform a behaviour equivalent to the behaviour we have failed to have: If we take someone else's property (wrong behaviour), we will have to return it (performance equivalent to the omitted right behaviour). And if we do not spontaneously carry out this performance equivalent to the right behaviour we failed to have, then it will be just to exact such performance coercively. Thus, it will be just to force a thief to return the stolen property.

With this example, the idea of just coercion is grounded in the idea of right behaviour, this by way of the relation set up through the linking idea of an equivalent performance: The rightness (*rätthet*) of returning the property and the justice (*rättvisa*) of exacting such restitution coercively rests on the very norm setting out the right behaviour, which in the example considered is the behaviour consisting in not stealing other people's property. The linking idea is that of an equivalent performance: It is on the basis of this idea that coercion is made just. Coercion is just insofar as the behaviour forced by coercion

[44] See Hägerström 1961, 106–10.

is a right behaviour, this being the behaviour which ought to have been performed—here, our not stealing—or a behaviour equivalent to it—here, restitution of the stolen property (Hägerström 1917, 100–1; cf. the first two essays in Hägerström 1966).

I spoke of thieves but not of punishments: I simply referred to the (coerced) return of the stolen property. This is because the idea of the justice of a punishment (infliction of suffering) is only partly founded on the idea of the rightness of a behaviour: The idea of an equivalent performance—the liaison between the idea of behaving rightly and the idea of justly forcing people to have the behaviour equivalent to the right behaviour they failed to have—is not entirely equipped to account for the idea of the justice of a punishment.

For clarity I will draw another distinction that in Hägerström is not explicit, and this is the distinction between coercion and the content of coercion. The aim here is become aware of the (psychological or ideological) foundation underpinning the justice of coercion, which justice is normally taken for granted and used as a background assumption in common legal consciousness.

The idea of equivalent performance grounds the justice of coercion by making reference to the *content* of coercion: Coercion is just insofar as its content (a coercively imposed behaviour) consists in the right behaviour (in the behaviour that ought to be performed) or in a behaviour equivalent to it.

A punishment, however, is not equivalent to a right behaviour that was not performed. For example, locking up a thief is not the equivalent of not stealing: Locking someone up does not return the stolen property to its rightful owner. So, too, imprisoning a murderer is not equivalent to respecting other people's lives: It will not give the victims their life back. Only returning stolen property is equivalent to the right behaviour the thief ought to have had; and only bringing the murdered person back to life is equivalent to the right behaviour the murderer ought to have had.

And yet it is a commonly held belief that coercively inflicting a punishment for criminal acts constitutes justice.

The distinction just drawn between coercion and its content prompts the following question: What makes it just to inflict a punishment? Is it the fact of coercion or is it the fact that its content—the punishment inflicted—causes suffering? This question and the distinction it is based on expand our horizon. I have thus far identified only one possible reason for the justice of coercion; namely, the content of coercion insofar as such content is a behaviour equivalent to the right behaviour that ought to have been but was not performed. We will now have to consider two other possible reasons for the justice of coercion: The fact of coercion itself and the fact that the content of coercion consists in inflicting suffering (punishment).

In Hägerström's view, the idea that inflicting a punishment is just draws on both the idea that coercion is just as such (as coercion) and the idea that the content of coercion is just insofar as it consists in inflicting suffering (punish-

ment). This second reason is based on a primitive idea of justice, which originates in a feeling of vengeance (cf. Hägerström 1917, 104–8). The first reason—the idea that coercion is just as such—can be traced to a distorted idea of equivalent performance. So let us now take a closer look at this distorted idea.

To explain how, through a distortion, coercion itself (in spite of its content not being a performance equivalent to a right but omitted behaviour) traces to the idea of a performance equivalent to a right behaviour that ought to have taken place but did not, and so how the justice of coercion as such is founded on the idea of rightness, Hägerström takes up the case of the compensation due when someone's property is damaged through mere carelessness.

Here those who cause damage neither intend to inflict damage nor realize they are inflicting it: They simply fail to exercise due care in judging the consequences of their behaviour, and for this reason they cannot be said to depart in any strict sense from the model of right behaviour (duty) that consists in not damaging other people's property. But still, it is commonly believed that compensation in the event of damage through mere carelessness is owed here, too, as a performance equivalent to a right behaviour that was not performed, just as it is owed in the case of intentional damage (I will not consider the criminal consequences attached to the wilful infliction of damage).

This mistaken common opinion, Hägerström submits, can be explained as follows: There is a general or class interest (*allmänt eller klassintresse*) in protecting property from damage, regardless of how such damage may come about (whether wilfully or by mere negligence). This interest prompts us to regard a certain degree of care in avoiding damage as a property owner's right, and so to regard careful and diligent conduct as that conduct which ought to take place (*bör ske*). This way the diligent conduct becomes a norm: It becomes the right behaviour that ought to be performed. Strictly speaking, the equivalent of an unperformed diligent behaviour should consist not in compensating the damage caused but rather in undergoing some sort of training or education aimed at instilling the needed diligence. And yet, since the interest the norm originates from is an interest in protecting property, and not an abstract interest in diligent behaviour as such, we are led to believe that compensation is the performance equivalent to the diligence that should have been exercised but was not. The interest in protecting property acts as a liaison between the idea of right behaviour and the idea of equivalent performance: Once the assumption is accepted that compensation for damage, whatever the cause of the damage, is equivalent to a right but unperformed behaviour, in such a way that compensation becomes itself a right behaviour (one whose performance is a duty), we will find it just to enforce such compensation should it not come about spontaneously.

Something along the same lines happens with punishment as well. Punishment does not strictly speaking constitute an equivalent performance engaged in for the benefit of someone who has fallen victim to a criminal act: It is said

to be restoration for the damage incurred by some social interests—for example, the interest in law abidance or the interest in maintaining a general sense of security—and this can be so in view of the ability of punishment to set a strong example for others to ponder. Most often, however, criminal offenders intend to hurt only the victims they strike, and they do so without considering the harmful consequences they indirectly and unintentionally bring about in such a way as to undermine social interests at large. Here, too, since with reference to social interests, right behaviour would consist in inducing an attitude of special care not to undermine social interests (like that in law abidance or in a general sense of security) the performance equivalent to the right but unperformed behaviour should consist not in subjecting criminals to punishment but, for instance, in forcing them to take special courses on the social damage that criminal behaviours cause.[45]

However, our common legal consciousness rejects the view that taking a course on the harmful consequences indirectly and unintentionally caused by criminal acts in society counts as a performance equivalent to the right behaviour the criminal ought to have but did not perform: The reason is that the norm prohibiting criminal acts originates not from an abstract interest in citizens' being aware of the social damage caused by criminal acts, but from the interest in having a deterrent against antisocial tendencies—a deterrent working by virtue of the exemplary nature of punishment—and maybe also from a social sentiment of vengeance (*en social hämndkänsla*), a case in point being the idea of retaliation in kind (*vedergällningsidé*), whereby justice requires criminals to suffer in the same way as those they cause to suffer.

Unlike compulsory courses on the social damage that criminal behaviours indirectly cause, neither the exemplary nature of punishment nor retaliation in kind (the *lex talionis*: evil repaid with evil) can make punishment a performance equivalent to the omitted right behaviour. Even so, once a norm sets out a punishment in consequence of a failure to have the right behaviour, punishment comes to be perceived as equivalent to the right but unperformed behaviour, and on this account we come to think that punishment by coercion is just.

Where punishment is concerned, the justice of coercion only apparently has its foundation in the principle of equivalent performance, and this appearance is something we come to have in virtue of a psychological distortion.

The failure to carry out a right behaviour is linked by a norm to coercion whose content consists in satisfying certain general or class interests or a desire

[45] Hägerström is not making superficial or irresponsible remarks aimed at abolishing the criminal system. Rather, he is trying to explain the psychological mechanisms that prompt us to think coercion just; in particular, since the principle of a performance equivalent to the right but unperformed behaviour plays a prominent role in our way of understanding the justice of coercion—despite at the same time seeming not to find application in all forms of coercion when looked at more closely—Hägerström sets out to show by what intervening factors this principle gets distorted and yet continues to appear to us to be at work.

for vengeance; this connection makes it so that the satisfaction of these interests or desires appears as the equivalent of the right but unperformed behaviour, and for this reason any coercion that takes this content will seem just by virtue of that fact alone. This way, rather than a behaviour becoming an object of coercion because equivalent to a right but unperformed behaviour, a behaviour is believed to be equivalent to a right but unperformed behaviour because of its being made a content of coercion. And if coercion grounds equivalence, and equivalence grounds the justice of coercion, then coercion finds within itself the foundation of its own justice: Coercion is just as such.

The point of Hägerström's remarks here is not that there is a general inclination, especially in developed societies, to regard coercion as just regardless of its content, that is, regardless of whether this content is disproportionate to the deed it is matched to, for example, or if it is cruel. And yet, in Hägerström's view, even restrictions to the content of coercion (examples being limitations on the compensation payable for unintentional damage, or a certain moderation in punishment) are in point of fact determined by general or class interests or by sentiments contrary to those originally inspiring the various contents of coercion. Thus, acting contrary to the interest in protecting property, as a counterweight to this interest, is an interest in not bringing everyone's activity to a standstill—whence the restriction on repayment for unintentional damage. Likewise, the interest in law-abidance and in a general sense of security, both of which go along with the general sentiment of vengeance, are counterbalanced by an interest in limiting a person's suffering and by the sense of humanity—whence the possibility of moderation in punishment.

In any event, the interests and sentiments on either side of this balance—or rather, the results they lead to once they are made into the content of coercion under a norm—wind up being rationalized through the previously described distorted psychological process, a process through which we come to believe that the satisfaction of such interests and sentiments is a performance equivalent to a right but unperformed behaviour, and that for this reason such satisfaction is justly made into a content of coercion.[46]

[46] See Hägerström 1917, 101–4. The example of education and training as equivalent to a correct but unperformed behaviour is adduced by Hägerström only with respect to criminal acts: Its extension to unintentional damage is mine. Similarly, some concepts that Hägerström mentions only in passing and some arguments he does not carry through completely have been elaborated on and made explicit. Hägerström (1920, 334) takes up the question of the forces that keep the common legal conscience on a leash (*föra i ledband*) and identifies these forces in the social interests that in fact determine punishment. Hägerström (1966, 183, 192) argues that a certain behaviour comes to be regarded as *intrinsically* bad (*ont*) when coercion is regularly observed to follow as a consequence of its occurrence; by the same token, the unpleasant consequences that are made to follow appear to us as connected with such behaviour *intrinsically*. See what Olivecrona (1939, 120ff.) writes along a similar line of reasoning.

13.7. More on Logical Reality and Effectual Reality

13.7.1. Kant behind Hägerström's Thesis That No Judgment Is Possible without the Logical Reality of Its Object

13.7.1.1. Kant on Judgment and the Nothing

For an adequate understanding of what Hägerström tells us in regard to the logical reality of the content of a representation which any authentic judgment is about, we must bear in mind the pages that Kant devotes to (*a*) the crucial relevance of the principle of contradiction as a *conditio sine qua non* of any judgment, and (*b*) his fourfold distinction of the nothing (*Nichts*) as opposed to the something (*Etwas*).

Kant has this to say in regard to (*a*):

> [(a1)] The universal, though merely negative, condition of *all our judgments* in general, whatever be the content of our knowledge, and however it may relate to the object, is that they be *not self-contradictory*; for if self-contradictory, these judgments are in themselves, *even without reference to the object*, *null and void*.[47] […]
>
> [(a2)] *The principle of contradiction* must therefore be recognised as being the universal and completely sufficient *principle of all analytic knowledge*; […]. The fact that no knowledge can be contrary to it without self-nullification, makes this principle a *conditio sine qua non*, but not a determining ground, of the truth of our [non-analytic] knowledge. Now in our critical enquiry it is only with the synthetic portion of our knowledge that we are concerned; and in regard to the truth of this kind of knowledge we can never look to the above principle for any positive information, though, of course, since it is inviolable, we must always be careful to conform to it. (Kant 1965, B 189–91; italics added on first, second, and third occurrence; square brackets in original on last occurrence)[48]

[47] Kant also writes: "The proposition that no predicate contradictory of a thing can belong to it, is entitled the principle of contradiction, and is a universal, though merely negative, criterion of all truth. For this reason it belongs only to logic. It holds of knowledge, merely as knowledge in general, irrespective of content; and asserts that the contradiction completely cancels and invalidates it" (Kant 1965, B 190). Here is Kant's original: "Der Satz nun: Keinem Dinge kommt ein Prädicat zu, welches ihm widerspricht, heisst der Satz des Widerspruchs, und ist ein allgemeines, obzwar bloss negatives Kriterium aller Wahrheit, gehört aber auch darum bloss in die Logik, weil er von Erkenntnissen, bloss als Erkenntnissen überhaupt, unangesehen ihres Inhalts gilt und sagt: dass der Widerspruch sie gänzlich vernichte und aufhebe" (Kant 1913, B 190).

[48] Here is Kant's original: "[(*a*1)] Von welchem Inhalt auch unsere Erkenntniss sei und wie sie sich auf das Object beziehen mag, so ist doch die allgemeine, obzwar nur negative Bedingung *aller unserer Urtheile* überhaupt, dass sie sich *nicht* selbst *widersprechen*; widrigenfalls diese Urtheile an sich selbst (*auch ohne Rücksicht aufs Object*) *nichts* sind. […] [(*a*2)] Daher müssen wir auch den *Satz des Widerspruchs* als das allgemeine und völlig hinreichende *Principium aller analytischen Erkenntniss* gelten lassen […]. Denn dass ihm gar keine Erkenntniss zuwider sein könne, ohne sich selbst zu vernichten, das macht diesen Satz wohl zur *conditio sine qua non*, aber nicht zum Bestimmungsgrunde der Wahrheit unserer Erkenntniss. Da wir es nun eigentlich nur mit dem synthetischen Theile unserer Erkenntniss zu thun haben, so werden wir zwar jederzeit bedacht sein, diesem unverletzlichen Grundsatz niemals zuwider zu handeln […]" (Kant 1913, B 189–91; italics added on first, second, third, and fourth occurrence).

Further, where (*b*) is concerned, Kant (1913, B 347–9) distinguishes four types of nothing as opposed to the something. The two types of nothing that are relevant for us here are the first one and the fourth one, the former of which Kant calls *ens rationis*, or *Gedankending* (a thought-thing), and the latter of which *nihil negativum*, or *Unding* (non-thing). He writes this in regard to the first and the fourth type of nothing:

> We see that the *ens rationis* (1) is distinguished from the *nihil negativum* (4), in that the former is not to be counted among possibilities because it is mere fiction (although *not self-contradictory*), whereas *the latter is opposed to possibility* in that the concept cancels itself. (Kant 1965, B 348–9; italics added on second and third occurrences)[49]

Kant's first type of nothing (the type "thought-thing," *das Gedankending*, or *ens rationis*) is relevant with respect to Hägerström's notion of what is logically real (determinate, consistent, noncontradictory, or possible), and hence with respect to his notion of the content of the representation a judgment is about (see Sections 13.3, 13.4.2, 13.5 and 13.7).

Kant's fourth type of nothing (the type "non-thing," *das Unding*, or *nihil negativum*) is relevant with respect to Hägerström's notion of the nothing, namely, of what is non-logically real (nondeterminate, inconsistent, contradictory, or impossible), which includes impossible contents of representations (nonentities), the apparent subject matter of what Hägerström calls impossible judgments, and which I call pseudojudgments (see Section 13.2 above).

13.7.1.2. Hägerström on the Nothing, Logical Reality, and Effectual Reality

13.7.1.2.1. The Nothing

The nothing, in Hägerström, is what is contradictory, indeterminate, inconsistent: It is that which is logically nonreal and so is neither effectually real nor effectually unreal in any effectually real complex, nor *can* it be either of those two things. For this reason, Hägerström writes that the negative judgment applying the principle of contradiction attests what effectual reality in itself is; it attests that "determinateness or connectedness comprises effectual reality" (*Bestimmtheit oder Zusammenhang Wirklichkeit einschließt*: Hägerström 1929a, 128; cf. Hägerström 1957, 138; see Section 13.5). Since noncontradiction is the principle not only of knowledge but primarily of reality itself, what lacks logical reality also lacks effectual reality: It is neither effectually real nor effectually unreal; it *cannot* be either of those two things.

[49] Here is Kant's original: "Man sieht, dass das *Gedankending* (n. 1.) von dem Undinge (n. 4.) dadurch unterschieden werde, dass *jenes* nicht unter die Möglichkeiten gezählt werden darf, weil es bloss Erdichtung (obzwar *nicht widersprechende*) ist, *dieses* aber *der Möglichkeit entgegengesetzt ist*, indem der Begriff sogar sich selbst aufhebt" (Kant 1913, B 348–9; italics added).

Hägerström's notion of what *is* contradictory, namely, logically non-real, takes up Kant's fourth type of nothing (the type "empty object without a concept," *leerer Gegenstand ohne Begriff*: Kant 1913, B 348), or *nihil negativum*. In Kant's words, the "object of a concept which contradicts itself is nothing, because the concept is nothing, is *the impossible*, *e.g.* a two-sided rectilinear figure (*nihil negativum*)" (Kant 1965, B 348; italics added on first occurrence):[50] "it is opposed to possibility in that the concept cancels itself"; it is a "non-thing (*das Unding*)"—it is *intigt*, as Hägerström (1951, 84) writes.

13.7.1.2.2. Logical Reality

As we saw in Section 13.7.1.1 at item (*a*), Kant clearly makes the point that in not contravening the principle of contradiction lies the *conditio sine qua non* of any judgment (not only analytic but also synthetic judgments): This Latin phrase, as used by Kant, describes a condition absent which there can be *no* judgment because there is no object for any judgment. Now, with respect to the object of any judgment, that is, with respect to the content of a representation, which is the object of any judgment, Hägerström presents a notion of logical reality coinciding with the notion of what is *not* contradictory, which in Kant had been presented as the *conditio sine qua non* that every judgment must fulfil in order to be an authentic judgment.

Add to this that, as we saw in Section 13.7.1.1 at item (*b*), the notion of what is *merely* not contradictory coincides in Kant with his notion of *Gedankending* or *ens rationis*—namely, with what he identifies as the first type of nothing (the type "empty concept without an object," *leerer Begriff ohne Gegenstand*: Kant 1913, B 348)—and that this same notion becomes, in Hägerström, the notion of logical reality. In other words, what in Kant was the first type of *nothing* becomes in Hägerström the first type of *reality* (the most elementary type), namely, logical reality, or *ein bestimmter Gedankengegenstand*, a determinate object of thought: The *bestimmter Gedankengegenstand* that Hägerström speaks of is the *Gedankending* that Kant speaks of (Hägerström uses *Gedankengegenstand*, or *tankeföremål*, referring to the content of a representation of words in regard to the principle of contradiction: Hägerström 1929a, 121; cf. Hägerström 1957, 128).

13.7.1.2.3. Effectual Reality

As we saw in Section 13.2, the object of any judgment, that is, the content of a representation, is logically real, and any complex in relation to which this ob-

[50] Here is Kant's original: "Der Gegenstand eines Begriffs, der sich selbst widerspricht, ist Nichts, weil der Begriff Nichts ist, *das Unmögliche*, wie etwa die geradlinige Figur von zwei Seiten (*nihil negativum*)" (Kant 1913, B 348; italics added on first occurrence).

ject is judged is effectually real: According to Hägerström, a judgment is a cognitive act of consciousness through which a knowing subject—having apprehended, presupposed, and *attested* as logically real an object to be judged—judges this object as effectually nonreal or as effectually real with reference to a wider complex apprehended as effectually real *in toto* (Hägerström 1929a, 120–1, 131–2; cf. Hägerström 1957, 126–7, 143–4).

In my interpretation of Hägerström, what is effectually real is any complex that on the whole is determinate (consistent, noncontradictory), as well as anything not merely represented which is found in a complex that on the whole is determinate.

Hägerström mainly uses *complex* (*Komplex* in German and *komplex* in Swedish) to designate effectually real worlds to which the content of a representation is referred in making a judgment about the effectual reality or noneffectual reality of such content (Hägerström 1929a, 120; cf. Hägerström 1957, 127).

He mainly uses *world*, rather than *complex*, to designate two conflicting, or contradictory, effectually real complexes to which two judgments, the first of which denies what the other affirms, refer the content of the same representation, as is the case with the content "men-who-breathe-through-gills" when that content is referred to the effectually real complex where men do not breathe through gills, on the one hand, and the effectually real complex where men do breathe through gills, on the other hand.

Finally, Hägerström mainly uses the German *Zusammenhang* and the Swedish *sammanhang*, rather than *complex* and *world*, to designate (*i*) the connection between two effectually real complexes and (*ii*) the world of spatiotemporal experience (Hägerström 1929a, 128–31; cf. Hägerström 1957, 138–43). The German *Zusammenhang* and the Swedish *sammanhang* have frequently been translated as context, a term I have not adopted here. The primary sense of those two words is that of a connection understood as a relational unity. I have thus translated them as "connection" or "connectedness" for case (*i*), whereas for case (*ii*), I have preferred to use "spatiotemporal world."[51]

13.7.2. A Crucial Passage by Hägerström and a Number of Misinterpretations

In Section 13.2.1, a clear distinction was introduced between *logical reality*, for the Swedish *realitet* and the German *Realität*, on the one hand, and *effectual reality*, for the Swedish *verklighet* and the German *Wirklichkeit*, on the other. I introduced this distinction so as to mirror a difference in linguistic usage which occurs in Hägerström's original texts, but which the English language

[51] It may be interesting to note that both words, *Zusammenhang* and *sammanhang*, refer etymologically to what "hangs or stands together," and so to its *cum-sistere*, in Latin, or to its *consistency*, in English.

cannot express with the single word *reality*, and which Hägerström's translators and commentators, even those who are native Scandinavian speakers, regularly ignore, thus posing serious obstacles to a proper understanding of his thought.

Indeed, in Hägerström, *realitet* (or *Realität*) is the reality of possibility, and so is a logical reality, whereas *verklighet* (or *Wirklichkeit*) is the reality of an actualized possibility, and so, whatever the actualized possibility may be—even one actualized in a fiction, let us suppose—this reality will be an effectual reality. One must bear in mind that Hägerström was trained in the Kantian-Hegelian tradition and that *Realität* and *Wirklichkeit* are not synonymous in this tradition. It should also be mentioned, incidentally, that even Kant's and Hegel's English translators at times ignore the question, and so it happens, for instance, that Hegel's well-known statement "Was vernünftig ist, das ist wirklich; / und was wirklich ist, das ist vernünftig," is incorrectly translated as "What is rational is *real*; / and what is *real* is rational" in Hegel 2001, whereas it is perceptively translated as "What is rational is *actual*; / and what is *actual* is rational" in Hegel 2003 (italics added). The translation of *wirklich* as *actual* reveals that the translator is aware of the different meanings of *Realität* and *Wirklichkeit* in Hegel's usage.

Quoted below is Hägerström's most pertinent passage on logical reality (*Realität*) and effectual reality (*Wirklichkeit*). In this passage Hägerström intends to show that the principle of contradiction attests what effectual reality is in itself, and since under this principle, he maintains, two judgments, one of which denies what the other affirms, cannot both be true, he asks what in a negative judgment is denied and what in an affirmative one is affirmed:

> What does it mean that a judgment denies something; that it denies, for example, that men breathe through gills? The negation seems to concern logical reality (*Realität*) itself. But it appears to be impossible that a judgment—in which invariably the logical reality (*Realität*) of something is attested—should deny the logical reality (*Realität*) of that about which the judgment is made. Pure nothingness cannot be judged at all. But what is that thing whose logical reality (*Realität*) is attested in a negative judgment? Here what can come into play is only the representation of that thing whose logical reality (*Realität*) seems to be denied, for example, the representation of men who breathe through gills. In a negative judgment ["Men do not breathe through gills"], such a representation must necessarily be apprehended as present. One finds that the content [men-who-breathe-through-gills] of this representation is logically real (*real*) insofar as one distinguishes such content within that representation as within a whole; however, one also concomitantly finds that the complex to which the representation along with its content belongs [namely, the effectually real complex where men do not breathe through gills] has a character different from that content [men-who-breathe-through-gills]. This "effectually non-real" ("*nicht wirklich*") is only a negative expression expressing the positive character of the *in toto* effectually real (*des in toto Wirklichen*) [namely, of the effectually real complex where men do not breathe through gills]. Conversely, in a judgment, an assertion ["Men effectually breathe through gills"] means our consciousness of this: that the aforementioned representational content [men-who-breathe-through-gills] occurs in what is apprehended as *in toto* effectually real, not only in a representation but also in the [effectually real] complex to which that representation belongs. From this it follows that two judgments, the first of which ["Men do not breathe through gills"] denies what

the other ["Men breathe through gills"] asserts, must necessarily have as their contents different worlds having no mutual connection [these are the effectually real world where men do not breathe through gills and the effectually real world where men breathe through gills]. (Hägerström 1929a, 120; my translation; cf. Hägerström 1957, 126–7)[52]

In the original version of this passage (which you can see in the footnote), Hägerström patently uses the German *Realität*, or *real*, when speaking of the content of a representation, and he instead uses the German *Wirklichkeit*, or *wirklich*, when speaking of *any* complex to which a representation, along with its content, is referred (or to which it belongs, as he says), namely, not only when speaking of the effectually real complex in which men do not breathe through gills, but also when speaking of the effectually real complex in which men do breathe through gills, as in the case of a fiction, I would say. Through a first-order negative and a first-order affirmative judgment respectively, the *same logically real* content of a representation (the content "men-who-breathe-through-gills") is judged with reference to two *different* and conflicting effectually real complexes (which, disjunctively considered, are both effectually real).

The way we interpret the passage quoted above is crucial. The content of the representation is the same (men-who-breathe-through-gills) in the negative and the affirmative judgment alike: in "Men do not breathe through gills" and in "Men breathe through gills" alike. What changes in these two judgments, the negative and the affirmative one, is not the object men-who-breathe-through-gills but the effectually real complex we refer to when judging this object: the effectually real complex where men do not breathe through gills in the negative judgment and the effectually real complex where men do breathe through gills in the affirmative one.

[52] Here is the German original: "Was bedeutet: ein Urteil verneint etwas, z. B., daß Menschen mit Kiemen atmen? Die Verneinung scheint die Realität [logical reality] selbst zu betreffen. Aber daß ein Urteil, in dem stets die Realität [logical reality] von etwas ausgesagt wird, die Realität [logical reality] dessen, worüber geurteilt wird, verneinen sollte, erscheint unmöglich. Über das reine Nichts kann überhaupt nicht geurteilt werden. Aber was ist das, wovon in einem verneinenden Urteil Realität [logical reality] ausgesagt wird? Hier kann nichts anderes in Frage kommen als die Vorstellung von dem, dessen Realität [logical reality] scheinbar negiert wird, z. B. die Vorstellung von Menschen, die mit Kiemen atmen. Eine solche [Vorstellung] muß in dem verneinenden Urteil als vorhanden aufgefaßt werden. Man findet, daß der Inhalt dieser Vorstellung real [logically real] ist, indem man ihn in der Vorstellung als dem Ganzen unterscheidet, findet aber zugleich, daß der Komplex, zu dem die Vorstellung samt ihrem Inhalt gehört, einem [*sic*] von letzterem verschiedenen Charakter hat. Dieses "nicht wirklich" [effectually non real] ist nur ein negativer Ausdruck für den positiven Charakter des in toto Wirklichen [effectually real]. Umgekehrt bedeutet die Bejahung in einem Urteil das Bewußtsein davon, daß in dem in toto als wirklich [effectually real] Aufgefaßten der betreffende Vorstellunginhalt nicht nur in der Vorstellung vorkommt, sondern auch in dem Komplex, zu dem diese gehört. Hieraus folgt, daß zwei Urteile, von denen das eine verneint, was das andere bejaht, verschiedene Welten zum Inhalt haben müssen, die keinen Zusammenang miteinander haben" (Hägerström 1929a, 120; cf. Hägerström 1957, 126–7).

That this is the only reading which adequately explains the passage in question is usually not grasped, and so neither is the importance of the thesis advanced by Hägerström, who distinguishes two functions in first-order judgments, negative and affirmative alike: (*a*) to attest logical reality (*Realität*, or consistency) and (*b*) to judge the effectual reality (*Wirklichkeit*) of what has been attested as logically real.

Hägerström's commentators either overlook the passage last quoted or, when they do consider it, they interpret it extravagantly. Thus, for example, according to the most devout Hägerström scholar, Martin Fries (1944, 304), what Hägerström is considering in that passage is a negative and an affirmative judgment having two different objects (men-who-breathe-through-gills for the negative judgment and men-who-breathe-through-lungs for the affirmative one) and a single effectually real complex which both judgments refer to, this being the complex in which men breathe through lungs.

Even Bo Petersson (1973, 49ff.) fails to grasp that, in the same passage, the object of the negative judgment and the object of the affirmative one are the same (the same logically real content of a representation, namely, the content men-who-breathe-through-gills), and that what change are instead the effectually real complexes the two judgments refer to. Consequently, he ventures into an unlikely interpretation of Hägerström based on a distinction between *objektiv verklighet* (objective effectual reality) and *subjektiv verklighet* (subjective effectual reality), a distinction that Hägerström himself (1929, 127; cf. 1957, 136) disqualifies by branding as a *contradictio in adjecto* his own momentary use of the expression *subjektive Wirklichkeit* (subjective effectual reality).[53]

Hägerström's original texts are either in Swedish or in German. All of Hägerström's commentators I know of, including those who use his original texts, pass over his linguistic usage concerning *Realität* and *realitet* (which I am rendering as "logical reality") and *Wirklichkeit* and *verklighet* (which I am rendering as "effectual reality").[54] The above-mentioned Fries (1944), in his

[53] Bo Petersson (1973, 16) assumes that *realitet* (logical reality), *verklighet* (effectual reality), and *existens* (existence) are synonymous in Hägerström, observing that Hägerström uses the terms *subjektiv verklighet* and *objektiv verklighet* for two different modes of something's belonging to the spatiotemporal world, namely, an indirect belonging and a direct one (ibid., 22; cf. Marc-Wogau 1968, 113ff.). Hägerström writes: "'Subjective effectual reality' is strictly a *contradictio in adiecto* even if, naturally, the thing which is qualified as effectually real may belong to what is *in toto* effectually real only as merely represented; and, naturally, it is only in this last sense that, for the sake of brevity, we speak here of a 'subjective effectual reality' in opposition to an 'objective effectual reality'" (Hägerström 1929a, 127; my translation; cf. Hägerström 1957, 136).

[54] As remarked in the previous pages, that usage is routinely ignored by Hägerström's English translators as well, since they use *reality* for both of the terms used by Hägerström: For instance, in R. T. Sandin's translations (Hägerström 1964) a number of gross inaccuracies are to be found (and some criticism of them can be found in Pattaro 1974b, 29–30, 50–1, 120–1). In addition, Sandin has also contributed to proliferating in the world a mistake regarding the title of Hägerström 1917 (*Till frågan om den objektiva rättens begrepp. I. Viljeteorien*). This work is

subject index, under the entry *realitet*, refers the reader to the entry *verklighet* and lists the entry *verklighet* providing the term *realitet* as a synonym.

Moreover, among the Scandinavian students of Hägerström, Jes Bjarup (1982), writing in English, reasons not on Hägerström's original texts, as would be more useful for the reader, but on the dubious and sometimes misleading English translations of Hägerström in circulation. One may wonder whether Bjarup uses these translations because they facilitate his objective as concerns Hägerström, which, it seems, is to issue invectives. By the same token, Bjarup (1978, 28) manipulates Hägerström's German original text (1929a, 119) by spuriously injecting words that do not appear in the original: Hägerström writes "Was versteht man unter Realität?"; Bjarup quotes "Was versteht man unter *Wirklichkeit oder* Realität?" (italics mine), adding on his own accord the two words I have italicised. This is a serious interpolation implying a synonymy between *Wirklichkeit* and *Realität*, a synonymy that Hägerström is far from intent on establishing, since he only uses *Realität* in the previously quoted sentence.

The best commentator on Hägerström's ontology, among those I know of, remains in my opinion Marc-Wogau (1968).[55] He too, however, fails to hew to Hägerström's linguistic usage as concerns logical reality and effectual reality, choosing to instead adopt only one word, *verklig* (in my translation *effectually real*), and to ascribe to it three concepts of reality that he finds in Hägerström, which he calls $verklig_1$, $verklig_2$, and $verklig_3$.[56]

often quoted under the erroneous title *Till frågan om den gällande rättens begrepp* (where *gällande* means "in force," while *objektiva* means "objective"). This erroneous title is used in Sandin 1962, 510, and in his translations of Hägerström (Hägerström 1964, 11, 318). The origin of this erroneous title is in Hägerström 1953a, a translation (by C. D. Broad, under the editorship of Karl Olivecrona) of a number of Hägerström's essays: in Hägerström 1953a, at point III, page V, under the heading "Original titles of the essays included in this volume," we find the erroneous Swedish title of Hägerström 1917 instead of the right one. In Broad's case, in Hägerström 1953a, the mistake can be imputed to an oversight, so much so that Broad 1964, 26, in commenting Hägerström 1917, correctly cites the original Swedish title. What instead happens with Sandin and some other scholars (who give the erroneous Swedish title of Hägerström 1917, this being the title they found, erroneously cited, in Hägerström 1953a at point III, page V) is that they apparently want to show they have read Hägerström 1917 in the original Swedish even though they may never have had it in their hands and instead rely on its English translation in Hägerström 1953a. It must be noticed that Hägerström wrote not only Hägerström 1917 but also Hägerström 1931, which carries the title *Till frågan om begreppet gällande rät* (however this is a review that Hägerström did of Ross 1929 and has nothing to do with Hägerström 1917).

[55] Marc-Wogau 1968 is a collection of essays that Marc-Wogau published at different times in his life.

[56] In Pattaro 1974b, 41–58, I accepted Marc-Wogau's diagrammatical reconstruction of Hägerström's ontology (Marc-Wogau 1968, 116), and in my own turn strayed from the vocabulary by which Hägerström expresses the concepts of logical reality and effectual reality. As I now consider Marc-Wogau 1968 with respect to its influence on my own work (Pattaro 1974b), I see it as an example of the opportunities missed by those who do not respect Hägerström's terminological usage.

According to Marc-Wogau, "*verklig*$_1$ = determined," "*verklig*$_2$ = belonging to what is *verklig in toto*, not merely as the content of a consciousness, that is, not as merely represented," and "*verklig*$_3$ = directly belonging to (or being an independent element in) the complex of spatiotemporal experience" (Marc-Wogau 1968, 117; my translation; cf. ibid., 116). He also observes that it would have been possible to use three different expressions for the three concepts he names *verklif*$_1$, *verklif*$_2$, and *verklif*$_3$—expressions such as *real* (in my translation *logically real*), *verklig* (in my translation *effectually real*), and *existerande* (a term I have not considered here but which I would translate as *existent*)—and he complains that Hägerström did not do so.[57] But still, Hägerström does use these three terms, and not synonymically at that. And in any event, what in Hägerström is existent, that is, "directly belonging to […] the complex of spatiotemporal experience," is also effectually real, and what is effectually real is also logically real.

[57] Marc-Wogau claims (without actually showing) that it is easy to document that Hägerström uses both *real* (in my translation *logically real*) and *verklig* (in my translation *effectually real*) for *verklig*$_1$, and *existerande* (in my translation *existent*) and *verklig* for *verklig*$_2$. As to *verklig*$_1$ as something determinate, it will be noted that what is *effectually* real, according to Hägerström, is no less determinate than what is *logically* real. Marc-Wogau (1968, 117) expressly observes that Hägerström uses *existerande* (in my translation *existent*) for *verklig*$_2$. It seems to me, however, that his critical observation makes sense only if we take Marc-Wogau to say that Hägerström *also* uses *verklig* (in my translation *effectually real*) for *verklig*$_2$.

Chapter 14

KARL OLIVECRONA'S LEGAL PHILOSOPHY

by Torben Spaak[*]

14.1. Introduction

Karl Olivecrona (1897–1980) and Alf Ross (1899–1979) were the most prominent of the Scandinavian realists, who were active from the late 1920s into the 1970s.[1] While Ross was better known on the international arena,[2] Olivecrona was in my view a more interesting thinker than Ross. To give the reader a brief introduction to Olivecrona's legal philosophy, I am going to focus in this entry on Olivecrona's thoughts on the concept of law (Section 14.2), rights (Section 14.3), coercion (Section 14.4), and the relation between law and politics (Section 14.5).

14.2. The Concept of Law

Olivecrona begins the first edition of *Law as Fact* (Olivecrona 1939) with a consideration and rejection of the view that law has binding force. He introduces the topic to be discussed in the following way:

> The most general definition of law seems to be that law is a body of rules, *binding* on the members of the community. Vague as it is, we may take this as our starting point for our investigation into the true nature of the law. It contains at least one element which, beyond doubt, is common to practically all those who have treated the subject. This is the assumption that the law is *binding*. Leaving aside for the time being the question how a rule is to be defined, we will first ask what is meant by the binding force of the law and try to decide whether the binding force is a reality or not. (Ibid., 9)

While Olivecrona does not explain what, exactly, he takes the binding force of law to be, the core idea must surely be that a binding legal rule "binds" the subjects of law in the sense that it obligates them (see Olivecrona 1951, 125; 1971, 10).

Having rejected several attempts to explain the nature of the binding force by reference to social facts, such as our wish to avoid sanctions, Olivecrona concludes that the binding force has no place in the world of time and space, but must be located in some sort of supernatural realm: "The absolute binding

[*] This article reports research carried out under the auspices of the Bank of Sweden Tercentenary Foundation. I would like to thank Robert Carroll for checking my English.

[1] On Ross, see Chapter 16 in this tome.

[2] Olivecrona's most important publications in English are (Olivecrona 1939, 1951, 1962, 1963–1964, 1971) and Ross's are (Ross 1946, 1957a, 1959, 1968).

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_42

force of the law eludes every attempt to give it a place in the social context. [...] This means in the last instance that the law does not belong to the world of time and space. It must have a realm of its own, outside the actual world" (Olivecrona 1939, 14–5). But, he objects, this is absurd. The law could not be located in a supernatural world beyond the world of time and space, because there could be no connection between such a world and the world of time and space:

> There is one very simple reason why a law outside the natural world is inconceivable. The law must necessarily be put in some relation to phenomena in this world. But nothing can be put in any relation to phenomena in the world of time and space without itself belonging to time and space. Therefore all the talk of a law, which in some mysterious way stands above the facts of life, is self-contradictory. It makes no sense at all. (Ibid., 15–6)

As Olivecrona sees it, we have here the dividing-line between realism and metaphysics, between scientific method and mysticism in legal philosophy. To believe that law has binding force and that therefore law belongs in a supernatural world is to give up any attempt at a scientific explanation of law and legal phenomena and to indulge in metaphysics: "The binding force of the law is a reality merely as an idea in human minds. There is nothing in the outside world which corresponds to this idea" (ibid., 17).

Olivecrona does not, however, explain *why* there can be no connection between the world of the ought and the world of time and space; he just asserts that there can be no such connection. But, even though he does not say so, his critique owes a lot to Axel Hägerström's critique of Hans Kelsen's theory of law, put forward in a 1928 review of Kelsen's *Hauptprobleme der Staatsrechtslehre* (Hägerström 1953b). Hägerström argued that the very idea of the world of the ought is absurd, because this world cannot be thought *of* as even existing alongside the world of time and space.[3] For, he reasoned, no knowledge of any reality is possible, except through relating its object to a systematically interconnected whole, and the fact that the two worlds—the world of the ought and the world of time and space—are different in kind means that they cannot be coordinated in a systematically interconnected whole. As he puts it, "so far as I contemplate the one [world], the other [world] does not exist for me" (ibid., 267).

Although Olivecrona does not say so in the first edition of *Law as Fact*, it is clear from his analysis in the second edition of *Law as Fact* that he takes the absence of binding force to imply, or to be equivalent to, the absence of legal entities and properties, that is, the absence of legal relations: Since legal rules do not and cannot have binding force, they cannot establish legal relations. As we shall see, Olivecrona introduces in the second edition of *Law as Fact* the con-

[3] On Hägerström, see also Chapter 13 in this tome.

cept of a performatory imperative, in order to account for those legal rules that do not immediately concern human behavior (1971, chaps. 5, 8). The introduction of this concept is of interest in this context, because Olivecrona adds to it a consideration of the nature of the legal effect that is commonly supposed to follow from the utterance of a performatory imperative (ibid., 221–6. But see also Olivecrona 1940a, 40–1). Such legal effects, he points out, are clearly supersensible. Having pointed out that already the Romans operated with legal effects of this type, he explains that the situation is the same today:

> Relatively uniform ideas of ownership, monetary claims, many other kinds of right, corresponding duties, and legal qualities are disseminated among the general public. These rights, duties, and legal qualities are supposed to be created, modified, transferred, and extinguished through operative facts by virtue of the law. They form a supersensible world: in the sensible, natural world there are no rights and duties, or legal qualities. (Olivecrona 1971, 223)

He adds that in the world of time and space, there is only the psychological fact that people tend to *believe* that there is a legal effect, and, of course, the (sociological) fact that they tend to act accordingly (ibid., 224–6).

It is not absolutely clear from his account whether Olivecrona (*i*) takes the claim that legal rules have no binding force to imply, or to be equivalent to, the claim that there are no legal relations, or whether he (*ii*) takes these two claims to be synonymous, to be two sides of the same coin, as it were. Although I do not think much depends on whether (*i*) or (*ii*) is the better interpretation, I am inclined to think that (*i*) is closer to the truth. I find it natural to assume that he means that it is the obligatory quality of rules that gives rise to legal relations – if the rules were not binding, there would be no legal relations.

In any case, Olivecrona turns to consider Kelsen's theory of law, because he believes that this theory illustrates the necessity for believers in the binding force of law to make a distinction between the 'world of the ought' and the world of time and space (1939, 17–8). He seizes on the fact that on Kelsen's analysis, there is a connection between operative facts and legal consequence in legal norms that is as unshakeable as the connection between cause and effect in nature. And this connection, he points out, is such that the legal consequence *ought* to ensue when the operative facts are at hand.[4] He writes:

> A legal rule, according to Kelsen, has a peculiar effect in that it puts together two facts, e.g. a crime and its punishment, in a connexion which is different from that of cause and effect. The connexion is so described that the one fact ought to follow upon the other though it does not necessarily do so in actual fact. The punishment ought to follow the crime, though it does not always follow. Now this "ought" is not, in Kelsen's theory, a mere expression in the law or jurisprudence. It signifies an objective connexion that has been established by the law. (Ibid., 18.)

But, Olivecrona objects, it is simply impossible to explain in a rational way how facts in the world of time and space, such as the activity of the legislature, can

[4] On Kelsen's conception of legal norms see Section 8.3 in this tome.

produce effects in the 'world of the ought.' As he puts it (ibid., 21), "[a]t one time Kelsen bluntly declared that this is 'the Great Mystery.' That is to state the matter plainly. A mystery it is and a mystery it will remain forever."[5]

Let us also note that although Olivecrona does not criticize the view that law has binding force in the second edition of *Law as Fact* (Olivecrona 1971),[6] it is clear from his discussion of various other topics in the second edition, such as the concept of a right and the purely psychological nature of so-called legal effects, that he still rejects this view.

As is clear from the very first quotation above, Olivecrona conceives of law as a body of legal rules. So, having rejected the view that legal rules have binding force, he turns to consider the nature of such rules conceived of as lacking binding force. The *content* of a legal rule, he explains, is an idea of an imaginary action by a judge in an imaginary situation (Olivecrona 1939, 28–9). The *form* of legal rules, he continues, is imperative, because the lawmakers do not aim to inform us about the existence of certain ideas in their minds, but to impress a certain behavior on us (ibid., 31). He is, however, careful to point out that he does not have the grammatical imperative form in mind when he maintains that legal rules have imperative form. Statutory provisions are often phrased in the indicative or the subjunctive mood, but they always express an imperative (Olivecrona 1942, 9).

On Olivecrona's analysis, what is important is that an utterance (or a gesture) functions as an imperative, and although he is not explicit about it, Olivecrona appears to believe that an utterance functions as an imperative if it is *intended* to be an imperative. But, he continues, to determine whether a particular utterance is intended to be an imperative, one needs to consider the whole situation in which the utterance takes place (ibid., 16–7).

Pointing out that the command is the prototype of the imperative, Olivecrona (1939, 33–4) explains that a command works directly on the will of the recipient of the command, and that this means that it must have a *suggestive character*. He maintains, more specifically, that if a command takes effect there arises in most cases in the addressee's mind a value-neutral intention to perform the commanded action, that is, an intention that is not motivated by

[5] Kelsen (1984, 411) had said that "[w]hat actually takes place in the act of legislation is the big mystery of law and state, and for that reason—or so one is inclined to think—it seems justifiable that descriptions of the nature of this act should turn out to be unsatisfactory" (my translation). The German original: "[e]s ist das große Mysterium von Recht und Staat, das sich in dem Gesetzgebungsakte vollzieht und darum mag es gerechtfertigt sein, daß nur in unzulänglichen Bildern das Wesen desselben veranschaulicht wird." I am not, however, convinced that Kelsen had in mind the question of how the activity of the legislature can produce effects in the 'world of the ought' when he spoke of the "great mystery." Instead I am inclined to think that he was concerned rather with the question of how the state can obligate itself.

[6] To be sure, he mentions the idea of the binding force of law at several places in the book—for example, when he considers classical natural law theory—but does not discuss it like he did in the first edition (see, e.g., Olivecrona 1971, 9–11, 17–8, 40, 112–4).

the addressee's own wishes, and he adds that in some cases a command may actually trigger an action without the addressee's having had any intervening value-neutral intention (Olivecrona 1942, 7, 10–1).

Olivecrona (1939, 35–40) proceeds to explain that legal rules are not commands. Pointing out that the imperative theory, or, as I would say, the command theory, presupposes that there is a commander, he objects that there simply is no one person or group of persons who could be the commander(s). He notes that it is often suggested that the state, or someone representing the state, is the commander, but points out that this is not so. For one thing, there is simply no one who commands anything in the process of law making. For, on closer inspection, we see that neither the members of the parliament or of the government, nor the head of state commands anything: What they do is push certain buttons (when voting) or sign certain documents (when promulgating the law). Olivecrona concludes that the imperative theory of law could work only if there were some kind of superhuman entity who functioned as commander, but points out that there can be no such entity.

But if legal rules are not commands, although they have imperative form, what are they? Olivecrona explains that in addition to commands, there is a class of imperatives that we may refer to as *independent imperatives*. And he maintains that legal rules are best conceived of as such independent imperatives (ibid., 42–9).

On Olivecrona's analysis, there are three important differences between commands and independent imperatives. First, whereas a command is always issued by a certain person, an independent imperative is not issued by anyone in particular (ibid., 32–41). Second, whereas a command is always addressed to a certain person or persons and concerns a certain action or actions, an independent imperative, although it concerns a kind of action, is not addressed to anyone in particular. Olivecrona's idea, then, is that an independent imperative concerns a class of persons (the norm-subjects) and a class of actions (the action-theme), not particular persons and actions.[7] Third, whereas a command is in no way equivalent to a judgment, an independent imperative can sometimes be replaced by a sentence that expresses a judgment.

Olivecrona believes that this last circumstance explains why people believe that they can have knowledge of what we ought to do (ibid., 45–6). He objects, however, to the view that an independent imperative can be replaced by a sentence that expresses a judgment, that there are no real judgments behind the sentences that (appear to) express such judgments, but only a *psychological connection*, viz. a connection in a person's mind between the imperative expression and the idea of an action. What is really going on in the process of legislation, he explains, is that the legislature attempts to influence human behavior by making use of the imperative form (ibid., 21–2).

[7] Of course, this is also a characteristic property of rules, including legal rules.

We should note here that the claim that imperatives are psychologically effective is of central importance to Olivecrona's naturalistic theory of law—if they weren't psychologically effective, the theory would be seriously incomplete, since, on Olivecrona's analysis, we have no reason to believe that there are legal relations the knowledge of which could somehow motivate the citizens to act accordingly.

Olivecrona identifies, in keeping with this, two general conditions for the efficacy of legislation in society. First and most important, the citizens must display an attitude of reverence toward the constitution: "Everywhere there exists a set of ideas concerning the government of the country, ideas which are conceived as 'binding' and are implicitly obeyed. According to them certain persons are appointed to wield supreme power as kings, ministers, or members of parliament etc. From this their actual power obtains" (ibid., 53). This attitude is not self-supporting, however, but must be sustained by means of an incessant psychological pressure on the citizens (ibid., 53–4). Hence a second condition for the efficacy of legislation in society must be satisfied, viz. that there be an organization that handles the application and enforcement of the law: "There must be a body of persons, ready to apply the laws, if necessary with force, since it would be clearly impossible to govern a community only by directly influencing the minds of the great masses through law-giving" (ibid., 55).

Olivecrona's view of the concept of a legal rule is essentially the same in the second edition of *Law as Fact* as it was in the first edition, except that he introduces the concept of a performatory imperative, in order to account for those legal rules that do not immediately concern human behavior (Olivecrona 1971, chaps. 5, 8). The introduction of this concept is of interest, inter alia, because it amounts to a connection with (then) contemporary philosophy of language. As J. L. Austin (1975, 4–7) explains, a performative utterance, such as "I promise to lend you $100" or "I hereby invite you to dinner on Saturday night", has its main verb in the first person present, indicative, active (singular or plural), or is equivalent to such an utterance. It differs from ordinary statements of fact in that he who utters it (*i*) does not describe or report anything, which means that it cannot be true or false, and (*ii*) is usually thought to *do* something rather than to (merely) say something. Olivecrona (1971, 133–4) explains, in keeping with this, that a performatory imperative is an imperative whose meaning is that something shall be the case or come to pass, and that the assumption among lawyers, judges, and legal scholars is that legal effects are brought about through such imperatives. He offers the example (drawn from Roman law) of a young man who has been sold three times by his father, and who therefore, according to the law of the twelve tables, "shall be free from the father." This, he explains, is clearly an imperative, though it is addressed neither to the father nor to the son or to anyone else, but "is directed toward a change in the status of the son" (ibid., 220).

Olivecrona's analysis of the concept of a performatory imperative includes a consideration of the nature of the legal effect that is supposed to follow from the utterance of such imperatives. Olivecrona maintains, in keeping with his belief that there is no such thing as binding force, that there is no legal effect to be found—there is only the psychological fact that people tend to *believe* that there is a legal effect, and, of course, the (sociological) fact that they tend to *act* accordingly. For example, when a clergyman has declared a man and a woman to be married, the citizens as well as judges and other legal officials tend to believe that a change of legal positions has occurred, and they tend to act accordingly. But, he points out (ibid., 225), we need not assume the existence of a special legal effect in order to explain these facts, because "[w]e are all conditioned to respond to the act in certain ways, and we do it."

Finally, Olivecrona points out that belief in performative imperatives is connected with a belief in magic—the idea in ancient Rome being that the effect in question could be commanded into being—and that we can gain a better understanding of the workings of performatory imperatives if we keep this connection in mind (ibid., 230–1). He adds that he is not suggesting that contemporary judges and lawyers believe in magic in the same way that people did in ancient Rome, only that there are important similarities (ibid., 230–1). The main difference between then and now, he explains, is that whereas the Romans imagined that words alone could bring about the relevant effects, we now believe that it is the acting person's will that brings about the effects (ibid.).

14.3. Rights

Olivecrona begins his analysis of the concept of a right in the first edition of *Law as Fact* by pointing out that since we have seen that the idea of the binding force of law is an illusion, we must conclude that the idea of duties is subjective: Duty, he explains, "has no place in the actual world, but only in the imagination of men" (Olivecrona 1971, 75). He then maintains that the situation is essentially the same with regard to the concept of a right (ibid., 76–7).

While Olivecrona intends his remarks about rights to be applicable to rights in general, his focus is clearly on *legal* rights (ibid., 77). Accordingly, he considers various ways in which a legal property right might correspond to facts, giving special consideration to (*i*) the view that the right is identical with the favorable position typically enjoyed by the right-holder in regard to the legal machinery, and (*ii*) the view that the right is identical with the right-holder's security in enjoying actual control over the thing to which he has the right. These two alternatives, he explains, "are the only facts which could, with any semblance of truth, be said to correspond to the notion of the right to property as we conceive it" (ibid., 83). He rejects both alternatives, however (ibid., 83–8). The problem with (*i*), he explains, is that whereas lawyers think of the right as being independent of circumstances in the real world, the favorable

position in regard to the legal machinery depends precisely on such circumstances. Hence the right and the favorable position cannot be identical. The problem with (*ii*) is that the right-holder's security is thought to *presuppose* the right and can therefore not be identical with it.

Having thus argued that the term "right" does not refer to anything real, he maintains that the essence of the concept of a right is a *supernatural power*:

> The essence of the notion of a right is that of *power*. The owner "can" do what he likes with the object; the creditor "can" claim a sum from the debtor—that is the way we paraphrase the notion of a right when we are trying to explain what we are thinking of. [...] This power, however, does not exist in the real world. We have seen that it is not identical with the actual control over the object generally exercised by the owner, nor with his actual ability to set the legal machinery in motion. It is a *fictitious* power, an ideal, or imaginary power. (Ibid., 89–90)

He does, however, point out that the concept of a right nevertheless fulfills an important function in legal thinking, in that it *guides people's behavior* (ibid., 95). He explains that "[...] it is essential that the idea of a pattern of conduct should be awakened in the minds of those concerned and that they should be incited to follow it. This may easily be done by means of such notions as that of a right" (ibid., 95). The term 'right,' he explains, can fulfill this function by expressing an *imperative*, according to which the right-holder may act in such and such a manner and to maintain control over that to which he has a right, whereas others may not act in the same manner or interfere with the object of the right (ibid., 96).

In his 1962 essay on legal language and reality, he repeats the claim put forward in the first edition of *Law as Fact* that the term "right" fulfills a *directive* function, in the sense that it functions as a permissive sign for the right-holder and as a prohibitive sign for other persons (Olivecrona 1962, 182).

In the same essay, he also identifies a secondary function of the term "right," viz. to *convey information* (ibid., 185–9). There is, he points out, no doubt that one conveys information when one asserts, say, that a certain person owns a certain house. The problem, on Olivecrona's analysis, is that there is no fact of the matter that corresponds to the term "ownership." How, then, can one convey information by asserting that the person in question owns the house? To clarify the issue, Olivecrona considers an imaginary case, in which *B* tells *C* that *A* is the owner of a certain house, and asks, what does *C* learn when told by *B* that *A* is the owner of the house? He answers that *C* learns that *A* has at some point *acquired* the house (and that he has not sold it since), and that is all (ibid., 86). But, he points out, although this piece of information is highly useful, it is not information about *A's ownership* of the house, because, as we have seen, there simply is no fact of the matter as to whether *A* owns the house or not (ibid., 187).

Finally, Olivecrona points out that the term "right" sometimes fulfills a *technical* function, in the sense that it ties together two sets of rules in a way

that facilitates our efforts to render the content of those rules. On this analysis, he explains, "right" plays the role of a railway junction. Having the concept of ownership in mind, he explains that "[...] the expression 'right of property' serves as a connecting link between two sets of rules: on the one hand the rules about the acquisition of property, on the other hand penal rules and rules about damages, etc., which refer to the situation where one person is the owner of an object and another person does something with regard to the object"(ibid., 189–90). As should be clear, Olivecrona is here proposing an analysis that is very similar to the well-known analysis proposed by Alf Ross (1957a; 1959, chap. 6).

One may, however, wonder whether there is really a significant difference between the informative and the technical function of rights statements. As I see it, the technical function is just a special case of the informative function, which consists in conveying the information that a person has a right the import of which is made up of the content of the two distinct sets of rules that are connected by the right concept.

In the second edition of *Law as Fact*, Olivecrona reiterates the claim put forward in the 1962 essay that the term "right" fulfills two main functions in legal language, viz. to direct behavior and to convey information (Olivecrona 1971, 252). He also reiterates the claim that the term "right" fulfils a technical, or, as he puts it here, a connecting, function (ibid., 199).

We see, then, that Olivecrona rejects the concept of a right as that concept is understood by most lawyers and legal scholars, on the ground that it does not refer to any natural entities, or does not refer at all, while identifying three distinct functions that the right concept does fulfill in our legal thinking, viz. (*i*) an action-guiding, (*ii*) an information-conveying, and (*iii*) a technical or connective function. We might say that in doing this, he has explained how the concept of a right can be so useful in legal thinking, even though it does not refer to natural entities, or does not refer at all.

14.4. Coercion

In the fourth and final chapter of the first edition of *Law as Fact*, Olivecrona observes that the reader will now have arrived at the conclusion that, on his (Olivecrona's) analysis, law is essentially a matter of organized force. For, he points out, the reader will have realized that if law is not binding in the traditional sense, if it is only a question of the psychological effects of some independent imperatives, then law must be essentially a matter of organized force (Olivecrona 1939, 123). And, he adds, the reader is right.

Olivecrona, who takes the term "force" to cover not only "actual violence," but also "the influence exercised by the concentration of superior strength" (ibid., 126), puts forward inter alia the following five distinct claims that are related to the idea that law is a matter of organized force. The first claim is that

organized force is necessary to the existence of the law, in the sense that the law depends necessarily on the use of force by state organs, inter alia, in the case of police measures against disturbances, the infliction of punishment, and the execution of civil judgments. The idea appears to be that the law could not fulfill its function—to secure peaceful coexistence among human beings—if it did not make use of force (ibid., 124–5).

The reason why Olivecrona believes that organized force is necessary to the existence of law is that he believes that human beings are such that disaster and ruin would follow if they were left to their own devices. He puts it as follows:

> This organized force is actually the backbone of our community as it stands. It is absolutely necessary for this purpose. We cannot conceive a community—at least not under modern conditions—which is not based on organized force. Without that there could be no real security, not even with regard to life and limb. The hidden reserves of hate, of lust for revenge, and of boundless egoism would break through in a destructive way if not held in check by the presence of force, immeasurably superior to that of any single individual or any private combination. Men need taming in order to live peacefully together. But taming on such a great scale as is required here presupposes unconquerable force. (Ibid., 136)

It is clear that his view of human nature, or at least the tendency of humans to behave in certain ways, echoes that of Thomas Hobbes (1651, chap. 13, par. 9), who said that life in the state of nature would be "solitary, poore, nasty, brutish, and short."

Olivecrona's (1939, 134) second claim is that *law necessarily consists of rules about the use of force*: "The real situation is that law—the body of rules summed up as law—consists chiefly of rules about force, rules which contain patterns of conduct for the exercise of force." Olivecrona does not explain in detail what he has in mind when he maintains that legal rules are rules about force, but it seems that he conceives of legal rules as being addressed to judges and other legal officials, requiring them to use force in certain circumstances. For example, he points out that the rules of criminal and private law are essentially rules about force, even though they are also rules for private individuals. He adds that the rules of administrative law, too, are essentially rules about force in the sense that they presuppose that there is organized force behind them (ibid., 135).

Olivecrona's third claim is that *the force of law exerts its influence on social life chiefly indirectly*. He maintains that we must look beyond the immediate effects on particular individuals and take into account the general effects on the community as a whole, if we want to assess the social significance of organized force (ibid., 141). The truth of the matter, he explains, is that organized and irresistible force that is consistently applied by the state organs is much more important to the influence of law on social life than the immediate effects, say, of punishing some criminals or transferring property from debtors

to creditors in a few cases (ibid., 141–2). He explains that we tend to overlook the indirect influence of the force of the law, because we do not like to think of fear of sanctions as what motivates us to obey the law. But, he points out, in reality fear is never far away when we are dealing with the law. He is, however, quick to point out that this does not mean that we live under an ever-present fear of being subjected to the force of the law. Since it is intolerable to live in constant fear, we adapt to the circumstances and do not even consider the possibility of committing a crime (ibid., 148).

Olivecrona's fourth claim is that *law causes us to internalize the moral values and standards* that make up the content of the legal rules (ibid., 151). The main reason why we internalize the independent imperatives so readily, he explains, is that the *suggestive effect* of imperatives is enormous, especially when the power of the state, surrounded by august ceremonies, is behind the imperatives (ibid., 155).

Olivecrona's fifth claim—the first part of which is a special case of the fourth claim—is that *law influences our moral values and standards, rather than the other way around, and that abolishing the force of law would, as time passes, likely result in important—and dangerous—changes in the moral values and standards that we accept* (ibid., 160–1).

In his later writings, Olivecrona (1971, 270–3) reiterates the first and the second of these claims, but does not have much to say about claims (*iii*)–(*v*). His fullest treatment of these issues is to be found in the Swedish version of the second edition of *Law as Fact*, viz. *Rättsordningen* (Olivecrona 1976, chap. 7). Here he points out that in discussing the nature of legal rules, rights, and duties, we keep coming back to the concept of the *state*, because the legal rules are in certain ways connected with the state, and that therefore we need to consider the relation between law and the state (ibid., 261). As Olivecrona sees it, law and the state are interdependent, in the sense that neither could exist without the other (ibid., 262–6). And since he views the possession of coercive power (= organized force) as characteristic of the state (ibid., 262), we may conclude that he also believes that organized force is necessary to the existence of law.

Olivecrona explains that in modern states the coercive power of the state is normally kept in the background, and that the citizens do not think of the state as possessing coercive power, but rather as possessing an ideal power to enact binding laws (ibid., 267). He adds that if this view is widespread among the citizens, the state will as a result possess *psychological* power, and he points out that these two types of power—coercive and psychological—presuppose one another (ibid., 267–8).

He also reiterates the claim that law consists of rules about force, though he qualifies this claim by saying that some sanction-imposing rules, especially those on the constitutional level, are not themselves sanctioned, and that in any case not all legal rules could be sanctioned (ibid., 276). He concludes that

we cannot guarantee impartial administration of justice by pointing to the existence of sanction-imposing rules, but must instead be careful when appointing judges (ibid., 278).

Olivecrona ends his analysis of the relation between law and the state with a few words about the foundations of legal certainty (ibid., 279–82). He reasons that since the coercive power of the state is handled by persons—politicians and high officials—who themselves are not subject to legal sanctions, it might seem that there can be no legal certainty. But, he explains, this need not be the case, because the use of state coercive power is subject to control by the courts, though he adds that this way of organizing things obviously presupposes that the courts are independent (ibid., 280). He concludes that only judicial independence and sound judicial ethics can guarantee legal certainty, and he points out that this means that we need to stay vigilant and nurse the legal certainty that we do have very carefully:

> Thus both the idea of the state's divine omnipotence and the idea of a will of the people as prevailing evaporate in a sober-minded consideration of the real state of things. It is because of the respect for an established system of rules that the always relative state authority exists; and it is in the immensely complex play of strength in society that legislation changes and develops the system of rules in connection with the ideas and desires that manifest themselves in society and acquire predominant influence. But it is not a matter of course that the legal certainty in this will be lasting. It can happen that its foundations will crumble away unobserved. Legal certainty must be tended with care if it is to be preserved. It is very important, not least for this reason, to see clearly what is really there when we speak of a legal system. (Ibid., 282; translation by Robert Carroll)

It is clear that Olivecrona's thoughts about the role of force in the machinery of law are an important part of what makes the legal philosophy espoused by Olivecrona so interesting. Unfortunately, I cannot treat his analysis in detail here. Suffice it to say that while his analysis is valuable, it is doubtful whether his claims about law and force really concern the nature of law, in the sense of what is part of the concept of law.

14.5. Law and Politics

Olivecrona does not have much to say on the topic of law and politics, but he does maintain in the second edition of *Law as Fact* that in deciding a case the court is necessarily creating law for the particular case, because there will necessarily be a margin to decide between two alternative interpretations of the pertinent legal rule. This indicates that he does not believe in a clear separation between law and politics. He puts it as follows:

> The actual role of the courts is that of being a lawgiver for particular cases. The legal rules, whether laid down through acts of legislation or evolved in some other way, cannot supply exact patterns of behaviour for every contingency. There is always a more or less wide margin for deciding which of two or more alternatives are to be deemed lawful. The margin is so small as to be (in general) negligible when you put your name on the back of a bill of exchange. If you have

> been involved in an accident when driving your car, the margin may be very wide. All of us have to apply the rules of civil law in our relations with our fellow-citizens. In a great many simple cases, for instance when we pay a tradesman's bill, we know what we have to do without asking anybody for advice. When difficulties arise, we have to consult a legal expert. But the experts may disagree. There must be some ultimate authority capable of giving a definite answer to the question of lawful behaviour in the situation. This task is entrusted to the courts. *They supplement abstract rules of law by laying down particular rules for individual cases*. (Olivecrona 1971, 211; italics added)

The reason why there will always be a margin, or, if you prefer, why the judge will always have discretion, he explains, is that the judge must *evaluate* the purported operative facts or legal texts in order to decide the case, and that evaluations are not objective (ibid., 212–5). He does not, however, discuss the status of evaluations in this context, but simply assumes that they are not objective; and this is in keeping with his non-cognitivist meta-ethics (on this, see Olivecrona 1939, 46; 1941; 1951, 129–30; 1971, 112, 183).

To illustrate the way in which the judge must evaluate a purported operative fact, Olivecrona considers a hypothetical case in which *P* requires payment from *D* for goods delivered in accordance with a contract of sale (ibid., 212–3). *P* maintains that *P* and *D* were involved in talks that resulted in a contract being concluded, whereas *D*, although he agrees that the talks took place roughly as described by *P*, objects that no deal was ever concluded. What should the court do? Pointing out that the law on sale of goods presupposes that there is a contract of sale to begin with, Olivecrona explains (*i*) that the court cannot simply compare the facts as described by the parties with a description in the law of how a contract is concluded, because there is no such description in the law. Moreover, he continues, (*ii*) although the law reports may include a number of cases that concern the question whether a contract has been concluded, the case at bar will always be different in some respects from the cases in the law reports. He adds (*iii*) that the textbooks will not contain sufficient information on this question. He concludes that for these reasons, the court itself will have to decide whether a contract has been concluded or not. And, he insists, such a decision necessarily presupposes an *evaluation* of the purported operative facts (ibid., 213).

One may, however, wonder whether a judge who determines that a contract has been concluded between *A* and *B* is necessarily evaluating the transaction, except in a trivial and derivative sense. For such an evaluation—if it is an evaluation—appears to depend completely on his prior determination of the facts. Consider in this regard the case of a school teacher who is correcting a multiple-choice exam, and in doing this finds that one of his students has managed to answer correctly each and every question on the exam. On the basis of this result, the teacher awards the student the highest grade there is. Does the teacher's awarding the student the highest grade mean that the teacher *must* have evaluated the student's answers? No, it does not. If, as in this case,

the teacher can determine, on the basis of factual considerations, whether the student has answered the questions correctly, then the circumstance that (pursuant to the relevant university rules and regulations) the teacher *also* must award the student a certain grade has no bearing on the question whether his awarding the student a certain grade necessarily involves an evaluation of the answers. Although one may well say that the teacher evaluates the exam that he grades, such an evaluation is trivial and derivative in that it depends completely on his prior determination of the facts, that is, the answers to the questions posed. And it seems to me that the judge's determination of the purported operative facts in a legal rule proceeds in the same way, even though this determination may sometimes be quite difficult to make.

If, then, Olivecrona really believes that the judge must evaluate the purported operative facts or, perhaps, the whole situation, in order to determine, say, whether *A* and *B* have entered into a legally valid contract, it seems that he must be using the term 'evaluation' in a broad enough sense to cover not only evaluations, including moral evaluations, but also considerations that are not evaluations at all. That is to say, Olivecrona's claim that judges have to evaluate the purported operative facts in order to decide a case appears to depend on a somewhat confused view about the nature of evaluations, including moral evaluations.

Chapter 15

ANDERS VILHELM LUNDSTEDT: IN QUEST OF REALITY

by Uta Bindreiter

15.1. Introduction

More often than not, it is asserted that Anders Vilhelm Lundstedt (1882–1955), a disciple and friend of Axel Hägerström who enthusiastically embraced the latter's philosophical theories, (*i*) went to great lengths to apply those theories in the central fields of law but (*ii*) actually deviated from Hägerström's teachings by introducing the complex notion of "social welfare" (or "social utility") as an objective—a *scientific*—principle for legislation and adjudication.[1] Lundstedt himself, while readily assenting to (*i*), vigorously disclaimed (*ii*) all his life: as late as 1955,[2] he protested that as far as he knew, he had "on the whole correctly interpreted Hägerström's views on matters of law" (Lundstedt 1956, 8).

Hägerström and Lundstedt had met at Uppsala in 1914.[3] For Lundstedt, this meeting was decisive in so far as his jurisprudential outlook thereby underwent a radical and lasting change.[4] Having gained insight into Hägerström's theories, he realized that traditional legal science frequently operated with assumptions the scientific quality of which he now judged as non-existent.[5] Determined to dedicate his life to the scheme of turning jurisprudence into a genuine science,[6] of thoroughly reshaping legal thinking[7] and, thereby, popularizing Hägerström's ideas,[8] Lundstedt launched a veritable crusade against

[1] On Hägerström see Chapter 13 in this tome.

[2] This was the year of Lundstedt's death. His last work was published posthumously (Lundstedt 1956).

[3] In 1914, Lundstedt was appointed professor of Civil Law and Roman Law at Uppsala University. On his biography, see Sundell 2005.

[4] Lundstedt's early writings, including his doctoral dissertation 1908, were influenced by conceptual jurisprudence (see Sundell 1991, 252).

[5] In Lundstedt's view, traditional jurisprudence was unworthy of being called a science (Lundstedt 1956, 5–6). Not surprisingly, one of his major works had the title *Die Unwissenschaftlichkeit der Rechtswissenschaft* (The non-scientific nature of legal science: Lundstedt 1932c, 1936).

[6] That is, a science such as the natural sciences. Lundstedt is aware, though, that legal science cannot be an exact science (see Section 15.2.6).

[7] Lundstedt was conscious of the importance of his work: "I feel that it was given to me to make some useful contribution to the enlargement of human knowledge and to the development of human thought" (Lundstedt 1956, 5).

[8] For this scheme, Lundstedt was eminently suitable. Not only was he professor at the Law Faculty (which Hägerström was not) and thus could influence the coming generation of Swedish

DOI 10.1007/978-94-007-1479-3_43

the idealistic constructions of conceptual jurisprudence, the superstitious (in his view) foundations of traditional legal concepts and, most important, the so-called method of justice (which, in his opinion, had distorted the legal scholars' view of law and legal science for centuries).

In his epistemology, Lundstedt follows the naturalistic approach advanced by Hägerström.[9] This approach implies, *firstly*, the view that reality consists in things that can be identified in time and space; and, *secondly*, the (related) view that what exists in time and space, can be known by experience and, therefore, lends itself to scientific explanations in terms of causal connections between things and events.[10] Lundstedt's ambition was to cope empirically with questions of law, and the only way to achieve this was, he thought, an approach based on historical facts, logical criticism of legal ideology, and psychological experience.[11]

Lundstedt figures as the most radical member of the Uppsala school—radical not so much in a political sense but, rather, as regards legal language.[12] This position is explained by his non-cognitivist outlook,[13] which he likewise adopted from Hägerström. Hägerström had denied the existence of moral concepts: Lundstedt agrees, denying that there is an objective morality, since judgements on moral rights and duties cannot be grounded in reason but are dependant on (subjective) feelings (Lundstedt 1925, 23).

jurists: he had also been elected into the Swedish Parliament as a member of the Social Democratic Party and consequently had ample opportunities to get in touch with people.

[9] Hägerström himself had called his approach rational naturalism, thereby indicating the contrast between his position and that of the Swedish idealist philosopher C. J. Boström (1797–1866) which went under the label rational idealism (according to Boström, reality is spiritual but can nevertheless be known by reason). On Hägerström's revolt against idealism see also Section 13.1.3 in this tome.

[10] On the importance of the principle of causality to Hägerström's philosophy, see Bjarup 2000, 32f.

[11] There are three types of naturalism: (*i*) Ontological (or metaphysical) naturalism; (*ii*) methodological (or epistemological) naturalism; and (*iii*) semantic naturalism. While there is no doubt that Lundstedt embraces version (*i*), it is unclear to which extent he embraces versions (*ii*) and (*iii*).

[12] Lundstedt follows Hägerström in conceiving of the legal language not as an action language (*handlingsspråk*), providing reasons for action, but as a behaviour language (*beteendespråk*), using words as a cause in order to influence the behaviour of the officials (as effect). The behaviour of the officials, in turn, influences that of the individuals.

[13] Hägerström had stated his non-cognitivist (or emotivist) position—i.e., the view that moral utterances cannot be considered to possess truth-value—in his inaugural lecture 1911, where he said that it was "an unmeaning (*omening*)" to consider the idea of ought as true. The respective Swedish passage reads as follows: "Då vetenskapen endast har att framställa, vad som är sant, men det är en omening att betrakta en föreställning om ett böra såsom sann, kan ingen vetenskap ha till uppgift att framställa, huru vi bör handla" (As science only has to describe what is true, but as it is an unmeaning to consider the idea of an ought as true, no science can have as its purpose to describe how we shold act) (Hägerström 1987, 48). The translation of the Swedish word *omening* with "unmeaning" is Jes Bjarup's (2000, 13 n. 6). On Hägerström's non-cognitivism see Section 13.2 in this tome.

Continuing Hägerström's attacks on traditional legal concepts, Lundstedt finds that *in reality*, there are no such things as valid legal rules or legal rights and duties, and he proposes to overhaul the legal language in its entirety, cleansing it, as it were, from all words that only remotely have a "metaphysical" ring to them: "Legal rights and duties, obligations, legal claims and demands, legal relationships (*Rechtsverhältnisse*), fault, guilt, liability, rules of law, (natural) justice etc." (Lundstedt 1956, 16) are said to be "false notions" (ibid.) and the expressions "(natural) justice, wrong, wrongful, lawful, legal ought, fault and guilt, should be rejected […] and not be retained even as terms or labels of certain realities" (ibid.).[14] These expressions are grounded in value judgements, and since value judgements lack truth-value, they are by definition unscientific.[15]

As a legal scholar, Lundstedt was highly productive in the fields of criminal law, tort law (his primary area of interest) and contract law. Also, as a law professor, he formed an entire generation of Swedish jurists as regards their view on law and legal science.[16] Nevertheless, whilst the work of Axel Hägerström, Karl Olivecrona and Alf Ross attracted considerable interest during the last half century, that of Vilhelm Lundstedt seems to have fallen into oblivion. Two types of criticism, in particular, have been levelled against him: *Firstly*, that Lundstedt, in setting up the "principle" of social welfare as the basis of all law, deviated from the Hägerströmian path of value nihilism[17] without being much aware of it himself, and, *secondly*, that the major part of his production consisted in critical, not constructive, work.[18]

In the following, I shall focus on the second type of criticism mentioned above, namely, the alleged lack of originality in Lundstedt's production.[19] I

[14] However, since Lundstedt thinks that it is impossible to eradicate these expressions in practice (and, what is more, since he also thinks that it is practically expedient to use them), he suggests to put them between quotation marks, thereby indicating that the writer is conscious of using meaningless expressions (Lundstedt 1956, 17).

[15] Lundstedt's terminology is confusing. On the one hand, he differentiates between theoretical, genuine *judgements* regarding true facts (i.e., real states of things) and *judgements of value*, or *(e)valuations*, which are based upon emotions and state nothing whatever about reality. Thus, they cannot possess truth-value (Lundstedt 1956, 44–5). On the other hand, he speaks of people's evaluations as "*true facts*, and as such objects of one's observation, and consequently of empirical knowledge" (ibid. 48). On this issue, see Section 15.2.5 below.

[16] "It fell upon Lundstedt […] to formulate such methodological maxims for practical use as could be derived from the Uppsala philosophy […] for those generations of Swedish lawyers who were trained under Lundstedt's influence, his energetic accent on the practical functions of law is likely to have had some salutary effects on a very general level" (Strömholm 1994, 196).

[17] In Scandinavia, Hägerström's version of non-cognitivism goes under the label "value nihilism."

[18] Lundstedt's jurisprudential work was intended, in its entirety, as an attack on current theories of jurisprudence: "The purpose of my theories is to show that current conceptions of jurisprudence regarding the law are *completely and fundamentally* irrational and are characterized, above all, by […] the *confusion of cause and effect*" (Lundstedt 1925, 11).

[19] The first type of criticism (regarding Lundstedt's "soundness" as a follower of Hägerström's moral philosophy) will be taken up in Section 15.2.5.

mean to show that Lundstedt's critique of the "ideologizing" in traditional jurisprudence is definitely constructive, and that his findings may properly be called both new and worthy of attention (as indeed they were called by himself) (Lundstedt 1956, 15).

Taking my point of departure in what Lundstedt calls "legal machinery" (15.2.2), I shall describe four "cogs" in the same machinery, namely: The reality behind so-called situations of right (15.2.3); the theory of the social function of criminal law (15.2.4); the theory of "social welfare" (15.2.5) and, finally (and related to the conception of "social welfare"),[20] the idea of a *constructive* legal science, comprising both scientific and evaluating elements (15.2.6).

15.2. "The Law": Legal Machinery in Action

15.2.1. Introduction

Human behaviour is influenced by what is called, in traditional jurisprudence, "objective law" or "the legal order." According to Lundstedt, such a view is *scientifically* untenable, since the idea of "the law" as a system or body of rules lacks any real basis (Lundstedt 1956, 31). The very concept of "legal rule" is *un-real*, he declares, and all this talk about legal rules and their validity is nothing but a sign that the speaker does not move in the world of reality (Lundstedt 1932c, 259–60). Certainly, the idea of a genuine rule is perfectly natural as long as one believes in the binding force of law: Since there is no such thing in reality, however, genuine legal "rules" cannot exist either. Just as there are no "commands," issued by the legislator, there are no legal "rules." As detached from the legal mechanism, both written and unwritten "rules" are simply unthinkable (ibid., 252).

Instead of binding legal rules, Lundstedt explains, it is here a question of an accumulation of power (*kraftkomplex*), and the most suitable name for it is *not* "the law" (a highly misleading word, and apt to support unrealistic ideas) but, rather, "legal or social machinery" in the sense of "regular enforcement of coercive acts, following upon certain modes of behaviour. The effect is that there arises a certain factual order—a standard, as it were—in people's behaviour towards their fellow-creatures" (Lundstedt 1929, 51; my translation).[21]

What is commonly called "the law" is, in itself, nothing but a concatenation of words that has come into being in a special way. The words, however, possess a suggestive force in giving rise to *ideas* about legal rules, in the

[20] In my view, it is of the utmost importance to *jointly* consider the theory of "social welfare" and the suggestion of a *constructive* legal science.

[21] The Swedish original: "[*r*]*ätts- eller samhällsmaskineriet* i mening av genomförandet med en viss reguljaritet av vissa tvångsåtgärder på vissa handlingssätt, varigenom i sin tur en viss faktisk ordning, s.a.s. standard, uppstår i människornas […] handlingssätt".

minds of the officials (judges, prosecutors etc.); who, in turn, monopolize the use of force. Thus, the concept of legal machinery refers to social facts, namely, a complex of psychological forces operating towards the realization of the "rules" (which, thereby, acquire the character of *legal* rules). Therefore, the concept of legal machinery is a *scientific* concept.

It cannot be denied that the "rules" of law—or paragraphs, as Lundstedt sometimes calls them[22]—possess a certain psychological power over people's minds. This power, however, does not exclusively stem from the content of the paragraph alone, but presupposes a complex of factors "which are active, as it were, in the mechanism in which the paragraph has been inserted" (Lundstedt 1947, 482 n. 29). In Lundstedt's view, it is impossible to regard the paragraphs themselves otherwise than as "purely *formal* directions, the real significance of which rests in the functioning […] of the entire legal mechanism" (ibid.).

Thus, legal "rules" are significant in so far as they are influencing peoples' minds and actions psychologically, but they do not possess this significance on their own, that is, as an inherent quality. Isolated from the legal mechanism, the so-called rules of law are nothing but empty words: Their significance presupposes the functioning of *other* rules within legal machinery.

15.2.2. Legal Machinery in Action

From Lundstedt's descriptions of legal machinery, scattered throughout his work, it emerges, *firstly*, that "legal machinery" refers to an already established legal system, not to its pro-cess of creation (Lundstedt 1956, 18); *secondly*, that he puts equation marks between society (or community) and "legal or social

[22] Lundstedt's claim, frequently uttered, that there are no legal rules has caused much confusion. In his work on historical legal positivism, he says the following: "Just as there are no imperatives, there are no legal rules – that is to say, not in the sense in which we normally understand the word "rule." By "rule", we mean "written" or "unwritten" sentences which we believe to exist *in abstracto*, and which we believe to imply that the courts and other authorities have to obey them […] There are no such sentences, however. They are simply unthinkable […] Legal rules in terms of reality cannot be understood otherwise than *on the basis of the fact* that the state authorities act in a certain way in certain situations, which again depends on a number of psychological factors and, thereby, has in various ways an impact upon the individual's mode of behaviour" (Lundstedt 1929, 60; my translation). This is the Swedish original: "*Lika litet* som det finns några imperativer, *finns det överhuvud några rättsregler* i den mening, som man föreställer sig med detta ord. Man menar ju därmed 'skrivna' eller 'oskrivna' satser, vilka in abstracto skulle ha existens och ha den betydelse, att de vore att följa av domstolar och andra resp. myndigheter […] Men sådana satser finns icke. De äro helt enkelt otänkbara […] Rättsregler i verklighetsmening kunna icke uppfattas annorlunda än *därigenom*, att statsorganen handla på ett visst sätt i situationer av visst slag, vilket åter beror på en mängd psykologiskt verkande faktorer och vilket i sin tur på olika vägar influerar de enskildas handlingssätt." Lundstedt himself, however, frequently speaks of "legal rules" and "rules of law"—as he says, for lack of more suitable words, and simply as a *term* for something (Lundstedt 1947, 474). He also uses (and seems to prefer) the word "paragraph," in the sense of written or unwritten rules of law (ibid., 482 n. 29).

machinery" (ibid., 165) since it is, here, a question of continual interplay between man's psychological impulses and (authorized) control; and *thirdly*, that the so-called common sense of justice plays a decisive role in the satisfactory functioning of what is called "the law." The constituent elements of legal machinery are social instinct and susceptibility to the pressure of "the law" actually in force (Lundstedt 1956, 165, 167).

In Lundstedt's view, it is futile to ask what is valid law. Instead, the central question—central because referring to reality—must always be: "What is it that actually determines, or motivates, the decision-making organs?" By thus inquiring after the motive, one invariably touches upon the entire complex of the legal mechanism in which the so-called legal rules play are larger or minor role.

Hägerström had declared that the legal order was nothing but a "social machine, in which the cogs are men" (Hägerström 1953a, 354). Lundstedt adopts this image but is nevertheless not quite happy with it: The problem is that in contrast to a genuine piece of machinery (e.g., an ocean liner lifted up in dry dock), the *legal* machinery is no "dead" object but consists "of live factors, the human beings, who through their modes of conduct and mental faculties constitute the power works, drive wheels, cogs and other gears of the machinery" (Lundstedt 1956, 18).

While ordinary ("dead") machinery can and must be described from an *external* point of view, this is hardly possible as regards working *legal* machinery, for there, the expert—i.e. the legal scholar—lives in the very midst of it and himself functions as a minor cog. Therefore, it is essential that he at least imagines himself detached from legal machinery, assuming the role of an outside observer and expected to apply a sociological perspective.

With Lundstedt, legal machinery is a figure of speech referring to a continual interplay between human nature and society. Since this interplay obviously exists, Lundstedt does not deem it necessary to inquire how, exactly, it has arisen. His only purpose is to describe its functioning from the observer's point of view. In doing so, he shows great psychological insight into the nature of man as partly rational, partly emotional.[23] What is more (and, one might say, somewhat curious): His investigations encompass an earnest plea for taking seriously the so-called common sense of justice—not, of course, as a starting-point for scientific reasonings but, rather, as a kind of catalyst for the functioning of legal machinery.

Ideas connected with the common sense of justice express, as Lundstedt puts it, "most primitive feelings *for* 'the right' and *against* 'the wrong'," (ibid., 169, Lundstedt's italics)[24] and he proceeds to unveil and analyze the historical

[23] Man's mind "does not only comprise rationality, intentions and other such manifestations, but also sensations, feelings, emotions and instincts" (Lundstedt 1956, 128 n. 6).

[24] "The conceptions of rights, legal duties, guilt and its reparation, in short, right and

and psychological realities underlying those feelings. Linking up with Hägerström's explanations on man's social instinct,[25] he starts from the "very strong assumption or hypothesis" (Lundstedt 1956, 128 n.6) that there is, in man, a social, or community-building, instinct. In view of our knowledge of the history of the human race, he cannot see why social instincts should be denied to human beings—after all, nobody denies social instincts in animals, such as for instance ants or bees (ibid.).[26] One may safely assume, then, that there is, in man, a psychological disposition "to build up a society and to maintain it in order to live there" (ibid., 167). This disposition, in turn, serves as an "impulse to action preserving the life of the race" (ibid.).

However, there is not only this social, life-preserving instinct. Everyone living in a community is invariably influenced by his surroundings, and by various kinds of pressure exerted by these surroundings. Thus, pressure is exerted by what is commonly called legal rules, and their maintenance invariably prompts a certain socio-psychic attitude. As will emerge from Lundstedt's theory of the social function of criminal law (see Section 15.2.4), it is pressure from exactly this quarter which produces and maintains the people's "impulses against crimes and other so-called unlawful actions" (Lundstedt 1956, 167). The reason for this is that people simply cannot help being influenced by surroundings where there is accumulated, as Lundstedt puts it, "a moral power-generating center for the benefit of the obedience of the laws" (ibid.).[27]

The regular application of the "rules" of law does not influence man's social conduct through conscious reflection alone: The most important influence stems after all

> from the contact that diverse rules of law are capable of establishing with certain chords in the *emotional* life of man. The application of the rules in question […] maintains and strengthens in man's emotional life the ideas […] of equity and justice, of rights and duties, of right and wrong. (Lundstedt 1956, 166)

wrong—all such conceptions are included in the so-called common sense of justice, forming a most irrational jumble. In the background lie animal instincts of avarice and revenge […]" (Lundstedt 1932b, 331).

[25] "The maintenance of the legal order presupposes in the first place what is called social instinct. This expression means that in a certain community the members are inclined, *in general independently of all reflexion*, to follow certain general rules of action, whereby co-operation at least for maintenance of life and propagation within the group becomes possible. A social instinct in the same sense occurs also in animals which form communities. The difference lies in the fact that in human societies the instinct can attach itself to laws which have been consciously created […]" (Hägerström 1953a, 350).

[26] Lundstedt's next sentence is revealing: "[w]ith this remark I have only wished to point out a special example suggesting that legal science is no exact science" (ibid.).

[27] The maintenance of coercive rules exerts a "*general psychological pressure on a man to act* […] *in accordance with the rule.* In reality this is what one means *judicially* by 'right' and 'duty'" (Lundstedt 1925, 118).

In short, Lundstedt has realized that man's "primitive" feelings render an indispensable service to society,[28] and through the maintenance of the social organization (i.e., legal machinery) over the centuries, these feelings have been refined or, as Lundstedt puts it, "bridled and checked" (Lundstedt 1956, 169).[29]

In this process, it is no coincidence that the common sense of justice turns out a social instrument: It *can* do so, because there "rings at its bottom so to speak a keynote socially attuned" (ibid., 167). In other words, the common sense of justice generally yields to points of view regarded as useful to society, if only these points are asserted with due authority (ibid., 168). And this very authority is exerted through the "rules" of law being applied regularly—without their application, Lundstedt claims, the common sense of justice would lose precisely those points of support which are necessary for the indispensable role it plays in legal machinery.

Thus, the functioning of "the law" is explained, by Lundstedt, as depending on a complex of feelings and interests, which ultimately find their expression in (authoritative) legal language. In the last analysis, however, the functioning of legal machinery is explained by the state monopoly of force.[30]

15.2.3. "Situations of Right"

15.2.3.1. Introduction

In traditional jurisprudence, a right is conceived of as a legal power, authorized by material law. The right is thought to exist by itself, quite independently from the maintenance of the rules according to which punishment or

[28] "The fact that irrational ideas may play a useful rôle in the development of the community does not imply any paradox. As a matter of fact, such an idea has merely unconsciously served as a *pretext for something else* that really has been useful" (Lundstedt 1925, 22).

[29] "In fact, the conceptions of the sense of justice are actually taken into the service of the legal machinery, and, governed by law and by the spontaneous, subconscious nature of the feelings of man, they become the most efficacious instruments against the anti-social passions of man […]. If the sentiments of justice were not taken into the service of the legal machinery in this way, the social function of laws could not be realized" (Lundstedt 1932b, 332).

[30] In international law, such a monopoly is absent; therefore, it cannot be called "legal machinery." According to Lundstedt, international law consists of false ideas about rights, with frequently disastrous consequences: "[r]ighteousness is not *only* a *moral ideal*; it also implies the power of subjugating the recalcitrant [nation] in a most *materialistic* way. There is nothing to say about this insofar as the relations between individuals are concerned— individuals who are subordinated to an authoritative order controlling them. But in *international* relations, in which there is no such order, 'compulsory law' implies that a state has the right of causing a world catastrophe […] merely for the furthering of its own interests. It is the *identity* between the right of *subduing* man (inseparably connected with the idea of law), and the right of *destroying* him—it is this identity that forms the infernal side of righteousness and justice in international relations" (Lundstedt 1932b, 338–9).

damages befall the violator of the right: The right is, so to speak, the starting-point for these other (coercive) rules, that is, their application presupposes that a right has been violated. Thus, coercive rules are understood as a *reaction* against the violation of the right.

Lundstedt, now, says that it is just the other way round: What is commonly called a right, is nothing but a certain position that shows itself as a *consequence* of—or a *reaction* to—the maintenance of certain "rules" of law.

Hägerström's analysis of the traditional legal concepts "right" and "duty" had been based upon the analysis of the concept of obligation in Roman law.[31] He concluded that rights and duties are not "genuine" concepts (*äkta begrepp*) but, rather, fictitious or false concepts (*skenbegrepp*), where words are employed as expressions of subjective feelings or interests. The concepts of "right" and "duty" do not correspond to anything factual in reality. Consequently, rights and duties are not *legal* concepts but, rather, *metaphysical* (alternatively "mystical" or "superstitious") concepts, referring to a transcendental reality. As such, they have no cognitive meaning but merely express man's illusion that "rights" exist.[32]

Lundstedt wants to elaborate on Hägerström's findings and, if possible, take them one step further: He means to disclose the *realities* underlying what is called "situations of rights" (Lundstedt 1956, 93–100, 109–14; 1925, 110–9). Independently from Hägerström,[33] he realizes that in such situations, the only observable reality consists in the workings of legal machinery—specifically, in the maintenance of the "rules" of law and their influence on people's attitudes and actions.

Lundstedt does not mince his words. The common belief in rights as some sort of power, existing irrespective of enforcement by positive law, he declares

[31] The reality of legal rights can be negated by claiming that "right" does not signify anything, not even in imagination; that the word, in short, lacks semantic reference. This is Hägerström's, Olivecrona's and Ross' approach (cf. Hägerström 1953a, 4). Also, the reality of legal rights can be negated by denying the *facultas moralis* of natural law doctrine and the (positivistic) *Willensmacht*-theory, respectively. This is Lundstedt's approach. On Hägerström's, Olilvecrona's, and Ross's view on rights see respectively Sections 13.5, 14.3, and 16.3 in this tome.

[32] It is difficult to establish whether or not Lundstedt made a mistake when applying value nihilism onto juristic sentences. Ingemar Hedenius (1908–1982), assistant professor in Practical Philosophy at Uppsala University, pointed out that Hägerström (as well as Lundstedt and Olivecrona) had failed to realize the distinction between "genuine" legal statements (*äkta rättssatser*), which are theoretically meaningless sentences expressing a desire or an interest, and "spurious" legal statements (*oäkta rättssatser*) which, as Hedenius pointed out, *can* have theoretical meaning and express statements or assumptions concerning social facts. Hägerström and his followers had overlooked that statements on rights, duties, unlawefulness etc. frequently can be understood as spurious (and, thus, as true or false) legal statements (Hedenius 1963a, 57). Both Lundstedt and Olivecrona vehemently repudiated Hedenius' accusation (Lundstedt 1942, Olivecrona 1942). On Hedenius see Section 17.3 in this tome.

[33] "That conception of 'legal right' as a reality […] is *his* property, not *mine*" (Hägerström 1934a, cited in Lundstedt 1956, 7).

to be false (Lundstedt 1925, 112; cf. Lundstedt 1956, 16): It is simply wrong to believe that a right is a primary phenomenon, protected by the state.[34] According to him, all that talk about rights and duties as if they were objectively given entities is nonsense and superstition: What actually exists, in observable reality, when somebody claims to possess, say, a "right of property," is a certain position with respect to a certain object. In reality, a right is nothing but an actual situation, characterized by "the regular absence of certain acts on the part of outsiders, which absence in its turn is due to the operation of laws consistently maintained" (ibid., 118).

And Lundstedt proceeds to show that such a situation arises in a perfectly natural way.

15.2.3.2. The Reality Behind the "Right of Property"[35]

In his zeal to uncover the realities behind so-called situations of right, Lundstedt adduces the example of the "right of property," arisen through a sale (Lundstedt 1956, 93ff.): A person A has bought an object X from another person B, and the bargain having been concluded, A finds himself in a certain position with respect to the acquired object X. It is this new position of A's, the position of "owner," which Lundstedt wants to analyze.[36]

Normally, the purchased object is at the buyer's disposal, to do what he likes with it. Thus, A may handle X in any way he chooses (he may use it, sell it, give it away as a present, destroy it) without thereby risking legal reactions in the form of punishment or damages. In other words: A finds himself in a position[37] where he enjoys risk-free possibilities of action (ibid., 93–4). As Lundstedt puts it, he stands there "without competitors, as the sole master over it" (ibid., 96).

Within this context, it is interesting to note that Lundstedt, in describing A's position, does not hesitate to use the word "power." Thus, he admits that A, being the owner, has "an undeniable power in regard to this 'property'" (Lundstedt 1925, 119) notwithstanding the fact that such a power does not exist and, as Lundstedt himself points out, that it is this non-existent power

[34] "The so-called will of the State as the 'maintainer' of the law is merely a phantom that can never be seized" (Lundstedt 1925, 125). Lundstedt's analysis starts with a critique of Jhering's conception of "right" as a legally protected interest (ibid. 112–7).

[35] The political dimensions of the right of property will not be considered in the present text.

[36] Lundstedt sees no reason to reject the term "owner," as long as it is clear that the concept of ownership, understood in the traditional, ideological meaning, is untenable (Lundstedt 1956, 302, n.1).

[37] Lundstedt admits that the word "position" is unsuitable: the maintenance of legal rules cannot possibly lead to the rise of a person's position with respect to an object. A position vis-à-vis an object denotes something physical, and this is not the case here. Nevertheless, Lundstedt speaks of a "more or less beneficial or secure 'position' for A in relation to the thing" (Lundstedt 1956, 111).

which had misled jurisprudence into the (false) assumption that A is in possession of a "right."[38]

Lundstedt maintains that A's situation can be explained in a completely natural way, based on our experience (Lundstedt 1956, 94): We can see that A's situation is conditioned by an obvious fact, namely, the fact that the *other* members of the community in most cases abstain from meddling with X (that is, from stealing it, damaging it etc.), and for different reasons:

For one, people do not touch X out of fear—they do not wish to run the risk of being punished. Evidently, the regular application of the rules of criminal law has a deterrent effect (see the following Section 15.2.4);

secondly, people do not touch X out of a sense of duty. In people other than A, there is a sense of duty (often purely instinctive) against meddling with A's "property." This sense of duty, or moral instinct, is conditioned by the regularity of the application of the respective rules;

thirdly, other people do not touch X because of their (ideological) conception of A's relation to X as a "right." According to the traditional (and erroneous) way of thinking, legal reactions to violations of A's "right" are motivated, or "just," exactly because people feel that a "wrong" had been done to the owner A. This point is particularly important because the ideological conception of "right" generally enhances the influence of the other two points in forming, as Lundstedt puts it, "an extra contributive cause of a moral attitude consistent with the law" (Lundstedt 1956, 95).

In other words: The traditional, irrational belief in a right as a power, as something that *ought to* be realized, strengthens the idea that it is no more than just that A should enjoy X unmolested. An environment addicted to this belief exercises a strong pressure on the individual to behave in conformity with it, and plays also an important part for the (instinctive or conscious) feelings of duty. Such an ideological view, Lundstedt points out, implies "a disregarding of facts empirically established" (ibid.). It cannot be denied, though, that it has an important effect.

Thus, the *real* factors determining A's (more or less secure) position with respect to X are (*i*) the deterrent effect of the regular application of certain legal rules; (*ii*), and following upon (*i*), a sense of duty towards the law; and (*iii*) the irrational but nevertheless quite useful belief that A's right to X is "just" and, consequently, "ought to" be realized.

Summarizing, Lundstedt admits that no matter how the real state of things has been distorted by ideologizing, one cannot escape the fact that this ideologizing "still does contain a momentous reality of essential importance for

[38] In his use of "power" Lundstedt follows Hägerström: "what is in question must always be a *power* over the thing, which nevertheless is not in itself a real power. To understand this right to protection as following from this power we must assume that it is quite independent of whether the proprietor has *actual* power" (Hägerström 1953a, 5).

the safety of A's position in relation to the thing bought by him" (ibid.). *Without* this reality (i.e. the psychological reality of conceiving of A's situation as a "right"), the organization of society would probably have developed along other lines. *With* this reality, by contrast, a prospering society life has been made possible—thanks to legal machinery making use of certain sentiments associated with the ideas of rights, duties, and "the supposed objectively, i.e. universally, valid ought" (ibid. 96 n. 5).

According to Lundstedt's theory, then, the real factors—*the reality*—behind the so-called right of property consists in the collective consequence of the maintenance of the rules of law and the influence of this maintenance on people; or in other words: In psychological phenomena.

15.2.4. The Theory of the General Moral-Forming Significance of the Maintenance of Criminal Law

15.2.4.1. Introduction

Lundstedt's ideas on the purpose and effect of criminal law were made known to the Swedish public as early as 1920–1921: Indeed, articles on this issue (Lundstedt 1920, 1921) are his first publications after his "conversion" to Hägerström's philosophy. Lundstedt's achievements in this field[39] amount to a complete revaluation of the function of criminal law and are regarded, by his contemporaries, to be his most outstanding contributions to Swedish legal science (see Olivecrona 1959; Schmidt 1978, 149–75).[40]

According to traditional jurisprudence, criminal acts are characterized by an element of wrongfulness (or unlawfulness). By acting as he did, the wrongdoer—so it was asserted—had disobeyed a "command," issued by the community. The community was deemed superior to the individual,[41] and therefore it was the individual's "duty" to obey such commands. By disobeying, the wrongdoer had violated an objective legal duty to the community, and the community had consequently a "right" to punish him. Thus, the infliction of punishment, by the community, was considered justified on account of the individual's unlawfulness (implying a violation of a *legal* duty) and, what is more, the punishment was considered justified *morally* as well, because of the individual's guilt: Having "sinned" against the community, the wrongdoer had "deserved" punishment (ibid., 33–4).

[39] Lundstedt's critique of traditional science of criminal law parallels that concerning tort law: there, the core of his critique is the circumstance that negligence (fault, *culpa*) is grounded in the concept of guilt.

[40] It is not clear, however, to which extent Hägerström backed up Lundstedt's ideas on the function of criminal law (cf. Lundstedt 1956, 8).

[41] Lundstedt points out that it is illogical to conceive of "community" and "individual" as opposed to each other (Lundstedt 1925, 34).

According to Lundstedt, by contrast, there exists among the people a general moral attitude against crime which, in direct opposition to traditional belief, is *conditioned* by the maintenance of the rules of criminal law (Lundstedt 1936, 95–7; cf. ibid., 91–4, 25–131). The members of the community have developed a sense of duty, or moral instinct, towards the law, and this moral instinct has actually arisen "from common knowledge of the consistent enforcement of the criminal code" (Lundstedt 1925, 48). Far from constituting the basis of criminal law, the citizens' general sense of duty with respect to evading penalized acts is, on the contrary, a consequence of the administration of criminal law through generations (ibid. 44.).

15.2.4.2. The Social Function of the Maintenance of Criminal Law

The traditional view that punishment is justified on account of the wrongdoer's "guilt" (a view tied to the principle of retaliation) directed attention to *individual* punishment, and gradually, there arose the idea that the whole purpose with punishment was the moral regeneration (ibid., 45–6)[42] of the individual criminal, with the ultimate view of thereby removing a danger to society. Following the theory of Special Prevention,[43] the focus of interest lies with the wrongdoer's person and personal circumstances. Gradually, the tie between crime and punishment was loosened, and this state of things prompted the notion that punishment must be substituted by other measures—measures which were suited to the wrongdoer's individuality, not to a certain type of crime.

Lundstedt thinks otherwise. In his view, it is not the purpose of punishment to re-socialize the individual criminal, and it cannot be its purpose to punish "sin," either. He reminds us that it was one of the cardinal mistakes[44] of traditional jurisprudence to cling to the old notion of "guilt" and the idea that the offender had "sinned" somehow and thereby drawn moral blame upon himself. As long as the ideas of sin and blame are suffered to dominate peoples' minds, the focus will be on the reason and the effect of *individual* punishment, not of the whole body of criminal law (Lundstedt 1925, 49). Individual punishment, however, is only a link in the entire system of punishment and can have no other reason than being "a necessary consequence of a paragraph or section of the penal *code* as being valid law" (Lundstedt 1956, 228). The purpose of punishment must be to benefit society, by means of upholding the rules of criminal law.

[42] Lundstedt points out that in reality, frequently the exact opposite is the case, since punishment stigmatizes the criminal as morally inferior (Lundstedt 1925, 46).

[43] From the 1920's onwards (with a peak in the 1970s), there were, in Scandinavia as well as on the Continent, strong tendencies towards conceiving of *special* prevention as the essence and ultimate function of punishment.

[44] The second cardinal mistake was, to believe that the deterrent effect of punishment was mainly owing to fear.

Lundstedt cannot but marvel at the extreme short-sightedness on the part of the advocates of Special Prevention. Since it is only a comparatively small group of persons who undergo punishment, of what importance is this group compared to the overwhelming majority of people who abstain from committing crimes? (Lundstedt 1925, 47). And why do they abstain? Dismissing the concepts of guilt and wrongfulness,[45] Lundstedt approaches the obvious fact of the abstinence of millions by posing the following question: "What is the *reality* behind the widespread restraint from committing socially undesirable acts?"

The very idea of "community," Lundstedt claims, already *implies* the existence of a criminal law (Lundstedt 1925, 45; 1956, 221). This claim is grounded in the strong assumption (almost amounting to a fact) that society would not survive without a criminal law. Owing to the complexity of human nature, society, without the upholding of criminal law through punishment, would invariably meet a truly Hobbesian fate, i.e. anarchy and chaos.[46] Therefore, the central inquiry after *the reality* behind the maintenance of criminal law cannot be answered otherwise than by pointing at man's sentiment of self-preservation which, in turn, leads to the necessity, for the community, to punish every act considered detrimental to society. The essential social function of punishment is, then, "to promote in the community in general a sentiment of duty of a special kind, a *moral instinct*, as it were, against crimes," (Lundstedt 1925, 48) and this function concerns the millions in the society, not the very few individuals sentenced to punishment (Lundstedt 1956, 228).

Therefore, the individual crime and its punishment must not be seen in isolation but, rather, as an element in the entire system of punishment (which, in turn, is a necessary consequence of the existing criminal law: Lundstedt 1925, 49): Punishment is both necessary and important, but only as a part in the administration of the bulk of criminal law.[47] The community, in punishing the individual, does not proceed on any principle of justice but solely with the view of preventing disastrous social consequences. It is imperative to punish the offender, but only in order that society may go on existing (Lundstedt 1956, 229; cf. Lundstedt 1936, 87–113). To put it crudely (as Lundstedt himself did): The individual criminal is being sacrificed for the sake of society.[48]

[45] Lundstedt dismisses the concept of guilt as totally meaningless: every human action is caused by something, and as soon as the so-called crime is identified in the chain of cause and effect, it is impossible to claim that he who committed the crime "deserves" punishment (Lundstedt 1956, 220ff.).

[46] "If the criminal law were not upheld, the community would be submerged in crimes, i.e. the community […] would dissolve into a state of *disorganization, i.e. of anarchy and barbarism*" (Lundstedt 1925, 44). "Without e.g. what we call criminal law, the law of contract and the law of torts, that which we now mean by society could not possibly exist" (Lundstedt 1956, 17).

[47] "The conception of punishment is simply included in our conception of criminal law as an existing force" (Lundstedt 1925, 40).

[48] "Criminal law is maintained for the benefit of *society* and not for the benefit of *criminals*" (Lundstedt 1956, 228).

Lundstedt made a point of that the regular enforcement of the rules of criminal law has an eminently important, moral-forming function, namely, to foster and maintain "spontaneous feelings, moral instincts as it were, against those actions encumbered with punishment, i.e. crimes, or so to speak, to stir up the general, spontaneous morale against these" (Lundstedt 1956, 229).

Formerly, it was held that punishment worked as a restraint mainly because of the fear it created.[49] Lundstedt agrees that fear may have a deterrent effect with some people, but emphasizes that this effect hardly deserves mention compared with the importance of the general moral instinct. It is not the individual punishment but, rather, the "consciousness of the existence of the criminal law as operative law—i.e. consciousness that the act will be punished—which has the effect" (ibid., 50). And this consciousness exists independently of our knowledge of individual crimes. The absence of punishment, by contrast, signifies that the Criminal Law has ceased to be operative and can no longer fulfil its function, namely: To maintain order in the community by keeping crime within proper limits.

15.2.5. The Theory of Social Welfare

15.2.5.1. Introduction

Hägerström's moral philosophy is characterized by a non-cognitivist view: Moral judgements, he declares, are not genuine (real) judgements, only expressions of feelings. Thus, moral science cannot be a teaching *in* morality, but only a teaching *about* morality.[50] The same applies to *legal* science: If the statements of legal science give expression to, how the legislator and the judge "ought to" act, then they are not providing information about anything; that is to say, they are not *scientific* statements, but only (subjective) evaluations.

Now, Lundstedt frankly admits that the Swedish word *samhällsnytta* (social utility) expresses subjective evaluations (Lundstedt 1932a, 538). From this admission, it might be inferred that a theory of social utility (or social welfare) cannot possibly be scientific in Hägerström's sense.[51] To this inference, how-

[49] Feuerbach had made this mistake (Lundstedt 1925, 48).

[50] "[This] view merely asserts that the science of morality cannot be a theory *of* morality, but only a theory *about* morality" (Hägerström 1987, 50; my translation). The Swedish original: "[den här framställda åsikten] hävdar endast, att moralvetenskapen icke kan vara en lära *i* moral, utan blott en lära *om* moralen". On Hägerström's non-cognitivism see Section 13.2 in this tome.

[51] Hägerström is explicit about the purposes of science in general: "As science only has to describe what is true, but as it is an unmeaning to consider the idea of an ought as true, no science can have as its purpose to describe how we should act" (Hägerström 1987, 48; my translation). The Swedish original: "Då vetenskapen endast har att framställa, vad som är sant, men det är en omening att betrakta en föreställning om ett böra såsom sann, kan ingen vetenskap ha till uppgift att framställa, huru vi böra handla." Consequently, there can be no science of legal rights and duties, i.e., one cannot determine scientifically what rights and duties exist under such and

ever, Lundstedt strongly objects, protesting that what is called, by him, the Method of Social Welfare is a *scientific* method, grounded in reality. Taking his point of departure in the reality of social interests (conceived of as homogenous) (Lundstedt 1933, 123; 1956, 175), i.e. in facts, and thus starting with a purely descriptive theory, Lundstedt nevertheless seems to end up with a normative theory, comprising an "ought" as expressed in a utilitarian principle.

15.2.5.2. The "Principle" of Social Welfare

As early as 1920, Lundstedt had declared that it was the legal scholar's task "to define legal rules and legal institutions by having regard to those purposes that from the point of view of *social welfare* [*samhällsnyttan*] should be attached to them" (Lundstedt 1920, 6; my translation).[52]

These words—an appeal, as it were, addressed to all "men of legal science"[53]—far more than anything else point at what was essential to the jurist[54] Lundstedt, namely:

First of all, the necessity of emphasizing the legal scholar's *responsibility* vis-à-vis the society he is living in;[55]

secondly, the necessity of enforcing a *shift of focus* from the individual to the collective;[56] and

thirdly, the necessity of substituting the traditional method of justice with the method of social welfare: Legal rules should be judged, not by their "justice" or "injustice" in the concrete case but, rather, by their social effect in general.[57]

It is not clear what, exactly, Lundstedt's conception of "social welfare" actually amounts to.[58] From the reactions to his early work *Superstition or Rationality* (1925), he could gather that the introduction of the term "social welfare" (or,

such circumstances. What *can* be investigated into, and determined scientifically, are actual *ideas* of rights and duties—as appearing in legislation, in legal practice etc.

[52] Lundstedt's theory of social welfare was made known to the English-speaking public in 1925, through his work *Superstition or Rationality* (Lundstedt 1925).

[53] Lundstedt prefers to speak of the "man of legal science," instead of the "legal scholar."

[54] On various occasions (vis-à-vis Alf Ross, for instance), Lundstedt made a point of his *not* conceiving of himself as a philosopher of law.

[55] "Legal science is the science of the conditions and forms of the social life of individuals, and of the life of societies, i.e., of nations, one with another. On account of this, legal science is responsible partly for the shape of the social life of its own nation, and partly for the development of the relations between nations" (Lundstedt 1932b, 331).

[56] This is informed by Lundstedt's view that "individual" and "community" are not to be conceived of as opposites.

[57] On Lundstedt's theory of social welfare see, e.g., Bjarup 1978, 104–8.

[58] From Lundstedt's descriptions of his theory, one might think that he, at various times, attaches different meanings to the expression "social welfare." Also, he may have had trouble with the translation of the word *samhällsnytta*. This is Schmidt's view (Schmidt 1978, 161–2).

rather, of the translation of the Swedish word *samhällsnytta* with "social welfare") had caused perplexity and misunderstandings, and in the years to come, he made repeated attempts to explain the sense in which he had used the term.

Thus, we are informed that by speaking of a "principle" of social welfare, Lundstedt does not mean a principle in the established sense of the word.[59] "Social welfare" has nothing to do with moral philosophy: It is actually something *most realistic*, in the sense that it refers to that which is

> actually considered, i.e. evaluated, as useful to men in society with the way of life and the aspirations and struggles which they really have at a certain time. In general the matter can be expressed thus: Socially useful is that which is actually evaluated as a social interest. (Lundstedt 1956, 137)

His conception of "social welfare"—Lundstedt goes on to explain—has no ethical colouring whatever, nor does it refer to any ideal, absolute concept, or any principle of philosophy.[60] "Social welfare," in *his* theory, amounts to something totally different from what is usually meant by *practical view*, *demands of society*, *Gemeinwohl*, *social policy*, and *common good* (ibid., 135): In *his* use, the term refers to a guideline—a *method*—for legislation and interpretation and naturally, also for legal science (ibid., 171–2). In other words: "Social welfare" can be characterized as "comprising the general spirit of enterprise and its postulate: A general sense of security as concerns enterprising activities as well as other modes of action not harmful from a social point of view" (ibid., 137–8).

Almost desperately, it seems, Lundstedt searches after a word that would capture the fact—the *reality*—that most people actually do have certain (material and ideal) needs and wants in common[61] and, therefore, continually strive after the realization of those needs and wants. Obviously, people's actions are

[59] Lundstedt explains this vis-à-vis Alf Ross: "It is obvious that the expression "principle of social welfare," as used in my work, is a name for the *method* I am using. I claim that this method is a scientific method in the study of law. Moreover, "principle of social welfare" *indicates* what kind of method it is" (Lundstedt 1933, 126; my translation). This is the Swedish original of this passage: "'Samhällsnyttans princip' i mina undersökningar [kan endast vara] en benämning på den *metod*, som jag i juridiken hävdar såsom vetenskaplig, en benämning, som samtidigt *antyder* metodens art." In his last work, Lundstedt says the following: "It is quite true that I have at times spoken of 'social welfare' as a principle for legislation and legal interpretation. But it ought to be clear to anyone […] that I have not thereby used the word 'principle' as a technical philosophical term. This would have implied that I have accepted social welfare as an absolute value, a conception from which I have dissociated myself from the very beginning" (Lundstedt 1956, 171).

[60] Already in 1925, Lundstedt had declared that "this fundamental principle," i.e., the welfare of the community as the only possible objective, had "*no relationship whatever* to the views of—among early authors—Bentham and Stuart Mill, and—among later ones—Ritchie, Duguit, Tawney, Krabbe, etc." (Lundstedt 1925, 24). On Duguit and Krabbe see respectively Sections 12.3 and 2.2 in Tome 1 of this volume.

[61] In this sense also Schmidt, a student of Lundstedt's: Lundstedt's setting up of "social welfare" as a practical guide was not identical with Bentham's idea that laws should promote the greatest happiness of the greatest number. Rather, Lundstedt's idea of social welfare was a "more abstract conception of some 'common weal'" (Schmidt 1978, 161).

determined *partly* by the goals they want to achieve, *partly* by their views on, how these goals might best be realized. Lundstedt himself—or so he assures us—has no idea of meddling with those goals and views—he does not suggest anything people "ought to" aspire to. He merely states that people, in fact, do so.

Lundstedt follows Hägerström in the view that social *value judgments* cannot be anything but expressions of feelings and, therefore, cannot provide information about reality. He takes his analysis one step further, though, when pointing out that the *social evaluations* underlying the value judgements—"as a condition on which social value judgements are expressed" (Lundstedt 1956, 200)—are, in themselves, factual, i.e. *realities* (ibid.). In short: Social evaluations are facts and, as such, objects of empirical knowledge (ibid., 48).

This is Lundstedt's point exactly: Since the Method of Social Welfare is grounded in the reality of human needs and aspirations and, thus, in the social evaluations appertaining to them (that is, in facts), the Method of Social Welfare is a *scientific* method.

In Lundstedt's theory, then, social evaluations are understood as an observable reality, seemingly stemming from "the people." Only seemingly, though: As Lundstedt admits, the social evaluations that become *directly* decisive for legislation and statute interpretation are, on the whole, not the evaluations of "the people," but those of the "law-maker."[62] This anomaly he explains by pointing out that the people's social interests may not be expressed sufficiently clearly, and that the law-maker consequently has to play a more active role as to which interests—that is to say, which politics—are to be pursued through law.[63] By paying attention to the demands of "social welfare," the law-maker—this seems, roughly, to be Lundstedt's meaning—is simply trying to ensure those patterns of behaviour which correspond to given social evaluations (and, therefore, can be said to benefit society).

The law-maker, in turn, can be influenced more or less directly by the views of a *constructive* legal science. Thus—as Zamboni (2002, 44) correctly points out—the circle politics-law-politics is being closed by Lundstedt's criterion of social welfare: Social interests (i.e. politics) are influencing the law-making process, and the law-making process, in turn, can largely influence social interests (see also Section 15.2.4 above).

[62] On Lundstedt and the law-maker function, see Zamboni 2002.

[63] Lundstedt makes it clear that the law-creating process can be influenced by other than strictly *legal* instances (1956, 152f.).

15.2.6. "Constructive" Legal Science

15.2.6.1. Introduction

Not surprisingly, Lundstedt encountered heavy criticism with respect to the presumed objectivity of his criterion of "social welfare."[64] Alf Ross' scathing comments set the stage in 1932,[65] and in the years that followed, Lundstedt was reminded more than once that "social welfare," conceived of as a general goal or principle of interpretation, was rooted in utilitarian philosophy and, therefore, incompatible with his professed non-cognitivist outlook.[66] Lundstedt, however, kept insisting that he, with his Social Welfare theory, merely states what happens in reality.[67]

Finally, in 1943 (Lundstedt 1943, 107–42), he took a decisive step in employing the term *Constructive Legal Science* for the type of jurisprudence envisaged by himself—a jurisprudence comprising both scientific and evaluating elements and grounded in "social welfare" *qua* basis of all law and a general guideline for legal activities.

15.2.6.2. The Constructivity of Constructive Legal Science

Lundstedt maintains that the legal scholar's work cannot be exclusively *scientific* in an epistemological sense: Obviously, jurisprudence is not pursued as a science when, for example, considering the question whether or not a certain law fulfilled its social function in the most satisfactory manner, or whether the interpretation of law—in general, or in a concrete case—is in total harmony with public welfare. In cases such as these, it is evidently not merely a question of statements on the part of the legal scholar, but also of evaluations (Lundstedt 1947, 477). Nevertheless—and it is at this point that Lundstedt's novel approach comes into the picture—it is justified, in cases such as these, to speak of a *scientific* activity.

By way of illustration, Lundstedt adduces the examples of the physicist constructing an instrument and the astronomer building a telescope. In both cases, it is undoubtedly a question of scientific work, notwithstanding the fact

[64] As Zamboni puts it, "the 'objectivity' and 'scientific' character of this content of legal politics is rooted in the fact that it is based on an undefined objective reality, a universal 'social instinct in man'" (Zamboni 2002, 58 n. 80).

[65] Ross was fiercely critical vis-à-vis the ideal of social utility, as informed by (subjective) legal politics (Ross 1932, 341–9; 1959, 295–6). On Ross see Chapter 16 in this tome.

[66] To the end of his life, Lundstedt vigorously defended himself against accusations of Neo-Benthamism (cf. Lundstedt 1956, 141ff.).

[67] In this case, Lundstedt offends against the fundamental rule of imperative logic, saying that an ought-statement cannot be derived from a series of is-statements (cf. Bjarup 1978, 107f.). Although appreciative of Lundstedt's theory, Zamboni advances the following criticism: "He [Lundstedt] focuses more on embellishing upon the content of the 'public welfare' and, despite his statement of objectivity, winds up choosing his own values, referring to them as 'objective' or 'undeniably important to the community'" (Zamboni 2002, 57).

that the physicist's and the astronomer's final productions are preceded by, and necessarily must be preceded by, a series of experiments and evaluations (ibid., 479; Lundstedt 1956, 212–3).

Now, turning to the "experiments" undertaken by legal science, Lundstedt proceeds methodically. "Does Legal Science Need Legal Ideology?" he asks[68]—rhetorically, of course, for his answer is given: "Most certainly not: Legal ideologies are nothing but chimerical assumptions that ought to be dismissed from the realm of science." Consequently, he sets about investigating what it is, if not ideologies, that *in reality* motivates legal activity. In short: What is the *purpose* of legal activity? (Lundstedt 1943, 124–7).[69]

In Lundstedt's view, there is no doubt that legal activities are indispensable to society; without them, there would be chaos. Therefore, the closer shaping of these activities must be determined with an eye to legal machinery, that is to say, to the frictionless functioning of the social organization.

When speaking of legal activities, Lundstedt refers to the work of the legislator and the judge, not to that of the legal scholar. As far as the latter is concerned, *his* task includes—apart from a purely epistemological or theoretical activity—an activity "aiming more practically and, as it were, more *constructively* at social life" (Lundstedt 1947, 476).[70]

From these words, it would appear[71] as if Lundstedt were hesitating to use the word *constructive*. In any case, he hastens to add a footnote, saying that *constructive* "has, of course, nothing to do with juridical 'construction' or such like. I use the word as referring to the contribution of jurisprudence to the *construction* of society" (Lundstedt 1947, 483 n. 32).[72]

Lundstedt does not say what, exactly, falls under the expression "construction of society."[73] However, he offers a detailed description of, how a *constructive* legal scholar is expected to proceed:

Firstly, and in view of his (more or less direct) influence upon legislation, the legal scholar must be guided by considerations of, whether or not a con-

[68] This question forms the title of Lundstedt 1943.

[69] The "late" Jhering focussed on exactly this issue. The difference between Jhering's and Lundstedt's conceptions of the purpose of law will not be examined in this paper, however.

[70] In the 1943 article, this sentence reads as follows: "Utöver nämnda enbart kunskapskritiska eller teoretiska verksamhet innefattar rättsvetenskapen även en mera *aktuellt* på samhälls- eller rättslivet inriktad, en om jag så får säga mera konstruktiv verksamhet" (Lundstedt 1943, 125). "Apart from the above named, merely epistemological or theoretical, activity, legal science also comprises an activity which aims *more directly* at social or legal life; an activity which is—if I may say so—more constructive" (my translation).

[71] The phrase "as it were" seems to point in this direction.

[72] In the 1943 article, the identical note reads as follows: "Ordet 'konstruktiv' har naturligtvis intet att göra med juridisk 'konstruktion' eller dylikt. Det torde kunna försvaras såsom avseende rättsvetenskapens bidrag till *samhällsbyggnaden*" (Lundstedt 1943, 125 n. 1). The note reappears in Lundstedt 1956, 133 n. 9.

[73] As an active politician, he would presume that this goes without explanation.

templated law can be expected "to ensure the greatest benefit to society or, expressed in another way, to fulfil in the best way, a social function" (Lundstedt 1947, 476);

secondly, and "in view of the interpretation of so-called valid law," the legal scholar must expound the law in such a way that its consistent application can be expected "to benefit society as much as possible, or […] cause the law to fulfil a social function in the best possible way" (ibid.);

thirdly, when systematizing the laws and dealing with legal institutions, the scholar must "consider the historical as well as the actual significance of legal ideology" (ibid.). He must always remember, though, that for a view of law free from ideology "there is nothing on which to base arguments except social realities, i.e. people, as they are physically and psychically constituted, the facts which form conditions precedent for people's relations to each other, these relations themselves, and the actual aspirations of people" (ibid.).

Naturally, the "must" contained in the three postulates enumerated above caused a storm of criticism. Lundstedt took great pains to explain that "must" has nothing whatever to do with an objective "ought" or the like: It is, here, a question of deliberately taking up a certain position with respect to the content of laws and proposed legislation, legal interpretation as well as systematization. This same position implies that one must recollect the starting-point for all legal activity, namely, the benefit to society. In Lundstedt's words:

> The constructive *juridik* must—as long as the situation is such that no motive for legislation and administration of law, freed from chimerical ideas, can be discovered, except the purpose to benefit society—*reckon with this purpose as a starting point for legal activity*. (Lundstedt 1947, 476)

This means that *if* the legal scholar wants to avoid coming into conflict with established facts, and *if* he wants to keep in touch with empirically given *realities—then* he simply must fulfil the above-mentioned three postulates (ibid., 476).[74]

Through his work, the legal scholar has gained maximum insight into the workings of legal machinery, and exactly because of this, he seems to be the proper person to make evaluations with respect to the functioning of the law. Lundstedt is convinced that the development of society would suffer from the lack of access to the evaluations coming from legal science: For who, he asks rhetorically, can be more suitable for the task of promoting that which society considers useful, than "the man of legal science"? Would it not be absurd if precisely that category that can be presumed to have the deepest insight into legal machinery—and consequently, the most authoritative conceptions of it—

[74] Lundstedt's *constructive* legal scholar makes evaluations for two reasons: *firstly*, because he must *presume* that the legislator is guided by considerations of social welfare; and, *secondly*, because he himself must be interested in benefiting society, by means of assisting the legislator.

were to evade making evaluations concerning the most expedient way for legal machinery to function? (Lundstedt 1947, 478).

There is no denying that the word *constructive*, in Lundstedt's use, has a strong political impact. What is meant to be constructed, is the organization of society. Thus, the purpose with the construction is a political one, namely, to arrive at an organization of society which is in keeping with the legislator's views on, what is (or, better, "ought to" be) social welfare. Jurisprudence can contribute to this constructing activity through advising and assisting the legislator. The *constructive* legal scholar is expected to make evaluations as to the proper *means* in order to achieve certain (political) *ends.* Or to put it the other way round: His evaluations have to do, not so much with that which "ought to" be realized but, rather, with the appropriate "know-how."

On a certain interpretation of Lundstedt's views on the law-maker function within the legal system, his Social Welfare thesis and his suggestion of a *constructive* jurisprudence, one might think that what he really aimed at was a scientific approach to the politics of law. Such an approach would provide the law-maker with an eminent advantage, namely, of commanding a position where he could be seen to refer to *scientific* advice.

Be that as it may: The surmise[75] that Lundstedt's *constructive* legal science was ultimately intended to provide the Swedish welfare state with a scientific grounding, does not seem so very far-fetched.

[75] In this sense also see Jes Bjarup (2005b, 12): "[The] making of the law is a scientific question grounded in the authority of Lundstedt's legal science that also informs the administration of law in order to establish the Swedish welfare state as a matter of scientific paternalism."

Chapter 16

ALF ROSS'S LEGAL PHILOSOPHY

by Mauro Zamboni[*]

16.1. Introduction

Together with Karl Olivecrona, the Danish legal philosopher Alf (Niels Christian) Ross (1899–1979) is internationally recognized as the best-known representative of Scandinavian legal realism. In fact, the very label Scandinavian legal realism was created to identify that particular movement in legal philosophy that incorporates both Axel Hägerström's Uppsala School (and his pupils, like Olivecrona and Vilhelm Lundstedt) and Alf Ross (see Bjarup 1978, 9; Marshall 1956).[1] This label is not just a designator: It is meant to point up the original contribution that Ross made to Scandinavian legal realism, particularly with his 1958 book *On Law and Justice* (Ross 1958), considering that he was not simply a student of Hägerström's anti-metaphysical stance.

After obtaining a law degree in Copenhagen (in 1922), Ross received a scholarship to study abroad and spent most of that period in France and England, and in particular in Austria in 1923. Here Ross was exposed both to Hans Kelsen's ideas and to the Viennese philosophical milieu (though he did not come into contact with logical empiricism until around 1930). During his stay in Vienna, Ross completed a manuscript titled "Theorie der Rechtsquellen" (Theory of the sources of law) which he submitted as a thesis for a doctor-of-law degree at the University of Copenhagen in 1926, only to be rejected. Ross thus decided to contact Hägerström and submit the manuscript as a thesis for a doctor-of-philosophy degree at the University of Uppsala. This required Ross to first obtain a degree in philosophy, an endeavor to which he applied himself from between 1928 and 1929, at which point he graduated in philosophy, and he was then awarded the doctoral degree in philosophy in 1929 when the manuscript was finally published as *Theorie der Rechtsquellen: Ein Beitrag zur Theorie des positiven Rechts auf Grundlage dogmenhistorischer Untersuchungen* (A theory of the sources of law. Contribution to the theory of positive law on the basis of historical-dogmatical investigations: Ross 1929), a work dedicated to Hans Kelsen.

[*] This article presents research carried out under the auspices of the Söderbergs Foundation and the Royal Swedish Academy of Sciences. I would like to deeply thank Jes Bjarup and Uta Bindreiter for their extremely valuable critiques and Laura Carlson for her comments and for proofreading my English.

[1] On Hägerström, Olivecrona, and Lundstedt see respectively Chapters 13, 14, and 15 in this tome.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_44

In order to promote an understanding of the task and method of jurisprudence through a critical analysis of fundamental concepts, Ross wrote the book *Kritik der sogenannten praktischen Erkenntnis: Zugleich Prolegomena zu einer Kritik der Rechtswissenschaft* (Critique of the so-called practical knowledge: With prolegomena towards a critique of legal science, Ross 1933), which he dedicated to Axel Hägerström. The following year, Ross published a second volume, also on the analysis of fundamental legal concepts, namely, *Virkelighed og Gyldighed i Retslæren: En Kritik af den teoretiske Retsvidenskabs Grundbegreber* (Reality and validity in jurisprudence: A critique of the basics of theoretical legal science, Ross 1934). This book was submitted for a doctoral degree in law at the University of Copenhagen, a degree he was awarded the same year, in 1934, and at the same university he would pursue his entire academic career until his retirement in 1969.

This mobility of Ross is very important to understanding his position within Scandinavian legal realism. Ross never disavowed his debt to Hägerström: To be sure, like many other Scandinavian legal realists, he wound up departing from Hägerström's teachings—he did so by addressing the concerns arising out of logical positivism (as by taking into account the central role of the philosopher in clarifying legal language)—and like those realists, he nonetheless continued to look up to Hägerström, the teacher "who opened my eyes to the emptiness of metaphysical speculations in law and morality" (Ross 1958, X; 1953, 4–5).[2]

However, unlike Olivecrona and Lundstedt, Ross never followed Hägerström's teachings faithfully (nor did he claim to do so); instead, he enriched the legal realist framework by incorporating into it insights coming from various philosophies and legal theories, primarily logical positivism and some aspects of Kelsenian legal theory and, to some extent, American legal realism.[3] For example, until the end of World War II, the Scandinavian legal realist school was heavily influenced by the German legal debate, and in particular by its search for criteria on which basis the study of law could acquire a "scientificness" (*Wissenschaftlichkeit*). Indeed, during this period, it seemed self-evident among Hägerström's followers that the study of law should modelled on the natural sciences.[4] After 1945, in part under the influences coming from the other side of the Atlantic, Ross shifted the focus of Scandinavian realism to the similarities between law and social science, noting, for example, that unlike the natural sciences, they both give rise to self-fulfilling or self-defeating prophecies (Ross 1958, 47; 1953, 61–2; Bjarup 1978, 85).

[2] The Scandinavians have always explicitly recognized, some more than others (Lundstedt more than Ross, for example), that their philosophical foundation lies in the Uppsala School and in particular in Hägerström's inquiries in the world of legal and moral philosophy. See Bjarup 1978, 23–38.

[3] See, for example, Hart 1959, 237, depicting Ross as "an American realist in Scandinavia."

[4] This conception is especially apparent in Lundstedt 1956, 129, and Olivecrona 1939, 25–7.

This incorporation of various legal philosophical ideas is one of the reasons why Ross often thought of himself as offering a new approach to law and to legal issues, an approach alternative to traditional legal theoretical streams, as could be found, for example, in legal positivism and natural law theory (see, e.g., Ross 1946, 11–3). Despite this multiplicity of sources from which Ross proceeds, he is correctly considered a proponent of Scandinavian legal realism, this on account of the attention he devoted to the nature of legal science, focusing in particular on the question whether its status is cognitive or noncognitive (Ross 1958, 31, 9; 1953, 22–3).

So, in light of that background, this entry has been structured around four main themes that all the Scandinavian realists can in one way or another be said to have been concerned with: (*i*) the concept of valid law, (*ii*) rights, (*iii*) coercion, and (*iv*) the relation between law and politics.

16.2. The Concept of Valid Law

Let us start with one of the topics to which Scandinavian legal realists paid much attention, namely, the concept of legal validity. According to Ross, law is valid when it has the property of binding a certain community or certain legal actors, such as judges, to certain modes of behavior, whatever behavior the law itself may prescribe. In this latter respect, Ross's conception of validity as a content-neutral concept can be likened to Kelsen's.[5] But whereas Kelsen rested validity on the basic norm, Ross did not understand validity as a property of law and of legal concepts that can be derived from the legal system itself (Ross 1929, 261). As legal realist, Ross believed that the source of validity needs to be sought *outside* the law, in the spatiotemporal coordinates of empirical reality:

> Our object in determining the concept of law is not to spirit away the normative ideas, but to put a different interpretation on them, reading them for what they are, the expression of certain peculiar psycho-physical experiences, which are a fundamental element in the legal phenomenon. (Ross 1946, 49)

A legal norm is valid when "in force," at which point it ceases to be a mere declaration of intent and becomes a binding statement (as when a policy guideline is implemented into a judicial decision). And there are two empirical criteria that need to be met in order for a norm to be legally valid in the sense just specified: It must be recognized and followed by the majority of the community of addressees, and in particular by the majority of the judicial body; and it must be felt by this majority to be "socially binding," as against being *morally* binding, so this second criterion serves the purpose of distinguishing law from morals (Ross 1958, 18, 34–8; 1953, 27–8, 47–51).

[5] On Kelsen's conception of legal validity see Section 8.5 in this tome and Section 2.3.2 in Tome 1 of this volume.

Alf Ross (1899–1979)

According to Ross, by incorporating these two criteria into the definition of valid law—that is, by predicating validity on (*i*) efficacy, or the fact of a norm's being in force, and (*ii*) a social feeling of being bound by the norm—we can resolve one of the classical antinomies in legal philosophy, the antinomy between efficacy and obligatory force, in that the law is considered "at the same time something factual in the world of reality [efficacy] and something valid in the world of ideas [obligatory force]" (Ross 1958, 38; 1953, 51).[6] In this way Ross avoids the radical position taken by Olivecrona, who reached the same conclusions but did so claiming that we need to do away with the very label "validity of law" if we are to avoid falling into the traditional debate between theories that stress one aspect of legal validity at the expense of the other, as has traditionally happened in particular between natural law theory and legal positivism (Olivecrona 1971, 112).[7]

Not much debate has developed around the first criterion of valid law, that is, the efficacy criterion, considering that it is also present in authors like Kelsen and Hart. The only point to be stressed in this regard is that, by incorporating the efficacy criterion into the concept of valid law, we make sure that we are talking about just that, namely, *valid* law, without also bringing into that concept the criteria needed to make law democratic or just. And although these additional criteria may not be an ingredient of valid law, they do have a fundamental role to play in making law binding, or "real," as Ross would say. Only in this way, he goes on to comment, will the law be more likely to be obeyed, since it will generally reflect values widely shared among its addressees, and in particular among judges.

By contrast, much criticism has been directed at the Scandinavian realists in response to the subjective or psychological criterion, and in particular to the move by which Ross sought to include the "feeling of being bound" by law in the very concept of (valid) law. The criticism, more to the point, was that this subjective component makes it difficult to distinguish legal concepts from moral ones, since both are grounded in the same feeling.[8] Ross conceded that law and morals operate in the same way—on a psychological basis—and that to some extent they help each other in inducing people to act in certain ways, according to modes of behavior consistent with law and morality themselves (see, e.g., Ross 1962, 1188–90). But, as much as the mode of operation may be the same, the *feelings* behind the legal and the moral phenomenon differ substantially: Whereas the addressees of legal provisions obey the law saying to themselves, "I *ought* to act thus" (that is, "I have to"), the addressees of moral prescriptions follow those rules saying, "I *must* act thus." The former thinking

[6] See also, generally, Ross 1998, 147–63, and 1968, 104.

[7] On Olivecrona see Chapter 14 in this tome.

[8] For criticism of Ross's idea of validity as expounded in *On Law and Justice*, see Hart 1959, 238–40. Ross's defence can be found in Ross 1962, 1186–7.

exemplifies what Ross calls *formal* legal consciousness; the latter, what he calls *material* legal consciousness (Ross 1958, 55; 1953, 69).

In the end, Ross understands law as whatever complex of norms and concepts happens to be binding in society, regardless of the ideologies espoused in society. That rigidity, however, is only partial, for it is tempered by the need to make the law receptive to its political and social environment. This is done by focusing on one of the constitutive and specific elements of legal concepts and categories: their validity. Their validity, in turn, means that they are "in force," in that (*i*) they are observed and, more important, (*ii*) they are felt to be binding by the majority of its qualified addressees, namely, the judges (Ross 1958, 35; 1953, 47–8).[9]

16.3. Rights

Like American legal realism, Ross's legal theory is grounded in an investigation of the central role that legal actors play (especially judges) in defining law and its conceptual constitutive elements (Ross 1958, 40, 45; 1953, 48, 50). But like his fellow Scandinavian legal realists, Ross held that a central element of law lies in its *language*. He can be said to have taken a more European approach to conceptual analysis, even though his aim is ultimately to point out, in keeping with Hägerström's teaching, that such legal concepts (and *in primis* that of rights) are just words devoid of any cognitive meaning.[10]

Ross begins his investigation by directly focusing on the different concepts and categories that constitute the essence of legal language: duties, property, damages, and, more important, rights. This starting point is common to all Scandinavian realists, but for different reasons. The linguistic aspects of law are central to Lundstedt's and Olivecrona's investigations due to the degree to which these two thinkers were influenced by Hägerström's historical analysis of the use of legal language and its fundamental role in explaining the binding nature of law (Olivecrona 1946; Hägerström 1965, 16–38). Ross also supported his analysis with investigations into the history of law, but to find out why he focused on the workings of legal language we instead have to go back to his early roots as a student of logical positivism, which shaped his legal thinking in significant ways.[11]

To wit, the language is in his view the primary means through which legal rules are produced by a legal order and addressed to the community. Legal language, however, is not seen by him as a descriptive device: Its point is not to

[9] As to the central role played by the judiciary to create "real binding law" also at the international level, see Ross 1947, 86–7.

[10] On Hägerström's non-cognitivism see Section 13.2 in this tome.

[11] Two examples of the influence of logical positivism on Ross's work can be found in Ross 1958, 67, and 1953, 82. See also Ross 1968, 15, particularly in connection with Ross 1969, 225.

describe the world of the is (*Sein*) or that of the ought (*Sollen*), nor does it describe an economically efficient reality or a relation of trust between the rulers and the ruled. In the footsteps of John Austin, Ross considers legal language as having primarily a directive function, though Ross rejects Austin's analysis of law in terms of commands in favor of Olivecrona's analysis of it in terms of independent imperatives, which Ross redefines as directives (Ross 1958, 8; 1953, 18). Legal language is an instrument of social control directed at shaping or creating a certain situation, especially through the influence it exerts on human behavior (Ross 1958, 8, 158–60; 1953, 18, 188–93). Over the course of centuries of education and ideology, the constitutive concepts of legal language, such as the concept of rights, are implanted in the mind of the population *as if* they were entities belonging to the spatiotemporal world. So in this socio-psychological dimension, legal concepts and ideas tend to somehow live and function independently of the ideological world of the values they implement in the community (Ross 1958, 55, 59; 1953, 69; 1968, 51). As a socio-psychological construct, the legal phenomenon must then make it possible for people to treat law itself as having the properties traditionally ascribed to it, especially its operating on the basis of logical reasoning (as with the dichotomy between valid and non-valid law) and by means of specific concepts, *in primis* the concept of rights. Through this attention paid to logic and legal reasoning, Ross, with his legal training and a law professor himself, moved away from Hägerström, who instead was not trained as a lawyer and was professor of practical philosophy (see, e.g., Ross 1958, chap. 2; 1953, chap. 2).[12]

Through his investigations, Ross arrived at two concurrent ideas about the nature of law in general and of rights in particular. First, legal concepts, like that of rights, are in themselves detached from any system of moral, religious, or political values: The concept of rights or that of duty are no more attached to moral or political values than is the expression *tû-tû*. In fact Ross's claim, made in an article so titled (*Tû-tû*: Ross 1957a, 818–22), is even more radical than asserting that legal concepts lack any ontological relation to the world of values. According to Ross, the legal concepts and categories constitutive of law do not even have an ontological dimension to begin with:

> "Ownership," "claim," and other words, when used in legal language, have the same function as the word "tû-tû"; they are words without meaning, without any semantic reference, and serve a purpose only as a technique of presentation. (Ibid., 821–2)

The law is a complex of linguistic signs or symbols, prominent among which is the word *rights*, used for the purpose of leading its addresses to behave or not behave in certain ways: These symbols act as signposts or "directives" pointing the way their addressees ought to take. Directives are "utterances with no

[12] See also Hägerström 1953a, 107–8. But see Peczenik 1972, 219.

representative meaning, but with the intent to exert influence" (Ross 1958, 8; 1953, 18). The legal phenomenon is a mechanism constructed through the use of linguistic or symbolic signs, and the sign *rights*, regardless of the values it carries, always works through words or symbols as a stimulus designed to elicit responses (i.e., behaviors) from the members of the community and in particular from the actors who monopolize the use of force, namely, the judges (Ross 1958, 32–3; 1953, 44–5).[13]

The very nature of the legal phenomenon is thus considered by Ross to be similar to that of a machine, and the direction the legal concept of rights point in (in realizing the value *f* or the opposite value *e*) does not influence its way of working, since that is relatively disconnected from the surrounding value environment. In order to support this idea of the nature of law as relatively neutral (i.e., relatively detached from values), Ross relies on legal history after the fashion of Hägerström and his "disclosing" of modern legal concepts through an investigation of ancient Roman legal concepts and categories (Hägerström 1941, appendix 5). Drawing on ancient Roman law, Hägerström shows how the law and its conceptual apparatus have always been a machine that invariably works in the same way even as its economic, social, and political environment changes, and with it its *value* environment. Through history, law tends to more or less retain its original nature as a complex of rules (rules of conduct as well as competence rules) designed to regulate the use of force (Ross 1958, 52–8; 1953, 69–73).

However, as noted, this detachment of the concept of rights from the surrounding environment is not absolute, since what is fundamental when speaking of a legal concept like that of rights is that, even though the concept does not connect to any concrete empirical reality, it *works within reality* as a stimulus through which to have people behave in certain ways. According to Ross, the traditional constitutive concepts of legal language (concepts such as "rights" and "duties") are in themselves meaningless. Still, they acquire an authoritative status, that is, they become law, simply by virtue of their being set in a certain social and political framework that, for example, makes words such as *tû-tû* meaningless, while making *property right*, by contrast, meaningful (Ross 1957a, 818). It is this framework, coupled with the values it embodies, that will then heavily influence lawmaking by determining what Ross would call the semantic reference of concepts and categories that otherwise would be mere *tû-tû*. Therefore, lawmaking has to lead to results (such as a new right) expressed in a legal language that in most cases shares the values of the majority of the population or, on Ross's conception, the majority of the judges. Only in this way can the law's stimulus-and-reaction mechanism work properly, bringing its addressees to actually consider the new law to be binding.

[13] Cf. Hägerström 1953, 354: "The legal order is throughout nothing but a social machine, in which the cogs are men."

So, for American legal realists and Ross alike, the overall task of legal scholars is to cut through these different ideologies and philosophies that have layered the legal phenomenon, making it almost unrecognizable. Once this work of peeling off the layers is done, the concept of rights will reveal itself in its reality as a linguistic and socio-psychological tool used to influence human behavior.[14]

16.4. Coercion

Ross starts out in his analysis of coercion and its role in the legal phenomenon by asking us to consider the normative system by analogy to the game of chess and the way the game works: If we were to observe two players engaged in a chess match but knew nothing about the rules of the game, he argues, we would perceive the players' activity as no more than a series of meaningless moves having no relation between them. In a similar way, social life is the outcome of individual behaviors whose interrelation can only be understood on the basis of a set of common rules understood by participants and observers alike. Only by knowing these rules and how they interact, Ross goes on to say, is it possible to understand, and to some extent predict, the actions that take place in social life. Hence Ross's conception of what the legal phenomenon is: This, he argues, can be defined as a complex of rules whose "real" existence depends on their being felt to be binding by their addressees, and in particular by the judges.

So legal rules are understood by Ross as a scheme of interpretation enabling us to view as an intelligible, coherent phenomenon what would otherwise appear to us as an assemblage of random and strange behaviors (such, for example, would be our understanding of what goes on in a courtroom). In fact, a whole range of human behaviors would appear that way to us if we couldn't rely on such a scheme of interpretation. Thus, for example, we would not be able to appreciate what it means for two human beings to marry—or what concrete consequences such an act entails—unless we took into account that the two parties performed a ritual created by law and existing under the law.

As to the *existence* of legal rules, there immediately comes up the question of how the rules that are perceived as binding law (and hence as valid law) can be distinguished from those that are not. This question Ross answers by pointing out *de facto* coercion (especially as implemented by the judiciary) as the basic criterion on which to rest the bindingness of legal rules: By observing which rules come to bear in regulating social relations, we can single out the ones that actually affect or are likely to affect the way judges will decide a dispute: "It is here [in the courts' decisions] that we must seek for the effectiveness that is the validity of law" (Ross 1958, 34–5; 1953, 47–8).

[14] On the similarity of the overall project of American and Ross's legal realism, see Martin 1997, 203–4, and Ross 1946, 9; 1958, 102; and 1953, 121–2.

As some commentators have pointed out, as much as Ross may assign a central role to coercion in defining law—accordingly defined as the complex of relations and measures that actually govern the way people interact or are forced to behave—his theory borders on a predictive account of law defined as whatever the judges will ultimately decide in accordance with the system of coercion they feel bound to implement (see, e.g., Duxbury 2001). According to Ross, to claim that a certain legal rule is valid means simply to claim that the rule will most likely be felt to be binding in future decision-making, in effect claiming that the rule will play a decisive role as a reason that courts in the future will invoke in deciding whether or not to apply a coercive measure.

For Ross, then, coercion plays a central role in shaping the very nature of law, that is, in its definition. The basic idea is that only "real" law is law and that real law is what is felt to be coercive, but what counts in this regard is not how the addressees in general feel—or what the people generally experience as having coercive force—but that the *judges* feel bound by as a coercive order. Not unlike Kelsen, then, Ross views valid law as a coercive system of rules regulating the institutional use of violence, especially and in the first place by the judiciary; or, as Ross puts it, what is essential about legal rules is "that they concern the application of force, not that they are upheld by means of force" (Ross 1958, 53; 1953, 70). That is the sense in which, on Ross's theory, the reality of law lies in its coercive nature: Law enables certain institutional actors to (coercively) use violence, but in a way that its addressees feel to be legitimate, and in this latter condition is captured the other component of law, namely, its validity or obligatoriness:

> The legislator is not like a god whose word creates a world out of nothing. The task of the legislator is to motivate men toward a certain desired course of action. The source of his power lies in the political ideology or myth which invests him with legal authority. (Ross 1958, 352–3; cf. Ross 1953, 444–6)

However, well aware of some of the difficulties met by the Kelsenian *Stufenbau*, Ross points out that not every legal rule is backed up by the threat of sanction. In other words, not every rule is guaranteed by coercive measures, such as physical violence as prescribed by a higher-ranking rule empowering the judges to order such violence if they should determine that the lower rule has been violated. Ross wants to stay away from this possible *regressus ad infinitum*, which, among other consequences, would entail the predicament of having to identify the competent judicial bodies and applicable coercive measures in a scenario where the basic norm written into law was hypothetical and "illegal" (Ross 1958, 81–3; 1953, 98–100).[15] Ross seeks to avert these kinds of problems by instead theorizing that in every legal system there exists a series

[15] See also Hart's account of a self-referring law in Hart 1983c, 175.

of norms whose legal validity does not rest on their being guaranteed by coercion. There are norms, like those on jurisdiction or competence (especially at the higher levels of the legal system), whose validity stands independently of any coercive means of enforcement. In other words, these norms are valid—i.e., their addressees feel bound by them—not because force can be used to ensure compliance but precisely because, through a historical process of socio-psychological and linguistic reinforcement, these "rules without coercion" come to be viewed by those addressees, and in particular by the judges, as having cultural and political legitimacy (Ross 1934, 93–4, 100–1; see also Ross 1946, 89–90, 108–12; 1958, 78–80; 1953, 95–7).

16.5. Law and Politics

In Ross's work, politics plays a central role in its relation to the law, and testifying to this centrality is the number of pages he devotes to that topic in *On Law and Justice*: more than one hundred, almost one-third of the book (Ross 1958, chaps. 13–17; 1953, chaps. 13–17). Like the other Scandinavian realists, Ross believes there to be a distinction between law and politics, on the reasoning that, although they both function as means through which people can be forced or persuaded to behave in ways they would not otherwise choose to behave in, the techniques they employ to that end differ, or at least they have historically done so: The political order "aims at bringing about practical agreement by influencing an opponent's viewpoint *through argumentation and persuasion*" (Ross 1958, 326; italics added; Ross 1953, 416); lawmaking, by contrast, produces norms that are "effectively complied with because they are *felt to be socially binding*," especially by the judges (Ross 1958, 34; italics added; Ross 1953, 47; cf. Ross 1958, 29; 1953, 41–2). In other words, over time the law has acquired a certain degree of independent legitimacy, that is, a legitimacy resting more on the specific ways a certain rule is enacted and implemented than on its content—more on its normative features than on its political goals.

However, in order for lawmaking to keep working as a system of procedures directed at producing valid law (the only kind deserving of that name), it needs to produce statutes and judicial decisions that embody the political values prevalent in the community, reproducing them as law. In other words, the legal order and its actors have to carry out procedures and processes that produce statutes and judicial decisions informed by the values embraced by the majority of the judges (or at least not contrary to their views and sentiments). As a result of so opening lawmaking to the political world, Ross is led to make the following claim: "There are no problems of legislation that are specifically legal-political, but every problem of legislation has a legal-political aspect" (Ross 1958, 329; 1953, 419).

But which values can be singled out as the ones that prevail in the community? Here Ross is inclined to say that we ought to recognize all those val-

ues traditionally embraced by the democratic political model, and he strongly criticizes Lundstedt's idea of "social welfare," stressing that the latter tends to bring together a mixed bag of interests and values that by their very nature are discordant and even incommensurable (Ross 1952, 231–43; 1958, 289–96; 1953, 375–84).[16] Ross notes that this sharing of values between legal and political orders is something that happens *most* of the time but not in all cases, recognizing that sometimes the law addresses technical issues that the majority of the population (or of the judges) have no knowledge of, and even if they did have some familiarity with such technicalities, they would not attach any value to them. In these cases, says Ross, the lawmaker needs to take into account the "legal consciousness" prevailing among the population (Ross 1958, 372–7; 1953, 471–2). Armed with that knowledge, the lawmaker can then set out to answer the question, what values would the majority of the people subscribe to if they were knowledgeable about the issue at hand or if they cared so much about it as to attach value to it?

This opening of the law to the political ideologies present in society means, for example, that we have to broaden the range of traditional sources of legally relevant materials the judges have to look to in deciding a legal issue. This can classically be appreciated in the status that in some Scandinavian countries is accorded to the *travaux préparatoires* (the parliamentary records making up a statute's legislative history)—and so to material of a clearly political nature—as authoritative sources of law ranked high in the hierarchy of sources (see, e.g., Frändberg 1999, 208–19).[17] Also attesting to the influence of this broad idea is the appreciation the Scandinavian legal community has for one of the proponents of legal realism, Per Olof Ekelöf, and for his teleological method of legal interpretation. According to Ekelöf, the aim of the interpreter (either as a legal scholar or a judge) is to achieve "*the total result* which may be regarded as the purpose of the statute" (Ekelöf 1958, 84; italics in the original).[18]

However, as previously mentioned, legal interpreters must bring this influence of the political world into balance with their legal education and with the constraints or directions imposed by existing ways of legal reasoning (see, e.g., Ross 1946, 72).[19] The law maintains its own specificity: As much as it may intersect with other phenomena, and in particular with politics, it cannot be equated with them. The legal phenomenon, in other words, is to some extent autonomous: This is why judges in particular regard the law *as if* it were free

[16] On Lundstedt's idea of social welfare, see Section 15.2.5 in this tome and Lundstedt 1956, 167–75.

[17] See also Ross's account of legal interpretation in Ross 1958, chap. 4; 1953, chap. 4.

[18] In other words, those who interpret a law or a judicial opinion must do so taking into account its underlying values, in such a way that those values come to fruition. See also Ross 1953, 171, taking Ekelöf's view into account, as is not done in *On Law and Justice* (Ross 1958, 147). On Ekelöf see also Section 17.2 in this tome.

[19] Compare Hart's criticism in Hart 1961, 133–4.

from political entanglements, and hence pure, and legal science cannot neglect to take that into account.

This limitation on the entrance of politics into legal discourse can easily be appreciated in some of Ross's textbooks. In contrast to Critical Legal Studies, for example, Ross's textbooks on constitutional law or in international law rarely make reference to political material as a source of law (see, e.g., Ross 1959b; Spiermann 2003, 699). When Ross takes up the reasoning developed within the political arena, he usually locates it under a specific and clearly separate heading dealing with the politics of law. In this sense, too, Ross's conception of legal science can be likened to Kelsen's.

According to Ross, political discourse always tends to take divergent interests and values into account at the same time, in such a way as to wind up reasoning from compromised concepts like that of social justice. These political concepts show that political reasoning is mainly concerned with integrating opposing solutions and values, as by attempting to strike a balance between individual and collective justice.[20] As a consequence, the

> political discussion does not lie on the plane of [the legal discourse's] logic: it does not strive to prove truths; it lies on the psychological-technical-causal plane: it aims at bringing about practical agreement by influencing an opponent's viewpoint through argumentation and persuasion. Within this framework a part is played by rational, argumentative assertions based on common experience or scientific insight. But their function is not to prove a truth, but to convince an opponent, that is, convert him to one's own standpoint. (Ross 1958, 326; cf. Ross 1953, 416)

In *legal* reasoning, by contrast, the *tertium* is often *non datum*: There is no third solution between opposite values (e.g., valid vs. invalid), and no compromise can be accepted ("partial validity" would not in this case be an option). The choice can only be between valid and invalid law, or, in Ross's terminology, between the law *in* force and the rules of law that are *not* in force and hence (on a realist perspective) are not valid.

This interest in drawing a boundary between law and politics plays an essential role in shaping Ross's view of how legal science relates to political material. Like the American legal realists, Ross wanted to make law a properly *scientific* discipline. To this end, it was necessary for the end result of legal science to be amenable to testing. Ross thus made it a primary task of legal science to produce statements that could be assessed as being either correct or incorrect in light of the empirical reality of the law in force, and in particular in light of judicial decisions (Ross 1958, 38–50; cf. Ross 1953, 51–65).

It is in this effort to make the study of law scientific that Ross recognized the shaping influence of political forces on law. A scientific investigation of the legal phenomenon is an investigation aimed at finding out what the law *really*

[20] Says Ross (1958, 321; cf. 1953, 411) in this regard: "The task of politics will always be anchored in a multiplicity of attitudes that do not constitute a system but are a conglomeration […] the political task is always one of integration, an adjustment of incommensurable considerations."

is. Law is a powerful tool that the political establishment uses to further its goals in society. Legal scholars therefore cannot disregard that developments in the legal world, and in particular the making of new law, stand affected by developments unfolding in the political world. It would accordingly be self-limiting for the study of law to only rely on traditional analytical tools, such as the logical techniques for assessing the coherence of legal concepts used in different legal provisions over time. Legal scholars must draw on history, political science, social science, psychology, sociolinguistics, and anthropology. As Hilaire McCoubrey and Nigel D. White comment, "it is not very surprising that Scandinavian realism originated at the beginning of the twentieth century at a time when the psychological theories of Sigmund Freud were very much in the public eye" (McCoubrey and White 1999, 178).[21]

This use of material that is not purely legal serves the purpose of situating the different legal concepts and categories in the wider value-context where these concepts and categories originated or have been used. Ross thus claims, for example, that no clear-cut distinction can be drawn, especially in the English-speaking world, between the study of law—that is, the traditional analysis of valid law, the sociology of law, and the history of law—and jurisprudence, that is, the philosophical analysis of the nature of law is (Ross 1958, 24–7; 1953, 33–6; cf. Ross 1953, 33–6).

In this way Ross opens legal science to concepts such as welfare and policy, that is, to concepts originating in disciplines typical of the political arena, disciplines like political science or political philosophy. Legal science is necessary a mixed discipline because

> it is […] impracticable to draw any sharp boundary line between cognitive pronouncements concerning valid law and legal political activity […]. Fundamentally, therefore, the cognitive study of law cannot be separated from legal politics. (Ross 1968, 48–9; cf. Ross 1953, 62–3)

It is not just on a theoretical level that Ross sought to work the overlap of the legal and the political worlds into an idea of law perceived by legal actors (and in particular by the judges) as if it was autonomous from politics: The same sort of commixture finds a parallel in Ross's own career as both a legal scholar and an engaged reformer. Ross actively participated in the politics of his own country and in the deep political reforms carried out by the social democratic governments in Scandinavia, so he knew the influence that political power exerts on the legal order and on its lawmaking activities.[22]

At the same time, however, Ross also promoted an idea of law as *separate* from politics. So, as much as he worked in the political order, he always did

[21] On a similar influence of psychological studies on American legal realism, see Duxbury 1995, 126–7.

[22] On the role of Scandinavian legal realism in the construction of a social democracy in Sweden, see Sundberg 1986, 315–20.

so as a lawyer and not as politician. According to Ross, "the role of the lawyer as legal politician is to function as far as possible as rational technologist," and legal scholars can intervene in the lawmaking process with mere "recommendations" offered to policy makers (Ross 1958, 377; 1953, 472).[23] His work and positions were those traditionally entrusted to those with the technical expertise of a lawyer: He served as professor of law and as legal consultant in the legislative process.

[23] See also Stone 1961; Ross 1958, 377; and Ekelöf 1991. Compare Ross's criticism of Ekelöf's position in Ross 1953, 430, a criticism not included in *On Law and Justice* (Ross 1958, 338).

Chapter 17

OTHER SCANDINAVIAN LEGAL REALISTS

by Uta Bindreiter, Mauro Zamboni, and Torben Spaak

17.1. Tore Strömberg: A Conventionalist Legal Realist (*by Uta Bindreiter*)

17.1.1. Introduction

The Swedish legal scholar Tore Strömberg (1912–1993)[1] is often characterized as the last true representative of the Uppsala school of legal thinking. This is correct: apart from shouldering Karl Olivecrona's heritage and refining a series of the latter's ideas, Strömberg also received much inspiration from Alf Ross. He did considerably more, however, than merely follow in his predecessors' footsteps.[2]

Strömberg's jurisprudential interest focussed on two issues: firstly, on the morphology of the law, i.e., the formal elements—in Swedish: the *byggstenar*[3]*—of the structure of a legal system; and, secondly*, on the meaning of the common assertion that a given rule is "a valid legal rule," or that it is "valid law." With respect to the first issue, it seems safe to say that Strömberg was the first to identify the rules of qualification as a special, necessary type of rule (Strömberg 1962, par. 14), and as regards the second issue, he arrives at the conclusion that people's belief in the validity of the law is nothing but a social convention, albeit an important one, since this belief constitutes the ultimate condition for the efficacy of the law.

Among Strömberg's major works, the following three monographs must be mentioned:

(*i*) *Inledning till den allmänna rättsläran* (An introduction to jurisprudence: Strömberg 1981). This work first appeared in 1962 in the form of a course compendium, to be used by the students in jurisprudence at Lund University. Published in book form, the work was used as a text book during the years 1970–1992. It reached eight editions, the latest one dating from 1981.

(*ii*) *Rättsfilosofins historia i huvuddrag* (The main features of the history of legal philosophy: Strömberg 1989). Also this work appeared first in the form of a course compendium. In book form, the work was used as a text book at

[1] Tore Strömberg was the first incumbent of the chair in jurisprudence (*Allmän rättslära*) at Lund University. He held the chair from 1961 until 1977.

[2] On Olivecrona and Ross see respectively Chapters 14 and 16 in this tome.

[3] See the title of one of Strömberg's major works (1988). Strömberg himself looked upon his investigations in connection with the formal structure of the legal system as the most important part of his work.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_45

Lund University during the years 1970–1998. In 1989, the book had reached four editions.

(*iii*) *Rättsordningens byggstenar. Om normtyperna i lag och sedvanerätt* (The constitutive elements of the legal order: On types of norms in statutory law and customary law, Strömberg 1988). Published in 1988, this book offers inter alia a further elaboration of Chapter 3 (The Nature of the Legal System) of Strömberg's major work *Inledning till den allmänna rättsläran* (see (*i*) above).[4]

In the following, I shall restrict myself[5] to highlight the salient features of two of Strömberg's more conspicuous achievements, namely, of his classification of legal rules (Section 17.1.2) and of his conventionalist approach to the issue of the "quality" of being valid (Section 17.1.3).

17.1.2. Strömberg's Classification of Legal Rules

In Strömberg's view, the content of legal rules corresponds *partly* to real facts (i.e., human behaviour and human situations), *partly* not: Rather, it consists in the rise of unreal (ideal) conditions (*förhållanden*), the most prominent of these being legal competence and legal quality (Strömberg 1962, 123). As will be shown below (see Section 17.1.3), the latter, unreal part of the legal rule's content is ultimately tied to the—according to Strömberg, conventional—concept of "legal validity."

In the present section, I shall first describe how Strömberg arrives at his classification of legal rules and why he insists on retaining qualification rules as an independent rule type (Section 17.1.2.1). Thereupon, I shall touch upon two issues connected with this classification, namely, the dissolution, as it were, of the "rules about rights" (Section 17.1.2.2) and the specific status of what Strömberg calls "legal directions for use" (Section 17.1.2.3). That he disagrees with Olivecrona's views with respect to the issues raised in Sections 17.1.2.2 and 17.1.2.3 deserves special mention.

17.1.2.1. Rules of Action, Rules of Competence, and Rules of Qualification

Strömberg looks upon the legal system as consisting of two "layers" of rules, namely, rules addressed to individuals and rules addressed to officials. Either of these "layers" comprises different types of rules—most prominently, rules of action (or conduct). Rules of action prescribe or prohibit something: They purport, *either* to give rise to a certain human behaviour, *or* to suppress certain other types of human behaviour (Strömberg 1988, 20). Apart from rules of ac-

[4] Among Strömberg's minor works, the following articles should be mentioned: Strömberg 1969, 1970, 1984, 1986.

[5] Strömberg does not specifically treat the issue of coercion, nor that of law and politics. On his view on "rules about rights," see Section 17.1.2.2.

tion, however, there are *other* rules—rules which do not prescribe or prohibit anything but which nevertheless seem to have imperative meaning.[6] It is towards these other rules that Strömberg's interest is directed in the first place.

In contrast to Ross, Strömberg is not an ardent reductionist (cf. footnote 19 below). Even if it is logically possible to reduce the number of existent norm types, he says, "it is not sure that we *will* do so. There may be a practical need for a distinction of types of norms which are characterized not only by their content but also by their linguistic form" (Strömberg 1984, 154).

Strömberg means to arrive at such a distinction on the basis of logical criteria (*på formallogiska grunder*) (Strömberg 1988, 8). In this undertaking, he focuses on the rules of statutory law, since they show a more stabilized linguistic form than those of customary law (ibid., 13). Nevertheless, even statutory rules show a great variety of linguistic shapes, and it is evident that there is no intimate connection between a rule's linguistic form and its content and logical structure.[7]

Strömberg realizes that what ultimately distinguishes a legal rule *qua* linguistic phenomenon from other kinds of sentences (in the logical, not in the grammatical sense) cannot possibly have to do with the legal rule's conditional clause.[8] Therefore, a legal-theoretical differentiation between different types of rules must stem from the content of the rule's *principal clause*, that is, the *legal consequence* (*rättsföljd*). Adducing three examples, Strömberg can point out different types of legal consequence (Strömberg 1988, 14; my translation):[9]

> Example 1: Any finder of lost property shall, without unreasonable delay, report the find to the Police.[10]

This is a *Rule of Action*, addressed "to whom it may concern"; that is, to anybody who happens to find lost property. The legal consequence of the rule consists in a *duty*, namely, to do exactly that which is indicated by the rule's pattern of behaviour (or conduct).[11] The duty is expressed by the word

[6] *Firstly,* in the sense of establishing, categorically, that an ideal quality or an ideal competence *shall* arise; and, *secondly*, in the sense of guiding people's thoughts and actions.

[7] "In order to specify [*artbestämma*] a rule of Statutory Law, one frequently has to fall back upon the content of the rule, and more often than not, this content can only be established by studying the rule against the background of other rules. When classifying an individual rule of Statutory Law, the linguistic form of the rule can be ambiguous or even misleading" (ibid., 14; my translation).

[8] There are conditional clauses in other types of sentences as well, e.g., in mathematical sentences.

[9] Because of difficulties in translation, Strömberg's Example 1 has been substituted for another.

[10] The Swedish original: "Var och en som hittar något skall utan oskäligt dröjsmål anmäla fyndet hos polismyndighet." This rule can be found in the Swedish regulation concerning the rights of the finder of lost property, namely, Lag (1938: 121) *om hittegods*, par. 1.

[11] Even rules of action "seem to be metaphysical if understood as rules about legal duties of action [*rättsliga handlingsplikter*]" (Strömberg 1981, 154; my translation). What is more, Strömberg holds that most rules of action are metaphysical in another sense as well, namely, in so far as

"shall," whereas the pattern of conduct is expressed by the words "report […] to the Police."

Example 2: Where goods are sold and found deficient, the buyer may cancel the purchase.[12]

In this example, the legal consequence consists in the rise of a certain ability or power, namely, the power to cancel the purchase agreement. Since the effect of the cancellation is a *legal* effect, the buyer's power must be a legal power, or *legal competence*. This rule, then, is a *Rule of Competence.*

Example 3: When a Swedish man marries a woman who is an alien, any child of theirs that was born before their marriage and has not acquired Swedish citizenship under Section 1 becomes a Swedish citizen if the child is unmarried and under eighteen years of age.[13]

The legal consequence of this rule consists in the rise of a quality, namely, that of "being a Swedish citizen." Since this quality is not a *real* but only an imagined—a *legal*—quality, Strömberg calls this type of rule *Rules of Qualification*.

Thus, the three types of legal consequence pointed out by Strömberg imply, respectively, a legal duty of action (Example 1), the rise of a legal competence (Example 2), and the rise of a legal quality (Example 3). On the basis of this differentiation, he roughly classifies the rules of a legal system into rules of action, rules of competence, and rules of qualification, maintaining that the legal system can exhaustively be described as consisting of these three types of rules[14] and, in addition, of their individual counterparts, namely:

(*i*) individual imperatives of conduct (*individuella handlingsimperativer*), e.g., payment orders;
(*ii*) competence acts, e.g., authorizations, and
(*iii*) qualification acts (Strömberg 1962, 125–6)[15], e.g., nominations for an office.

Competence acts and qualification acts are interesting linguistic phenomena. They belong to a special category of sentences which are usually called *perfor-*

the prescribed actions are *symbolic* and, as regards their social significance, determined by *other* legal rules (ibid.).

[12] Strömberg's example was taken from the former Swedish Sales Law (Lag 1905 *om köp och byte av lös egendom*, par. 42).

[13] The Swedish Citizenship Act (SFS 2001: 82), sec. 4. Examples 2 and 3 are in the indicative mood, but the meaning of these rules is nevertheless imperative (Strömberg 1981, 83).

[14] Alf Ross, by contrast, looks upon the legal system as a complex of norms of conduct and norms of competence. Also, he holds that the latter are indirectly expressed norms of conduct (Ross 2004, 32, 59). Strömberg points out that on this issue, there is no unanimity in Scandinavian jurisprudence (Olivecrona, for example, did not take up a definite position).

[15] A qualification act can have a negative counterpart, which might be called a *Disqualification Act*—e.g., a divorce sentence (ibid., 126).

matives.[16] Performatives do not assert anything. On the face of it, the speaker is talking about something he is doing—such as, for instance: "I promise to come"—but the curious thing is, that what actually is being done is, that a sentence is being uttered. A performative can be called an utterance addressed to the speaker himself but, at the same time, announced to his surroundings. It is assumed that this utterance gives rise to an effect in accordance with its content. As Strömberg aptly puts it, "[t]he effect is only an imagined one, but since the conception of such an effect [*föreställningen om effekten*] influences the people's attitudes towards each other, it acquires the appearance of reality" (Strömberg 1962, 127; my translation).

In 1961, when Strömberg took the chair in Jurisprudence at Lund University, the issue of competence rules had long been a matter of discussion among the Scandinavian legal realists.[17] Realizing the important link between legal competence and legal validity (a link based upon the legal-political *desiderata* of order and legal certainty: Strömberg 1962, 128).[18] Strömberg has no doubts about the necessity of retaining the competence rules as an independent class of rules: "Obviously, competence rules cannot be totally eliminated from a system of rules, if this system is to be considered valid" (Strömberg 1981, 89; my translation).[19]

The issue of qualification rules as an independent rule type, on the other hand, dates from the year 1962, when Strömberg "launched" this idea in his manuscript compendium *Inledning till den allmänna rättsläran* (An introduction to jurisprudence: Strömberg 1962, 117, 123ff.).[20] Qualification rules do not have any pattern of conduct: They do not tell us what we should do or omit to do. Rather, they confer upon persons (things, relationships) a certain quality.[21]

Theoretically, qualification rules could be eliminated by incorporating their content into other rules—rules of action or rules of competence—which are

[16] On this issue, Strömberg relies largely on Olivecrona's studies (see Olivecrona 1971, chap. 8). On Olivecrona's theory of performatives see Section 14.2 in this tome.

[17] According to Ross, for example, norms of competence are, properly speaking, indirectly expressed norms of conduct (Ross 2004, 32).

[18] The validity of any legal rule presupposes that it has been created by somebody who had the competence to do so.

[19] According to Strömberg, a total reduction of competence norms leads to Kelsen's theory of the Basic Norm and to Hart's theory of the Rule of Recognition (Strömberg 1984, 161). Consequently, he is anxious to "preserve" the norms of competence as a special type of norm: In his view, they are an indispensable element in the organization of society (ibid.).

[20] The term *kvalifikationsregler* (rules of qualification) was adopted by Olivecrona (1976, 166 n. 1). See also Spaak (1994, 182 n. 18). Spaak does not recognize qualification norms as an independent norm type since, in his view, qualification norms do not seem to have the capacity of guiding human behaviour (ibid., 168).

[21] "The meaning content of the rule of qualification is that the legal quality arises, or exists, as a consequence of certain facts" (Strömberg 1981, 83; my translation). The Swedish original: "Kvalifikationsregelns innebörd är, att den rättsliga kvaliteten uppstår eller finnes som följd av vissa fakta." Cf. Spaak: "[if] certain operative facts are at hand, then, as a consequence of these, there ensues a certain legal effect. The effect is thus thought to occur *ipso iure*" (Spaak 1994, 168).

connected with them. In Strömberg's view, however, such a measure would be highly unpractical as well as unwise, since qualifications are of extreme importance, appearing, as they do, as legal facts in a host of statutory rules (Strömberg 1970, 300).

The following competence norm demonstrates why Strömberg deems it necessary to distinguish[22] between rules of competence and rules of qualification: "If a person is ordained as a minister in the Swedish Church he acquires a competence—in compliance with the marriage ritual of this church—to marry a man and a woman to each other" (Strömberg 1984, 155).

As Strömberg points out, this norm actually comprises three distinct criteria, namely:

(*i*) The *conditional sentence* ("if […]") comprises the claim that the respective person shall belong to a certain class of persons (namely, clergymen in the Swedish Church);
(*ii*) the *principal sentence* ("he acquires […]") endows this person with a certain competence, namely, the ability to "marry" a couple; and, what is more,
(*iii*) the *principal sentence also* ties the exercise of the competence to a certain procedure or ritual ("in compliance with […]").

Similarly to other competence norms, the competence norm above establishes "*who* can produce *what* and *how* he can do it" (ibid., 156).[23] The last mentioned point—the procedure or ritual[24]—is of particular interest, since it may be obligatory for the validity of the respective act (Strömberg 1984, 156). This is indeed the case here: The requisite procedure (i.e., the marriage ritual of the Swedish Church) is included in the *principle* sentence (*iii*), as an element of the *legal consequence*. Now, this is a controversial point, because the procedure may be conceived of as a *condition* for exercising the competence.

Therefore, one naturally wonders if the correct place for the procedure is, perhaps, a subordinate (conditional) sentence, not the principal sentence. Strömberg hastens to perform this experiment, and the norm of competence

[22] Another reason for Strömberg's retaining qualification rules as a special rule type is the circumstance that rules of competence always can be transformed into rules of qualification but that this does not apply *vice versa.*

[23] In Spaak's formulation, competence norms "express […] that persons who are qualified in a certain way in certain specified situations can bring about a certain legal effect by proceeding in a certain way" (Spaak 1994, 181). Spaak arrived at the conclusion that it is logically possible to reduce competence norms to fragments of duty-imposing norms, addressed to the officials (ibid.).

[24] Most statutory rules say nothing about the manner, in which the competence ought to be exercised: It is tacitly understood that "the competence is exercised by an enunciation that the legal effect enters" (Strömberg 1984, 156)—that is, by a *performative*. For example, a Swedish statutory rule which endows the judge with the competence of appointing an administrator of a bankrupt's estate, does not say expressly how this shall be done: It is understood that the judge shall do this by saying or writing that he appoints Mr. NN as administrator (ibid.). In other cases, however—such as, e.g., the marriage ritual—the procedure may be minutely regulated.

now reads thus: If a person is ordained as a minister in the Swedish Church and if—in compliance with the marriage ritual of this church—he declares a man and a woman to be spouses…

Then what? Strömberg asks: What will the rest of the norm be like? Obviously, the legal consequence will consist in that the man and the woman get "married" (or become "spouses"); or in other words, that the two people, pursuant to the minister's *performative*, acquire a certain quality (ibid., 157).

Evidently, the linguistic forms of the two norms differ, and their respective legal consequence is not the same, either: In the *first* norm, the legal consequence is about a competence ("he acquires a competence […] to marry […]")—in the *second* norm, the legal consequence ("that the man and the woman get 'married'") does not at all express the idea of a competence but, rather, the coming into existence of a new quality.[25]

Frequently, qualification rules have the indicative form and are, therefore, to all appearance theoretical sentences. Owing to their imperative meaning, however, they have nevertheless a practical function, in so far as they, albeit indirectly, induce people to think and act in a certain way (Strömberg 1962, 127). Strömberg's "classical" example for a simple qualification rule reads thus: "If a child is in the joint custody of its parents, both parents are the child's guardians" (my translation).[26]

Let us assume that we are used to call person *X* the "guardian" of *Y*. Our considering *X* as a "guardian" means, in effect—or so Strömberg contends—that we are looking upon *X* in such a way simply because there is a rule exhorting us to do so (namely, to consider *X* as the guardian of his son *Y*, who is a minor).[27] Interestingly, Strömberg himself is uncertain whether or not formulations such as "I consider *X* the guardian of *Y*" are correct linguistically. As he says, it can hardly be the case that qualification rules purport to encourage people to falsify reality wilfully! (Strömberg 1981, 83). Rather, it must be the case that this particular qualification rule "decrees categorically" (ibid.) that parents *shall be* the guardians of their children, and that according to the meaning content of this rule, they "really" become guardians (ibid.).

Involuntarily, what comes to mind here is the Hägerströmian exclamation: "This is magic!"[28] In Strömberg's view, however, there is nothing magi-

[25] Competence norms—and as Strömberg believes, all competence norms—can easily be transformed into qualification norms without their purpose undergoing a change: The original norm remains substantially the same, quite independently of the transformation. Strömberg likens this phenomenon to that of an ordinary statement being expressed in different terms (ibid.).

[26] The Swedish Code of Parenthood and Guardianship, chap. 10, par. 2. The Swedish original: "För barn som står under vårdnad av bägge föräldrarna är dessa förmyndare."

[27] According to Strömberg, H. L. A. Hart's Rule of Recognition is an unwritten rule of qualification, exhorting the judges to consider the rules that have been identified according to it, as valid legal rules. On this issue, see Bindreiter 2002, 51–4.

[28] Here, I am referring to Hägerström's discussion of the *mancipatio* in Roman law, where the buyer acquires a certain property by means of uttering a certain formula and making certain ges-

cal about the sudden rise of an ideal quality. Certainly, an individual—or an object, or a relationship—cannot acquire a new quality simply because there is a rule saying that he/it *shall have* this quality: "To assert such a thing would be tantamount to ascribing a supernatural effect to the rule" (Strömberg 1988, 43; my translation). Therefore, the effect which, for example, chap. 10, par. 2 of the *Swedish Code of Parenthood and Guardianship* is assumed to have—namely, to "turn" parents into "guardians"—is only to be found on an imaginary level (*på det föreställdas plan*: ibid.). Similarly to the quality of "being a Swedish citizen," the quality of "being a guardian" is an ideal, merely thought, quality: "We can call it a 'legal' quality" (ibid.; my translation).

Unreal as they are, legal qualities are of considerable technical importance because they allow for shortenings in the linguistic reproduction of a norm system's content. Among *purely legal* concepts, Strömberg mentions "guardian," "citizenship," and "marriage":

> *As links within the legal system, these concepts function only as 'conjunctions'*: Apart from this, however, they are frequently of practical importance on a socio-psychological level—something that can be used for legal-political purposes (Strömberg 1981, 102; my translation).

17.1.2.2. Strömberg's Views on "Rules about Rights"

Interestingly, Strömberg's classification of the legal rules into rules of action, rules of competence and rules of qualification allows for the "dissolution" of so-called rules about rights.[29]

Although agreeing with Olivecrona (Strömberg 1962, 135)[30] that the concept of "right" has an important co-ordinating function within the entire system of the conditions (*rekvisita*) and patterns of behaviour of legal rules, Strömberg is reluctant to engage in a discussion on the meaning of the word

tures. In the course of this discussion, Hägerström employs the German expressions *Wortmagie* (word magic) and *Zauberformel* (spell): Hägerström 1927, 40. On Hägerström's theory of legal transactions see Section 13.5.2 in this tome.

[29] As regards legal rules about duties, Strömberg considers them to be identical with legal rules of action (ibid., 154, with reference to 64).

[30] Cf. Olivecrona: "Thus, for example, it would turn out to be extremely inconvenient and confusing if one were to tie all the rules which presuppose that somebody is the owner of an object, together with all the rules there are about various kinds of lawful acquisition. By inserting the idea of a right, one achieves something similar to a traffic junction […] this technical function of tying together is extremely important. Indeed, it is so important that it is difficult to imagine how we could do without it" (Olivecrona 1960, 121–2; my translation). The Swedish original: "Det skulle t. ex. vara ytterst besvärligt och bli oöverskådligt om man direkt anknöte alla de regler, som förutsätta att någon är ägare till ett objekt, med alla de regler som finnas om olika laga fång […] Genom inskjutande av rättighetsidén åstadkommes en motsvarighet till en trafikknut […] denna sammanknytande tekniska funktion är synnerligen betydelsefull. Den är i själva verket så viktig att det är svårt att se hur man skulle kunna undvara den." On Olivecrona's theory of rights see Section 14.3 in this tome.

"right."[31] He admits, though, that it is possible to distinguish, linguistically, a special group of legal rules about rights (although of heterogeneous content).[32] The linguistic structure of the legal system is, after all, based upon an ideology of rights (Strömberg 1962, 123).

Nevertheless, Strömberg is not slow to point out (Strömberg 1981, 111–2) that what is problematic, is that there are highly different kinds of "rules about rights." Whereas some of them easily can be transformed into rules of action,[33] others might rightly be called exceptions from rules of action.[34] Also, there are "rules about rights" which, in fact, express a legal competence.[35] The most problematic group of such rules are, however, those concerning property rights: Among these, there are rules which, according to their content, give rise to a new property right (i.e., the rules about "original acquisition"). According to Strömberg's theory, such rules can easily be conceived of as qualification rules, since they endow the respective person (e.g., the hunter or fisher) with the quality of "being the owner" to his catch.

In consideration of such a variety of "rules about rights," Strömberg questions the expediency of adding a fourth category to his classification of legal rules. As he keeps emphasizing, "rules about rights" lend themselves to transformation—as he puts it: to "dissolution" —and can (as shown in the survey above) be allocated to either of the categories rules of action, rules of competence, and rules of qualification (Strömberg 1962, 123; 1981, 114).

Leaving aside this argument against the suggestion of adding the so-called "rules about rights" to the *byggstenar* of the legal order (an argument which *prima facie* seems tenable), one gets the impression that Strömberg, in the face of the Uppsala doctrine that there is no such thing as a right in reality, heartily disapproves of a special category of rules labelled "rules about rights."

17.1.2.3. "Legal Directions for Use"

In his work *Rättsordningen* (The legal order: Olivecrona 1976), Olivecrona took up the issue of those legal rules that have no sanctions attached to them (ibid., 276ff.). Among such rules, there are, for example, the rules about marriage, telling us how to proceed to create a marriage that will be considered

[31] Strömberg contents himself with referring to the Scandinavian debate on that head (see, e.g., Olivecrona 1960, 86ff., 133ff.).

[32] This was done by Olivecrona in the second edition of his work *Rättsordningen* (The legal order: 1976, 165).

[33] E.g., the rule about one's "right" to obtain a divorce, no matter how much the spouse objects. This rule can be transformed into a rule of action, addressed to the court and prescribing that the court *shall* pronounce the divorce sentence.

[34] Frequently, an exception from a rule that prohibits something presupposes an individual legal rule, such as, e.g., a licence issued by an authority.

[35] E.g., the rules about military officers' "right" to command: Properly speaking, such rules are competence rules.

valid and binding. Such rules are, then, about the proper way to achieve a certain legal effect, and according to Olivecrona, they are to be seen as a special kind of legal rules of action (ibid.).[36]

Strömberg disagrees. In his view, the formulations in question are not adequate expressions of legal rules of action (nor, for that matter, of legal "rules" at all): They do not prescribe what we shall or shall not do—rather, they tell us that *if* we want to arrive at a certain goal *A*, *then* we must use a certain means *B*. In short, such sanctionless "rules" express a relationship of means and end: They are, as Strömberg puts it, offering us "directions for use" (Strömberg 1981, 156; my translation). He considers them, not as proper legal rules but, rather, as paraphrases or corollaries of legal rules.[37]

As Strömberg points out (1986, 666), the formulations in question certainly show a pattern of behaviour. This pattern, however, is to be followed voluntarily, in a certain situation. The formulations differ from commands (*påbud*) in so far as they, according to their content, do not constitute a legal duty of action, which means that if we omit to follow the direction, no sanction will be applied. The only consequence of our omission will be that the legal effect will fail to appear.

Curiously, the formulations in question frequently contain imperative "signals" (e.g., the word "shall"), which give them the appearance of bindingness. In a certain sense this is indeed the case: Expressing, as they are, a "shall" or a "must," the "directions for use" indicate a condition which must be fulfilled if a certain result is to be achieved (ibid.). The intention behind a "direction for use" is, obviously, that we "shall" follow it. As Strömberg explains:

> To me, it seems unnatural to conceive of legal directions for use as information on facts […]. They have a practical function […] technical norms and legal directions for use are similar in so far as they are practical sentences without being prescriptive. (Ibid., 668; my translation)[38]

[36] On Olivecrona's theory of sanction in connection with rules see Section 14.4 in this tome.

[37] "I do not conceive of […] these formulations as adequate expressions of legal rules of action, nor, for that matter, as legal rules at all, but as *paraphrases or corollaries of legal rules*" (Strömberg 1981, 155; my translation and italics added). The Swedish original: "Jag uppfattar […] dessa formuleringar inte som adekvata uttryck för några rättsliga handlingsregler eller för några rättsregler överhuvudtaget utan som *omskrivningar av rättsregler eller som följdsatser till sådana*."

[38] In contrast to both Alf Ross and Nils Kristian Sundby (in whose view "directions for use" were theoretical sentences), Strömberg embraces G. H. von Wright's ideas on the subject. He refers to von Wright's discussion (1963) of what he calls "directives or technical norms," an example of these being "directions for use." According to von Wright, technical norms are practical sentences without, however, being imperatives (for example: "If you want the house to be inhabitable, you must warm it up"). This sentence is neither descriptive nor prescriptive. In contrast to these directives, there are also purely descriptive sentences, expressing that A is a necessary condition in order to achieve B (for example: "If the house is to be inhabitable, it must be warmed up"). This sentence mentions the necessary condition. According to von Wright, the two sentences are not identical but there is a logical connection between them: In the directive (technical norm), the descriptive sentence on the tie between means and end is presupposed (Strömberg 1986, 667–8; von Wright 1963, 9–8).

They are different, however, in so far as "legal directions for use," in contrast to technical terms, presuppose the existence of a legal system; otherwise, they would not have any purpose. The marriage ritual is an excellent case in point: Shall there be then any purpose with a man and a woman acting as bridegroom and bride in a wedding ceremony, it must be assumed that these two people, through this ceremony, will get "married." Thus, there has to exist a *rule of qualification*, according to which, in the marriage ceremony, the two people acquire the quality of "being spouses."

There is, then, a logical connection between a "legal directive for use" and the rules that make this directive expedient.[39]

17.1.3. Valid Law: A Social Convention

In his major work *Law as Fact* (1971), Olivecrona did not give much space to the "validity," or binding force, of legal rules:

> Ascribing binding force to a rule means proclaiming that it ought to be followed […]. This is a value judgement. It has the linguistic form of a proposition concerning a property in the rule. But the 'oughtness' is no conceivable property. To discuss whether certain rules possess oughtness or not is therefore useless. This is no scientific problem. (Olivecrona 1971, 112)

To be sure, when speaking of "valid legal rules" we are only *imagining* them to be valid and binding.[40] In Strömberg's view, this ability to imagine an undefinable quality should be explained more accurately. Intent on taking the issue one step further, he investigates into the existence, *not* of the quality of "being valid" but, rather, of people's *conception* of such a quality (Strömberg 1981, 49). He arrives at the conclusion that the concepts of "legal rule" and "valid law" are conventional concepts, and that they are conventional exactly as to those aspects in which legal rules distinguish themselves from other kinds of rules: "One might say […] that a legal rule is a rule that is considered a legal rule" (ibid., 37; my translation).[41]

Strömberg proceeds methodically. What exactly, he asks, does it mean for an ordinary Swedish citizen like himself to hear or utter the phrase "Rule X is a valid legal rule?" Well: It means, vaguely, that Rule X in one way or another belongs to, or is a part of, the Swedish legal system: The word "valid," in short, seems to include the quality of "being national" (ibid. 40; my translation). Nationality, however, is not a factual but a conventional concept.

[39] Strömberg 1986, 668–9. A "legal direction for use" (expressing a necessary condition) can always be "transformed" into a legal rule, or a part of a legal rule (ibid., 670).

[40] Cf. Olivecrona: "Every attempt to maintain scientifically that law is binding in another sense than that of actually exerting a pressure on the population necessarily leads to absurdities and contradictions […]. The 'binding force' of the law is a reality merely as an idea in human minds. There is nothing in the outside world which corresponds to this idea" (Olivecrona 1939, 17).

[41] What follows in this section is mainly based upon Strömberg1981, par. 8.

A concept or a view is *conventional*, Strömberg explains, if it is embraced by a majority of a certain group, irrespective of whether or not individual members of the group whole-heartedly accept it or merely accommodate their conduct to the attitude of the majority (ibid. 38).[42] The view that people are divided into nations, and that the surface of the earth is parcelled out into territories, occupied by those nations, is a conventional, because generally accepted view. The concept of "nationality," then, cannot help us in our quest to define the quality of "being valid."

Nevertheless, the fact remains that the expression "valid legal rule" points at the quality of "being Swedish," and in a simple, thoroughly plausible way, Strömberg shows that this is indeed the case. Our ability to *imagine* legal rules as "valid" has to do, firstly, with the organization of the Swedish state (Strömberg 1962, 124; 1981, 42)[43] and, secondly, with those legal rules by which the state organization is being "held together" and which, in their totality, constitute a "scheme of interpretation" (*meningssammanhang*) (ibid., 46, 99; my translation).[44] In Strömberg's view, Ross was right when he said that the individual legal rule's quality of "being valid" cannot be verified directly but only indirectly, namely, via its connection (*meningssammanhang*) with the legal system as a whole (Strömberg 1981, 46).

Usually, organizations arise on a voluntary basis, that is, as a consequence of the intentions of two (or more) individuals to pursue a common goal. By external observers, organizations are conceived of as unities, comprising the activities of the individuals working within them as well as their means to achieve the common goal. The "organization" of the modern state, by contrast, is based upon the co-operation of a huge number of individuals, among whom there is little natural solidarity—so very little, indeed, that an organization cannot possibly be borne up by it. Instead—or so Strömberg claims—the state organization is borne up (rather: "glued together") by *social conventions* (ibid., 43).

These conventions concern the individuals who are co-operating within the state organization; specifically, they concern these officials' respective degree of superiority (*höghet*).[45] The ordinary citizen's conceptions (*föreställningar*)

[42] Strömberg does not enter more closely into the problematic of legal conventionalism.

[43] Strömberg's point was *not* to show how, exactly, the "organization" of a state arises; rather, he meant to show what such an organization amounts to, and how it works (Strömberg 1981, 45).

[44] In this, Strömberg follows Ross (2004, 17–8, 29). The expression *meningssammanhang* implies, inter alia, that an act of qualification is a legal fact within rules of action or rules of competence only under the condition that the act has been executed in accordance with a competence rule, saying that the agent has the competence to perform such an act of qualification. Thus, a "marriage" is not "valid," or not "legally valid," if it has not come about through an official who had the necessary competence (Strömberg 1962, 128; 1981, 102).

[45] The officials functioning within the state organization occupy different levels in a structural hierarchy. In their various functions, they exercise a certain degree of "competence" or power, and as a consequence thereof, they give the impression of standing in a relationship of super- or subordination to each other. According to Strömberg, the concepts of "superiority" (*höghet*) and

of super- and subordination have an emotional basis, that is, they are grounded in *feelings* (i.e., feelings of superiority and inferiority). These feelings are objectivated as well as enhanced exactly by their being *conventional* (ibid.). Similarly to Ross, Strömberg holds that every state organization presupposes a prevailing legal ideology. In the case of Sweden, the essential precondition for the state organization is a historically given ideology of authority and power (*höghets-och maktideologi*) (ibid., 44–5), which has found its foremost expression in the written Constitution.

The organization of the modern state can be described as a pyramid, with the Head of Government (or King) at the apex, the ordinary citizens at the base, and various grades of officials occupying the middle *stratum*.[46] Owing to the ideas of super- and subordination—vague, but deeply rooted in the citizens' minds—as well as to the (imagined) power of the authorities (i.e., the "higher" officials), this kind of "organization" works and has proved viable.[47]

The Constitution of the state represents a coherent system of rules of action, rules of competence, and rules of qualification. Through legislative acts, the rules of statutory law are connected with the Constitution (and, thereby, also with each other). The rules of customary law, on the other hand, are connected with the Constitution through the organization of the courts. This system is, however, not only constituted through different types of rules: Also, it includes various types of individual acts, such as judicial decisions and other legal acts in the form of performative utterances or individual imperatives of action (*handlingsimperativer*) (ibid., 128).

By way of illustrating how the "scheme of interpretation" works, Strömberg adduces a rule of valid Swedish law, prescribing that "the court" shall, under certain conditions, appoint an estate administrator (*boutredningsman*).[48]

"competence" are irreducible and, owing to their ideological nature, do not lend themselves to definition (ibid.).

[46] In order to demonstrate the fundamental principles of state organization, Strömberg adduces the example of the absolute monarchy. The king's (or emperor's) "superiority" (*höghet*) is not a *real* quality, that is, it cannot be stated empirically. What *can* be stated empirically, however, is the fact that, for some reason or other, a certain individual is considered "a king" at least by a majority of the group. The king is thought to possess some sort of power, but similarly to the unreal "superiority" of his position, his power is *unreal* as well. Nevertheless, people *believe* in the king's power, and as a consequence of this belief, the king has possibilities of action which other individuals do not have. These possibilities, in turn, intensify the citizens' conceptions of real power—which, again, enhances the king's possibilities of action, and so on. Gradually, the king will be able to guide the citizens in the direction he wants and, thereby, acquire *real* power (ibid., 44).

[47] The differentiation between the different functionaries is achieved, *not* through qualification rules but, rather, through qualification acts. Thus, for example, when Jean-Baptiste Bernadotte was elected crown prince of Sweden in 1810, his being elected was a qualification act, on the basis of which he became king later on (1818). His successors, by contrast, possessed their "quality" of being kings as a consequence of the qualification rules of the Act of Succession 1810 (Strömberg 1962, 124).

[48] "Upon the request of the heirs, the court shall order that the estate be administrated by

This prescription, a rule of action, actually implies a competence rule, according to which "the court" alone "can" (i.e., is able to) appoint an estate administrator (that is, endow an individual with the legal quality which is denoted by the word "estate administrator"). This competence rule, in turn, presupposes *another* legal quality, namely, the quality of "being a court," which quality stems from *other* competence rules and, ultimately, from the Swedish Instrument of Government (*Regeringsformen*).

Thus, legal quality and legal competence are conditioning each other. The different types of rules "hang together" because, in people's imagination, all of them are tied, at least indirectly (via the Constitution) to one and the same pivotal point, namely, the concept of the Swedish state (Strömberg 1981, 46). This system is not seriously challenged, and the citizens have got used to look upon it as the system "that ought to be valid before other systems" (ibid.) as regards the regulation of their mutual relations. In short: The Swedish people have got used to respect the Constitution and the rules emanating from it, and to "believe in" their legal system.

But *how*? one might ask. Because—and this is Strömberg's "conventionalist" answer—because the Constitution is considered valid above all by those individuals who are the subject of constitutional norms, namely: the Head of State, the Head of Government, the ministers, the members of parliament etc; that is to say, by the individuals who are functioning on the "higher" levels of the state organization. Not surprisingly, the attitude of these persons influences that of the ordinary citizen, who gets used to embrace the same attitude. Gradually, there has arisen a general mental disposition vis-à-vis legal rules—a general *conception of their "validity"*—and what is more, the citizens' insight that the observance of the Constitution is a precondition for the maintenance of society, works in the same direction (ibid., 45).

Thus, according to Strömberg's theory, it is actually ourselves and our specific, conventional attitude towards legal rules that determines, which rules are to be considered "valid legal rules." And he proceeds to explain that their *appearance* of being valid—their leaving the *impression* of validity—is nothing but the result of an *emotional projection* on our part (ibid., 48 ff.).

Our attitude towards the law is basically subjective, that is, we are "feeling bound by" the law.[49] Owing to a general yet erroneous opinion on that head—namely, that the law *is* binding—our (subjective) attitude is being projected, or mentally transferred, to the object that aroused this feeling within us, namely,

an estate administrator, and appoint someone to deal with the administration of the estate in this capacity" (The Swedish Inheritance Code [*Ärvdabalken*], SFS 1981: 359, chap. 19, par. 1; my translation). The Swedish original: "Då dödsbodelägare begär det, skall rätten förordna, att egendomen skall avträdas till förvaltning av boutredningsman, samt utse någon att i sådan egenskap handha förvaltningen."

[49] Similarly to Ross, Strömberg includes in the very idea of "the law" the subjective component of feeling "bound" (cf. Ross 2004, 37).

the individual legal rule. This "emotional projection" (Strömberg 1981, 48; my translation) has the effect that the quality of "being valid and binding" emerges as a quality that is inherent in the legal rule itself.

Thus, for example, individual A thinks that the rules of Statute X are valid legal rules. When asked to motivate this view, A would presumably point out that X has been issued in a formally correct way. According to Strömberg's theory of the conventional nature of the concept of "valid law," however, A's opinion is ultimately grounded in the fact that individuals B, C, D etc. are of exactly the same opinion (namely, that the rules of X are valid legal rules). In Strömberg's view, this state of things cannot be explained otherwise than as a consequence of mutual and many-fold suggestions: "If nobody thought that the statutory rules in question were legal rules, there would be no reason whatsoever to assert that they *were* legal rules" (ibid.).

Interestingly, Strömberg draws attention to the logical peculiarity of conventional concepts, an issue that is frequently overlooked. If we define the concept of "week," for instance, the correctness of our definition depends on the fact that it is common usage to call seven subsequent days "a week": In natural reality, there are no seven-day-periods corresponding to the concept of "week." Thus, the assertion that "a week" is seven days, is correct only because this is the case according to an ancient and generally accepted convention as to chronology (ibid., 38).

In summary: According to Strömberg, the concepts of "valid law" and "valid legal rule" are conventional concepts, since they cannot be verified in any other way than by being compared with people's *conceptions* of their content. Our belief in the "validity" of the law and of individual legal rules is thus grounded in a social convention, which is based upon a historically given ideology of authority and power.

According to Alf Ross, a legal norm is considered valid if it is applied, or "in force." By a norm being "in force," Ross means that the norm must fulfil two criteria: Firstly, of being followed and applied by the courts, and secondly, of being felt, by the judges, to be socially binding.[50] According to Strömberg, by contrast, legal rules are not considered valid because they are actually efficacious (*faktiskt verksam*) (Strömberg 1981, 47): Rather, they are efficacious *because* they are considered valid. The ultimate condition for the efficacy of the law is our own *conception of validity* (*giltighetsföreställning*): "Legal rules become efficacious thanks to their being considered valid" (my translation).[51]

[50] "In the concept of validity two points are involved: Partially the outward observable and regular compliance with a pattern of action, and partly the experience of this pattern of action as being a socially binding norm" (Ross 1959, 37). On Ross' views on legal validity see Section 16.2 in this tome.

[51] The Swedish original: "Rättsreglerna blir effektiva genom att de betraktas som gällande."

To put it bluntly: "Valid legal rules" would simply vanish into thin air, if people were not thinking and talking about them.

17.2. Per Olof Ekelöf (*by Mauro Zamboni*)

17.2.1. Introduction

Per Olof Ekelöf (1906–1990), professor of procedural law at Uppsala University for almost thirty years, is among the lesser known Scandinavian legal realists, at least beyond Swedish borders. This is mainly due to language and to the kinds of issues he was concerned with: He wrote most of his major works in Swedish and dedicated the bulk of his scholarly production to national topics, especially in Swedish procedural law. But Ekelöf deserves a place in Scandinavian legal realism even so, considering that to a much greater extent than fellow Scandinavian legal realists, he implemented these ideals into the way law is understood and taught in Sweden, particularly in his role as a leading scholar of Scandinavian procedural law. Moreover, Ekelöf's works on procedural law certainly make him the one Scandinavian legal realist who still affects the way law in Sweden is applied by public officials and interpreted by judges.

If we look at Ekelöf's academic career, it will seem paradoxical that he should be situated among the legal realists as the "doer." He started his academic career with a degree in philosophy from Uppsala University (1928), having studied practical philosophy under Professor Axel Hägerström (1868–1939) at that time already well-established as a Scandinavian legal realist.[52] Barely a decade later, in 1937, Ekelöf had already received a law degree and successfully defended his doctoral thesis in law, at which point he took up a career as a legal scholar (Ekelöf 1937).

Ekelöf's legal philosophy was deeply inspired by Hägerström; however, Ekelöf belongs to the "second" Uppsala school of legal philosophy, which reached its peak in Sweden in the 1950s. Together with philosophers like Anders Wedberg, Ingemar Hedenius and Konrad Marc-Wogau, and unlike Karl Olivecrona, Ekelöf appears to have abandoned Hägerström's psychological approach to law, based on the idea that law can be reduced to a series of psychological processes.[53] Instead, in a pattern that in a way parallels Alf Ross's development,[54] Ekelöf prioritized a more socially grounded explanation of what law is and what it *should* be—in its lawmaking, its application and en-

[52] On Hägerström see Chapter 13 in this tome.

[53] On Wedberg and Marc-Wogau see respectively Sections 21.2.1.1 and 21.2.1.2 in Tome 1 of this volume. On Hedenius see the following Section 17.3. On Olivecrona see Chapter 14 in this tome.

[54] On Ross see Chapter 16 in this tome.

forcement, and its judicial interpretation.[55] Consequently, the essence of law, for Ekelöf, particularly when it comes to its application, is something that lies beyond the intention of the lawgivers or the conventional rules of language: It lies in the role of law as functional to the pursuit of the general welfare in society. In this way, Ekelöf further advanced the goal that Scandinavian legal realism had set out, namely, to contextualize law: This is something he did in particular by opening law to the realities of social life as an essential step in both understanding and using the law. So it should not come as a surprise, in light of this social ontology of the legal phenomenon, that the three main areas of interest of Ekelöf's legal philosophy are the social function of lawmaking, the teleological method for interpreting the law, and the concept of rights.

17.2.2. Law, Its Making, and the Sense of Duty

Looking at the social function of lawmaking, Ekelöf appears to begin where Hägerström somehow left off, that is, from the importance of that which *surrounds* the law. However, as noted, while Hägerström stressed the *psychological* aspects of the law, Ekelöf shifted his attention to its *social* dimension, following a path parallel to the one developed by Anders Vilhelm Lundstedt.[56] In particular, according to Ekelöf, the main function of law in general—the function lawmakers have to fundamentally take into account when making law—is not so much that of prohibiting or allowing certain behaviors rather than others: The ultimate goal of all lawmaking must instead be to fashion a social ideal of what is and what is not morally acceptable. For example, in *Straffet, skadestånd och vitet* (Punishment, liability and penalty: Ekelöf 1942), Ekelöf advances the theory that the basic function of criminal law should not be to threaten individuals through sanctions but rather to instill in the community the idea that they should voluntarily refrain from criminal actions: This is accomplished by building, or helping to build, a moral sense of duty. That goes for the law in general—and so also for criminal law—whose overarching goal (and so the criterion on which basis to make law) should accordingly be, in either case, to foster a general sense of duty to obey the law, rather than to reinforce a fear of the law.

In particular, Ekelöf understands the role of substantive legal rules as that of constructing a certain moral or sense of duty among addressees, while the function of procedural laws is somehow to implement the substantive rules and their goal of achieving the general welfare in society. This combination,

[55] For instance, Ekelöf would later refer to his second book, *Straffet, skadestånd och vitet: En studie över de rättsliga sanktionernas verkningssätt* (Punishment, liability, and penalty: A study on the mode of operation of legal sanctions; Ekelöf 1942), as "a speculative sociological and group-psychological work in the spirit of Weber." See also Ekelöf 1978, 13.

[56] On Lundstedt see Chapter 15 in this tome.

according to Ekelöf, entails a certain way of considering and engaging in lawmaking: Its goal, in other words, should be to promote in addressees a sense of moral duty such that they will ultimately obey the law spontaneously. When it comes to contextualizing the legal phenomenon, this goal ought to be pursued in light of the idea that the social function of law (and procedural law in particular) is to proactively guide the community's behavior toward a more law-abiding attitude, rather than to resolve conflicts or protect rights (see Ekelöf and Edelstam 2002, 13–31).

In this way, one can easily appreciate the sense of Ekelöf's effort to place the law and its making into a broader social context: The point is not to "socialize" the law, or to make the law more receptive to the needs and interests of the community, as is the case in Roscoe Pound's sociological jurisprudence, and to some extent of American legal realism at large. Quite the contrary, Ekelöf's idea (in embedding law into the social) is that lawmaking should aim to "legalize the social," on a lawmaking model that—by constructing a socially widespread moral sensibility, that is, a "moral duty to obey the law"—can integrate the law into the community in a more fluid and efficient way. In other words, Ekelöf's idea is to use lawmaking as a tool for shaping a social environment more responsive to the lawmakers' ideas, and to integrate the law into society by moulding the latter through lawmaking in accordance with political ideals (see Ekelöf 1990, 71–84).

17.2.3. A Teleological Method

As Ekelöf's idea is that the law is a tool in the hands of politicians, and that lawmaking should serve the purpose of creating a widespread sense of a duty to obey the law, it is no surprise that he should stress the *interpretation* of law as a central part of his theoretical programme, focusing in particular on the criteria that judges and public authorities should use in fulfilling these basic goals. Even in his first book (Ekelöf 1937), Ekelöf makes the interpretation of statutory law central to his legal theory, arguing that this activity—and in particular the judiciary's interpretive work—is essential in creating a legal culture centrally concerned with statutory law, its concrete consequences on society in general, and its application to the case at hand. As a consequence, Ekelöf designed and promoted a specific interpretive method to be used in particular with what Anglo-American legal scholars would describe as "hard cases": This was a *teleological* method of interpreting the law. Though still a vexed question in legal scholarship, the teleological method has become Ekelöf's most evident legacy to the Scandinavian legal world: It is a paradigm overwhelmingly endorsed by Swedish judges, public agencies, and to some extent lawyers when an issue comes up requiring the law to be interpreted in its application.

The basic idea behind the teleological method is that judges applying a statutory provision should never consider that provision as an entity per se

or as defending positions (such as rights) regardless of context (Ekelöf 1958, 75–117; Ekelöf and Edelstam 2002, 79–95). Indeed, as discussed, law is considered part of a larger social context, and so public officials and judges applying the law (particularly in its statutory forms) need to take into account the aims to advance which its provisions have been created. In order to discover those aims, public officials (as well as legal scholars) should in particular rely on an "objective teleological method" (ibid., 84; my translation), objective in the sense that legal interpretation should not be based on the subjective aims for which a given law has been enacted (the aims which this or that lawmaker was pursuing in pushing for the law, and which can be ascertained by looking at the legislative history on the public record). Instead, the interpreter should look for the *objective* goal of legislation, which lies in the function the law in question is intended to serve in society, a function that can be retraced in "objective" data, namely, the legislative texts, the relevant judicial precedent, and the customs and practices adopted by public agencies. In other words, the objective teleological method means that statutory provisions should always be interpreted taking into account the way these provisions can affect the community. In view of these effects on the environment (the broader context in which the law is set), the interpreters must then choose the interpretation best suited to the aims the law is meant to advance: This they must do by taking account of the statutory text, judicial precedent, and custom, all the while ignoring the lawmakers' subjective aims, such as they can be gleaned from the legislative history (see, e.g., Ekelöf 1991b, 1951).

17.2.4. The Concept of Rights

We can now turn to Ekelöf's third and final contribution to legal theory—a sort of theme running through the work of all the Scandinavian legal realists, namely, the question of rights.[57] It can be observed here how Ekelöf shifts the core of his analysis from the problem of identifying the real elements on which rests a statement of rights (a problem closer to the first Scandinavian realism) to that of finding what states of affairs could be substituted in such a statement.

Ekelöf attempts to discover the semantic referent of the term *rights*, and to this end he analyses in particular the semantic referent of the term *claim*. He starts out by noting how the function of the latter term changes substantially in the two statements "If there exists an advance payment, there also exists a claim" and "If a claim exists, the payment should be made on the fixed day" (Lindblom 1991, 216–41): In the first sentence, the term indicates a complex of "legal consequences"; in the second, a complex of "legal facts (or acts)."

[57] An almost complete collection of Ekelöf's writings on the concept of rights can be found in Lindblom 1991, 185–288.

And that change in turn winds up changing the very ontology of the reality expressed by the same term *claim*.

This implies that when it comes to the question of rights, we cannot rely on syllogism to yield any appreciable scientific result, since the middle term in a legal a syllogism (in this case the term *claim*) will have a different meaning in the major premise than it does in the minor. The reason for this ambiguous use of the term *claim* is the same that explains the ambiguous use of the related term *right*, namely, that it is conventionally used as an intermediate key term between two factual realities. Rights, more to the point, are understood as both (*a*) a complex of legal consequences extracted from a plurality of legal facts (as when a right to property is said to be contained in a contract) and (*b*) the legal basis or the legal facts that give rise to legal consequences (as when it is concluded that one has a right to sell the thing owned). As a result, the syllogisms so often used in legal language are bound to be always valid, independently of what one uses in place of the middle term *right* (or, in this case, *claim*). Therefore, this concept not only fails to denote anything belonging to the spatiotemporal reality; from a linguistic point of view, the word *right* also lacks a semantic referent.[58]

Still, as Ekelöf concedes, the use of this legal terminology—the use of words such as *right* and *duty*—carries unquestionable advantages by making for economy of language. In particular, the use of the word *right* makes it possible to draw a continuous line, in the psycho-social dimension, between the original legal fact or act and its legal consequences.[59] However, in order for legal terms to play this connecting function between an act and its legal consequences, they each need to be able to carry a meaning—possibly the *same* meaning—within a context wider than the single legal statement, that is, within the global organization of rules framing a legal and social order. It is this wider context of elements that gives to the word *right* its meaning, its *significatum*; outside this context, words such as *right* and *duty* will become empty.

In conclusion, it should be stressed that Ekelöf does not outright deny the existence of rights. He is simply saying that these legal concepts are not absolute, particularly in their sociolinguistic context, but relative, that is, relative to the functioning legal system. Moreover, even though rights and duties are concepts lacking any specific content, they still play an essential function. Therefore, instead of asking the question "What does such and such a right *stand for*?" legal interpreters and scholars alike should ask, "How does this right *work* in legal thinking?"

[58] Compare Ross 1957b, 151–3.

[59] See generally Bjarup 1978. For a simplified evaluation of Ekelöf's idea of rights, see Strömholm and Vogel 1974, 54–61.

17.3. The Legal Philosophy of Ingemar Hedenius (*by Torben Spaak*)*

17.3.1. Introduction

Ingemar Hedenius (1908–1982) was professor of practical philosophy at Uppsala University 1947–1973 as well as a prolific and controversial contributor to the public debate in the 1940s through the 1960s. His critique of Christianity, in particular (e.g., Hedenius 1949, 1951, 1964), caused quite a stir (on this, see Nordin 1984, 177–84). Although Hedenius was primarily a moral philosopher, he also treated legal-philosophical questions now and then, and it is these contributions that have earned him a place among the Scandinavian realists. But unlike better-known realists like Alf Ross (1946, 1959) and Karl Olivecrona (1939, 1971), Hedenius, who wrote almost exclusively in Swedish, did not put forward a comprehensive legal philosophy. He did, however, introduce into legal thinking a distinction between internal and external legal statements (Section 17.3.2), and put forward a "realistic" (or sociological) analysis of the concept of a valid legal rule (Section 17.3.3) and an ideal-type analysis of the concept of ownership (Section 17.3.4). He also analyzed the concept of a performative and discussed its relevance to legal thinking (Section 17.3.5).

17.3.2. Internal and External Legal Statements

In a celebrated book entitled *Om rätt och moral* (On law and morality: Hedenius 1941, 60–85), Hedenius maintains that Axel Hägerström and Vilhelm Lundstedt (and Karl Olivecrona) failed to maintain a distinction between internal statements, that is, first-order value judgments or rules, and external statements, that is, second-order value judgments or statements *about* rules, and as a result wrongly concluded that there is no law and that there are no rights and duties.[60] In the same book, he also maintains that in their analyses Hägerström et al. confused the meaning of normative terms, such as "right," "duty," and "ought," with a mistaken *theory* about the meaning of these terms, viz. the theory that these terms have a magical meaning (ibid., 81), and that this caused them to wrongly conclude that there is no law and that there are no rights and duties. Although Hedenius appears to hold that Hägerström et al. committed both these mistakes, he does not make it clear precisely how they relate to one another. I shall, however, focus in this entry only on the former, viz. that of failing to maintain a distinction between internal and external legal statements.

* This article reports research carried out under the auspices of the Bank of Sweden Tercentenary Foundation. I would like to thank Jes Bjarup, Åke Frändberg, and Thomas Mautner for helpful comments. I would also like to thank Robert Carroll for checking my English. The usual caveat applies, however: The author alone is responsible for any remaining mistakes and imperfections.

[60] On Hägerström and Lundstedt, see respectively Chapters 13 and 15 in this tome.

The distinction between internal and external legal statements is clearly important to legal (and moral) thinking, especially for those who embrace a non-cognitivist meta-ethics, as Hedenius and the other Scandinavian realists do; and even though it may seem obvious in the abstract, it turns out to be quite difficult to maintain the distinction consistently when analyzing legal problems, especially in light of the fact that it is not always clear from the wording of a sentence whether it is of the one or the other type. The significance of the distinction should also be clear from the fact that since Hedenius introduced it, it has been accepted by a number of distinguished legal scholars or philosophers, such as Bulygin (1982, 127), Kelsen (1945, 162–4), and von Wright (1963, 103–5).[61] Indeed, Åke Frändberg (2005b, 378) refers to it as Hedenius's most important contribution to legal philosophy.

Hedenius attributes the following line of reasoning to Hägerström and Lundstedt (and Olivecrona). Since according to the non-cognitivist theory, a sentence such as "This is right" (which in its Swedish translation may mean either "This is right" or "This is the law") is *meaningless*, in the sense that the word "right" lacks cognitive meaning and does not refer, and since on one common interpretation (namely, "This is the law") this sentence is equivalent to the sentence "This rule has binding force," this latter sentence, too, will be meaningless. Moreover, since the sentence "This rule has binding force" is in turn equivalent to "This rule belongs to the law," the latter sentence can never be true (or false) either. Hence no rule can belong to the law. Hence there can be no law. Hedenius puts it as follows:

> The phrase "this rule has binding force" is equivalent to a common use of the phrase "this is right". This must mean that the words "binding force of law", and similar expressions, in the meaning they have in everyday conversations as well as in the law, do not refer to any kind of fact. If one draws the conclusions, the results are patently paradoxical. The phrase "this rule belongs to the law", which is equivalent to the phrase "this rule has binding force", can never be true. The law, which according to ordinary usage is the sum of everything that has binding force in a legal sense, is *nothing at all*. There is nothing that these words can refer to according to the use that the words have in ordinary legal language. Worse yet, the whole legal order [legal system], which is supposed to be the sum of what we call the law and its application in society, must be thrown out of the world of reality. *There does not exist any legal order.* This blunt assertion must be true in an unrestricted way: the term "legal order", precisely according to common usage, cannot refer to any facts whatsoever. And as that which we call "the state" necessarily involves maintaining a legal order, then there do not exist such things as states. The sentence "some states are monarchies while others are republics", which is based solely on terms with legal quality, cannot "be about" anything at all: it is made up of meaningless words, it does not express any assumption or assertion about anything, it cannot be true or false. (Hedenius 1941, 62–3; translation by Robert Carroll)

[61] Note that A. J. Ayer (1947, 105–6) makes the very same distinction. Note also that H. L. A. Hart's distinction (1961, 52–7) between internal and legal statements of law is closely related to, if not identical with, Hedenius's distinction. On this, see Hedenius (1977, 131).

But, Hedenius objects, clearly something has gone wrong here: We have to admit that at least in some cases, a sentence, such as "Brian owns the blue Volvo" or "This is prohibited", expresses a statement *about* something, typically about the law, and that it can therefore be true or false (ibid., 63). That is to say, he points out that in some cases such a sentence will express an external statement.

But is Hedenius right? We see that the line of reasoning attributed by Hedenius to Hägerström et al. starts with the sentence

(1) This is right,

and proceeds via the sentences

(2) This is the law, and
(3) This rule has binding force, to
(4) This rule belongs to the law.

The idea is clearly that (1) implies (2), which implies (3), which implies (4), and that since (1) lacks truth-value, so does (4). But the inference is obviously invalid. For (1) implies (4) *only* if (1) is construed as an *external* statement. If, however, (1) is construed as an external statement, the term 'right' does have cognitive meaning and does refer. More specifically, the equivocation is between (1a) "This is right," which is an internal statement, and (1b) "This is the law," which is an external statement." If (1) is construed as an *internal* statement, as in (1a), then (1) is *not* equivalent with (2), which is an external statement; if, on the other hand, (1) is construed as an *external* statement, as in (1b), then (1) is equivalent with (2), though neither (1) nor (2) will be meaningless in the sense contemplated by Hedenius. So, either way, the inference is rendered invalid.[62]

I shall leave it an open question whether Hägerström et al. really failed to maintain a distinction between these two types of statement, as Hedenius claims, though I must admit that I have my doubts (see also Bjarup 1978, 80–1). Certainly, both Lundstedt (1942, 24–6, 43–4) and Olivecrona (1942, 42–3) object that they never doubted that we can make second-order value judgments or statements *about* rules. Thus Olivecrona explains that even though the word "right" can function as an imperative in legal thinking, it does not follow from this that each and every sentence that includes "right" is an independent imperative or some sort of theoretically meaningless phrase for pressuring. It all depends on the context. For example, he says, somebody who

[62] But, one may wonder, if the relevant sentences are construed as internal statements, which lack truth-value, could one sentence really *imply* another? As is well known, the received view is that the laws of logic apply only to *statements* (or propositions), which can be true or false (on this difficulty, see Ross 1944, Alchourrón and Martino 1990).

maintains that German law underwent a radical transformation with the introduction of the *Bürgerliches Gesetzbuch* is making a true statement.[63] But even if Hedenius is wrong on this, the distinction as such is important: It is imperative in legal and moral analysis that it be maintained.

17.3.3. The Concept of a Valid Legal Rule

Having introduced the distinction between internal and external statements, Hedenius proceeds to elucidate the meaning of the latter type of statement. Focusing on statements about legal rules, his starting point is that we must conceive of such statements as statements about *valid* legal rules, and of valid legal rules as legal rules that would be *applied* by the courts, if they were applicable (Hedenius 1941, 86–7). He then explains that to say that a legal rule, according to which theft will be punished by imprisonment, is valid, is to say that *if* a person steals something, and *if* he is caught, and *if* he is indicted, and *if* the judge is satisfied that he did it, then the judge will sentence him to imprisonment. He adds that the fact that a legal rule is valid in this way is a *hypothetical state of affairs*, which is a species of *empirical* states of affairs:

> This fact is a purely empirical state of affairs that exists *now,* irrespective of whether at the moment any thieves are being discovered, prosecuted, proven guilty or sentenced. It is not just some imagined state of affairs or something that is expressed in a figurative way. It is a social fact, which constitutes a distinct element of our country's social structure just now. (Ibid., 100; translation by Robert Carroll)[64]

Hedenius observes that the occurrence of *mistaken* court judgments has been a major problem for those legal philosophers who have attempted to analyze legal concepts in terms of social facts (ibid., 102). For, he explains, if we analyze the concept of a valid legal rule in terms of what judges would do in a certain type of situation, we seem to be unable to distinguish between correct and incorrect applications of the law; and this, of course, is highly counter-intuitive. He notes that we can hardly respond to this objection that judges are supposed to judge in accordance with *valid* legal rules, since this would amount to a circular reasoning. But, he suggests, we might say that judges must judge in accordance with rules that are valid *according to* the received legal opinion, though he admits that this way of putting it is rather inexact and not very informative, unless one adds something about sources of law and legal method (ibid., 102–3).

[63] On Olivecrona, see Chapter 14 in this tome.

[64] The Swedish original reads as follows: "Detta faktum är ett rent empiriskt sakförhållande som föreligger *nu*, oavsett om just nu några tjuvar upptäcks, åtalas, överbevisas och döms. Det är icke något blott tänkt sakförhållande eller något som är uttryckt på ett bildligt sätt. Det är ett socialt faktum, som utgör en bestämd ingrediens i vårt lands sociala struktur just nu."

Hedenius returns to the analysis of the concept of a valid legal rule in his last legal-philosophical essay (Hedenius 1978). Here he repeats the essentials of his earlier analysis, and rejects a common objection to this type of analysis, viz. that it is circular because the concept of a court (Hedenius actually speaks of "authorities" or "agencies") must be defined in terms of the concept of a valid legal rule, although the analysis has it that the concept of a valid legal rule is defined in terms of the concept of a court. Hedenius's response is simply that the rules by virtue of which a purported court is indeed a court may be valid by virtue of having been applied by the court(s) in question (ibid., 43).

I cannot say that I find this response persuasive. As we have seen, the problem is that, on this analysis, a rule is a valid legal rule if, and only if, it is applied by a court, and that there can be no court that can apply the rule, unless there already are valid legal rules by virtue of which the purported court is indeed a court. Since this is so, it is hard to see how the rules by virtue of which the purported court is indeed a court may be valid by virtue of having been applied by the court(s) in question. As far as I can see, Hedenius simply insists that the alleged circle is not a circle, at least not a vicious circle. But he does not explain *why* this is so.[65]

There is also another problem that mars Hedenius's analysis. As we have seen, Hedenius (1) maintains that we need to distinguish between (*a*) internal statements, which only express the speaker's feelings or attitudes, and (*b*) external statements, which are empirical statements that can be true or false; and (2) assumes as a matter of course that an external statement can render the content of an internal statement correctly.

At first glance, this seems reasonable enough. But on closer inspection, we see that problems arise in regard to (2). If terms like "right," "duty," and "binding force" have no cognitive meaning and do not refer when they occur in an internal statement, and if the same holds when they occur in an external statement, then the latter statement cannot assert anything about the internal statement and can therefore be neither true nor false. If, on the other hand, these terms do *not* have the same meaning in internal and external statements, then an external statement cannot render the content of the internal statement correctly (Frändberg 2005a, 66–7). Either way, the analysis is inadequate. I do not know how to solve this problem, but will be content to point out that it appears to be more or less identical with the so-called Frege-Geach problem (or the embedding problem), that is, the problem that, on the non-cognitivist analysis, moral terms like "right," "duty," and "ought" do not have the same meaning in asserted and unasserted contexts (see, e.g., Blackburn 1993).

[65] Drawing on ideas put forward by Anders Wedberg (1945, 10–3), Frändberg (1986) has made an attempt to explain why this is so, however, and I believe that his attempt is successful. Swedish-speaking readers are hereby referred to Frändberg (1986) and Wedberg (1945, 10–3).

17.3.4. The Concept of Ownership

Like most Scandinavian legal philosophers, Hedenius has defended an analysis of the concept of ownership (1977). Hedenius's analysis is of particular interest, however, because it makes use of the so-called ideal-type analysis, and is put forward as an alternative to the well-known analyses defended by Anders Wedberg (1951, 272–4) and Alf Ross (1957).[66]

Hedenius's starting point is that ownership is a relation between a person, viz. the owner, and an object, viz. his property, and that an analysis of the concept of ownership must aim to clarify this relation. The terms "ownership," "owner," and "property," he explains, make up a family in a logical sense: Whoever is said to be an owner will be the owner of some property, and any piece of property will be the property of some owner (Hedenius 1977, 134–5).

He notes that the assumption that ownership is the relation between the owner and his property, although plausible, is not self-evident, and points out that in fact it has been rejected by Anders Wedberg in his influential analysis of the concept of ownership (ibid., 135–6; Wedberg 1951, 272–5). Wedberg suggests in his article that we may look upon the term "property" (or "ownership") as a purely syntactical device, whose function is to facilitate legal inferences by connecting statements about the acquisition of ownership with statements about the legal consequences of ownership (ibid., 272). Hedenius (1977, 135–6) notes, more specifically, that Wedberg holds that a statement such as "P owns O at t" will most likely differ in *meaning*, depending on whether it is asserted in regard to the one or the other legal system, and depending on whether it is construed as an internal or as an external statement (Wedberg 1951, 262–3). Hedenius cannot accept this result of Wedberg's analysis, however, and proceeds to develop an ideal-type analysis that is intended to account for his (Hedenius's) basic intuition, viz. that the term "ownership" has the *same* meaning in different legal systems and in normative and descriptive contexts. The reason why he cannot accept Wedberg's result is that he feels that it would complicate the logic of legal and moral thinking far too much (ibid., 137). I myself cannot see how the difficulty of an analysis can be a reason to reject the analysis, unless there is available an equally convincing and less complicated analysis that competes with the one under consideration. But, as we shall see in the next paragraph, this is not the case here.

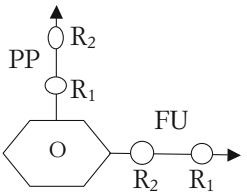
As should be clear, the proposed definitions differ in that the one (Wedberg's) is system-dependent, in the sense that the content of the concept in question depends on the content of the relevant legal rules, whereas the other (Hedenius's) is system-independent, in the sense that the content of the concept does *not* depend on the content of any legal rules at all (on this, see Frän-

[66] Note that Wedberg, not Ross, was the first philosopher to put forward such an analysis (for more on this topic, see Frändberg 2005b, 379). On Wedberg, see Section 21.2.1.1 in Tome 1 of this volume.

dberg 2005a, 69). One may, however, wonder whether the system-dependent analysis is really incompatible with the system-independent analysis. It seems to me that the one type of analysis doesn't exclude the other.

Note also that Hedenius's view that the term "ownership" has the same meaning in different legal systems and in normative and descriptive contexts is difficult to reconcile with Hedenius's commitment to non-cognitivism. For on the non-cognitivist analysis, as we have seen, normative words do not have cognitive meaning at all, though they may have so-called emotive meaning (see Stevenson 1937). But if they do not have cognitive meaning, how can the term "ownership" have the same (cognitive) meaning in different legal systems and in normative and in descriptive contexts? My guess is that Hedenius means that general normative terms like "right," "duty," and " ought" lack cognitive meaning, whereas more concrete, or thick, normative terms like "ownership," "brutality," "cowardice," and "courage" have a limited cognitive meaning.[67] That Hedenius holds such a view gains support from his discussion of Richard Hare's well-known distinction between the *phrastic* and the *neustic* part of meaning (Hedenius 1972; Hare 1952, chap. 2).

In any case, Hedenius suggests that we conceive of the concept of ownership as an *ideal-type* concept that includes two dimensions, viz. (*i*) protection of possession and (*ii*) freedom of use (1977, 145–9). In the figure below, for example, R_1 is closer than R_2 to the ideal type on the protection-of-possession dimension, whereas R_2 is closer than R_1 on the freedom-of-use dimension:



Hedenius notes that the legal rules that concern protection of possession and freedom of use will likely differ from one legal system to another, while denying that this means that there are two different concepts of ownership in the two legal systems:

> The definition of ownership as the most strongly protected and privileged *right in rem* [*Sachenrecht*] is what is essential, and this core of the concept stands firm irrespective of the variations of the content in the rules that protect the *right in rem*. (Ibid., 151; translation by Robert Carroll)[68]

[67] I would like to thank Jan Österberg for suggesting this interpretation. On thick concepts, see Williams (1985, 129–30).

[68] The Swedish original reads as follows: "Definitionen av äganderätten som den starkast skyddade och privilegierade sakrätten är det väsentliga, och denna begreppskärna står fast, oberoende av växlingarna hos innehållet i de regler som skyddar sakrätten."

That is to say, his idea is that the ideal-type analysis makes it possible to think of, say, ownership according to Norwegian law and ownership according to Swedish law as two instances of the very same concept of ownership; and this, of course, is very much in keeping with common sense.

17.3.5. Performatives

The concept of a performative was introduced into philosophical thinking by J. L. Austin (1962, 1975) and was further analyzed by John Searle (1969). As Austin (1975, 4–7) explains, a performative, such as "I promise to lend you $100" or "I hereby invite you to dinner on Saturday night," has its main verb in the first person (singular or plural) present, indicative, active, or is equivalent to such an utterance. He also explains that it differs from an ordinary statement of fact in that he who utters it (*i*) does not describe or report anything, which means that it cannot be true or false, and (*ii*) is usually thought to *do* something rather than to (merely) say something.

Legal philosophers quickly realized that performatives are of interest to anyone concerned with the law (see, e.g., Hart 1972, 820–2; Frändberg 1973, 57; Olivecrona 1971, 133–4, 217–39; Ross 1972; Samek 1965, 197), because many of the best examples of performatives are actually drawn from the world of the law. And, as one might expect, in his contribution to the literature on performatives, Hedenius emphasizes the relevance of performatives to legal thinking and points out that so-called declarations of intention (*Willenserklärungen*) are really performatives (Hedenius 1963b, 116). But unlike Austin and others, such as Ross (1972), he maintains that performatives can be true or false. Speaking of promises, he maintains that "[*a*] promise-performative is a true sentence […] if and only if it can be said that a promise has come into being through the sender's utterance of this promise-performative to the sender" (Hedenius 1963, 117; see Mautner 2001, 224–6). He maintains, in keeping with this, that performatives cannot be conceived of as imperatives, since performatives, but not imperatives, can be true or false (Hedenius 1963, 122–3); and this means that he rejects by implication Olivecrona's view that there are so-called performatory imperatives (Olivecrona 1971, 134).[69] He also objects to the view held by Hägerström (1953c, 301–2) and Olivecrona (1971, 226–33), that the belief that *saying* so can *make* it so amounts to a belief in magic. We have no reason to doubt that the act of uttering a sentence can cause the sentence to be true, he explains, and points out that performatives are just one type of such utterances (ibid., 112–5).

[69] On Olivecrona's theory of performatory imperatives see Section 14.2 in this tome.

Chapter 18

LEON PETRAŻYCKI'S THEORY OF LAW

by Edoardo Fittipaldi[*]

18.1. Introduction

Leon Petrażycki (1867–1931) was active not only as a legal theorist but also as a scholar of Roman law (e.g., Petrażycki 1892, 2002), as a forerunner of economic analysis of law (e.g., Petrażycki 1895, 2002), as a political and theoretical supporter of women's rights (e.g., Petrażycki 1915, 2010d), as a philosopher of science (e.g., Petrażycki 1908), as a philosopher of logic (e.g., Petrażycki 1939), as a psychologist (e.g., Petrażycki 1908), as an economist (e.g., Petrażycki 1911), and as a general sociologist (see Lande 1935, 42–3; 1959b, 1975).

Petrażycki set out six sciences meant to deal with legal phenomena: (1) the general theory of law, (2) descriptive legal science, (3) the history of law, (4) legal prophecies,[1] (5) legal policy, and (6) legal dogmatics.

In this text I will focus almost exclusively on Petrażycki's theory of law. Owing to space limitations, I will not discuss his conception of legal policy (and of the role of love within it).[2] As for Petrażycki's conception of legal dogmatics, it will be discussed from a strictly theoretical point of view. As for his contribution to the psychology and sociology of law, these are so intertwined with his legal theory that to a good extent discussing the latter amounts to discussing the former as well.[3] In fact, it would not be entirely inaccurate to maintain that Petrażycki's theory of law is a psycho-sociology of law. As for his logic and his philosophy of science, these will be discussed here only to the extent necessary to understand how he devises legal-theoretical concepts. Therefore,

[*] I wish to thank Enrico Pattaro, Elena V. Timoshina, Corrado Roversi and Filippo Valente for helping me to improve the final version of this essay. I have also greatly benefited from exchanges with Krzysztof Motyka and Roger Cotterrell. I should also especially thank Jacek Kurczewski, Małgorzata Fuszara, and Iwona Jakubowska-Branicka, who greatly helped and encouraged me since my first years of research on Leon Petrażycki.

[1] In his *Teorija prava* (Theory of law) Petrażycki did not mention legal prophecies (Petrażycki 1909–1910, 648; Petrażycki 1955, 298–9). He would mention them in Petrażycki 1939, 111. A discussion of these different legal sciences can be found in Fittipaldi 2013a.

[2] See Petrażycki 2010a and 2010b. See also Kojder (1995, 106-23) and Fittipaldi 2015.

[3] To be sure, Petrażycki rejected the concept of *sociology of law*, and to my knowledge he used this term only once (Petrażycki 1939, 104). His rejection of that concept is connected with his classification of the sciences, a classification we need not discuss here. The reader should only bear in mind that the Petrażyckian term *theory of law* overlaps to a large extent with what would now instead be called socio-psychology of law, comparative legal science, and history of law. On Petrażycki's attitude towards sociology "of law" see Timoshina 2013a.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_46

I will focus exclusively on his concept of an adequate theory and on a few related concepts.

18.2. The Concept of an Adequate Theory

Petrażycki proposed many stipulative definitions of terms that traditionally belong to general jurisprudence. In particular, he proposed new definitions for such terms as *law* (*pravo*),[4] *morality* (*nravstvennost'*), *ethics* (*ėtika*), *positive law* (*pravo positivnoe*), *authority* (*vlast'*), *public law* (*publičnoe pravo*), and *private law* (*častnoe pravo*),[5] among others.

When Petrażycki proposes new definitions for old terms, his goal is neither to grasp some essence nor to describe some linguistic usage. True, most of his definitions do present an "approximate coincidence"[6] with linguistic usage, but this is not Petrażycki's aim.

His aim is exclusively to develop concepts suitable for *adequate theories*. Only these concepts are *scientific* concepts, as opposed to the *practical* concepts that emerge out of clusters of the most diverse practical needs.[7] So in or-

[4] Russian words will be written in accordance with the orthographic reform of 1918. Transliterations into the Latin alphabet will be made according to the standard ISO 9 of 1968. When quoting Petrażycki, I will always indicate the pages of both the Russian original and the English translation contained in Petrażycki 1955. If no reference is made to Petrażycki 1955, it means that I am quoting passages that have not been inserted in that compilation.

[5] To be precise, Petrażycki distinguished between *public-legal* and *private-legal* authorities. See Section 18.11 below.

[6] This term, *approximate coincidence* (*priblizitel'noe sovpadenie*), was used on at least one occasion by Petrażycki (1909–1910, 139; 1955, 91), when discussing his distinction between moral and legal phenomena, a distinction that will be discussed in Section 18.7 below.

[7] For a classic example see Petrażycki's discussion of the concept of "vegetable" as a practical—i.e. nonscientific—concept: "Professional linguistic usage naturally adapts itself to the particular practical needs and goals that are specific to its given special sphere of practical life. From the point of view of such needs and goals the *most diverse objects* (diverse as to their nature and objective properties) may have *identical* practical importance, identical value, etc., and may also be used in identical practical dealings (behaviours), and *similar* objects may have *different* importance and different practical dealings. In this way the corresponding special practical linguistic usage becomes consistent, unifying what is different and separating what is similar, according to how this is useful and proper from the point of view of a certain practical need and goal, and only from this point of view. For example, from the culinary point of view, the most diverse plants, and in particular different parts of plants of different *genera* and *species*, etc., are unified into one group and receive the same name, 'vegetable,' etc., because all of them are appreciated as material for the preparation of dishes or for some sort of culinary need (e.g., as spices, etc.); and innumerable other plants that are similar as to their nature are excluded from the group, and the corresponding name is not used; some of them because they do not taste good; a second group is excluded because the plants in it need to be boiled for a very long time, or else because it is so difficult to prepare them or because the nutritional or gastronomical result is not worth the effort; a third group of plants is excluded because they are spiny, hard, etc.; a fourth group because the plants in it cause stomach ache, headache, etc.; a fifth group because consumption of these plants is impeded by particular customs, prejudices, ignorance of their qualities, etc." (Petrażycki 1908, 52; my translation).

der to understand how Petrażycki sets out his concepts, we must first become acquainted with his concept of an adequate theory (*adekvatnaja teorija*).[8]

By *adequate theory* Petrażycki means

> a theory in which what is stated [*vyskazyvaetsja*] (the logical predicate […]) […] is stated in a true and precise way […] about a class of objects […], to the effect that if something is stated about one [class], while that statement actually holds true […] for a broader class, or if the mismatch goes in the opposite direction, the theory is not adequate. (Petrażycki 1908, 67; my translation)

In other words, a theory predicates a certain property of a certain class of objects.[9] If the class used in the theory is too narrow, Petrażycki calls the theory *limping* (*hromajuščij*) because it *fails to cover* all the phenomena for which it holds true. If the class used in the theory is too broad, Petrażycki calls the theory *leaping* (*prygajuščij*) because it *goes beyond* the phenomena for which it is true.[10] A theory is instead adequate if its class (*klass-podležaščee*) is determined with the proper generality (*nadležaščaja obščnost'*) (Petrażycki 1908, 69). An amusing and often quoted example of a limping theory given by Petrażycki in regard to 10-gram-weighing cigars:

> As regards 10-gram-weighing cigars […] we could produce a large mass of true statements and develop so many theories that it would take more than one thick volume to write them all down. We could say about 10-gram-weighing cigars that if set in motion they would tend to maintain a uniform direction and velocity (due to inertia), or that they are subject to gravity and thus fall down according to certain laws (i.e., they tend to fall if there is no air friction or other complication), or that they undergo thermal expansion, and so on. […]. Such a science, however, would be a mere parody, a splendid illustration of how not to construct scientific theories. (Petrażycki 1908, 67–8; translation adapted from Nowakowa and Nowak 2000, 400)

Limping theories are not false: they are simply too narrow.[11] Leaping theories are instead too broad, and hence partly false. An example of a leaping theory might be a theory stating that water boils at 373.15 degrees Kelvin (my example). Such a theory holds only at 1 atmosphere of pressure. It "leaps" for differ-

[8] To be precise, Petrażycki discusses, not how concepts are arrived at, but rather their *scientific legitimacy* (*naučnaja legitimost'*) (see Timoshina 2012, 193).

[9] Petrażycki (1939, 62) distinguished two kinds of classes, (*i*) realistic classes and (*ii*) ideological ones, depending on whether (*i*) they comprise *both* externally existing objects of thought (such as currently existing *dogs*) *and* externally nonexistent ones (such as past, future, or purely imaginary *dogs*) or (*ii*) they comprise *solely* externally nonexistent objects of thought (such as *triangles*, to use Petrażycki's example). On the possible connections between Petrażycki's concept of an object of thought (*przedmiot myśli*) or thought-object (*myslimyj ob"ekt*), and the similar concepts developed by Brentano, Meinong, and Husserl, see the extensive discussion in Timoshina 2012, chap. 3, sec. 3.

[10] A theory may also be at once limping and leaping (Petrażycki 1908, 81).

[11] Kortabiński (1969, 1975) showed that the concept of a limping theory had been anticipated by several authors, including Aristotle and Bacon.

ent pressures. Likewise, a sociological theory is leaping if it picks out as relevant only one factor (for example, the economy) out of many that are relevant.[12]

Although Petrażycki did not make any use of the language of *set theory*, I think his definitions can be made clearer by using it:

– A theory is *limping* if it ascribes a certain property to only a *subset* of the phenomena that have that property.

– A theory is *leaping* if the phenomena that have a certain property form only a *subset* of the set of the phenomena to which that theory ascribes that property.

– A theory is *both leaping and limping* if the set of the phenomena that have a certain property only *intersects* with the set of the phenomena to which that theory ascribes that property.[13]

We will see in Section 18.8 that the criterion according to which Petrażycki selects legal emotions, as opposed to nonlegal (i.e., moral) ones, makes it possible to select phenomena that play a role in several adequate theories in Petrażycki's sense. As I said, all the redefinitions Petrażycki offers of certain traditional concepts are intended to have this property.

There has been much discussion about Petrażycki's concept of an adequate theory (see Motyka 1993). An objection that has been often raised against it is that adequacy is too demanding a requirement to meet—one that, if taken seriously, would hamper the development of science. For instance, Kotarbiński observed that "[l]aws that are applicable to entire classes of objects often emerge out of partial laws, which are therefore 'lame,' since they ascribe a given property to only some objects in that class" (Kotarbiński 1975, 20). Kotarbiński makes the example of the general laws of genetics, which were first established only with reference to certain plant species.

In my opinion the requirement that theories be adequate can be given a less demanding interpretation. Suppose that:

1. we are using a *naive label* (e.g., *solid*[14]) to refer to the members in a certain class C,
2. the membership in class C depends on meeting a certain criterion *a*, or on meeting at least a certain number of criteria within a given set of criteria $a_1, a_2, \ldots, a_n$[15] (imagine, in our example, that one of these criteria is the property of being possibly found the biosphere),

[12] On the difference between limping and leaping theories in Petrażycki see Section 16.2 in Tome 1 of this volume.

[13] Thus, as pointed out by Kojder (1995, 58), a theory, according to Petrażycki, may be (1) adequate, (2) limping, (3) leaping, (4) both limping and leaping, and (5) completely wrong.

[14] My example.

[15] This is typically the case of such naive concepts as that of *vegetable* (see footnote 7 above). To use a modern terminology, according to Petrażycki naive concepts *usually are* polythetic, while scientific ones *should all be* monothetic. As is known, this latter requirement is too demanding. For example, polythetic concepts are used in psychiatry. But this does not touch on the issue of whether the principle of adequacy is itself too demanding.

3. about the members in C we state the feature *b* (in our example, having a certain melting point).

Suppose also that we find out that even *objects other than the members in C* have *b* (e.g., solid oxygen). In this case Petrażycki's principle of adequacy simply requires that the label we use to refer to the members in C should be used to refer also to these new-found objects (or else it should be replaced or modified), and that we should search for a criterion other than *a* (or a_1, a_2, … , a_n) or *b*[16] to establish the membership in C. We should not *stubbornly* refuse to include these new-found objects in the class referred to by that label just because we are used to our traditional, or practical, categories, or we think that these further objects are somewhat "unworthy" of being associated to that label.[17] By the same token, if we discover some "exceptions" (e.g., glass, which has no melting point) the class will need be narrowed in order to make it cover solely the objects for which the theory holds. Also such discoveries will require the search for a criterion of membership in C other than *a* (or a_1, a_2, … , a_n) or *b*, as well as the replacement, modification or qualification of the usage of the traditional labels (think again of glass, which is not considered a solid *in a strict sense*).[18]

According to Petrażycki the concept of an adequate theory is relevant as well in the teleological sciences. In this connection he showed that limping statements may be quite dangerous because of the *argumentum a contrario*—an argument that in fields other than law "is not expressed but has practical application" (Petrażycki 1985b, 414; my translation). If I just tell you that a certain mushroom is toxic when eaten *raw* (while it is toxic not only when raw but also when cooked), you might infer that if you cook it, it will no longer be toxic (my example).

With that background in place, we are equipped to examine Petrażycki's general theory of law.

18.3. Ethical Emotions

The first redefinition we encounter is that of *ethics* (*ėtika*), along with its adjectival form, *ethical* (*ėtičeskij*). Petrażycki uses these terms as hypernyms to refer to both moral (*nravstvennye*) and legal (*pravovye*) phenomena. I will use all these terms in the same way as Petrażycki.

Now, Petrażycki's legal psychologism should rather be called an *ethical* psychologism because he argued for the psychological reduction of all ethical phenomena and treated legal phenomena as a mere subclass of ethical ones.

[16] If *b* were adopted to define C we would end up with a class with no theory attached to it.

[17] We shall see that this method led Petrażycki to include among legal phenomena the rules of games, the rights a child ascribes to his or her doll, and the obligation some person may experience to give his soul to the devil, among other examples.

[18] On the question of how classes should be *named*, see Petrażycki 1908, 86–96.

The starting point for his whole theory is the concept of emotion (*ėmocija*) or impulsion (*impul'sija*), two terms he used as synonyms. Petrażycki tried to distinguish emotions from other psychical phenomena, such as sensations (*čuvstva*), cognition (*poznanie*), and volition (*volja*). According to him, emotions are different from these other psychical phenomena because emotions are *active-passive*. An example of an emotion in his sense is hunger, as it comprises both a *passive* experience (feeling hungry) and a drive toward a certain action, namely, eating (cf. Petrażycki 1908, 175ff.).

In addition to emotions such as hunger, thirst, and sexual appetite, Petrażycki holds that there are also *ethical* emotions.

Just like other kinds of emotions, ethical emotions may be either appulsive (*appul'sivnyj*) or repulsive (*repul'sivnyj*).[19] Let us look at a key passage where Petrażycki describes how a repulsive ethical emotion works:

> If an *honest* man (in exchange for money or some other benefit) is invited to commit deceit, perjury, defamation, homicide by poisoning, or the like, the very representation of such "foul" and "wicked" conduct will evoke in him repulsive emotions that reject these acts; moreover, that rejection will be so powerful as to either forestall both the attractive impulsions (the ones directed to the promised benefit) and the corresponding teleological [*celevoj*] motivation or crush such motives if they do appear. (Petrażycki 1909–1910, 20; translation adapted from Petrażycki 1955, 30; italics added)[20]

Petrażycki does not provide a correlative description of ethical "appulsions." Examples of such appulsions could be the emotion we may experience toward paying the check at the restaurant or helping a friend in need.[21]

Now, ethical emotions form the core of Petrażycki's ethical psychologism. According to him, *law and morality are made up of ethical emotions and therefore exist exclusively within each Subject's*[22] *psychical reality*. It follows that law and morality are purely individual phenomena:

> In general, every kind of law, all legal phenomena [*pravovye javlenija*]—including legal judgments [*pravovye suždenija*] that gain the consent and approval of others—are purely and exclusively individual phenomena from our [Leon Petrażycki's] point of view, and the possible consent

[19] He also uses the terms *repul'sija* (repulsion) and *appul'sija* (appulsion).

[20] To avoid misunderstandings, it should be stressed that nowhere does Petrażycki contend that ethical emotions are always successful in counteracting other kinds of motivation. I italicized the term *honest* in order to stress that in a not-so-honest man, repulsive ethical emotions—provided he can experience them—may not be able to counteract other kinds of emotions. Such cases may eventuate in regret, a phenomenon Petrażycki sometimes mentions.

[21] A totally different example of an ethical appulsion seems to be the emotion experienced by a right-holder where his own behaviour is concerned, as when he experiences, say, he has a right of way or some political liberty. See in this regard Section 18.9.3 below.

[22] In this discussion the term *subject* will be uppercased when meaning "each of us as a solipsistic ego"; it will instead be lowercased when referring to a subject as an object of predication in a judgment, or else when referring to a participant in a legal relationship (where by *participant* is understood also a possible third spectator).

and approval on the part of others are irrelevant from the point of view of defining and studying the nature of legal phenomena. […] Every sort of psychical phenomenon appears in the psyche [*psihika*] of one individual and only there: Its nature does not change depending on whether or not something happens somewhere else between individuals, or above them, or in the psyche of others, nor does it depend on whether or not other individuals exist, etc. (Petrażycki 1909–1910, 105; translation adapted from Petrazycki 1955, 75)

This is why Petrażycki's theory of law can be called a *solipsistic theory of ethics* (or *ethical solipsism*).[23]

When it comes to distinguishing ethical emotions from other kinds of emotions,[24] Petrażycki mentions the following criteria:

1. Ethical emotions seem to "procee[d] as from a source […] extraneous to our prosaic ego" (Petrażycki 1955, 37–8; 1909–1910, 34).
2. They are experienced as if provided with "some […] voice addressing us and talking to us" (ibid.).
3. They are experienced as "an inward impediment to freedom—as a particular obstacle to the free exercise of a preference and the free selection and free following of our propensities, appetences, and purposes" (ibid.).
4. They have a "unique mystic-authoritative character, […] they […] posses[s] a mystical coloration, not without a tinge of fear" (ibid.).
5. Unlike other emotions such as hunger, thirst, or sexual appetite, ethical emotions are "blanket" emotions, meaning that they "can serve as stimuli to any conduct whatever" (Petrażycki 1955, 27; 1909–1910, 11–2).
6. They "are similar to the imperative emotions (*povelitel'nye ėmocii*) aroused by commands or prohibitions addressed to us" (Petrażycki 1955, 38; 1909–1910, 35–6).

As regards point (6), it should be stressed, in order to avoid misunderstandings, that according to Petrażycki "[*n*]*either law nor morality has anything in common with commands and prohibitions as such*" (Petrażycki 1955, 158;

[23] To my knowledge, the first author who used the term *solipsyzm* to refer to Petrażycki's legal theory was Rozmaryn (1949, 17, quoted in Seidler 1950, 21). Unlike these authors, I do not use this term in a derogatory way. Olivecrona did not use the term *solipsism* but criticized Petrażycki on such grounds (see Olivecrona 1948, 178, and the discussion of Olivecrona's criticism in Fittipaldi 2012a, 12 n. 9). Znamierowski (1922, 59) used the term *solipsyzm* in order to show that Petrażycki's ethical solipsism is logically conducive to general metaphysical solipsism. Against this objection, see Fittipaldi 2012a, 114. On Olivecrona and Znamierowski see respectively Chapter 14 and Section 20.2 in this tome.

[24] According to Petrażycki ethical emotions are a subclass of the broader class of normative emotions. The class of normative emotions also takes in aesthetic emotions, which Petrażycki does not classify as ethical emotions because of their lack mystic-authoritativeness, which according to Petrażycki is the *differentia specifica* of ethical emotions. In this essay, if not otherwise specified, I will use the terms *normative* and *ethical* as synonyms.

1909–1910, 332). There are plenty of ethical phenomena where no command whatsoever can be found. Petrażycki gives the example of custom (ibid.).[25]

Moreover, from the above it follows that legal and moral behaviours have nothing to do with either teleological or aesthetic behaviour[26]:

> If larceny, defamation, or coarse treatment of a servant is rejected as uncomely, ugly, or inelegant—if, in other words, the relevant impulsion is a negative aesthetic impulsion—the judgments [*suždenija*] are then neither moral nor legal: They are aesthetic experiences. The same utterances [*izrečenija*] may in general be based on opportunistic [*opportunističeskie*], or teleological [*celevye*], judgments […]. If a person saying, "One should not steal" merely contemplated that the relevant conduct might entail a term in prison, punishment in the life to come, or the like, and by reason thereof […] when he formed the judgment "One should not steal," there arose in his psyche neither an ethical […] nor an aesthetic emotion, but the repulsive motorial excitement of a fearful nature that generally accompanies the idea of a term in prison or of torture in Hades, and this motorial excitement were here extended to larceny, his judgment "One should not steal" would be the an opportunistic and teleological [*teleologičeskoe*] experience [*perežívanie*]—a judgment of worldly prudence and calculation—and not a normative [*principial'noe*] experience at all. (Petrażycki 1909–1910, 82–1; translation adapted from Petrażycki 1955, 60–1)

In other words, by definition there can be no ethical behaviour without ethical emotions.

According to Witold Rudziński (1976, 127) a problem with Petrażycki's theory of ethical emotions is that he did not explain where they come from. Moreover, drawing on Piaget's (1985) distinction between *morality of constraint* and *morality of cooperation*, Rudziński wrote that one would be tempted to hazard the view that the kind of ethical experience Petrażycki is talking about "is an infantile relic in our adult life" (Rudziński 1976, 96). On the other hand, by drawing not only on Piaget but also on Freud and other modern psychologists it could be argued that Petrażycki's ethical appulsions and repulsions should be reduced to more basic ethical emotions, such as guilt, shame, anger, indignation, etc. (Fittipaldi 2012a).[27]

[25] We will see below (Section 18.11) that commands are involved in a particular kind of legal relation that Petrażycki calls *authority*.

[26] On aesthetic emotions, see footnote 24 above. It should be also recalled that Petrażycki's distinction between *normative* (i.e., aesthetic + ethical) and *teleological* motivation can be compared to Alfred Schütz's distinction between *Weil-Motive* and *Um-zu-Motive* and to Max Weber's distinction between *Wertrationalität* and *Zweckrationalität*. See in this regard Timoshina 2013b, 452ff.

[27] For example, if the Subject experiences an ethical repulsion toward the action of some other individual, that repulsion should be understood as the Subject's *anger* or *indignation* (among other emotions) toward that action. By the same token, if the Subject's repulsion is directed toward an action of the Subject himself, that repulsion should be understood as the Subject's anticipated *guilt* or *shame* (among other emotions) for carrying it out. On a Petrażyckian passage supporting the reduction of ethical repulsion to indignation, see also footnote 76 below).

18.4. The Theory of Projections

Petrażycki contends that all ethical phenomena should be explained in terms of ethical emotions. Such an approach raises an obvious question: If law and morality are made up of ethical emotions, where are the ethical realities jurists and laypeople usually talk about? Here is a passage where Petrażycki addresses this issue:

> Let us suppose that we are dealing with the following judgments:
>
> "The landlord A has the right [*imeet pravo*] to receive from the tenant 5,000 rubles as a price for the rental" or "The tenant B is obliged [*objazan*] to pay to the landlord A the rental price of 5,000 rubles agreed on in the contract." According to the legal terminology between A and B there exists [*suščestvuet*] a legal relationship [*pravootnošenie*].
>
> In this case there is a legal phenomenon [*pravovoe javlenie*], but where is it? Where can it be found in order to investigate it?
>
> It would be wrong to think that it is situated somewhere in the space between A and B—for example, if the landlord A and the tenant B are in the province of Tambov, then to think that the legal phenomenon in this case is [*imeetsja*] precisely in this province—or to think that the legal obligation which in the cited judgment was ascribed to the tenant B is something that is situated near to this person and that the right to receive 5,000 rubles is something that exists and can be found near to the tenant A, in his hands, in his soul or somewhere around or in him. (Petrażycki 1908, 24; translation adapted from Petrażycki 1955, 7)

Here Petrażycki mentions three possible mistakes: (1) the debt is believed to exist between A and B; (2) it is believed to exist somewhere in the province where A and B reside; (3) it is split into two entities, namely, a debt and a credit, one near to the debtor, the other near to the creditor.[28]

According to Petrażycki, all these answers are wrong. This also applies to the epistemological status of the traditional *scientia juris*, which in his view deals with *illusions of a special kind*:

> The content of the science of law, along with the issues it gives rise to and the solutions devised in the attempt to address them, appears to be an optical illusion [*optičeskij obman*] consisting in the following: It does not see legal phenomena where they actually take place, and it sees them where they in no way are, nor can they be found, observed, and known, i.e., *in the world external to him who experiences* [*perežívajuščij*] *the legal phenomena* […]. This optical illusion has […] its natural psychological causes […], just as, for example, completely understandable and natural is the optical illusion (in the literal sense of the word) by virtue of which people ignorant about astronomy think (as did the very science of astronomy prior to Copernicus) that the sun revolves around us, that it "rises" in the morning, and so on […]. (Petrażycki 1908, 25; translation adapted from Petrażycki 1955, 8; italics replacing spaced in the original)

[28] In order to avoid misunderstandings it should be stressed that Petrażycki does not mention a fourth possibility, namely, that the debt is believed to exist in some of realm-of-the-ought-to-be (*Bereich des Sollens*). As will be explained shortly in this section, Petrażycki's projectivism only makes it possible to explain why we add further entities to *this* world. This is a major difference between Petrażycki and Hägerström, as the latter maintains that *objectifications* (a concept loosely equivalent to Petrażycki's *projections*) lead us to conjure up a world of duty as existing *in distinction* to the world of facts but parallel to it (see Sections 13.2.3 and 13.3.1 in this tome).

Now, according to Petrażycki, moral and legal illusions can be all explained by way of a single mechanism, that of *projections*:

> [The emotions],[29] aroused in us by various objects (by perceptions or by representations of those objects) or experienced in reference to them, communicate [*soobščajut*] a particular coloration [*okraska*] or particular nuances (*ottenki*) to the perceptions or representations corresponding to those objects, such that the objects themselves appear to us as if they objectively possessed the relevant qualities. Thus, if a certain object such as a roast (its perception, appearance, smell, and so forth) arouses appetite in us, it then acquires a particular aspect in our eyes, and we ascribe particular qualities to it and speak of it as appetizing, as having an appetizing appearance, and the like. If the same object or another object offered to us as food awakens in us the contrary (negative) emotion instead of appetite (the physiological condition of our organism being different), and if this negative emotion is relatively weak, we will then attribute to the object the quality of being unappetizing, whereas if the [emotion] is more intense, we will confer on the object the quality of "loathsomeness" (Petrażycki 1909–1910, 38; translation adapted from Petrażycki 1955, 40).

According to Petrażycki, all kinds of emotions are more or less conducive to projections, and ethical emotions are no exception. It bears recalling that a similar mechanism was pointed out by Axel Hägerström in connection with norms.[30] That is no surprise, considering that projectivism is an explanation typically invoked by *empiricists* and *ethical emotivists*—starting from David Hume, who as far as I know is never quoted in this regard by Petrażycki.[31] Now, unlike these authors, Petrażycki holds that if all kinds of emotions are somewhat capable of producing *projective qualities*, ethical emotions can even bring about *illusions of entities* (or things):

> The ethical emotional projection […] is not restricted to the representations of the existence […] of obligatedness[32] [*objazannost'*, *dolženstvovanie*] as a specific state [*sostojanie*] of submission [*podčinennost'*] […]. It goes further into fantastic production. What we could call a materialization [*oveščestvlenie*, *materializacija*] of the obligation [*dolg*] takes place. As is apparent from the etymology of the structure of the word *ob(v)jazannost'* (*obligatio*, and the like), as well as from the diverse usages of the words *objazannost'* and *dolg* (for instance, *na nem ležit objazannost'* [lit.. "the obligation lies on him"], *tjaželyj dolg* [lit., "heavy debt"], *byt' obremenennym objazannostjami, dolgami* [lit., "to be burdened with obligations, debts"], and the like); there is here—in the place where the projection is directed, near the individuals onto whom the obligatedness is being

[29] Petrażycki uses here the term *motornoe razdraženie* (motor excitation), which he uses as synonymous with *ėmocija* or *impul'sija*.

[30] See, for instance, the following quotation: "The norm […] acts through its power to attach reverence or respect. Esteem is attached to right action, and disesteem to wrong action" (Hägerström 1953d, 194; in this translation this text is mistakenly identified as bearing the title *Till frågan om den gällende rättens begrepp*). On Hägerström's conception of norms see Section 13.3 in this tome.

[31] Cf. Hume 1978, sec. 1.3.14, 167. On the different ways the term *projection* is used in psychology, see Piaget 1985, 47 (also quoted in Fittipaldi 2012a, 55 n. 3). On the role of projections in legal realism see also Section 12.5 in this tome.

[32] Throughout this text (as well as in Fittipaldi 2012a), I use the term *obligatedness* to refer to an *individual's* "deontic" projective quality (his being obligated), while I use *obligatoriness* to refer an *action*'s "deontic" projective quality (its being obligatory). This corresponds to different Russian terms used by Petrażycki.

projected—the representation of the presence of objects of the sort that have weight, of some sort of material object, such as a rope or chain, through which those individuals are obligated and burdened. (Petrażycki 1909–1910, 42; my translation and italics added)

Unfortunately, Petrażycki failed to explain why ethical emotions are supposed to be more productive than other kinds of emotions.[33]

Another flaw in Petrażycki's theory is that he failed to expound it in any non-projective terminology. His use of terms such as *obligation*, *right*, and *power* comes without qualification. According to him,

[t]here has been such a complete adjustment to this point of view [the projectional point of view] that to start an examination of the problems of ethics from the teaching of scientific psychology […] would be to raise difficulties of thinking and of language and in substance to "speak in an incomprehensible language" (Petrażycki 1909–1910, 43; translation adapted from Petrażycki 1955, 43).

This is why, even while contending that ethical qualities and entities are illusory phenomena, Petrażycki proceeded from the projectional point of view in presenting his theory.

According to Czesław Znamierowski (1888–1967), recognized as the most important critic of the psychological theories of law (cf. Motyka 1993, 27), the fact that Petrażycki couldn't present his theory without recourse to projective terminology proves that his psychological theory of law is untenable (Znamierowski 1922, 32).[34] If a theory developed to explain any set of phenomena is tenable, it must be possible to describe these phenomena in terms of that theory itself. I think this objection is sound. But I also think that it *is* possible to present Petrażycki's theory without recourse to the projective point of view.[35] Even so, I will keep using Petrażycki's "projective" terminology so as to avoid having to introduce cumbersome and unusual neologisms.

18.5. Norms and Normative (or Ethical) Convictions

Leon Petrażycki's psychological theory of law differs from the other most complete psychological theory of law as yet proposed, namely, Pattaro 2005,[36] in that in Petrażycki's theory the concept of a norm plays but a *secondary* role.

[33] It could be objected that projections can produce solely illusions of ethical *qualities*, and that the illusions of legal *entities* should be explained in different ways. In Fittipaldi 2012a, chap. 4, I attempted to show that it is possible to explain the illusions of legal entities with hypotheses other than projections, while still remaining within the framework of Petrażycki's theory of law.

[34] On Znamierowski see also Section 20.2 in this tome.

[35] In Fittipaldi 2012a, I addressed some legal-ontological problems within the framework of Petrażycki's theory of law, without adopting the projective point of view. This made it necessary to adopt such cumbersome neologisms as *attributivesidedness* or *imperativesidedness*. On the view that projective beliefs, though "ontologically suspect," may be "useful, and indeed rational, for a practical reasoner," see Sartor 2005, 101.

[36] To be precise, Pattaro's is a psychological theory of (*what is*) *right* as distinguished from *law*. A comparison between Pattaro's and Petrażycki's conceptions can be found in Timoshina 2011, 68ff. On this issue, see also footnote 19 in Section 20.1.5 in this tome.

Let us read a passage where Petrażycki gives his own definition of a *norm*, as well as other definitions we will make use of in this and the next section:

> The existence [*suščestvovanie*] and operation in our psyche [*psihika*] of immediate combinations [*sočetanija*] of action representations [*akcionnye predstavlenija*] and emotions (rejecting or encouraging the corresponding conduct—i.e. repulsive or appulsive) *may be manifested* in the form of judgments [*suždenija*] rejecting or encouraging a certain conduct *per se*—and not as a means to a certain end: "a lie is shameful"; "one should not lie"; "one should tell the truth"; and so forth. Judgments based on such combinations of action representations with repulsions or appulsions we term […] normative-practical [*principial'nye praktičeskie*] (i.e. that determine behavior) judgments or, briefly, normative judgments [*normativnye suždenija*]; and their contents [*soderžanija*] we term normative-practical rules of behavior [*principial nye pravila povedenia*], principles of behavior [*principy povedenia*] or norms [*normy*]. The corresponding dispositions […] we term principle-practical or normative convictions [*normativnye ubeždenija*]. (Petrażycki 1955, 30; 1909–1910, 20–1; italics added)

For Petrażycki *the core phenomenon is the combination of action representations and ethical emotions*. He uses the term *normative conviction* to refer to the stable presence of such combinations in our psyches.[37] The term *norm* is instead reserved to the *contents* of the projective judgments based on these combinations (cf. in this regard Section 12.4 in this tome).

According to Petrażycki, "judgments are emotional acts [*ėmocional'nye akty*]" (Petrażycki 1908, 248; my translation):[38]

> [E]motions are the essential element of judgments. Positive, affirmative judgments—statements of something about something, of the form *S* (subject) is *P* (predicate), such as "The Earth is a sphere" or "The earth revolves around the sun"—are *appulsive*-emotional acts. Negative judgments, of the form *S* is not *P*, such as "the earth is not a sphere," are *repulsive*-emotional acts. The psychological scheme of the former is $S \leftarrow P$, where *S* designates the representation of the subject, *P* means the representation of the predicate, and the arrow between them means the attractive, acceptive emotion, bringing the second representation into connection with the first one, that is, "stating" [*"utverždajuščij"*] the second one as regards the first one. The psychological scheme of negative judgments is $S \dashv P$, where the sign between *S* and *P* designates a refusing, rebutting emotion.
> […]
> It is possible […] to discover […] the presence of extremely different […] [judgment] emotions. A judgment emotion like "Hunger is an emotion" (a *theoretical* judgment, or theoretical emotion) has a character completely different from the judgment emotion "We should forgive our neighbors for the wrong they have done" (a *moral* judgment, or moral emotion), which in turn has a different character from the judgment emotion "I have the right to do that" (a *legal* judgment, or legal emotion), etc. (Petrażycki 1908, 246–7; my translation and italics added)

[37] The terms *normativnyj* (normative) and *ėtičeskij* (ethical) are not perfect synonyms in Petrażycki (see footnote 24 above).

[38] Petrażycki kept working on these issues throughout his whole life. See his posthumous work *Nowe podstawy logiki i klasyficacja umiejętności* (New foundations of logic and a classification of competences: Petrażycki 1939) where he proposed to replace the concept of judgment with the more basic concept of *position* (*pozycja*). As regards the similarities and differences between Petrażycki's concept of *position*, on one hand, and Russell's and Wittgenstein's concepts of *atomic proposition* and *Elementarsatz* (elementary proposition) see Timoshina 2012, 56ff. (see also Section 20.1.2 of this tome).

As emotional acts, *judgments*, in Petrażycki's use of this word, are *experiences* (*perežívanija*), and *not sentences* (*predloženija*). The expression of a judgment without the underlying emotions is not to be viewed as an authentic (*podlinnyj*) judgment in his sense (Petrażycki 1908, 253). By the same token, judgments can be experienced even without a corresponding utterance.[39] They can be "mute."[40]

In the case of normative judgments, some illusory ethical predicate is experienced about some person or some course of action.[41] As noted, Petrażycki calls the *content* of this experience a *norm*. Now, *since in Petrażycki's terminology normative judgments are projective phenomena, norms cannot play a central role in his theory*.

A crucial role in his theory is instead played by *normative convictions*. In order to understand this concept, we should first read a passage where Petrażycki explains his general concept of *conviction*:

> The judgments we experience […] have the tendency to leave corresponding "tracks," dispositions, e.g., the ability to experience the same judgment—the same pairing of representations and affirmative/acceptive or negative/refusive emotions—in case the corresponding occasions [*povody*] should present themselves again […]. *We shall call "convictions"* (*ubeždenija*) *the corresponding dispositional cognitive-emotional pairings*. (Petrażycki 1908, 248; my translation)

It is difficult not to think of psychological associationism when reading such a passage. Nonetheless one can give it also a more modern interpretation. For example, think of the role of disgust in the socialization of children (M. Lewis 1992, 110). If every time a child attempts to play with his poo his parents make him feel ashamed by virtue of their disgusted faces, he will probably develop a stable disposition to experience that activity as shameful. However, even if adapted to modern psychological approaches, psychological associationism is far to being an exhaustive account of how ethical dispositions (i.e., convictions) emerge in human animals.[42]

[39] Petrażycki holds that judgments are strictly connected with our reactions to food, and in this regard he quotes Darwin's 1872 *The Expression of the Emotions in Man and Animals* (see Petrażycki 1908, 248 n. 1).

[40] Petrażycki (1939, 31) also maintained that judgments—made up as they are of three different psychical acts (the act of formulating a subject, the act of formulating the predication, and the emotion connecting the latter to the former)—originate from the development of language. Needless to say that to hold that judgments—as distinguished from positions (footnote 38 above)—*originate* from language does not amount to holding that judgments *always* need to be expressed linguistically.

[41] This ethical predicate exists exclusively within the Subject, without any externally existing (i.e., objective) counterpart. If normative judgments are formulated as if their predicate had not only an internal existence but also an external one—as is mostly the case—they are simply *erroneous* (*błędy*) objective judgments (Petrażycki 1939, 36; cf. also 18 n. 7). In this regard see also Section 12.7 in this tome.

[42] For an attempt to reconcile Petrażycki's theory with Freud's and Piaget's theories on the emergence of ethical emotions in the child, see Fittipaldi 2012a. In passing, it should be recalled

To conclude this section, a few words are in order on the question whether Petrażycki's conception of a norm is compatible with the conception set out in Pattaro 2005. In my opinion the difference between them is chiefly terminological. What Pattaro calls a *norm* roughly corresponds to what Petrażycki's calls a *normative conviction*. According to Pattaro a norm is a motive of behaviour, namely, the belief (*opinio vinculi*) that a certain type of action must be performed, in the normative sense of the word, anytime a certain type of circumstance is validly instantiated. And this must be so unconditionally, regardless of any good or bad consequences that may stem from the performance in question (Petrażycki 2005, 97).

For Pattaro a norm is made up of the following three elements: (1) a type of circumstance, (2) a type of action, and (3) a conception or experience of that type of action as binding per se. It might seem that in Pattaro's definition of norms, emotions do not play the crucial role they play in the context of Petrażycki's normative convictions. But Pattaro also writes:

> With regard to a belief in a norm, some prefer to say "acceptance" rather than internalization. […] I prefer "internalization" [because, among other reasons] an internalization will not always be conscious or determined by reasoning; it is rather often unconscious and *determined by emotions*. (Pattaro 2005, 100; italics added)

My conclusion is therefore that Petrażycki's and Pattaro's psychological theories of normativeness are compatible in this regard.[43] Since Enrico Pattaro can be recognized as a consistent developer of Scandinavian realism, this compatibility is one further argument for introducing the historiographical concept of a *Continental* or *psychological realism* to refer to both Petrażyckian and Hägerströmian legal realisms (see in this regard also Chapter 12 in this tome).

18.6. The Structure of Normative Convictions and the Distinction Between Positive and Intuitive Ethics

According to Petrażycki *the minimal psychological structure of ethical experiences consists of the representation of some behaviour coupled with an appulsive or repulsive ethical emotion*.

The behaviour in question can also be psychical—a purely *mental* action (Petrażycki 1909–1910, 45). For example, I may experience an ethical repulsion toward some thought of mine: "Thou shalt not *covet*" (thy neighbour's house, and so on).

that Petrażycki seems to have denied the existence of blanket emotions, and therefore also of ethical emotions, among animals (see Piętka (without date), 229).

[43] Another minor difference seems to be that since Pattaro also includes the type of circumstance in the structure of norms, all norms in his view seem to be somewhat hypothetical, whereas Petrażycki holds that there can be also *categorical* ethical convictions (see Section 18.6.1 below).

Furthermore, a normative conviction may involve three different kinds of cognitive elements (*poznavatel'nye elementy*): (1) the representation of a normative hypothesis, (2) the representation of addressees, and (3) the representation of a normative fact. Let us take these up in turn.

18.6.1. Normative Hypotheses

A *normative hypothesis* is a "representation of the circumstances […] upon whose presence the obligatoriness of a certain conduct depends" (Petrażycki 1955, 44; 1909–1910, 47).

The term *normative hypothesis* is mine. Petrażycki simply uses the term *gipotesa*, setting it in contrast to *dispozicija*, which is the *normative consequence*, namely, the obligatoriness of a certain conduct. Petrażycki's *gipotesa* corresponds to what German and Italian jurists call *Tatbestand* and *fattispecie astratta*,[44] respectively, as well as to what Wesley N. Hohfeld (1964) called an *operative fact*. As for *dispozicija*, this term somewhat corresponds to the German *Rechtsfolge*.[45]

That Petrażycki's concept of a normative hypothesis corresponds to the concepts of *Tatbestand*, *fattispecie astratta*, and *operative fact* does *not* mean that it thereby *coincides* with them. Unlike these terms, which refer to actual facts external to the Subject, Petrażycki's normative hypotheses are *objects of representations* within the Subject. This implies that, according to Petrażycki, in order for an obligation—understood as a psychic phenomenon, namely, a projection—to come into psychical existence, it suffices that the Subject *believe in the truth* of the representation of some normative hypothesis that brings that obligation about (e.g., Mark's breaking of John's window). The actual truth of the representation is instead completely irrelevant from a psychological point of view (Petrażycki 1909–1910, 457; 1955, 212).[46] The Subject's

[44] On this issue, cf. Pattaro 2005, 16 n. 8.

[45] I say *somewhat* because, according to Petrażycki not only legal norms but also moral norms may have a hypothetical structure, whereas *rechts-* in *Rechtsfolge* might convey the idea that hypothetical norms can be found solely in the domain of law (*Recht*).

[46] This is not to say that its truth—understood as correspondence with external reality—is not relevant from other points of view, such as that of *legal dogmatics*. Quite the contrary. What Petrażycki and Lande state as regards the *legal-dogmatic* relevance of the *truth of normative facts* (on the concept of normative fact see Section 18.6.3 below) holds also for the other cognitive elements of normative convictions (cf. Section 18.12 below, and Fittipaldi 2013d, par. 1.2, where Reinach's (1989, [178] 149) classical objection against legal psychologism is discussed). However, Petrażycki's contention that the *truth* of these representations is *completely irrelevant from a psychological point of view* may seem too radical. It could be objected that an ethical conviction based on the *false belief* in the instantiation of its hypothesis is less stable than an ethical conviction based on a *true belief*. At the end of the day, a false belief seems to be more amenable to change than a true one. Be that as it may, a change of belief does not touch on the existence of the ethical phenomenon until the belief it is based on actually gets changed. And this is precisely

believing in the truth of a representation of his makes this a *realistic* representation (*przedstawienie rzeczywistościowe*) as opposed to a *fantastic* representation (*przedstawienia fantastyczne*)—to use a terminology Petrażycki would introduce in his later lectures on logic (Petrażycki 1939, 26ff., 109).

Petrażycki distinguishes *categorical* normative convictions from *hypothetical* ones.[47] Only hypothetical normative convictions comprise the representation of a normative hypothesis. Categorical ones do not. A Petrażyckian example of a categorical normative conviction is |Thou shalt not kill|.[48]

It is in order here to recall that Hans Kelsen—like many other modern legal theorists—would oppose the very idea of a categorical norm, and that Kelsen's arguments could be used also against Petrażycki's idea of a categorical ethical conviction. Kelsen maintained that

> omissions cannot be prescribed unconditionally. Otherwise they could be complied with or violated unconditionally, which is not the case. An individual cannot lie, commit theft, murder or adultery always, but only under definite circumstances. If moral norms prescribing omissions established unconditional, that is to say, categorical obligations, an individual during his sleep would fulfil these obligations—sleeping would be an ideal state from the point of view of morality. (Kelsen 1950, 11)

It is not clear whether Kelsen's statement concerning sleeping as an ideal state from the point of view of morality is to be taken as a *reductio ad absurdum*. If I have the categorical ethical conviction that one should not kill, and nonetheless I wish or dream of killing someone, I may perfectly feel guilty or ashamed for that wish or dream. These emotions are symptoms of the existence within myself of a corresponding categorical conviction. More generally speaking, having the *categorical ethical conviction that one should not kill* is one thing, having the *hypothetical ethical conviction that if one has the opportunity to kill somebody he should abstain from doing that* is quite another one. There is reason to think that Petrażycki would have rejected the transformation of the former into the latter as *arbitrary reinterpretations of facts* (cf. Sections 18.7 and 18.9.3 below).[49]

Petrażycki's point. From another point of view, one could observe that Petrażycki's emphasis on the Subject's *belief in the truth* of his representations rather than on their *actual truth*, is perfectly compatible with the research that Sigmund Freud was doing in those very years. Indeed, Freud went even further, showing that, for example, the need for atonement in certain individuals may arise not only as a consequence of their realistic representation of having committed some crime (i.e., having instantiated a normative hypothesis) but also by virtue of the mere *wish* to commit it, when that wish is backed by a narcissistic overvaluation of one's own psychical acts (e.g., Freud 1966, sec. 4.7).

[47] But see (earlier than Petrażycki) Zitelmann 1879, 222, and Bierling 1894, 76.

[48] I shall use the pipe (|) character to signal that I am referring to a normative conviction, not to some linguistic phenomenon.

[49] Another option is to hold that categorical normative convictions are hypothetical normative convictions whose normative hypotheses are constantly being instantiated. In this case, however, the difference is retained, if in a cognitively less salient way.

Now, I think that Petrażycki's distinction can be upheld considering that there is at least one psychological difference between a hypothetical normative conviction and a categorical one. *If you have a hypothetical normative conviction, you can try to avoid the instantiation of the normative hypothesis without experiencing some ethical repulsion toward this attempt*. This does not hold for circumstances eliciting ethical emotions in the case of categorical normative convictions. Consider the categorical conviction |Give alms to the beggars you run into|. This is different from the normative conviction |*If you run into a beggar*, you should give him alms|. In this latter case, you would not feel guilty if you should decide to change your usual route in order to avoid running into a certain beggar. If some third spectator should hold such a hypothetical normative conviction, this person would neither be indignant at you for doing that nor disapproving of you. In the case of a categorical normative conviction, instead, such a behaviour could be disapproved of as a form of *normative avoidance*.[50]

In my opinion, Petrażycki's conception implies that the question whether a conviction is categorical or hypothetical should be viewed as an empirical one. A certain normative conviction is categorical if—when transformed into a hypothetical one—the avoidance of the instantiation of its "normative hypothesis" elicits ethical repulsion. It is instead hypothetical if such avoidance does *not* elicit any ethical repulsion.

Finally, it should be remarked that it is perhaps easier to conceive categorical normative convictions concerning abstentions from action than concerning engagements in action (but recall |Love thy neighbor as thyself|). This may be why the only example Petrażycki gives is |Thou shalt not kill|.[51]

18.6.2. Addressees

As a second possible cognitive element Petrażycki mentions the representation of the *addressees* of a certain normative conviction, namely, the "representation of individuals or classes of people […] or other beings [*suščestva*] […] from which a certain conduct is ethically required [*ėtičeski trebuetsja*]" (Petrażycki 1955, 44; 1909–1910, 47). This element he calls *subjectual representation* (*sub"ektnoe predstavlenie*).

Since Petrażycki draws a distinction according to whether the subjectual representation concerns (1) certain spatiotemporally individuated beings, (2) the class of all beings, or (3) certain subclasses thereof, this cognitive ele-

[50] Needless to say that this phrase is modelled on *tax avoidance*. On the phenomenon of *command avoidance*, see Section 18.11 below.

[51] Petrażycki neglected to discuss the case of categorical normative convictions that admit of exceptions (|Thou shalt not kill, except in self-defense|). I think that in order to accommodate such phenomena a distinction should be made between *affirmative*-hypothetical normative convictions and *negative*-hypothetical ones, the latter being like categorical normative convictions in every respect except that they leave room for exceptions.

ment makes it possible to distinguish three kinds of normative convictions corresponding, *mutatis mutandis*, to the traditional concepts of (1) an *individual norm*, (2) a *general norm*, and (3) a *special norm*.[52]

Now, it may be asked whether special normative convictions can be transformed into general hypothetical normative ones, or the other way around. We should devote a few words to this important issue, which unfortunately was left unattended by Petrażycki.

Consider the following ethical conviction: |Employees must wash their hands before returning to work|. It could be argued that the concept of an addressee can be replaced by the concept of a normative hypothesis, and that the historical event of having been employed is one element of the normative hypothesis making up that normative conviction (the other element being having gone to the restroom). Conversely, consider the example Petrażycki gives when discussing hypothetical normative convictions: |In God's temple we must conduct ourselves thus and so|. This normative hypothesis could be transformed into the following one: |The class of people who are in God's temple must conduct themselves thus and so|. Likewise, |Ye shall kindle no fire throughout your habitations upon the Sabbath day| (Exodus 35:3) could be transformed into |The class of people who are on Sabbath day ought to kindle no fire anywhere in their habitations|. Now, since addressees are necessarily *animate entities*, while normative hypotheses seem to be able to encompass whatever *reality* (if by *reality* we understand a hypernym for the three main naive ontological kinds: entities—whether or not animate—, qualities and events), some purported principle of economy of thought might seem to require that we should do away with the concept of an addressee and replace it with an all-embracing concept of a normative hypothesis.

Arguably, even in this case (cf. the previous Section 18.6.1) Petrażycki might have replied that such a reduction is an *arbitrary reinterpretation of psychological facts* (cf. Sections 18.7 and 18.9.3 below).

I think that Petrażycki's distinction can be maintained if we adopt the framework of prototype psycholinguistics and, among others, its concept of *inherent relationality* (Croft 1991, 62–3, see also Fittipaldi 2012a) as a *distinctive feature of prototypical qualities*. The fact that *being-on-Saturday* is construed as an event rather than as a quality necessarily inherent to something or somebody[53] is mirrored by the fact that the (pseudo-)quality of *being-on-Saturday* cannot

[52] Since according to Petrażycki (see Section 18.7 below) whatever object (*predmet*) represented as animate (*oduševlennyj*) can be experienced (on this use of *experienced* see footnote 64 below) as a duty-holder (or as a right-holder), it follows that a true *general* normative conviction has as its addressees the class of all beings the Subject represents to himself as animate. It is hardly necessary to stress how this approach is compatible with the research done by Jean Piaget (1973) on child animism.

[53] According to Croft, events *may or may not be* inherently relational to something or somebody, while qualities must necessarily be inherently relational to *one* being (animate or not).

be expressed with an acceptable linguistic construction (*?John is on Saturday*). Generally speaking, the passage of time—and the consequent succession of the days of the week—is usually construed as an *event*, and events need not be relational to anything or anybody. Now, since within ethical convictions *events* (*sobytija*) play the cognitive role of *normative hypotheses* rather than that of addressees, the occurrence of Saturday must be regarded as a normative hypothesis.[54] By contrast, some individual's *being-an-employee* is typically construed by most people as a quality (or a state)[55] inherent to that individual rather than as a historical event having occurred to him (his having being employed by someone somewhere at sometime in the past). Therefore the slot of being-an-employee within an ethical conviction is that of an addressee—if we are to take psychology seriously.

Such a defense seems to be implied by Petrażycki's theoretical and methodological tenets.

18.6.3. Normative Facts

We can now turn to the third possible cognitive element of a normative conviction: the *normative fact* (*normativnyj fakt*), which Petrażycki also calls *norm-creating fact* (*normoustanovitel'nyj fakt*).[56] He gives the following examples:

1. ⌈We must act thus *because it is so written in the New Testament, the Talmud, the Koran, or the Code of Laws*.⌋
2. ⌈We must act thus *because our fathers and grandfathers did so*.⌋
3. ⌈We must act thus *because the assembly of the people has so ordained*.⌋

Ethical experiences that comprise representations of normative facts are termed by Petrażycki *positive* (*pozitivnye*) ethical experiences.[57] Ethical experiences that do not comprise such representations are called by him *intuitive* (*intuitivnye*) or *nonpositive* (Petrażycki 1939, 111) ethical experiences.

In this case, too, Petrażycki is proposing a redefinition of traditional concepts. His distinction between *positive* and *intuitive* ethical experiences roughly corresponds to the traditional distinction between *positive law* and *natural*

[54] Of course, this holds for those people who regard Saturday as the instantiation of a Sabbath where the term *Sabbath* is to be understood as the *nomen iuris* of a particular normative hypothesis.

[55] On Croft's (1991, 137) concept of state from a Petrażyckian perspective, see Fittipaldi 2012a (67).

[56] On norm-destructing normative facts see below in this section and Section 19.4 in this tome.

[57] To be sure, according to Petrażycki, there may be normative facts also in the domain of aesthetic phenomena. On aesthetic emotions as a subclass of normative emotions, see footnote 24 above.

law. Indeed, according to Petrażycki, what natural law teorists called *natural law* was nothing but the complex of their own *intuitive* ethical experiences.[58]

Let us read a passage where Petrażycki explains his distinction:

> [I]f anyone ascribes to himself an obligation to help those in need, to pay his workers the agreed wage punctually, or the like, independently of any outside authority whatsoever, the corresponding judgments, convictions, obligations and norms are then […] intuitive ethical judgments etc.; whereas if he considers his duty to help the needy "because this was the teaching of our Savior," or to pay his workers punctually "because it is so stated in the statutes," the corresponding ethical experiences (obligations and norms) are then positive […]. (Petrażycki 1955, 44–5; 1909–1910, 47–8)

Petrażycki did not explain what precisely it means to "refer to" (*ssylat'sja na*) some normative fact as the foundation of one's ethical conviction.[59] In my opinion, for something to be a normative fact in some individual it must *at once* (1) actually bring about a normative conviction in him or her and (2) be experienced by him or her as its foundation.

Since Petrażycki's concept of a normative fact seems to be made up of two elements, we could ask whether there can be solely *causative* normative facts and solely *foundational* ones. As regards the former Petrażycki mentioned the possibility that over time positive ethical convictions become intuitive, through

> processes, where the intuitive law is produced out of the positive law, […] in which legal experiences […] take an independent character, and appear *qua* intuitive law independently of the corresponding normative fact. (Petrażycki 1909–1910, 501; translation adapted from Petrażycki 1955, 238)

In this case, however, he is referring to *historically* causative normative facts, while neglecting to address the issue of *currently* causative normative facts, despite their not being drawn on by the Subject to found some ethical conviction of his. By the same token, Petrażycki neglected to discuss the issue of solely *foundational* normative facts such as, say, the Koran when erroneously used to justify female genital mutilation (cf. Fittipaldi 2012b, 39–40).

[58] To be precise according to Petrażycki "legal natural doctrines are based […] on *legal*-intuitive psyche. The foundation of these systems is a dogmatics of intuitive *law*, namely the systematic presentation of the autonomous-*legal* convictions of their authors" (Petrażycki 2002, quoted in Timoshina 2013b, 467, my translation, italics added). Nonetheless, when one thinks of such authors, like Immanuel Kant who held that homosexuality should be punished with castration, it is difficult not to view certain natural law theorists as presenting not only their own *legal* but also their own *moral* intuitive convictions (in a Petrażyckian sense). This is so because one could ask who is to be regarded as an attributive side when it comes to the prohibition of homosexuality.

[59] He also used the term *opredeljat'sja* ("to be determined"). See in this regard also the following passage: "in the domain of positive law the rules of conduct are experienced [*soznajutsja*] as binding [*objazatel'nye*] depending on [*v zavismosti ot*] certain facts represented as authoritative-normative [*avoritetno-normativnyj*] and on the grounds [*na osnovanii*] of them" (Petrażycki 1955, 228; 1909–1910, 484).

Petrażycki's concept of a normative fact *roughly* corresponds to the traditional concept of a *source of law*. It is Petrażycki himself who held that "it is possible to retain the usual […] term 'source of law' [*istočnik prava*], but only if it is referred to normative facts and if it is strongly distinguished from the law itself, from the customary law, from the statutory law, etc." (Petrażycki 1909–1910, 519; my translation). As much as the term *normative fact* may correspond to the traditional concept of a source of law, the same cannot be said of such terms as *statutory law* and *customary ethics*. By these terms Petrażycki refers not to the classes of statutes or customs but to the classes of *positive ethical psychical experiences referring to them*.

But that is only a terminological difference. A much more important difference between the traditional concept of a source of law and Petrażycki's concept of a normative fact is that in his view the "term *normative fact* must be understood to mean, not external, objective events as such, but rather *the contents* [*soderžanija*] *of the corresponding representations, the represented facts, independently of their actual existence*" (Petrażycki 1909–1910, 521; translation adapted from Petrażycki 1955, 249 and italics added). As in the case of normative hypotheses, in the case of this possible element of an ethical conviction we also are dealing with *realistic* representations (see Section 18.6.1 above).[60]

This has the significant implication that the normative fact may not exist at all in the reality external to the Subject. In other words, the realistic representation may be false and, despite its being false, it may nonetheless bring about positive-ethical convictions in the Subject.

Moreover, Petrażycki holds that (irrespective of whether a given normative fact exists or existed in external reality) the *most diverse norms*—whether or not mutually compatible—may be extracted from the *same* normative fact. On the case where *incompatible* norms may be extracted, see below, Section 18.12. Here, let us read his example of the extraction of *compatible* norms from a provision (i.e., a normative fact) under which he who commits larceny should be subjected to a certain punishment. From it one could extract such norms as:

> (1) that all persons are bound, with regard to owners, to refrain from corresponding encroachments: that owners have a right to a corresponding abstention on the part of others; (2) that one who has committed larceny is bound to tolerate the corresponding punishment: that the subject of the punitive authority has the right to punish; (3) that a judge is obligated to the state to condemn the thief to the corresponding punishment; (4) that the public prosecutor is obligated to charge the person who has committed larceny and to obtain his *punishment*; and (5) that the police are bound to conduct investigations, make arrest, and so forth. (Petrażycki 1955, 142ff.; 1909–1019, 229)

[60] Since Petrażycki speaks of *contents* of representations, it would be more precise to speak of normative facts as *objects* of realistic representations. Generally speaking, Petrażycki's adoption of the noun *fact* in the phrase *normative fact* is misleading, as it conveys the idea that normative facts should exist outside the Subject. Other terms, such as *normative object* or *norm-active object* would be preferable. In this essay, I shall stick to Petrażycki's terminology.

I will address some of these issues in greater detail when discussing the different kinds of normative facts described by Petrażycki (Sections 18.10 and 18.11).

In addition to norm-creating normative facts, Petrażycki also discusses such norm-destructing normative facts as repealing statutes (which will be discussed below in Section 18.9.4).

18.7. Moral vs. Legal Phenomena

We can turn now to Petrażycki's distinction between moral and legal phenomena.[61]

Petrażycki viewed his distinction as *stipulative*.[62] Although he maintained that his distinction roughly coincides with nontechnical usage, it is *not* meant to so coincide but is rather meant to select classes of phenomena with the proper degree of generality for adequate theories (see Section 18.2 above). This is the only criterion by which his distinction should be evaluated.

Here is how Petrażycki drew the distinction between moral and legal phenomena:

> Obligations conceived as free with reference to others—obligations as to which nothing appertains or is due from obligors to others—we will term *moral obligations*.
>
> Obligations which are felt as unfree with reference to others—as made secure on their behalf—we shall term *legal obligations*. (Petrażycki 1955, 46; 1909–1910, 50)

In other words, while in the case of moral obligations there is exclusively an *imperative side* (a duty-holder), in the case of legal obligations there is *also* an *attributive side* (a right-holder), who, as it were, "owns" the imperative side's obligation. The *imperative side* (*imperativnaja storona*) and the *attributive side* (*atributivnaja storona*) are Petrażycki's own terms.

Although Petrażycki is not the first to have proposed bilaterality as a criterion for distinguishing legal from moral phenomena,[63] his conception is by far the most systematically developed one.

[61] I use *law* to render *pravo* and *legal* as the adjective of *law* (even if *legal* is not etymologically related to *law*). Indeed, as Enrico Pattaro (2005) has shown, it is misleading to translate *Recht*, *droit*, *diritto*, etc., with *law*. This holds as well for the Russian *pravo* (and the Polish *prawo*). In the case of Petrażycki, the best choice would be to translate *pravo* (and *prawo*) with the term *Right* (uppercased) and to use *jural* as its adjective. This terminological choice would make it possible to use the English term *law* to refer to Petrażycki's *positive Right* or to his *official Right* (on the concept of official "law," see Section 18.12 below), or to some combination of them (e.g. positive-official Right, with the exclusion of intuitive-official one). Here I shall keep using *law* and *legal* instead of *Right* and *jural*, so as not to depart to much from Babb's translation of Petrażycki 1955.

[62] This is not the term he used, but see footnote 6 above.

[63] As concerns other authors who espoused a correlativist conception before Petrażycki, see Motyka 1993, 138ff., and Opałek 1957, 424 n. 8. To be sure, Petrażycki never used the term *korelatywność* (Motyka 1993, 138 n. 172). A conception somewhat similar to Petrażycki's would subsequently be advanced by Bruno Leoni (2004), as well as by Giorgio del Vecchio and Gustav Radbruch (see Ossowska 1960).

As for *moral* phenomena, Petrażycki gives the examples of the obligation to help someone in need, the obligation of almsgiving, and the following ones taken from the Gospel:

> But I say unto you, That ye resist not evil: but whosoever shall smite thee on thy right cheek, turn to him the other also. And if any man will sue thee at the law, and take away thy coat, let him have thy cloke also. (Matthew 5:39–40; see also Luke 6:29)

Petrażycki comments thus:

> In the psyche of persons who have advocated and experienced or who are presently experiencing such ethical judgments, the underlying norms do not of course mean that corresponding claims [*pritjazanija*] in behalf of the offenders have been established: that the offenders have been endowed with the right to demand that the other cheek be offered by the smitten, or that someone who has taken another's coat should thereby be rewarded with the injured person's cloak as well (or otherwise has a rightful claim to that cloak). (Petrażycki 1909–1910, 57; translation adapted from Petrażycki 1955, 46)

As for *bilateral* ethical (i.e., *legal*) phenomena, they are phenomena where some individual's obligation is *experienced* as belonging to some attributive side. The attributive side is *experienced*[64] as entitled to some behaviour on the part of the imperative side.

Petrażycki gives the example of paying an agreed wage to a worker or a manservant. Another easy example (my own) could be the obligatoriness of the payment of the check at a restaurant:

1. The *owner of the restaurant* experiences
   – himself as an attributive side and
   – the customer as an imperative side.
2. The *customer* experiences
   – himself as an imperative side and
   – the owner of the restaurant as an attributive side.
3. A *third spectator*, if any, experiences
   – the owner of the restaurant as an attributive side and
   – the customer as an imperative side.

It is of paramount importance to stress that in Petrażycki's psychological theory of law, *in order for a legal relationship to exist it suffices that one Subject exist*. No more than one Subject is necessary. This Subject may experience him-

[64] Throughout this text I am using the verb *to experience*—in both its active and its passive form (*to be experienced*)—to render Petrażycki's usage of *perežívat'* and *soznavat'*. The verb *perežívat'* contains the same root as *žizn'* ("life"), and thus somewhat corresponds to the German verb *erleben*, as used by phenomenologists. As for the verb *soznavat'*, Petrażycki uses it in the sense of "to have the consciousness of", and its structure fully parallels the Latin etymology of the English adjective *conscious* (*cum-scire*).

self as an imperative side, as an attributive side, or as a third spectator. *The other two participants may also exist exclusively as objects of some realistic representation within the psyche of the only existing participant*, and the only existing participant may also be the third spectator.

> As to who or what can be the subject of legal relationships [*pravootnošenija*], obligations, and rights, the psychological theory holds that subjectual representations can correspond to all possible representations of a personal [*personal'nyj*] […] character […]. These can be objects that are not actually alive but are represented as animate [*oduševlennyj*] (such as stones, plants, and so forth), animals and their spirits, persons (including their embryos and their spirits after death), human societies and institutions, and various deities and other incorporeal spirits. Everything depends on the level of culture, religious creed, and individual peculiarities of the given man, his age and so forth (in *child law* [*detskoe pravo*] *there are such subjects of rights as dolls, which are not found in the legal mind of adults, and vice versa*). (Petrażycki 1909–1910, 416; translation adapted from Petrażycki 1955, 189–90 and italics added)

Thus the subject in a legal relationship is not necessarily some really existing person. The subject is whatever *animate entity* is the object of some realistic representation on the part of the Subject—which Subject, I should reiterate, can be the imperative side, the attributive side, or some third spectator. If the Subject should represent to himself a right of $subject_1$ in relation to $subject_2$, it suffices that $subject_1$ and $subject_2$ exist within the Subject's psyche, in his logical reality (to use Pattaro's terminology: see Section 13.5 in this tome).

In this way Petrażycki does away with the old jurisprudential issue of what a juristic person—as opposed to a natural one—should be deemed to be. According to him the *theory of law* should deal with people, animals, corpses, dolls, associations, states, corporations, or treasuries in the same *empirical* way. What matters is only the empirical issue of whether and in what way they are experienced by somebody as animate entities involved in legal relationships. Let us read in this regard a passage by Petrażycki:

> As a subject of a right, the "treasury" must not be interpreted to mean that the subject is the state: this would be an *arbitrary reinterpretation* [*proizvol'noe peretolkovyvanie*] contrary to reality. […] When we ascribe rights to the treasury in relation to ourselves or to others, we are concerned with a representation that is completely different from the representation to which the word "state" ordinarily corresponds. The representation of a state ordinarily comprises the representation of a territory and a people.[65] There is nothing of that in the representation of the treasury, which is akin to the idea of a cashbox and the like. The nature of other so-called juristic persons—monasteries, churches, and so forth—is misinterpreted in yet another sense if they are understood as combinations of persons, social organisms, and the like. In reality, the content of the relevant representations is different; thus the representation of buildings and so forth enters into the representation of "monastery," especially if it is a particular monastery known to the individual. (Petrażycki 1909–1910, 413–4; translation adapted from Petrażycki 1955, 188 and italics added)

[65] In order to avoid misunderstandings it should pointed out that this is the way Petrażycki reconstructs the *naive concept* of a state. On Petrażycki's stipulative class of states (which includes also certain nomadic peoples), see footnote 138 below.

Therefore, according to Petrażycki, the question of what a juristic person *is* should be translated into the question of what is *experienced as* a juristic person, and should thus solved in a purely psychological way. In this way Petrażycki's conceptualization is a suitable tool for *anthropology of law*. It recommends to take seriously—as objects of investigation—the legal beliefs of all peoples on earth, even when they are totally incompatible with the scientific view of the world.

As for the completely different question of what *should be* regarded as a juristic person, Petrażycki holds that it rather pertains to *legal dogmatics* (or *legal policy*).[66] For example, a judge wishing to decide in accordance with the official law of the state he or she works for might have to refrain from recognizing a doll, a monastery, or an unborn individual as a legal subject. But this kind of issue does not as such pertain to the theory (i.e., psycho-sociology) of law (cf. Section 18.12 below).

Another point of paramount importance that must be stressed if we are to avoid misunderstandings is that *there is no a priori reason why a certain behaviour should be experienced as morally or legally obligatory*. True, certain kinds of behaviour are mostly experienced as *legally* obligatory, while others are instead mostly experienced as *morally* obligatory. But, according to Petrażycki's theory, *any* kind of behaviour can be experienced in *either way*:

> In order to avoid misunderstandings in regard to […] the examples of the two kinds of consciousness [*soznanie*] of obligatedness [*dolženstvovanie*]—one's consciousness of the obligation [*dolg*] to pay an agreed wage to a worker or a manservant, on the one hand, and one's consciousness of the obligation [*dolg*] to help someone in need or not to refuse almsgiving, on the other—it is necessary to remark that we can imagine subjects whose psyche is such that, when they are faced with beggars asking for alms or the like, they experience a consciousness of obligatedness according to which the other side has a right to receive what he is asking for; the other side may [rightfully] claim that help be given to him, and the like; by the same token, we can imagine subjects who—when dealing with servants claiming payment of the agreed wage, and the like—experience a consciousness of obligatedness according to which nothing is owed to the other side: the latter may not [rightfully] claim payment, and the like. From the point of view of our (psychological) classification, such a consciousness of obligation toward beggars should be classified as the consciousness of a *legal* obligation; such a consciousness of obligation toward servants should be classified as the consciousness of a *moral* (not a legal) obligation. (Petrażycki 1909–1910, 51 n. 1; my translation and italics added; see also Petrażycki 1909–1910, 106 and 1955, 75)

[66] Petrażycki (1895, 462–3) also devised a specific concept of juristic person for his *legal policy*, which can, by rights, be called an *economic analysis of law*, *ante litteram*. Even in this context he rejected the distinction between natural and juristic persons. Here *a person is nothing but an ideal station of goods in the process of distribution*. This is why he called the person a *Vertheilungsstation* (or *Güterstation*), namely, a "distribution station" (or "station of goods"). This station is something ideal (*ideell*), that is, something existing exclusively within the Subject as the object of some representation of his (cf. also Petrażycki 2010a, 565). Also ideal is the *Verbindung* (connection) between rights, claims, legal transactions (*Rechtsgeschäfte*), etc., and the *Vertheilungsstation*. All this implies that nothing prevents policymakers from creating a *Vertheilungsstation* with the *name* of some god or whatever they like. Generally speaking, "in the modern world there are more *Güterstationen* than people" (Petrażycki 1895, 464; my translation). It is hardly necessary to stress that this concept somewhat resembles Kelsen's concept of *Zurechnungspunkt* (point of ascription).

Now, Petrażycki's distinction between moral and legal phenomena has been criticized as too overly skewed toward private law (see the authors discussed in Motyka 1993, 146ff.). The distinction has been argued to be incompatible with criminal law, administrative law, and the obligations of the judge.

These objections can be discarded if we bear in mind the two points that have just been made:

1. In order for a legal relationship to exist, it suffices that *one* Subject exist.
2. The question whether a certain behaviour is experienced as legally or morally obligatory is an empirical one—it cannot be solved theoretically.

If these two points are borne in mind, it is quite easy to reply to Ziembiński's objections to Petrażycki's distinction. Ziembiński's starting point is that obligations such as the obligation to display the nation's flag on private buildings on national holidays or the obligation not to pollute the environment can only be *legal* obligations (Ziembiński 1980, 350, quoted in Motyka 1993, 150). Since Ziembiński fails to find a right-holder, he concludes that Petrażycki's distinction is wrong. Ziembiński completely misses the point. He looks for a priori answers to questions that can be answered only a posteriori, namely, the question whether these obligations are experienced as moral or legal ones and the question of who is experienced as an attributive side—provided that those obligations are actually experienced as legal ones.

As regards the judge's obligations, we may begin by noting that, from a Petrażyckian perspective, the judge is probably to be regarded as an attributive side in an authority relationship. Authority relationships are a kind of legal relationship in Petrażycki's terms (Section 18.11 below). By those very terms, that suffices to call this a *legal* phenomenon. As for the obligation of the judge to decide in accordance with the (official) law[67], rather than according to personal preference, the question whether the judge experiences this obligation as a moral or a legal one is, again, empirical. Moreover, nothing excludes that the judge might abide by the (official) law out of non-ethical reasons (cf. Lande 1925a, 347). Likewise purely empirical, in case the judge should experience his or her obligation as a legal one, is the question whether entities like a god, the people, the truth, the state, or the party who is in the right, are experienced by him or her as attributive sides, attributive sides having the "right" that he or she decides in accordance with what he or she deems to be the (official) law.

Two final remarks are in order here.

First, Petrażycki's stipulative distinction between law and morality implies that *games* are *legal* phenomena:

[67] On Petrażycki's concept of official law and its connection with legal dogmatics, see Section 18.12 below. There is also addressed the difficult problem arising from the fact that on Petrażycki's definition of official law whatever law the judge applies is turned into official law by definition.

> The rules of games (such as games of cards, checkers, chess, dominoes, lotto, forfeits, bowls, billiards, cricket, etc.), which determine [*opredeljajuščie*] who can and should, in what order and how, accomplish the various actions involved therein […], all represent, from our point of view, legal norms. They are of an imperative-attributive character. (Petrażycki 1955, 64; 1909–1910, 88–9)

Second, *Petrażycki denied that there can be such a thing as purely attributive phenomena*. Jacek Kurczewski, by contrast, pointed to some phenomena that cannot be understood except in these terms. As Kurczewski puts it: "Rightful claims need not be correlated with duties. Thus a soldier has the right to kill the enemy but any duty of the killed to submit to the killer would negate the essence of war, and slaughter would take place instead" (Kurczewski 1976, 7; a discussion of pure attributive phenomena can be found in Fittipaldi 2012a, sec. 4.5 and 274, and 2012b, 50).

18.8. Features Associated with Moral vs. Legal Phenomena

As noted, Petrażycki set out his distinction between moral and legal phenomena in order to select with the proper degree of generality phenomena that fit into adequate theories. In this section I will give an account of six properties that according to Petrażycki correlate with moral or legal phenomena.

18.8.1. Possible Fulfilment of Some Legal Obligations on the Part of Persons Other than the Imperative Side

Petrażycki contended that the presence of a right-holder diverts *attention* away from (*a*) the behaviour expected of the duty-holder toward (*b*) the *concrete result* that is the main concern of the right-holder.

Aside from (or instead of) having a representation of the behaviour owed by the duty-holder, the right-holder represents to himself the useful effects that will result when the imperative side complies with its obligation. It is these useful effects that matter to the right-holder.[68] For the right-holder the duty-holder's fulfilment of an obligation "is merely a means of attaining these effects" (Petrażycki 1955, 203; 1909–1910, 443). The duty-holder knows that and focuses on these effects as well. Therefore, *while in the case of moral phenomena the focus is on the behaviour of the duty-holder, in the case of legal phenomena the focus may be exclusively on the useful effects pursued and expected by the right-holder.*

An important corollary of this theory is that in law, unlike in morality, there may be cases where *it does not matter who actually fulfils an obligation*. It just matters that it be fulfilled.

[68] Elsewhere (Fittipaldi 2012a, 218ff.), I argued that this may be why in some languages the term for *debt* stems from the idea of the usefulness the attributive side may draw from the imperative side's action (as is the case with the Ancient Greek χρέος) or from the representation of the thing the imperative side is to give to the attributive side (as is the case with the Latin *aes*).

Thus, if what is owed to the right-holder is furnished to him by others (and not by the duty-holder), as where the amount due to the creditor is paid to him not by the debtor but by his kinsman or acquaintance, all is then well from the point of view of the law, and the proper performance has been rendered (Petrażycki 1909–1910, 71; translation adapted from Petrażycki 1955, 54).

In other words, "the fulfilment of legal obligations is possible without participation and without any sacrifice by the imperative side, provided that what is due to the right-holder is furnished by someone" (Petrażycki 1955, 100–1; 1909–1910, 154).

This theory does not exclude that in certain cases the right-holder may have an interest that a certain obligation—by reason of its strictly personal nature—be fulfilled by a specific person. Petrażycki's hypothesis only excludes that *a moral obligation can be fulfilled without personal involvement of the duty-holder.* To this extent, this theory is falsifiable in Karl Popper's sense.

18.8.2. The Possibility of Representation in the Field of Legal Phenomena

In the case discussed in Section 18.8.1 third persons act "in their own name and account,"[69] without the duty-holder even knowing that some third person may wish to pay for him. Now, if that is possible, "it is understandable and natural that [legal] obligations can be fulfilled […] through representatives—third persons acting by virtue of special legal relationships to the duty-holder, in his name and for his account" (Petrażycki 1955, 101; 1909–1910, 155).

But representation is something more than the mere possibility for a person other than the duty-holder to "terminate" (by payment) the right-holder's obligation.[70] A representative is also regarded as able to "create" obligations in the name and on the account of the prospective duty-holder, who in turn is not regarded as a duty-holder by any participant until the representative's activity is carried out. Moreover, in addition to "representation of the imperative side [be it prospective or not] […], there may also be legal representation of the attributive side" (ibid.). These two aspects of representation explain why "a contract may create obligations between two newborn infants" (ibid.).

What Petrażycki neglects to explain is how the attributiveness of certain ethical phenomena (i.e., their being *legal* phenomena) explains the emergence of representation not only for the termination of obligations but also for the creation of new ones.[71]

[69] Babb's translation contains a mistake here. He refers the reflexive possessive adjective *svoj* in the phrase *postoronnimi licami, dejstvujuščimi ot svoego imini i na svoj sčet* to the duty-holder rather than to the third persons (i.e., the *postoronnye lica*. Cf. Petrażycki 1909–1910, 155 and 1955, 101).

[70] In order to avoid this "projective" terminology, we should rephrase the last part of this sentence as follows: "to terminate (by payment) some or all participants' belief in the existence of the right-holder's obligation".

[71] This issue is probably bound up with that of the emergence of illusions of legal entities (e.g., obligations) as distinguished from projective qualities (e.g. obligatedness or obligatoriness), as well as with that of the emergence of legal illusions unrelated to current legal convictions.

18.8.3. The Possibility of Coercion in the Field of Legal Phenomena

Petrażycki contends that only legal phenomena involve coercion (*prinuždenie*), or coercive fulfilment (*prinudetel'noe ispolnienie*).

The attributive side usually does not care whether or not the imperative side fulfilled its obligation voluntarily. What matters to the attributive side is just to reap his "useful effects". That is why in the field of legal phenomena coercion can play a role. That is in contrast to the field of moral phenomena, where if the duty-holder

> is not doing the bidding of the moral imperative, but is subjected to physical force which leads to the same outward result as if he had fulfilled his obligation—as where what he should have given voluntarily is taken from him by force—this does not constitute a realization of the imperative function (the only function which exists in morality) and there is no fulfillment of a moral obligation. (Petrażycki 1955, 102–3; 1909–1910, 156–7)

Now, it could be objected that Petrażycki draws this conclusion because he only takes into account those moral obligations that have as their object *actions*. Had he also taken into account moral obligations that have as their object *abstentions from actions* (e.g., the abstention from using contraception), then he would have been forced to admit that coercive fulfilment may take place in the field of morality as well.

But I think that this does not invalidate Petrażycki's hypothesis, if taken in a weaker version under which *coercion positively correlates with imperative-attributive phenomena*. That is so simply because, if in the case of moral and legal phenomena alike there can be *indignant* third spectators, it is only in the field of legal phenomena that there can *also* be attributive sides who are more likely than third spectators to resort to violence, because as attributive sides they aim to get what they feel entitled to (or require that violence be used in order to let them get it).

In order to avoid misunderstandings, it should be stressed that Petrażycki's concept of coercion is much more restrictive than the broad concept of *Zwang* ("coercion") used, for instance, by Hans Kelsen (1960b, 34). Petrażycki's concept of coercion does not encompass such phenomena as revenge or punishment.[72] As for revenge, Petrażycki deals with it under the heading of the conflict-producing nature of legal phenomena (Section 18.8.6 below), whereas he deals with punishment under the headings of *pati – facere* legal relationships (Section 18.9.3) and that of authority (Section 18.11).

18.8.4. The Role of Intentions in the Field of Moral Phenomena

According to Petrażycki "a legal obligation can be fulfilled also if the behavior of the imperative side [i.e., the duty-holder] took place fortuitously without his

[72] A similar nonconflation of coercion and punishment can be found in Axel Hägerström. See in this regard Section 13.6 in this tome.

wish and intent, as where he acted absentmindedly or mechanically, or otherwise independently of intent (Petrażycki 1909–1910, 158; 1955, 103).

This is so because in the field of legal phenomena what matters is only that the attributive side reaps the "useful effects" deriving from the fulfilment of the obligation. A moral obligation, by contrast, can never be fulfilled unintentionally.

18.8.5. The Role of the Motives of Fulfilment in the Field of Moral Phenomena

While "the satisfaction of the moral duties requires the presence of moral motives," the "law is indifferent to the motives of fulfillment" (Petrażycki 1955, 104; 1909–1910, 159).

This hypothesis is different from the hypothesis discussed in Section 18.8.4. That hypothesis concerns the possible *lack* of any intention whatsoever in the field of legal phenomena. This one instead concerns the *kind* of intention the duty-holder must have, *provided he has one*. While in the field of moral phenomena the duty-holder must have the *right* intention, that need not be the case in the field of legal phenomena. As Petrażycki puts it, the action of a legal duty-holder may be "evoked by extraneous motives entirely unrelated to law (such as egoistic motives, a desire to attain some advantage for himself, or fear of disadvantage) or even by evil motives (such as the wish to compromise the obligee)" (ibid.). Instead, if some moral duty-holder fulfils his obligation out of reasons other than the proper ones, this will elicit ethical repulsion (i.e., indignation) in third spectators.

It bears stressing, in order to avoid misunderstandings, that neither in this case nor in the case of a duty-holder acting mechanically or absentmindedly are we dealing with any *ethical* phenomenon whatsoever within the imperative side's psyche. The *legal* phenomenon is located within the psyche of one or both of the other possible participants (i.e., the attributive side or the third spectator) and consists in the appulsion that one or both of them may experience toward fulfilment, irrespective of its taking place for ethical or nonethical causes.[73]

18.8.6. The Conflict-Producing Nature of Legal Phenomena vs. the Peaceableness of Moral Phenomena (and the Unifying Tendency of Law)

Petrażycki sets up a contrast between law and morality by noting that in the domain of *morality* there is a tendency for fulfillment (when it amounts to furnishing material advantages) to arouse gratitude, love, sympathy, while nonfulfillment does not arouse malicious or vengeful reactions. In the domain of

[73] By the same token, in the case of moral phenomena, the moral psychic phenomenon consists of some third spectator's ethical repulsion toward some duty-holder who fulfils an obligation out of nonethical reasons.

law, by contrast, there is no tendency for fulfilment to arouse gratitude, while there is a tendency for "non-fulfillment […] to [be] experienced […] as a loss […], as an aggressive action", thus possibly prompting malicious or vengeful reactions (Petrażycki 1955, 111; 1909–1910, 169–70).

As Peczenik (1975, 89) summed up this contrast, "the legal psyche is aggressive, while the moral psyche is nonaggressive" (on this point see also Lande 1959b, 874; 1975, 25).[74] The attributive side experiences the imperative side's nonfulfilment as an aggression and thus reacts accordingly.

It could be objected to this thesis that aggressive reactions can be observed in the domain of legal and moral phenomena alike. Also in morality is it possible to observe third spectators becoming indignant at the non-fulfilment of some obligation or violation of some prohibition.[75] Nonetheless, it is only in the domain of legal phenomena that angry attributive sides can be found. Moreover, from a Petrażyckian perspective, in the case of a third spectator becoming indignant[76] because some person injured a third party, that third spectator is to be regarded as experiencing a legal emotion, not a moral one.[77]

The possible different reactions on the part of an attributive side and a beneficiary in case of satisfaction or disappointment of a normative expectation[78] are summed up in Table 1.

Table 1. Different reactions in case of satisfaction or disappointment of normative expectations (within round brackets are the phenomena Petrażycki neglected to consider)

		SATISFACTION	DISAPPOINTMENT
BENEFICIARY	Morality	Gratitude, (peace of mind)	Peace of mind, (indignation)
ATTRIBUTIVE SIDE	Law	Peace of mind	Anger

[74] In this regard, Petrażycki's conception is similar to Lundstedt's: see Section 15.2.1 in this tome.

[75] Cf. Ranulf 1964 (1), who defines *moral indignation* as "the emotion behind the disinterested tendency to inflict punishment". But Ranulf's definition embraces also, and foremost, the cases where indignation is aroused by the fact that some person has injured a third party. On this issue, see shortly in text, as well as Fittipaldi 2013b and 2013c.

[76] To my knowledge, nowhere did Petrażycki distinguish *anger*, as the attributive side's ethical repulsion, from *indignation*, as the third spectator's. He seems to use the terms *gnev*, *negodovanie*, *vozmuščenie* as synonyms. This notwithstanding, there is at least one passage where Petrażycki (1909–1910, 89; 1955, 65) uses the term *pravovoe negodovanie* ("*legal* indignation", italics added). Therefore, one may ask whether in addition to *legal* indignation there is also a *moral* one. Moreover, in the same passage Petrażycki seems to equate an "outbreak of imperative-attributive emotions" (*vspyška imperativno-atributnivnyh emocij*) to *pravovoe negodovanie*, therefore this passage is an argument for the reduction of Petrażycki's ethical emotions to more modern emotions like anger, indignation, etc.

[77] In the language of modern psychology, we could say that we are facing a phenomenon of identification with the victim.

[78] I am using here Luhmann's (1969) terminology to clarify Petrażycki's point.

Petrażycki's ethical solipsism, along with his criterion for selecting *legal* phenomena, implies that *law is a dangerous phenomenon*. On this view, law is not at all a means *ne cives ad arma ruant*, namely, a means by which to attain peace. More to the point, because opinions as to the existence and compass of mutual obligations and rights may well not coincide, legal phenomena often are "a source of destruction, a dangerous explosive material" (Petrażycki 1955, 113; 1909–1910, 172).

In Petrażycki's theoretical framework, the possible coincidence or compatibility of legal opinions is *not* taken for granted but is rather taken up as a sociological problem, namely, that of describing and explaining the mechanisms that to some extent counteract the natural divergence of legal opinions—a divergence that can be expected even where there is no bad faith in anybody (Petrażycki 1909–1910, 177; 1955, 116). Now, since rights and obligations do not exist in a world external to the Subject (be it psychical or physical), the fact that different Subjects may have coinciding or compatible opinions about the existence (or non-existence) of rights and obligations cannot be explained in the same way as we might explain the coincidence of their opinions about the existence (or non-existence) of, say, chairs, apples, mountains, and the like.[79]

Now, Petrażycki dealt at length with this issue and maintained that, *associated with the conflict-producing nature of legal phenomena*,

> on the ground of, and explained by, socio-cultural adaptation [*prisposoblenie*] *is the tendency of law to development and adaptation in the direction of bringing legal opinions of the parties into unity, identity and coincidence*, and in general *toward the attainment of decisions as to obligations-rights which possess the utmost possible degree of uniformity and identity of content from both sides, and*—so far as may be—*exclude or eliminate discord*. (Petrażycki 1955, 113; 1909–1910, 172–3; italics added)

Petrażycki called this tendency a *unifying tendency* (*unifikacionnaja tendencija*). He mentioned the following "subtendencies" that contain the non-coincidence of legal opinions, however much imperfectly (Petrażycki 1909–1910, 173ff.; 1955, 112):

1. The tendency of normative facts and corresponding positive law to develop (this tendency could be called *positivization*; cf. footnote 139 below).
2. The tendency for legal concepts to become precise and definite in content and compass (this could be called *intensional formalization*; cf. Petrażycki 2002, 255–8 and Fittipaldi 2012b, 61–2).

[79] According to Petrażycki (1939, 36, 38) the principle of non-contradiction (as well as the principle of the excluded middle) holds only for objective-cognitive sciences (i.e., sciences concerned with what exists outside the Subject), and legal dogmatics—understood as a science that describes the legal-dogmatic "existence" of rights and obligations—is not an objective-cognitive science but rather a subjective-relational one. On the distinction between these two kinds of sciences, see also Sections 19.2 and 20.1.2 in this tome. On Petrażycki's ideas on the role played by the principle of non-contradiction in legal dogmatics, see also Section 18.12 below.

3. The tendency for the "existence" of legal obligations and rights to become contingent on facts susceptible of proof (this could be called *extensional formalization*; cf. Petrażycki 2002, 258–60 and Fittipaldi 2012b, 61–2).
4. The tendency toward subjecting disputes to the jurisdiction of a disinterested third party (this could be called *jurisdictionalization*).
5. The tendency of legal dogmatics to bring about the unification of legal convictions (see Section 18.12 below).

Petrażycki did not satisfactorily explain what it is that causes these tendencies to emerge. He did mention socio-cultural adaptation (as we saw), but his explanations are far from convincing.[80] Be that as it may, it doesn't follow from his failure to explain these phenomena that they do not exist: That we have no explanation for a phenomenon we are describing doesn't mean that the description is thereby false.

18.9. Kinds of Legal Relationships and Compound Legal Relationships

According to Petrażycki (1955, 193; 1909–1910, 426), "all possible classes of conduct can be reduced to three categories: positive actions, abstentions, and tolerances."[81] That means that the object of one's obligation can be to (1) positively *perform* an action, (2) *abstain* from an action, or (3) *tolerate* an action.

While (1) and (2) can be objects of both a moral and a legal obligation, as they concern a behaviour of the duty-holder, (3) can only be an object of legal obligation, as the action at issue is necessarily the right-holder's.

Thus, Petrażycki set out three kinds of legal relationships depending on whether the right-holder is experienced[82] as entitled to a *facere*, a *non facere*, or a *pati* on the part of the duty-holder. In the third case the right-holder is entitled to the duty-holder's tolerance of the positive action he or she (the right-holder) performs.

By introducing both the duty-holder's and the right-holder's points of view, Petrażycki gave the following names to the three possible legal relationships: (1) *facere – accipere*; (2) *non facere – non pati*; and (3) *pati – facere*.

It should be reiterated, to avoid misunderstandings, that according to Petrażycki, in order for a legal relationship to exist it suffices that *one* side ex-

[80] Some hypotheses are advanced in Fittipaldi 2009. There is probably not a simple answer to all these questions. See, for example, the hypothesis that Max Weber (1978, 270) put forward to explain why the ancient Greeks, unlike the Romans, did not develop a formal system of law (see also Fittipaldi 2012b, 59ff.). In regard to jurisdictionalization, it could be observed that it is a long road until two strangers (or social groups)—without kinship or other bonds—accept to subject their dispute to a third stranger qua judge. Also this phenomenon requires an explanation.

[81] This tripartite classification of actions is not original with Petrażycki himself: See Bierling 1894, 242.

[82] On this use of *experienced*, see footnote 64 above.

ist. Moreover, a legal relationship can exist even exclusively in the imagination of a third spectator.

Let us now discuss the Petrażyckian legal relationships in some detail. After discussing Petrażycki's three kinds of legal relationship, I will address the question of whether Alexander Rudziński—a pupil of Petrażycki—was right to introduce a fourth kind of legal relationship, namely, *pati – non facere*.

18.9.1. Facere – Accipere

Here the duty-holder is experienced as obligated to do something for the right-holder and the duty-holder is experienced as entitled to that performance. This may consist of "paying a certain sum of money, furnishing other objects, performing a certain work, of rendering other services," etc. (Petrażycki 1955, 54; 1909–1910, 71)

Petrażycki did not analyze either this kind of legal relationship or the others in terms of ethical appulsions or repulsions. Had he done so, then perhaps he would have maintained that, in order for this legal relationship to (psychically) exist, the imperative side, the attributive side, or the third spectator must have the disposition to experience an appulsion toward the imperative side's *facere* as well as a repulsion toward whatever else imperative side's action that should be empirically incompatible with the carrying out of that *facere*.[83]

A further question is whether the duty-holder's *facere* must necessarily consist of some activity that can somehow be received (from *accipere*, "to receive") by the right-holder.

In my opinion, what matters is only that the attributive side is experienced as entitled to the imperative side's *facere*, not that that *facere* can be somehow "received" by an attributive side. A sentinel, for example, may experience his superior as entitled to have the sentinel himself keep guard, even though there is nothing to be "received" in a strict sense.[84]

18.9.2. Non Facere – Non Pati

Here the imperative side is experienced as obligated to abstain from a certain conduct, such as "encroaching on the life, health, honor of the attributive side." What belongs to the attributive side in these cases is termed by Petrażycki (1955, 55; 1909–1910, 72) "negative freedom,"[85] "immunity" (*neprikosnovennost'*), or "safeguarding" (*obrannost'*).

[83] For an analysis of this issue, see Fittipaldi 2012a, sec. 4.4.1.

[84] A. W. Rudziński (1947, 23) instead distinguished a passive *accipere* of the attributive side from an active one.

[85] Petrażycki's use of the term *negative freedom* has very little, if anything, in common with the similarly named distinction drawn by Isaiah Berlin (1958). Actually, as will be seen shortly, Petrażycki's definition of *positive freedom* covers certain freedoms that Berlin would instead characterize as *negative* (such as the freedom of speech or the freedom of association).

18.9.3. Pati – Facere

Here the imperative side is experienced as obligated to tolerate or suffer certain actions of the attributive side, for example,

> uncomplainingly enduring certain unpleasant conducts originating with the right-holder […] such as reproofs or physical punishments […]; tolerating oral or printed communications and propagandas by the right-holder of religious, political, and other opinions, the organization of public assemblies, meetings, and so forth. (Petrażycki 1955, 55–6; 1909–1910, 73)

What belongs to the attributive side in this case is termed by Petrażycki "positive freedom" (*položitel'naja svoboda*, *svobododejstvie*).

In this context, in order to better understand Petrażycki's psychological method, it is in order to recall how Petrażycki criticized Rudolf Bierling (1841–1919) for his contention that the obligation of *pati* can be reduced to the obligation to not encroach on the attributive side's action (*non facere*), on the view that "a request that something be tolerated is *nothing but* [*nichts anderes als*] a prohibition" (Bierling 1894, 243; my translation, italics added).

Understanding Petrażycki's criticism of this kind of reductionism is crucial to understanding the method of his psychological theory of law. According to him the reduction of actions of tolerance to ones of abstainment or non-opposition (where we abstain from engaging in any counteraction) results from the application of an unscientific method. He speaks of an *arbitrary reinterpretation* (*proizvol'noe peretolkovyvanie*) *of facts* from the point of view of practical considerations (in that forebearances are equivalent to abstentions, or omissions, if measured by their practical result, and the like). The psychological method, by contrast, studies what is found in one's psyche, irrespective of whether this has any practical outcome. What matters is the actual representation of the object of the obligation, or objectual representation (*ob"ektnoe predstavlenie*):

> There are […] cases of the consciousness of a duty of tolerance in a field wherein ordinarily there is not even a thought of opposition or of abstention therefrom, and from which the corresponding association of ideas is excluded: such are cases of the consciousness of a duty to tolerate patiently and without repining—to endure submissively—diseases, ruin, the death of those near to us, and other misfortunes sent down by the omnipotent God. Here the idea of opposition and of abstention therefrom—as in general in the field of the relations with the Almighty—does not *ordinarily* arise at all: it is already forestalled and eliminated by the idea of omnipotence. Moreover it is ordinarily a matter of enduring, not actions or events which are impending (so that the idea of averting or hindering them is admissible), but events which have already taken place. The obligation to endure with submission the death of one who is near, or other unhappiness sent down by God, excludes the thought of opposing or hindering: not merely because the other party is omnipotent, but because the event has already occurred. As to the time prior to the event—for instance, before the onset of the death of one who was dear—the consciousness of a duty to endure misfortunes sent down by God does not exclude resort to the physician and the like, although this means an attempt not to permit the onset of the threatening event. (Petrażycki 1955, 194; 1909–1910, 427–6)

Petrażycki's methodological refusal to arbitrarily reinterpret (psychic) phenomena is the reason why it was previously argued (in Section 18.6) that the reduction of categorical normative convictions to hypothetical normative ones and the reduction of addressees to normative hypotheses (and vice versa) are incompatible with Petrażycki's theory and method.[86]

In this regard it is useful to contrast Bierling's account of the experience of the obligation to tolerate a penalty with Petrażycki's account. According to Bierling:

> It must be denied that there are cases where by tolerance we *understand* something *more* than a pure omission, for example, when we talk of the duty of the convicted person to tolerate the penalty. In these cases […] there is always only a mixture of *action* and *omission*. (Bierling 1894, 243; my translation and italics replacing spaced in the original)

Petrażycki replied that whether or not a convicted person *inwardly* accepts the penalty matters a lot. An innocent convicted person may comply with all the rules of the prison where he is serving his sentence, but he may nonetheless not experience an obligation of tolerance. Let us read a passage that unfortunately was not included in Timasheff's compilation:

> If a criminal who has committed a serious crime is sitting shackled in prison, and if circumstances are such that he cannot think of an escape or of any other opposition, this does not in any way exclude that he can experience a more or less emotionally strong and vivid consciousness of the obligation to suffer the punishment. An example could be a person of normal ethical development […] who has done a bad and evil deed as a consequence of a particular confluence of circumstances. To the jailer and to others it may be completely indifferent whether this person experiences an obligation of tolerance: Any opposition, any attempt to escape, and the like, is ruled out, and that is enough. But from a psychological point of view there is here a peculiar […] noteworthy phenomenon with further psychic and physical consequences. If somebody who has been jailed does not experience an obligation of tolerance (supposing, for example, that he has been convicted, thrown into disrepute, and jailed as a consequence of a wrongful prosecution and of dirty intrigues, without being guilty), he might turn crazy (as often happens), or die out of despair, or start scraping the walls, ripping his chains, etc. (This would not in any way signify an attempt to *oppose* anything: It would simply be a release [*razrjady*] of strong emotions of anger [*gnev*], etc.) (Petrażycki 1909–1910, 428; my translation and italics added)

Therefore, it matters a lot whether or not the jailed person experiences himself as an imperative side in a *pati – facere* legal relationship.

Let us now devote a few words to the right-holder in such a legal relationship. Petrażycki says nothing in this regard. If the right-holder experiences an ethical appulsion toward his own *facere*, this appulsion must be something different from the appulsion experienced by a duty-holder toward his own *facere* in a *facere – accipere* legal relationship. Elsewhere (Fittipaldi 2012a, sec. 4.4.3) I have argued that in *pati – facere* legal relationships the attributive side's ap-

[86] Quite similarly, I will be arguing (in Section 18.11) that Petrażycki's normative facts cannot be reduced to elements of normative hypotheses.

pulsion toward his own *facere* could be understood in terms of a release of (otherwise restrained) aggressiveness that somewhat backs (or encourages) the attributive side when exercising or standing up for his or her rights.[87]

However that issue is taken, we can conclude by stating that what Petrażycki conceives here is a proper *Recht auf eigenes Verhalten* (a right to one's own behaviour)—a category that a few years later Hohfeld would regularly reduce to either mere *absences of duties* (i.e., "privileges") and/or to *rights to noninterference*.[88] According to Hohfeld rights always concern the behaviour of some subject *other* than the right-holder. Thus, for example, some party's right to eat shrimp salad (despite its giving him colic) should be reduced to "that party's respective privileges against A, B, C, D and others in relation to eating the salad" and to his "respective rights […] as against A, B, C, D and others that they should not interfere with the physical act of eating the salad" (Hohfeld 1964, 41). There is no need to stress that a reconstruction of that kind—as much as Bierling's one—would have been rejected by Petrażycki as an arbitrary reinterpretation of facts.

18.9.4. Pati – Non Facere, Legal Non-Experience, and Repeal

We can now turn to the criticism that has been directed at Petrażycki for not recognizing a fourth kind of legal relationship: *pati – non facere*. This discussion will also enable us to discuss Petrażycki's concept of repeal.

To my knowledge, the first author to have stated that Petrażycki's classification should be completed by adding this fourth kind of legal relationship was Alexander Witold Rudziński (1900–1989) in his *Z logiki norm* (On the logic of norms: Rudziński 1947; but see also Sztykgold 1936). This fourth kind of legal relationship, among others, was arrived at by him via negation. He contended that "the negation of a legal relationship produces, on the duty-holder's side, *a right* […] to the contrary behaviour, and, on the right-holder's side, […] *an obligation* to the contrary behavior" (Rudziński 1947, 27; my translation).

Thus, if the negation of the *facere* in a *pati – facere* legal relationship brings about a *non facere – non pati* legal relationship, the negation of the *facere* in a *facere – accipere* legal relationship should bring about some sort of *pati – non facere* legal relationship, provided that it is acceptable to equate a *non accipere* to a *pati* (see Table 2; cf. Rudziński 1947, 57).[89]

[87] This is compatible with Petrażycki's (1904, 57–60) ideas on the role of rights in pedagogy and on their influence on character. Since according to Petrażycki imperative-attributive emotions have a mystic-authoritative nuance his ideas can be compared to Olivecrona's (1939, 98–9; but see also Fittipaldi 2012a, 176). On Olivecrona's conception of rights see Section 14.3 in this tome.

[88] This might be a result of Bierling's indirect influence on Hohfeld: See Postema 2011, 100.

[89] In this way we obtain four kinds of legal relationships, which to some extent correspond to the four deontic modalities: *obligatory*, *prohibited*, *permitted*, and *omissible* (cf., in this regard, Fittipaldi 2012a, 164).

Table 2. How Rudziński devised *pati - non facere* legal relationships

DUTY	RIGHT	DUTY	RIGHT
pati	*facere*	*facere*	*accipere*
non facere	*non pati*	*pati*	*non facere*

Among the examples of *pati – non facere* legal relationships given by Rudziński are the (1) the "right" of a wounded soldier not to perform his duty, (2) the "right" of a sick worker not to work, and (3) the "right" of a taxpayer not to pay a given tax after it has been repealed.

I think Rudziński's completion is necessary. Actually, *facere* and *non facere* exhaust all possible sorts of behavior on the part of the imperative side or of the attributive side, respectively,[90] while Petrażycki did not explain the *fundamentum divisionis*[91] on which basis he distinguishes three kinds of imperative side's behaviour (*facere*, *non facere*, and *pati*) that according to him can be the object of an attributive side's right.[92]

Jerzy Lande (1953–1954), Petrażycki's most faithful pupil, instead stuck to Petrażycki's idea that there are three kinds of behaviour (*facere*, *non facere*, and *pati*) and thus rejected Rudziński's proposal. According to Lande, Rudziński's *pati – non facere* legal relationships are nothing but *phenomena consisting in a lack of legal phenomena*.[93]

In my opinion, Lande and Rudziński are both right, each in his own way. As for Lande, he points to an important phenomenon (better yet, a "non-phenomenon"), namely, *legal non-experiences*. Lande was wrong, however, to reduce Rudziński's *pati – non facere* legal relationships to phenomena of legal non-experience.[94] As for Rudziński, he was right to contend that Petrażycki's distinction of three kinds of behaviour is scientifically unsound.

Now, if on the one hand we accept Petrażycki's contention that obligations of tolerance (*pati*) are ethical phenomena not susceptible of reduction to obligations of action (*facere*) or abstention (*non facere*), but on the other hand we also argue that Petrażycki's distinction of legal relationships according to his threefold distinction of behaviours into actions, abstentions, and tolerances

[90] In other words the object of the right may be either the attributive side's own *facere* or *non facere*, or the imperative side's *facere* or *non facere*.

[91] I am drawing here on a logical tool that Petrażycki himself very often makes use of in his work, as in Petrażycki 1909–1910, 668 n. 1. Cf. Petrażycki 1908, 174 n. 1.

[92] This point was also made by Rudziński (1947, 22), but he also held that *pati* should be reduced to *facere* and *non facere*. I instead think that Petrażycki's contention of the irreducibility of *pati* is an important contribution to the theory of law.

[93] To be sure, Lande avoids a psychological language by using the phrase *stan pozbawiony regulacji prawnej* (state devoid of legal regulation) (Petrażycki 1953–1954, 992).

[94] On the distinction between legal non-experiences and *pati – non facere* legal relationships, as well as on the linguistic purport of this distinction, see Fittipaldi 2012a, 186–200.

lacks a clear *fundamentum divisionis*, we must ask the question of *how we are to accommodate the obligations of tolerance (pati).*

In my opinion the solution is to *deny* that the obligation to *pati* is present *exclusively* in *pati – facere* and *pati – non facere* legal relationships. The obligation to *pati* should be understood as an obligation to *acknowledge (or inwardly accept) the attributive side's right*, irrespective of whether the attributive side is experienced as entitled to his own behaviour or to the imperative side's. In the case of a legal relationship of the *facere – accipere* kind, for example, the imperative side *usually* has an obligation not only to *perform* the *facere* but also to *acknowledge* that he owes that *facere* to the attributive side. If the attributive side experiences this entitlement, too, he might become angry at the imperative side if the latter should perform the *facere* out of nonethical reasons and afterward regret having done that (but see the previous discussion beginning in Section 18.8.1), or else challenge[95] the "existence" of the attributive side's right.[96]

But what exactly does the difference between a legal non-experience and a *non facere – pati* legal relationship consist in? The answer is that, when an *ethical* (i.e., legal or moral) *non-experience* is at hand, *no* ethical emotion is expected to be elicited. Instead, when a *non facere–pati* legal relationship is at hand, the opposite is true. In the case, say, a wounded soldier or a sick worker is experienced as entitled not to fight or work, we can expect that even the simple *request* to fight or work may elicit *legal indignation* within that soldier or worker, or within third spectators (on legal indignation, see footnote 76 above). Here we have a *dispensation* as the object of a right.

Rights to a *non facere* have sometimes even been explicitly stated in normative facts.[97] The example that comes to mind is the one that Kazimierz Opałek (1957, 418) took from Article 70 of the Polish Constitution of 1952: *Nobody may be compelled to participate in religious activities or rites*. Here we are not dealing with a dispensation but with a full-fledged right to abstention.

Let us now turn to Rudziński's third example, which will also give us an opportunity to spend a few words on Petrażycki's concept of *repeal*. According to Rudziński we have a *non facere – pati* legal relationship even when a previous obligation to *facere* has been repealed.

[95] On the attributive side's legal indignation in case of *osparivanie* ("challenge") of his rights, see Petrażycki 1909–1910, 89.

[96] Another aspect of this duty to *pati* is the imperative side's duty to endure without lamenting the attributive side's *claim* that he perform the *facere*. In my opinion, this is the way Hägerström's observations in this regard can be worked within the framework of Petrażycki's theory. On this see also Section 13.5.1.2 in this tome.

[97] To be precise, this sentence should be rephrased as follows: "Texts have been produced by people who have the legislation in their hands to the goal of bringing about imperative-attributive convictions concerning a prospective attributive side's *non facere*." In passing, it is worthwhile to recall that Petrażycki used the phrase *imejuščie v svoih rukah zakonodatel'stvo* ("those who have legislation in their hands") at least twice (Petrażycki 1985d, 468; 1909–1910, 498), and that that phrase was not inserted in Petrażycki 1955.

To understand what is wrong with Lande's objection to Rudziński (namely, that in this case we are dealing with nothing but legal non-experiences) it is first necessary to get acquainted with Petrażycki's conception of a *repealing statute*.

According to Petrażycki *repealing statutes are normative facts*. *They are not normative convictions* (or *norms*). *The function of repealing statutes is to purify (očiščat') the legal psyche of certain legal convictions*. That is why once the legal psyches have been purified, there is no reason to keep republishing them (Petrażycki 1909–1910, 328; 1955, 157).

Repeal is a psychological phenomenon. If a repealing statute is aimed at repealing another one, repeal is accomplished in some individual's psyche once the (realistic representation of the) previous statute ceases to produce any effect in that psyche. Aside from psychological repeal, Petrażycki's conception also allows for a sociological concept of repeal. A repealing statute may be described as *sociologically efficacious* if to a sufficient degree the psyches of people in a certain community are "purified" of the normative convictions that the repealing statute aims to remove, and the cause of this purification is the repealing statute itself. Now, if a repealing statute is efficacious in some psychological or sociological sense, Lande is right. There is ethical non-experience (or absence, in my equivalent use of those two terms) of ethical phenomena.

But the efficaciousness of repealing statutes cannot be taken for granted. Repealing statutes are often thought to bring about an *immediate* state of affairs (e.g., Conte 1989; see also Section 12.6 in this tome). But this is what is believed to happen in the *Bereich des Sollens* (domain of "ought"). In other words, this is the point of view of legal dogmatics (see Section 18.12 below).

In the *Bereich des Seins* (domain of "is"), by contrast, repealing statutes may be more or less efficacious.

To be sure, in modern states the inefficaciousness of repealing statutes is an unusual phenomenon, and this may be why the point of view of legal dogmatics is taken as correct for the theory of law as well. But according to Petrażycki this is wrong.

Indeed, there are examples to be found of the inefficaciousness of repealing statutes. Petrażycki so describes the situation after the repeal (*otmena*) of serfdom in Russia:

> Some peasants—chiefly those who were aged—preserved for decades, and to the end of their lives, the earlier mentality of the law of serfdom and were unwilling to know and to acknowledge the reform, declaring to their former masters that they considered it their sacred duty to serve faithfully and truly also for the future (Petrażycki 1955, 240; 1909–1910, 503).

All this implies that there is no purely theoretical way to know a priori whether a repealing statute (*a*) produces no effect whatsoever, (*b*) produces the experience of *pati* – *non facere* or *facere* legal relationships, or (*c*) completely removes certain normative convictions.

We are now equipped to analyze Rudziński's third example. If a statute aims to repeal some tax, we can usually expect its effect to be quite immediate, such that from that point onward officials will no longer be trying to collect that tax. But this is an empirical hypothesis. It cannot be ruled out that in some inefficient state certain officials might keep collecting taxes that have been officially (or, better yet, *legal-dogmatically*) repealed. If some citizens should *rebel* against that because they know about the repealing statute, they may be experiencing repulsive ethical emotions. This could be viewed as amounting to the existence of a *pati – non facere* legal relationship within those citizens' psyches.

18.9.5. Compound Legal Relationships

18.9.5.1. Ownership

Even ownership, according to Petrażycki, is a purely psychological phenomenon. It exists solely in the psyche of one who attributes a right of ownership to himself or to another.

Ownership is a *compound* legal relationship. A person who ascribes a right of ownership to the individual X with regard to the thing T (*a*) experiences himself and others as obligated to tolerate any kind of action by X with regard to T (*pati – facere*), and (*b*) experiences himself and others as obligated to abstain from every sort of action with regard to T (*non facere – non pati*) (Petrażycki 1909–1910, 190; 1955, 124).

In other words, according to Petrażycki the right of ownership consists of "two legal relationships bound up with each other: the first one of the *pati – facere* kind, the second one of the *non facere – non pati* kind" (Lande 1959b, 877; my translation).

From an internal point of view, Petrażycki's conception of ownership has been criticized as being too narrow. First, it does not cover phenomena of *relative ownership*: X may be the owner of thing T vis-à-vis Y, but not vis-à-vis Z (Kurczewski 1977a, 366). Second, the range of actions permitted to the attributive side may be restricted. This is why Jacek Kurczewski called Petrażycki's conception a *monistic conception* (*monistyczna koncepcja*) and attempted to generalize Petrażycki's definition in the following way: "Between two persons the owner of the thing as for actions of the kind K is the person who has the freedom to carry out those actions—a freedom that others must respect [*respektować*]" (Kurczewski 1975, 162; my translation).

In my opinion, Kurczewski's definition has two easy-to-fix problems. It mentions neither *non facere – non pati* legal relationships nor *pati – non facere* ones. That is why I think that Kurczewski's definition could be improved in the following way: *X is experienced as the owner of a certain thing T vis-à-vis the imperative side Y if X is experienced as the attributive side in some*

pati – facere, pati – non facere, *or* non facere – non pati *legal relationship involving T*.[98]

18.9.5.2. Authority

Another compound legal relationship is authority (*vlast'*). Since its discussion presupposes a detailed discussion of the different kinds of normative facts, it will be discussed in Section 18.11.

18.10. The Different Kinds of Normative Facts and Positive Ethical Phenomena

In this section I will discuss in some detail the kinds of normative facts and positive ethics discussed by Petrażycki. Petrażycki discusses them in the context of legal phenomena because, as we know, legal phenomena are in his view much more conducive to positivization than moral ones (see Section 18.8 above). I prefer to use the broader term *positive ethical phenomena* in order to call the attention to the fact that, according to Petrażycki, next to positive *legal* phenomena there also exist positive *moral* ones. Moreover, as he explicitly states, the very same (representation of a) normative fact may bring about moral phenomena in one individual and legal ones in another.

18.10.1. Statute (Zakon)

Statutes are defined by Petrażycki as *"someone's legal directives* [*rasporjaženija*]*—qua objects of representation* [*predstavljaemye*]*—insofar as they play the role of* [*javljajutsja*] *normative facts (i.e., insofar as those* [*podležaščie*] *representations exert a corresponding influence on someone's legal psyche by arousing, removing, or modifying imperative-attributive experiences)"*[99] (Petrażycki 1909–1910, 543, my translation and italics added; cf. 1955, 258–9). Statutory law (*zakonnoe pravo*) is the class of "imperative-attributive experiences referring [*so ssylkoj*]

[98] More on Petrażyckian ownership can be found in Fittipaldi 2013b, 2013c, and 2012a, 272–80. Perhaps the redefinition offered in text should be further broadened so as to also include *facere – accipere* relationships, where the owner X of T, as a consequence of his being the owner of T, is entitled to a certain (kind of) *facere* on the part of the imperative side Y (who in turn may also be somehow connected to T). This further broadening would make it possible to also accommodate certain legal phenomena such as serfdom.

[99] I use the phrase *qua objects of representation* to render the Russian present passive participle *predstavljaemyj* (being represented) of the verb *predstavljat'* (to represent)—a term systematically used by Petrażycki in order to point out that he is speaking of *representations* and their *contents*. Babb in his translation (Petrażycki 1955) often neglects to translate these terms. Further, Babb translates in most cases the noun *predstavlenie* ("representation") with *idea* (a term that rather corresponds to the Russian term *ideja*).

to someone's unilateral legal directives—qua objects of representation [*predstavljaemye*]—as normative facts" (ibid.).[100]

Petrażycki sharply criticizes the idea that in order for some directive to be a statute, it would have to be enacted in accordance with the constitution, or *verfassungsmäßig* (Petrażycki uses this German term in 1909–1910, 534, 536; cf. 1955, 254–5). As an argument, he points to the possibility that, as a matter of fact, a certain directive may be experienced as a statute without having been enacted in accordance with the constitution, while another one may *not* be experienced as a statute despite its having been enacted in accordance with it.[101] Moreover, he also points out that on this definition a constitution should not be considered a statute at all. That is because not only

> constitutions of revolutionary origin [but also] constitutions of peaceful origin have been compiled and promulgated without the observance of the established form, for the simple reason that, prior to the publication of the constitution, there was no form of any sort established for the publication of statutes. (Petrażycki 1955, 254–5; 1909–1910, 534, 536)

According to Petrażycki "[w]hat is essential for the presence of a statute and of statutory law is not the enactment [*izdanie*] in the established form, but the presence of corresponding imperative-attributive experiences, the presence of the legal-psychical action [*dejstvie*] of a certain provision, as a normative fact" (Petrażycki 1909–1910, 537, my translation; cf. 1955, 255–6).[102]

In order to avoid misunderstandings, it is of paramount importance to stress that Petrażycki sharply distinguishes—if not always explicitly—(*a*) the question of whether a certain (thought) object instantiates a certain kind of normative fact, and so it is a statute, a custom, a judgment, etc., from (*b*) the question of whether a certain normative fact, like a statute, is experienced as *binding*[103] by a certain individual, by people at large, by a certain set of indi-

[100] In order to avoid misunderstandings, I should recall the fact previously pointed out (in Section 18.6.3) that Petrażycki consistently uses the term *law* (*pravo*) to refer to *a class of psychical experiences*. Consistently, a term such as *statutory law* (and others like it, such as *customary law*) refers *not* to collections of normative facts but to a certain subclass of legal experiences so caused and justified, i.e., the legal experiences caused by the representations of statutes and justified on that basis.

[101] On Petrażycki's examples, see at greater length Fittipaldi 2013a.

[102] As pointed out by Cotterrell (2015, 11): "A Petrażyckian approach would not focus on identifying 'pedigree tests' of what is to count as legal or non-legal by looking to see from what social sources the regulation in question has been brought into being. Instead it would focus on the subjective experiences of those who encounter the regulation".

[103] Petrażycki uses a variety of terms to refer to a normative fact's *playing the role of a normative fact* within someone's psyche. For example, he uses (*a*) the following nouns or adjectives+nouns: *dejstvie*, *prestiž*, *avtoritet*, *sila*, *objazatel'noe značenie*, *normativnoe značenie*, (*b*) the following participles or adjectives: *dejstvujuščij*, *objazatel'nyj*, and (*c*) the following verb: *dejstvovat'*. In order not to confuse the reader, I will constantly use the terms *bindingness*, *binding*, and *to bind*. In this connection one might ask whether a normative fact that does not play the role of a normative fact in anybody's

viduals (such as officials), or else, from (*c*) the question of whether a certain normative fact has been enacted *verfassungsmäßig* (as well as whether it at all exists or existed in external reality).

Since also *Verfassungsmäßigkeit* (namely, constitutionality, the quality of being in accordance with the constitution) indeed plays some role in Petrażycki's overall conception of law, for the sake of simplicity, I will refer to that feature by the more general term *validity*.[104] This role will be explained below in Section 18.12. For the time being, we can say that, according to Petrażycki, what matters in the *theory of law* (i.e., psychosociology of law) is only the *psychological bindingness* of a statute (or of any other kind normative fact), while its *validity*—namely, its having been produced or recognized in accordance with some procedure—plays a role solely within the domain of *legal dogmatics*.

The way Petrażycki sharply sets in contrast *bindingness*, on one hand, to *Verfassungsmäßigkeit*, or *validity*, on the other, could be criticized for neglecting the possible *causal connection* between *validity* and *bindingness*—a causal connection pointed out by Axel Hägerström (see Section 12.6 in this tome). In other words, there is no reason to rule out the possibility that a directive's constitutional enactment (its having been *validly* enacted) has any *causal* significance in explaining why someone might experience it as binding.

In order to avoid misunderstandings it should also be stressed that nowhere does Petrażycki maintain that the bindingness of a statute (or of some other normative fact) amounts to its *efficaciousness*, namely, its causing people to comply with it.[105] The bindingness of a statute means only that it is experienced as the cause and justification of an individual's normative conviction, but having a normative conviction does not unfailingly causes the people who have it to comply with it.

psyche is still a normative fact. The answer is that here it becomes apparent that Petrażycki is setting out types (or εἴδη) of normative facts by a sort of phenomenological epoché (or bracketing) that sets aside not only the assumption of their external existence but also that of their bindingness. On the possibility of a phenomenological interpretation of Petrażycki see Timoshina 2011, 2012, 2013a, 2013b and Section 20.1 in this tome. See also, in this regard, Walicki 1992, 236–7.

[104] I am borrowing this way of using the term *validity* from Enrico Pattaro, who calls a directive *metonymically* valid if it has been validly enacted through activities that congruently instantiate the type of circumstance (a type of procedure, for example) set forth in a competence norm (Pattaro 2005, 149 and chap. 2).

[105] I use the term *efficaciousness* to refer to what Pattaro (2005, 109) calls *effectiveness* in the context of directives (in the context of norms he uses *efficaciousness* in the way I do here). He calls *effective* those directives "that contribute to carrying a conative effect" (ibid., 197), and according to him "the production of such effects [amounts to] the directive being complied with" (ibid., 196). On this last point there is perhaps a difference between Petrażycki and Pattaro. Petrażycki *never* contends that experiencing an ethical appulsion toward (or a repulsion for) a certain action unfailingly causes the performance of that action (or the abstention therefrom). Nor, as I point out in text, does Petrażycki contend that the bindingness of a normative fact unfailingly causes its efficaciousness or effectiveness.

18.10.2. Custom (Obyčaj)

Petrażycki's definition of custom is one of his most original contributions to legal theory. He defines *customary law as the class of imperative-attributive experiences involving the representation of a mass conduct as a normative fact*: "I (or we, or he, or they) have a right to this, or are bound to that, because it was always heretofore observed, because our forebears acted so, etc." (Petrażycki 1955, 263; 1909–1910, 553).

This definition is completely different from any other definition hitherto proposed. Nonetheless, it captures an important aspect of the naive conception of custom, namely, its role when it comes to the justification of the Subject's conduct ("I did that because everybody does"). What the people object of representation *actually* do or have done in the past does not matter. What matters is only what the Subject *realistically represents to himself*,[106] what he believes to have taken place. Whether that belief is true or not does not matter from the point of view of the theory of law.[107] The Subject's "ancestors may have known nothing whatever of the custom ascribed to them or have acted in a completely different way" (Petrażycki 1955, 248–9; 1909–1910, 519–20).

Thus Petrażycki's customary law is a purely psychological phenomenon.

In order to avoid misunderstandings, it should be stressed that *customary law is a completely different phenomenon from intuitive law*. In intuitive legal phenomena there is no representation of a fact that causes and justifies an individual's normative conviction. For example, in Petrażycki's conceptualization, the taboo of incest could be hardly viewed as a phenomenon of *customary law* (or morality). In most—if not all—cases it should be regarded as a phenomenon of *intuitive law* (or morality).[108] In passing, it bears recalling here that according to Petrażycki (1909-10, 481) intuitive law adapts itself more easily than customary law to historical evolution (*istoričeskoe razvitie*).[109]

Finally, it is worth recalling that Petrażycki distinguished two kinds of customary law: (1) *staroobraznyj* (modelled on antiquity) and (2) *novoobraznyj* (modelled on novelty). In the first kind of customary law the principle is *the*

[106] On the concept of realistic representation, see Section 18.6.1 above.

[107] But it usually matters from the point of view of legal dogmatics. See Section 18.12 below.

[108] From a Petrażyckian perspective, it goes without saying that the conceptualization of the taboo of incest as a legal or a moral phenomenon depends on the presence or absence of the representation of an attributive side (experienced as having the right that incest does not occur). If we read Freud (1966, cf. also De Waal 1998, 162) from this perspective, the attributive side may have been the father (or the chief of the "primal horde") up to the age when the taboo of incest has become a moral phenomenon. Nowadays, in case of incest with minors, it is perhaps the minor who is experienced as an attributive side.

[109] From this perspective, LGBT rights should be viewed as originating from intuitive legal phenomena, which do not have anything in common with customary legal phenomena.

older, the more binding; in the second one the principle is *the more widespread, the more binding*[110] (Petrażycki 1909–1910, 553–4; 1955, 264–5).

18.10.3. Kinds of Normative Facts Related to the Activity of the Courts

Petrażycki distinguishes three kinds of normative facts related to the activity of the courts: (1) the practice of the courts (*sudebnaja praktika*), (2) a single *praejudicium* (*otdel'naja prejudicija*), and (3) the res judicata (*res judicata*).

The courts' practice assumes the role of a normative fact if certain "legal obligations or rights are ascribed with reference to the fact that such is the court practice—that in this way analogous problems were 'always' decided by the courts or a definite higher court" (Petrażycki 1955, 272; 1909–1910, 573).

This phenomenon is often referred to by civil lawyers by such terms as *ständige Rechtssprechung*, *jurisprudence constant*, etc. (consistent line of court rulings).

Petrażycki sharply distinguished this kind of positive law from the law of a single *praejudicium*. This latter phenomenon is present when the legal experiences refer to individual *praejudicia* (Petrażycki 1909–1910, 575; 1955, 273).

Petrażycki calls *praejudicial law* (*prejudicial'noe pravo*) both the class of legal experiences referring to court practice and the class of legal experiences referring to a single *praejudicium*.

In order to avoid misunderstandings, it is of paramount importance to stress that Petrażycki's claims about praejudicial law are *purely theoretical* (i.e., psychosociological). They should not be taken to be *legal-dogmatic* or *legal-political* claims. Let us read a passage where this is expressly stated:

> The foregoing statements are statements of legal theory [*teorija prava*] which state the facts (regardless of what seems desirable or proper from the practical point of view) without predetermining questions of legal dogmatics [*dogmatika*] or legal policy [*politika prava*] as to whether or not the binding significance [*objazatel'noe značenie*] of this law should be acknowledged (and, if so, upon what conditions and to what degree). (Petrażycki 1909–1910, 576; translation adapted from Petrażycki 1955, 273–4)

Indeed, this is Petrażycki's consistent approach as to all the normative facts he discusses.

As normative facts, *praejudicia* stand in contrast to a third kind of normative fact related to the courts' activity, namely, *judgments*. Petrażycki calls the resulting kind of law *judicial law* (*judicial'noe pravo*).

Here the judgment referred to is the very judgment sought by the litigants. In the case of praejudicial law, by contrast, the legal experiences refer to judgments issued for *other* (previous) litigants.

[110] The terms Petrażycki uses here are *prestiž* (prestige), *avtoritet* (authoritativeness), and *ėmocional'naja sila* (emotional force). On this terminology, see footnote 103 above.

According to Petrażycki, judicial law is a phenomenon closely associated with the imperative-attributive nature of law as well as with the corresponding need to eliminate conflicts and unify legal convictions (see Section 18.8.6 above). In this phenomenon he expressly includes the decisions of any third party called on to decide some legal dispute, *including the "father, mother, nurse or companions in the case of childish legal disputes"* (Petrażycki 1955, 274; italics added; 1909–1910, 577).

As a matter of fact, Petrażycki observes that a judgment "eliminates or renders unimportant the earlier (conflicting) legal views of the parties […] and substitutes for them a third legal view with reference to the fact that a court or a judge (official or otherwise) has so decided" (Petrażycki 1955, 274; 1909–1910, 576–7).

It is also worth stressing that in Petrażycki's theory of law (that is, in his psycho-sociology of law) there is no such thing as a *Stufenbau* à la Kelsen.[111] Nowhere does Petrażycki argue that our experience of judgments as binding is a phenomenon to be explained by having recourse to some other binding normative fact —indeed, a *meta-…* normative fact—by virtue of which judgments, as a matter of fact, happen to be experienced as binding.[112]

18.10.4. Books (Knigy)

Even books—that is "collections of legal statements compiled even by a private person—sometimes acquire in legal life a normative significance [*normativnoe značenie*] similar to that of legislative codes" (Petrażycki 1909–1910, 579–80; translation adapted from Petrażycki 1955, 276). In such cases legal experience refers to what is written in such and such a book. Petrażycki mentions, for example, the Sachsenspiegel and the Talmud. This kind of legal experiences he calls *knižnoe pravo*, literally "book law".

18.10.5. Communis Doctorum Opinio

In addition to books, Petrażycki mentions the opinions accepted in legal science (*nauka prava*): "Earlier jurists held legal science to be a source of law and ascribed binding significance [*objazatel'noe značenie*] to the opinions commonly accepted therein" (Petrażycki 1955, 279; 1909–1910, 586).

[111] On the compatibility of the idea of a *Stufenbau* with Petrażycki's legal dogmatics see Section 19.4 in this tome.

[112] On the possibility of *meta-…* normative facts as well as of resulting *positive convictions on normative facts* ("positive normative-factical convictions") in a Petrażyckian theory of law, see Fittipaldi 2014 and 2015.

18.10.6. Doctrines of Individual Jurists or Groups Thereof

Here the role of a normative fact is played by "the teaching of such and such a great jurist, or such and such a school of jurists" (Petrażycki 1955, 280; 1909–1910, 587–8).

In this context Petrażycki points to an interesting phenomenon concerning the way different kinds of normative facts may affect one another.

The opinion of some scholar about a certain normative fact (e.g., a statute) may eventually replace that very normative fact in the legal psyches, thereby becoming the only relevant normative fact. Petrażycki gives the example of Roman law, where "jurists interpreted, extended by analogy and developed a positive-law material (statutory or otherwise) which was fairly meager (the law of the Twelve Tables, the praetorian edicts, etc.)" (Petrażycki 1955, 281; 1909–1910, 588). Over time, it came to be that "the original positive bases of law were so thrust into the background and bereft of normative significance that they were no longer referred to as normative facts, and their place was taken by words of eminent jurists of an earlier time (Petrażycki 1955, 281; 1909–1910, 589).[113]

Here, too, Petrażycki is merely describing these phenomena from the standpoint of the theory of law. He is not recommending anything from the standpoint of the policy of law or of legal dogmatics.

18.10.7. Legal Expertise (Juridičeskaja Expertiza)

According to Petrażycki, one of the functions of legal scholars is to solve "legal questions at the request of private persons or societies, administrative authorities and institutions, and occasionally of the courts" (Petrażycki 1955, 282; 1909–1910, 591). These opinions are not usually experienced as normative facts. Sometimes, however, they "may be raised to that degree […] and thus [be] acknowledged as binding [*objazatel'nye*] by the court having jurisdiction of the matter which occasioned the request for the expert opinion" (ibid.). Petrażycki gives several examples.

Petrażycki held that expert law is akin to judicial law, and in certain cases, as where schools of law prepare decisions for the courts, it may not be entirely clear whether the phenomenon pertains to judicial or to expert law (Petrażycki 1909–1910, 593; 1955, 283).[114]

[113] Here Petrażycki also discusses the Laws of Citations. That discussion has not been included in Petrażycki 1955.

[114] See also Petrażycki 1909–1910, n. 2, as regards the correct way to view the judgments rendered by courts of cassation.

18.10.8. Contracts and Treaties (Dogovory)[115]

Petrażycki criticizes the theory that contracts create rights, while treaties create law (*ob"ektivnoe pravo*). According to him, treaties, contracts, and even pacts between children, when experienced as normative facts, all bring about the same kind of positive law (Petrażycki 1909–1910, 597–8; 1955, 285).[116]

Just as in the case of judicial law (above, Section 18.10.3), *nowhere does Petrażycki contend that contracts are experienced as binding because of some other binding normative fact by virtue of which contracts, as a matter of fact, happen to be experienced as binding normative facts*. Thus, Petrażycki's theory does not say anything about whether it is by virtue of Article 1372, first paragraph, of the Italian Civil Code ("Contracts have the force of law between the parties") that Italians ordinarily experience contracts as binding. In the frame of Petrażyckianism the question whether Italian legislators could abolish contracts as normative facts in the psyches of Italians is to be viewed as an empirical one. Petrażyckianism is therefore at odds with Kelsen's idea that "the parties, exercising powers delegated [*delegiert*] to them by statute, set concrete norms that prescribe their reciprocal behaviour" (Kelsen 1934b, 82; my translation).

This difference between Petrażycki and Kelsen can be framed as a difference between the standpoint of the *theory* of law (its psycho-sociology) and the standpoint of legal *dogmatics*. But this is not where the differences between Petrażycki and Kelsen end. Also divergent are their conceptions of legal dogmatics. If we assume—as I do—that Jerzy Lande's conception of legal dogmatics is to a good extent a plain development of Petrażycki's main tenets, we have to conclude that Petrażycki would never have contended that certain normative facts—of whatever kind: contracts, customs, statutes, or the like—are included *a priori* among a Subject's ultimate normative facts as transcendental conditions of that Subject's legal-dogmatic knowledge (cf. Section 19.3 in this tome). This is instead precisely what Kelsen did when contending that the constitution in a legal-logical sense includes even the *unconstitutional custom* (Kelsen 1960b, sec. 35.b, 232–3), such that one might ask why custom should

[115] Just like the German term *Vertrag*, the Russian *dogovor* means both "contract" and "treaty." I shall use both terms (*contract/treaty*) whenever necessary.

[116] Indeed, it is not clear whether according to Petrażycki contracts/treaties should be regarded as being, at one and the same time, normative facts *and* normative hypotheses. Elena Timoshina has called my attention to a passage where Petrażycki treats a *dogovor* as a normative *hypothesis* (Petrażycki 1909–1910, 340), suggesting the conclusion that contracts/treaties are indeed both (or at least that they *may* be both) a normative fact and a normative hypothesis. In Fittipaldi 2012b, sec. 3.5.8, I argued that normative hypotheses and normative facts must be kept apart. Now, if this Petrażyckian distinction is to be maintained, Petrażycki was wrong not to set contracts and commands in contraposition to treaties and statutes (the former being normative hypotheses and the latter normative facts). The same could be argued about judgments as opposed to *praejudicia* (in which regard, see also Section 18.11 below).

be included, while *pacta sunt servanda* should not.[117] Petrażycki's overall philosophical system implies that the question whether it is *advisable* that legal-dogmaticians should include custom, *praejudicia*, contracts, treaties, or other normative facts among their ultimate normative facts should not be worked out by reference to any purported transcendental philosophy,[118] but rather by an empirical science of *legal policy*.[119]

18.10.9. Promises (Obeščanija)*, Programs* (Programmy)*, and Acknowledgments* (Priznanija)

Aside from contracts, Petrażycki mentions *promises*. These are to be distinguished from *programs*, which Petrażycki also refers to as "information about future behaviour." Writes Petrażycki in this regard:

> Sometimes the legal psyche elevates even simple communications of certain persons as to the course of their future actions to the rank of normative facts, ascribing to the authors the obligation to act accordingly as regards those for whom the observance of what is announced is important, who had reason to hope for the observance, and the like. (Petrażycki 1955, 286; 1909–1910, 599)

In other words, the persons for whom the observance of what is announced is important may come to feel *anger* in the event of nonobservance, and this anger—this ethical repulsion, in Petrażycki's language—amounts to a *legal* phenomenon.

The example by which Petrażycki illustrates the way programs may bring about program law (i.e., legal experiences) is the *edictum* and the *ius honorarium* resulting therefrom in Roman law.

Still a different phenomenon, according to him, is *priznanie*, a statement by which someone to whom certain obligations are ascribed recognizes those obligations.

According to Petrażycki, this acknowledgment is an independent and special normative fact, in that "after the act of admission, *claims patently unfounded* become proper and enforceable" (Petrażycki 1955, 287; italics added; 1909–1910, 603).[120] Examples of such acknowledgments, in the

[117] On the parallelism between Kelsen's *Grundnorm* and Grotius's *pacta sunt servanda*, see Pattaro 2005, 48.

[118] Petrażycki (1985a) was sharply critical of Kant's philosophy and of that of his followers. See also, in this regard, Section 19.3 in this tome.

[119] On Petrażycki's critical stance on custom, see for example Petrażycki 2010c and Timoshina 2013b, 80 n. 10.

[120] It may be asked what "patently unfounded" (*javno neosnovatel'nyj*) means in the context of legal solipsism. In my opinion it could mean, for example, that the contract one of the participants referred to in order to found her right in relation to the other one was not validly executed. This amounts to the incorrectness of the legal-dogmatic judgment stating the "existence" of that right. On this issue from a Petrażyckian perspective see Section 19.4 in this tome.

view of Petrażycki, are charters of rights when unilaterally granted by a king (Petrażycki 1909–1910, 605; 1955, 605).

18.10.10. Precedents (Precedenty)

We have a form of precedential law (*precedentnoe pravo*) when someone claims that since a given legal problem was solved in a certain way in a certain situation in the past (and no clear or established standard exists yet for solving that problem), "this [past way of solving the problem] should 'therefore' be followed in the new situation as well" (Petrażycki 1955, 289; 1909–1910, 607). So, for example, "if a 10 was left face up when dealing the cards, and similar circumstances occur again, then the corresponding positive legal psyche will operate, referring to the precedent so as to claim that the behaviour should be the same" (Petrażycki 1955, 289; 1909–1910, 607).

This kind of normative fact should not be confused with the single *praejudicium* (Section 18.10.3 above), for in the case of precedents the role of normative fact is not played by a judgment but by some behaviour other than issuing a judgment.[121]

18.10.11. Other Kinds of Normative Facts

Petrażycki mentions further kinds of normative facts, such as *maxims and proverbs* as well as the *statements and models of conduct of religious-ethical authorities* (Petrażycki 1909–1910, 596; 1955, 283ff.). As regards the latter, Petrażycki offers examples taken from the history of Christendom, but it is not difficult to accommodate here the phenomenon of *Sunnah* in Islamic law.

Petrażycki also mentions the phenomenon that sometimes "claims are made, and obligations are ascribed, with reference to what is ordinarily done 'in the whole world' or 'in all the nations' or 'in all civilized countries' or 'in all constitutional states'" (Petrażycki 1955, 14; 1909–1910, 596), thus pointing to a phenomenon (so-called "legal transnationalism") that would subsequently play a role in the spread of human rights.

But there is a kind of normative fact he does *not* mention, namely, *commands*.[122] To this silence I will devote a few words in the next section.

[121] On the distinction between precedent and custom, see Petrażycki 1909-1910, 609 n. 1.

[122] Another kind of normative fact Petrażycki does not mention is regulations (*rasporjaženija*, *Verordnungen*, *réglements*). This is due, once again, to the absence of anything like a *Stufenbau* in his theory of law (but not so, in his conception of legal dogmatics). He would probably have viewed them as nothing but statutes. As for legislative preparatory works (i.e., legislative history, or parliamentary record) as discussed by Ross see Section 16.4 in this tome, there is no reason not to view these materials as a special kind of normative fact that Petrażycki simply forgot to mention.

18.10.12. What Do Normative Facts Have in Common with One Another?

We can now ask whether there are constraints concerning what can play the role of a normative fact. Most normative facts are *symbolic*, though they are so in a broad sense (Kurczewski 1977b, 103). But some are not, not even in a broad sense. Think of precedents. The fact that a 10 was dealt face up is not symbolic of anything. In my opinion, the feature a fact needs to have in order to play the role of a *normative* fact is that *it must be possible to extract from it some pattern of behaviour, even by the way of pure imitation*.[123] If this may perhaps be enough to rule out as normative facts (the representation of), say, pencils or steps, this is for sure not enough to rule out such "curious [*kur'eznye*] 'normative facts'" as (the representation of) a neighbour's or passerby's *dixit*, to use Elena Timoshina's words and examples (Timoshina 2011, 65; see also Section 20.1.5 in this tome). A possible explanation, for Timoshina, is that normative facts are spontaneously selected in such a way as to enhance social coordination, that is, in such a way that they contain the conflict-producing nature of legal phenomena. A different explanation, which nonetheless seems to me to be compatible with Timoshina's, could be that in order for some fact to be capable of playing the role of a normative fact it must be metonymical or metaphorical of the parental agency or of the significant others encountered by the individual during his or her primary and secondary socialization (on this question, see also the next Section 18.11).

18.11. Authority (*Vlast'*)

As anticipated above (in Section 18.9.5.2) Petrażycki conceptualized two kinds of compound legal relationship: ownership and authority. After discussing the various kinds of normative facts, we are now ready to discuss authority.

Unlike ownership, authority (*a*) does *not* involve things and (*b*) is made up of *all* three kinds (or four, if accept Rudzińzki's proposal) of legal relationships set out by Petrażycki, in the sense that the attributive side (the authority-holder) is experienced[124] as entitled to actions, abstentions and tolerances on the part of the imperative side (the subordinate).

Petrażycki distinguished two kinds of authority: *general* and *special* (Petrażycki 1909–1910, 199; 1955, 129).

General authority (*obščaja vlast'*) is a kind of legal relationship involving a *general obligation to obey any sort of command (velenie) issued by the attributive side along with a general obligation to tolerate any sort of action by the attributive side*—including corporal punishments that involve maiming or kill-

[123] Petrażycki (1909-1910, 528; 1955, 253), when dealing with this issue uses the verb *izvlekat'* ("to extract"), and the nouns *pravilo* ("rule") and *šablon* ("template", "pattern").

[124] On this use of *experienced*, see footnote 64 above.

ing. Petrażycki further sub-distinguished general authority into *limited* or *unlimited* depending on whether or not the attributive side's authority is *subject to specific exceptions*.[125]

As for *special authority*, it too involves both kinds of obligations. But it differs from general authority in that the obligations it involves are limited to a specific scope of behaviour (*ograničennye opredelennoj oblast'ju povedenija*). Petrażycki gives the example of the president of a legislative assembly.[126] This person has the right to have the members of the assembly (*a*) observe his arrangements and (*b*) tolerate his actions such as these actions and arrangements "relate to the observance of the proper order of considering the appropriate issues (*and not, for example, such as relate to the private domestic life of the members of the assembly*)" (Petrażycki 1955, 129; 1909–1910, 199; italics added).

Authority is made up of two completely different kinds of *facere* by the attributive side:

1. the *facere* (and *non facere*, if we are to accept Rudzinski's proposal: see the previous Section 18.9.4) involved in *pati – facere* (and *pati – non facere*) legal relationships; and
2. a *facere* consisting of issuing commands to subordinates—thus determining their obligations and prohibitions (*facere – accipere* and *non facere – non pati*), if the authority-holder so wishes or deems it necessary.

Two questions can be raised here: (1) Are commands normative facts and, if so, of what sort are they? and (2) What happens if an authority oversteps the limits—if any—of his authority?

Let us start with the first question. To my knowledge, nowhere in his *Teorija prava* (Theory of law) does Petrażycki state that commands are normative facts.[127] Nonetheless, two reasons can be adduced to argue that commands are normative facts.

First, Petrażycki sometimes uses the term *rasporjaženie* (provision) when discussing authority (e.g., Petrażycki 1909–1910, 208). This is the same term he uses when he defines statutes (see Section 18.10.1 above).

A second reason is that in *Ogólna teoria prawa* (General theory of law: Kormanicki 1931–1932)—a compilation of lectures based on Petrażycki's theo-

[125] From a Petrażyckian perspective, it is obvious that one should regard as forms of authority not only the authority of the *paterfamilias*'s in ancient Roman law (which authority also included *ius vitae necisque*) but also the forms of authority discussed by Lonnie Athens (1992, 28) in the context of brutalization: "Submission to authority figures requires not only obeying their commands, but equally important, showing proper respect for them as superiors. When a subordinate is perceived as being disobedient or disrespectful, an authority figure may exert or threaten extreme physical force in a brutal attempt to make the subordinate obedient and respectful".

[126] A question that to my knowledge was never discussed by Petrażycki is whether the power of judges should be viewed as a sort of special authority.

[127] But see Petrażycki 1904, 12, where he mentions a *mother*'s commands to her children.

ries—Wacław Kormanicki (1891–1954) holds that statutes, internal provisions of associations, and commands (*rozkazy*) are similar phenomena, and for the positive law that makes reference to them he proposes the term *prawo stanowione* (Kormanicki 1931–1932, 259–60).[128]

But there may be two reasons why in *Teorija prava* Petrażycki does not explicitly state that commands are normative facts.

First, only in the case of commands is the authority-holder experienced as an attributive side. But this seems hardly to apply where the authority-holder is a legislative assembly. It could actually be argued that in the case of a statute the projective quality of being an authority is shifted from the legislative assembly to the documents it produces.[129] This may be why Petrażycki sometimes uses the term *postoronnye avtoritety* (external authorities) to refer to normative facts (e.g., Petrażycki 1909–1910, 479).[130]

Second, Petrażycki may have suspected that commands are sometimes not full-fledged normative facts. That is because, by "logical" transformation, commands can be transformed into either (*a*) normative hypotheses (or elements thereof) within (hypothetical) legal convictions or (*b*) elements of categorical legal convictions.

In case (*a*) we obtain a hypothetical legal conviction, such as |*If the authority-holder issues a command*, the subordinate should comply with it|. In other words, we have here a *facere – accipere* legal relationship where the *facere*[131] is determined by the attributive side.[132] In case (*b*) we obtain a categorical legal conviction such as |The subordinate should do *whatever* the authority-holder commands|.

In my opinion, Petrażycki's psychological method implies that the question whether a command should be regarded as a normative fact, as an element of a normative hypothesis, or as an element of a categorical legal conviction is purely empirical.

Normative facts are conscious causes and justifications of possibly diverse, and sometimes ever mutually incompatible, normative convictions, while normative

[128] *Prawo stanowione* should be translated as *statutory law*. Since I view as unsettled the question of whenever legal convictions based on commands should be regarded as *statutory* legal phenomena, I prefer not to translate that term in this way.

[129] This may carry implications in that, unlike prototypical commands, prototypical statutes are experienced as binding on those who enact them (cf. Fittipaldi 2012a, par. 4.10), and are suitable to analogical construction.

[130] But recall that the authority we are discussing in this section is called by Petrażycki *vlast'* not *avtoritet*. Petrażycki uses the latter term to refer to the bindingness of normative facts. On the variety of terms used by Petrażycki to refer to the bindingness of normative facts, see footnote 103 above.

[131] This is a *facere* in a broad sense, as it could also amount to a *non facere*.

[132] On this kind of reduction, see Pattaro 2005, 123ff., 145ff. Pattaro's line of reasoning (as in Pattaro 2005, 125–6) seems to imply that *all* normative facts, rather than only commands, should be viewed as elements of normative hypotheses.

hypotheses and normative consequences presuppose specific normative convictions and concern the elicitation of ethical emotions. For example, while "Thou shalt love thy neighbour as thyself" (Matthew 22:39) was aimed at bringing about normative convictions, "Rise up, let us go!" (Mark 14:42) probably did not. "Rise up, let us go!" was aimed at giving rise to emotions, not convictions. That may be why in many languages "Thou shalt love thy neighbour as thyself" is not called a *command* but a command*ment*.

In the case where a command is not experienced as a normative fact, we face the question of whether it should be reduced to (*a*) or (*b*). In my opinion Petrażyckianism requires to view this question as an empirical one, where the distinction between (*a*) and (*b*) can be operationalized by drawing on the criterion of the ethical repulsion towards *command avoidance*—a criterion parallel to that of normative avoidance (cf. above, Section 18.6.1).

We can now turn to the second question: What happens if the attributive side oversteps the limits—if any—of his authority, by issuing a command in an area of conduct that should either *be excluded* from its reach (limited general authority) or *not be included* in it (special authority)? In other words, what happens if an authority acts *ultra vires*?[133]

My opinion is that Petrażycki's very definition of a limited or special authority implies that *there must be a factual threshold* beyond which a command ceases to be experienced as binding. If there is no such a factual threshold the authority is by definition an unlimited one.[134] If this interpretation is correct, it should be applied also to the case where the authority-holder not only issues commands but also *acts* beyond the limits of his authority. In such cases the subordinate will not experience any obligation of tolerance in regard to the authority-holder's action (e.g., an act of violence will not be experienced as a "punishment").

Before concluding this section, we should mention that Petrażycki distinguished the forms of authority not only into unlimited, limited, or special ones

[133] I know of only one passage where Petrażycki indirectly deals with this issue, and it reads as follows: "In several social organizations […] a big role is played by the right of certain persons […] that the holder of a certain authority [*władza*] perform [*wykonywał*] certain acts of authority only if he has obtained the consent of the [holder of the] *ius consentiendi*. Such a right is usually sanctioned by the invalidity [*nieważność*] of any acts performed without the consent of the holder of that right (*ius perfectum*, *lex perfecta*)" (Petrażycki 1985c, 457; my translation). The problem here is that this is one of the few passages in Petrażycki's mature works where it is not clear whether he is adopting the point of view of the psychological theory of law or that of legal dogmatics. In other words, is it the case that such an act *would* be or *should* be experienced as invalid and consequently as nonbinding?

[134] It should be observed that, as famous experiments such as the Milgram or Stanford experiment have shown, the threshold—if any—may not be as clear-cut as Petrażycki would have it. In the case of some forms of special authority there is perhaps a further threshold beyond which the commands issued by the authority-holder cannot even be taken seriously. This could be the case if the president of an assembly—to use Petrażycki's example—should issue commands that "relate to the private domestic life of the members of the assembly," as by prohibiting them from having clam chowder for dinner.

but also into *private-legal* (*publično-pravnye*) and *public-legal* (*častno-pravnye*) ones. A public-legal authority is characterized by its being experienced as obligated to act and issue commands *for the welfare of its subordinates*, while in the case of a private-legal authority such an experience of obligation is absent, and so the authority is experienced as entitled to act and issue commands in its own interest (Petrażycki 1909–1910, 728ff.; 1955, 313ff.).[135]

Of course, Petrażycki does not maintain that a public-legal authority *is* always exercised in the interest of its subordinates. In order for a certain authority to be classified as a public-legal one it suffices that that authority's acting upon egoistic considerations be experienced as an abuse (*zloupotreblenie*) (Petrażycki 1909–1910, 733; 1955, 316). In other words, it suffices that such a behavior elicit legal repulsion.

18.12. Official Law and the Role of Legal Dogmatics

Petrażycki sharply distinguished the theory of law from legal dogmatics. He uses the term *science* (*nauka*) to refer to both of them but, while he regards the theory of law as a theoretical, or descriptive science (*nauka teoretyczna*), he regards legal dogmatics as a normative, or prescriptive one (*nauka normatywna*). The correctness of the judgments produced by legal dogmatics does not depend on their correspondence with reality (i.e. their truth) but on the possibility of their *foundation* (*uzasadnienie*) *on normative facts* experienced as binding by the Subject. This is so because according to Petrażycki the judgments[136] produced by legal theory belong the broader class of *objective-cognitive judgments*, while the judgments produced by legal dogmatics belong to the broader class of *subjective-relational judgments* (see at length Petrażycki 1939, as well as Sections 12.7, 19.3, and 20.1.2 in this tome). Subjective-relational judgments do not describe reality, they rather express the Subject's attitudes in relation to it.[137]

Even though one can conceive dogmatic sciences concerned with the most diverse and curious normative facts, the most developed forms of dogmatic sciences happen to be the ones *concerned with the normative facts produced or recognized by state*[138] *officials* (at least in certain legal traditions). This is due

[135] A work that to my knowledge is yet to be done it to compare these Petrażyckian concepts with Max Weber's (1978, 1006 ff.) concepts of *Herrschaft* (domination).

[136] To be precise we should be speaking of *positions* (see footnote 38 above).

[137] It goes without saying that Petrażycki was a relativist (cf. Lande 1959d, 613: "Petrażycki jest relatiwistą"). On how to reconcile Petrażycki's relativism with his ideal of love, see Fittipaldi 2015.

[138] Petrażycki offers a stipulative definition of *state*. His starting point for defining states is his concept of an *independent social group*, namely, a group that is united (*obëdenennyj*) by one *supreme authority* (*verhovnaja vlast'*) (Petrażycki 1909–1910, 210; 1955, 133). Within independent social groups he distinguished groups united by the ascription of legal relationships of kinship (*pripisyvanie pravootnošenij rodstva*), on the one hand, and groups that are not united by

to the conflict-producing nature of legal-phenomena (see Section 18.8.6 above and Chapter 19 in this tome).

Petrażycki also offered a stipulative definition of *official* or *state law* (the two phrases are synonyms in Petrażycki), as distinguished from *unofficial law*. *Official law is "the law that is the object* [*podležaščee*] *of application* [*priminenie*] *and support* [*podderžka*] *by the representatives of state authority in the line of their duty* [*po dolgu*] *to serve society* (Petrażycki 1909–1910, 221; cf. 1955, 139).[139] *Unofficial law* is any other kind of law. In order to avoid misunderstandings, it is of paramount importance to stress that Petrażycki's definition of official law is a *descriptive definition*. Petrażycki's class of *official imperative-attributive phenomena* is made up by what state officials *actually* experience in their capacity of public-legal authorities (Section 18.11 above)[140], not by what—from a legal-political or legal-dogmatic point of view—they *should* experience in that capacity. As will be illustrated shortly, from a Petrażyckian perspective, *whatever legal conviction or normative fact state officials apply or support is turned by definition into official law or into an official normative fact*.[141] This is so even if from a legal-dogmatic point of view what they do is against the constitution.[142]

such ascriptions, on the other (Petrażycki 1909–1910, 212; 1955, 133–4). He called the latter *official groups* (*oficial'nye grupy*) or *states* (*gosudarstva*), and included in this class also certain nomadic groups (Petrażycki 1909–1910, 212-3, cf. also 1955, 135).

[139] In order to avoid misunderstandings, it should be stressed that Petrażycki's concept of official law is completely independent of his concept of positive law (see Kurczewski 1971). The representatives of state authority may well be officially authorized to draw on their own *intuitive* legal experiences. Petrażycki (1909–1910, 491; 1955, 231–2) makes the examples of sentencing in criminal law and giving marks in school. He also discusses processes of positivization of formerly intuitive-official law, and makes the example of how equity underwent positivization in England.

[140] Claims have been made that Petrażycki's extra-psychological concepts of a state and of official law are inconsistent with the psychological premises of his theory of law (for references, see Cotterrell 2015, 13; Motyka 2006, 130; 2007, 37). This is a serious objection, but I think that one could reply that, if these claims were correct, then Petrażycki's theory of law would not allow for the phenomenon of *civil war* (I am thinking, for example, of the Italian civil war of 1943–1945, as characterized by V. Ferrari 2004, 53, in the context of his discussion of legal pluralism). Now, from a Petrażyckian perspective, nothing rules out the possibility of a *civil war*. In case of civil war the Subjects—whether or not representing themselves or others as state officials—represent to themselves the members and the officials of independent social groups (in particular, states) other than their own as obligated to recognize their own supreme authority (in my example: either the king or the "Duce") and officials. The subjectivism of the Petrażyckian approach requires that we take into account the incompatible ways different Subjects *may* represent to themselves (or construct—one would say in a more modern jargon) their own independent social groups, their own supreme authorities and officials, as well as these authorities' and officials' capacities.

[141] In order to avoid misunderstandings (cf. footnote 140 above) we should rephrase the sentence in text as follows: "whatever legal conviction or normative fact (the Subject believes the animate entities he represent to himself as) state officials apply or support is turned by definition into official law or into an official normative fact (within that Subject's psyche)".

[142] In this not too far-fetched to contend that as for *theory of law* Petrażycki maintains Kelsen's (1945a, 161) Midas principle that "just as everything King Midas touched turned into

Petrażycki neglected to discuss legal dogmatics in detail and to explain the difference—if any—between the way a legal theoretician and a legal dogmatician are to "choose" their *ultimate normative facts*. This question would be tackled by Jerzy Lande (see also Section 19.3 in this tome and Fittipaldi 2013a). Here I will stick to the scanty observations to be found in Petrażycki's works.

According to Petrażycki legal dogmatics has both a duty (*zadača*) and a function (*funkcija*):

1. It has a "duty […] to protect […] the principle of legality [*princip legal'nosti*] and to cooperate toward its realization" (Petrażycki 1897, 375; my translation).
2. It unintentionally serves the function of unifying our legal convictions (Petrażycki [1909–1910, 231] speaks of a *bessoznatel'naja tendencija*, "unconscious tendency").[143]

We have seen (Section 18.10.1 above) that Petrażycki, in order to discard the definition of a *statute* in the terms of its *Verfassungmäßigkeit*, or *validity* (to use a more modern terminology), argued that it may perfectly be the case that a statute is experienced as binding despite its not having been validly enacted, or the other way around. But it would be a huge mistake to conclude that, for Petrażycki, legal dogmatics should acknowledge reality and only take into account those, and only those, normative facts which, as a matter of fact, happen to be experienced as binding by officials and people at large. The opposite is true.

I think it useful to discuss an example in some detail because it may cast more light on the way Petrażycki conceived the bindingness and the validity of normative facts.

In his *Theory of Law and State* Petrażycki devotes an appendix to the situation of official law in Russia. Here he adopts the point of view of legal dogmatics and discusses the questions of the bindingness and of the validity of the *Svod zakonov Rossijskoij Imperii*, a compilation of statutes made during the Russian empire. To understand this example, it should be borne in mind that the commission established in 1832 to make this compilation *was not endowed with legislative power*, and yet it sometimes would make substantial changes to the texts it included in it. These texts began to be experienced as binding in the amended version, while the texts that had *not* been included ceased to be experienced as binding.

gold, everything to which the law refers becomes law". But there is a huge difference. Kelsen held this view as for legal dogmatics and sociology of law *alike*, while Petrażycki held this view *only as for his theory (i.e., psychosociology) of law*. Indeed, we will be seeing shortly that Petrażycki's opinion as for legal dogmatics was opposite to Kelsen's.

[143] This aspect was stressed by Peczenik (1975, 1969).

Now, when discussing this situation, Petrażycki himself recalled that under Article 86 of the *Osnovnye Zakony Rossiskoj Imperii* (Fundamental Laws of the Russian Empire) read as follows: "No new statute shall follow without the approval of the State Council and the State Duma, nor shall it take effect without the assent of the Emperor" (quoted in Petrażycki 1909–1910, 625 n. 1).

Petrażycki reports that at his time a debate was going on about the legal significance to be attributed to the omissions and the amendments made by the commission.

According to Petrażycki, from the *point of view of the psychological theory of law*, there was no doubt that the "people's legal psyche […] deal[s] with the Svod as an autonomous set of statutes that substituted the statutes previously binding [*dejstvujuščie*] until the Svod was compiled." Still from the psychological point of view, Petrażycki remarked that

> ancient statutes […] that were not included in the Svod, or parts of their content that did not end up in the Svod do not play the role of statutes in force [*dejstvujuščie zakony*], either in the people's legal psyche or in state institutions (Petrażycki 1909–1910, 629–30; my translation)

To put it otherwise, from a theoretical point of view, the Svod was turned into *an official normative fact* playing the role of both a norm-creating and a norm-destructing normative fact (see Section 18.6 above and Section 19.4 in this tome). But Petrażycki also held that the *point of view of legal dogmatics* should be different:

> Of course, this situation or, better yet, these facts (with which not only a theorist but also a dogmatician who supports the principle of law [*princip prava*] against arbitrariness [*proizvol*] must reckon do not exclude the possibility and the obligation for legal dogmaticians [*juristy-dogmatiki*], for the senate, for the other courts to exact […] that the original statute [*podlinnyj zakon*], and not the amended one contained in the Svod, be applied, and in particular to refer [*ssylat'sja*] to Article 86 the of *Osnovnye zakony* [the fundamental laws] […], pointing to the fact that "the approval of the State Council and of the State Duma" never concerned certain propositions [*položenija*] of the Svod, but exclusively certain propositions of the original statute. (ibid., 630 n. 1; my translation and italics added)

In other words, even though a validly enacted (and not yet validly repealed) statute is *no longer being experienced as binding by the courts, officials, and the people*, it *should be* regarded as binding by *legal dogmaticians*. By the same token, legal dogmaticians *should* regard as *nonbinding* an invalidly enacted statute that is experienced as *binding* by the courts, officials, and the people despite its not having been validly enacted. According to Petrażycki the question of a statute's *legal-psychological* bindingness must be kept carefully apart from the question of its *legal-dogmatic* bindingness.[144]

[144] The term *dogmatycznie obowiązujący* ("dogmatically binding") was used at least once by Lande. See in this regard Section 19.3 in this tome.

It is apparent that Petrażycki's theory of legal dogmatics is quite different from Hans Kelsen's, who contended, for example, that any legal norm, even a statutory norm, may lose its bindingness by way of desuetude (Kelsen 1945a, 119).[145] Elsewhere (Fittipaldi 2010, 2012b, 2013a) I have given other examples to show that Kelsen's legal dogmatics, unlike Petrażycki's, is not at the service of the principle of legality and that, from a Petrażyckian point of view, it conflates the point of view of the psycho-sociology of law (or theory of law, as Petrażycki would have called it) with that of legal dogmatics.

We can now devote a few words to the unifying function of legal dogmatics.[146] Unification is achieved through activities as follows (Petrażycki 1909–1910, 226ff.; 1955, 142ff.):

1. ascertaining whether or not a normative fact exists or existed in the reality external to the Subject (e.g., the external existence of a custom; see Sections 19.3 and 19.4);
2. identifying normative facts (e.g., establishing the original text of a statute);
3. differentiating the spheres of application of different normative facts in order to avoid conflicts between them;
4. working out precise concepts (i.e., concepts whose scope or meaning cannot be stretched or compressed) for the terms used in legal texts (what I propose to call *intensional formalism*, as discussed in Section 18.8.6 above);
5. enumerating special categories of cases that should be subsumed under a certain term;
6. casuistry (*kasuistika*), namely, finding solutions to hard cases;
7. creating abstract concepts and propositions and bringing them into a systematic order;
8. using these concepts and propositions as premises on which basis to deductively solve cases whose solutions are neither directly contemplated nor predetermined by normative facts (i.e., what Phillip Heck would derogatorily call *Inversionsmethode*);
9. recourse to analogy.

Two points should be made here in order to avoid misunderstandings.

First, Petrażycki was *opposed to the teleological construction of statutes*. In his view a teleological construction of statutes would be "a hypocritical slave, openly cheating his master, and explaining his words according to his own convenience" (Petrażycki 1897; translation by Peczenik in Peczenik 1975, 91; see also at greater length Peczenik 1969).

[145] Here Kelsen uses the term *validity*, not *bindingness*, but I choose the latter term in order to avoid confusion (in this regard, see Pattaro 2005, 156).

[146] The topic is further discussed in Fittipaldi 2012b, sec. 4.3.

Second, Petrażycki *did not hold that legal dogmatics can arrive at objective truths*. Quite the opposite. He held that legal dogmatics is a sort of innocent and unintentional (*neumyšlennaja*) sophistry (*sofistika*) (Petrażycki 1909–1910, 231). For instance, he argued that "*if the main purpose of the doctrinal study of law consisted of an objective, historical study of the content of statutes, etc., it would often be forced to admit plain contradictions between […] statutes*" (ibid.; traslated by Peczenik [1975, 91]; italics added). By the same token, Petrażycki held that legal dogmaticians refuse to admit that there is "*a quantity of ambiguous expressions that can be understood in different ways with the same degree of plausibility*" (ibid.; traslated by Peczenik [1975, 91]; italics added).[147]

According to Petrażycki, in other words, legal dogmatics assumes that official normative facts do not conflict with one another, are not ambiguous, and do not contain any gaps. These assumptions are often completely false, but they make it possible for legal dogmatics to unintentionally contribute to the unification of legal experiences, thus conteracting the conflict-producing nature of legal phenomena.

[147] One could ask whether these statements are compatible with the statements Petrażycki would make in his posthumous *New foundations of logic* (Petrażycki 1939, see footnote 79 above). In my opinion they are compatible if we understand the principle of non-contradiction in the context of legal dogmatics not as a cognitive-objective hypothesis (i.e., a hypothesis concerning external reality) but as a subjective-relational decision (i.e., a postulate concerning the Subject's own internal attitudes)—a decision that the Subject may or may not adopt. See in this regard Chapter 19 in this tome, as well as Fittipaldi 2013d and 2013e.

Chapter 19

JERZY LANDE

by Edoardo Fittipaldi[*]

19.1. Introduction

Jerzy Lande (1886–1954) was Petrażycki's most faithful pupil. From a historical point of view he can be credited with having been the liaison between Leon Petrażycki and the modern Polish sociology of law developed by Adam Podgórecki (1925–1998) (cf. Kojder 2009, 22). From a theoretical point of view, among others,[1] he has the merit of having developed Leon Petrażycki's conception of legal dogmatics by both drawing on Petrażycki's posthumous works and completing that conception with some ideas borrowed from Hans Kelsen (provided that they were compatible with the main tenets of Petrażycki's theory of law).

Presenting Lande's ideas is difficult for two reasons.

First, he mostly expressed his views when discussing the ideas of other scholars, so many important ideas of his are scattered across different writings and are not presented systematically.

Second, it is often not easy to understand whether certain ideas expressed by Lande are

1) Petrażycki's, only Petrażycki did not publish them, since there was generally very little he published in his Warsaw period;
2) plain developments of Petrażycki's ideas; or
3) Lande's original contributions, to some extent departing from Petrażycki's ideas.

Presenting Lande's ideas on legal dogmatics is of paramount importance because much criticism addressed to Petrażycki's theory of law was based on the misunderstanding that his legal-theoretical statements were to be understood as legal-dogmatic ones. Unlike what Petrażycki had been wont to do in his

[*] I wish to thank Piotr Szymaniec who helped me to find two rare texts by Jerzy Lande: Lande 1947 and 1935. I wish also to thank Corrado Roversi and Filippo Valente for their extremely valuable suggestions in critiquing an earlier version of this essay.

[1] On those aspects of Lande's thought that I will not be discussing here, see Wróblewski 1959, 69ff. Generally speaking, the interpretation of Lande offered here is opposite to Wróblewski's, as he is at pains to demonstrate Lande's discontinuity with Petrażycki, while I am convinced that Lande's work can be understood exclusively within the overall framework of Petrażycki's philosophical system. As to the fact that Lande accepted Petrażycki's philosophical system without reservations, see also Waśkiewicz 1955–1957, 274.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_47

German and Russian years, in his Polish years he refrained from replying to the criticism addressed to him, so it was Jerzy Lande who took on the task of replying to it. The most systematic criticism was the one that Czesław Znamierowski advanced in his *Psychologistyczna teoria prawa* (The psychological theory of law: Znamierowski 1922). This can very well be our starting point.[2] It goes without saying that an understanding of the following discussion presupposes a prior knowledge of Petrażycki's theory of law and conception of legal dogmatics (on which the reader can refer to Chapter 18 in this tome).

19.2. From the Reply to Znamierowski to the Postulate of Uniqueness in Legal Dogmatics

Jerzy Lande replied to Znamierowski as early as during the *Narady nad teorją prawa* (Meetings on the theory of law) that took place at the Philosophical Society (*Towarzystwo filozoficzne*) in Cracow on March 25–27, 1924. But to my knowledge, the text with the most detailed reply to Znamierowski's criticism is Lande's *Socjologia Petrażyckiego* (The Sociology of Petrazycki: Lande 1959b, in particular at 864ff.).

Among Lande's replies to Znamierowski's objections to Petrażycki's theory, it is worth recalling Lande's reply to Znamierowski's attempt at *reductio ad absurdum*. Here is a selection of Znamierowski's contentions quoted in Lande's text:

> If *A* and *B* are clashing over the right of ownership over *t*, it is evident that both […] *may* view themselves as owners. Let us assume that this is the case. In this case both *A* and *B* must experience "the emotion of being owner of *t*." And, in Petrażycki's view, as soon as they experience that emotion they are owners. What judgment is to be rendered by the judge who has to decide who the owner is? It seems that such disputes should be settled by recognizing joint ownership. (Znamierowski 1922, 66; my translation)

Lande observes that Znamierowski is confusing two kinds of judgments (in a logical sense):

1) descriptive (or theoretical) ones, according to which, say, certain psychical legal experiences are taking place in *A* and *B*, namely, each of them experiences himself or herself, at the same time, as *exclusive* owner of *t*; and
2) legal-dogmatic ones, according to which, say, *A* (or *B*) *should be* regarded as the *exclusive* owner of *t*.

[2] Not only did Lande reply to Znamierowski's criticism on Petrażycki's theory of law, but he also sharply criticized Znamierowski's *Podstawowe pojęcia teorji prawa* (Fundamental concepts of legal theory: Znamierowski 1924) See Lande's contributions in Jaworski 1925 and Lande 1926. On Znamierowski see Section 20.2 in this tome. On the debate between Lande and Znamierowski, see Makarewicz 2014.

Now, Lande rightly remarks that, according to Petrażycki's theory of law, these two kinds of judgments have nothing to do with each other, and Petrażycki would surely never have maintained that if two people contemporarily claim to be the exclusive owners of something, the judge should issue a judgment to the effect that they are joint owners of that thing.

As regards the crucial distinction between the point of view of the theory of law and that of legal dogmatics, it is worth reading the following passage by Lande:

> The [legal-dogmatic] question of who the owner of *t* is […] is a normative question requiring a normative answer. The theory of law does not ask this question and has no answers to it: The [legal-dogmatic] right to a plot of land *t* is not affected by any legal phenomenon [i.e., by any psycho-legal phenomenon], and so not only is it not affected by the convictions of B, C, D (who are mentally healthy but are mistakenly [*błędnie*] convinced of having an ownership title), and not only is it not affected by the conviction of E (who is crazy), but it is not even affected by the "correct" [*"słuszny"*] conviction of A (the registered owner [*właściciel hipoteczny*]). This question is asked by each of the aforementioned people—and rightly so—but for the legal theorist it is only the selfsame process of having a conviction [*sam proces przekonania*] that can be an object of investigation; whether it is A or somebody else who is right [*ma słuszność*] or not is a question that can be answered only by the legal dogmatician by recourse to the civil code and the land registry. (Lande 1925a, 343; my translation)

Here Lande has recourse to his idea that the conditions for the correctness of legal-dogmatic statements are twofold: There is a semantic condition (the meaning of certain provisions in the civil code) and a historical one (the land registry as *current* evidence of certain *past* events (but see footnote 34 below).

This is an issue I will return to, but let us now focus on another point instead.

According to Lande, Znamierowski's *theoretical* contention that *A* and *B* cannot be at once the exclusive owners of *t* is the incorrect consequence of Znamierowski's mistakenly taking legal-dogmatic contentions for theoretical truths. The contention that *A* and *B* cannot at once be the exclusive owners of *t* is a consequence of the *postulate of uniqueness* (*postulat jedności*) typical of legal-dogmatic approaches (Lande 1959b, 867). According to Lande, this postulate is a consequence of the tendency to hypostatize the law in force into something existing outside the Subject.[3]

Here Lande seems to adopt the metaphysics emerging from Petrażycki's posthumous *Nowe Podstawy logiki* (New foundations of logic: Petrażycki 1939). In this book Petrażycki sets up a sharp contrast between objective-cog-

[3] I am using the verb *to hypostatize* to render Lande's noun *hipostaza*, and the phrase *existing outside the Subject* to render Lande's phrase *realnie istniejące* (really existing). As to Petrażycki's sometimes confusing way of using these terms and why it is better always to state explicitly if we are speaking of internal or external reality, or else to adapt to Petrażyckianism the Hägerströmian distinction between logical and effectual reality, see Section 12.5 in this tome. In this text I will be using *Subject* uppercased for the reasons explained in Sections 12.2 and 18.3 in this tome.

nitive judgments (*sądy objektywno-poznawcze*) and subjective-relational (*subjektywno-poznawcze*) ones.[4] Objective-cognitive judgments concern "what exists and how it exists, independently of whether we like it or not, whether we want it or not, whether in our opinion we should strive for it, etc." (Petrażycki 1939, 35; my translation). Subjective-relational judgments are instead

> concerned with our subjective attitude toward something that is either existing or imagined, that is, they are concerned with our sympathy for it, our liking it, our wanting it, or our dislike, our disgust, our censure, or our desire to eliminate or create something, the goals toward which we strive, principles of behavior, etc. (Ibid.; my translation)

Now, according to Petrażycki (ibid., 36, 38), the *principle of noncontradiction* and the *principle of the excluded third* hold only in the context of the objective-cognitive sciences, and not in the subjective-relational ones. This contention seems to stem from the *hypotheses that nothing can at once externally exist and externally not exist* and *that either something externally exists or it does not externally exist*. This seems to imply that Petrażycki gives an empirical interpretation of the principles of noncontradiction[5] and of the excluded third. Now, if the principle of noncontradiction by contrast does not hold for the Subject's *internal attitudes*, we must conclude that according to Petrażycki nothing prevents the very same Subject from at once hating and loving—*odisse et amare*!—the very same person, from experiencing at once ethical appulsion and repulsion to the very same action, from experiencing the very same statute as being at once in force and repealed.[6] (It should be recalled that according to Petrażycki, legal dogmatics is a subjective-relational science; therefore, in his view the principle of noncontradiction does not hold for legal-dogmatic.)

Now, according to Jerzy Lande, too, the principle of noncontradiction does not hold for legal-dogmatic judgments, because they are of a subjective-relational nature.[7] Nonetheless, the fact that subjective-relational experiences are often *hypostatized* into objective-cognitive ones induces legal dogmaticians to

[4] To be precise, Petrażycki speaks of *positions*. See Section 18.5, fotnote 38, in this tome..

[5] In Łukasiewicz's (1987) terminology, Petrażycki could be said to adopt an ontological conception of the principle of noncontradiction and that the logical principle of noncontradiction, according to Petrażycki, is a corollary of its ontological nature.

[6] One need scarcely mention how compatible this view is with Sigmund Freud's ideas in this regard: See Freud 1932, sec. 32; Matte Blanco 1998; Fittipaldi 2013e, 2013d.

[7] In the following I will focus on the role of the principle of noncontradiction because this is an issue that Lande, as well as Petrażycki, explicitly addressed. Since Petrażycki maintained that not even the principle of the excluded third holds in the subjective-relational sciences, it could be asked whether legal dogmatics is an exception. I don't think so. It bears recalling here that it is this principle that Kelsen relied on in order to argue that legal-dogmatic systems contain no lacunae: "If the legal system establishes no legal obligation of some individual to carry out a certain behavior, it thereby authorizes that behavior" (Kelsen 1960b, par. 25.g, 251; my translation).

adopt a postulate that counteracts the fact that the legal sources (normative facts) the legal dogmaticians adopt as their points of departure (dogmata) are often ridden with contradictions (see Section 18.12 in this tome). This results in the dogmaticians' belief that there is no contradiction in their system, that a statute cannot at once be in force and not in force, that a debt cannot at once exist and not exist, that nobody can at once be and not be the exclusive owner of something, and so on.[8]

According to Lande—very much in a Petrażyckian spirit—the *dogmaticians' (empirically) false assumption of the principle of noncontradiction is a fortunate mistake, for in this way legal dogmaticians are prompted to give an extremely precious contribution to the containment of the conflict-producing nature of legal phenomena*.

But this valuable practical contribution should not be mistaken for a theoretical truth. To be sure, it is practically valuable that a judge should not find *A* and *B* to be (1) at once the exclusive owners of *t* or (2) joint owners just because both of them claim to be the exclusive owners of *t*, but that fact does not exclude that it is perfectly possible for each of them to experience himself as the exclusive owner of *t*, and that it is this experience which forms the core of the phenomena investigated by legal theory.

In legal dogmatics contradictions are possible, and the principle of noncontradiction is not a hypothesis but a mere postulate—a *postulate of uniqueness*, as Lande called it—resulting from a process of socially useful hypostatization.

19.3. The Task of Legal Dogmatics and how Legal Dogmaticians Choose Their *Grundnorm*

The way Lande distinguishes legal dogmatics from the theory of law plainly corresponds to the scanty indications in this regard that can be found in Petrażycki's *Nowe podstawy* (Petrażycki 1939, 111). According to Lande, the theory of law is concerned with imperative-attributive emotions and convictions, while legal dogmatics is exclusively concerned with normative facts and their contents (Lande 1925b, 70).[9]

[8] This situation, according to Lande, is akin to that of the medieval Scholastics, who assumed that there cannot be contradiction within the Holy Scriptures or between those scriptures and the writings of Aristotle and the church fathers (Lande 1925a, 323), and so were at pains to force all those writings and scriptures into unity.

[9] To be sure, Petrażycki seems to have changed his mind in this regard, as he also contended that "in general, legal natural doctrines are based […] on the legal-intuitive psyche. The foundation of these systems is a dogmatics of intuitive law, which is the systematic presentation of their authors' autonomous-legal [i.e. intuitive-legal] convictions" (Petrażycki 1902, quoted in Timoshina 2013b, 467; my translation). This is to say that there can be kinds of legal dogmatics that also elaborate intuitive legal convictions, and not only normative facts. I will return to this question shortly.

To be precise, legal dogmatics is not concerned with normative facts proper, because in Petrażycki's terminology normative facts are psychical phenomena (namely, objects of *realistic representations*—see Sections 18.6.1 and 18.6.3 in this tome). Legal dogmatics is instead concerned with the *truth* of normative facts, where truth is understood as correspondence.[10]

This crucial difference can be appreciated by considering *custom*. A legal theorist is exclusively interested in ascertaining whether some Subject experiences his realistic representation of people behaving in a certain way as a foundation for a certain ethical emotion, conviction, or action of his.[11] This is what Lande, in line with Petrażycki, calls a phenomenon of customary law (*zjawisko prawa zwyczajowego*). From a legal-theoretical perspective, it is not necessary that the Subject's representation of a custom be true in order for a phenomenon of customary law to exist within him. It suffices that the Subject *believe* in its truth.

From the perspective of a legal dogmatician, it is instead the actual truth of the representation that matters:

> The dogmatics of customary law is aimed at ascertaining, not the phenomena of customary law, but rather the normative facts of custom (which may not be legal phenomena at all) in order to found on them legal norms.[12] (Lande 1925a, 276; my translation)

To ascertain the normative facts of customary law is to investigate whether the representation which has as its object certain people$_1$ behaving in a certain way is true. That is the question with which legal dogmatics is exclusively concerned: It is *not* concerned with whether people$_1$—provided that they exist (or existed) and that they behave (or have behaved) in that way—would, in turn, justify (or would have justified) their own behavior by invoking the behavior of *other* people$_2$. In this case also the behavior of people$_1$ would be a phenomenon of customary law. But this is a matter only for legal theory, not for legal dogmatics. Legal dogmatics is not even concerned with whether people$_1$ act in that way out of moral or legal convictions (*opinio iuris*). Even this question, according to Lande, concerns only legal theory, not legal dogmatics. Finally, according to Lande, legal dogmatics is not concerned with whether the Subject invoking the custom (who may, but need not be, a plaintiff or defendant in

[10] To be even more precise, legal dogmatics is concerned, among other things, with the question of the external existence of those—internally existent—objects of representation called *normative facts*. If it is the case that these internal objects are also externally existent, the representation of those objects is true.

[11] To avoid misunderstandings, it should be stressed that the Subject's having an ethical conviction that he should behave in a certain way does not imply that he will actually behave in that way.

[12] The Polish original: "[D]ogmatyka prawa zwyczajowego ma za cel stwierdzanie nie zjawisk prawa zwyczajowego, lecz faktów normatywnych zwyczaju (które mogą nie być bynajmniej zjawiskami prawnemi), aby na nich oprzeć normy prawa." On Lande's concept of a norm, see Section 12.4, footnote 21, in this tome.

court) actually experiences his own behavior as ethically permitted or mandatory. Even these legal phenomena concern only legal theory, not legal dogmatics. Legal dogmatics—I should reiterate—is concerned only with whether people$_1$ actually behave or have behaved in the way represented in the representation in question. This can be said, *mutatis mutandis*, of each of the normative facts discussed by Petrażycki (see Section 18.10 in this tome).

We are facing here a plain development of the main tenets of Petrażyckianism.

Now, a difference between Petrażycki and Lande seems to be that, while Petrażycki (Section 18.12 in this tome), in discussing legal dogmatics, mentioned both the (*a*) task of being at the service of the principle of legality and (*b*) the function of unifying legal convictions, Lande, to my knowledge, never mentioned the principle of legality and focused *exclusively* on the unifying function.

In my opinion, a possible reason why Lande dropped the principle of legality is that it is impossible to consistently comply with it. Indeed, Lande explicitly states that the "logical unity of every official system is an ideal rather than a real possibility" (Lande 1959d, 663; my translation).

In this regard Petrażycki seems to have had a contradictory attitude. If, on the one hand, he was very well aware that legal dogmatic systems may be ridden with flaws, indeterminacies, contradictions, inconsistencies, on the other, he never parted with (1) his conviction of the paramount importance of the principle of legality and with (2) his idea that the theory of law (i.e., not the psycho-sociology of law) and legal dogmatics should—in neither direction—interfere with one another.[13] Petrażycki held that for a legal dogmatician who cares about the principle of legality, normative facts (e.g. statutes, customs, etc.) that have not been passed (or recognized) in accordance with the constitution must be treated as *nonbinding* even if they are experienced as binding by officials and people at large, whereas normative facts that have been passed (or recognized) in accordance with the constitution must be treated as *binding* even if they are *not* experienced as binding by officials and people at large.[14]

Now, as far as I know, Lande did not discuss this formalistic aspect of Petrażycki's conception of legal dogmatics, but he did discuss the comparable positions expounded by Hans Kelsen in *Hauptprobleme*.

Of Kelsen's positions, those that in my opinion should be compared with Petrażycki's are the ones he expressed on *desuetudo* and the unconstitutional

[13] To avoid misunderstandings it bears stressing that (2) is not a corollary of (1). It is rather a corollary of Petrażycki's classification of judgments (or positions—to be precise). See Petrażycki 1939.

[14] In this regard, see above the discussion of Petrażycki's treatment of the psycho-sociological bindingness of *Svod zakonov Rossiskoj Imperii* (the code law of the Russian Empire) in Section 18.12 of this tome.

acts of the monarch. As regards *desuetudo*, Kelsen held that the "process of a purely factual repeal [*bloß faktisches Außerkraftsetzen*] of provisions is […] completely ungraspable from a legal perspective [*rechtlich völlig unfaßbar*]" (Kelsen 1923, 50; my translation). Symmetrically, as regards the monarch's possible unconstitutional acts, Kelsen took the view in *Hauptprobleme* that "the legal construction [*juristische Konstruktion*] fails [*versagt*] anytime there are violations of the constitution—as when the monarch enacts unconstitutional acts—that produce factual effects" (ibid.; my translation). While in the parallel case of the *Svod zakonov Rossijskoj Imperii* Leon Petrażycki required that legal dogmaticians fulfil their legal duty to comply with the principle of legality, in *Hauptprobleme* Hans Kelsen simply speaks of *rechtliche Unfaßbarkeiten* (legal unintelligibilities) and of *Versagungen der juristischen Konstruktion* (failures of the legal construction) because, as he argues, it would be "nonsensical [*unsinnig*] to legally justify the revolution" (ibid.; my translation). Since these problems relate to the very nature of one's conception of legal dogmatics, let us read Lande's opinion as regards Kelsen contentions:

> Kelsen states that we are dealing with acts that go beyond the limits of legal construction, with "legally ungraspable" acts. This is definitely correct [*słuszne*] from the point of view of the "law" contained [*się zawiera*] in the violated system—and it would be more appropriate to frankly speak of violations. But every such violation of one system commences a new system, new "law," just as a revolution does. And if the new law catches on [*przyjmuje się*] and lives on [*utrwali w życiu*], the dogmatician [*dogmatyk* (in the singular)] is faced with no other option than to recognize both systems as law for himself, despite their contradicting [*sprzeczne*] each other. Of course [*oczywista*], he would be acting more correctly [*słuszniej*] if, instead of stretching them into unity with false constructions [*fałszywe konstrukcje*], he openly recognized the diversity of sources and the contradiction among norms [*odmienność źródeł i sprzeczność norm*]. (Lande 1925a, 301; my translation)

It seems that according to Lande, the legal dogmatician has four options:

1. He can build a new system every time there is a violation of the constitution, thus building an endless series of new systems (*szereg nieskończony systemów*: ibid., 301), and this series *has to* be endless, as these violations are frequent, even in normally functioning states (ibid., 334, 337).
2. He can build two or more independent systems at the same time, though these systems will be, at least partially, incompatible with one another.
3. He can rely on false constructions to artificially force the unconstitutional phenomena into his previously adopted system.
4. He can simply admit that the principle of noncontradiction applies only to the reality external to the Subject, and since legal dogmatics is a subjective-relational science, not an objective-cognitive one, the principle of noncontradiction is not inherent in it but is rather a mere postulate, the viability of which may depend on the normative facts the legal dogmatician adopts as his ultimate ones.

We know that Kelsen would eventually choose the third option—not with a *false* legal construction, however, but with a *transcendental* one. He would maintain that the "insertion of custom as a law-generating legal hypothesis happens as high up as within the *Grundnorm*, understood as the constitution in a legal-logical sense [*Verfassung im rechtslogischen Sinne*]" and that "[c]ustomary law has repealing effect even as against some […] constitutional statute explicitly prohibiting the application of customary law" (Kelsen 1960b, par. 35.b, 232–3; my translation). As for the monarch's unconstitutional acts, Kelsen would likewise maintain that his alleged "*rechtslogische Verfassung*" (legal-logical constitution) also contains an *Alternativbestimmung* (alternative clause) "authorizing the legislator to produce general legal norms, even through a procedure other than the one directly established by the constitution, and to give these norms a content other than the one directly established by the constitution" (ibid., par. 35.j.β, 277; my translation).[15]

Lande's solution differs from both Petrażycki's formalistic one and Kelsen's "transcendental" one. Lande is aware that from a Petrażyckian perspective these problems pertain neither to legal dogmatics nor to the sociology of law but to *legal policy*. But in the meantime, according to Lande, legal dogmaticians have to provide judges, officials, and laypeople with answers. According to Lande, "a legal dogmatician cannot refuse to answer the question *quid juris*" (Lande 1925a, 322; my translation):[16]

> The legal dogmatician in his line of work is condemned to make use of the incomplete design [*niedoskonała koncepcja*] of the system in force. The inevitable virtual non-unity of the system owed to the collision between different "sources," namely, normative facts, is not an impossible obstacle to overcome: Dogmatic thinking [*myśl dogmatyczna*] elaborates principles on which basis cases of collision can be settled, which principles may be fixed and over time enacted into law; the evolution of legal life itself imposes the removal of certain provisions as "obsolete" and the creation of others for their the substitution or for the filling of lacunae on the part of court practice, parliamentary practice, etc. […] [S]ome fluidity and elasticity as to the determination of what is law and what is not law in the sense of the provision dogmatically in force [*przepis dogmatycznie obowiązujący*]—insofar it does not exceed certain limits [*o ile nie przekracza pewnych granic*]—does not cause damage, and is even to some extent useful, as it makes possible some evolution within the system, an evolution that the legislative machinery [*aparat ustawodawczy*] is usually unable to consciously guide, and about which science is unable to give conscious advice, owing to the lack of development of legal policy. (Lande 1925a, 336–7; my translation)

Here Lande, by drawing on Petrażycki's ideas on legal policy, is more or less contending that allowing some room to the free evolution of spontaneous law, as distinguished from legislation, may be conducive to the selection of rules

[15] Let me remark in passing that, ironically, what Kelsen wrote about a socio-dogmatic approach to *desuetudo* in 1923 (Kelsen 1923, 51) is an excellent criticism of what he would write in Kelsen 1945a, par. 12.I.

[16] The situation of a legal dogmatician, according to Lande, thus closely resembles that of the French judge according to Art. 4 of the *Code Civil*.

beneficial to society—including economically efficient rules (cf. Petrażycki, 1892, 202ff.; 1895, 582).[17]

If, from a legal-political point of view, it may be advisable—especially in default of a properly developed science of legal policy—not to determine too strictly what the law dogmatically in force is, as opposed to the law dogmatically *not* in force, a legal dogmatician could still ask how he is to select the *supreme normative facts* on which to found his own legal-dogmatic system, namely, his own subjective-relational judgments.

It goes without saying that this *selection of ultimate normative facts* largely overlaps with Kelsen's concept of the *Grundnorm*.[18] Since Lande's *Norma a zjawisko prawne* (Norm and legal phenomenon) was published in 1925, and at that time Kelsen was using the term *Grundnorm*—along with other terms, such as *Ursprungsnormen* (source norms), *Verfassung im rechtslogischen Sinne* (constitution in a legal-logical sense), and *letzte Quellen des Rechtssystem* (ultimate sources of the legal system) (e.g., Kelsen 1928b, 251, 94)—there is no strict coincidence with the terminology the modern reader is most acquainted with. But I do not think that this will create a major obstacle to understanding the following passage, where Lande discusses the proposal that Kelsen made in this regard in the *Problem der Souveränität*, and where Lande ultimately makes his own proposal:

> Kelsen […] does not cease to […] come back to the factual criteria he programmatically expunged from the field of normative knowledge. When criticizing the old conception of positiveness, understood as factual efficaciousness, he explains that the selection of a system that at least to some extent is complied with by real people—and in this way he still remains on the ground of the relativity of the system—is only a principle of "economy of knowledge," which requires "to reduce as much as possible the tension between *Sollen* [*powinność*] and *Sein* [*byt*], namely, to cognize the biggest possible content of *Sein* as being in accord with the content of *Sollen*"[19] [… If] we here forget his incorrect use of the "principles of knowledge" [20], he is only a small step away from correctly understanding the issue: Among several different systems of legal norms which from an epistemological [*naukowo-poznawczego*] point of view have exactly the same rights, the dogmatician will choose as his basis [*podstawa*] the one that in social life achieves the

[17] No need to stress how this approach is compatible with that propounded by Hayek (e.g., 1973–1979) and by modern economic analysis law, specifically as regards the pressure that ligation exerts toward the selection of efficient rules (see Postema 2011, 200; Posner 1998, chap. 8; Cooter and Ulen 1996, 376). In Fittipaldi 2009, it is instead argued, drawing on Petrażycki 2002 and on modern economic analysis of law, that litigation is conducive to formalization rather than to the selection of efficient rules.

[18] On Kelsen's *Grundnorm* see Section 8.5 in this tome and Section 2.3.2 in Tome 1 of this volume.

[19] That is my translation based on the German original: Kelsen speaks of "die möglichste Reduzierung [d]er Spannung […] zwischen Sollen und Sein" and of the tendency "möglichst viel Inhalt des Seins als mit dem Inhalt des Sollens übereinstimmend […] zu erkennen" (Kelsen 1928b, par. 24).

[20] According to Lande, this is wrong because the Subject here is confronted with a practical (in this case: political) choice, and not with principles of knowledge (Lande 1925a, 328).

maximum of force and unity, thanks to its being backed by the social organization that in a given moment becomes predominant: That is why a dogmatic science [*nauka dogmatyczna*] elaborates the law of the *state* (N) but not the law of a criminal organization roaming within that state; that is why, at the time of a state revolution, it adopts [*przyjmuje*] the law—be it legal or revolutionary—that manages to gain the prevalence of implementations [*przewaga realizacji*]; and that is also why the dogmatician can move so easily from one system to another system that just a while earlier in his eyes was "nonlaw" [*nieprawny*, "nonlegal"]. (Lande 1925a, 331–2; my translation)

Here Lande is merely trying to *sociologically explain* what prompts the legal dogmatician to choose one *Grundnorm* rather than another. He is *not* recommending any one choice over any other.[21] Moreover, he is completely opposed to Kelsen's pretentious terminology (*pretensjonalna terminologia*) consisting of speaking of *transcendental idealism* (Lande 1925a, 323).[22]

From a *logical and epistemological point of view*, according to Lande, there is no difference between a legal dogmatics concerned with a constitution and a legal dogmatics concerned with a manifesto put out by some madman:

From the point of view of the critique of knowledge [*krytyki poznania*], the statement [*zdanie*] "According to Art. A of Constitution C the president of the Republic has right R" has the same value [*walor*] as the statement "According to the manifesto of Madman M, its author has the hereditary right to rule the moon," as both statements are founded [*oparte*] in an identically correct way on corresponding "sources" […], or normative facts. (Lande 1925b, 70; my translation)

According to Lande, any normative "fact can be taken as the foundation of a positive system; the selection […] of the positive basis of bindingness [*postawa obowiązywania*] is scientifically free [*naukowo dowolny*]" (Lande 1925a, 299; my translation). There is no way to distinguish a subjective sense from an objective one (to use Kelsen's terminology), since Lande—very much in line with the sparse clues that can be found in Petrażycki's work—takes the view that legal dogmatics is a subjective-relational science, namely, a science concerned exclusively with attitudes existing *within* the Subject. This is an issue I will return to in the next section.

Further, it should be reiterated that, unlike Kelsen, Lande does not seek to "enact" any recommendation as regards the possible contents of the *Grundnorm*. He merely adopts a sociological stance. With that important qualification, we can now attempt to reconstruct and summarize what contents according to Lande the *Grundnorm ordinarily* takes.

1. The *Grundnorm* contains convictions concerning diverse normative facts (*odmienność źródeł*), which normative facts may come into conflict with one another. These conflicts may be of two kinds:

[21] A different treatment of the question of how to choose the *Grundnorm* from viewpoint of Petrażyckianism can be found in Fittipaldi 2013d, 2013a.

[22] Cf. the similar criticism in Max Lazerson: see Section 20.1.2 in this tome.

1.1. substantive conflicts (i.e., some $norm_{\alpha}$ extracted from normative $fact_1$ is empirically incompatible with some $norm_{\beta}$ extracted from normative $fact_2$), or
1.2. procedural conflicts (e.g., normative $fact_2$ has been passed or recognized in a way_{β} other than some way_{α} extracted from normative $fact_1$ as the only "possible" one).

2. The *Grundnorm* also contains, along with convictions about the bindingness of certain normative facts, intuitive legal convictions that not only people but also judges and jurists may "put forward as sources [*źródła*] completing [*uzupełniające*] or reforming [*reformujące*] statutes" and other normative facts (cf. Lande 1925a, 346; my translation).[23]

We can conclude that according to Lande the contents of the *Grundnorm* result from the Subject's selection of (1) certain supreme normative facts and (2) certain intuitive-legal convictions as his own axioms. Lande (1945, 829) uses the term *axiomat* only in the second context (2). Elsewhere (Fittipaldi 2013a, 2013d), I have proposed a more symmetrical terminology, referring to (1) by the term *normative-factical axioms* and to (2) by the term *intuitive-legal axioms* (2). Henceforth I will use my own terminology.[24]

To avoid misunderstandings let me reiterate that from a Landian-cum-Petrażyckian perspective nothing rules out that the Subject adopts axioms—be they intuitive-legal or normative-factical—in conflict with one another.

Further, it should be recalled that according to Lande, legal dogmatics is not the exclusive to judges or scholars. This is perfectly consistent with the Petrażyckian conception that legal phenomena take place first and foremost outside courts: "Legal dogmatics is practised by any citizen who asserts [*twierdzi*] or founds [*uzasadnia*] his rights or obligations, by any lawyer who explains to his client his rights and obligations, by the judge when formulating his judgment and its grounds" (Lande 1959f, 387; my translation).

19.4. The Truth-Incapability of Legal-Dogmatic Judgments and Their Conditions of Correctness

One of the main tenets of Petrażyckianism is the strict distinction between the theory (or psycho-sociology) of law and legal dogmatics. As an objective-cog-

[23] But Lande's talk of sources in the case of legal-intuitive convictions is terminologically inconsistent, as he elsewhere uses the term *źródło* solely to refer to Petrażycki's normative facts. In this regard, see also footnote 9 above.

[24] Judging from the table at the end of Petrażycki's *Nowe podstawy* (Petrażycki 1939, 111), it seems that the unification of the Subject's intuitive-legal and normative-factical axioms as the axioms of a single normative science of the Subject is compatible with the last developments of Petrażycki's thought, as in that table he inserts *prawoznawstwo normatywne* (normative legal science) in the singular.

nitive science, the theory of law produces judgments concerning what exists *outside* the Subject.[25] Therefore, its statements are capable of truth. Legal dogmatics is instead concerned with attitudes existing *within* the Subject, namely, his freely chosen *Grundnorm* and the legal-dogmatic system resulting therefrom. Its statements are not capable of truth, as they do not concern any reality external to the Subject.[26]

Lande gives two arguments to demonstrate that legal-dogmatic judgments are incapable of truth.

The first argument is that legal-dogmatic judgments are ultimately made up of emotions within the Subject and therefore do not concern the reality external to him (Lande 1959a, 827; cf. footnote 58 below).

The second argument is rather a *set of metaphysical arguments* related to the fact that *many legal-dogmatic statements assert "facts" that are totally impossible in the reality external to the Subject*, and therefore they must concern phenomena that take place exclusively in the Subject's fantasy. In Lande's writings I have found the following three subarguments, pertaining to

1. the possibility of contradictions;
2. the violation of the principle *Natura non facit saltus*;
3. the violation of the principle of locality.

The first subargument was previously discussed in Section 19.2. Such "contradictions" as the same apple at once existing and not existing, the same table at once being completely white and not being completely white, etc., are impossible in the reality external to the Subject. But *within* the Subject it is perfectly possible for the same person to be loved and hated, or for the same behavior to be experienced as being at once obligatory and permitted, or for the same statute to be experienced at once as in force and repealed. This possibility of contradictions implies that legal-dogmatic judgments concern objects that exist *within* the Subject's psyche.

The second subargument is *Natura non facit saltus*.[27] According to Lande,

> a reality that ceases to exist [*przestaje istnieć*] in accord with a clause in a new statute regarding the time when [that new statute] "comes into force" (e.g., at the stroke of midnight on a given day of the calendar) would be a strange "social reality" indeed. (Lande 1959b, 865; my translation)

[25] To avoid misunderstandings it should be emphasized that the theory of law may also be concerned with psychical phenomena taking place within "Subjects" other than the Subject proper, as is the case when the Subject is concerned with other people's legal convictions. In this regard, see Section 12.5, footnote 30, in this tome.

[26] Indeed, it could be objected that the concept of truth can also be applied to the Subject's internal reality (*Innenwelt*), provided that it is independent of him. On the Subject's *Innenwelt* as a possible realist assumption, see Section 12.7, footnote 54, in this tome.

[27] This is the way Lande puts it: "a phenomenon may have a certain real feature or it may not; it can show a certain gradual evolution [*ewolucja stopniowa*], but is cannot show sudden leaps" (Lande 1925a, 334; my translation).

A Scandinavian realist would contend that these phenomena pertain to the realm of magic.

The third subargument is somewhat implicit in the last-quoted passage by Lande and was more explicit in Petrażycki. It concerns the violation of the principle of locality: It is impossible for a statute to come into force for everybody everywhere in a given state at the very moment when the head of state signs it into law or at the stroke of midnight (see Section 12.6 in this tome).

As I have said, Lande—very much in line with a consistent development of the main tenets of Petrażyckianism—takes the view that since these phenomena are impossible in the reality *external* to the Subject, they must be searched for *within* the Subject himself.

But *the fact that legal-dogmatic judgments are truth-incapable, because they do not concern external reality, does not rule out that they may be founded in a somewhat intersubjectively reliable way*. In other words, there can well be a connection between legal-dogmatic judgments and external reality, but that connection is not a direct one as the one presupposed by the concept of truth as correspondence.

If we are to properly address this issue, we will need to examine Lande's ideas on the classes of practical judgments, since (as Table 1 below illustrates) legal-dogmatic judgments are a subclass of one of those classes.

Lande's starting point is Petrażycki's classification (Petrażycki 1939).

Petrażycki classified legal-dogmatic judgments as a subclass of ethical-dogmatic judgments. These latter judgments, in turn, he classified as a subclass of ethical judgments, which in further turn are a subclass of practical judgments. According to Petrażycki, the class of practical judgments contains not only the subclass of ethical judgments but also that of teleological judgments.

Table 1. Kinds of judgments according to Petrażycki and Lande

Practical judgments				
Ethical (or normative)[28] judgments				Teleological judgments
Ethical-intuitive judgments		Ethical-dogmatic judgments		
Moral-intuitive judgments	Legal-intuitive judgments	Moral-dogmatic judgments	Legal-dogmatic judgments	

According to Lande ethical judgments should be distinguished from teleological ones according to their method of foundation (*metoda uzasadnienia*).

[28] In Petrażycki's terminology, to be accurate, the class of normative judgments is larger than that of ethical judgments, as it also includes aesthetic judgments. See Section 18.3, footnote 24, in this tome.

The correctness of teleological judgments depends on the truth of judgments expressing causal laws, which are a kind of theoretical judgments[29] (Lande 1959g, 411; 1959a, 789). The subjective nature of teleological judgments is owed to the Subject's freedom to choose his own goals or τέλη.[30]

The methods for the foundation of ethical judgments should be distinguished according to their ethical-intuitive or ethical-positive nature. Let us first consider the foundation of legal-dogmatic judgments and then turn to intuitive-ethical ones.[31]

According to Lande, even though legal-dogmatic statements are truth-*incapable*, they are formulated as if they were truth-*capable*, that is, as if they expressed theoretical judgments (to use Lande's Petrażyckian terminology):

> The form of the statements [*zdania*] in which the dogmatician expresses his doctrine [*wykład*] should not deceive. If, for example, a treatise on Polish constitutional law should state—repeating after Art. 95 of the March Constitution—that "The republic of Poland guarantees across its territory a complete protection of everybody's life, freedom, and property without distinction of descent, nationality, language, race, or religion," its author is not expressing the theoretical (historical[32]) judgment that that declaration was factually made or that that state of affairs factually exists in Poland, but is exclusively expressing a normative, dogmatic judgment, namely, that pursuant to Art. 95 of the Polish Constitution the citizens of Poland and foreigners in Poland have a right to the protection of life, etc., and the other citizens and officials have an obligation to abstain from certain actions as to those citizen. (Lande 1959f, 387; my translation)

Now, Lande subscribes to Petrażycki's contention that rights and obligations do not exist outside the Subject. Therefore, judgments about them are not capable of truth. But this incapability according to him is not a flaw to be fixed by arbitrarily reinterpreting them as such truth-capable judgments as historical or sociological ones. This is something a careful realist like Lande would not do (on the concept of careful realism see Chapter 12 in this tome).

[29] Petrażycki and Lande distinguished theoretical judgments in a strict sense from theoretical judgments in a broad sense. All of them depend on the reality external to the Subject as for their truth. But theoretical judgments in a strict sense concern exclusively *classes*, while theoretical judgments in a broad sense include also judgments concerning *spatiotemporally individuated* phenomena. As for theoretical judgments in a strict sense they seem *not* to overlap with judgments expressing causal laws. A theoretical judgment in a strict sense, on Petrażycki's conception, has the form *every object that has property A also has property B*. If B need not also come *after* A, a theoretical judgment may be also a judgment concerning mere correlations. Neither Lande nor Petrażycki seem to have discussed this problem (cf. Petrażycki 1908, 100; Lande 1959d, 579). Moreover, both Lande and Petrażycki seem to assume that the connection between A and B may be not only causal but also logical, yet neither of them clarifies what a *purely* logical relation is supposed to consist in.

[30] As to the question of how to choose these teleological postulates, see Lande 1948, 830ff.

[31] Along with the subclass of moral-positive judgments, legal-dogmatic (i.e., legal-positive) judgments are a subclass of ethical-positive judgments. What Lande says on legal-dogmatic judgments holds also for moral-positive ones.

[32] On judgments concerning spatio-temporally individuated past events as theoretical judgments in a broad sense, see footnote 29 above.

Lande maintains that legal-dogmatic judgments, despite their truth-incapability, are capable of a foundation:

> We can found [*uzasadniamy*] [the correctness of a legal-]positive [judgment][33] ("Pursuant to normative fact NF, it is obligatory that P") by combining two theoretical statements [*konjunkcja dwóch zdań teoretycznych*]; a historical one,[34] namely, that that [normative] fact happened; and a descriptive one, namely, that that [normative] fact contains [*zawiera*] that provision; for instance, we can found the prohibition of homicide by invoking [*powołanie się*] the fifth divine commandment or the appropriate article within the penal code (in common practice, the proof of the historical statement [*zdanie*]—which would often cause difficulties—is dropped, and we are content with indicating the text where the norm can be read). (Lande 1959a, 828ff.; my translation)

Thus, the correctness[35] of a legal-dogmatic statement is founded through the conjunction of two operations, which consist in

1. proving the truth of a historical judgment,[36] and
2. proving the truth of a descriptive judgment.

As regards (1), the fact that this kind of investigation is usually not undertaken is a consequence of the historical development of official gazettes (cf. Petrażycki 1909–1910, 520).

[33] To be sure, Lande uses the phrase *obowiązywanie normy* (the bindingness of a norm). I choose to avoid this terminology in the text because it may deceive the reader. Indeed, from Lande's Petrażyckian perspective a norm is *not* a linguistic phenomenon but rather the content of an ethical judgments—and judgments need not be expressed linguistically (see Sections 12.4, footnote 21, and 18.5 in this tome). In Lande the term *obowiązywanie* designates the Subject's adhesion to the content of some normative judgment. The *obowiązywanie* of the content of a normative judgment within the Subject parallels the Subject's belief in the *truth* of the content of a judgment (cf. Lande 1925a, 333, and footnote 57 below).

[34] Here Lande is using the term *historical* in a strict Petrażyckian sense. In the same text, however, Lande rejects Petrażycki's breakdown of spatiotemporally determined (or *konkretno-indywidualne*) judgments into historical, descriptive, and predictive ones, proposing in its place an opposition between judgments about objects in a *static* state and judgments about objects in a *processual* one (Lande 1948, 736).

[35] Lande was not as precise as Olivecrona in using the terms for "correctness," but he definitely did on occasion use these terms in order to avoid using other terms meaning "truth" (see Section 12.7 in this tome).

[36] In the case of certain normative facts, such as novelty-modelled custom (see Section 18.10.2 in this tome), the judgment is a descriptive one, since it concerns facts believed to take place *currently*. Let me remark that this also holds for cases of normative facts where some special *currently existing form* is required. Think of some kind of contract for the validity (and consequent bindingness) of which the *current existence* of a written instrument is necessary (*forma ad substantiam*, in Italian legal Latin, its equivalent in English law being the memorandum required under the statute of frauds). In such cases historical investigations are not necessary for the foundation of the correctness of a judgment about the "existence" of the obligation founded on that contract. It is the contract—understood as an *instrument*—that must be currently existing, and the same may hold in certain legal systems for registration of property in a land registry as discussed by Lande (see Section 2 above). This implies that the conditions of correctness that Lande talks about are indeed two, but they cannot be distinguished depending on their being historical or descriptive: They must instead be distinguished depending on their being semantic or nonsemantic.

As regards (2), it could be asked what exactly it means to *ascertain whether a certain normative fact contains a certain provision*. To my knowledge, Lande did not address this question. Neither Lande nor Petrażycki sufficiently investigated the problem of the interpretation of the various kinds of normative facts. As an adherent to this tradition of thought, I think the ascertainment Lande talks about cannot be understood in any other way than as an empirical-semantic investigation as regards the psychical-representational effects that a certain normative fact may cause in the people exposed to it.[37]

The fact that the correctness of legal-dogmatic judgments depends on empirically ascertainable facts makes some intersubjective convergence possible as regards their correctness or incorrectness, and this despite their truth-incapability. It is worth remarking, in passing, that this intersubjectiveness depends on the objectivity of both sematic and historical phenomena—namely, on assumptions that are largely out of fashion in the contemporary philosophical market, with the notable exception of Popper and Albert's critical rationalism.[38]

Lande's contribution in this context is especially important because he showed that Petrażycki's conception of legal dogmatics is by and large compatible with Kelsen's (so long as we forgo Kelsen's claim that legal dogmatics should be entrusted with providing a general concept of law).[39]

This compatibility comes through clearly where Lande incorporates into his Petrażyckian conception of legal dogmatics Kelsen's idea of a *Stufenbau*, an idea that to my knowledge never emerges in Petrażycki's writings.[40]

[37] A line of investigation that may prove necessary (especially where statutory interpretation is concerned) is into the historical intentions of those who have drafted a statute. The distinction between the representation in the psyche of the *producer* of some statement (*Sinn*) and the representation in the psyche of the *receiver* of that statement (*Bedeutung*) is Hans Albert's (e.g., 1994, 65; cf. also Fittipaldi 2003, 108, n. 86). It goes without saying that where normative facts such as custom are concerned, only the *Bedeutung* can be investigated. To my knowledge the symbolic nature of normative facts was first pointed out by Jacek Kurczewski (1977b, 103).

[38] Let me observe, again in passing, that the Hartian debate on the meaning of the term *vehicle* might have perhaps looked quite different if analytical philosophers had been interested in empirical investigations such as the ones undertaken by Eleanor Rosch (e.g., Rosch 1975). On Hans Albert's ideas about history as a *Realwissenschaft* (a science of reality), see the extensive discussion in Fittipaldi 2003, 2013d.

[39] The effort to produce a *reductio ad absurdum* of this claim of Kelsen's is basically the subject matter of Lande's *Norma a zjawisko prawne* (Norm and legal phenomenon: Lande 1925a).

[40] To avoid misunderstandings, I should stress that in Petrażycki's theory of law (which is a psychosociology of law) there is hardly any room for a *Stufenbau* (cf. Section 18.10.3 in this tome). From a Petrażyckian perspective, for example, whether or not people experience contracts as psychologically binding normative facts *because that is stated in the civil code* is a purely empirical question, so it cannot be answered by any a priori method. Instead, as Lande demonstrates (see the discussion that follows), a *Stufenbau* is perfectly compatible with a Petrażyckian legal dogmatics.

Lande (1959a, 829)[41] explicitly contends that the proof of the correctness of a *legal-dogmatic judgment*[42] *concerning the "existence"*[43] *of a contractual obligation* depends on its being in accordance with the civil code. This being in accordance depends on the truth of the following two theoretical statements:

1. a historical one, namely, that the contract was actually entered into; and
2. a descriptive one, namely, that the civil code contains a provision such as "Il contratto ha forza di legge tra le parti" (Art. 1372, first paragraph, of the Italian Civil Code) and that this provision means[44] that the contract has the force of law between the parties.[45]

In turn, the correctness of a judgment about a contractual obligation is logically correlated with the correctness of a judgment concerning the dogmatic being-in-force (or bindingness) of the civil code. Here, too, the correctness of the judgment at issue (i.e. the one concerning the being-in-force of the civil code) depends on two theoretical judgments:

1. a historical one, namely, that the civil code was historically passed;[46] and
2. a descriptive one, namely, that contained in the constitution is a provision such as "Tutti i cittadini hanno il dovere di essere fedeli alla Repubblica e di osservarne la Costituzione e le leggi" (Art. 54 of the Italian Constitution) and that this provision means that all citizens have a duty to be loyal to the republic and to uphold its constitution and statutes.[47]

[41] In the text I make explicit what in Lande is implicit by combining what he says about the *Stufenbau* with what he says about the correctness of legal-dogmatic statements as depending on the truth of two theoretical judgments: a historical one and descriptive one. The examples are mine.

[42] Lande speaks of *obowiązywanie pewnej normy umownej* (the bindingness of a certain contractual norm). I will stick to my terminology (see footnote 33 above).

[43] I use *existence* in quotation marks because from a Petrażyckian-Landian perspective we are dealing here, not with an existence *external* to the Subject, but with a *purely internal* existence. Although Lande does not use here a term meaning "existence," elsewhere (e.g., Lande 1959b, 864) he uses terms such as *istnienie* often enclosing them within quotation marks. As a careful realist, Lande takes care when using terms meaning "existence" or "reality," and so do I in the text.

[44] On the meaning of *meaning*, see footnotes 37 and 38 above.

[45] To be sure, the conditions of correctness may be more complicated than is stated in the text, as anankastic conditions may also be involved. The concept of an anankastic condition is by Amedeo G. Conte (e.g., Conte 1997). Lande would have refused to use the term *norm* (*norma*) to refer to Conte's anankastic-constitutive rules (cf. Lande 1959c, 934) because, according to Lande, the "rules" that Conte would call "anankastic-constitutive" are exclusively concerned with the *hypothesis* of a norm (its *Tatbestand* or *fattispecie astratta*, in German and Italian, respectively), and so they contain no ought-effect (*Rechtsfolge* or *disciplina*, in German and Italian, respectively). A similar position is argued as well in Pattaro 2005, 18. (In Fittipaldi 2014 and 2015, I suggest a possible way in which Petrażyckian legal realism can be made to accommodate the phenomena pointed out by Conte.)

[46] On the *anankastic* requirement that the code be enacted in accordance with a constitution, see the previous footnote 45.

[47] For the sake of example we are assuming that the Italian Civil Code was enacted or recog-

In further turn, Lande mentions a previous constitution and concludes—very much in line with Kelsen—that "the fact of the revolution happens to be the normative system's supreme normative fact [*najwyższy fakt normatywny*]" (Lande 1959a, 829; my translation).

Lande observes that also in the case of the correctness of legal-dogmatic statements, and not only in the case of teleological judgments, there is some sort of connection with empirical facts. But, according to him, it is obvious (*oczywista*) that the empirical foundation (*uzasadnienie empiryczne*) of legal dogmatic statements is completely different (*zupełnie inne*) from the empirical foundation of teleological ones. While in the case of teleological judgments the facts being drawn upon are *causal laws*, in the case of legal dogmatic judgments the facts being drawn upon are *spatiotemporally ones*, and so capable of being individuated.

Now it should be clear why Lande held that Kelsen went—"not without mistakes"—in the same direction as Petrażycki in trying to "purify legal dogmatics of psychological elements extraneous to it" (Lande 1925c, 376; my translation; cf. 1925a, 262 n. 2). Kelsen's purification corresponds to Petrażycki's sharp distinction between practical and theoretical sciences.

The foundation of legal-dogmatic judgments has nothing to do with the ascertaining of psycho-legal experiences outside the Subject. If that were the case, those judgments would be capable of truth. The foundation of legal-dogmatic statements is made via an indirect reference to empirical facts, and these empirical facts can in no way be understood as their conditions of *truth*, since legal-dogmatic judgments do not concern any reality external to the Subject.

Let us now turn to legal-intuitive judgments.[48] These form a subclass of ethical-intuitive statements, in which regard Lande simply writes that "also in this case the foundation can go through a few steps and will then encounter a vacuum where the psychologist spots an emotion, and a philosopher—an ethicist or axiologist—spots an axiom [*axiomat*] or a 'primitive feature' [*cecha pierwotna*]" (Lande 1959a, 829; my translation). It is not clear whether Lande thinks these judgments should rest on a foundation like that of judgments belonging to Kelsen's static systems (e.g., Kelsen 1945a, sec. X.A.b). In my opinion, another line of development, one that is even more compatible with Petrażyckianism, could be found in Weber's (1968) discussion of *letzte Wertaxiome* (ultimate value axioms), as he discussed the possibility of multiple potentially conflicting axioms within the same Subject.

nized in accordance with the 1948 constitution, even though this is not what happened (on how this problem might be dealt with from a Petrażyckian perspective, see Fittipaldi 2013a).

[48] The term Lande uses for these is *normy absolutne*, which in a Petrażyckian terminology is synonymous with *intuitive norms*.

19.5. Comparing Legal Dogmatics with Prescriptive Grammar to Understand the Nature of Dogmatic Sciences

In most of his writings, Jerzy Lande compares legal dogmatics to prescriptive grammar. He does so in order to discard the claim of certain legal philosophers (first among them Hans Kelsen) that the basic concepts of the theory of law should be provided by legal dogmatics.

Through this comparison Lande seeks to show that it is impossible to reduce the concept of law to the concept of positive law, and even less to the concept of dogmatically binding law.

For example, the class of legal phenomena comprises not only the experience of powers on the part of some "duly"[49] appointed police officer or the convictions of certain contractual parties concerning the obligations stemming from a "valid" execution of their contract (my examples), but also the convictions of the members of some criminal organization as to the way they should distribute the spoils of a robbery or some madman's conviction of being entitled to rule the moon and to transmit this power to his descendants (Lande's examples). A legal theorist who should refuse to recognize even these latter phenomena as *legal* phenomena would be acting like a linguist who should refuse to recognize as a *linguistic* phenomenon some such English usage as "There ain't no war" or "all of the sudden" just because that linguist considers these specimens of language to be poor or incorrect English (Lande 1959b, 869).[50]

In my opinion, the purport of Lande's comparison is much more than polemical. The comparison may be scattered across different writings, to be sure, but it shows how Petrażycki's conception of normative phenomena can be fruitfully applied even in a field where Petrażycki, to my knowledge, never thought of applying it.[51]

To begin with, Lande (1959b, 874ff.) remarks that, owing to the conflict-producing nature of legal phenomena (see Section 18.8.6 in this tome), there

[49] The term *duly*, as well as the term *valid* just below, is written in quotation marks to emphasize that in a Landian-Petrażyckian perspective the being *duly* appointed of some police officer or the being *validly* executed of some contract are not their *objective* qualities, but rather qualities superimposed on them by the Subject.

[50] The usage examples are mine. Lande just writes that a "jurist who limits his concept of law to the domain of official law acts in the same way as a linguist who were to recognize as Polish language exclusively the system according to which he evaluates the 'correctness' [*poprawność*] of the way students speak" (Lande 1959b, 869; my translation).

[51] In his early writings, Petrażycki held that linguistic normative evaluations are of an esthetic nature. But Lande reports that Petrażycki subsequently became sceptical of that view, so Petrażycki may have held that there can be also normative emotions that are neither ethical nor esthetical (Lande 1959a, 826). Be that as it may, it bears recalling here that Lande not only compared legal dogmatics to prescriptive grammar (he spoke of *dogmatyka językowa*, "linguistic dogmatics": Lande 1947, 36) but also explicitly addressed the issue of *policy of language* (*polityka językowa*) (ibid.). Thus, Petrażycki's distinction between theoretical legal sciences, legal dogmatics and legal policy is perfectly mirrored in Lande's treatment of language.

is a much stronger tendency toward the positivization of legal convictions than toward the positivization of linguistic-normative ones. But that is not to deny that even in language there may be normative facts that people may invoke in order to found some linguistic conviction of theirs.[52]

Lande (1959h, 658; 1947, 36ff.) mentions in order of importance four normative facts prescriptive grammarians, as well as educated people, use to refer to: (1) custom, (2) models taken from certain writers, (3) the opinions of grammarians, and (4) statutes.[53]

As for custom (cf. Section 18.10.2 in this tome), it usually consists not in (the representation of)[54] the language spoken by the people at large but rather in (the representation of) the language spoken in certain milieus or areas (Lande 1959a, 831). In certain cases multiple customs are taken into account at the same time, as has been the case in Italy for centuries: *Lingua toscana in bocca romana*, meaning "Tuscan language in a Roman mouth" (my example).

As for the models taken from the most prominent writers (ibid.), it is usually only the most prominent literary writers that are taken into account (as for Italy, think of Manzoni in 19th century),[55] but in certain cases this role has been played by intellectuals, such as Martin Luther and his influential translation of the Bible into German (my examples). It goes without saying that this normative fact parallels the models of conduct of religious-ethical authorities mentioned by Petrażycki (see Section 18.10.11 in this tome).

As for the opinions of grammarians (which parallel the opinions of the individual jurist: see Section 18.10.6 in this tome), think of how influential Noah Webster was on the development of American English (my example).

Finally, as regards statutes, Lande gives the example of the 1936 reformation of Polish orthography (Lande 1946, 701). In order to avoid misunderstandings, it should be stressed that Lande uses the term *statute* in Petrażycki's sense (see Section 18.10.1 in this tome), so, for example, there is no need for the academy that issues certain linguistic directives to be officially charged with that role by the state. It suffices that these directives be *experienced* as binding linguistic statutes by somebody. Their prestige[56] may be completely independent of their recognition by a state authority.

[52] Lande does not discuss where the push toward the standardization of languages may come from. One factor may be the nation-building processes.

[53] On further normative facts in the field of language see Lande 1947 (34ff.).

[54] Let me observe, in passing, that even in this context Petrażycki's emphasis on the fact that normative facts are *representations* is paramount. Only with this qualification is it possible to accommodate such phenomena as hypercorrections (e.g., *expresso*) or hyperurbanisms, neither of which Lande examined.

[55] For instance, Manzoni often used the suffixes *-avo*, *-evo*, and *-ivo* to form the imperfect first person singular of verbs, and that probably led to their eventual replacement of the more antiquate suffixes *-ava*, *-eva*, and *-iva* (Serianni 1988, sec. 11.72).

[56] It bears recalling that in a Landian-Petrażyckian perspective terms, such as *prestige*, *being-in-force*, *bindingness*, *authority*, are used as synonyms when referred to normative facts.

Just like legal dogmatics, prescriptive linguistics is also a subjective-relational science. The correctness or incorrectness of linguistic behaviors lies exclusively within the Subject and depends on his *Grundnorm*. This phenomenon is in turn akin to that of dogmatic religion:

> "The law in force" is a section of the whole domain of law in general, a section selected through our recognizing it as binding for us [*obowiązujący dla nas*[57]], just as the "true religion" is a system selected from among innumerable religions on the basis that we believe in it, or "correct language" is a section of linguistic phenomena selected on the basis that we recognize it as a binding model. (Lande 1959h, 657; my translation)

All kinds of dogmatics, according to Lande, presuppose that the Subject subscribes to their ultimate axioms,[58] and this makes them subjective sciences that have nothing to say about the reality external to the Subject as such. Prescriptive grammar is simply a case where this is more evident.

[57] To avoid misunderstandings it should emphasized that the pronoun *nas* in the phrase *obowiązujący dla nas* ("binding for us") is not to be taken as referring to a collective Subjectivity. That pronoun should rather be understood as referring to the dogmatician as *the* Subject. See, for example, among many passages, Lande 1925a, 303, where Lande talks of the researcher in the singular (*badacz uznaje za obowiązujący*). See also the second block quotation in the previous Section 19.3, as well as the next footnote.

[58] Where legal and moral dogmatics are concerned, Lande (1925a, 294) speaks of *zsolidaryzowanie się z jego treścią* ("solidarity with its content"). It is not clear whether it suffices to have an *als ob* solidarity, just like the one Hart refers to when saying, "One vivid way of teaching Roman Law is to speak *as if* the system were efficacious still" (Hart 1994a, 104). Elsewhere Lande writes that "a norm is binding, a religious thesis obliges, a theoretical thesis is true, only for the person who accepts its content as his own" (Lande 1925a, 320; my translation). To be sure, here Lande is probably stating that a theoretical thesis is *experienced as true* only for the person who adheres to it.

A problem with Lande's (and probably Petrażycki's) contention that subjective-relational sciences presuppose the Subject's adherence to their ultimate normative facts or axioms is that this contention seems to rule out the possibility of *assumptions* (*Annahmen*) *without inward adherence*. This argument, if taken seriously, would rule out the very possibility of such an argument as a *reductio ad absurdum* (cf. Fittipaldi 2013d, 92ff.). How can we not be reminded of Giovanni Saccheri here? He attempted to prove Euclid's fifth postulate by *reductio ad absurdum*, by first (*a*) assuming that the sum of the internal angles of a triangle is less than 180° and then (*b*) assuming that that sum is more than 180°. In case (*a*) he proved that straight lines are finite, while in case (*b*) he proved that there exist two straight lines which, when stretched to infinity, merge into a single straight line and have a common perpendicular at infinity (Wolfe 1945, sec. 22, 32). It is obvious that Saccheri did *not adhere* to either (*a*) or (*b*), as his goal was to prove Euclid's fifth postulate precisely by proving postulates (*a*) and (*b*) to be absurd.

That the theorist of dogmatics should abandon the view that a dogmatician must necessarily adhere to the axioms of the dogmatic system he elaborates is all the more implied in Lande's reconstruction of dogmatic (or axiomatic) thinking, considering that Lande (1925a, 333) himself speaks of one among several possible systems of logic and mathematics (*z pośród możliwych*). Such a statement seems to rule out inward adhesion as always necessary (cf. Fittipaldi 2013d, 92). If this is so, then Lande was able to go a little bit farther than Olivecrona, who as recently as in 1971 expressed the view that "the assertion that a statement is correct contains a reference to fundamental evaluations" (Olirecrona 1971, 265) and that "[a]rgumentation of this kind becomes meaningless from the point or view of a neutral observer" (ibid.). On this issue see Spaak 2014, 210, as well as the other authors quoted there. For a defence of Olivecrona's distinction between truth and correctness from the standpoints of 1960s Polish-Russian legal realism and modern logical and mathematical pluralism, see Fittipaldi 2013d.

Chapter 20

OTHER RUSSIAN OR POLISH LEGAL REALISTS

by Elena V. Timoshina, G. Lorini, and W. Żełaniec

20.1. Max Lazerson's Psychological Theory of Law (*by Elena V. Timoshina*)*

20.1.1. Introduction

Max Lazerson (1887–1951)—a disciple of Leon Petrażycki, graduated from the university of Saint Petersburg in 1916. In 1920, he emigrated to Latvia, where he wrote his major work, namely, *Obščaja teorija prava* (General theory of law: Lazerson 1930). After that he lived for some years in Palestine. In the early 1940s, through the help of another pupil of Petrażycki, Pitirim A. Sorokin, he moved to the United States and taught at Columbia University.[1]

Whereas other pupils of Petrażycki took different methodological directions, Lazerson in his works consistently kept to the tenets of psychological realism.[2] His most original idea (as compared with Petrażycki's) was probably his development of a realist conception of natural law. Aside from that, his works are interesting because they make it possible, to some extent, to reconstruct the attitude the psychological theory of law took to certain new directions in theoretical jurisprudence (such as Kelsen's theory of law and phenomenology).

20.1.2. The Object and Method of Legal Theory from the Standpoint of Psychological Realism

Lazerson characterizes his theoretical position as *psychological realism*, or *psychological positivism*, and this, according to him, is the only possible—and even "inevitable"—path for the development of legal theory.

In the first place, he considers it necessary to draw a strict line of demarcation between legal theory and the philosophy of law. The lack of such a demarcation, according to him, hampered the development of legal theory as a freestanding science. As a consequence of the continuous close contact between general philosophy and so-called philosophy of law, the latter turned

* I am grateful to Edoardo Fittipaldi for his remarks, which helped me to improve the final version of this essay. This Section 20.1 has been translated from Russian into English by him.

[1] Over the course of this discussion several of Lazerson's most important works will be mentioned. Following is a list of works that will not be mentioned directly but are nonetheless significant for an understanding of his philosophy: Lazerson 1918, 1926, 1927, 1933, 1945a, 1945b, 1951, 1981.

[2] On Petrażycki's theory of law see Chapter 18 in this tome and Section 16.2 in Tome 1 of this volume.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_48

into a branch of general philosophy. This results in the fact that the variability and diversity of the different philosophical schools find their stereotypical mirroring in the philosophy of law. Lazerson suggests that this is to account for the marginal position of legal theory. Philosophically educated jurists devote their efforts to styling their works after fashionable philosophical doctrines and remain within the framework of the legal philosophy developed within those doctrines. As for dogmatic jurists, they are not interested in philosophical issues, because they do not regard them as relevant for practical disciplines. In this way legal theory and its adepts "hang in the air [*povisajut v vozduhe*]" (Lazerson 1930, 69; my translation) between philosophers of law and worshippers of dogmatic jurisprudence. That, Lazerson (ibid., 69ff.) concludes, is the tragic destiny of legal theory.

Hiding behind the dividing line that Lazerson draws between legal theory and the philosophy of law is his conviction of the latter's superfluity. In making that argument, he refers to Petrażycki's scheme:

philosophy of law = legal theory + legal policy

It is apparent that the objective-cognitive theses of the theory of law and the subjective-relational theses of legal policy cannot, by addition, amount to a freestanding scientific discipline, and this very addition contradicts Petrażycki's thesis—a thesis Lazerson subscribed to—on which theoretical and practical judgments cannot be mixed within the same science.

Lazerson thought it necessary to conceive legal theory as a "premiseless [*bespredposyločnaja*] science" (Lazerson 1930, 60–2; my translation) whose purpose in investigating its object is not to illustrate the correctness of the contentions of this or that philosophical school. In the end legal theory should become "immanent [*immanentnaja*] in an authentic sense" (ibid.; my translation), rather than be built in the spirit of this or that stream. The only path that makes it possible to build a legal theory that ceases to be "a conglomerate of certain premises lying […] outside and before any empirical experience [*opyt*] and causal research—a conglomerate brought about by changing religions, ideologies, and philosophical and sociopolitical schools" (ibid.; my translation)—is the path proposed by psychological positivism. Only proceeding from the explanation of law (*pravo*)[3] as a psychical experience can legal science rid itself of its dependence on the historically changing aprioristic

[3] Since Lazerson adopts Petrażycki's correlativist theory of *pravo*, *Recht*, *droit*, etc., translating the Russian term *pravo* with the English term *law* may sometimes prove misleading. In these cases, depending on the context, I will sometimes use *law* followed by the Russian *pravo* within square brackets, or I will translate *pravo* as *right*. See Pattaro 2005, 5ff., on the difficulties involved in the attempt to systematically use *law* as a translation for *Recht*, *droit, diritto*, etc., *in an objective sense*. (Translator's footnote.)

premises posited by different philosophical trends (*napravlenija*), as well as to exclude references to certain meta-juridical facts—like the state's will or the economic basis—as law-generating (*pravoporoždajuščie*) factors. According to Lazerson, legal positivism's traditional denial of natural law and its restriction of its subject of investigation to nothing other than the positive law that has at its disposal the sanction of official recognition does not yet say anything about "the positiveness of legal theory" (ibid. my translation).

From here comes the *first* meaning of the term *psychologičeskij pozitivizm* (psychological positivism) understood as the "*positivization* of legal theory" (ibid.) namely, as a science concerned with the law's psychical *existence* [*bytie*], whereas the *second* meaning comes from its being characterized by its making use of the explanatory method, namely, the "method of causal research" (ibid.; my translation).

Following Petrażycki, Lazerson (ibid., 61) draws a distinction between theoretical and practical legal sciences.[4] The logical foundation of this distinction, according to Petrażycki, lies in the so-called *positions* (*pozycie*), which he defined as "the simple, not further reducible meaning, or content, of judgments or sentences" (Petrażycki 1939, 17; my translation). In the structure of a scientific theory he distinguished three kinds of positions: (1) the main ones, namely, the *theses* (*tezy*); (2) the *bases* (*bazy*), which play the role of foundations (*uzasadnienia*) for the theses; and (3) the accessories (*accessoria*: ibid., 60), such as examples and illustrations, etc. Petrażycki points out that the criterion for the classification of sciences lies precisely in theses. He distinguishes theses into *objective-cognitive* ones—evaluatively neutral, constative positions to which the criterion of truth can be applied—and *subjective-relational* ones, expressing evaluations, wishes, claims (*wymagania*), etc., to which the criterion of truth is inapplicable. Accordingly, he distinguishes the sciences into *theoretical* ones, whose theses have an objective-cognitive character, and *subjective-relational* (or *practical*) ones, and formulates the methodological rule that the bases of the theoretical sciences must be objective-cognitive positions, while the bases of the practical sciences may be both objective-cognitive positions and subjective-relational ones. As for the *theses* within one science, there should not be the confusion between theoretical and practical theses that is so typical of the social and human sciences. From this we can reconstruct Petrażycki's definition of theoretical and practical knowledge: A *theory* is a methodologically founded (*obosnovannyj*) system of objective-cognitive theses—the object of truth evaluations—whose subject is an adequate class; a *practical science* is a system, which is also built in accordance with the principle of adequacy but that is not an object of truth evaluations, and whose bases

[4] As regards the fact the Petrażycki's distinction between objective-relational sciences and subjective relational ones seems to violate Petrażycki's own principle that in every distinction there should be a unique *fundamentum divisionis*, see Fittipaldi 2013.

may have both an objective-cognitive and a subjective-relational character.[5] The definition just given highlights the possible connection between the theoretical and practical sciences where the theoretical validity (*obosnovannost'*) of some practical knowledge *may be one of the conditions* of its scientific soundness (*sostojatel'nost'*).

Also, Lazerson's starting point is that the theses of theoretical sciences are judgments concerning existence (*bytie*) and that they are capable of truth or falsity; the theses of the practical sciences, instead, indicate desirable or obligatory behaviors and as such are not subject of truth evaluations. Thus, if under the legal-customary norms of some peasants "a horse thief shall be killed," we are facing a normative judgment, which cannot be rejected as untrue. It can be rejected only through an evaluation, as by judging it "barbaric" or "obsolete" (Lazerson 1930, 66; my translation). Therefore, legal theory and legal dogmatics are a theoretical and a practical science, respectively, differing from each other as to both their object and their method. Legal theory is a science concerned with the psychical *existence* of law and is characterized by its using an explanatory method, while legal dogmatics is a science that studies positive law as a system of normative judgments by means of the so-called normative method.[6]

Lazerson's methodological position defines the main directions of his criticism of Kelsen's pure theory of law (for details, see Section 20.1.3 below). He views it as disastrous for legal theory that Kelsen should have removed it from the class of explanatory sciences—those that study "that which exists and the causal connections among phenomena [*byvanie i pričinnaja svjaz' javlenij*]" (Lazerson 1930, 64; my translation)—attributing a normative character to that science. On this ground Lazerson refused to recognize normativism as having a *theoretical* character. Lazerson characterizes as *methodological monism* the transformation of a method admissible within a certain subspecies of legal sciences into the universal method of jurisprudence (*jurisprudencija*). He viewed Petrażycki's classification of legal sciences as having the undoubted advantage of proposing a pure (*čistaja*) distinction between theoretical and practical disciplines, between their objects, theses, and methods (ibid., 64ff.).

In this connection, an essential difference between Petrażycki's position and Lazerson's should be recalled. Petrażycki formulates the following methodological rule: In order to build a theory, it is not sufficient to establish some factual existence (*faktičeskoe byvanie*); it is also necessary to establish

[5] See the previous Chapter 19 in this tome (on Lande) for a discussion of the kinds of possible involvement of theoretical judgments in the foundation of practical judgments in a Petrażyckian perspective.

[6] It should be observed that Petrażycki seems to have also recognized a dogmatics of intuitive law. See Petrażycki 1902, col. 1802, as well as Timoshina 2013b, 467, and Fittipaldi 2013a, sec. 4.

the existence of some *logical or causal connection* between the specific feature (*priznak*), or *differentia specifica*, of one class of objects (the theoretical subject) and the specific feature of another (that which is stated about that class, i.e., the predicate).[7] Lazerson instead confines the method of the construction of a theory exclusively to the establishment of *causal connections*, even though he does not explain the reasons for this limitation.

Finally, psychological positivism eliminates evaluative and normative judgments in the context of the definition of the essence of law (*pravo*). For this positivism there is no limitation on the law of a given era by the exclusion of other allegedly unjust laws, nor is there any limitation exclusive to positive law. As Lazerson maintains, "Unjust law [*nespravedlivoe pravo*] *is* law" (Lazerson 1930, 64; my translation and italics added). Evaluations do not exist in the context of a *positive* investigation of phenomena, and the elimination of clouding evaluations is possible if we address that which continues to be the only data directly accessible to investigation, namely, the human psyche.

20.1.3. A Realist Criticism of Normativism

In Petrażycki's works we can find only few critical mentions of "Kelsen and his school" (Petrażycki 1939, 59, 104; my translation). Lazerson's works are interesting also because they make it possible to reconstruct an attitude that psychological realism may possibly take to the pure theory of law.

According to Lazerson's characterization, normativism is a scientific trend that "does not consider it possible to search for the law in the domain of what really exists [*real'noe bytie*]" (Lazerson 1930, 22–3; my translation). Lazerson maintains that this produces the result that "norms lose the real roots [*real'nye korni*] of their causal existence and start to appear as something existing outside or above the real world of things" (ibid.; my translation). In analogy to the concept of commodity fetishism (*Warenfetisch*) of Marx's political economy, Lazerson characterizes this position as *legal fetishism* (*pravovoj fetišizm*). Just as the commodity fetishist ascribes a value to the commodity and to its material properties, the legal fetishist does something analogous to the legal norm *as such*, ascribing to it "the necessary property of obligatoriness [*dolženstvovanie*]" (ibid.; my translation), bindingness (*objazatel'nost'*), or

[7] Petrażycki (2010f, 461) clarifies this methodological rule in the following way. If it is established that between a feature *a* of a certain class *A* and another feature *b* there exists a *necessary logical connection*, such that from the assumption of the presence of *a* the presence of *b* necessarily follows, it is thereby proved that all thinkable *A*s are related to *b*. In just the same way, if it is established that between some property of a certain class and some property of another one there exists a *necessary causal connection*—that is, if the causal tendency *b* is characteristic (*prisuščaja*) of property *a* of class *A*—it is thereby proved that all thinkable *A*s have the property of having tendency *b*, that is, this tendency must be mentally ascribed.

force (*sila*).[8] Normativism, on Lazerson's interpretation, is the manifestation of the hypostatization (*gipostazirovanie*), or divinization (*obožestvlenie*), of norms characteristic of everyday thinking (ibid., 53). Accordingly, Lazerson views the uncovering (*razoblačenie*) of legal fetishism as one of the necessary conditions for the development of legal theory.

Lazerson views normativism in the same way as he views what he calls dogmatic positivism and historical materialism applied to law. All these conceptions are described as *naïve-realistic*,[9] in that they each identify the psychical existence of law with a reality of a different order: Law is viewed as something that acts upon the individual *from without*, and the individual appears exclusively as the object of an external influence.[10] According to him, as long as this heteronomy is not uncovered in a causal way, the scientific value of the corresponding statements is not much greater than that of the doctrine of the divine origin of law. Lazerson (1930, 53–5) holds that one of the methodological flaws of normativism consists in the fact that the naive-projective point of view—which in the first place is typical of everyday consciousness (*soznanie*), and which prompts one to see norms as entities existing outside time and space and as endowed with binding force—is turned into the methodology of legal-theoretical investigations.

But the main critical argument that Lazerson levels at the pure theory of law is its "methodological confusion" between legal theory and legal dogmatics. As a consequence of this confusion, the method of dogmatic jurisprudence in Kelsen appears as "the method for the knowledge of the essence of law" (Lazerson 1930, 24; my translation). The transformation of the normative method into the sole method of legal science, according to Lazerson, does not provide any methodological advantage: The analysis of positive law carried out by means of the normative method remains within traditional legal-logic

[8] Lazerson views his use of the concept of fetishism as analogous to Petrażycki's concept of emotional projection (on which see Section 20.1.5 below).

[9] This term is used by Petrażycki to characterize one of three possible "naïve-fantastical constructions" in legal theory. Next to *naive-realistic* (*naivno-realističeskie*) conceptions, he also distinguishes *naive-nihilistic* (*naivno-nigilističeskie*) ones—consisting in the negation of the existence of a certain legal phenomenon owing to the impossibility of detecting it in the "space" of external world (an example being the theory that juristic persons are nothing other than fictions)—and *naive-constructivist* (*naivno-konstruktivnye* or *naivno-konstruktivistskie*—Petrażycki used both terms interchangeably) ones, consisting in the creation of factitious constructions or excogitations for the phenomena pertaining to legal reality, a creation prompted by "a lack of something real corresponding to them" (examples are several different metaphysical legal theories, such as that of the "general will" as the fundamental source of law). In this regard, see Petrażycki 2010f, 399ff.

[10] Lazerson refers to Goethe's Mephisto (disguised as Faust): *Vom Rechte, das mit uns geboren ist* (*Faust*, I. Vers 1978), and in so doing he emphasizes that law has never seriously been considered as "born with us." In other words, it has never been conceived as an internal, psychological experience of the individual. According to him, not even the numerous supporters of natural law who talked of "innate" human rights are free from this reproach, because even here we have nothing other than a realistic *terminology* (Lazerson 1913, 870).

line of work by virtue of its using the rules of interpretation developed in legal dogmatics, and so it does not need a neo-Kantian characterization (ibid., 27).[11]

Finally, Lazerson emphasizes that by using two critical arguments—the argument of the tautological nature of the definition of the concept of law in terms of authoritatively enacted norms[12] and the argument of the infinite regress of sanctions[13] under the assumption that every legal norm must be guaranteed by a sanction[14]—Petrażycki "predicted" (*predskazal*) the necessary

[11] Compare in this regard Jerzy Lande's characterization of Kelsen's talk of transcendental idealism as "pretentious terminology." On Lande see the previous Chapter 19 in this tome.

[12] Petrażycki points to the fact that in that definition there is a *definitio per idem*: "A norm of law (*x*) is a norm set forth in the manner prescribed by the law (*x*) on the part of the organs established by the law (*x*) of the legal (*x*) community, namely, the state" (Petrażycki 2010e, 283ff.; my translation). With the rejection of the idea of a personified sovereign as the authority founding the legal order, the classical positivist concept of law necessarily took on a tautological character. As is known, and as is stated below in the text, the basic norm was also a tool intended to break out of this logical circle.

[13] Writes Petrażycki in this regard: "From the point of view of the theory of coercion, A norm (*x*) is a legal norm only in case there is another legal norm (x_1) that provides for the application of coercive measures in default of voluntary compliance with it (*x*), as when, for example, that other norm (x_1) prescribes to other people (a bailiff, policeman, etc.) to enforce it [*primenet' prinuditel'noe ispolnenie*]. But in turn, according to the theory of coercion, this norm (x_1) can be a legal norm only if there exists a further norm (x_2) that in case of default of voluntary compliance with norm (x_1) in its own turn provides for coercive measures (for example, if the bailiff, police officers, etc., are unwilling to voluntarily comply with their obligations, it prescribes that certain people adopt coercive measures against these disobeyers. In just the same way, norm x_2, must have a further sanction with a corresponding content, namely, x_3; and norm x_3 must be followed by sanction x_4; and so on to infinity" (Petrażycki 2010e, 289; my translation). Petrażycki accordingly concludes that "it is impossible to prove that a given norm fits such a definition, and so that it must be recognized as a legal norm, because that would require an infinite proof, and every end of the proof […], absent a further sanction, would at the same time be a proof of the fact that all the preceding norms are not legal norms (for example, if we arrived at norm x_{20}, but no norm (x_{21}) could be found that should provide for coercive measures in case of noncompliance with norm x_{20}, then it would turn out that x_{20}—because of its being a "noncoercive" legal norm—is a nonlegal norm, and so x_{19}—because of its being devoid of any legal sanction, namely, a sanction in the form of a legal norm prescribing coercion—would itself turn out to be a nonlegal norm, etc.)" (ibid.).

[14] Petrażycki's argument of the infinite regress of sanctions was subsequently recalled by Kelsen (1945a) and by Olivecrona (1948), as well as by Hart (2001, 171–3), in the context of the debate with Ross concerning self-reference in law. In a section titled "The never-ending series of sanctions," Kelsen agrees with this argument. At the same time, he proposes a solution for the problem raised by Petrażycki: On the assumption that the series of legal norms establishing sanctions cannot continue infinitely, Kelsen closes the series of sanctions with an ultimate norm whose sanction does not amount to an obligation for the subject authorized to exercise coercion. Kelsen makes the point as follows: "That a behavior is 'commanded' means that the contrary behaviour is the condition of a sanction which 'ought' to be executed. The execution of the sanction is *commanded* (i.e., it is the content of a legal obligation), if nonexecution is the condition of a sanction. If this is not the case, the sanction is only authorized, not commanded. Since this regression cannot go on indefinitely, the last sanction in this chain can only be authorized, not commanded" (Kelsen 1967, 25). But the impossibility of guaranteeing the efficacy of all rules of

and only possible line of thought for a consistently dogmatic "theory" of law, namely, the postulation of a basic norm (*Grundnorm, osnovnaja norma*) as the foundation (*osnovanie*) of a normative order (Lazerson 1930, 26).

According to Lazerson, the pure theory of law gives "an interesting, but stylized picture [of law] in one normative dimension" (ibid., 29; my translation). In Kelsenian normativism Lazerson sees the "historical fruit of 19th-century jurisprudence, which knew only positive law and its dogma, which stubbornly refused to view law as a real phenomenon and—against the general rise of empiricism in the sciences—moved […] legal phenomena into a world of constructional noumena [*konstruktivnye noumeny*]" (Lazerson 1914, 2161; my translation). Contemporary legal theory, according to him, must be built as a consistently realist theory. It is necessary to turn from the search for new methods of logical analysis of positive law to the internal psychical experience of norms and so to investigate, so far as possible, *the existence of the ought* (*suščestvovanie dolžnogo*).

20.1.4. The Psychological Theory of Law and Phenomenology

From the standpoint of psychological positivism, Lazerson also makes some remarks critical of phenomenological legal conceptions, characterizing them as "a phenomenological version of normativism." According to him, these conceptions reject the two main tenets (*osnovy*) on which the psychological theory of law rests: (1) the idea of the psyche, and hence psychology, as the sphere where law must be searched for [*nahoždenie*]; and (2) Aristotelian logic. He therefore establishes two fundamental differences separating the phenomenological theory of law from the psychological theory: Anti-psychologism and the rejection of the pyramidal system of traditional logic, namely, the method of definition *per genus et differentiam*. Lazerson (1930, 56–7) comes to the conclusion that the phenomenological school in jurisprudence simply transforms *definitio per idem* into logical necessity.

Lazerson's brief critical review of phenomenological legal conceptions provides us with an opportunity to say a few words about the general issue of a possible connection of the psychological theory with phenomenology.

A typical feature of Petrażycki's theory of law was the ambiguity of its methodological foundations. This resulted (1) in the possibility of its subsequent development, not only in a realist-sociological direction (Jerzy Lande, Adam Podgórecki, Jacek Kurczewski, Nicholas Timasheff, etc.), but also in a phenomenological one (Georges Gurvitch, Pëtr E. Mihajlov, Georgij A. Nanejšvili) and (2) in the establishment of a research tradition consisting of a

the legal order by means of rules establishing sanctions does not exclude the possibility of counting as legal norms only those rules that establish a sanction (for a critique of Kelsen's solution, see Timoshina 2011; Kraevskij and Timoshina 2012).

phenomenological interpretation of his theory. Phenomenological undertones were found in Petrażycki's idea of a self-sufficient (normative) motivation. For example, Gurvitch (2004, 345) held that the very method of describing the immediate data of legal consciousness (*pravosoznanie*)—a method that according to him was very close to the method of his contemporary German phenomenologists—allowed Petrażycki to arrive at the penetrating discovery of the imperative-attributive structure of legal (*pravovoe*) experience.[15]

An attempt to unify psychological realism, on the one hand, and the analytical phenomenology of Husserl's *Logische Untersuchungen* (*Logical Investigations*), on the other, was made by Pëtr E. Mihailov. He maintained that law can be viewed in two ways: (1) as a *real-psychical* experience and (2) as an *ideal-normative* element (*ėlement*) of consciousness. This "element" consists of legal norms, which according to Mihajlov have "an ideal-objective content [*ideal'no-ob"ektivnoe soderžanie*]" (Mihajlov 1914, 41–2; my translation), and which, along with mathematical entities (*veličiny*), belong to the domain of ideal-objective existence (*bytie*). In this connection, Mihailov emphasizes that legal norms, as contents of legal judgments,[16] should not be identified with judgments themselves understood as processes of thinking (*processy myšlenija*), namely, with certain psychical experiences. Mihajlov thus attempts to unify the "subjectivism of the real-psychological element of legal consciousness" (ibid.) with the "objectivism of the ideal-normative element of consciousness" (ibid.). As Mihailov writes: "Corresponding to the law as a real-psychical experience and process is the legal norm as an ideal entity [*veličina*] containing in itself *the objective idea of the legal ought* [*pravno-dolžnoe*] as such" (ibid.). In this way he concludes that, along with an understanding of law as a real phenomenon of psychical activity with its own laws of causal connections, we also need an understanding of law "as [a complex of] norms of legal-ethical obligatoriness [*normy pravno-ėtičeskogo dolženstvovanija*], as an ideal-objective element of legal consciousness dependent on the ideal connections of foundation [*osnova*] and consequence [*sledstvie*], and not at all on the real causal connections of coexistence [*sosuščestvovanie*] and consecution [*posledovatel'nost'*]" (ibid.).

The thesis can be advanced that Husserl's *Logische Untersuchungen* influenced the methodology of the psychological theory of law (Timoshina 2012, 177–203). This would make it possible to highlight several respects in which Petrażycki's epistemological ideas are similar both to the analytical-phenom-

[15] Gurvitch (2004, 345) maintained that the conception of a self-sufficient motivation is close to Max Scheler's theory of the emotional intuition of values. Georgij A. Nanejšvili, a pupil of Petrażycki, held that if we remove from Petrażycki's theory all that is incompatible with emotional apriorism—in which according to him lies its basic idea (*osnovnaja mysl'*)—then what we "gain is an extremely elegant phenomenological theory of law" (Nanejšvili 1987, 68).

[16] Judgment in a logical sense: *suždenie*.

enological tradition of Gottlob Frege, Franz Brentano, and Alexius Meinong in general and to the analytical phenomenology of Edmund Husserl's *Logische Untersuchungen* in particular. At least seven arguments as follows can be offered in support of that thesis.

(1) It is a common idea that the object of knowledge is not the external world but the internal experience of the subject psychologically (Brentano, Petrażycki) or phenomenologically (Husserl) understood.

(2) Both Husserl and Petrażycki admitted the mental existence of general objects (classes) and of corresponding general concepts as a necessary condition for theoretical knowledge.

(3) Petrażycki's conception of a general concept as "the idea of all that is thinkable as possessing certain features" ("every idea having the structure 'all that has the feature *a*'") and of a class as a thinkable object ("all objects possessing the property *a*") (Petrażycki 2010f, 428; my translation) can be compared to Husserl's conception of intentional objects and of general concepts.[17]

(4) Frege, Husserl, and Petrażycki all took as their starting point the idea that the extension (*ob"jom*) of a general concept (*ponjatie*) does not depend on the empirical existence of a certain finite set (*množestvo*) of objects, thinkable by means of a certain concept. In other words, the extension of a general concept is infinite, and the corresponding class (*klass*)—or, in Husserl's terminology, the *allgemeiner Gegenstand* (general object)—is a thinkable object distinct from the empirical population of the members of the class.

(5) Brentano, Meinong, and Husserl's conception of intentional objects as objects present in the consciousness regardless of the question of their correlation with empirically existing objects parallels one of the main tenets of the psychological theory of law, namely, that we should not search—"somewhere in space"—for empirical counterparts of the concepts of legal theory, be it the concept of a legal subject or of a legal object, of a right, or of a legal obligation. These concepts and the corresponding objects of thought exist exclusively as elements of the intellectual structure of legal emotions, that is, they exist exclusively in the consciousness of the subjects experiencing the corresponding emotions.

(6) When comparing Husserl's and Petrażycki's ideas, it should also be noticed that a starting point for both thinkers was the idea of the logical unity of scientific knowledge—an idea that, as Husserl wrote, ruled out the arbitrariness of the division of the realm of truth (*Reich der Wahrheit*) into objective

[17] An indirect argument confirming the conceptual "kinship" of the ideas developed by both authors lies in the fact that from a nominalist standpoint, Stanisław Leśniewski—an exponent of the Lvov-Warsaw school—spoke critically of Petrażycki's and Husserl's conceptions of general objects, emphasizing that these conceptions "distinguish themselves by the characteristic of taking even extremely fine thinkers to the 'back roads' [*proseločnye dorogi*] of objectless 'speculations'" (Leśniewski 1913, 29; my translation).

areas (E. Husserl 1900, 5) and brought about in Petrażycki an awareness of the need for a reformulation of the then-existing system of sciences in accordance with the principle of adequacy.

(7) Both thinkers shared the idea of the incommensurability between theoretical and empirical knowledge, and so of the logical impossibility of deducing a theory from a knowledge of collections of individual facts, an idea involving the criticism of the empiricist theory of abstraction on the part of both thinkers.[18]

Of course, from these comparisons it does not follow that Petrażycki's theory has a phenomenological nature, not least because the conceptual apparatus of phenomenology and its very method in the *Logische Untersuchungen* had not been yet developed. However, there are at least two conclusions that can be drawn from this comparison.

(*a*) The traditional appraisal (*ocenka*) of Petrażycki's theory as a consistent psychological positivism—an appraisal that Lazerson (1930, 65) subscribed to—may be partly undermined.

(*b*) The appraisal of the methodological foundations of the psychological theory of law partly depends on the theoretical orientation of the interpreter, who to some extent reduces this theory to his or her own methodological positions—in Lazerson's case, to his psychological positivism.

20.1.5. Law without Norms?

As suggested by Fittipaldi in Chapter 18 of this tome, on Petrażycki, one of the main points on which Petrażycki's theory differs from the other most consistent psychological theory of law ever proposed—namely, Enrico Pattaro's—is the secondary role that in Petrażycki's theory is played by the concept of a norm.[19] In Lazerson, the legal norm does not even play a secondary role; it is

[18] For further similarities and arguments, see Timoshina 2012, 177–203.

[19] It bears pointing out the following proximities between Petrażycki's and Pattaro's (2005) theoretical positions. (1) A proximity is to be seen, in the first place, in their idea that legal norms have a mental existence: In Petrażycki's interpretation, a legal norm is the content of a normative judgment understood as an emotional act, and the disposition to experience such normative judgments he calls *normative conviction* (*normativnoe ubeždenie*); in Pattaro's theory a legal norm is the content of a deontic judgment, experienced as normative by at least one individual, called a *believer in a norm*, and this individual's characteristic psychical state he calls *normative belief*. (2) Just like Petrażycki, Pattaro views legal norms as a "powerful motive of human behaviour" (ibid., 88). (3) Pattaro understands a legal norm as a rule experienced as "binding per se," and on these grounds he distinguishes legal norms from rules of prudence, which have a teleological orientation. This corresponds to the two kinds of motivation highlighted by Petrażycki: The self-sufficient, or normative, motivation (including the legal one as a species thereof) and the teleological one, motivating actions in view of a given goal. Therefore, the starting point for both Petrażycki and Pattaro is a general concept of normativeness as self-bindingness [*samoobjazyvanie*]. (4) Pattaro makes use of the concept of "type of action" in a sense analogous to the Petrażyckian con-

simply redundant: "We can […] think of law," he states, "without the existence of legal norms" (Lazerson 1930, 129; my translation).

Lazerson holds that the time of manifestation of norms does not coincide with the time of manifestation of law (*pravo*). Initially, legal claims where satisfied even without the existence of norms, as through a judicial decision. Only a long evolution of law under the influence of its unifying tendency (see Section 18.8.6 in this tome) can prevent us from removing the historical stratification and from seeing law in its "normless state [*beznormennoe sostojanie*]" (Lazerson 1930, 130; my translation). In supporting the thesis that legal norms are not necessary, Lazerson, among others, refers to the free law movement and to Soviet judicial practice, with its "revolutionary sense of justice [*pravosoznanie*]" (ibid.), as a foundation for judicial decisions.

The motivational action of law manifests itself not through norms but rather by virtue of the very emotional experience of law (*pravo*), which as such does not require norms. Legal norms have no reality. What in science are called *legal norms* consist exclusively in *the rationalization of the behavior that in a certain legal order is desirable*. Lazerson actually reduces the intellectual (*intellektual'nyj*) structure of legal emotions to the representation of action:

> What commands is not the norm itself, as its primitive understanding naively imagines, but exclusively the *pattern of behavior* [*obraz povedenija*] that was developed in that situation on a given range of conducts. (Lazerson 1930, 128ff.; my translation and italics added)

It could be remarked that Petrażycki's legal theory gives no grounds for so radical a conclusion as Lazerson's. According to Petrażycki, a legal norm is the content of a normative judgment—where a normative judgment is understood as an emotional act, namely, an emotion, the disposition to experience which Petrażycki called "normative conviction" (cf. footnote 19 above and Chapter 18 in this tome). The specific feature of normative judgments—as well as of normative emotions (of which legal emotions are a species)—is that (1) they approve or reject a certain type (*tip*) of behavior "not as a means to a certain end but as such," and that (2) they motivationally affect the subject's behavior. If we consider that the intellectual structure (*sostav*) of legal emotions coincides with the very elements of the structure that Petrażycki ascribed to legal norms, we can conclude that concealed in the term *legal emotion* is the concept of a legal norm understood, not as an emotional projection, but as a

cept of "action representation" [*akcionnoe predstavlenie*], understood as a representation of the type of obligatory behavior accompanying the normative motivation. (5) A proximity between their theoretical positions can be also seen in their explanations of the psychological mechanism by which legal norms are objectivized and universalized, a mechanism connected by Petrażycki to the "mystical-authoritative" nature of legal emotions and by Pattaro to the concept of *catholodoxia*—a reification, or hypostatization, of normative beliefs that results in the normative system being represented as "objectively" existent. More on the similarities between Petrażycki and Pattaro can be found in Timoshina 2011.

"real" psychical phenomenon, that is, as the actual experience of the value of the ought, which motivates one to realize that ought in action.

20.1.6. The Realist Interpretation of Natural Law

Lazerson's realist interpretation of natural law is probably the most original part of his legal views, because in the other parts he is entirely aligned with Petrażycki's legal theory. On the basis of Petrażycki's distinction of law into positive and intuitive,[20] Lazerson distinguishes different *kinds of intuitive law*. His purpose—in accordance with the position of psychological positivism—was to decouple the concept of natural law from any ideology and consider it "in a real-psychological way," namely, as a certain kind of psychical experience formed as the result of the evolution (*ėvolucija*) of the legal psyche. According to Lazerson, contending that the essential feature of natural law lies in one of its ideological vestments (religious, rationalist, etc.) is a mistake owed to a lack of understanding about the psychological nature of natural law (Lazerson 1930, 298ff.).

As is known, Petrażycki identified intuitive law with justice. In emotions of justice, he writes, "we deal with judgments concerning, not what is required according to the laws, etc., but what belongs, should be attributed to whom according to our 'conscience,' according to our autonomous convictions, independent of other authorities" (Petrażycki 2000, 404; my translation). The sphere of action of justice is that of the *distributio bonorum et malorum* (literally, "distribution of goods and bads") in which intuitive law coexists alongside positive law. The experience of justice influences the interpretation, application, and scientific construction (*osmyslenie*) of positive law and is a (peacefully or revolutionarily active) factor of its enactment, amendment, and abrogation. Clearly, Petrażycki is reproducing in a different terminology the old dichotomy between natural and positive law, despite his objecting to such a treatment of his conception of intuitive law as a sort of natural law with historically changing content. Petrażycki himself held that intuitive law should be recognized as "a more suitable *scale* [*masštab*] than morality *in criticizing positive law*" (Petrażycki 1902, col. 1802; my translation and italics added), because morality does not know claims and so is an inadequate scale for law.

Lazerson holds that the properties that Petrażycki determines for the whole sphere of intuitive law—first among them its individual variability[21]—

[20] While positive law consists of *heteronomous* imperative-attributive emotions prompted within the subject's psyche by normative facts, intuitive law consists of *autonomous* imperative-attributive emotions arising within the psyche of the subject without the mediation of normative facts (more in this regard in Chapter 18 of this tome).

[21] "Essentially [*principial'no*], intuitive law remains […] a law whose content varies for each individual, a law with no template, and as for its content, it can be stated that there are as many collections [*sovokupnosti*] of intuitive-legal convictions or collections of intuitive rights [*prava*] as there are individuals" (Petrażycki 2000, 383).

can be attributed only to one of its kinds, that is, to *individually-adapted* (*individual'no-prisposoblennoe*) intuitive law. Next to this kind he also distinguishes *socially-adapted* (*social'no-prisposoblennoe*) intuitive law, which according to Lazerson is what is conventionally referred to as natural law (*estestvennoe pravo*).

Between the two kinds of intuitive law there is an *evolutionary connection*. Through *social selection*, individually-changing (*individual'no-izmenčivoe*) law may become socially-adapted (natural) law. Lazerson clarifies this point through the following example: At a certain stage of social development a certain individual may feel the need for a certain independence from others. The transformation of such an individually-changing intuitive law into a natural-law "personal liberty" is the result of a continuous process of social selection. From Lazerson's point of view, it is only the individually-adapted law capable of motivating mass behavior that can turn into natural law. One of the factors of this transformation is the commonality of the conditions of formation and development of the individuals' intuitive-legal psyche within the confines of a social group.[22] At the same time he holds that there exist natural-law positions that can be thought of only as originally socially-adapted, an example being freedom of association or of assembly (Lazerson 1930, 282ff.).

It is apparent that in the illustrated argument, Lazerson is hardly successful in completely avoiding ideological biases. The question why and how certain natural rights (*prava*) are socially selected and not others, namely, the question of why these rights have the quality of "social adaptation" (*social'naja prisposoblennost'*), remains unanswered by him.

While the formula of individually-adapted intuitive law corresponds to the saying "Everyone has his truth" (*u každogo Pavla svoja pravda*), socially-adapted intuitive law purportedly recognizes that which has always, everywhere been held by everybody: *Quod semper, quod ubique, quod ab omnibus*. Natural law's claim to universality and immutability is viewed by Lazerson as a psychological *tendency* necessarily inherent in it, without which natural law—as socially-adapted intuitive law—could not assert itself next to individually-changing law, on the one hand, and to positive law, on the other. While the bindingness of positive law is owed to corresponding normative facts, the bindingness, or_motivational force, of natural law can be achieved only by invoking its "eternity," its sociocultural universality, its reasonableness (*razumnost'*). In this way, certain features that certain scholars traditionally ascribe to natural law are exclusively the expression of a "psychological necessity," namely, the strengthening of its motivational force in the absence of normative facts. Accordingly, natural law—viewed by Lazerson as "a stable element of people's

[22] However, this idea can also be found in Petrażycki (2000, 381), who talked of the intuitive law of a given contemporary civilized society, or of a given social class (workers, manufacturers, farmers, landowners), or of a given family, or of children, women, men, etc.

legal psyche [*narodno-pravovaja psihika*]"—is a universal socio-psychical phenomenon, and not in any way the set of natural-law doctrines formulated in the European culture of the modern era. It is precisely for that reason, according to Lazerson (1930, 310), that to argue for the "death" of natural law in consequence of the decline of natural-law doctrines is to misunderstand the psycho-legal and social essence of natural law as socially-adapted intuitive law.

Lazerson (1930, 287) distinguishes three kinds of law according to the degree of their motivational force: individually-adapted intuitive law, socially-adapted intuitive law (natural law), and positive law. In this connection he makes the proviso that positive law has strong motivational force only when its content coincides with natural law.[23]

Lazerson sums up his view as follows:

> The […] foregoing investigation of natural law as a kind of intuitive law does not need any ideological justification. It rejects theism, pantheism, rationalism, socialism, etc., as historically changing shells connected to different eras. By focusing on *functional role* [*funktional'noe značenie*], our objective investigation—ultimately based on the psychological theory of law—does not connect the *essence* of natural law to the *content* of the legal requests [*trebovanija*] it made in different ages, one after another. According to our point of view, not only is it inadmissible to reduce natural law to few norms mirroring […] its *eternal* minimal content: It is also inadmissible to be satisfied with affirming […] the *changing* content of natural law. (Lazerson 1930, 287; my translation and italics added in the first occurrence)

Lazerson's hypothesis about the evolutionary selection of intuitive-legal emotions makes it possible to assume, in turn, that the same evolutionary selection acts on positive law, first and foremost in determining normative facts. Therefore, Lazerson's idea may serve as an argument for the hypothesis that Petrażycki assumed that in the process of sociopsychological development a selection takes place in determining which facts wind up being interpreted as having a normative sense. If we consider the sociocultural perspective on the evolution of law as an evolution directed "toward the common good"—a perspective that goes to the very core of Petrażycki's Weltanschauung—then it becomes possible to remove some contradictions from his construction of normative facts. It cannot be maintained at all that *any fact whatever* can have a social relevance as to the foundation of rights and legal obligations. Those facts that cannot bring about "a social coordination of behaviors" cannot contribute to ethical progress. Therefore, the ethical end of the sociocultural evolution of law not only determines the social legitimacy of normative facts,[24] but also

[23] In setting out the connection between positive and natural law, Lazerson by his own telling went a little further than Petrażycki, but here we will not enter into the details of Lazerson's position.

[24] An interesting discussion and development of Petrażycki's conception of normative facts that differs from the account just offered can be found in Fittipaldi 2012b, 107ff., 112; see also Sections 18.6.3 and 18.10.12 in this tome. It should be recalled in this context that in Fittipaldi

shapes the character of the motivational processes responsible for the selection of what is socially obligatory (*social'no dolžnoe*) on the part of the subject.[25]

At the same time Lazerson's postulation of the action of a universal evolutionary tendency within law is the *premise* at the basis of his self-claimed premiseless (see Section 20.1.2 above) legal conception.

20.2. Czesław Znamierowski: From Social Ontology to Legal Realism
(*by Giuseppe Lorini and Wojciech Żełaniec*)

20.2.1. The Threefold Realist Dimension of Czesław Znamierowski's Philosophy of Law

Professor Czesław Znamierowski (1888–1967)[26] is reported to have been in the habit of interposing a peculiar question when giving exams at the law school of the University of Poznań. He would ask his students, "If you stood atop the City Hall tower and looked down, what would you see?" Observing his students at a loss for words, he would step in and answer, "Nothing but people and things." "But if that is the case," he would then go on to ask, "what use is legal reality, with its contracts, its legal statuses, its legal entities? How is a reality like that possible in the first place in a world of physical and mental beings?"

It is precisely that question that Znamierowski's philosophy of law attempts to answer, taking a realist premise as its point of departure.[27]

This realist premise consists in the negation of the existence of a dimension of reality above and beyond the dimension of the physical and the mental, be it a *social* dimension (a critique of Adolf Reinach's phenomenology)[28] or a *deontic* one (a critique of Hans Kelsen's "pure theory").

2012a an extensive linguistic investigation of legal phenomena is developed within the framework of Petrażyckianism, and before Fittipaldi's work, the only such attempt made was by Max Lazerson (1919).

[25] More in this regard can be found in Timoshina 2011, 65.

[26] Czesław Znamierowski (CHESSwahff znahmyairOFFsky) was a Polish legal scholar as well as a legal and social philosopher. For most of his life he taught at the University of Poznań (Poland) and was prolific from the early 1920s until his death. He studied for the most part in Germany, where he learned the phenomenological method as developed by Husserl's most brilliant student, Adolf Reinach, yet the stance he took to it was critical, as was his stance to the rest of contemporary German philosophy—and the same goes for his attitude to the legal philosophy of his great fellow countryman, Leon Petrażycki (cf. Fittipaldi 2012a and 2012b). He was and remained a lone genius, not only because he wrote in Polish but also, as we should like to argue, because the time in which his influence might, or should, have begun to make itself felt was uncongenial to intellectual endeavours like his, this owing to the Moscow-imposed totalitarian (Bolshevist-Communist) dictatorship in Poland (1944–1989). See Czepita 1986 and 1987, as well as Lorini and Żełaniec 2013. On Znamierowski see also Section 16.2 in Tome 1 of this volume.

[27] For a different take on Znamierowski's legal realism, see Gidyński 1968.

[28] For a discussion of Reinach as himself a realist, even if in a *sui generis* sense, see De Vecchi 2012. On Reinach see Section 4.2 in Tome 1 of this volume.

Using Occam's razor,[29] and unlike what Reinach thought, Znamierowski maintains that it is not necessary to accept the existence of a world of legal objects with their purportedly autonomous existence not reducible to either the physical or the mental, or a dyadic ontology à la Hans Kelsen that sets a world of the *ought* (*Sollen*) against the world of the *is* (*Sein*).

Znamierowski explicitly criticizes phenomenology for its assumption of a "new, social 'dimension' of reality," again invoking Occam's razor: "Phenomenology, so generous in multiplying beings beyond any necessity, is ready to enrich reality with a new dimension like that" (Znamierowski 1924, 71; our translation).

For Znamierowski, there is just the psychophysical reality, and legal reality is a part or a sub-domain thereof.

Znamierowski's legal realism takes shape, too, in the (originally phenomenological) postulate of returning to things (*res*) themselves, against what he calls "jurisprudence mythology," of whatever kind: "It appears important to me to accustom the reader to direct thinking of what things are like and disaccustom him from [a] museum-like interest in what various people think of […] things" (Gidyński 1968, 50; slightly modified quotation).

Other than that, Znamierowski's legal realism is characterised by a "substantialist" conception of legal reality, on which "the main role in the world of legal reality is played by the category of 'things' [*rzeczy*]" (Znamierowski 1922, 28; our translation).

In what follows, we shall try to reconstruct this Znamierowskian conception of legal reality taking our point of departure in social ontology, a philosophical discipline of which Znamierowski was one of the founders. Social ontology is the theoretical framework in which his realist theory of law can best be understood.

20.2.2. On the Origins of Social Ontology

Among the first thinkers to speak of social ontology was the German phenomenologist Edmund Husserl, who as early as 1910 introduced the term (*soziale*

[29] In the folklore of English-speaking countries, this principle seems to be about the simplicity of explanations (the simpler, the better; the more involved, the worse—all other things being equal). In Continental folklore, by contrast, the razor is about the number of assumed entities. The latter is also suggested by formulations in mediaeval Latin (or what is considered to be such) like *Entia non sunt multiplicanda praeter necessitatem* (Entities must not be multiplied beyond necessity). Now, these two razors are by no means equivalent. Explanations (proofs, considerations) that employ fewer entities are usually more complex than those that use more. As has been known at least since Russell and Whitehead, all mathematics can be built on the assumption that there exists just one entity, namely, the empty set (plus the operation of forming a set of any given elements). But even a schoolbook for grade-schoolers with mathematics employing just that entity would run to hundreds, if not thousands, of pages. Znamierowski himself mentions the razor (in the Continental sense) in Znamierowski 1925b, 7.

Ontologie) in a short essay accordingly titled *Soziale Ontologie und deskriptive Soziologie* (Social ontology and descriptive sociology), published posthumously in 1973 (Di Lucia 2003, 10).

It is with critical reference to the phenomenological tradition that in the 1920s Znamierowski began his studies in social ontology.[30] Social ontology was first mentioned by him as *ontologia społeczna* (see Lorini 2010) in a 1921 essay titled *O przedmiocie i fakcie społecznym* (On social objects and social facts: Znamierowski 1921, 2).[31] By *ontologia społeczna* (social ontology) Znamierowski means a new philosophical discipline distinct from sociology (*socjologia*), which Znamierowski understands as a science devoted to the task of building a "theory of specific social groupings" (*teoria konkretnych zgrupowań społecznych*).[32]

According to Znamierowski, social ontology is an a priori science (*nauka aprioryczna*) whose business it is to "establish general truths concerning every (actually existing or merely possible) form of social being" (*byt społeczny*). This science, he noted, is best "called social ontology, because it establishes general truths that hold for all social beings, both actually existing and merely possible, and because, as an a priori science, it is legitimate for it to point to its philosophical character by its very name" (Znamierowski 1921, 2; our translation).

Znamierowski returned to the expression *ontologia społeczna* three years later—in the introduction he wrote to his own book *Podstawowe pojęcia teorji prawa: Układ prawny i norma prawna* (Basic concepts for a theory of law: The legal system and legal norms, Znamierowski 1924, 5–6)[33]—so as to distance himself, ironically, from Husserl's phenomenology. In that work, Znamierowski refuses to construe *ontologia społeczna* in the rather narrow meaning attributed to it in Husserl's phenomenology. To him, social ontology is "not just direct, intuitive knowledge […] of the essence [*istota*] of entities—a knowledge gained by a pure eidetic intuition [*reine Wesensanschauung*]—but a system of more general cognitions of a class of objects delimited by conventionally accepted definitions" (ibid. 137; our translation).

[30] To be sure, even before that time, in an article of 1915, Znamierowski (1915) used the similar-sounding concept of the metaphysics of society (*metafizyka społeczności*), but on that occasion he was discussing Josiah Royce's philosophy of Christianity, so the concept (as developed in that context) does not have the requisite generality.

[31] As is known, exactly seventy years later, in 1991, Searle would be speaking of an "ontology of social facts" in his essay *Intentionalistic Explanations in the Social Sciences* (Searle 1991, 340), thus revitalising research in social ontology. Searle's major contribution to the field is his 1995 book *The Construction of Social Reality*. Znamierowski investigated social ontology in his essays *Psychologistyczna teorja prawa* (A psychologistic theory of law: Znamierowski 1922) and *Z nauki o normie postępowania* (From a theory of norms of conduct: Znamierowski 1927) and in his book *Podstawowe pojęcia teorji prawa: Układ prawny i norma prawna* (Basic concepts for a theory of law: The legal system and legal norms, Znamierowski 1924).

[32] More to the point, Znamierowski (1924) explained that relation by describing social ontology as the *foundation* of sociology and of the social sciences in general.

[33] Parts of that book are available in English in Znamierowski 1987.

The social sciences, Znamierowski (1921, 1–2) goes on to claim, badly need a unified and unifying foundation for basic concepts such as society, social act, social object, and social function: This unifying discipline is precisely what Znamierowski proposes to call social ontology, and without the basic concepts it seeks to ground, the single social sciences (each going its own way) will grope in the dark and entangle themselves in absurdities. In fact, Znamierowski is lucidly aware of the importance of method and of the consequences that, through the intermediating role of epistemology, first methodological choices will have on a theory yet to be built, and he opts for a method of "conventional construction whose legitimizing touchstone lies not in the 'dignity of truth' but in utility (fruitfulness)" (ibid., 3; our translation)—which is to say that he rejects the Reinachian intuitive insight into essence as a method.

Social ontology as proposed by Znamierowski in the 1920s branches out into an ontology of "social reality" and an ontology of "thetic reality." To these two branches we devote the next two sections.

20.2.3. Czesław Znamierowski's Ontology of Social Reality

In the 1921 article *O przedmiocie i fakcie społecznym* (On social objects and social facts: Znamierowski 1921), Znamierowski sketches out his own ontology of social reality in opposition to Adolf Reinach's phenomenology. At the basis of that ontology is an investigation of the essence of society and of social entities.

His main concern is to establish the essence of society as such, not by what he saw as a merely pretended intuitive insight, but by meticulously analyzing the concepts employed (and, to no lesser degree, the realities corresponding to these concepts) and the construction of new concepts.

After discussing this topic at length, Znamierowski arrives at the following definition: A society is a collective of at least two persons such that at least one of them knows of the existence of the other, not *simpliciter* but *qua* person, and there is a non-mind-dependent possibility for the person who knows of the existence of the other to consciously affect that other person by her action, and the former person knows of this possibility.[34] To be sure, in his original phrasing of this definition, Znamierowski (1921, 10) resorts to the metalinguistic device of saying "by the word 'society' we shall be denoting a collective," rather than saying (as we have) "a society is a collective," but it is clear from the context that what he means is the *thing*, not the word. That is, his definition is more like Aristotle's definition (ὁρισμός) than what we can expect from a modern philosopher.

He then goes on to discuss persons, the milieu, mind-independence, and other things relevant to his definition of society—always speaking of *things,* not of the corresponding *words*.

[34] Relevant in this context are the highly sophisticated views that Znamierowski (1939–1946) has on the nature of causality.

Znamierowski (ibid., 20ff.) then turns to the main subject matter of his essay, namely, social objects and social acts. Examples of the former are legal norms (including state constitutions), rules of social etiquette, and social institutions. He observes that the ontological status of such objects has not yet been established, and he embarks on a long refutation of Reinach's (1983) account of social objects as having a status different from, but on a par with, that of both physical and mental objects. Both an admirer of Reinach and a critic of him, Znamierowski tries to find a middle ground: It would be silly, he notes, cautiously siding with Reinach, to confuse the Polish Constitution of 17 March 1921 with the copies of this text which at the time were signed by the Marshal of the Sejm (the "speaker" of the Polish parliament), and which in this sense are the only "authentic" copies of that constitution, or with the mental processes of the lawmakers as they set about enacting that law. It would more generally be simplistic to insist that there is no third category of objects aside from the physical and the mental—that would amount to philosophical dogmatism, which Znamierowski (1921, 21) disapproves of. But wishing to take his point of departure in a position that implies the smallest number of contestable assumptions, Znamierowski maintains that a social object like the Polish Constitution of 17 March 1921 can be identified (which is not the same as asserting it to be identical) with a "peculiar system" (*specyficzny układ*)[35] of objects both physical and mental (mind-dependent), and perhaps ideal, such as Fregean "thoughts" or Russellian "propositions."

Next, we have social *facts* or *acts* (dynamic objects, as it were). Znamierowski faults Reinach for what in his view amounts to unduly restricting the concept to only one of its structural components, that is, to psychological-intentional experiences of both the actor and the person the act is directed at (the promisee, say, in the case of a promise). While this "undue restriction" (if it is such) gives Reinach the distinction of being the most important pre-Austinian student of what Searle later called "speech acts" (Smith 1990),[36] Znamierowski is right to point out that it is inadequate, as it leaves out the whole aspect of social facts that bears a connection to the environment and no connection to intentionality. The killing of a person, or a theft, Znamierowski observes, are very important classes of social facts in their own right, even though by their very nature they fail to contain the element of the "need of being heard":[37] They are not *vernehmungsbedürftig* (Znamierowski 1921, 3; our translation). A social fact, according to Znamierowski (ibid., 23), is (1) an intentional act aimed at bringing about a change in the social structure (2) via

[35] The word *układ*—which can be translated as "system," "arrangement," "disposition," "array," or the like—plays a very prominent role in throughout Znamierowski's work.

[36] Reinach's insightful and penetrating analysis of social acts is in Reinach 1983, 18–22.

[37] This "need of being heard," (or, more generally, perceived) according to Reinach (1983, 19), is one of the constitutive moments of a social act.

a change in the environment that envelops that structure, a change that brings about (3) an effective change in that structure itself. So, for example, in order for a homicide to be such (a homicide), it must be (1) conscious and purposeful (which involves intentionally envisaging the person to be killed *qua* person); but it must also (2) go through the stage of where someone (the killer) uses a lethal weapon (e.g., shooting a revolver), which is typically part of the environment enveloping the social structure the agent is intending to change; and (3) it must "hit its target" (in the literal sense of the person to be killed). These three moments—the intentional psychological act, the use of a means by which to change the environment, and the change actually effected in the social structure—are inseparable, and none of them is more important than the other two (ibid., 24).

Znamierowski (ibid. 24ff.) goes on to offer an interesting consideration on what he calls the social "significance" or "bearing" (*doniosłość*), on the one hand, and the social function (*funkcja*), on the other, of various social as well as nonsocial objects. Objects that are not intrinsically social but have social bearing are objects that in one way or another have an influence on social facts, as is the case with climate, the health of the population, technological advancements, and works of art. All objects of this sort, whether physical or cultural, are socially significant and have a social impact in that they can, and typically do, influence social facts. Of course, social objects and facts can themselves have such a bearing (ibid., 27). An object's social function, by contrast, consists in its being a condition for a social structure, or in its symbolizing a social structure, or in its being a regular means for a type of social action (ibid., 27). A social function so understood can be ascribed to material objects such as the property of a member of society, as well as to symbols, such as coats of arms, military flags, border posts, and suchlike. Objects that are social in themselves also have a social function.

At this point, Znamierowski extends his definition of a social act or fact by adding that it also includes acts directed not at persons but at other types of objects, as long as such objects are endowed with either a social function or a social bearing. An example is the theft or destruction of a military flag, and another is setting fire to a forest in an area of military action, in which case the social bearing of a forest lies in its strategic importance (ibid., 28).

An important difference between social bearing and social function is that the former, but not the latter, can come in degrees: It can be a matter of "more or less." An object can have various functions (an individual may happen to be at the same time the director of a local church choir, the president of a walking grandfathers' club, and chairman of the Joint Chiefs of Staff), thereby acquiring social bearing to a very high degree. But its different social functions remain separate: They do not "grow together," or concresce, just in virtue of existing next to other social functions. Another example might be a pathogenic bacterium, which ordinarily would have no social function at all, but it would

perhaps take one on if it were deployed as a bacteriological weapon, and in this case its social bearing would obviously be higher the more contagious the corresponding disease is (ibid., 29).

Armed with such distinctions, Znamierowski is in a position to solve various abiding problems in the social sciences. For example, is religion a social phenomenon, a complex of social objects and acts? he asks without mentioning Durkheim. No, because (as he argues) it is possible to be religious and practice one's religion all alone, without this entailing any changes in any social structure or any impact on the environment in which those structures exist. Yet religious practices typically do have a social bearing, and quite often a social function, and at least in this derivative sense they can be said to be social. Another example: Is the economy as such social? The production of material goods need not be, as Robinson Crusoe has clearly demonstrated. But then, again, as we noted above, the very existence of such goods typically has a social bearing and can be assigned a social function. Similarly, a buyer's choice, useful as this concept may be for the theory of marginal utility, is a nonsocial act; in the context of other such acts, that choice can acquire both a social bearing and a function (ibid., 31ff.).

20.2.4. Czesław Znamierowski's Ontology of Thetic Reality

Still more innovative is the ontology of thetic reality that Znamierowski expounds in his previously mentioned book *Podstawowe pojęcia teorji prawa: Układ prawny i norma prawna* (Znamierowski 1924). Here Znamierowski does not proceed from a presupposed ontological theory, as he did three years earlier (in Znamierowski 1921), taking Reinach's phenomenology of social reality as his point of departure. He instead charts an entirely new philosophical path. In his examination of concepts relevant to the philosophical study of the social and of the corresponding objects, Znamierowski makes a discovery that is fundamental for social ontology. He discovers a particular kind of *social entity*: These are entities that can exist only within society (*społeczność*), and he calls them *thetic entities*. (Forty years later John Searle will rediscover the ontological specificity of these entities, calling them institutional facts: Searle 2010, 10–1; cf. Lorini 2000.)

The ontological specificity of thetic entities lies in their existing by virtue of a norm, and in particular of a type of norm that Znamierowski calls a norm of construction (*norma konstrukcyjna*).

There is one kind of thetic entity that Znamierowski is particularly interested in studying: He calls it a *thetic act*, and in this class we find acts such as saluting, drawing up a will, playing chess, or celebrating a wedding—all of which he distinguishes from mere "psychophysical acts," such as walking or drinking a glass of water.[38]

[38] Much of what follows was anticipated by Znamierowski one year earlier in a talk he gave

As we shall see, this discovery of thetic acts marks a revolutionary moment in the study of legal realities. But let us begin with the ontology of social reality, examining its fundamental moments as presented in Znamierowski 1924.

Right at the beginning of this work, Znamierowski (1924, 2) explains his method of simplified models and conceptual constructions: This, he says, is a method that has proven useful in the natural sciences, and he is recommending it for what he calls the "ontology of the social sciences." In a note to this expression in which he is much more explicit on what this method involves, he uses the phrase "social ontology" and explains that the method begins by analyzing the concepts currently used in thinking about society and then establishes the relations that hold among these concepts, and consequently also those that hold among the corresponding objects (ibid. 136; our translation). From the very first pages of the book, Znamierowski's language is directed at *objects*, not concepts. So as he proceeds, the distinctions he draws and the new categories of objects he finds lie in social reality itself, not among the concepts used by social scientists.

Among the first types of objects he finds (and, of course, among the first concepts) are *thetic norms*. A norm—he tells us after having carefully distinguished norms from commands and orders—is "a linguistic proposition" (ibid., 8) that contains the word *ought* in the predicate position, but this "ought" can be taken to express various meanings. So in Poland, for example,

> when I say that one ought to register with the local authorities no later than twenty-four hours after arriving [at a new place], I mean […] that doing so is in conformity with the [legal] norms of conduct *laid down* in Poland. In this sense, a thing that ought to be is simply a thing which is in conformity with a valid norm, which [in its turn] is something that belongs to the class of things distinguished by an act we shall later call an "enactment." This new sense of the expression *ought to* I shall call "thetic" (from τίθημι), as it refers to something's being enacted or laid down. (Znamierowski 1924, 12; our translation)

The source of thetic norms—that is, norms whose "ought" must be taken in the thetic sense just explained—is an act of legislation, an "enactment" (*ustanowienie*), as Znamierowski calls it.

Thetic norms in turn give rise to thetic *acts* and thetic *states* of affairs:

> I shall call thetic acts particular actions connected with other actions by a thetic norm, in such a way as to take on a specific meaning,[39] or organic wholes constructed by a norm from the actions of one or more persons. The meaning of the objects and acting subjects involved in such acts I shall call their conventional meaning.[40] The psychophysical actions themselves, which in virtue of

at a Polish congress of philosophy held in Lwów (perhaps better known under its German name, Lemberg) and published only in 1927 (Znamierowski 1927). Much of the material presented in this section is accessible in Lorini's Italian translation (Znamierowski 2002).

[39] *Znaczenie* in Polish. *Meaning* is understood here not just as semiotic meaning but also as a new ontological identity that meaning-bearing actions acquire in virtue of a thetic norm.

[40] Znamierowski (1924, 64–6) carefully distinguishes between actions and acts—the former distinguished by their having an *aim*, the latter by their having *accomplished* or completed something—but we need not go into this matter here, as the difference is not material in every context.

a norm become thetic acts or parts of thetic acts, shall be called the material acts of the thetic acts in question. (Ibid., 68; our translation)

The concept of a thetic act becomes a formidable instrument for an innovative study of a classic object of jurisprudence—namely, legal acts, or acts in the law—and it turns out to be a fundamental conceptual instrument in the study of the legal reality. As Znamierowski writes:

According to this definition, activities such as parlour games, which are founded on a convention, are thetic acts. Among such acts are, for instance, chess moves, all kinds of activities in card games, and so on. But, even more importantly for us here, thetic acts also include those in the class of acts done exercising one's "legal" will. A sale, for instance, is not a simple psychophysical action, nor is it a simple social act; it is rather an arrangement of actions and acts held together by a system of norms that construct a sale as an act. Drawing up a will, entering into marriage, delivering a verdict, a detention—in a word all types of acts called "legal." (Ibid.; our translation)

Legal acts are nothing but thetic acts, that is, acts constructed by means of norms, which are then necessary conditions for the possibility of these acts. We have to do here with a kind of reality whose very existence depends on norms for its validity.

None of them would have existed if the norms which construct them had not existed. Just as it is not possible to "kill a pawn" (in chess) in the absence of the norms of chess, it is not possible to donate a horse if there are no norms establishing the institution of property and the act of donation. In the absence of these norms, it is only possible, in the former case, to move pieces of wood on the chessboard, and, in the latter case, to transfer the *de facto* possession (*faktyczne posiadanie*)[41] of the horse by putting the reins in someone else's hands, taking the animal to someone else's stable, or something like that. (Ibid., our translation)

Without these norms, the thetic act disappears and leaves its own shadow the material act or acts that were its substrate. Without the norms that constitute donation as a *type* of act, it is impossible to donate a horse. It is at best possible to put the reins into someone else's hands.

However, alongside the concept of a thetic act, it is necessary to emphasise the relevance of the concept of a material act, akin to (but not identical with) the concept of a "brute fact" introduced by Elizabeth Anscombe (1958) and made famous by Searle in his theory of constitutive rules.

In one of the previous quotations Znamierowski speaks as though all material acts were psychophysical acts: "The psychophysical actions themselves, which in virtue of a norm become thetic acts or parts of thetic acts, shall be called the material acts of [i.e., underlying] the thetic acts in question" (Znamierowski 1924, 68). Yet later on, he makes it clear that whether an act is "material" or "thetic" depends on its position in the hierarchical construction of

[41] By this he means not a legal title to possession of an object, not even the *animus rem sibi habendi*, but the "brute fact" of having the object in one's power.

acts: The material acts (*i*) underlying a thetic act (*ii*) can be *thetic* acts with respect to certain acts (*iii*) that underlie them (*i*), which acts (*iii*) will consequently be *material* acts with respect to the former acts (*i*), and can, though need not, be psychophysical:

> For a comprehensive explanation of the structure of thetic acts it must here be added that a thetic act can have not just psychophysical actions but also other thetic acts as components. So, in contract bridge, for example, the player who plays the highest card in the suit led "wins the trick," but this "winning the trick" is a thetic act composed of a series of thetic acts, namely, the acts consisting in the other players playing their cards. Similarly, what with the passing of a new law: For the law to become valid it must first be passed by the Chamber of Deputies and the Senate and then be signed by the President. Only after these three acts—all three doubtless thetic—will the unitary act of enacting a law be completed and the law itself take effect. (Znamierowski 1924, 71ff.; our translation)

As can be seen from the last part of this quotation, the analogon of Searle's "brute fact" is, in Znamierowski, not the material act (which need not be all that "brute"), but rather the psychophysical act.[42]

Znamierowski is explicit about a further point: Thetic acts (at any given level) enjoy a degree of freedom relative to their underlying material acts, which, once again, to bring home the point, need not be "brute," or merely psychophysical. This links him to Aristotle's investigations into the relation between form and matter, as well as to modern contemporary theories of emergence: "Quite different or partly different material acts can go into the making of the same thetic acts, in that the individual peculiarities of these material acts are not taken into consideration at all" (Znamierowski 1924, 71; our translation).

Here, the conventionalism of the Znamierowskian conception of thetic reality comes through. To clarify the thesis just quoted, Znamierowski examines the conditions for the existence of the thetic state of affairs called "the enforceability of a ruling":

> In order for the thetic state of affairs called "the enforceability of a ruling" to come into being, there has to be a thetic act called "the issuing of the ruling." The corresponding norm may require that the issuing of a ruling should take place by the act of the judge in the courtroom reading out the ruling as already written down. Would the reading out of the ruling then be identical with its issuing? By no means. It would not, in the first place because the reading out is just one of the material acts that go into the act of issuing a ruling—another, prior act would be that of the judge writing the ruling down and signing it. Second, there is also another reason why it is not possible to identify the issuing of the ruling with its being read out, which is that such reading out may be performed not by the judge but by the secretary of the court, or it may be replaced by the act of handing a copy of the ruling to the parties. If, then, a material act can be removed from the composition of a thetic act, it can no longer be identified with it. (Znamierowski 1924, 71; our translation)

[42] We suspect that Anscombe's "brute facts" are closer to Znamierowski's "material acts" than to Searle's "brute facts." That question, however, remains outside the scope of this essay.

Yet this does not mean that thetic acts are a separate domain of reality. Here Znamierowski clearly parts company with Reinach (1983) and the whole phenomenological tradition. As if echoing Aristotle's doctrine of matter and form[43] (and, in the background, Aristotle's objections to "separate forms"), Znamierowski continues:

> This possibility of replacing one material act with another creates the appearance that the thetic act is completely independent of material acts, as if it belonged to a new, social "dimension" of reality. Phenomenology, so generous in multiplying beings beyond any necessity, is ready to enrich reality with a new dimension like that. But the appearance is explained away if we realize that *thetic acts are organic wholes, constructed by a norm out of material acts*; the latter can be different in any two given cases, yet the wholes will be the same in the sense that their conventional meaning will be the same in the system of thetic actions. (Ibid., 71; our translation, italics added)

This is very important for a proper understanding of Znamierowski's social ontology and his theory of legal entities: There is the psychophysical reality,[44] and there is also the thetic reality, but this must not be understood as a juxtaposition. To use an Aristotelian analogy, there are heaps of brick and slabs of wood on the one hand, *and* there are houses on the other,[45] but not as separate realities on a par with each other (nor is *house* just a fancy name for what in reality is just a pile of bricks and slabs of wood). A house is an "organic whole," in which the form (the structure) constitutes an "organic whole" together with the (not quite) "raw" materials of brick, wood, and whatnot. Analogously, thetic acts are real wholes, not just *entia rationis* employed in speaking of psychophysical acts, and yet they are not juxtaposed with the latter but are wholes comprising the psychophysical acts as their "materials."

Now, it is not without reason that in the passage last quoted the word *construct* occurs: A thetic act is an organic whole *constructed* through a norm. That word is also key to another important distinction: Among thetic norms there are some that, as it were, "engage" or involve only a selection of mental or physical properties of certain actions, taking these properties as "input":

> Suppose I have a stick I sometimes use as a makeshift walking stick and sometimes as a measuring rod. The entirety of my actions with the stick (including those in which it is a walking stick and those in which it is a measuring rod, and all the others) constitutes a unity that is natural in the sense that they are all actions which a single subject exerts on or does with one and the same

[43] See, e.g., Aristotle, *Metaphysics*, VIII, 1043b–1044a.

[44] We are simplifying things here. In the passage just quoted, Znamierowski speaks of *material* acts, not of *psychophysical* acts. However, the hypostasising of the sphere of thetic acts (a misstep he ascribes to phenomenology) would be quite pointless unless there were a level of acts that are *only* material—and not *also* thetic with respect to acts at some lower level. (Just as well, one could think that "taller things" form a separate domain of reality: This would make sense only if we could assume that there is a class of things that are less tall than anything else.) There *is,* in fact, such a lowermost level: that of (merely) psychophysical acts.

[45] This is just an analogy: We are not suggesting that houses are thetic objects.

thing. In some cases—supposing, for example, that my ownership title to the stick were at issue—precisely this natural unity would be relevant, because every action done with or involving the object in question would be relevant in settling this issue. However, from the perspective of a rule of action, that is, a norm, the entirety of my actions involving the stick is clearly divided in two classes. From the perspective of the rules for handling a walking stick the classes comprise, on the one hand, those actions which satisfy the conditions defining the activity of "handling a walking stick" and, on the other, those actions which do not. The former class is further characterized by a certain qualitative homogeneity, in clear contrast to the heterogeneity of the second class. So the property of having a relation to a norm singles out a class of actions. This class of actions, as against the natural unity of all actions involving the stick, I shall call a *conventional system*. The norm is thus a rule of inclusion in a system. If my uses of the stick are brought under the norm of "handling a walking stick," on the one hand, and the norm of "handling a measuring rod," on the other, we shall get two different conventional systems, such that the class of all other actions involving the stick remains outside of them. (Ibid., 13; our translation)

The thetic norms that enable me to use the stick as a walking stick on the one hand and as a measuring rod on the other may be atypical, because they are for my own use, but in either case they exploit certain natural properties of the wooden object, one set of properties being exploited in the former case, another set in the latter. In thetic acts of this sort there is nothing essential that had not been in their "raw materials," that is, in the corresponding material acts; the new element lies in the specific selection and arrangement of the material acts serving as input for both norms. But there are human enactments that create new social objects (acts) in a much stronger sense.[46]

Znamierowski examines in particular the function served by thetic norms in three different game activities: (*i*) saluting with a flag; (*ii*) solitaire; and (*iii*) chess.

Under (*i*), Znamierowski has us imagine a game in which two boys agree that if either of them raises a little flag in salute, the other will also. These two flag-raising activities are merely psychophysical activities (*czynność psychofizyczna*), mere movements devoid of any meaning. It is only in virtue of the thetic norm constituted by way of the agreement between the two boys that these two movements acquire the meaning of a salute, or rather, that they become a salute (in the game in question): "This thetic norm has created a connection between the two movements of the two flags, giving to each of them a specific meaning, say, that of mutual greeting—not a meaning selected from an assortment of preexisting natural meanings but a new, constructed one" (ibid., 66–7; our translation).

As Znamierowski writes, it is only in virtue of, and with reference to, that thetic norm that "the first physical movement becomes a greeting, while the other becomes an acknowledgment of that greeting. It is only with respect to the norm that has instituted the two movements that they acquire their mean-

[46] Here we are inclined to see an analogy with Searle's distinction between "causal functions" and "status functions."

ings, and only in virtue of that norm do they become correlative actions" (ibid., 67; our translation).

Under (*ii*)—solitaire (*pasjans*)—Znamierowski considers in particular a rule that in certain situations allows an ace to be placed on top of a king. According to Znamierowski, "Placing an ace on the table and placing a king on the table are doubtless two psychophysical activities" (ibid., our translation). But in virtue of that rule, the activities acquire a new meaning in solitaire, in that

> the rule of solitaire has constructed a connection between them that bestows on them a meaning in virtue of which they are henceforth related to each other. In virtue of this norm they are no longer just acts of placing coloured paper on the table but become the acts of "playing a king" and "playing an ace:" They are acts laid down and constructed by the norm in question. (Ibid., our translation)

The same idea applies to (*iii*), namely, chess:

> Here, too, in virtue of a certain rule, or rather a whole system of rules, certain psychophysical actions acquire a new meaning constructed through norms. The chessmen, which are initially just pieces of lathed wood or bone, become "chessmen" that can be moved in this or that way. Physical objects and psychophysical actions acquire a new meaning constructed through a norm. (Ibid.; our translation)[47]

This passage is particularly relevant to social ontology and legal ontology. In his analysis of chess, Znamierowski brings out the fact that the rules of chess do not just assign a conventional meaning to *acts*, but also assign that meaning to physical objects (*przedmiot fizyczny*). In virtue of the rules of chess, pieces of wood or ivory assume a new meaning—a *conventional* one, such as that of "chess king"—and thereby become "chessmen."

Although the term *przedmiot tetyczny* (thetic object) does not appear in *Podstawowe pojęcia teorji prawa* (Basic concepts for a theory of law), Znamierowski does, in that work, bring to the fore the particular nature of certain objects (*przedmiot*), such as the chessmen, whose *type* is constructed in virtue of norms (Czepita 1990, 400).

Aside from the three aforementioned examples of thetic acts that are structurally extremely simple (in that they all have a single psychophysical act as a substrate), there are thetic acts that are much more complex. Znamierowski calls them *cooperative* thetic acts:

> Sometimes, things are more complex. A norm does not construct an act on the basis of a single action but creates an organic whole out of several psychophysical actions, introducing this whole, as a single act, into the system [*układ*] of actions it constructs. That is the case, for instance, when under a group's organizational rules, an act of the group may arise only if all members of the group do certain actions or social acts. As can be seen from this example, a whole consisting of actions done by more than one acting subject […] can belong to a system constructed by a norm. (Znamierowski 1924, 66ff.; our translation)

[47] At least three other authors, after Znamierowski and without any reference to him, have used chess as an example of an activity constituted in virtue of rules: Alf Ross, John R. Searle, and Amedeo Giovanni Conte.

Such thetic norms—which confer a new, conventional meaning on objects and acts—Znamierowski (ibid., 72) proposes to call "norms of construction" (*norma konstrukcyjna*). This concept is very close to Searle's concept of a constitutive rule.[48] One would expect Searle's correlative concept of a *regulative* rule to crop up somewhere in Znamierowski, too. But it does not, at least not directly. In a sense, all thetic and other norms except for those of construction are a counterpart to regulative rules in Searle's sense (ibid., 77). But, more specifically, one finds in Znamierowski a type of norm he calls coercitive norm, whose concept is subtler than that of a regulative rule. A norm is coercitive if it provides for the eventuality that someone could act out of keeping with some other norm—even if the latter is a norm of construction (in our previous flag-raising example, this would mean that one of the two boys refuses to raise the flag when prompted)—by constructing a thetic act of punishment (ibid., 83ff.). If either of the two boys refuses to raise the flag when prompted (thus contravening the rules of the game), then a penalty ought to follow. The norm of construction about raising a flag in salute frames the behaviour of the "thetic group"—another type of social, or thetic, object distinguished by Znamierowski—from the point of view of legal doctrine (*dogmatyka prawa*); from this point of view, the group of boys at play simply ceases to exist once either of the boys stops playing by the rules (ibid., 77). But the second norm of construction, which places a penalty on such noncompliant behaviour, frames the actions of "the same" group from a sociological (and commonsensical) point of view, turning the first norm into one that, unlike a "sheer" norm of construction (or constitutive rule), is not blind to noncompliant behaviour, and yet remains a norm of construction in its own right. But the two norms taken jointly are coercitive (ibid., 75–84).

20.2.5. The Ontology of Legal Reality and Occam's Razor

As we saw at the beginning of this discussion, Znamierowski uses Occam's razor, in the Continental sense (as explained in footnote 29 above), to deny the existence of any further dimension of reality above and beyond that of the physical and the mental: There is simply no such thing as a reality other than psychophysical reality.[49] As he was wont to remind his students, it is only people and things that you can see from atop Poznań's City Hall tower.

[48] Writes Znamierowski (1924, 103): "A norm of construction creates new possibilities of action." Compare that with Searle's classic formula, under which "constitutive rules […] create or define new forms of behavior" (Searle 1969, 33). A particular aspect of this similarity is discussed in Conte 1995, 532. Cf. Żełaniec 2013, chap. 2.

[49] This is more catholic than the position of Znamierowski's famous compatriot, Tadeusz Kotarbiński, who claimed that there is nothing other than merely *physical* reality (such was his "reism," on which see Woleński 1990).

But if that is the case, how can legal reality exist, given that it is "made of" legal acts, legal statuses, legal objects—which *prima facie* are neither mental nor physical?

Znamierowski agrees with Reinach that legal realities cannot be identified with any single mental or physical object: "I do not in the least claim that legal objects are identical with all the various physical or mental objects" (Znamierowski 1925a, 408; our translation).

As Znamierowski writes, for example: "My property right to the book in front of me does not lie in the book itself or in any thoughts that I or someone else may have about that book" (Znamierowski 1921, 20; our translation). But, as we know, unlike Reinach, Znamierowski does not intend to introduce a new dimension of reality. Even though Znamierowski takes phenomenology as his point of departure, it is neither a point of arrival nor a safe haven for him. In fact, he is very critical of the phenomenological tenet of the existence of a level of reality distinct from both the physical and the mental.

So how can legal reality exist? The key concept here, in answer to this problem, is that legal entities form specific "systems" (*układy*) which include both physical and mental elements, but which (as just noted) cannot be identified with any single object, be it physical or mental.

This thesis features both in Znamierowski's ontology of social reality and in that of thetic reality.

In the essay *O przedmiocie i fakcie społecznym* (On social objects and social facts: Znamierowski 1921), Znamierowski examines, for instance, the nature of a particular type of social object, namely, the law. According to Znamierowski, a given law

> is a specific system, a unifying structure of physical objects, to wit, the "original" statute and its official copies, as much as of mental objects, such as mental processes and dispositions—processes through which citizens and authorities become aware of the contents of the statute as valid law, and through which arises the design and decision to act in conformity with this law or, on the contrary, to intentionally run afoul of it, and dispositions to undergo such processes. (Znamierowski 1921, 21; our translation)

In his book *Podstawowe pojęcia teorji prawa: Układ prawny i norma prawna* (Basic concepts for a theory of law: The legal system and legal norms, Znamierowski 1924), Znamierowski conceives of legal acts as thetic acts in the form of specific systems of both physical and mental elements constructed through norms of construction.

"Thetic acts," he says, "are organic wholes that a norm constructs out of material acts" (ibid., 71; our translation).

With the ontology of thetic reality a new element comes into play (new with respect to the ontology of social reality), and that is the norm. In particular, thetic realities are, for Znamierowski, realities made possible by (and constructed in virtue of) norms of construction. But there is yet another new

element to the ontology of thetic reality: the quasi-semantic element, consisting in meaning (*znaczenie*) conferred through norms.

In fact, according to Znamierowski, norms of construction perform their function by assigning a new, conventional meaning to activities and things.[50] Here, Znamierowski's legal realism must reckon with a mystery which it was beyond its powers to explain, namely, the mystery of meaning—the same mystery that Emil Lask had described back in 1905 as the "problem of the mutual engagement of legal meaning and the real substrate in the individual case" (Lask 1923, 318; our translation). We shall not try our hand at uncovering this mystery, at least not here.

[50] A remarkable analogy surfaces here between Znamierowski and the ontology of cultural objects developed by Heinrich Rickert (1921). Rickert distinguishes two types of real objects: natural objects and cultural objects (*Kulturobjekte)*. The latter are such in relation to values (*Werte*), rather than in relation to norms (of construction), as is the case in Znamierowski. For Rickert (1921, 21ff.), it is values that assign a determinate cultural meaning (*Kulturbedeutung*) to natural objects. Rickert defines cultural objects as objects provided with meaning and "realities furnished with value" (*wertvolle Wirklichkeiten*). On Rickert see also Section 1.1 in Tome 1 of this volume.

Part Four

Legal Reasoning

Introduction

A NOTE ON TERMINOLOGY AND PURPOSE

by Pierluigi Chiassoni and Eveline Feteris

"Legal interpretation" is notoriously ambiguous. On the one hand, the phrase may refer to an activity or process in the mind of a judge, a jurist, a lawyer, etc. (*interpretation-process*). On the other hand, it may also refer, alternatively, to the outcome or product of such intellectual activity (*interpretation-output*).

As a general label for intellectual processes dealing with legal materials in view of solving legal problems and interpersonal conflicts, "legal interpretation" is in turn capable of a variety of further, more specific, meanings.

The central of these meanings points to *textual interpretation* or *interpretation proper*, i.e., to the activity that consists in the determination of the meaning of a (legal) norm-formulation (hereinafter a *provision*), translating it into one or more *explicit norms*, contextually justified or potentially justifiable as the legally "correct" meaning of the provision itself.

There is also a broader meaning of "legal interpretation"(-process), where the phrase refers to a set of activities, which are different from, but related to, textual interpretation. The qualification of previously identified legal norms (understood, e.g., as simple rules, principles, exceptions, general clauses, etc.), the filling of (presumed) gaps in the law, the resolution of normative conflicts, and doctrinal systematization of normative sets all belong to the reference of "legal interpretation" in such a broader sense: "legal interpretation" as *meta-textual* interpretation, one might say.

The above definition of textual interpretation establishes a conceptual connection between the determination of the meaning of a norm-formulation, on the one side, and its actual or potential justification, on the other side. This is neither casual nor arbitrary. Indeed, the deliberate reference to justification and correctness, as far as textual interpretation and its outputs are concerned, makes the definition a (purported) rational reconstruction of a concept that may be considered pivotal in practical and theoretical legal discourse alike. In fact, whenever a judge or a jurist provides an interpretation-output for some provision (claiming, for instance, that "Section *X* of Act *Z* means *N*"), that interpretation-output (*N*) is usually put forward as the correct interpretation of provision *X*; furthermore, it is usually accompanied by some argument purporting to justify it. The game of textual interpretation is a practical game. And people expect, and often have a legal right to expect, that interpreters provide good reasons for their interpretive claims—for claiming, e.g., that provision *D* expresses the explicit norm *N*, at least as far as the context of application *C* is concerned; or, in other terms, that *N* is the (all things considered) legally correct

or proper meaning of provision *D* in context *C*. This claim—from a theoretical point of view—is to be regarded as a *relative* claim: relative to the *interpretation-setting* the interpreter unavoidably *selects* and *is committed to*, which is made of a discrete set of *authoritative legal materials* (basically, provisions), *interpretive directives* (rules or canons of interpretation), *interpretive resources* (dictionaries, history, *travaux préparatoires*, case-law, juristic essays, scientific treatises, etc.), and *values* (ideologies about the law, interpretation, adjudication, the proper role of judges and jurists within the legal fabric, etc.). Accordingly, from the perspective of the activity of textual interpretation, it seems worth distinguishing between two different, but related, sorts of *interpretive outputs*, namely, (*a*) the explicit norm(s) the interpreter puts forward as the "correct" meaning(s) of a provision, which is/are tantamount to as many sentences belonging to the interpreter's discourse *(interpretation-output in a narrow sense)*; (*b*) the formulation of the "correct" meaning(s), *plus* the line of argument deployed by the interpreter to justify it, which is a piece of interpretive argumentation or interpretive justificatory discourse *(interpretation-output in a broad sense)*.

When, in their essays, jurists and legal philosophers deal with the subject of legal interpretation and argumentation, whichever label they may use (though *theory—Theorie*, *théorie*, *teoria*, *teoría*—is most often employed) and whichever view they may entertain about their own activity, they usually perform one or more of the following tasks:

(1) They describe how provisions have been and/or are being interpreted in fact, and which interpretive arguments are usually provided, in a given legal context (legal experience, legal order, legal system) at a given moment.

(2) They describe how provisions ought to be interpreted, and which arguments ought to be resorted to, in a given legal context at a given moment, according to the methodological views entertained by the judges and jurists working there.

(3) They (claim to) account for what the law of the land "really" requires interpreters to do, when interpreting its provisions, and invite them to act accordingly.

(4) They (claim to) account for what the law, "properly" understood in its very nature, "really" requires interpreters to do, when interpreting the provisions (especially statutory and/or constitutional provisions) of any legal order whatsoever, and invite them to act accordingly.

(5) They provide definitions of the interpretive-argumentative terminology—which, according to the perspective assumed by the jurist or legal philosopher, may be lexical definitions, rational reconstructions of lexical definitions for theoretical purposes, rational reconstructions of lexical definitions for practical purposes, or even outright stipulations for practical purposes;

(6) They analyze the tools—techniques, methods, arguments, canons, directives—of legal interpretation and argumentation, in order to cast light on their structure and functioning.

(7) They state which interpretive tools are to be employed, and how, if a certain goal (e.g., a certain politics of the judiciary) is to be attained.

Clearly, the several tasks we have just listed are heterogeneous. The first two tasks are genuinely descriptive: They belong to descriptive methodology and the sociology of legal interpretation. Contrariwise, tasks (3) and (4) belong to the domain of normative jurisprudence: to the field of legal politics and legal ideology, where moral and political allegiances are at stake. Task (5)—the definitional task—takes its colour from the discourse and perspective it happens to belong to. Task (6) is an analytical task, usually performed, for theoretical and informative purposes, by legal theorists. Task (7), finally, is a technical task, purporting to show the proper means to some goal that practitioners may, or do, opt for.

The present Part 4 of this tome is devoted to the "theories" of legal interpretation, argumentation, and reasoning that perform one or more of the above-mentioned tasks in contemporary Continental legal culture, from the early 19th century to the end of the 20th century. Though its major focus is on the 20th century, it has been deemed necessary to cast a glance at a few fundamental theories of the 19th century, since they make up the scenery for a better understanding of the methodological issues, attitudes, and revolutions that characterize the 20th century. In any case, due to space limits, only the most meaningful and influential conceptions have been selected for presentation from both centuries.

This part comprises seven chapters.

The first one, Chapter 21—"The Heritage of the 19th Century"—contains a concise exposition of the theories of interpretation associated with the jurists of the exegetical school, namely, Friedrich Carl von Savigny, Rudolf von Jhering, and Bernhard Windscheid.

Chapter 22—"The Age of Discontent"—deals with the most important anti-formalist movements in Continental legal culture between the end of the 19th century and, roughly, the first half of the 20th century. Gény and the so-called scientific school, the free law movement, the jurisprudence of interests and, last but not least, the pure theory of law are covered here as major subjects.

Chapter 23—"Taking Stock of the Past: Rhetoric, Topics, Hermeneutics"—deals with a distinctively backward-looking side of the theoretical and methodological revolution affecting the Continental theory of legal interpretation and argumentation from the mid-20th century. Taken into account here are Chaïm Perelman's new rhetoric, Theodor Viehweg's topics, and the hermeneutic outlooks of Emilio Betti (1890–1968), Hans-Georg Gadamer (1900–2002), and Josef Esser (1910–1995).

Chapter 24—"The Age of Analysis"—concerns those theories of legal interpretation and argumentation that, from the mid-20th century onward, turned to some variety of analytical philosophy to find the tools and methods

for properly performing their philosophical inquiry into such an immense subject. The outcomes of the analytical turn in Continental jurisprudence is represented here by the views of Norberto Bobbio (1909–2004), Alf Ross (1899–1979), Carlos Alchourrón (1931–1996) and Eugenio Bulygin (1931–), Jerzy Wróblewski (1926–1990), Giovanni Tarello (1934–1987), and Riccardo Guastini (1946–).

Chapter 25—"Legal Argumentation as Practical Discourse"—deals with the most meaningful developments, mostly by analytical legal theorists, in the field of the theory of legal argumentation and justification, from the 1970s onwards. The theories of Neil MacCormick (1941–2009)—exceptionally included here, even though he belongs to the common-law tradition—Jürgen Habermas (1929–), Robert Alexy (1945–), and Aleksander Peczenick (1937–2005) are exposed and analyzed.

Chapters 26 and 27—"Law and Logic in the 20th Century" and "Recent Developments in Legal Logic"—are devoted to the analysis of legal reasoning by means of symbolic logic, and hence to the development of deontic logic from its outset to its most recent trends.

Chapter 21

THE HERITAGE OF THE 19TH CENTURY: THE AGE OF INTERPRETIVE COGNITIVISM

by Pierluigi Chiassoni

21.1. Foreword

This chapter deals with the three most influential theories concerning legal interpretation and argumentation in 19th-century Continental jurisprudence: the views of the jurists belonging to the so-called *École de l'exégèse*; the views of Friedrich Carl von Savigny, the foremost founder of the historical school of law in Germany; the views of Rudolf von Jhering (the "first" Jhering) and Bernhard Windscheid (1817–1892), among the most important representatives of Conceptual Jurisprudence (*Begriffsjurisprudenz*) and Pandecticism.

As a whole, these outlooks are usually considered to represent as many varieties of *interpretive cognitivism* or, as legal philosophers like to say, (interpretive) *formalism*: the view according to which textual interpretation, the resolution of normative conflicts and gap-filling are not as many "acts of will" but, rather, "acts of knowledge" concerning the discovery of the true meaning of provisions and, generally speaking, the one-right-answer to legal problems (see Bobbio 1979, 86ff., 141ff., 153–4, 249–63; Hart 1961, chap. 7; Tarello 1974b). From this perspective, the 19th century is indeed an "Age of formalism" (Morton White). Generations of jurists and legal philosophers, from the late 1800s onwards, and at an intensified pace during the first half of the 20th century, will revolt against it, while a more nuanced setting will finally prevail from the 1960s. So runs the story about 19th century legal methodology on the Continent.

Going beyond stereotypes and received views, it is worth knowing the details of interpretive cognitivism at its heyday, in order to be able to get a fuller and sounder appreciation of the ideas and attitudes it apparently provoked by way of reaction.

21.2. The Exegetical School

The label *École de l'exégèse* (exegetical school) was coined by Emile Glasson in 1904, but did not enter into common usage until after Julien Bonnecase's successful 1919 book *L'École de l'exégèse en droit civil* (The exegetical school in civil law: Bonnecase 1924). From that time onwards, it has been employed by jurists and legal philosophers to refer at once to:

(*a*) The group of French and Belgian jurists and law professors who, during the 19th century, devoted themselves to the interpretation, exposition, and

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_49

teaching of the 1804 *Code civil*, also known as *Code Napoléon*, the centrepiece of the Napoleonic reform of French law.

(*b*) The theories worked out by these jurists and law professors as to the proper "method of interpretation" of the Code, together with their theoretical and ideological presuppositions (see Bonnecase 1924).

It is customary to arrange the members of the exegetical school into three generations, if only as a clue to some difference among their views.

The first generation—the dawn generation—includes those jurists who were still educated under the *ancien régime* and were active until about 1825–1830, like, e.g., C. Delvincourt, A. Proudhon, C.-B.-M. Toullier, G. A. Chabot de l'Allier, and P. A. Merlin.

The second generation—the heyday generation—includes those jurists who were already educated under the Napoleonic and Restoration regimes, and were active roughly between 1830 and 1880. A. Duranton, C. Demolombe, R. T. Troplong, F. Laurent, F. Mourlon, V. Marcadé, and A. M. Demante all belong to this generation, and are usually acknowledged as having the status of paradigmatic members of the school.[1]

The third generation—the dusk generation—includes the last followers of the exegetical method. They were active from the 1880s, and worked between the increasingly stronger, German-imported, dogmatic method, on one side, and the criticisms by the incoming anti-formalist movements, on the other side. T. Huc and H. Baudry-Lacantinerie are usually listed in this last group.

21.2.1. The Professional Ideology of the Exegetical Jurists

The representatives of the Exegetical School shared a few basic ideas about the law, its sources, and the proper role of judges and the function of adjudication. These ideas make up the professional ideology of the exegetical school.

1. *The law properly so called is positive, state-made law.* Law proper is positive law: the law set by the political authorities of a community. Positive law is state-made law. Natural law, on the contrary, is not really law, not law properly so called; rather, it is morality—though a morality which positive law usually refers to and dwells upon, like an island dwells upon the high sea. Furthermore, natural law is inherently indeterminate, vague, most of the time unable to provide a secure guidance for human conduct. By contrast, positive law, as state-made, codified, law, is inherently determinate and does usually provide

[1] There is no agreement as to whether two other eminent 19th-century French jurists—Charles Aubry (1803–1883) and Frédéric-Charles Rau (1803–1877)—do belong to this generation or not, due to the deep Germanic influence displayed by their masterpiece: the *Cours de droit civil français* (1st ed., 1839; 4th ed., 1869). See Bonnecase 1924; Bobbio 1979; Tarello 1988a; Husson 1972; Perelman 1976; Frydman 2005, 343ff.; Halpérin 2008a.

clear guidance for human affairs. Accordingly, so-called natural law may be resorted to, when applying positive law, only insofar as it is either *secundum legem positivam* or *praeter legem positivam*; it may never work *contra legem*, though, provided that, far from being superior to positive law, it only works, if at all, as a helpful servant to the latter.[2]

2. *Legalism.* Due to its technical and ethical superiority, the major source of positive law should be legislation, as a set of well-written and well-ordered legislative sentences expressing legal norms, enacted by the elected representatives of the nation. Customary law, by contrast, should play a marginal role in the legal regulation of human conduct. Furthermore, case-law and juristic opinions should be ruled out from legal sources in any society that cares about the certainty of the law and the well-being of its members.[3]

3. *Voluntarism*. Positive law—in its more valuable and extended part: legislation—is the outcome of deliberate acts of creation by the legislator. Behind any piece of legislation, there is a corresponding piece of legislative will (*will-to-content claim*). This will pre-exist the judicial application of laws and is fixed forever to guide it for the times to come (see, e.g., Laurent 1878, 12, 22).[4]

4. *Subordination of the judge to the legislator (separation of powers)*. In a statutory-centred legal system, judges should be regarded as utterly subordinate to the legislator. They ought to limit their activity to the application of binding legislation, without making any addition, change, or innovation whatsoever to it.[5]

[2] It is worth looking at a passage from Mourlon 1846, quoted by Bonnecase 1924, 150–1: "For the jurist, for the attorney, for the judge, *there is only one law*, positive law […]. Indeed, natural or moral laws, *are not binding unless* they have been *sanctioned by the written law* […]. Only the legislator has the right to determine, among the many and disputed rules of natural law, which ones are at the same time obligatory […]. *Nothing is above legislation*, and eluding its provisions under the pretext that natural equity is incompatible with it amounts to sheer prevarication. So far as the doctrinal study of law and case-law are concerned, there is no, nor can there be, any *more reasonable reason* or *fairer equity* than the reason and equity of legislation" (my translation).

[3] "All the [enacted] law," claims Aubry, quoted by Husson 1972, 116, "both in her spirit and in her letter, with a wide application of her principles and the most thorough development of the consequences coming from her, and nothing but the law: that has been the motto of the professors teaching the *Code Napoléon*" (my translation).

[4] Obviously, by endorsing voluntarism, the Exegetical jurists cut no new ground, though, of course, their attitude was supported by the most powerful example of law-making will from the time of Justinian. See, e.g., Mailher de Chassat 1822, 101–2.

[5] According to another of the greatest, heyday-generation Exegetical jurists, Laurent (1869, 62), "When we say that the judge is bound by legislation this means that the judge has no right to review it, that he is not allowed to analyse whether it is in accordance with the principles of right and wrong that God has written in our conscience […]. It is pointless to emphasize a principle that is basic within our modern public law" (my translation). The *Cour de Cassation* made this point very neatly in a decision of May 25, 1814: "It is by no means up to the courts […] to judge legislation; they ought to apply it as it is, and they are not allowed to make any modification or restriction, whatever its urgency may be" (my translation). See also Laurent 1978, 9, 54: "The

5. *The cognitivist conception of adjudication*. The subordination of judges to the law is a viable goal if, and only if, adjudication can be performed in such a way as to be an act of knowledge, where the judge discovers the law, discovers the relevant facts of a case, and then simply deduces the right legal decision from these data.

The philosopher Louis Liard provided the following description of the jobs in the law:

> The law is written legislation. Accordingly, their task [of the faculties of law] consists in teaching how to interpret legislation. It follows that their method is deductive. The sections of the Code are as many theorems, between which it is necessary to show their mutual connections and to draw their consequences. The pure jurist is a geometer; the purely juristic training is dialectical. The main task of the judge or attorney consists in unravelling the texture of the cases, and connecting their components to this or that rule established by the laws. (Quoted in Gény 1919, 54–5; my translation)

The Exegetical jurists, however, were apparently not so passionate about this theoretical point. François Laurent (1810–1887), for instance, may be regarded, rather than a sheer, naïf theoretical cognitivist, as a staunch preacher of a critical passivism in front of the "enacted law" and "the principles following from it" ("la loi et […] les principes qui en découlent"), and the enemy of the sweeping activism of his fellow jurists and lower judges (see Laurent 1878, 58–61).[6]

6. *The (quasi-)completeness of statutory law*. According to the common view about the exegetical school, a central point in the ideology of its representatives would be the idea that Napoleonic codification provides people with a complete, i.e., gapless, normative system (see, e.g., Bonnecase 1924, 52; Bobbio 1961, 85, 95–6; Tarello 1988a, 82–83, 85).[7]

Such a point, however, must be qualified in light of the attitudes actually held on the subject by eminent Exegetical jurists.

codes leave nothing to the arbitrariness of the interpreter, who no longer has the task of making the law: The law has already been made. There is no more uncertainty: The law is written in authentic texts. However, in order that the codes may provide this advantage, it is necessary that the authors and the magistrates accept their new position; I would say that they have to resign themselves to it […]. It is not true that the role of the jurists is being downgraded; only, […] their sole mission consists in interpreting [the law] […]. In making the law, scholars and magistrates would usurp the power that the sovereign nation has conferred with such an attribution" (my translation).

[6] "In all respects, accordingly, interpreters do make law, as to the specific case: I contest their right to do so" (Laurent 1878, 61; my translation).

[7] For instance, Bobbio finds evidence for this view in a sentence Demolombe writes in his commentary to Art. 4 of the Preliminary Title to the *Code civil*: "the judge cannot *legally* pretend that legislation does not provide him with the means for deciding the lawsuit he is hearing." This sentence, however, may also be read in a dimmer way, as Demolombe's colleagues openly suggest. Such a realistic interpretation of Demolombe's passage is shared, e.g., by Husson 1972, 118.

Following Portalis, who was one of the drafters of the *Code civil*, Charles-Bonaventure-Marie Toullier (1752–1835), among the most famous first-generation exegetical jurists, holds that statutes and codes may in fact prove gappy. In such an event, Toullier claims, judges should resort to equity and custom.[8]

Like Toullier, Alexandre Duranton (1785–1866) admits as a matter of course the possibility that legislation—Napoleonic legislation—may be gappy. In such a case, however, unlike Toullier, Duranton claims that the judge should find the right answer on the very basis of legislation (i.e., by way of "self-integration," as Francesco Carnelutti put it later on in the 20th century), by means of analogical reasoning, and only by default should he resort to "reason and natural equity."[9]

It is François Laurent, however, who provides the most realistic and disenchanted view. Indeed, in his commentary to Art. 4 of the Preliminary title of the *Code civil*, Laurent claims what follows:

(*a*) Positive laws do not—and cannot—provide a complete regulation of human conduct in a social context.
(*b*) Art. 4, far from presupposing positive law to be a complete normative system in itself, presupposes that it may prove gappy in the face of experience.
(*c*) On such a presuppostion, Art. 4 is meant to confer on judges, if only within the limits of individual lawsuits, a quasi-legislative lawmaking power: the power to interstitially make the rule for the unregulated case.
(*d*) Hence, when there is a gap, adjudication is not simply the "retrieval" of an already established solution.[10]

Toullier, Duranton, and Laurent all agree that legislation—including that very drafting masterpiece represented by the Napoleonic codification—may be

[8] "[W]hich rule shall the judge follow in those hard cases where the laws seem to be silent? In the first place, equity, by which we go back to the law of nature, and, in the second place, usage, which is the most natural supplement to the laws" (Toullier 1825, 103; my translation)—echoing a clause to the same effect of the unenacted "Preliminary book" to the *Code civil*.

[9] "[T]he judge faces two alternatives in order to get to his decision. In the first place, he may decide according to inductions from the laws pertaining to different matters, which nonetheless display some analogy with the matter to be decided upon. In the second place, he may decide with the support of reason and natural equity" (Duranton 1844, 21; my translation).

[10] "The Code, by prohibiting to the judge any appeal to the legislator, and by imposing on him a duty to adjudicate, even when there is no law applicable, does nothing but avoid one of the mischiefs resulting from the insufficiency of legislation: If the legislator is not turned into the judge of lawsuits, then the judge must be turned into a legislator […] among the two evils, the drafters of the Code have chosen the lesser one […]. Notwithstanding that, Art. 4 confers on the tribunals a great power, and somehow a part of the exercise of the legislative power. Whenever a law is obscure or insufficient, the judicial decision is legislative in character, for it is the judge who writes down the rule before applying it" (Laurent 1869, 294; my translation).

gappy. They disagree, apparently, about the ways judges ought to follow in filling gaps properly. The former two consider further sources, including natural law; the latter, contrariwise, is a partisan for statutory self-integration (as we shall see below). In any case, however, no naïf view about the "natural" or "logical" completeness of positive legal orders seems to belong to the conceptual apparatus through which these skilled and worldly jurists looked at their law. Indeed, the *postulat de la plénitude de la loi écrite*, also with heyday-generation Exegetical jurists like Laurent, is, to be understood as pointing to an interpretive ("hermetic") or, more properly, a "methodological," completeness, and not to an "ontological" one.

21.2.2. The Interpretive Codes of the Exegetical Jurists (the Exegetical Codes)

Unlike many of the codes that were enacted in the ancient, pre-modern, and modern age (from the *Codex Iustinianus* down to the Prussian 1794 *Allgemeine Landrecht*, the Austrian 1811 *Allgemeine Bürgerliche Gesetzbuch*, the 1819 Neapolitan *Codice per lo Regno delle Due Sicilie*, the 1837 Sardinian *Codice civile*, etc.), the *Code Napoléon* does not contain any section directly dealing with statutory interpretation.

In fact, the drafters of the *Code*—Portalis, Bigot-Préameneau, Maleville, Tronchet—had planned a "Preliminary book" that included a Title V dealing with "the application and interpretation of the laws," where a few telling sections on the subject were set forth. The opinion prevailed, however, that those sections should not be enacted, since interpretation—being a "logical" process—was considered to be a subject unfit for legal regulation. The "Preliminary book" was never enacted. Many exegetical jurists, however, while dealing with statutory interpretation in their commentaries to Arts. 4 and 5 of the enacted "Preliminary title," used its sections as valuable doctrinal statements, as we shall see in a moment.[11]

The basic distinction, in the exegetical method of interpretation, is between "authentic interpretation" (*interprétation par voie de autorité*) and "doctrinal interpretation" (*interprétation par voie de doctrine*, *interprétation de doctrine*).

Authentic interpretation is exclusively to be provided by the legislator, in order to clarify, by means of an interpretive statute, the meaning of some section of a previously enacted statute the sense of which proved doubtful against the benchmark of its application to real cases.[12] It is to be given in the form of

[11] The texts of the two clauses run as follows: Art. 4: "The judge who will refuse to adjudicate, under the pretext of the silence, obscurity, or insufficiency of the law, shall be liable to be prosecuted under the charge of denial of justice." Art. 5: "It is forbidden for judges to pronounce, by way of general or regulatory provisions, on the lawsuits that are brought to them" (both translations are mine).

[12] "Interpretation by way of authority consists in solving [interpretive] doubts in the form of general provisions and command" (Art. 2 of the Preliminary book; my translation).

a generally binding law; it is basically an act of will, though eventually grounded in some pretended act of cognition on the part of the legislator.

Doctrinal interpretation, by contrast, is performed by judges, jurists, lawyers, and laypeople at large. It has no binding force, but for judicial interpretation, its force is, in any case, limited to the individual lawsuits.

Doctrinal interpretation is characterized in terms apt to suggest that its nature is purely cognitive. According to Art. 2 of the unenacted Title V of the "Preliminary book," "Doctrinal interpretation consists in grasping the true meaning [*le véritable sens*] of a law, in its application to a particular case."

These words are clearly echoed in the doctrinal definitions provided, e.g., by François Laurent (1810–1887)[13] and Antoine Demante (1789–1856).[14]

Beyond this point, however, there is no general agreement among the exegetical jurists: neither as to the proper scope of interpretation, nor as to the proper tools to perform it.

Concerning the proper scope of interpretation, two sides may be singled out.

On the one hand, there are those—like Laurent—who mean *interpretation* to be a necessary task in general: Any case whatsoever of application of a law necessarily presupposes its interpretation, for it is impossible to apply it without having previously grasped its (true or proper) meaning (see Laurent 1878, 14).

On the other hand, there are those—like Demante and Mourlon—who, following a more traditional way of thinking, suggested by the *ius commune* maxim *In claris non fit interpretatio*, hold "interpretation" to be necessary if, but only if, the text of the law has proved indeterminate.[15]

Turning to the proper tools of interpretation, and the proper way to use them, the attitudes of the exegetical jurists are so nuanced that no unitary exegetical interpretive code can be reconstructed out of them. To account for their basic methodological views, I will use François Laurent's opinions as the starting point, pointing out the differences with other eminent representatives of the exegetical school, as they come up.[16] Furthermore, since we are dealing

[13] "To interpret a law is to grasp its meaning in its application to the concrete case" (see Laurent 1869, 302; my translation); see also Demolombe 1860, 128–9.

[14] "It is almost totally pointless to know the general effects of the laws, if one does not know how to make a correct application [*juste application*] of them to the different concrete situations [*espèces*] that may come up. But in order to make a correct application of a law, it is above all necessary to grasp its true meaning. It is for logic to direct our understanding [*esprit*] in the search for truth" (see Demante 1876, 5; my translation).

[15] According, e.g., to Mourlon 1846, 61, "Interpretation consists in determining, with the aid of reasoning, the true sense of the laws that are obscure or ambiguous." See also M. A. Mailher de Chassat 1822, 3.

[16] In fact, Laurent thought the most eminent among his colleagues had accepted a method of interpretation that did not pay the laws their due respect. See Laurent 1878, 6, where he justifies his criticism of fellow jurists like Toullier, Merlin, Duranton, Troplong, Demolombe, Aubry, and Rau by claiming that "the interpreters of the code have chosen to follow a wrong way: They ne-

with methodological instructions, I will express them in the form of as many interpretive directives.

Directive 1. The fundamental duty of interpreters. Any interpretive code, any discrete set of interpretive directives, either actually used in legal practice or set forth by way of a methodological proposal, rests on some—consciously or unconsciously adopted—fundamental axiological directive. This directive usually belongs to a certain ideology about the law and the proper role of interpretation and interpreters within the constitutional framework as a whole: it sets out the "point of interpretation-making" and affects the selection of the other directives in the code. Now, according to Laurent, "the first duty of the interpreter" is "to be respectful of the enacted law."[17] This is a view that was shared also by the other exegetical jurists. As we shall see in a moment, however, Laurent provided a more demanding reading.

Directive 2. Modes of textual interpretation. Respect for enacted law requires giving to legislative clauses their true meaning, i.e., the meaning corresponding to the will of the legislator (*la volonté du législateur*) that enacted it. This will be carried out by two means: the text of the law (*le texte de la loi*) and the spirit of the law (*l'esprit de la loi*) (see Laurent 1878, 12). Consequently, in order to grasp the true meaning of a law in its application to an individual case, interpreters should resort *in any case* to grammatical interpretation (*interprétation grammaticale*) and logical interpretation (*interprétation logique*) (see Laurent 1869, par. 272; see also Laurent 1878, 66).[18]

glect the text of the law [*la loi*], or they depart from it at any moment, to look for what they call the spirit of the law […] and […] such a pretended spirit of the law is nothing but the personal opinion of each interpreter" (my translation).

[17] The French original: "Le respect de la loi, tel est le premier devoir de l'interprète" (Laurent 1878, 37).

[18] M. A. Mailher de Chassat, who writes about interpretation from the standpoint of the prerevolutionary legal tradition, also approves of such a basic distinction, originally drawn by Quintilian, and then retrieved by "the modern jurists," i.e., the jurists of the exegetical school (see Mailher de Chassat 1822, 7, 101ff.), though he distinguishes five basic resources helpful to get to the "true meaning" of a legislative clause: (*i*) grammar, (*ii*) rethoric, (*iii*) logic, (*iv*) legal history from the Roman Age, and (*v*) moral philosophy and natural law (natural reason). Among these resources, he considers grammar, logic, and equity to be paramount. The distinction between "logical" and "grammatical" interpretation was the centrepiece of one of the most influential essays on legal interpretation of the period, surely known by the exegetical jurists, if only through the French translation by Mailher de Chassat: I mean *Theorie der logischen Auslegung des Römischen Rechts* (Theory of logical interpretation of Roman law: Thibaut 1806), by Anton F. J. Thibaut. Thibaut apparently had a peculiar view about "logical interpretation," which he conceived, as being at once subjective and objective: "Logical interpretation explains the spirit of the laws, and this it finds partly in what the legislator really had in mind, and partly in their reasons" (ibid., par. 6; my translation). So, according to Thibaut, there are apparently three basic resources for any act of interpretation intending to know the thought expressed in any legislative clause: the letter (*littera legis*), the actual legislative purpose (*mens legislatoris*), the reason behind the law itself (*ratio legis*). By way of an interpretive "fiction," the legislator is to be supposed to have willed, and intended, "whatever can be deduced from the reason behind the law" (ibid., par. 3; my translation).

Notice that this directive performs a double job. On the one hand, it selects the proper tools for textual interpretation. On the other hand, it regulates their use, prescribing that any section whatsoever is always to be interpreted according to *both* tools.[19] In so doing, the directive endorsed by Laurent departs from the view—usually labelled "the clear meaning doctrine" (*la doctrine du sens clair*)—according to which logical interpretation should be regarded as a subordinate, supplementary, by-default, interpretive tool, to be resorted to if, and only if, grammatical interpretation failed to provide the relevant section with a clear meaning applicable to the case at hand.

Directive 3. Grammatical interpretation. Grammatical interpretation focuses on the words of the laws. It is the subject of a three-pronged directive.

Ordinary words should be given the meaning they have in common usage, as the best dictionaries of the relevant natural language record it.

Technical words should be given the meaning that is established for them by the legislator, by means of legislative definitions or, in defect thereof, the meaning that has been sanctioned by the legal tradition.

When a word has both an ordinary and a technical meaning, the technical meaning should generally be preferred to the ordinary meaning.[20]

Notice that this directive performs, again, a double job. On the on hand, it establishes the resources, which grammatical, or literal, interpretation should take into account. On the other hand, it establishes a priority rule for situations of conflict between the first two instructions.

Directive 4. Logical interpretation. Logical interpretation focuses on "the spirit of the enacted law" (*l'esprit de la loi*), legislative thought (*la pensée du législateur*), the subject and purpose of the law (*l'objet de la loi*), or the will of the legislator (*la volonté du législateur*) as something to be gleaned by going beyond the text of the law in its grammatical meaning. It should be used in view of three different purposes:

First, in order to "vivify" or "animate" the clear grammatical meaning of the interpreted clause, so as to perform what *ius commune* jurists were used to calling "declarative interpretation" (*interpretatio declarativa*) (see, e.g., Heinecke 1778, 27).

Second, in order to "clarify" the grammatical meaning of a clause whenever it proves indeterminate (obscure, ambiguous, vague), by way of a supplementary interpretation (*interpretatio suppletiva*).[21]

[19] From a logical, or conceptual, viewpoint, this is not one directive, but the combination of two different, second-level interpretive directives: a selection-directive and a (pure) procedural directive, pertaining to two first-level interpretive directives. On this point, see Chiassoni 2007, chap. 2.

[20] In this sense, Aubry, Rau, Laurent, Baudry-Lacantinerie, and Houques-Fourcade, all quoted in Gény 1919, 31.

[21] According to Thibaut (1799, par. 7), this would be the proper situation where *interpretatio declarativa* steps in. According to Laurent, "Though the text may be clear, it is necessary to

Third, in order to "correct" the clear grammatical meaning of a clause whenever it proves to be at odds with the will of the legislator (*interpretatio correctiva*).

Against the corrective use of logical interpretation, Art. 5 of Title V of the unenacted "Preliminary book" sanctioned the doctrine of clear meaning: "Whenever a law is clear, one ought by no means to elude its letter, under the pretext of penetrating its spirit."

Following this directive, Laurent strongly opposes using the spirit of the law as a way to correct the clear meaning of a legislative provision, since "the pretended spirit of the law is really the spirit of the interpreter" (see Laurent 1878, 16; my translation). Accordingly, Laurent qualifies the clear-meaning doctrine with prudential considerations:

> It is necessary to go farther than that. Maybe the letter, though clear, does not express the true thought of the legislator. If it has been proved that this is so, surely the spirit should be preferred to the text. But it is necessary that such a case be proved, for it is not likely that the legislator, while speaking with a clear voice, said the contrary of what he meant to say. Accordingly, if that occurs, it is surely a very rare exception […] the letter must give way to the spirit. But the exception confirms the rule; and the rule is that the clear letter is tantamount to the spirit of the law. (Laurent 1869, par. 274; my translation.)[22]

Directive 5. Tools of logical interpretation. In the view of Laurent, the spirit of a law should be identified on the basis of three interpretive resources: *travaux préparatoires*, "history" (or "tradition"), and, above all, legal "principles." They are to be used as follows.

Travaux préparatoires. *Travaux préparatoires*—in the most extensive meaning—include all the parliamentary materials preceding the enactment of a law: bills and projects, official expositions, reports, records of the discussions within legislative commissions and on the floor, etc. According to Laurent—who is voicing a still widespread Continental attitude on the subject—these materials should have at most a supplementary value in the interpretation of an "obscure and dubious" text for they are provided with a mere "authority of reason," and most of the time are uncertain, obscure and self-contradictory, such that "the most opposed systems find support" in them.[23] They should never be employed to justify a corrective interpretation of the clear text of a law (see Laurent 1878, 22–3, 25, 28, 34ff.).

animate it, to vivify it by resorting to history, to discussion, to *travaux préparatoires*; with stronger reason, this is necessary when the law is obscure!" (Laurent 1869, par. 274; my translation; see also Laurent 1878, 20).

[22] See also Laurent 1878, 12–22. Laurent, however, seems to claim that such an event is very rare, if not totally impossible. For a less qualified statement, see Mailher de Chassat 1822, 102.

[23] "Our conclusion is that one should always consult the *travaux préparatoires*; but one should also avoid to see in them an authentic interpretaion of the *Code*. One would end up riddled with legal heresies if they were taken literally" (Laurent 1869, 309; my translation). See also Laurent 1878, 15–6, 22ff., 36–7.

History. Like *travaux préparatoires*, history—the ancient law and legal tradition from which the Code got its content—is an interpretive resource rife with uncertainties and contradictions (that's why it was replaced by a code), where interpreters may find support for any interpretive outcome whatsoever (see Laurent 1878, 38–9, 40ff., 50–1). Accordingly, Laurent urges that history be used as a supplementary tool for coping with obscure, dubious, or insufficient statutory provisions; it should never be used, though, to subvert (or "correct") the clear, principle-supported, literal meaning of legislative clauses.

Apparently, Laurent maintains that the proper interpretive use of history should be Janus-like, so as to give pride of place to the time of the enactment of the clause, against *both* the past and the future.

On the one hand, interpreters should not presume that the legislator intended always to defer to the legal tradition. This means a presumption against—so to speak—the rule of the dead over the living legislator and its subjects. It means, in other words, a presumption against the overall conservative thrust of legislative intent—against the idea that, while enacting a law, the legislator simply wished to preserve the previous legal regulation, though eventually couching it in new, different, clearer words (see Laurent 1878, 51). The target behind this presumption is the contrary interpretive presumption that was a matter of course for *ancien régime* interpreters, according to whom statutes were never presumed to be against past law, as represented by the *ius commune*.[24]

On the other hand, however, once a law has been enacted, its meaning should be fixed, for the coming time, with regard to the time of its enactment. That is the most relevant temporal frame for the purpose of ("true") interpretation. Accordingly, jurists should abstain from providing evolutionary interpretations of old statutes and, in particular, from making a new code out of the old one.[25]

[24] See, on this point, the criticism Laurent makes of Merlin: Laurent 1878, 89ff. As to the traditional presumption, see, e.g., Mailher de Chassat 1822, 281, where as "Rule II" ("Règle II") of doctrinal interpretation, it is stated, that "Interpretatio illa capienda semper, per quam ad jus commune reducimur, quae juri communi convenit, et per quam juris communis correctio vitatur, et per quam jus communis minùs offenditur, et per quam minimè receditur à jure communi" ("Always that interpretation is to be accepted by which we hew to the common law, which is appropriate to the common law, by which any correction of the common law is avoided, by which the common law is minimally offended, by which we depart minimally from the common law") Mailher de Chassat, however, also records an exception to the rule: It does not hold, whenever "primaevus status et antiqua natura rei prorsus et in totum mutata sit et extincta" ("the primordial and ancient nature of the thing is totally changed and extinguished." At the end of his treatise, he records one hundred "General rules of interpretation" (*Régles générales d'interprétation*) drawn from the tradition of the *ius commune* (Roman sources, Civilians, Canonists, etc.), and concerning doctrinal interpretation. These "rules," making up a chaotic whole pulling in whichever direction is suitable to the interpreters' desires, Mailher de Chassat justifies as being "undisputable principles, declared by universal reason, that shall always direct the wise spirits, the men of good faith" (see Mailher de Chassat, 1822, 2).

[25] "We should not rule out […] the old doctrines in the name of our modern ideas, introducing into the texts a spirit that is foreign to them. It is this latter tendency that ought to be feared

The prohibition against the evolutionary interpretation of laws, so forcefully advocated by Laurent, was to become one of the major targets of the "critique of the traditional legal method" launched by François Gény at the end of the 19th century (as we shall see in Section 22.3 in this tome).

Legal principles. Legal principles—according to Laurent—are the most reliable resource for getting to the spirit of a law. They are either directly formulated in the codes or derivable from their provisions. They find their ultimate "explanation and justification" in "reason and tradition." The will of the legislator is always to be presumed to be in accord with them. They are the ultimate benchmark for the viability of the interpretive suggestions coming from *travaux préparatoires* and from history (see Laurent 1878, 17, 29, 39).[26]

Further perspectives. Other exegetical jurists apparently have a wider, and more liberal, view than Laurent, about the tools of logical interpretation and, above all, their proper use.

Concerning the "means" for identifying "the spirit of the legislator," Antoine Demante urges interpreters to take into account the following six: (1) preambles; (2) *travaux préparatoires*; (3) legal tradition, paying particular attention to Roman law; (4) foreign laws; (5) customs; and, last but not least, (6) the "system" of legislation.[27]

Likewise, Aubry and Rau include among the "main tools" of logical interpretation—beyond the appeal to the system, conceived in the same way as

most, for we are quite eager to accomodate to it; if the interpreter is not wary against this need for progress, he will end up making himself the legislator, changing the laws, and even doing violence to them when necessary. He ought to cast light on gaps, but it is not for him to fill them up; he ought to cast light on shortcomings, but it is not for him to correct what the legislator has done" (Laurent 1869, 308; my translation). See also Laurent 1878, 9, 61ff., and in particular the following quotation: "Humanity is constantly rejuvenating; this is a law of its life, and to live is to make progress. But there is another element which is also necessary, and this is stability; now, our science is conservative par excellence, because it is traditional; and reconciling progress and stability is easy. While interpreting the law, we do not have the right to innovate, but we have a duty to cast light on gaps and flaws" (Laurent 1878, 65; my translation). The French original: "[L]'humanité– se rajeunit sans cesse, c'est une loi de sa vie, et vivre c'est progresser. Mais il y un autre élément tout aussi nécessaire, c'est la stabilité; or notre science est conservatrice par excellence, puisqu'elle est traditionnelle; et la conciliation entre le progrès et la conservation est facile. En interprétant la loi, nous n'avons pas le droit d'innover, mais nous avons le devoir de signaler les lacunes et le défauts."

[26] "What to do? Keep to text and principles" ("Que faire? S'en tenir au texte et aux principes") (Laurent 1878, 12).

[27] See Demante 1876, 5–6: "One may find [the spirit of the legislator] above all in the set of the provisions that make up the same statute, or likewise in the comparison of a law with other laws, paying attention to the stronger or weaker analogy between the matters they concern. This latter practice is particularly advisable with respect to those laws that, like the different titles of our codes, make up a single body of legislation." Cf. Mailher de Chassat 1822, 26: "Logic allows us to appreciate the ordering and the method employed by the legislator in conceiving and drafting the law, in arranging the several matters, in the way in which each part is deduced from the other; therefrom we gather new means to discover the legislator's will." See also, in this regard, Demolombe 1860, 129–30.

Demante—two further means: (*a*) teleological interpretation, i.e., the "investigation concerning the motives and purposes of the law" to be performed on *travaux préparatoires* and the legal tradition (the law of the past); (*b*) consequentialist interpretation, i.e., "the evaluation of the consequences that would follow from the application of the law," if interpreted in a certain way—being careful to avoid any absurd outcome (see Bonnecase 1924, 146–7).[28]

Finally, other exegetical jurists—like e.g., Demolombe and Duranton—expressly considered case-law (*la jurisprudence*) to be a further, valuable, means to get to legislative will (see Bonnecase 1924, 139–43).

Directive 6. Dissociative interpretation. Dissociative interpretation is that kind of corrective interpretation where the interpreter reads into a legislative clause a distinction that does not appear on a literal reading of the clause itself. Accordingly, dissociative interpretation is a form of restrictive, narrowing interpretation, usually justified by appealing to legislative intent and/or the objective purpose of the law (*teleological restriction*). It is also the way through which exceptions are introduced to a general rule, thereby defeating it.

Laurent—with an altogether different terminology—considers dissociative interpretation, making it the subject of two directives.

Generally speaking, interpreters should abide by the old juristic dictum, *Ubi lex non distinguit nec nos distinguere debemus* (Where the law does not make any distinction, we ought not to make any distinction either).

This directive, coming from the age of the *ius commune*, was included by the drafters of the *Code Napoléon* as Art. 7 of Title V of the unenacted "Preliminary book": "It is not permitted to distinguish where the law does not distinguish."

A legislative clause may nonetheless be interpreted or reinterpreted, so as to draw from it a norm containing a distinction which has not been literally expressed if, and only if, such a distinction is justified in light of legal principles expressed by, or derived from, other clauses (see Laurent 1869, 312; Laurent 1878, 63–4, 70–1).

This means, in terms of present-day legal theory, that Laurent thought there was only one kind of defeasibility compatible with the proper deference due by interpreters to the legislator: "closed" defeasibility grounded in systemic interpretation.

Directive 7. The authority of case-law. As to case-law, and the connected directive, and argument, from the (persuasive) authority of judicial precedents, Laurent suggests a prudential approach roughly as follows: Interpreters should always make a critically aware use of judicial interpretive precedents. This view was in line with the idea that doctrinal interpretation is a rational activity (*Veri-*

[28] Laurent objects that the (negative) criterion of absurd effects, far from providing a reliable clue to legislative intent, is biased toward the interpreters' own views and is a way to make them prevail over the legislator's will. See Laurent 1878, 18–9, 68ff.

tas, non auctoritas, facit interpretationem: see Laurent 1869, par. 281; Laurent 1878, 74–6, 84ff.). A different attitude, one apparently more deferent to precedent, was advocated instead by Demolombe.

It is time to take stock of the exegetical directives considered so far, concerning the textual interpretation of legislative clauses. Apparently, they outline a picture of the exegetical method that is not totally in line with the common view.

1. According to a widespread and persistent commonplace, the exegetical school would be characterized by an interpretive code centred on two basic criteria: literal meaning and legislative intent, as it may be gathered from the *travaux préparatoires*.

2. The interpretive tools of the exegetical school, however, appear to make a more complex and articulated set.

To begin with, *travaux préparatoires* have neither an exclusive nor a privileged place as to legislative intent: legal history and legal tradition, legal principles, the systematic arrangement of legislative materials, the goals and consequences of the law, foreign law, and case-law are all resources to be used "in the search for the true meaning of a law."

Furthermore, all these tools are not reducible to the idea, and method, of so-called subjective interpretation: The intent of the actual, historical legislator is, of course, paramount; however, its identification follows ways where the boundaries between the actual intention of the historical legislator, on the one hand, and his counterfactual or even his ideal intention (according to the interpreters' own ideals), on the other hand, are very thin and blurred.

Finally, the exegetical jurists, far from being a unitary group, divide roughly into two parties as to their preferred interpretive code.

On the one hand, there are the partisans for a *strict* interpretive code, centred on literal and systemic interpretation, as the most suitable way for interpreters to perform their constitutional duty of respect for the enacted laws. This party opposes any resort to the spirit of the laws, as something to be gathered from *travaux préparatoires*, tradition, and equity, to be used liberally for the purpose of corrective interpretation.

On the other hand, there are the partisans for a *liberal* interpretive code, centred on the paramount relevance of the spirit of the laws as the main tool for both supplementary and corrective interpretation.

3. The official view of the exegetical jurists is usually accounted for by historians and critics in a way expressed by the following words of Mailher de Chassat: "The general methods of interpretation may be considered the most natural and the simplest ways *to get to know* the meaning of the laws" (Mailher de Chassat 1822, 77; my translation and italics added). The exegetical codes for textual interpretation, however, do not provide interpreters with sets of rigorously defined tools arranged in a fixed sequence of use, leading always to the same outcome from the same materials. Indeed, they allow for much leeway,

where the interpreters' own ideological allegiances, skills, and sense of the law come through to play a pivotal role. Furthermore, notwithstanding the simplistic picture usually provided by their critics, at least some of the exegetical jurists were well aware of that, and willing to alert their readers to it. This seems to be case, for instance, with Charles Demolombe and François Laurent.[29]

So far, I have dealt with that part of the exegetical code that deals with textual interpretation. Interpreters, however, usually have to deal with further problems, like normative gaps and normative conflicts. It is time to see which methodological prescriptions Laurent and other exegetical jurists have considered for such events.

Directive 8. Normative gaps. *Gaps* is a very ambiguous term. It may refer either to a *casus omissus* (a normative gap proper, a real gap), or to a *casus male inclusus* (an ideological gap, an axiological gap, an apparent gap, a *contra legem* gap). In the first situation, there is by hypothesis no law regulating a case; in the latter situation, contrariwise, there is a law, but—in the interpreter's opinion—it is a bad law.

Whenever there is a normative gap, according to Laurent, judges, in order to fulfil properly the duty imposed on them by Art. 4, should resort to the principles concerning analogical and *a contrario* reasoning, to legal tradition, and, eventually, to equity.

To begin with, any normative gap in the *Code* should be filled by means of analogical reasoning from the provisions of the *Code* itself. Analogical reasoning, however, is forbidden if the disposition from which it would proceed is an exception: In such a case, the proper way to fill the gap is by *a contrario* reasoning. But if the exception is itself—or is justified by—a general rule, it may be applied by way of analogy on the basis of the *eadem ratio*.

Concerning *a contrario* reasoning, interpreters may resort to this tool if, and only if, its use is compatible with legal principles and does not lead to absurd results.[30]

It may also happen that, in a matter insufficiently regulated by legislation, the enacted clauses refer to the legal tradition (e.g., to some institute of Roman

[29] According to Demolombe: "Interpretation may be more or less ingenious or subtle, and it may sometimes *even attribute to the legislator intentions he did not have* […] [which may be] better or worse, though under the condition that *he not pretend to have invented it*; otherwise, *it would not be interpretation anymore*" (quoted by Bonnecase 1924, 141–2; my translation and italics added; see also Laurent 1878, 71).

[30] The example Laurent offers is as follows: "Art. 3 of the *Code* says: 'Immovable property, even though owned by foreigners, is regulated by French law.' Arguing from the silence of the law, we may say: The legislator speaks of *immovable* property, and makes it subject to French law; he does not speak of *movable* property; hence he does not make it subject to French law: What he says of the former, he denies of the latter. '*Qui de uno dicit* […] *de altero negat*.' A similar interpretation would lead to this supremely absurd outcome: that French law would not regulate the movable property owned by French people in France" (Laurent 1869, 313; my translation); see also Laurent 1878, 70–1.

law). In such a case, the gap should be filled by applying the rules of the pertinent ancient law.

If, and only if, all the preceding means are not viable, a gap may be filled by resorting to equity: The judge would then become "a minister of equity." Laurent, however, claims that "such an hypothesis is so rare that we can rule it out in our debate."[31]

The position of Laurent is to be contrasted with the more traditional attitudes of those first- and second-generation exegetical jurists who point to equity, natural reason, and customs as primary resources for filling statutory gaps. This means that, from the viewpoint of contemporary judges and lawyers, the task of filling gaps could be performed by means of alternative sets of tools (alternative gap-filling codes), to be used depending on circumstances.

Directive 9. Normative conflicts. Whenever there is a normative conflict, according to Demante, interpreters should proceed as follows.

To begin with, they should try to solve the conflict by way of prevention: by means of a suitable re-interpretation of the relevant legislative clauses, so as to derive mutually compatible legal norms from them.

Secondly, whenever such a corrective re-interpretation of the clauses is not viable, the interpreter should see whether one of the two laws makes an exception to the other, so as to settle the conflict by means of the *lex specialis* criterion (*lex specialis derogat legi generali*).

Thirdly, and finally, if neither of those two ways is viable, the normative conflict should be solved by means of the *lex posterior* criterion (*lex posterior derogat legi priori*).[32]

One last word is in order, before proceeding to the historical school.

While dealing with *a contrario* reasoning, Laurent comes to the following general conclusion about the virtues (and limits) of the "rules," or directives, concerning interpretation: "We are here again looking at a rule of interpreta-

[31] "Sometimes the exception, though derogating from some rule, is an application of some other legal rule. In such a case, the will of the legislator is not that the exception be limited to the case for which it was specifically provided for; it is, rather, an example that the legislator offers and, consequently, the interpreter may and ought to allow for the same decision as to the unregulated cases, where there is the same reason for deciding" (Laurent 1869, 312; my translation). "When the law has spoken, the interpreter cannot pay heed to equity: The judge is by no means the minister of equity, he is the organ and slave of the law" (Laurent 1878, 57–8; my translation). The French original: "Quand le droit a parlé, l'interprète ne peut plus écouter l'équité: le juge n'est point le ministre de l'équité, il est l'organe et l'esclave de la loi."

[32] "When two laws seem to be contrary to each other, it is first of all necessary to see whether the legislator did not have different cases in mind; in such a case, to make them agree is enough to apply each law to the case it concerns. It is then necessary to see whether one of the two laws does not make exception to the other, for in such a case it is evident that the general rule cannot prevail over the exception. Finally, if the contradiction is a real one, it is clear that one should follow the later law, which has derogated the previous one" (Demante 1876, 6; my translation).

tion that has nothing of the absolute, that here and now is good, there and then is bad" (See Laurent 1869, 313; my translation).[33]

Far from being an isolated, short-lived spark of sound realism in the otherwise foggy sea of methodological (self)-deception depicted by Gény (see Section 22.3 in this tome), this sentence may be considered as (further) evidence of a disenchanted interpretive attitude, apparently shared as well, for instance, by the other exegetical giant, Charles Demolombe. This understanding suggests, in turn, the following conclusions.

Perhaps, we may reproach the exegetical jurists—maybe, with the notable exception of Laurent—for having advocated a style of interpretive reasoning riddled with the rhetoric of "principles" and the "spirit of the law," and by no means effective in setting actual limits on interpretive discretion: a style of reasoning that, incidentally, is not here and now the pale and waning heritage of a long-gone past. It seems, however, that the charge of naïf or even fraudulent interpretive cognitivism (interpretive formalism) should be considerably played down.

Perhaps the proper way to pass judgment on the exegetical school would amount to singling out a seeming fundamental incoherence.

On the one hand, judging by what the exegetical jurists say about the *notion* of interpretation, they seem to consider it a sheer matter of knowledge—a matter of grasping the "true meaning" of statutory clauses.

On the other hand, however, judging by what they say about *interpretive directives*, they seem aware that even the most austere method of statutory construction—the textualist approach advocated by Laurent—has leeway for interpretive discretion. Their methodological candour is at odds with their pretended interpretive cognitivism.

Whoever frames the exegetical school as a paradigm of theoretical interpretive formalism misses the target. The capital issue for the exegetical jurists was not theoretical, an issue of descriptive methodology, but normative, an issue of prescriptive methodology. It may be formulated roughly as follows: Design the interpretive method that is most adequate to the constitution and ideology of a legislative, rule-of-law State, while at the same time preserving a key role for legal science. For jurists like Laurent, this meant taming the mutinous horses of interpretation, as far as possible. For other jurists, like Demolombe, it meant leaving those very horses unbridled, as far as possible.

[33] The passage also contains the following: "In any case, these maxims are to be dealt with carefully: one must avoid applying them mechanically. The law is not a mechanical science, and principles are not to be treated as algebraic formulas. Our science proceeds from reason, we should never take principles away from the motives which justify them" (Laurent 1869, 313). See also Laurent 1878. Cf. Mailher de Chassat 1822, 8: "Finally, one should never forget that what does the work in interpretation is not so much science as good faith" (my translation).

21.3. The Organicistic Legal Hermeneutics of Friedrich Carl von Savigny

The historical school of law emerged in Germany roughly in the second decade of the 19th century. Though obviously tied to the preceding age through forerunners (Gustav Hugo, Justus Möser)[34] and the personal experiences of some of its followers, it rose in stark opposition to the core tenets of the ideology of legal Enlightenment: individualism; the paramount relevance of reason in legal matters; universal eternal natural law and the natural rights of man; the artificiality of positive law and self-confident, radical, constitutional engineering; the primacy of written law and codification over custom, case-law, and the authority of the jurists (see Becchi 2009).

The forefront founder and representative of the historical school was Friedrich Carl von Savigny (1779–1861). In the editorial essay *Über den Zweck dieser Zeitschrift* (On the purpose of this review: Savigny 1815), introducing the first issue of the *Zeitschrift für geschichtliche Rechtswissenschaft* (Review for an Historical Legal Science)—the school's mouthpiece, founded in 1815 with Karl F. Eichhorn (1781–1854) and J.-F. Göschen (1778–1837)—Savigny distinguishes two antagonistic philosophical standpoints: the "a-historical" and the "historical" standpoint, corresponding to as many "schools" of German jurists.

The a-historical standpoint, as a general view about men and their political institutions, maintains what might be called a double separation thesis.

On the one hand, the present age is "separate"—or "autonomous"—from the past: Each age is properly to be considered as being fully capable of "creating for herself, at liberty and discretion, her own existence and her own world, be it good and happy or bad and unhappy," according to "the measure of her understanding and strength." This "historical egoism" of each age carries with it a dim view of history, looking at it simply as a collection of "moral-political examples" that may be useful, and used, in creating the present-day world.

On the other hand, individuals are to be regarded as "separate from the whole": In particular, they are—and ought to be made—autonomous from the state.

Once applied to the law, these individualistic ideas suggest that the "matter" or substance of the law is, for any age, the output of the will of the people endowed with legislative power; it is completely independent from the law of the past; it depends solely on the "conviction" that presents itself to the legislators as "the best for the time being."

[34] See Savigny 1814, par. 2. On Savigny, see, e.g., Jhering 1861; Marini 1978. On the historical school, see, e.g. Marx 1842; Solari 1971; Wilhelm 1958, chap. 1; Losano 1968; Bobbio 1979, 43ff., where five identifying traits are singled out: (*i*) flesh-and-blood men in specific historical settings, rather then the idealized "man" of Enlightenment and natural law theories; (*ii*) irrational impulses and attitudes as the real working factor of any historical development; (*iii*) anthropological pessimism; (*iv*) appreciation and love for the past; (*v*) a respectful, conservative attitude towards legal tradition. See also Tarello 1988b.

Contrariwise, the historical standpoint, as a general view about men and their political institutions, maintains a double necessary-connection thesis.

On the one hand, each age, far from being separate from past ones, is to be regarded as intimately connected to them, like a ring is tied to the other rings of a same chain: "Each age of a people" is "the follow-up to and the development of all the past ages."

On the other hand, "there is no human existence that is altogether autonomous and isolated; rather, what may appear to be autonomous, if considered from another angle, is a ring of a higher whole." Accordingly, "each single man," far from being a separate moral agent, "is also to be thought of as a member of a family, of a people, of a state."

Once applied to the law, these holistic ideas suggest that legal matter, for any age, is produced by the whole past of the nation; it is not just the output of arbitrary acts of creation by a body of passing legislators; it is rather the output of "the inner essence of the nation's self and of her history." Accordingly, far from entertaining any false thought of legislative omnipotence, "each historical age"—by legislators, judges, and jurists—"should be directed to studying, renewing, and keeping alive such legal matter as exists in virtue of an inner necessity."[35]

Starting from these ideas, Savigny worked out a theory of law, legal sources, and legal interpretation that was destined for great influence on the legal culture of the 19th century, in Germany and abroad (see Savigny 1840).

21.3.1. An Organicistic Conception of Legal Interpretation: Savigny's Interpretive Code

Savigny's "theory" of interpretation—basically a piece of normative methodology heavily dependent on his holistic, organicist, and historical jurisprudence—is set forth in the first volume of his *System des heutigen römischen Rechts* (System of contemporary Roman law: see Savigny 1840, 1, pars. 32–51; see also Savigny 2004b, 2004c, 2004d). It divides into three parts: (1) the interpretation of "single," non-defective laws "considered in themselves"; (2) the interpretation of "single," "defective laws" considered in themselves; (3) the interpretation of "the sources [of law] as a whole."

21.3.1.1. Interpreting Single, Non-defective Laws

The core of Savigny's methodology is a concept of interpretation (*Auslegung*), according to which interpretation is the "free intellectual activity" by means of which we "recognize a law in its truth," we discover "the true thought" expressed by the norm-formulation (see Savigny 1840, vol. 1, pars. 32–3).

[35] All the quotations in the text are from Savigny 1968; see also Savigny 1814, pars. 1–2; 2004a, 263–4.

This definition makes of Savigny's methodology a clear example of interpretive cognitivism. Furthermore, unlike the exegetical jurists, whose cognitivism was apparently shallow and at odds with their methodological avowals, Savigny's cognitivism is supported by a powerful, comprehensive vision of the world of law. In this vision, where all law is popular law, living in the people's common conscience, and legislators are its agents, any piece of legislation is presumed to express a thought, the thought of the legislator, which thought is presumed in turn to have grasped the essence of legal reality as to a certain type of legal relation. From such a perspective, interpretation is a "doctrinal" or "scientific" enterprise, which by its very nature is free ("a free intellectual activity"), within the limits, if any, eventually placed on it by "legal interpretation," in the two varieties of "authentic" interpretation (the legislator's own) and customary interpretation (*interpretatio usualis*).

Doctrinal interpretation is an act of knowledge: It is *scientific* interpretation proper. Accordingly, Savigny claims, the "modern writers" who claim interpretation to be "a form of legislation," or a way to "reform the laws," are mistaken.

Scientific interpretation is always necessary: It is not possible to apply a legal norm to the real or imaginary case at hand (to "translate legal rules into practical life"), without having previously grasped its content. Accordingly, those jurists who accept the old adage *in claris non fit interpretatio* are likewise mistaken.

As to the proper way to conceive the structure of such an intellectual activity, Savigny emphasizes that it is a "reconstruction" of the thought (*Gedanke*) "enclosed in a law," by means of a thought experiment: (Good) interpreters should put themselves in the same starting point of the legislator, and "artificially repeat in themselves his way of proceeding, so that the law may come to be born again in their mind" (Savigny 1840, vol. 1, 212–3; my translation).[36]

From the standpoint of (what I have called) its structure, statutory interpretation does not differ from any other interpretation of any other "expressed thought" (like philological interpretation). Indeed, according to Savigny, the specificity of statutory interpretation lies rather in its tools or techniques ("elements," in Savigny's own words).

Against that background, the basic interpretive directives of the Savignyan interpretive code may be roughly set out as follows.

Directive 1. The four-elements doctrine. To gain to a complete understanding of the content of a law, interpreters should resort to four "concurring" interpretive resources: grammar, logic, history, and system.

Grammatical interpretation (the "grammatical element") focuses on the words of the norm-formulation, appealing to the rules of the language employed by the legislator.

[36] This same idea may also be found in Savigny's earlier methodological lectures: see, e.g., Savigny 2004b, 93; Savigny 2004d, 217.

Logical interpretation (the "logical element") focuses on the arrangement of the legislator's thought and, more precisely, on "the logical relations among its several parts."[37]

Historical interpretation (the "historical element") pays attention to the condition of objective law, as to the legal relation concerned, at the time of the enactment of the norm-formulation to be interpreted as formulated, in order to grasp the effects that the enacted law should have had on it and the changes it made to pre-existing law.

Finally, *systemic interpretation* (the "systematic element") concerns the

> inner connection, encompassing all institutes and all legal norms in a great unity. This connection, like the historical connection, was likewise present to the mind of the legislator, so that we shall know his thought fully only when we shall have learned the relation in which the (single) law stands to the whole system of the law, and the effect that law is to have within it. (Savigny 1840, vol. 1, 213–5; my translation)

From the perspective of the history of Western methodology, two different systems can be said to be at stake here. On the one hand, logical interpretation deals with the "logic of legislation": with the arrangement of legislative provisions by the legislator and with their mutual relationships. It deals with a *designed* system. On the other hand, systemic interpretation, concerned as it is with the inner connections between legal institutes, norms, and relations, deals with a *spontaneous* and *organic* system. The two systems are connected: The designed—shallow, outer—system is assumed to mirror, though always incompletely, as we have seen, the organic—deep, inner—system.

Directive 2. The proper interpretive functions of the ratio legis. The "motivation" for a law, or its *ratio legis*, is something to be regarded as separate from the law itself.

On the one hand, from a backward-looking perspective, it may consist in some pre-existing "rule" of the system, of which the "present" law is a "logical development."

On the other hand, from a forward-looking perspective, it may consist in the goal, or purpose, the present law is meant to serve in the future.

According to Savigny, the *ratio legis* may be profitably and confidently resorted to in order to establish "the legal nature" of a norm: whether, for instance, it is a rule of *ius commune* (ordinary law) or instead a rule of *ius singulare* (an exception). Contrariwise, as a tool for the textual interpretation of legal formulations it may be used only with "great care" and a full awareness of the risk it involves of replacing the interpreter's own thought with that of the legislator (see Savigny 1840, vol. 1, 217–8).

[37] Here, from a technical point of view, Savigny's position seems in line with that of exegetical jurists like Demante, Aubry, and Rau.

As we shall see in a moment, Savigny believes the *ratio legis* to be a proper, though dangerous, interpretive tool for those laws whose expression has proved to be "defective."

Directive 3. Forbidden interpretive resources. A third directive, by way of a possible reconstruction of Savigny's interpretive code, establishes a prohibition against the two following interpretive resources: on the one hand, the non-determinant *occasio legis*, i.e., those circumstances, present at the time of the enactment of the law to be interpreted, which had no determining causal impact on the legislator's activity; on the other hand, the purely subjective motives, the personal and changing goals of the legislator (see Savigny 1840, vol. 1, 221).

So far, if viewed with the cold glance of dispassionate appreciation, the interpretive code Savigny provides for the legal profession seems affected by obscurity and incoherence. Obscurity: Systemic interpretation, with its romantic appeal to the inner, organic, unity of legal institutes, defies any rational control. Incoherence: Systemic interpretation seems to include, as a matter of course, interpretation according to the *ratio legis*, whenever the *ratio legis* is some pre-existing norm of the system. As we have just seen, however, Savigny does not seem to think so. The picture gets even worse, as we shall see now, when Savigny's methodology turns to the interpretation of defective laws.

21.3.1.2. Interpreting Defective Laws

The four-elements directive concerns the methodological tools fit, and necessary, to cope with laws "in a normal state." These tools fall short, however, in the face of laws that are "defective."

A law is in a "normal state" whenever two conditions are met: The norm-formulation ("expression") "encloses a thought that is complete in itself"; there is no obstacle preventing interpreters from "recogniz[ing] this thought as the true content of the law."[38]

Contrariwise, a law is defective whenever its formulation has proved defective. This may happen in two different situations: The law has been provided with an "indeterminate expression," one that "does not convey any thought perfectly"; the law has been provided with an "erroneous expression," one that "immediately" sets forth a thought that is "different from the true thought of the law" (Savigny 1840, vol. 1, 222; my translation).

[38] See Savigny 1840, vol. 1, 222: "The fundamental principles of interpretation above established (par. 33) may be enough for the normal state of legislation, where the expression of the law encloses a thought that is complete in itself, and there is no circumstance preventing the recognition of this thought as the true content of the law. Now, however, we have to deal with the more difficult cases of imperfect laws, and propose at the same time the means by which these difficulties can be removed" (my translation).

To cope with these situations, Savigny deems it necessary to resort to further tools. Accordingly, in Savigny's methodology the textual interpretation of formulations considered in themselves appears to be regarded as a two-stage activity.

In the first, necessary stage, interpreters try to get to the true content of a norm-formulation by means of the four-elements directive.

If this approach fails, a second stage of textual interpretation will become necessary so as to overcome the defects of the norm-formulation and get to the true content of the law. By way of charitable interpretation, we may suggest that, here, Savigny is pointing to the following two situations: first, the four elements (grammar, logic, history, system) do not make it possible to translate the norm-formulation into one clear legal norm (indeterminate expression); second, the grammatical element and the logical element lead to different interpretive outputs, while the historical and systemic elements do not provide any clue as to which of them is to be preferred (erroneous expression).

We may wonder, in passing, how it could ever be that the joint use of the four elements above fails, given their wide, declared scope. Somehow, by introducing this distinction, Savigny is downplaying the interpretive and argumentative power of the four elements. In so doing, he adds a confusing, unfit part to his interpretive code. From this standpoint, Savigny's methodology seems the output of the clumsy, not fully successful combination of heterogeneous intellectual sources: the new, romantic-organicist-historical view, on one side; the tradition of juristic hermeneutics, with its usual way of handling interpretive problems and the interpretive process, on the other side.

Directive 4. Tools for interpreting single defective laws. To cope with defective laws, interpreters should in turn resort to three interpretive criteria.

To begin with, they should employ the systemic criterion of the "inner connection of legislation." This requires interpreting "the imperfect part" of a law in light both of the other parts of the same law, and of other laws as well.

Secondly, they should employ the teleological criterion of the "connection between the law and its motivation (*ratio legis*)." This criterion may prove useless, however, whenever interpreters face either the absence of one, determinate *ratio legis* or the presence of a plurality of competing, irreducible *rationes*.

Thirdly, and finally, if the two criteria above fail, interpreters should resort to the substantive, axiological criterion of "the intrinsic value of the content resulting from interpretation": the intrinsically most valuable among the several competing interpretations of a same law (norm-formulation) is to be preferred.

Due to the danger that interpreters, by using this criterion, may "trespass into the field of the legislator," Savigny suggests limiting its application to the laws with an indeterminate expression (see Savigny 1840, vol. 1, 223).

Directive 5. Varieties of corrective interpretation. There are—Savigny claims—two different kinds of corrective interpretation (*interpretatio correctiva*) of the

laws that are flawed by erroneous expression: corrective interpretation proper, and spurious corrective interpretation. The former is a genuine form of interpretation, purporting to correct a defective law by making its expression to fit for its true thought. Contrariwise, the latter is an underhanded way to change the law. Interpreters should only perform corrective interpretations proper.

Unfortunately, due to the overall fuzziness of Savigny's interpretive directives, the distinction between true and spurious corrective interpretation, though conceptually clear, seems by no means easy to apply in practice. Indeed, all things considered, we have no sound benchmark by which to distinguish the true thought of the law from the false—even though, in juristic opinion, the two may be seriously at odds.

The exegetical jurists demonstrate a shallow interpretive cognitivism, openly and consciously betrayed by their methodological avowals. Savigny, by contrast, shows no sign of uncertainty whatsoever as to his cognitivist creed. The methodology he sets forth, however, presents serious fissures, casting a gloomy light on the soundness of his bold attitude.

21.3.1.3. Interpreting Legal Sources as a Whole: Antinomies and Gaps

In Savigny's view, the task of a (good) interpreter is by no means exhausted by textual interpretation of single laws and their formulations. The sources of law should also be "interpreted" as a whole, so as to make the law appear as it is, namely, "a whole […] meant to provide a solution to any question that comes up in the field of law"; a whole that must necessarily possess ("negative") "unity" and "completeness" ("positive unity") (Savigny 1840, vol. 1, par. 46; my translation).

Savigny apparently distinguishes the "ordinary" interpretation of the sources of an objective law as a whole from the activities of metatextual interpretation specifically dealing with antinomies and gaps. His views in this regard may likewise be accounted for in the form of a few methodological directives.

Directive 6. Ordinary interpretation of the sources as a whole (systematization). The ordinary process of metatextual interpretation is tantamount to the systematization of legal materials: Interpreters should derive "a system of law" from the set of sources which, to that end, may even be regarded as a "single law." This means, more precisely, that they should dig out the inner relations that hold between legal institutes, rules, and relations, even by resorting to *ratio legis*, and bringing to bear all the organizing power of legal science (see Savigny 1840, vol. 1, par. 42).

Directive 7. Establishing the negative unity of the legal system (solving normative conflicts). On its way to scientific systematization, the law may appear to be riddled with "antinomies" or "contradictions" ("lack of negative unity"). In such an event, Savigny suggests that interpreters should proceed as follows.

First, they should try to solve the normative conflict by means of interpretation: in the same may as for Demante, by making it disappear through a convenient corrective re-interpretation of the relevant formulations of law.

Secondly, whenever corrective re-interpretation is not viable, they should overcome the normative conflict by resorting, in turn, to the "systemic unity," the "historical unity," and the "organic unity" of objective law.

From the standpoint of the systemic unity of law, the basic criterion for solving an antinomy is the criterion of exceptionality (sometimes improperly referred to as the *lex specialis* criterion): The exception prevails over the rule.

From the standpoint of the historical unity of law, the basic criterion for solving an antinomy is the chronological criterion: *Lex posterior derogat legi priori*.

Finally, from the standpoint of the organic unity of law, the basic criterion to be used is (what may be called) the axiological criterion: The rule that is most fitting to the fundamental principles of law prevails. This criterion is to be used if, and only if, the two former criteria are not viable (see Savigny 1840, vol. 1, pars. 42, 44, 45).

Directive 8. Establishing the positive unity of the legal system (filling normative gaps). Whenever the legal norms established by means of legislation or custom leave some case unregulated, Savigny suggests that interpreters should proceed as follows: (*a*) They ought not to resort to natural law or natural equity, as a pretended universal law governing human actions, for there is no such thing; contrariwise, as representatives of popular law, they ought to instead resort, (*b*) analogical reasoning from established legal norms (*analogia legis*) and (*c*) the fundamental principles of objective law. In so doing, they have to exploit the "organic," "inner force" of objective law, by which it may "fill itself out" (principle of organic self-integration) (see Savigny 1840, vol. 1, par. 46).

Notice that, in this way, all gaps come to belong to the shallow level of legislation and custom, and the filling of such *explicit* gaps by jurists—and judges duly instructed by the former—is tantamount to bringing to light, and developing, the inner potential of objective law as an organic entity with its "inner system." The dogma of methodological cognitivism is accordingly being preserved in regard to meta-textual interpretation as well.

21.4. Legal Interpretation in the Heaven of Concepts

In the heaven of legal conceptualism (*Begriffsjurisprudenz*), so the story goes, dwelled two very mighty deities: Jhering and Windscheid—even though one of them one day left it to found a new, more earthly enterprise. The present section is devoted in turn to their respective theories of interpretation and legal method.

21.4.1. Rudolf von Jhering

It is usual to distinguish two stages in the work of Jhering: the so-called "first" Jhering, advocating the method of juridical construction, until about 1861, on one side; the so-called "second" Jhering, defending an instrumentalist conception of law and anticipating the Continental and American anti-formalist movements, from about 1861 onwards, on the other side. Here, I shall focus on the first Jhering: the author of the celebrated, four-volume *Geist des römischen Rechts auf die verschiedenen Stufen seiner Entwicklung* (The spirit of Roman law through the different stages of its development: Jhering 1873–1877), published from 1852, and the founder, with Carl Friedrich von Gerber, in the year 1857, of the *Jahrbücher für die Dogmatik des heutigen römischen und deutschen Privatrechts* (Yearbooks for the dogmatics of current Roman and German private law) (see ibid., pars. 3, 43, 46).[39]

In a nutshell, Jhering's legal methodology may be summed up as follows.

1. The starting point, the one that identifies the subject matter of legal method, is a *Savignyan concept of positive law*.

> The law […] is an objective organism of human liberty […] the law is by no means […] an exterior aggregate of arbitrary provisions, owing its origin to the legislator's thought; it is, like the language of a people, the inner and regulated output of history. (see Jhering 1873–1877, vol. 1, par. 3; my translation)[40]

Furthermore, as in Savigny, the law contains both a visible and an invisible part. The visible part is made of the formulated rules of law, of those rules that have already been expressed by means of legislation, custom, and juristic writings. They make up the "formulated law." The invisible part is instead made of the "latent rules" of law, waiting to be discovered and duly formulated for everyone's use. They make up the "real law," of which the formulated law is always a tentative, approximate, perfectible representation (see Jhering 1873–1877, vol. 1, par. 3).

2. As to the nature of legal method, Jhering endorses a position of *methodological naturalism*. Methodological directives are not necessarily the arbitrary,

[39] On Jhering see, e.g., Wilhelm 1958, chap. 3; Lazzaro 1965, chap. 1. Incidentally, in what is regarded as the first document of his second period, Jhering attempts a unitary interpretation of his work, claiming that, unlike many colleagues living in the dark, rarefied Heaven of Legal Concepts, he always thought that legal technique and juridical constructions were never to be severed from the practical necessities of ordinary life the law must cope with. See Jhering 1891a, n. 5. A continuity is also stressed in the very first page of *Der Zweck im Recht* (Purpose in law), the most celebrated work of the "second Jhering," three different editions of which appeared between 1877–1883 and 1898.

[40] Later on, we also read that "The law, as a real, objective creation that manifests itself in the form and movement of life and external commerce, may be considered as an organism: It is this standpoint that we will assume in making the whole of our study" (see Jhering 1873–1877, vol. 1, par. 3; my translation).

external outputs of the methodologists' own reflection. There are in fact *true* methodological directives: They are those "provided by the law itself, in virtue of a necessity contained in its very essence, the necessity of regulating in a firmly established manner the way in which the law is to proceed in the field of practice" (Jhering 1873–1877, vol. 3, par. 42; my translation). Consequently, the proper task of a (good) methodologist is to bring to light, and provide with an adequate formulation, the true directives of legal method. In this way, Jhering presents the following methodological instructions not as his own's invention, but as dictated by the law itself, for whatever legal experience.

3. The study of law comes in two basic varieties: the historical study of law (legal history), on one side, and the doctrinal or dogmatic study of law (legal dogmatics, legal science, *Jurisprudenz*), on the other side. Both disciplines are genuinely scientific enterprises. The natural sciences represent the universal standard of scientificity. Like the natural sciences, legal history and legal dogmatics combine a "receptive" side with a "productive" side. On the receptive side, they discover the substance of a—historical or present—positive law. On the productive side, they arrange the substance in the proper scientific form in keeping with the systematic-classificatory method of the natural sciences (the "method of natural history," in Jhering's own words) (see Jhering 1873–1877, vol. 1, par. 3; Jhering 1857, 2).

4. As concerns legal dogmatics, where the "opposition" between receptive and productive inquiry holds "true" in a "much greater measure" than for the method of legal history, the receptive side is entrusted to the "lower," or "inferior" doctrinal study of law (inferior legal science: *niedrieger Jurisprudenz*); its productive side to the "higher," or "superior" doctrinal study of law (superior legal science: *höher Jurisprudenz*) (see Jhering 1873–1877, vol. 1, par. 3, see also n. 11).[41]

5. The inferior doctrinal study of law is devoted to performing those interpretive tasks that *ius commune* jurists were used to considering under the label of *comprehensio legum*.

Indeed, according to Jhering, here the jurists should proceed by means of "interpretation," a multifarious activity concerning "the raw legislative material" and including "explaining the matter," "getting rid of apparent contradictions," "overcoming obscurities and imprecisions," "bringing to light the whole content of the legislator's will" by "deducing" from isolated provisions the principles making up their foundation, and drawing from these principles the consequences that follow from them (see Jhering 1873–1877, vol. 3, par. 46).[42]

[41] Later on, Jhering himself provided a concise, but vividly critical, account of his own view of legal science in the first part of Jhering 1891a, the essay usually regarded as marking the passage to his second period.

[42] "*Interpretation*, here you have in one word the field of activity of inferior legal science"

Interpretation "establishes the *true meaning of legislation*, and opposes it either to a too narrow, or to a too broad, drafting." Corrective interpretation is accordingly one of the major tasks Jhering assigns to textual interpretation, on the basis of the dichotomy between formulated law and latent (and real) law, and from a clear-cut cognitivist interpretive outlook: Pieces of legislation *do have* true meanings, and these *can* be discovered by jurists through interpretation.[43]

In Jhering's view, the inferior doctrinal study of law is—and should be—throughly conservative. It does not change the content of the law, nor even its "*immediate practical* form," namely, the imperative form of commands and prohibitions, that is, "the regular form under which the law appears in the statutes." Interpretation simply identifies the content of the law more accurately in its "inferior forms" as a set of norms of which there are two basic kinds: provisions or maxims (detailed rules of conduct), and general legal principles (see Jhering 1857, 6ff.).

6. The superior doctrinal study of law is aimed at gaining an intellectual mastery over positive law. It is not simply a way of casting light on the law. Rather, it turns the law into a systematic set of juridical "institutes" or "bodies," this by a process of "perfecting the form of the legal matter" through a "quantitative and qualitative simplification" of the "mass of [legal] materials" (see Jhering 1873–1877, vol. 3, pars. 43, 46).[44]

In that process lies the core of "legal technique." Indeed, without a duly performed *formal transfiguration* of the law, the other main concern of legal technique, that is, "make certain and ease up the application of abstract law to concrete cases," would not be viable (see Jhering 1873–1877, vol. 3, par. 43).[45]

(see Jhering 1873–1877, vol. 3, par. 46; my translation). From this broad view of the proper tasks of interpretation, analogical reasoning (analogical extension) would seem to belong to inferior legal science. As we shall see in a moment, however, Jhering somehow contradictorily assigns it to the quantitative simplification stage of superior legal science. See Jhering 1857, 4–5; 1873–1877, vol. 1, par. 3 and n. 11; ibid., vol. 3, par. 46.

[43] "What legal science brings to light in doing this job [interpretation] is never *specifically* new. It is nothing but the original, albeit explained, legal content" (von Jhering 1873–1877, vol. 3, par. 46; my translation). In his 1884 satirical essay *Im Begriffshimmel* (In the heaven of concepts: Jhering 1891b), one of the most celebrated of the second Jhering's writings, Jhering depicted interpretation as something not so innocent, carried out by means of a "dialectic-hydraulic press" through which interpreters may both "inject" into the texts of the laws "concepts, presuppositions, and limits that are totally outside the author's thought," on one side, and "eliminate" any (for them) unwelcome expression the laws may contain, on the other side.

[44] In a telling passage, Jhering claims that the effect of superior legal science on the law is "by no means like that of a light that simply lights up the [juridical] bodies; it is rather like the heat that turns them from a solid state into a fluid, condensable state. Rigid at its primitive state, and reducing the art of the jurists to the narrowest proportions, legal matter is somehow liquefied; in this state, it makes its being moulded and shaped possible; its latent forces and qualities, which lay dormant, are awakened and set into action. The method of natural history transforms and elevates legal matter in its very essence" (Jhering 1873–1877, vol. 3, pars. 43, 46; my translation).

[45] Here is the way Jhering characterizes the basic question of "legal technique," as a matter of "pure form": "How should the law—making abstraction from its content—be organized and es-

To sum up: Inferior legal science provides superior legal science with legal materials in their imperative form. It identifies the tentative, surface extension of a positive law as a set of norms. This is the normative basis from which the simplificatory job making up the peculiar scientificity of legal science starts.[46] This simplificatory job is, according to Jhering, twofold: quantitative and qualitative.

Quantitative simplification. Quantitative simplification is aimed at

> reducing the mass of [legal] materials, of course *without* affecting the results to be obtained. Making the most that is possible with the minimum possible elements, this is its law: The more the material is limited, the easier it is to manage (*law of economicality*). (Jhering 1873–1877, vol. 3, par. 43; my translation)[47]

According to Jhering, quantitative simplification is to be obtained by means of four basic "technical operations": the "analysis of the matter"; the "logical concentration of the matter"; the "systematic ordering of the matter"; and the fixing up of a "juridical terminology."

Analysis of the matter. In Jhering's metaphorical thinking, informed by the natural sciences, the analysis of the matter is tantamount to the "chemistry of law." Its subject matter consists of legal relations regulated by positive legal provisions and principles. Its goal consists in identifying their shared normative content, if any, e.g., the "general ideas" that are common to all contracts, and/or obligations, and/or torts, and/or ways of acquiring property, separating them from the "local" or "particular" parts. The basic tool of analysis is "abstraction": By means of it, specific, separate legal relations that come into being in the course of time may be discovered to be as many "points of historical irruption" of some general backstage idea. From Jhering's perspective, analogical inquiry ("extension by analogy") is again—though counter-intuitively—a tool of analysis and quantitative simplification. Indeed, by identifying the common general idea behind some regulated and some unregulated case, legal science spares the legislator from making a new, pointless, *ad hoc* rule for the not yet expressly regulated case (see Jhering 1873–1877, vol. 1, par. 3; ibid.,

tablished so that its mechanism may simplify, promote, and enable as much as possible the application of the rules of law to the concrete cases?" (Jhering 1873–1877, vol. 3, par. 43; my translation).

[46] "In order to proceed to construction, it has to first interpret; inferior legal science is the first, necessary step to superior legal science. It is, however, only a first step, and legal science should not abide there any longer than necessary. It is not until the higher level is reached that its task and method become specifically legal, that it attains a specific scientific character, making of it something different from all the other sciences" (Jhering 1873–1877, vol. 3, pars. 43, 51; my translation).

[47] "This law requires that legal science should never create new means and principles for accomplishing what it can carry out by using the means and principles it masters" (Jhering 1873–1877, vol. 3, par. 43; my translation). This is what Jhering calls "the art of skillfully using what already exists" (ibid., vol. 3, par. 66; my translation).

vol. 3, par. 44; Jhering 1857, 4–5). It is worth emphasizing that Jhering considers abstraction and analogical extension as purely scientific, cognitive, technical processes.[48]

Logical concentration. The logical concentration of the matter consists in "concentration," or reduction, of the "external volume of a mass of legal matter that positive law has created for this or that legal situation." It is apparently aimed at eliminating any redundancy from positive legal norms. Here again, the basic tool is abstraction: "the universal logical mode of proceeding that consists in abstracting a principle from a given set of species and expressing it by means of a new and more energetic logical formulation" (Jhering 1873–1877, vol. 3, par. 45; my translation).[49]

Systematic ordering. The systematic ordering of the matter is the arrangement of the juridical bodies into an ordered set of classes. This order is neither casual nor arbitrary. There is a true systematic classification waiting to be discovered by legal science through an exact perception of the objects and their relationship with other objects (see Jhering 1873–1877, vol. 3, pars. 44, 46).

Juridical terminology. The fixing up of a juridical terminology concerns the development of a technical vocabulary made of rigorously defined terms replacing fuzzy and longer ordinary-language expressions. It is related to the definition of the notion of a juridical institute or juridical body, which in turn is one of the key jobs in juridical construction (see Jhering 1873–1877, vol. 3, par. 43 and n. 1).

Qualitative simplification. The "qualitative" side of a matter—says Jhering— is tantamount to its "inner order," "symmetry," and "unity." The law is "qualitatively simple" whenever its several parts, though "exactly delimited and separated" from one another, nonetheless harmoniously join into a single

[48] "In so doing, legal science does not exceed beyond its powers, does not trespass into the role of the legislator; it does not create anything, but it exercises a critical function; it adopts an interpretation of a higher character: one that concerns not the words but the ideas of the legislator. This operation requires a greater faculty of abstraction, a finer discernment than ordinary interpretation; mistakes are possible in both directions, either by not going far enough or by going too far, that is to say, either by erroneously considering as abstract ideas elements that are essentially and exclusively peculiar to a particular species or, contrariwise, by perceiving abstract ideas as specific elements" (Jhering 1873–1877, vol. 3, par. 44; my translation).

[49] In the contemporary terminology of Alchourrón and Bulygin's systematization theory, Jhering's logical contraction is tantamount to the conservative contraction of the normative basis (see Alchourrón and Bulygin 1971). Here again, however, Jhering emphasizes how the "final discovery of the principle [behind a set of statutory provisions] by no means has for science, the sole importance of concentrating the already existing matter, but also has the advantage that the principle, once found and recognized, in turn becomes the source of new legal rules" (Jhering 1873–1877, vol. 3, par. 45; my translation)—"new," as will be pointed out later, not as to substance, but in virtue of expressing latent contents and energies of positive law. On Alchourrón and Bulygin, see also Section 24.2.2 in this tome and Section 26.2.1.3 in Tome 1 of this volume.

unity, "of which the eye may perceive the whole as easily as its parts" (Jhering 1873–1877, vol. 3, par. 43; my translation).

Qualitative simplification depends on one basic technical operation: juridical construction (*juristische Konstruktion*), "the application to the legal matter of the method of natural history," "the plastic art of legal science," "a work of art," "creation," "invention," "organization," aiming at the working out of juridical *institutes* as juridical *bodies* (*Körper*)—the latter word being used to emphasize the organic, living nature of juridical institutes—the fact that, like any living organism, they are created and grow up, expand, retreat, develop, change, interact with other bodies, and perish.

A (good) theory of juridical institutes (legal bodies) should accordingly perform the following tasks:

(1) conveying the essence of each juridical body into an adequate *concept* or *notion*, by way of a suitable "ontological definition" (e.g., a suitable definition of property, contract, tort, sale, bill of exchange);

(2) providing a suitable account of the "structure," or "anatomic elements," of each body—for instance, if the body is property, legal science should provide a rational explanation of the legal right to property, focussing on its subjects, objects, content, effects and the actions pertaining to its protection;

(3) providing a suitable account of "qualities," "forces," and "events in the life" of each juridical body;

(4) providing a systematic classification of the several juridical bodies, grouping them into a coherent whole (see Jhering 1873–1877, vol. 3, pars. 43, 46).

In working out juridical bodies from legal principles and provisions, jurists should follow three "laws of juridical construction": the law of fitness, or content-preservation; the law of systemic unity; the law of juridical aesthetic (concerning "the legal beautiful").

According to the first law of juridical construction—the law of fitness, "the law of concordance between doctrinal construction and positive legal matter"—the construction "should be exactly applicable to positive law." It should pay the utmost respect to the "content" or "practical force" of positive legal norms, while being totally free as to its *form*. In fact, in Jhering's view, legal science may even contradict the constructions—the notions and definitions—provided by the legislator, if there are any, since the legislator has no "authority," no "legislative power," in matters of "theory."

According to the second law of juridical construction—the law of systematic unity, or the law of the "absence of contradictions"—legal science should avoid establishing "what is juridically impossible." This law imposes on juridical constructions a double coherence (and consistency) requirement. On the one hand, the requirement of *internal coherence*: Each juridical construction should be made of mutually coherent elements. On the other hand, the requirement of *external coherence*: The set of juridical constructions worked out by jurists should form a coherent whole. External coherence is, above

all, historical, or diachronic, coherence: New and old juridical constructions should fit.

The benchmark for the "legitimacy and truth" of any juridical construction lies in its successful working: both in itself, and in combination with other juridical creations.[50]

The third law of juridical construction—the law of the juridical beautiful—sets out the aesthetic requirements for properly worked out juridical bodies: The juridical constructions should be *clear* (making the essence of legal relationships easily accessible to the understanding), *natural* (in tune with the phenomena of the physical and intellectual world), *transparent* as to their legal consequences, and *simple*.

Jhering regards the first two laws as setting as many conditions for the truth and legitimacy of juridical construction. Contrariwise, the third law simply states an aesthetic ideal that may not always be accomplished.[51]

There appears to be a fourth law in Jhering's methodology of juridical construction: a law we could call the *law of systemic self-development*.

The outcome of a properly performed job of juridical construction, says Jhering, is the "system" of a given positive law: "We shall call *system* the law as it results from construction in the sense of the method of natural history" (Jhering 1873–1877, vol. 3, par. 46; my translation).

Now, in Jhering's view, the (properly built) system of positive law has two basic virtues. First, it is the most convenient "practical form" for any given positive legal matter. It is the most "visible" and "plastic" form for positive legal norms. Secondly, it is the "source of new legal matter," though in a way that is always in line with the essence of positive legal norms. Indeed, by means of "juridical speculation," jurists may fill any legislative gap by resorting to a matter that "is partly provided by the different [juridical] bodies in themselves, by their nature and internal dialectics, and partly by the general theory of juridical bodies."[52] Such gap filling, Jhering claims, far from being abusive,

[50] "The *proof of the juridical construction* consists, for legal science, in placing the doctrinal creation in any imaginable position, in combining it in all possible different ways with other creations, and in making it agree with each of its fundamental principles" (Jhering 1873–1877, vol. 3, par. 46; my translation).

[51] In the totally different context of a logical positivism, roughly the same requirement is set forth by Alchourrón and Bulygin for "rational reconstructions" of juristic and legal-theoretical concepts (see Alchourrón and Bulygin 1971).

[52] "The system […] discloses to legal science an incommensurable field of activity, an inexhaustible quarry of investigations and discoveries, and a source of a most lively intellectual enjoyment. The narrow limits of the positive laws do not work as borders around its domain; the purely practical questions do not mark the paths it should follow. Free and unhampered, the spirit, as in philosophy, may wander and inquire without the least fear of getting lost. The practical nature of the world it dwells in will always take it back to the reality of things. But while coming back to it, it will have the satisfaction of having done more than to satisfy a purely individual need for knowledge: It will bring out […] something precious for the world and for mankind. The ideas it

is something practical life cannot do without; something jurists ought to perform, whenever the occasion arises.

The heaven of legal concepts is indeed a paradise for jurists. In that realm those jurists are granted an absolute right to act as a substantive legal source, through the definition and ordering of living juridical bodies, though under the pretence of sheer legal knowledge and pure legal technique.

21.4.2. Bernhard Windscheid

Bernhard Windscheid, the last great representative of German Pandecticism, published the first edition of his masterwork, *Lehrbuch des Pandektenrechts* (Handbook of the law of Pandects: Windscheid 1886), in the years 1862–1870. In the first volume, he devotes a chapter to interpretation and scientific treatment of the law (see Windscheid 1886, chap. 2, pars. 20–6).

Like the jurists of the exegetical school, Savigny and Jhering, Windscheid adopts, as a starting point, a cognitivist notion of interpretation. Interpretation, Windscheid says, consists in the "declaration [*Erklärung*] of the content of the law." Furthermore, he distinguishes, along with Savigny, between "true" interpretation, which is a free intellectual inquiry, on the one hand, and the spurious "interpretation" by the legislator, being in fact the production of a new, retroactive positive law, on the other hand. Finally, like Laurent, Savigny and Jhering, Windscheid suggests that (true) interpretation is a necessary task for anyone wishing to know what the law is, for scientific or practical purposes alike. The content of the law may be more or less clear: In the first case, interpretation is likewise at work, though its "task" is less "important" than in cases where the content of the law is unclear.

So far, Windscheid seems to be playing the genuine interpretation theorist. In a few lines, however, the initial notion of interpretation discloses its character as a stipulation making up the conceptual cornerstone of a concise, well-ordered, prescriptive methodology concerning the "art" of true interpretation: Windscheid's own proposed interpretive code.[53] If you will learn to follow the directives of this code properly—Windscheid seems to suggest—your outcomes, whatever they be, will be as many (correct) declarations of the true content of law.

Let us have a closer look at Windscheid's code for statutory interpretation, providing an account of it in the (by now familiar) form of a set of interpretive directives.

will have found will not exist as simple ideas; they will become practical powers" (Jhering 1873–1877, vol. 3, par. 46; my translation).

[53] True interpretation "is not so much a science, which can be taught; it is rather an art to be learned; the theory cannot but draw attention upon directive viewpoints" (Windscheid 1886, vol.1: par. 20; my translation).

Directive 1. Declaring the true content of a single legal norm. To declare the true content of a single law (norm-formulation), interpreters should perform *in any case* a threefold interpretive inquiry: *first*, they should proceed to "grammatical interpretation"; *secondly*, they should proceed to (what might be qualified as) actual-thought-oriented "logical interpretation"; *thirdly*, they should proceed to (what might be called) counterfactual-thought-oriented logical interpretation.

Directive 2. Grammatical interpretation. Grammatical interpretation consists in ascertaining the meaning expressed by the words used by the legislator in formulating a legal norm: This is to be done on the basis of "linguistic rules." These are the general rules of current ordinary language, but also the specific forms of expression in use at the time and circumstances when the law was enacted.

The output of grammatical interpretation—though Windscheid does not use this expression—is the literal meaning of a norm-formulation. The literal meaning may be indeterminate (obscure or ambiguous) or even flawed (erroneous). That is why further interpretive inquiries are called for in any case.

Directive 3. Actual-thought-oriented logical interpretation. "Logical interpretation" is meant to identify what the legislator *actually* did and *deliberately* wanted to say in enacting a certain norm-formulation. Its goal is the actual, deliberate thought (spirit, will, thinking, mind) of the legislator. That is why this form of logical interpretation may more properly be called *actual-thought*-oriented logical interpretation, to distinguish it from the third form of interpretive inquiry envisaged by Windscheid, which, as we shall see in a moment, is a counterfactual form of logical interpretation aimed at the legislator's *conjectural* thought.

Actual-thought-oriented logical interpretation "goes beyond the outcome obtained by applying linguistic rules." It does the job of overcoming obscure literal meanings by turning them into clear, applicable ones; selecting the correct literal meaning among the several alternative meanings brought to light by grammatical interpretation; amending the clear literal meaning of a norm-formulation whenever it is at odds with the legislator's actual and conscious thought; and providing a *corrective* (re)*interpretation* of the norm-formulation.

In what is one of the most original points of his methodology, Windscheid distinguishes three modes of corrective interpretation: *quantitative extension*, which is needed whenever the legislator has said less than what it consciously wanted to say; *quantitative restriction*, which is needed, contrariwise, whenever the legislator has said more than what he deliberately wanted to say; and, finally, *qualitative modification*, which is needed whenever the legislator has said something qualitatively different from what he consciously wanted to say.

As to the techniques for discovering the legislator's actual, conscious thought ("penetrating as completely as possible into the spirit of the legislator"), Windscheid recalls the following:

(*a*) *systemic interpretation*, where the "system" is made up of "other undisputed parts of the same law," and/or "other laws of the same legislator," and/

or "other laws of different legislators," if connected to the one to be interpreted by "intentional unity";

(*b*) *historical interpretation*, to be grounded in the state of positive law at the time of the enactment of the law to be interpreted ("for one should assume that such a state was present to the legislator");

(*c*) *teleological interpretation*, to be grounded in "the goal that the legislator intended to achieve" by means of the enacted law;

(*d*) *consequentialist interpretation*, to be grounded in "the value of the outcome," presuming the legislator wanted to say something meaningful and convenient, rather than something meaningless and inconvenient.

Where the techniques above do not point to a single certain outcome, interpreters should settle for plausible outcomes, with the aid of default interpretive criteria like "Prefer the narrowest departure from existing law" or "Prefer the milder view" (see Windscheid 1886, vol. 1, par. 21; my translation).

Directive 4. Counterfactual-thought-oriented logical interpretation. This kind of interpretation, for which Windscheid provides no name, is grounded in the idea that the legislator may not have had a clear and full perception of what it wanted to express; that the legislator was not (totally) aware of some points, but, *had* it been aware of them, he would have expressly taken them into account while enacting a law. Hence, the ("highest and noblest") task of interpreters becomes that of giving effect to the legislator's true and full thought, to his "true concept" and true "will," as against his "expressed will," by inferring this true concept from the meaning the legislator wished to actually express.[54]

Counterfactual-thought-oriented logical interpretation is a means of corrective interpretation—basically in the form of quantitative extension and quantitative restriction of the laws. Its tools are the same as those of actual-thought-oriented logical interpretation.

Directive 5. Gaps. Gaps, Windscheid suggests, are basically legislative gaps: They are situations the legislator did not expressly consider in his enacted laws. Accordingly, the position of jurists and judges confronted with a gap is pretty much the same as where there is a gap between the legislator's actual thought as to the content of a law, on the one hand, and his true concept of that law, on the other hand: "It is a matter of *knowing the true concept of the legal whole*, like earlier it was a matter of knowing the true concept of the sin-

[54] "It may happen, and it often happens, that the legislator self did not have a completely clear perception of this concept, and stopped at a form of manifestation of that concept that does not fully correspond to its true scope. It is the highest and the noblest task of interpretation to come to the rescue of the legislator, and in light of the will he expressed, to give effect to the will he really had. In so doing [interpretation] does not exceed beyond its powers: It acts in a way that is perfectly in tune with legislative intent; it does *nothing but express what the legislator itself would have expressed if it had paid attention to the points in regard to which it had no awareness*" (Windscheid 1886, vol. 1, par. 22; my translation and italics added).

gle legal norm" (Windscheid 1886, vol. 1, par. 23; my translation and italics added). On that presupposition, Windscheid provides two prescriptions for properly coping with statutory gaps: *First*, gaps should *not* be filled by resorting to "so-called natural law"; indeed, from Windscheid's posivist-historicist position, that is an entirely discredited entity; *second*, gaps should instead be filled by resorting to "the spirit of the legal whole self"—from this perspective, the "correct decision" is the one that is supported by analogy from enacted norms and the body of legal concepts they presuppose.

Directive 6. Contradictions. Due to the combined pull of legal tradition, the historical school, and Jhering's natural history jurisprudence, Windscheid tends to consider normative conflicts ("contradictions," "antinomies") as mostly apparent. He nonetheless also entertains the extreme, rare situation where a real contradiction comes out and is here to stay. In any case, Windscheid's directives for coping with antinomies are meant—as usual—to show interpreters the right way to discover the true answer.

Seeming contradictions should first of all be carefully examined to see whether they are apparent. A contradiction is apparent in two different situations. First, the seeming contradictory norms actually concern different situations—what may be discovered, in light of Windscheid's code, by means of both types of logical interpretation, leading to suitable corrective (re)interpretations of the relevant formulations of law (see Directives 3 and 4, above). Second, the seeming contradictory norms, though they concern the same situation, do belong to different legal "levels." This, in turn, may happen in two different cases: One of the norms belongs to the *ius commune*, while the other belongs to the *ius singulare*; or one norm is older than the other. In the first situation, there is no real contradiction, for the conflict is settled by the *lex specialis* criterion (*lex specialis derogat legi generali*); in the second situation, there is no real contradiction, either, for the conflict is settled by the *lex posterior* criterion (*lex posterior derogat legi priori*).

Whenever a normative conflict cannot be solved in the above-mentioned ways, interpreters should resort to (what we could call) a *logical-axiological criterion*: The norm that is "provable" to be more in keeping with "the legislator's true thought" prevails over the other.

Finally, if the normative conflict "is not apparent (being instead unsolvable)," in that even the logical-axiological criterion fails, interpreters should conclude that, since the two conflicting norms "have exactly the same value," each one derogates the other, and hence "it is to be decided as if neither existed" (see Windscheid 1886, vol. 1, par. 23; my translation).

Chapter 22

THE AGE OF DISCONTENT: THE REVOLT AGAINST INTERPRETIVE COGNITIVISM

by Pierluigi Chiassoni

22.1. Foreword

By the end of the 21th century, the disparate cognitivist views endorsed by the exegetical jurists, Savigny, the "first" Jhering, Windscheid, and their fellows began to be perceived, and severely criticized, as false and obnoxious to the legal culture and the legal profession by a generation of jurists and legal theorists who, following the lead of the revolutionary instrumentalist turn advocated by the "second" Jhering, brought into the law the general spirit of derogation and impatient *ennui* for the *long siècle* that was finally drawing to a close—though they had to wait until 1914 for its final, ominous, demise.[1]

On the Continent, the torchbearers of the revolt—a quite nuanced set, by no means amenable to simple generalizations—came from four main quarters: the Free Scientific Research view, advocated in France by François Gény; the free law movement, championed in Austria and Germany by Eugen Ehrlich and Hermann U. Kantorowicz; the jurisprudence of interests, launched in Germany by Philip Heck; the pure theory of law, developed by Hans Kelsen and his disciple Adolf Merkl in the so-called *Wiener Rechtstheoretische* School.[2]

22.2. François Gény: *Critique de la méthode traditionnelle* and *libre recherche scientifique*

François Gény (1861–1959) developed his methodological views in two major works: *Méthode d'interprétation et sources en droit privé positif: Essai critique* (Method of interpretation and sources in positive private law: Critical essay, Gény 1919), published in 1899, with a second, final, expanded edition in two

[1] The basic ideas of the "second" Jhering—*Der Kampf um's Recht*; *Der Zweck im Recht*; *Scherz und Ernst in die Jurisprudenz* (see Section 21.4.1 in this tome)—boil down to the following: (1) an instrumental conception of law—the law (legal norms, institutes, bodies and concepts) is not an end in itself, but a means to ends ("Purpose is the creator of the whole law"); (2) a non-cognitivist conception of interpretation and legal dogmatics; (3) the distinction between legal theory and normative ethics as concerns the law; (4) the claim in normative ethics that peace and justice are the basic goals the law should serve, by means of a necessarily relentless struggle against oppression and injustice.

[2] On Gény see also Section 12.5 in Tome 1 of this volume. On Ehrlich and Kantorowicz see also Chapter 3 in Tome 1 of this volume. On Kelsen and Merkl see also Chapter 2 in Tome 1 of this volume.

DOI 10.1007/978-94-007-1479-3_50

volumes appearing in 1919; *Science et technique en droit privé positif: Nouvelle contribution à la critique de la méthode juridique* (Science and technique in positive private law: New contribution to the critique of juridical method, Gény 1914–1924), in four volumes, published between 1914 and 1924, which was meant as a complementary essay to the former.[3]

In accounting for Gény's pivotal ideas about interpretation, the distinction between *is* and *ought*—between how legal phenomena are in fact, on the one hand, and what interpreters should do, to do their job properly, on the other; between theoretical or descriptive methodology, on one side, and normative methodology, on the other—is to be given pride of place, for it represents the tacit cornerstone of Gény's investigations.

Two conspiring theses represent the core of Gény's theoretical methodology: the former about the nature of legal interpretation, the latter concerning legal sources.

The limited discretion thesis. As a matter of fact, statutory interpretation is not, and cannot be, a matter of pure discovery of the "absolute and categorical rule" to be mechanically applied to the facts at hand. On the contrary, it is an activity unavoidably marked by the "subjectivity" of interpreters: by their necessary evaluations (*appréciations*) and discretionary judgments. Interpretive discretion is not necessarily tantamount to sheer arbitrariness, though. For it is, and can be, limited by two factors: legal sources (once we go beyond legislation, as we shall see in a moment) and institutional arrangements, like the work of a supreme *Cour de cassation* carrying out a centralized review on trial judges in matters of law and seeing to the uniform interpretation and application of the law.

The limits-of-written-law thesis. As a matter of fact, the law is not, and cannot be, exhausted by written law (codes, statutes, decrees, orders, etc.). Besides legislation (*la loi écrite*), its "formal sources" (*sources formelles*) also include custom (*la coutume*), case-law (*la jurisprudence*), and the output of the doctrinal study of law (*la science du droit*), the latter two making up between them the traditional or authoritative source (*la Tradition ou les Autorités*). These are *formal* sources, Gény claims, for they are all materials endowed with authority, though different in kind and legal force, as is evidenced by their "actual life" (*vie actuelle*), from which interpreters may draw instructions on how to decide a case (see Gény 1919, vol. 1, 237).[4]

[3] On the work of Gény, see, for bibliographical references as well: Halpérin 2008b, Bernuz Beneitez 2006, Grossi 1991. For a biographical sketch, see Kayser 1991.

[4] "By formal sources of positive law I mean authoritative injunctions, external to the interpreter and endowed with the property of commanding his judgment, when these injunctions are formed according to competence and have as a proper and immediate purpose the revelation of a rule, serving to direct legal life." Legislation and custom come first in the hierarchical order of sources, that is "designed by the very facts"; furthermore, the tradition-authority source is not an "independent," "sui generis," legal source, like the former; it is contrariwise *parasitic* on them:

Gény's insistence on the plurality of legal sources was intended as a direct criticism of what was regarded as the pillar of traditional juristic thinking: the legalistic credo according to which the law is tantamount to legislation, it is (almost) completely exhausted by legislation, and the regulation of every corner of social life may be found in, and constructed out of, it. This credo Gény criticizes on two grounds.

As a theoretical claim, he suggests, it is plainly false: Judges and jurists, when solving a legal problem, make use not only of legislation but also of customs and, above all, tradition and authorities, which work as standard supplements to legislation.

As a practical, normative claim, it is not viable: It prescribes a course of action that paradoxically runs contrary to the presumed, paramount goal of absolute legal certainty. Absolute legal certainty does not belong to this world; and relying exclusively on legislation has the baffling, paradoxical outcome of underhandedly transferring lawmaking power to the interpreters, under the pretence of adhering to objective laws. If we are seriously concerned with legal certainty, there is only one path available: recognizing that we can only get close to it, but never achieve it completely, and that the more sources we take into account, the more interpretive discretion finds itself hemmed in.

This theoretical core, for which Gény deploys a detailed argument, sets the background for the basic problem that normative methodology should face and settle: Once we give up the utopian, fanciful pretense to absolute legal certainty (by means of legislation), how is any viable, reasonable level of legal certainty to be obtained? What should judges and jurists *do* in order to promote and serve that goal?

The recipe Gény offers turns on the following notions and prescriptions.

1. Written law—or "legislation" (*la loi*, *la loi écrite*) in a broad sense of the term—is the output of the will of legal-political authorities, and consists of linguistic formulations conveying legal rules or precepts:

> What characterizes the written law is that, in relation to the rule it establishes, it represents the will of a given social organ cast in a verbal formula that fixes its limits and defines its content in order to impose that will on everybody. Whence comes perfect information about, and also something like a perfect integration of, the legal idea, which without definiteness and consistency floated in the vast chaos of the nature of things. That idea becomes a clear precept, and at the same time clearly binding, by virtue both of the formula that expresses it and the power of the authority that stamped it with its seal. (see Gény 1919, vol. 1, 241; my translation; see also Gény 1919, vol. 1, 243, 248, 267).

> "They [authority and tradition] can only pave the way for the written law, by inspiring its provisions, and above all they can contribute to the creation of customs, providing the basis, among the interested people, for uses supported by a legal sentiment. In themselves, they are like torches which light up the interpreter's path, without imposing any direction, and like precedents, which will aid his reason, without destroying every activity that is proper to it" (Gény 1919, vol. 2, 72–3; my translation).

2. On the *pars destruens* side, two interpretive attitudes have to be rejected beforehand, while considering the proper "directive principles" for statutory interpretation: on the one hand, the traditional approach ("la méthode traditionnelle"), as exemplified by the exegetical jurists; on the other hand, the social-evolutionary approach.

The traditional approach should be rejected on three grounds: It endorses the dogma of legislator's omnipotence, the false idea that statutory law is capable of providing a discipline for whatever case is at hand (the idea of the "logical completeness," or "logical closure," of written law); it pretends to *make* it true by way of an interpretive effort assumed to be a matter of pure logic, totally blind to consequence and good sense; it assumes, on that basis, that whatever jurists and judges do with statutes, in order to get to the right answer for any case at hand, properly belongs to the realm of "interpretation."[5]

The evolutionist approach should be rejected for the opposite reason: Far from extolling legislation by the ascription of the magic virtue of logical completeness, it is guilty of contempt, for it requires us to consider statutes as vehicles for prescriptions totally detached from their author and context, and bound to serve, at any time, the felt necessities of society.

3. Both approaches fly in the face of the very nature of legislation: its being the product of the will of an historically situated legislator. Accordingly, on the *pars construens* side, Gény conceives methodological investigation into the "principles of interpretation" as

> the search for ways of proceeding that will make it possible to draw from the legal text the whole complex of the legal rules it contains, in view of an adaptation, as perfect as possible, to the circumstances of social life […] it is a matter […] of knowing by what means the interpreter (the necessary middleman between the legal formula and legal life) […] will be able to discover and connect, from actual life, both the conditions implied by the text and the solution it attaches to them. (Gény 1919, vol. 1, 253–4; my translation)

Following this path of critical reflection, Gény comes to a set of methodological instructions that may be presented in the form of the following directives, making up Gény's "interpretive code."

Directive 1. Presumption of meaningful content. In interpreting any piece of legislation, interpreters should adopt, as the only suitable attitude, the presumption that the legislator

> has filled with his thought and will, for otherwise it would be possible to see the legal text as an empty vessel, which anybody will fill at pleasure. (Gény 1919, vol. 1, 263; my translation)

[5] We know from Chapter 21 that the traditional approach, expecially as far as some exegetical jurists are concerned, was not exactly like that. Gény is here taking sides against it in its worst, most extremely cognitivist version.

Directive 2. Statutory interpretation proper defined. On the basis of the previous presumption, statutory interpretation proper is to be conceived as the "search for the content of legislative will, aided by the formula expressing it," the search "for what its authors wished and were able to express in its enactment" (Gény 1919, vol. 1, 265, 268; my translation).

Directive 3. The principle of critical originalism. Interpreters should look for the original meaning of statutory clauses, i.e., for the meaning the legislators were willing and able to attach to them in the context of enactment,

> without any preconceived idea, either about the more or less ideal perfection of the rule to be discovered or about its more or less complete fit with the social context in which it ought to be applied. (Gény 1919, vol. 1, 265; my translation)

Directive 4. The principle of limited evolutionism. Interpreters are allowed to depart from the search for the original meaning of statutory clauses and proceed to an evolutionary interpretation providing them with a "new meaning," grounded in the "ideas that govern at the moment of their application," but only if:

(*a*) the clauses contain deliberately vague or open ("general") clauses, like *ordre public* (public order), *bonne foi* (good faith), *diligence du bon pêre de famille* (due diligence), etc.;

(*b*) the conditions of the statutory prescriptions have totally disappeared or lost their original relevance (see Gény 1919, vol. 1, 272–4).

Directive 5. Realizing interpretive originalism. To give the maximum effect to the original-content-original-context principle, Gény suggests the adoption of the following interpretive directives.

(*i*) Grammatical and logical interpretation ("le texte et l'esprit": the text and the spirit), far from being considered at odds with each other or hierarchically ordered, ought to be regarded as necessary complements. On this basis, it is useful to distinguish two intertwined activities, within the unitary process of interpretation: *intrinsic interpretation*, or interpretation through the statutory-clause formulation ("par *la formule du texte*," or within "la ligne de ses éléments strictement intrinsèques," i.e., "in line with its strictly intrinsic elements"); *extrinsic interpretation*, or interpretation on the basis of external elements ("à l'aide d'*éléments étrangers à la formule*"); the former considers statutes as "psychological" phenomena, the latter as "social" phenomena (see Gény 1919, vol. 1, 276, 287).

(*ii*) Whenever the outcome of the intrinsic interpretation of a norm-formulation—the will-content identified from the formulation itself—is not at odds with its extrinsic interpretation, that will-content ought to be regarded as controlling interpreter's judgement and discretion.[6]

[6] "[I]t will dictate the interpreter's decision, suppressing any hesitation" (Gény 1919, vol. 1, 277; my translation).

(*iii*) While doing textual interpretation, interpreters should look for the widest possible scope and content, within the presumed bounds of the original meaning. On this score, interpreters should reject the doctrine according to which the only, proper, will-content of statutory clauses, binding upon interpreters' decisions, lies general and abstract prescriptions (*préceptes juridiques*, *Rechtssätze*), while definitions and other "theoretical" contents, if any, belong to the realm of nonbinding "simples et pures conceptions" ("pure and simple conceptions"). Once included in a statutory clause, such conceptions ought instead to be regarded as fully binding law, like any piece of legal prescription. On the same ground, whenever a general term has been employed, the extension of which is now wider than it was originally, the extension ought to be considered *within* the limits of a "strict interpretation of the written law" (see Gény 1919, vol. 1, 278–83; my translation).

(*iv*) The meaning of a statutory clause, the *pensée voulue du législateur* (the thought the legislator has willed), to be completely identified by way of *intrinsic interpretation*, should also be determined by means of (what might be called) a *logical-systemic* interpretation, paying attention, first, to the logical consequences of the statutory formulation considered in itself ("the natural laws of the human mind command one to suppose, in every reflective volition, the sequence of rational deductions implied by the psychological act": Gény 1919, vol. 1, 286; my translation)[7]; second, to the will-content of the other related clauses belonging to the *same* piece of legislation; and third, to the joint logical consequences of the interpreted clause and other related clauses—according, one might say, to the technique of so-called *combinato disposto*.[8]

(*v*) Turning to *extrinsic interpretation*, it should look at those data, external to the statutory formulation, that make up the social environment which the legislative will (presumably) took into account and/or was affected by. Among the resources of extrinsic interpretation, interpreters should count the facts which the statutory provision was meant to regulate; the moral, political, social, economic, or technical needs to be satisfied by means of the provision making up its goal or *ratio legis*, "which, without revealing in and of itself the means which the legislator resorts to in order to realize it, at least makes it possible to better understand them and develop them in their detail" (Gény 1919, vol. 1, 288; my translation)[9]; the social and legal environment of the statutory provision, i.e., its historical precedents, the *occasio legis*, the outlooks supposed to have informed the mind or the spirit of the legislators, for-

[7] The French original: "les lois naturelles de l'esprit humain commandent de supposer, dans toute volition réfléchie, la suite des déductions rationnelles, que comporte l'acte psychologique."

[8] See Gény 1919, vol. 1, 286; see also ibid., 284–5. *Combinato disposto* means what is prescribed by the combined directive import of two or more legal norms.

[9] The French original: "qui, sans révéler, par lui-même et à lui seul, les moyens, que le législateur met en oeuvre pour le réaliser, permet, du moins, de mieux comprendre ces moyens et d'en développer les details."

eign legislation; the *travaux préparatoires*, as a "formal element, that expands the text, and sometimes explicates it" ("comme élément formel, amplifiant le texte, et parfois l'expliquant"); "purely logical elements," like the *principles* the drafters considered as objectively true and absolutely valuable, and any related provision "casting light and completing those to be interpreted" ("éclairant ou complétant celle qui est à interpréter": Gény 1919, vol. 1, 288; my translation).

The fatal outcome of such an interpretive approach—according to Gény the *only* approach suitable to the very nature of legislation as the will-product of a historical legislator—is the *limited scope* of statutory norms relative to the variety of facts and cases in any society at any time: the fatal incompleteness of legislation, its being structurally, unavoidably rife with gaps.

Against the broad traditional conception of "interpretation" Gény sets the view that interpretation properly so called merely consists in finding out the clear meaning, *if any*, that the legislator intended for his statutory clauses; in this way, whenever such a task proves impossible, for there may be no clear meaning or even no relevant statute at all, what jurists do is no longer *interpretation* but rather consists in appealing to other formal legal sources (custom and tradition) and performing the delicate task of *free scientific research* on the data ("le donné") out of which the right legal answer ought to be worked out—data that Gény identifies with the laws concerning the nature of things and social reality, which, in his view, are in turn as many pieces of a theological and teleological natural law.[10]

Against the idea of the logical completeness of written law Gény sets the idea of its necessary incompleteness. This is due both to the complex and dynamic character of the social reality the written law is intended to regulate, and to the fact that the tools traditionally supposed to carry out the "logical" completeness of legislation are in fact either unviable (*deduction* presupposes that a rule is already *there*, but in case of gaps there is precisely no law out there to be applied), or ineffective, as in the case of so-called *inductive* forms of reasoning (by analogy, *a fortiori*, *a contrario*). For, as a whole, they make up a mutinous set, by itself not capable of dictating any single answer for a gap situation, unless a discretionary judgment by judges or jurists intervenes to establish the path to be followed (see Gény 1919, vol. 1, par. 81 *bis*).

The last basic directive of Gény's interpretive code mirrors these ideas.

Directive 6. Properly dealing with gaps. Statutory gaps ought to be filled up not according to the principle of the hermetic or "logical" completeness of legislation, i.e., by reasoning from analogy, *a fortiori*, *a contrario*, or from the gen-

[10] In his two-stage view of the doctrinal study of law, Gény sets these scientific inquiries into law (*science*) in contrast to the technical elaboration of law (*technique*), which constructs its concepts and proposals (*le construit*) from the data discovered at the scientific stage. Clearly, the background model for Gény's theory of legal science is Jhering's two-level legal dogmatics.

eral principles of law, but by resorting to custom, case-law, and doctrinal opinions, and, whenever these sources have run out, to "free scientific research" on law (see Gény 1919, vol. 1, 267).

Free scientific research is not tantamount to purely sociological, empirical investigations, though. It also involves *intuition* and whatever the *moral conscience* the jurist may *feel* and *grasp*. Accordingly, the "free scientific research" of law, its name notwithstanding, is not a totally rational, modern mode of inquiry, bearing contrariwise the deep marks of an irrationalist, pre-modern, mysterious, conception of human "knowledge."[11]

In this way, the presumed objectivity of law's *data* is combined with the necessary discretion and subjectivity of legal jobs, in a picture where the century-old idea of a natural law is bundled together with ideas and idiom of the newborn sociology (Emile Durkheim) and the philosophy of French contemporary irrationalism (Henry Bergson and spiritualists like Léon Ollé-Laprune and Maurice Blondel).[12]

22.3. The Free Law Movement

The free law movement—*Freirechtsbewegung*—is a German-language movement, the foremost representatives of which are Eugen Ehrlich (1862–1922) and Hermann U. Kantorowicz (1877–1940). They share with Gény the fundamentals of the criticism addressed to traditional legal methodology: Legislation does not exhaust the whole law (law is more than legislation); codes and statutes do not make up a complete, "logically closed" system ("the doctrine of closure and completeness of the legal system"), for it is not true that "within the law in force, any legal question that may arise finds its own answer, provided one knows how to look for it" (see Ehrlich 1987, Introduction and pars. 1–2; my translation; see also Ehrlich 1929, chap. 1, par. 4); the judicial

[11] "In my view—Gény writes in his 1910 lecture *Les procédés d'élaboration du droit civil* (The modes of elaboration of civil law)—the data of the natural legal order require, if they are to be fully penetrated, further means than those of strictly scientific procedure, and necessitate […] an appeal to *the obscure forces of moral conscience*" (quoted in Grossi 1991, 26; my translation and italics added). The French original: "le *donné* de l'ordre juridique naturel exige, pour être pleinement pénétré, d'autres moyens que ceux de la procédure strictement scientifique, et nécessite […] un appel aux *forces obscures de la conscience morale*."

[12] "To sum up, writes Gény, within the limits of such authoritative rules as govern it, and in front of which any individual will must back down, legal interpretation appears to us as the necessary mistress of its decisions, being subject only, by virtue of the very purpose of its mission, to draw inspiration from the great sources of justice and social utility, nourishing the organic life of the law" (Gény 1919, vol. 1, 207; my translation). The French original: "En somme, sous la réserve de ces règles d'autorité qui la dominent, et devant lesquelles toute volonté individuelle doit baisser pavillon, l'interprétation juridique nous apparaît maîtresse nécessaire de ses décisions, n'étant assujettie, que par le but même de sa mission, à puiser ses inspirations dans le grand fonds de justice et d'utilité sociale, qui alimente la vie organique du droit."

application of law is not tantamount to the logical deduction of individual decisions from statements about the facts of the case and given general normative premisses, being rather at bottom discretionary; the proper method for the doctrinal study of law ("legal science") is not the mere combination of abstraction and deduction. Their views, with historical hindsight, not only stoked further the revolt against methodological unawareness, *naïveté*, but also self-interestedly beguiled mainstream late-19th-to-early-20th-century-jurists, aptly couched in powerful battle cries that were bound to stay: *living law*, *free law*, *free legal science, free judicial law-finding*.[13]

22.3.1. Back to the Future: Ehrlich's Vindication of Free Judicial Law-Finding

The revolution in legal methodology advocated by Eugen Ehrlich is a combination of progress and retrieval. With the aid of newborn (legal) sociology, to the rise of which he directly contributed, Ehrlich vindicated *free law-finding*—representing the core of classical Roman law, German pre-Reception medieval law, and the English common law, the noblest components of Western legal culture—against modernity ("modern law," "modern lawyers," modern jurisprudence), urging a dramatic change in the contemporary theory and practice of law, adjudication, and legal science (see Ehrlich 1987, 1929, 1966).

Looking at the law from a sociological-historical viewpoint, Ehrlich criticized the dominant "state-conception of the law" (*staatliche Rechtsauffassung*) by insisting on the theoretical relevance of two distinctions: between *legal norms* and *legal propositions*, and between *living law* and *apparent law* (the latter term is mine).

Legal norms (*Rechtsnormen*) are *decision-making norms*: abstract commands and prohibitions establishing which of two or more conflicting interests ought to prevail in any given case. Indeed, Ehrlich claims, the basic function of the law is to be seen to identify and settle conflicts of interest between the members of a society, by way of a purportedly proper (correct, just) balancing (*Interessenabwägung*), in light of the proper ultimate principles of justice. *Legal propositions* (*Rechtssätze*), by contrast, are decision-making norms provided with an authoritative formulation in words.[14] Legal propositions are the out-

[13] Ehrlich claims to have been the first to draw attention to the necessity, and advantage, of judicial *freie Rechtsfindung*, before Gény 1919 and von Bülow 1885, who simply cast light on the fact that "judicial activity is law-creating by its very nature, even when consisting in the pure application of law" (see Ehrlich 1888, 1987).

[14] Legal propositions "decide over generally determined conflicts of interest […]. A legal proposition establishes which of the conflicting interests, from the standpoint of the state or society, is to be regarded as higher, and so ought to be protected by means of the judiciary or of administrative agencies […]. A legal prescription that does not protect an interest against an attack is not a legal proposition, or at least is not a complete, full-fledged legal proposition" (Ehrlich 1966, 186; my translation).

puts of legislation, the only kind of law the state can really make, usually on the basis of pre-existing legal norms produced by social interaction (usages, relationships of dominion and possession, family relationships, declarations of will in testaments, contracts, associations, corporations, etc.), and with the aid of jurists and legal experts. Legal norms may be expressed by, and also derived from, legal propositions, but they do not correspond exactly to them. In fact, the positive law of any society is usually made partly by legal propositions (state law proper), partly by legal norms that are not legal propositions (nonstate law, law beyond legislation).[15]

Living law (*lebendes Recht*)—the American realists' *law in action*—is made of those decision-making norms that, at any time, are actually followed and applied in any given society. It is to be carefully set in opposition to what is mere *apparent law* (the American realists' *law in books*): the complex of legal propositions, legal norms, doctrines, theories, and dogmas that do not in fact regulate or concern what is really going on in society.

The sociological view of the law suggests that the modern theory of adjudication and legal science—which is part of the state conception of the law—is false and practically noxious.

From the standpoint of the state conception of the law, where judges are seen as a collectivity of anonymous civil servants, adjudication is tantamount to a purely legal-proposition-applying, non-law-making venture. That view however, Ehrlich claims, is wrong on many counts. To begin with, legal propositions, even those that do not contain any deliberately indeterminate expression, "do not automatically produce" judicial opinions. Between legal propositions, on the one hand, and the facts of the case and their proper judicial decision, on the other, there is a gap requiring what might be called a *semantic leap*: Facts need to be classified in terms not of the legal proposition itself, but of an intermediate, concrete decision-making norm derived from the former by way of interpretation. This, in turn, means that the connection between legal propositions and concrete decision-making norms is by no means logical or necessary, being instead discretionary, deeply affected by the personality of the judge and, through it, by the *evolutionary pressure* in virtue of which "even the decision-making norms already established must be continuously refined in light of social evolution" (Ehrlich 1987, par. 2; see also Ehrlich 1929, chap. 15). Furthermore, there are plenty of cases for which no legal proposition holds:

> no theory concerning the [judicial] application of law may get around the fact that any system of fixed legal rules is, by its very nature, riddled with gaps; that at the very moment of its being established it is born outdated, and hence it will perhaps be able to regulate the present, but nothing can be said about the future. (Ehrlich 1987, par. 2; my translation)

[15] "Even in the present age, as in any other age, the centre of gravity in the development of the law is to be found neither in legislation, nor in legal science, nor in case-law, but in society itself" (Ehrlich 1929, "Vorwort," my translation; see also Ehrlich 1987, par. 4).

The need for semantic leaps, the working of evolutionary pressures, and the existence of gaps all show that adjudication is not a matter of purely logical subsumption of cases under clear legal propositions, and, what is more, that between adjudication in case of gaps and adjudication in normal situations of interpretation there is only a difference of degree, not in kind.[16] The state conception of law tries to hide these data under the idea of a *technical* judicial law-finding under the aegis of the unity and completeness of a legislation embodying the almighty and all-knowing will of the lawgiver. In so doing, however, judicial law-finding gives itself over to *fictions and constructions*.

Moving from theory (descriptive methodology) to prescription (normative methodology), Ehrlich advocates free judicial law-finding (*freie Rechtsfindung*) as perhaps the most valuable factor in the working of legal systems—since, as Ehrlich suggests, human societies can do without legislation, but they cannot do without law.

Unlike *technical* law-finding, free judicial law-finding is *free* from fictions, abstract constructions, and the faith in the existence of miraculous interpretive techniques (like so-called *legal deduction* and the traditional methods of *legis comprehensio*; the traditional techniques of *legis extensio* like *analogia legis* and *analogia iuris*; and juristic construction). Accordingly, it comes with the methodological awareness that "law-finding" is really, and also, law-*making*, the creation of law, an activity that fatally engages each judge's own moral and political responsibility ("since freedom means responsibility"). Free law-finding is not tantamount to arbitrary judicial lawmaking, though: "The judge is actually bound by legislation, custom, tradition, and the principles embodied in previous judicial decisions, but these do not provide the ground for his decisions; rather they represent the limits to which the freedom of the judge extends." And indeed, if properly conceived, "free [judicial] law-finding adopts the legal tradition as a starting point and aims at the *right Law* (*richtiges Recht*), in Stammler's sense," i.e., to decision-making norms informed by the principles of justice that social interactions are supposed to embody (Ehrlich 1987, pars. 2–4; my translation).

Turning to legal science, Ehrlich distinguishes *theoretical* legal science, or legal science proper (*Rechtswissenschaft*), which he conceives as legal sociology, or the empirical study of law in ongoing societies, on one side, and *practical* legal science (*Jurisprudenz*), on the other (see Ehrlich 1929, chap. 14, par. 5; chap. 15). In his view, the practical legal science suited to the future of human societies should display a host of properties that may be described as follows.

[16] "[T]he judge is never totally bound by the legal proposition, never completely deprived of his own will, and the more general the legal proposition, the greater the freedom of the judge" (Ehrlich 1929, chap. 15; my translation); "every decision adds something to the law in force […] it is not simply a piece of evidence for it, but may also be a source of new law" (Ehrlich 1987, par. 1; my translation).

It should be "organically connected to tradition," i.e., to the best examples of laws, case-law, and juristic writings in the history of Western law.

It should gain its "scientific foundation" from "the sociological science of law." This would provide it with information about the living law of a society by the "study [of] social relations even when they are not the subject of any judicial decision or official order"; it would also make clear that "There is no justice that is given once and for all and forever," that "like positive law, justice is the outcome of historical evolution," and, accordingly, that "the most genuine task of free juridical investigation consists in decision-making norms that, being derived from the nature of social relationships, change their content in accord with them" (Ehrlich 1987, par. 4; my translation).

It should get rid of the "ridiculous masquerade of abstract constructions and conceptual frameworks" worked out by *Begriffsjurisprudenz*, at least as far as its worst representatives are concerned.

It should get rid of traditional juristic logic, with its false claims of being able to *discover* the right answer to any legal question whatsoever.

It should understand the activity of free law-finding as entailing, not "freedom from the laws, but freedom from useless and idle abstractions and constructions," as a process involving the balancing of conflicting interests, informed by an instrumentalist conception of the law in light of which juristic disputes about "what the law is" are to be read, more correctly, as disputes about "which decision is the most suited to justice, most adequate" to worthwhile social goals (Ehrlich 1987, par. 5; my translation).

It should be placing "high expectations in the outcomes of the creative thinking of great individualities" among judges and jurists.

It should be committed to an *evolutionary* and *consequentialist interpretation* of legal propositions and legal norms in general, viewing them not as "rigid dogmas" but, rather, as "living forces," whose meaning is continuously in flux and should be tested against the benchmark of its likely social effects.

It should be committed to a thorough, in-depth study of case-law, not limited to a shallow evaluation of judicial *dicta*, but primarily devoted to digging out and bringing to the fore the ideologies that, at any time, make the machinery of justice work:

> Case-law is always the output of different *forces* operating upon the judge: The wording and literal meaning of a legal norm is *one* such force, but not the only one. Every judicial decision is the expression of some social view existing in fact: Even the most abstract scholasticism, the most evident mistake, the most self-conscious prevarication have a scientific value, if only because they are tokens of social aspirations. It becomes the task of legal science to identify the aspirations which every day affect case-law, their origins, their effects, which type they are, what their value, and, in such a way, to provide an account of what is going on in case-law and why. (Ehrlich 1987, par. 5; my translation)

Finally, it should be committed to providing judges with the conceptual tools needed to understand "the great social, economic, and political issues" on

which the proper solution to "new problems" depends, in order to prevent judicial "mistakes" and promote correct decision-making (Ehrlich 1987, par. 5).

22.3.2. Down with "the Last Strongholds of Scholasticism": Kantorowicz's Free Legal Science

What is unanimously recognized as the *manifesto* of the free law movement—*Der Kampf um die Rechtswissenschaft* (The struggle for legal science: Kantorowicz 1962), a title bearing evident homage to Jhering's celebrated 1872 *Der Kampf um's Recht* (The fight for legal science)—appeared in 1906 under the disguised authorship of Gnaeus Flavius, but soon every lawyer familiar with Continental legal culture knew it was written by the fine legal historian and philosopher Hermann U. Kantorowicz.[17]

In the course of relatively few, terse, and witty pages, Kantorowicz outlines his own, radically realistic version of "the new conception" (*die neue Auffassung*) of law, legal science, and adjudication, exposing the many shortcomings of the old 19th-century "positivistic" *Rechtsanschauung* (the legal dogmatics of which is "Scholasticism"), but also criticizing, though tacitly, the fellow free law jurists who did not completely follow through with the new way.

The law of every advanced society, Kantorowicz claims, is made up of two ingredients: *state law* (*formal law*) and *free law*. State law, whose basic source is legislation, is the outcome of political processes and legal institutions. Free law comes instead into existence out of people's beliefs, attitudes, and daily actions and relationships ("the free law of women, retailers, workers," etc.), independently of state action and state coercion. This makes free law the "natural law of the 20th century," though the analogy stops here (a "resurrection of natural law in a different form"). Indeed, unlike the natural law of traditional natural law theory, free law makes no claim to absolute, universal, eternal existence and validity, what incidentally Kantororowicz regards as a "metaphysical mistake" ("our philosophy of law has little to do with that of Pufendorf and Wolff"). It is, contrariwise, "positive" law, like state law, its existence being a contingent *fact* in the history of a human society; its validity resting on force (*Macht*), will (*Wille*), and recognition (*Anerkennung*). The legal positivists of the 19th century pretended the whole law to be formal, or state, law, and claimed state law to be a gapless system of norms. But they were wrong. To begin with, state law gets its contents from free law; furthermore, it is riddled with gaps ("in legislation, gaps are not fewer than the words" themselves). Whenever a gap in legislation comes up in a lawsuit, judges fill it up by resorting to free law. This is why free law is *law* on a par with state law, for it is one, and the most extensive, of the two basic sources for judicial decisions. One should not replace an idealized, fictional view of state law with an idealized, fictional view of free law,

[17] Also of interest for the present account are Kantorowicz 1928, 1934.

though. Like state law, free law is no *system*, no gapless and consistent set of legal norms, providing one right answer for any case where legislation may fail. On the contrary, free law too, being the historical, spontaneous product of human conscience, sentiments, and actions, is at any moment a set of norms from different times and contexts, created either by (and for) individuals or by (and for) communities, conflicting among themselves and gappy, so that there will always be cases where, whatever decision is made—be it either in the course of adjudication or out of court—it cannot but ultimately depend on the decision maker's own options and discretion (see Kantorowicz 1962, 13–21; see also Kantorowicz 1928, 692ff.).[18]

The free law view of law—which Kantorowicz presents as the only genuine, realistic theory we may entertain—provides the theoretical basis for the free law view of legal science and adjudication.

As to legal science, in the *pars destruens* of his theory Kantorowicz attacks the positivistic "dogmatic legal science" (*dogmatische Jurisprudenz*), "this paper legal science" ("diese papierene Jurisprudenz"), this "bounded dogmatics" ("gebundene Dogmatik"), with its cognitivist views about interpretation, fictions, logic, analogy, *ratio legis*, and the so-called "spirit of the law" (in fact, "the spirit of their Lordships the jurists [is] nothing but the spirit of those who would like to find in the laws what suits to their own personal taste [*Geschmack*]": Kantorowicz 1962, 21ff.; my translation), showing they are all tools and procedures by means of which a variety of competing solutions may be argued for, at any moment, for the *same* legal problem, according to the outcome each interpreter desires to achieve (see Kantorowicz 1962, 21–33).

The traditional conception of legal science, with its claim to be a pure, absolute (rational and/or historical) objective knowledge of law, is to be rejected as empirically false. A new model of legal science should be practiced in its place, the free law model. This model, in Kantorowicz's view, sees the following basic features in a legal science properly conceived: *voluntariness*, a *relativistic method*, the *repudiation of autonomy*, and the *repudiation of the spirit of orthodox theology*.

[18] "The free law doctrine teaches (if we may sum up an elaborate system in a few words): The traditional sources of the law, the 'formal' law, statutes, and precedents, have gaps which must be filled up, must be filled up with law if the decision is to be a judicial decision, and this law must have a general character if equality before the law is to be maintained; the gap-filling material must therefore consist of rules, rules of law. These are 'free' law in the sense that they are not formal law: They have not been formalized but are still in a state of transition like bills, principles of policy, business customs, inarticulate convictions, emotional preferences. Many of them are formulated for the purpose of a concrete judicial decision by the courts, acting within their discretion, through acts of will and value-judgments, and constitute therefore judge-made law. Their validity is far less than that of the formal law and sometimes nil, but their practical importance is even greater, because, where the formal law is clear and complete, litigation is not likely to occur. This free law thesis has been exaggerated by those realists who teach that law consists of judicial decisions alone, and therefore of facts" (Kantorowicz 1934, 1241).

Voluntariness. Once we realize how the social phenomenon of law is in fact, we must also realize that legal science cannot but play the active, albeit complementary, role of "a source of law," providing "definitions of the notions" mirroring the "characteristic notes" of the free law norms, showing how to "fill gaps" in legislation, being neither an abstract "construction" nor a mere "knowledge of what is known," but "free law-finding" (*freie Rechtsfindung*), "where it reveals and brings to application the [free] law of the community," and "free law-creation" (*freie Rechtsshöpfung*), "where it produces and gives validity to the [free] law of individuals" (Kantorowicz 1962, 21; my translation), building up *systems* of law out of state law and free law materials. Such a legal science, free legal science, being a legal source, cannot but partake of the basic character of legal sources in general: *voluntariness* ("It is itself a source of law, so it must have the same nature as all sources, and like the law itself, it must be *will*": Kantorowicz 1962, 21; my translation). From this point of view, Kantorowicz suggests, the life of the law is *neither* logic *nor* experience, to echo and partly reverse O. W. Holmes's well-known saying, *but* will. Of course, the good jurist takes into account both (juristic) logic and experience, but he doesn't expect them to do the whole job for him, for they simply *cannot* do that: Logic and experience can only point to a frame of possible solutions to legal questions, among which the will must decide ("it is always the will that by the leash leads the understanding": ibid.; my translation).

The relativistic method. Once we adopt the scientific standpoint advocated by the free law movement and see the law in the way it suggests, we must realize that there are, in the free law of any society, different sets of norms, as there are "different *Weltauffassungen*, different characters, different interests," from which those normative sets ultimately come. Accordingly, the proper stance for legal science is neither objectivism nor subjectivism, but relativism. Objectivism pretends there to be just one right normative viewpoint outside legislation, and maintains it should win the day, if necessary by decree; subjectivism tries to carry out its normative viewpoint, without paying attention to different ones; relativism, by contrast, accounts for "the different possible [normative] viewpoints" and identifies "the different interpretations" corresponding to each one of them, which are all "*relatively* correct […] insofar as they are compatible with the laws" (Kantorowicz 1908, 112–3; my translation).[19]

[19] No reference to a "relativistic method" can be found in the German edition of *Der Kampf*. Apparently, it was added by Kantorowicz to the 1908 Italian translation, by A. Majetti (see Kantorowicz 1908, 112–3). According to the translator, Kantorowicz, who wrote *Der Kampf* while in Bologna and was familiar with Italy where he did research on the Glossators, "amended, added, explained, conferring new original value to my [translation]" (see Kantorowicz 1908, 25; my translation). These ideas, by the way, are also clearly formulated in the later Kantorowicz (1928, 683–6, 705). As we shall see in a moment with the idea that jurists, in looking for the "objective meaning" of statutes, "must content themselves with ambiguous results (e.g., with several equally valid interpretations)," Kantorowicz extends the relativistic method ("juristic relativism") to ad-

Repudiating autonomy. Free legal science repudiates the isolationist, impoverishing ideal of the autonomy of legal science preached by traditional legal dogmatics. Taking stock of the first principles of the historical school of law, which were paradoxically neglected by its own followers, free legal science regards historical, psychological, and sociological inquiries as necessary to know the law and play its law-finding and law-creating role (see Kantorowicz 1962, 27–8).[20]

Repudiating the spirit of orthodox theology. The basic flaws of traditional legal dogmatics—the fictional claim to objective legal knowledge covering subjective, self-interested, value-laden, opportunistic uses of interpretive techniques *bonnes à tout faire*—were somehow legitimized by the like ways of thinking, reasoning, and interpreting adopted by orthodox theology. Free legal science should accordingly rid itself of such a dishonest theological spirit, bringing instead to the law the liberating, honest spirit of reformation (see Kantorowicz 1962, 30–3).

Turning to adjudication (*Rechtsprechung*), Kantorowicz makes an inventory of the basic tenets of the traditional, cognitivist outlook: (1) "Foundation of every judicial decision on the law (*Gesetz*)!"; (2) "The judge ought to be the servant of the law (*Gesetz*)!"; (3) "Every imaginable case ought to be decided, and this (can be done) on the sole ground of the law (*Gesetz*)!"; (4) "Judicial decisions should be predictable!"; (5) "The judgment (*Urteil*) ought to be objective; it cannot be subjective (*persönlich*)!"; (6) "The judgment ought to be a strictly scientific performance!"; (7) "Adjudication ought to be free from affections!"—showing them, in turn, to be either unviable (3, 4, 5, 6, 7) or not worth pursuing (1, 2) from the standpoint of what the free law theory of law and legal science suggest.[21]

In discussing the second tenet, Kantorowicz sets forth, by way of proposal, his own code concerning the judicial interpretation of law:

1) to begin with, judges ought to decide cases according to the *clear letter of the law*, if any;

2) if there is no law or the law is unclear, judges ought to decide by applying the norm that, according to their own firm persuasion, corroborated by historical and sociological inquiries, the legislator himself would have enacted

judication as well (Kantorowicz 1962, 33–6; 1928, 699–700), in such a way that the whole construction may be regarded as a forerunner of Merkl's and Kelsen's idea of *scientific interpretation* (see Section 22.5 below).

[20] The first principles of the historical school are described by Kantorowicz as follows: (1) all law is *positive* law: There is law if, and only if, there is "a *reality* (force, will, recognition) behind the legal proposition"; (2) a legal proposition can be fully understood only by he who has a full knowledge of its historical evolution.

[21] "[…] the ideals of legality, passivity, foundation, scientificity, legal certainty, objectivity appear to be at odds with the new movement. But, fortunately, it may be shown that those postulates are partly unviable, partly not worth realizing" (Kantorowicz 1962, 33–6; my translation).

now for the case at hand—in other words, judges ought to decide on the basis of an *open* counterfactual intentional interpretation or gap-filling;

3) if judges do not come to any firm persuasion about the counterfactual will of the legislator, they ought to decide according to free legal dogmatics and free law ("customary law in its different forms," "nascent law," "desired law," explicit or implicit); finally, failing that;

4) judges ought to *make* the law to be applied to the case at hand, according to their own good legal sentiment (*Rechtsgefühl*), seeing to it in every case that their decision, though necessarily *praeter legem*, not also be *contra legem*.

That interpretive code is in turn an example of a normative free-law conception of adjudication, characterized by *popularity* (judges should give full play to the popular, living free law), *specialization* (judges should reject legal magic and dilettantism, and be learned instead in psychology, history, sociology, and economics), *impartiality* (judges should resort to the relativistic method, as a necessary step in their decision-making), *restoration of the authority of legislation* (by the honest and open recognition of its limits by faithful, scrupulous, responsible judges), and *justice* (judges should provide the most adequate judgment for any case at hand, making a proper use of their freedom, personality, and wisdom) (see Kantorowicz 1962, 36–8).

In a later essay, Kantorowicz makes clear a few points of his free law methodology that are worth mentioning, since they bring to light his teleological-instrumentalist commitment:

1) The most widespread vehicle by which free law connects to formal state law, and indeed combines with it in judicial decision-making, is statutory and case-law *interpretation*. This makes up what Kantorowicz calls *interpretative free law*:

> The bulk of what the continent considers "interpretations" of the codes is *free law*, namely, *desired explicit law* in disguise. The bulk of what in Anglo-Saxon countries is deemed mere application of established case law is again *"free law,"* namely, *desired implicit law* in disguise. The fact that the construction of a statutory rule or the interpretation of a judicial opinion is dubious, is a proof that *a logically stringent decision is impossible*; and the assertion that the case before the court is "similar" to a certain precedent, generally implies *a subjective evaluation* that the differences between the two cases are insignificant and an admission that there is no established rule governing the case in question in its full individuality. So the lawyer is, in fact, always faced with "gaps" in the law. (see Kantorowicz 1928, 698–9; italics added)

2) There are two sorts of gaps: "material gaps" and "textual gaps."

3) Textual gaps are present whenever "an adequate textual expression" of the "purpose" of a formulated rule is lacking;

4) Textual gaps ought to be filled by means of a purposive-consequentialist

> "free interpretation," *i.e.*, an interpretation which, by understanding the law in a broader or in a narrower sense (the broader sense including the process of analogy), *adapts the law to its own*

purpose. This purpose must [ought] *not* [to] be identified with *the subjective intentions* of the legislator [the investigation thereof is doomed to be a "pseudo-historical interpretation"], *nor* with *the interests which are protected by the law* [presumably, at the time of its enactment, from the standpoint of its effects], *nor* with *the abstract principle* governing the respective rule of law. The purpose must [ought to] be found in the *present social effects* of the application of the rule in so far as they are *desirable*, *i.e.*, as they would *justify the making* of that rule *today*. This of course cannot be ascertained without sociological, economic, psychological, etc., reflections and investigations. (Kantorowicz 1928, 699–700; italics added)

5) In dealing with textual gaps, judges ought to proceed according to the method of "juristic relativism,"

where different interpretations of the statute are possible, *all of them*, in so far as they are compatible with the purpose of the statute, *have to be systematically collected* and then alternatively applied: one time, one interpretation and another time, the other interpretation, according as the one or the other allows the realization of the purpose of the statute. *If* this *purpose cannot be ascertained*, then the judicial ideal of the interpreter takes its place. This method alone, although the contrary seems to be true, is capable of *giving a scientific character* to *juristic theories*, of *diminishing the uncertainty of judicial practice*, and of *abolishing its arbitrariness*. (Kantorowicz 1928, 699–700; italics added)

6) Material gaps are present whenever "the rule of law itself is lacking"; they ought to be filled by resorting to the several materials that make up the formal law (state law) and the free law of a society, in keeping with counterfactual hypotheses geared toward desirable social effects and with juristic relativism.

On the whole, Kantorowicz's directives make up an interpretive code whose understanding and application may require a bit of charitable interpretation. But its core is clear. First, value options are widespread and paramount in the law's life: They bear on law's determinacy or indeterminacy, they come into play when establishing the counterfactual intentions of legislators, and they ultimately determine what the purpose of any piece of law is. Second, they cannot be wiped off, being instead part and parcel of law, adjudication, and legal science. Third, what a good prescriptive methodology should aim at is accordingly to make them explicit, bringing them to the fore of public evaluation and criticism. Candour, transparency, and responsibility are the sole remedies reason can suggest against uncertainty, arbitrariness, and partisanship.

22.4. The Jurisprudence of Interests

In the bibliographical appendix to his *The Struggle for Legal Science*, Kantorowicz includes Philip Heck (1858–1943), the leading figure of *Interessenjurisprudenz*, among the jurists who sided with the "free law doctrine." In fact, Heck shares many ideas of the free law movement, such as the wholesale repudiation of *Begriffsjurisprudenz* and considering the social sciences a necessary helpmate to legal science. Nonetheless, Heck claims that his own version of a "jurisprudence of interests in a narrow sense" is theoretically and meth-

odologically sharper than mainstream "Teleological jurisprudence," and also takes a more conservative attitude, as he charges the "so called School of Free Law"—unwarrantly, as far as Ehrlich and Kantorowicz are concerned—with striving "to liberate judges from the fetters of statutory law" (Heck 1948, 35; my translation).[22]

The gist of Heck's jurisprudence of interests may be described, in a nutshell, as follows.

1. *Methodology, not philosophy*. The Jurisprudence of interests claims to be what we would now call a *prescriptive* methodology, "designed to serve the practical ends of law," and aimed at "finding those principles that judges should follow in deciding cases." It is neither a comprehensive "general philosophy" nor a "legal philosophy," though it obviously presupposes one, along the lines of "modern" legal theory.

2. *The law as it is: Causal connection between law and interests.* The paramount notion in the jurisprudence of interests is not *purpose* but, as one would expect, *interests*. This word should be understood "according to its widest connotation," so as to embrace "all things that man holds dear and all ideals which guide man's life" (Heck 1948, 33; my translation).

That is so because, contrary to Jhering's well-known saying, the creator of all law is—Heck claims—not purpose but interests. Law consists of commands. *Begriffsjurisprudenz* claims that commands derive from general, "classificatory" legal concepts ("obligation," "contract," "will," etc.); but this is a mistake, since legal concepts, far from *causing* legal rules to exist, are nothing but "subsequent condensations of legal rules." Indeed, from a causal, genealogical standpoint, the law—as a set of commands and definitions—is properly to be regarded as "the product of interests":

> Each command of the law determines a conflict of interests; it originates from a struggle between opposing interests and represents, as it were, the resultant of these opposing forces. The protection of interests never occurs in a vacuum. It operates in a world full of competing interests, and therefore always works at the expense of some interests. This holds true without exception. (Heck 1948, 35; my translation)

3. *The need for ("the maxim" of) interests-analysis*. The presence, in any society, of competing and conflicting interests is of the utmost importance for legal science and adjudication alike. It suggests why the mainstream teleological-instrumentalist approach taken by Jhering and his free law followers is "crude"; why the focus should be moved away from purpose; and why interests-analysis—that powerful "legal microscope"—should play a pivotal role in legal scholarship and legal practice:

[22] A futher unwarranted charge is made against Hans Kelsen, who would be an "old conceptualist" as regards "part" of his "methodological theory." See Heck 1948, 31; 1932a, 1914, 1932b.

If we confine ourselves to an examination of the *purpose of a law*, we see only the interest that has prevailed. But *the concrete content of the legal rule, the degree to which its purpose is achieved, depends on the weight of those interests that were vanquished* […]. Therefore, Jhering's teleological jurisprudence is not sufficient. It needs to be deepened with the aid of an analysis of interests, or, […] the theory of conflicts. *For each rule of law* [expressing a command], *the conflict of interests which underlies it must be analyzed*. (Heck 1948, 36, 47; my translation and italics added)[23]

4. *The judicial process as it is*. The jurisprudence of concepts sees the judicial process through "the dogma of cognition." It takes a cognitivist view of adjudication, centred on subsumption ("the laws of logic," "the judge […] as an automaton") and "the filling of gaps *by construction* […] or [the] 'method of inversion' […], first distilling a concept out of existing legal rules, and then deriving new rules from this concept" (Heck 1948, 37–8; my translation). It does not pay any attention to the social effects of judicial decisions. In so doing, however, it flies in the face, at once, of both empirical, sound legal theory and the needs of legal practice and social life in general (see Heck 1948, 37–8).

There is a "sham," "crypto-sociology" variant of "conceptualistic reasoning," contemplating the possibility that gap filling by construction may point to a plurality of competing outcomes and prescribing, in such cases, that the "most satisfactory solution from the practical point of view" be preferred. But even that variant—Heck claims—should be rejected, especially for normative reasons: The judge is allowed to provide a *sham* motivation, not "the true reasons of his judgment," depending on his own evaluation of interests; and his "sense of responsibility" is weakened, since he can again pretend his decision to be "Not his own fault, but […] the fault of the concepts."

A wholly new approach has to be adopted instead, following "the modern trend in legal thinking," according to which adjudication cannot be a purely cognitive enterprise, since, among other things, it

is pre-eminently through judicial decisions that law affects human affairs […]. Not until the law has been embodied in a judicial decision does it become *a living reality*. (Heck 1948, 37, 40; my translation)

5. *What judges ought to do*: *Heck's interpretive code*. The kernel of Heck's "methodology," the "principles" judges should follow in properly performing their function, boil down to the following directives.

[23] See also Heck 1948, 47–8, where the connection between interests-analysis and legal scholarship is considered: "The subject of a modern treatise is not a system of legal concepts, with some discussion of their practical application [as in Windscheid's celebrated *Lehrbuch*], but rather life itself, its demands and problems. It is only as a means for the solution of those problems that legal commands, and the value judgments of the legal community which these commands embody, are applied […]. It has been said that the jurisprudence of interests eliminates the necessity of scholarly research in the law. This is a grave error […]. The study of social life and the value ideals to be pursued is an almost infinite task […]. Discussion of definitions, controversies about concepts, and the whole cult of concepts are receding into the background. Factual research and evaluation of social interests take their place" (my translation).

a) *Legality*. Under "the Constitution, the judge is bound to abide by the law." This in turn means that "the judge" ought to "adjust interests, deciding conflicts of interests *in the same way* as the legislator." The legislator's own "evaluation of interests" ought to have "precedence over the individual evaluation of the judge, and is binding on the judge."

b) *Collaboration*. Positive laws are doomed to be "inadequate, incomplete, and sometimes contradictory by comparison with the wealth and variety of actual problems which keep arising in daily life." Accordingly, it is to be presumed that the "modern legislator" *authorizes* ("expects") judges *not* to "obey the law literally," but to apply it "in accordance with the interests involved," to frame "new rules where the law is silent," and even "to correct deficient rules."

The proper institutional function of the judge is neither defer to passive literalism nor "to freely create a new legal order," but is "rather to collaborate, within a given legal order, in the realization of recognized ideals […] the judge [ought] not only [to] apply a particular command, but he [ought to] also protect the totality of interests which the legislator has deemed worthy of protection."

c) *Interests-geared statutory interpretation*. Judges ought to interpret statutory clauses by taking into account the outcome of a legislator-abiding interests-analysis, and decide on the basis of their own evaluation whenever such analysis points to a plurality of competing meanings. The judicial evaluation of competing interests is also in order in cases of express delegation of law making power and legislator's intentional resort to indeterminate expressions and general clauses, like "important ground" and "sufficient basis." In any case, judges ought to take into account not only the several competing interests involved, but also the likely practical effects of each of the alternative readings they deem viable.

d) *Interests-geared gap filling*. The filling of gaps, where, "too, the maxim of analysis of interests […] must apply," should be performed as follows: *First*, judges should "envisage the conflict of interests which underlies the dispute"; *second*, they should "examine whether or not the same conflict of interests underlies other factual situations which have been expressly regulated by legislation," and, if so, apply the express rule to the unregulated case by analogy; and *third*, if interests-analogy is not viable, such that the legal system as a whole appears "entirely lacking," or if "contradictory statutory evaluations," judges should "render the decision he would propose if he were the legislator [by paying attention to interests and the practical effects of each of the viable gap filling ways]. This is the rule […] in the famous Article 1 of the Swiss Civil Code [i]n its substance […] valid for the German judge as well."[24]

[24] All quotations in this part are from Heck 1948, 31, 40–4; my translation and italics added. Art. 1 of the Swiss 1907 Civil Code says that: "The Law must be applied in all cases which come within the letter or the spirit of any of its provisions. Where no provision is applicable, the judge

Interests-geared legality and collaboration are regulative interpretive ideals, setting goals which can only be approximated, never totally attained, if only because of the normally elusive character of the legislator's interests-evaluations. Their carrying out, so far as possible, is committed to judicial—and juristic—allegiance and skills. Here again, as in Kantorowicz, the new methodology sets judicial reasoning in a disenchanted landscape, where correctness ultimately rests on candour, transparency, wisdom, and personal responsibility to a lively, alert juridical public opinion.

From the late 1970s, this point will be taken seriously by Robert Alexy, the leading figure of the so-called standard theory of legal reasoning. He will set forth a code of the rules and forms of practical and legal discourse; he will retrieve Heck's idea of interests-analysis in his "formulas of weight" for the judicial balancing of fundamental rights.[25]

22.5. The Pure Theory of Law

In the same spirit of Kantorowicz's theoretical revolution, the ideas on interpretation entertained by the *Reine Rechtslehre* theorists—notably, by Hans Kelsen (1881–1973) and Adolf Merkl (1890–1970)—represent the most radical attempt to develop a genuine, radically realistic *theory* of interpretation. The other "theorists" of the antiformalist front were in fact, above all, jurists concerned with legal policy issues, committed to promoting some politics of judicial interpretation. That is why their "theories" usually combine a genuinely descriptive and theoretical side with bits of prescriptive methodology, with recipes for legal interpreters—jurists and judges—about what they should do if they are to do their job properly. With Kelsen and Merkl, however, we apparently find ourselves in a totally different world. Here the core and point of the matter is to disclose the nature of the mysterious phenomenon that jurists are used to calling "interpretation," without any bias or prejudice, and to set it in a proper conceptual framework. In a sense, their ideas are Kantorowicz's ideas; but they express them in a clearer way, and, furthermore—what makes a difference worth considering—they tie them up with a brand-new theory about the overall *dynamic character* and *gradual structure* of positive legal orders.

The central ideas of the Pure Theory of legal interpretation may be described as follows.[26]

shall decide according to the existing customary law and, in default thereof, according to the rule which he would lay down if he had himself to act as legislator. Herein he must be guided by approved legal doctrine and case-law." It is perhaps the most celebrated interpretive directive ever enacted, a veritable cult provision of anti-formalist jurists, who saw in it a candid authoritative recognition of formalism's mistakes. See, e.g., Gény 1919, 2, 308–29.

[25] On Alexy's theory of legal reasoning see Section 25.4 in this tome.

[26] Following is a selection of works or passages by Merkl and Kelsen devoted to the Pure Theory of legal interpretation: Merkl 1916, 1918, 1927, 211; Kelsen 1934a, 1934b. chap. 6;

1. *The place of interpretation in the working of positive legal orders*. Positive legal orders are *dynamic* normative orders: They regulate their own production by means of competence norms. Legal orders consequently have a *multilevel structure*: Legal norms sit on different levels, from the highest level of constitutional norms, regulating the production and content of ordinary legislation and general customs, down to executive decrees, local regulations, local customs and statutes, judicial decisions, administrative orders, and contracts and wills. The working of a legal order is tantamount to a very large set of acts of law-creation and law-application. Except for the extreme cases of pure law-creation (the creation of the first historical constitution) and pure law-application (the material execution of judicial and administrative orders), every act of law-creation is at the same time an act of law-application. The creation of a new statute by Parliament is at the same time an application of the relevant constitutional provisions; the creation of a judicial decision is at the same time an application of substantive and procedural norms (e.g., the norms of the codes of civil and criminal procedure). Interpretation is closely connected to law-application: Any act of law-application presupposes an interpretation of the higher norms applied in view of the creation, or production, of some lower norm. Accordingly, interpretation—by legislators, judges, and public officials in general—is the intellectual activity that accompanies "the process of law production, as it proceeds from a higher to a lower level of the *Stufenbau*."

2. *The nature of interpretation by state organs*. From the viewpoint of law-making and law-applying, legal interpretation, be it performed by legislators, judges, or other officials, is an *act of will*, one by which authorized interpreters establish in an authoritative way, at least for the case at hand, the interpretation of the general norms they contextually apply. In that sense, *every* authoritative interpretation, not just those by legislators interpreting their own laws, is *authentic interpretation* ("autentische Interpretation"), which "creates law" ("Sie schafft Recht").

3. *The multiplying effect of interpretive methods*. Legal interpretation is usually justified by appealing to some established interpretive method. Unfortunately, these interpretive methods (including the ones proposed by the free law school and the jurisprudence of interests), far from being a set of convergent selective devices pointing to one interpretive solution ("the true meaning of a statutory clause") for any situation, are instead entropic, meaning-multiplying devices, if only because positive legal orders never regulate their content and hierarchy effectively. The momentous theoretical import of this point receives an unprecedented emphasis in the *Stufenbau* theory and dynamic conception of law. From the dynamic standpoint of law-application (*a*) any general norm whatsoever is not really *one* norm, but a *frame* of several, alternative

1945a, 143–62; 1950, 1957, 2000, 15–6, 209–12, 251–5, 271–80, chap. 8; 1979, chaps. 29, 31, 50 (n. 125, 127, 128, 129), 57, 58 (pars. 3–4), 61 (n. 183).

norms competing for interpreters' selection and (*b*) there is not *one* legal order, but *as many* legal orders as are the alternative outcomes of the possible combinations of viable interpretive methods.

4. *Scientific interpretation*. In legal experiences as we know them, there is room also for genuinely *scientific interpretation* (*erkenntnismäßige Interpretation*). As a genuine "act of knowledge," as a pure and true act of science, however, scientific interpretation cannot go beyond the worthwhile task of identifying the frame of meanings corresponding to each general norm, and lay it down both as an aid to adjudication ("in the service of law-application") and as a vehicle in the technical criticism of legislation and legislative drafting.

5. *The bounds of interpretation*. Authentic interpretation by judges and officials is still to be regarded as *interpretation*, even though its outcome points to a meaning lying outside of the frame identified by scientific interpretation.

6. *Juristic interpretation*. Legal interpretation by legal scholars, whenever it is not confined to scientific interpretation, is an exercise in *legal politics* (*Rechtspolitik*): It is *political interpretation* (*politische Interpretation*), setting forth value-laden, interests-driven proposals about the "proper" judicial reading and application of some law.

7. *The myth of legal gaps*. Contrary to the almost unanimous view of old and new jurists alike, there are no *real* gaps in modern legal orders characterized by specialized judicial bodies having the duty to provide a decision for any case submitted to them (*non liquet-Verbot*). That is so, according to Kelsen, since the legal order *as a whole* can *always* be applied to any case whatsoever, on the basis of the principle that *either* (the judge decides that) the defendant or indicted person has violated a legal duty, and so ought to be convicted or (the judge decides that) he did not violate any legal duty, and so ought to be acquitted. In these terms, the denial of the existence of real gaps, far from conspiring with some cognitivist view of adjudication, is grounded in the ordinary working of legal orders, with their built-in judicial lawmaking (all judicial decisions are not *declarative*, but *constitutive*, in character).

8. *Ideological gaps*. Since there are no real gaps, all the gaps that jurists, judges, and even legislators regard as unavoidable, embarrassing glitches in legal orders are in fact *ideological* gaps: situations where (what is usually regarded as) the plain legal answer to the case at hand is *at odds* with what the judge thinks the law *ought to* be. From this standpoint, gap-filling is always a complex activity by which the judge, far from *filling* an imaginary space left empty by the norms of the legal order, *replaces* the answer provided so far by the legal system with a different and, in his opinion, better one. On this basis, express legislative authorization of judicial lawmaking to fill gaps ("where no express law provides for a case") may be read, Kelsen suggests, as a fictional device by which legislators try to hide from judges that they can *always* make law "as delegated legislators" and "in substitution of the legislator."

9. *The proper connection between gaps and interpretation*. Interpretation is traditionally considered as the means by which gaps in the law are both *discovered* and *fixed*. But that view is wrong. First, judicial interpretation never amounts to *discovery*, to a pure *act of cognition*. Second, the role interpretation can in fact play as regards gaps is exactly the opposite one: Interpretation is in fact a means for *creating* gaps. Third, once so created, gaps cannot be resolved through interpretation; only an act of judicial lawmaking can fix them.

10. *Why jurists like mythology*. All these points are usually overlooked by traditional juristic thinking, since they are eager to uphold the comfortable mythology allowing legal politics to be done, by jurists and judges alike, under the pretence of pure science and value-neutrality.

11. *The pure jurist and normative conflicts (antinomies)*. Legal norms are liable to conflict. Antinomies are a common feature of legal orders. If considered with the cold eye of the pure theory of law, however, such normative conflicts do not have disruptive effects on the working of legal orders, since legal orders usually provide explicit and/or implicit ("tacit") criteria of resolution. As far as conflicts between two norms on the same level of the *Stufenbau* are concerned (e.g., between two statutory norms), *lex posterior*, *lex specialis*, and the default criterion of commitment to judicial discretion usually govern. Likewise, conflicts between norms on different levels of the *Stufenbau* (e.g., between a piece of ordinary legislation and the constitution, between the norms of the civil code and a judicial decision) are resolved by the explicit or tacit enactment of the *lex superior* criterion. The pure jurist, *qua* legal scientist, cannot but bring these criteria to the fore and show their likely working and their limits.[27]

[27] The view that the *lex posterior* criterion is not a "logical principle," whose presence in a legal order is not a matter of positive law, as many traditional jurists maintained, but is instead a principle of positive law, was first advocated by Merkl. For a while, Kelsen regarded the *lex posterior* principle not only as a principle of positive law, but also as an epistemic device in a Kantian constructivist conception of pure legal science, the use of which was to be deemed necessary by the epistemic presupposition of the *Grundnorm* as the scientific ("logical") basis of "a meaningful order" (see Kelsen 1945b, 401–4; see also Kelsen 2000, chap. 5, par. 34; 1979, chap. 57).

Chapter 23

TAKING STOCK OF THE PAST: RHETORIC, TOPICS, HERMENEUTICS

by Pierluigi Chiassoni, Eveline Feteris, and Hanna Maria Kreuzbauer

23.1. Foreword (*by Pierluigi Chiassoni*)

In the second half of the 20th century, a "revolt against formalism" as sketched in the previous section can be distinguished also in the study of legal argumentation. As a reaction to the traditional, formal, logical approach and the emphasis it places on the formal aspects of legal argumentation ("logicism"), various authors proposed a different approach to legal argumentation that emphasizes the content of arguments and the context-dependent aspects of the acceptability of legal argumentation. A common characteristic of the authors that can be regarded as representatives of this approach is that they have used insights from the classical studies of argumentation to develop their theories of legal argumentation and interpretation. Prominent representatives of this approach are Chaïm Perelman, with his new rhetoric, and Theodor Viehweg, with his topics.

Another approach that likewise proceeds by taking stock of the past is legal hermeneutics, represented by such authors as Emilio Betti, Hans-Georg Gadamer, and Joseph Esser.

In what follows, we start with a discussion of Perelman's new rhetoric (Section 23.2). Then we discuss Viehweg's topics (Section 23.3). Finally, an overview of the basic points of hermeneutical theories is provided (Section 23.4).[1]

23.2. The Rediscovery of Rhetoric (*by Eveline Feteris*)

23.2.1. Perelman's New Rhetoric

In his *New Rhetoric*, Chaïm Perelman (1912–1984) introduces a model to describe how arguers try to convince others of the acceptability of their views. Perelman is of the opinion that the logical criterion of formal validity is not an adequate basis for evaluating arguments in everyday language, and he develops an alternative criterion of validity. On his approach, based on insights from classical rhetoric, argumentation is sound if it is acceptable to the *audience* addressed by the arguer. Perelman describes the argumentative techniques a

speaker can use to convince an audience. In *La Nouvelle Rhétorique. Traité de l'Argumentation* (*The New Rhetoric: A Treatise on Argumentation*, Perelman and Olbrechts-Tyteca 1958), he, together with Lucy Olbrechts-Tyteca, describes the *starting points* and *argumentation schemes* that can be effective in defending a standpoint.

According to Perelman, the law is an important example for the new rhetoric. Therefore, he pays special attention to the practice of legal argumentation. In *Logique juridique: Nouvelle Rhétorique* (*Legal Logic: New Rhetoric*, Perelman 1976), he describes the starting points and argumentation schemes used to convince a legal audience.

In the following sections we will explain in more detail how these central topics are specified in Perelman's general and legal argumentation theory. Section 23.2.2 describes Perelman's general argumentation theory. Section 23.2.3 specifies how these ideas of his general theory are applied in his legal argumentation theory.

23.2.2. Perelman's General Argumentation Theory

Perelman opposes the view that factual statements can be assessed as to their acceptability to the view that value judgements cannot. He challenges the view that no rational consensus is possible about the acceptability of value judgements.

Perelman is of the opinion that value judgements play an important role in everyday communication and can be assessed as to their acceptability. Lawyers, for example, seldom give formal proof. Rather, they justify their standpoint by putting forward supporting arguments. According to Perelman, such a justification can be considered rational if the arguer succeeds in gaining acceptance of his standpoint from the audience he addresses.

In Perelman's view, argumentation is always addressed to a certain (real or imaginary) *audience*. The audience may be composed of a concrete group of people, such as the members of a court or a parliamentary committee. If the arguer addresses such a concrete group, which Perelman calls a *particular audience*, the argumentation is aimed at *persuading* this audience. The audience may also be composed of all human beings that are considered reasonable. Argumentation which lays claim to approval of such a *universal audience* is called *convincing*. According to Perelman, argumentation is reasonable if it gains the approval of the universal audience—entirely composed of rational human beings. However, the universal audience must not be seen as a concrete, actually existing group of people. It is a construction of the arguer concerning an idea that rational people would accept in a particular case. Because the conception of an arguer of the universal audience depends on his perception of what is considered generally accepted at a particular moment, the conception of the universal audience always depends on historical, cultural, and social factors.

To gain the approval of an audience an arguer must attune the argumentation to the preferences of the audience. An arguer will have to begin with certain *starting points* which are considered common points of departure. Beginning from such starting points, the arguer can use certain *argumentation schemes* to transfer approval of the starting points to the claim he wants to make. In the *New Rhetoric*, together with Olbrechts-Tyteca, Perelman describes the starting points and argumentation schemes which prove to be successful in gaining the approval of an audience.

23.2.3. Perelman's Legal Argumentation Theory

In his legal argumentation theory, Perelman describes the argumentative techniques that are used in law. Which forms of legal argument are used and what are the specific legal starting points and argumentation schemes? What is a lawyer's audience and which standards of reasonableness are applied?

According to Perelman, the justification of a decision in law is not formal proof. The view that the judge only has to give a formal logical proof in which he subsumes the facts of the case under a general rule is out of date. In modern legal theory, there is a consensus that the decision-making process does not consist solely of an automatic application of the law to the facts. If the meaning of a rule in a concrete case is unclear, the judge must interpret the rule. The choice of a particular interpretation is never compelling but is always based on a weighing of values, a weighing of what is the most fair and legally correct decision.

Because legal decisions are based on choices, the judge must justify the choices by establishing that they are correct and that the decision is right. He must show that the decision is fair and in accordance with valid law. Perelman draws attention to the fact that the judge must show that the choices he has made—and the values he has used to justify his decision—are not based on a subjective choice. He must show that the choice is well-founded and can be justified as intersubjectively acceptable. He must offer reasons for his decision, and, in doing so, he must convince the parties that the decision is not based on an arbitrarily chosen position.

In justifying the decision, various argumentative techniques play a role. By showing that the decision is in accordance with the shared legal starting points and forms of reasoning, the judge can try to gain the approval of the legal audience.

In a legal context, it is important that the arguer, for example the judge, uses starting points that are accepted by the legal audience. To gain approval for his standpoint, he will have to use starting points which are accepted in the legal community.

According to Perelman, *loci* play an important role as starting points in law. To gain the approval of the legal audience, he can use generally accepted legal values which can be considered as *loci*. The advantage of such general values is

that they are mostly vague and can be interpreted in various ways in concrete cases. An example of such a general value is the principle that all individuals are considered to be equal. However, that principle does not prevent one from making a distinction between two categories of persons.

General legal principles play an important role as *loci*. Because there is a certain consensus on general legal principles in postwar continental law, they can be used as common starting points in legal argumentation. Starting from an accepted principle, the judge can try to gain approval for a concrete, but still controversial, standpoint.

The use of general legal principles is often necessary when the judge chooses a certain solution which is fair in the concrete case but cannot be defended on the basis of valid law. By referring to a general legal principle, the judge can show that the decision is in accordance with generally accepted legal starting points.

According to Perelman, there are specific legal argumentation schemes by which to transfer approval of the starting points to the proposed conclusion. To justify a legal decision, it is important that the judge explain why a legal rule has been interpreted in a certain way. Perelman describes the various forms of argument used in interpreting legal rules, which he bases on the list of such forms proposed by Tarello (1972). Tarello distinguishes the following forms of argument: *argumentum a contrario*, *argumentum a simili*, the analogical argument, *argumentum a fortiori*, *argumentum a completudine*, *argumentum a coherentia*, the psychological argument, the teleological argument, the *argumentum ab exemplo*, and the systematic argument.

According to Perelman, the view about the way in which the judge should justify his decision depends on the underlying conception of law. If one starts from a teleological conception of law, an interpretation will be preferred which takes into account the goals of a particular statute. Starting from this conception, the justification focuses on the question of whether the interpretation furthers these goals. If one starts from a functional conception of law, the law is considered to be a means of attaining certain goals intended by the legislator. Starting from this conception, the justification will focus on the considerations which take into account the will of the legislator.

23.3. Arguing by Topics (*by Hanna Maria Kreuzbauer*)

The 20th century's rediscovery of topical legal argumentation and reasoning is mainly the merit of the German legal scholar Theodor Viehweg (1907–1988), who in 1953 published *Topik und Jurisprudenz: Ein Beitrag zur rechtswissenschaftlichen Grundlagenforschung* (Topics and jurisprudence: A contribution to basic research in legal science; Viehweg 1974; for his later works, see Viehweg 1995).[2] In the 1960s and 1970s, Viehweg's book occasioned a heavy dispute

[2] So coincidently the 1950s saw the advent of three major traditions of rhetoric and argu-

about legal reasoning within legal science, but as the English translation was published only in 1993 (cf. Viehweg 1993) this was mainly limited to the German speaking countries.[3] Viehweg's topics is meant to be a revival of classical topics, so it goes without saying that Viehweg extensively refers to Aristotle and Cicero (cf. Aristotle's *Topics* and Cicero's *Topics*), the authors of the most important ancient topics. But he also puts a lot of his own ideas under the classical headline.

As Viehweg writes not only as a philosopher but also as a legal scholar, his sources are not only the works of philosophy but also of ancient legal science, above all Roman civil law with all its application-oriented and pragmatic character.

23.3.1. Theodor Viehweg's Topics

Viehweg formulates his ideas most prominently in the already mentioned 1953 book, *Topik und Jurisprudenz.* Despite its thinness this treatise is no easy text, which is mainly due to the fact that Viehweg discusses his basic ideas on very different places, spread around all over the book and because he remains ambiguous about his understanding of topical reasoning.

Viehweg's attempt to revive topical reasoning is based on three ideas: (1) There are two styles of scientific reasoning, i.e., *topical reasoning* and *deductive-systematic reasoning*[4] (Viehweg 1974, 16), and unlike the latter topical reasoning is problem-oriented thinking (Viehweg 1974, 31), (2) deductive-systematic reasoning is not suitable for legal science, although in his view legal science has tried to adopt this style of reasoning for a long period, and (3) legal reasoning requires a reform that shifts it from deductive-systematic to topical reasoning.

23.3.2. The Two Styles of Reasoning: Topical and Deductive-Systematic Reasoning

Viehweg's first idea shows the very basis of his theory, i.e., the sharp distinction between topical and deductive-systematic reasoning. This is a perspective he adopted from Vico, a famous opponent of René Descartes. Vico consid-

mentation theory, i.e., the new rhetoric, founded by Chaïm Perelman and Lucie Olbrechts-Tyteca (see Perelman and Olbrechts-Tyteca 1958), the model of argument introduced by Steven E. Toulmin (see Toulmin 1958), and topics reinvented by Theodor Viehweg (see Viehweg 1953).

[3] When Viehweg wrote the first edition of his book, the notion "legal argumentation" was not commonly used in German legal terminology, because this concept was popularized not before the 1970s. In these days all phenomena that we call "legal argumentation" today, were subsumed under the notion "legal reasoning." Therefore, anything said about legal reasoning in this context applies to legal argumentation as well.

[4] This is Viehweg's first naming, and since he is not completely consistent on this, we will follow it for the purpose of this text.

ered Descartes as the main inventor of the rationalist method of reasoning (cf. Goldmann 1998, 1282), which he—and following him also Viehweg—regarded as the prototype of deductive-systematic reasoning (cf. Viehweg 1974, 81–94). To understand topical reasoning one must first understand deductive-systematic reasoning as its most important counterpart. For this type of reasoning sometimes also the phrase "*more geometrico*" is used (cf. Viehweg 1974, 17), a concept not very common in our time but perfectly showing the essential idea. Here, Viehweg cites Vico, who writes:

> The starting point [of deductive-systematic reasoning] is a *primum verum*, which cannot be destroyed by any doubt. Then, the further development takes place following the *style of geometry*, i.e., in accordance with the first science based on proving, namely, in chains of inferences (sorites) as long as possible. (Viehweg 1974, 17, my translation and italics added)

This obviously refers to the method of proof used in Euclidian geometry. Euclid built his system of geometry upon five postulates, i.e., axioms that seem to be intuitively evident but remain unproven in fact. All other sentences of his system—the theorems—are derived from these axioms by way of deduction. Consequently, Euclidian geometry can be seen as a system of sentences with a very small stock of preliminary accepted sentences and a huge number of derived sentences, gained by rather long chains of deductive operations. Therefore, Viehweg's name, "deductive-systematic reasoning" (Viehweg 1974, 14; my translation) is quite plausible. Unlike Euclid, who used this method of reasoning for abstract mathematical entities, Descartes applied it to philosophy. In his most famous piece of reasoning the *primum verum*, i.e., his axiomatic basis, is the statement that the self (seen form the perspective of an individual person) exists, which is proven by his famous "Cogito ergo sum." All following insights in this context are derived from this statement by way of deduction.

23.3.3. Legal Reasoning Should Become Topical Reasoning

Viehweg concludes that all concepts and sentences of jurisprudence must be linked to the specific problem and that legal reasoning can be understood only from the direction of the problem (Viehweg 1974, 97). As just mentioned above, Viehweg finds this type of reasoning in the Roman lawyers' non-systematic way of thinking (Viehweg 1974, 51) and he concludes that also contemporary legal reasoning should develop in this direction. Viehweg actually provides some more detailed ideas about how topical reasoning should be implemented in legal science and generally distinguishes between two kinds of topics (Viehweg 1974, 35): first-level topics and second-level topics. The first is topical reasoning based on an implicit leading point of view; the second uses catalogues of such leading points of view. According to Viehweg, lawyers work with second-level topics, i.e., with *tópoi* catalogues (Viehweg 1974, 56), but he himself does neither quote nor provide any example. So this was up to his suc-

cessors, and an important step was the *tópoi* catalogue presented in 1971 by Gerhard Struck. This catalogue consisted of 64 legal *tópoi*, including such diverse items as *Lex posterior derogat legi priori* (The later law supersedes the earlier one: *tópos* 1), *Nemo plus iuris transferre potest quam ipse habet* (No one can transfer to another more rights than he himself possesses: *tópos* 16), purpose (*tópos* 57), interest (*tópos* 58), etc. (see Struck 1971, 20–34).

23.3.4. Critique

Viehweg's idea that legal reasoning should shift towards topical reasoning is not a theoretical statement but rather a scientific program. It caught an extraordinary amount of attention (Larenz 1991, 147) and, as mentioned above, it caused some dispute about legal methodology (for the scientific discussion about Viehweg's topics cf. Horn 1967, Otte 1970). That is because the topical approach was a serious attack on the established standard model of continental legal science, which Bertea also calls "the traditional approach" (Bertea 2004, 467). By "standard model" we mean the still dominant model of legal methodology, used in legal science but also in legal practice, which has been established at least since the early 19th century and basically says (1) that legal reasoning is a style of rational reasoning but not deductive-systematic reasoning in Viehweg's sense, (2) that its most important goal is to figure out the "real" law by interpretation of the code books, (3) that interpretation is the most important method within legal methodology.[5] Therefore the so called *canones* of interpretation have been developed, but beside this also *tópos*-like fundamental principles of law and other figures are in use although only playing an inconsiderable role. Viehweg's model received some critique from the adherents of the standard model. One of the prominent adherents of this is Larenz, who does not generally deny that lawyers might apply topical reasoning (Larenz 1991, 145–55, and in particular 147). But, legal arguments, he argues, stands in a certain (non-problem-oriented but methodological) system, which is completely neglected by topics (see ibid.). So, he concludes that topics as a collection of argumentative tools would not offer any better alternative (see ibid.).

From the perspective of legal argumentation theory also Robert Alexy writes about topics (Alexy 1991, 39–43). Some of his points of criticism concern the vagueness of topics (Alexy 1991, 40) and its incapability to incorporate legal argumentation into the institutional framework of legal dogmatics and the use of precedents (Alexy 1991, 41).

Critique also came from the side of legal logic, most prominently expressed by Ota Weinberger (cf. Weinberger 1973 and Weinberger 1989, 400), who considers the theory of logical structures to be really fundamental for legal meth-

[5] It has to be emphasized that all of these claims are based on scientific fictions.

odology (Weinberger 1973, 34), neither the standard model, nor topics. Weinberger sees logic and topics not as conflicting but complementary (Weinberger 1973, 34). His main critique on Viehweg's topics is that topics does not provide any guidance for selecting the relevant *tópoi* out of all possible *tópoi* (Weinberger 1989, 400). The essence of this critique is that topical reasoning is not sufficiently systematic, along the same line of the just mentioned critique by Larenz.

23.3.5. Conclusion

Viehweg's topics not only influenced continental legal methodology but it also played an important role in the development of legal rhetoric in Germany. As his successors one may name scholars like Ottmar Ballweg, Hubert Rodingen, Katharina von Schlieffen, Thomas-Michael Seibert, and Waldemar Schreckenberger (cf. von Schlieffen 2007, 206–12). Viehweg was probably (but also trivially) right in the diagnosis, that legal reasoning includes an essential part of problem-oriented reasoning and cannot be systematized like some fields of physics, but not in the therapy, because he himself was not able to offer any better solution. As his opponents rightly pointed out, that is because topical reasoning in Viehweg's sense leads to a completely unsystematic play with equally relevant *tópoi*, and conflicts between arguments based on such *tópoi* are almost insolvable. So, if legal reasoning were but based on topics, it would get vaguer and the predictability of legal decisions would decrease. Since legal logic, which provides precision at the cost of an extensive increase of complexity, offers no alternative either, the standard model is still in use. Consequently, Viehweg's reform plan has to be counted as a failure.

Nevertheless, Viehweg's critique of the standard model was the first, the most radical and the most the influential one, so far as German 1950s legal culture is concerned. Due to his work the standard model was seen differently and this gave rise to an increased scientific interest in the linguistic, semiotic and rhetorical aspects of legal reasoning, a development that would have been unthinkable without Viehweg's contribution.

23.4. Legal Interpretation and Hermeneutics (*by Pierluigi Chiassoni*)

It seems useful distinguishing between hermeneutics as a social phenomenon, hermeneutics as a methodology, and hermeneutics as philosophy.

As a very widespread *social phenomenon*, *hermeneutics* (interpretation) consists of a variety of linguistic performances: a variety of acts performed *with* (some) language and usually *in relation to* language, including such things as expressing someone else's hitherto unarticulated thoughts, will, desires, emotions, etc.; translating from one language to another; translating notes into sounds, scripts into plays; bringing to the fore, explaining, and making understandable the hidden, deep, meanings of an obscure, or only apparently plain, text; understanding words, texts, acts, and pieces of human communication in

general; unveiling the real meanings of words and deeds to their very authors, making them aware of them; etc.

As a *methodology*, *hermeneutics* is tantamount to *hermeneutiké téchne*, *ars interpretationis*, *Kunst der Interpretation*, the *art of interpretation*; in its central meaning, it consists in an inquiry on the proper tools needed, either in general or, more often, in some specific field of practice or learning, in order to play some interpretation game correctly, be it the game of expressing someone else's thoughts, will, or desires, or the game of giving *names* to things and thoughts (as in the Aristotelian treatise *Perí hermenéia* [On interpretation]), or the game of explaining the meaning of some obscure text, or the game of ascribing meanings to authoritative legal or religious texts; etc.

Finally, as *philosophy*, *hermeneutics* is tantamount to the philosophical views, developed in the 20th century from Heidegger's 1927 *Sein und Zeit* (*Being and Time*) onwards, according to which views the multifarious, universal, social phenomenon of hermeneutics (interpretation), with its core of understanding and explication, is considered a paramount feature of the human condition ("examination," "hearing," and "answering" being the ontological key-notes of humankind), and perhaps even *the* fundamental issue philosophy should deal with (see Ferraris 1988, 1999).

From the late 1940s on, the methodological and philosophical relevance of hermeneutics (as the widespread social phenomenon of interpretation) afforded the possibility for pathbreaking double-crossings.

On the one hand, some jurists and legal philosophers who were investigating legal interpretation deemed it important to look for a general hermeneutical philosophy that would provide the foundations for their local theories and methodologies.

On the other hand, some philosophers—notably, Hans-Georg Gadamer and Paul Ricoeur—deemed it important to take legal interpretation into account as a source of evidence supporting their philosophical hermeneutics.

In the following sections, only a few pages from that complex history will be recounted.

23.4.1. The Legal Hermeneutics of Emilio Betti

Emilio Betti (1890–1968) is one of the leading figures in legal hermeneutics. In fact, as a jurist deeply learned in the civilian tradition, he did not just go into philosophy looking for the foundations of his own legal methodology; instead, he built up a general philosophy of interpretation (*allgemeine Auslegungslehre*) of his own—starting from the pre-Heideggerian hermeneutical thought of scholars like Friedrich Schleiermacher and Wilhelm Dilthey—where legal interpretation was assigned a well-carved pigeonhole.[6]

[6] The sources of Betti's hermeutics are actually broader, including the bulk of 19th-century

The basic points of Betti's hermeneutics are as follows (see Betti 1971; 1955, esp. chaps. 1–3, 8; 1959; 1961; 1965).

1. *Notion*. *Interpretation*, whichever field that activity is being performed in, consists in *understanding* (*intendere*) the *meaning* of the *representative forms* (*forme rappresentative*, *forme sensibili*) in which somebody else's "mind" (*spirito*, *spiritualità*) has been "objectified" in order to communicate with other "minds." In semiotic terms, Betti adopts a *triadic*, *communicative* model of interpretation understood as a "process" that comes into being in situations structurally characterized by the presence of *sender* ("objectified sense and spirit"), *message* (representative form), *addressee* ("interpreting spirit"):

> At one end of the process, there is the living and thinking spirit of the interpreter; at the other end, there is a spirituality that has objectified itself into representative forms. These two terms do not come immediately into touch with each other; rather, they meet through the middleman of those representative forms in which the spirituality [of the author] stands against the interpreting subject as something that is *other than* and *independent* from the latter, as an *irremovable objectivity*. (Betti 1965, 239; my translation)

The interpretive process is furthermore a *dialectical process* characterized by the structural *opposition* ("antinomy") between "(postulated) objectivity" and "(unavoidable) subjectivity," an opposition to be dealt with, and overcome by, proper interpretive canons, as we shall see in a moment.

2. *Kinds*. There are three different "kinds" of interpretation:

a) *purely recognitory interpretation*, or interpretation with a "purely recognitory function," the goal of which is "pure understanding," understanding for understanding's sake;

b) *reproductive interpretation*, or interpretation with a "reproductive or representative function," the goal of which is "making" somebody else "understand";

c) *normative interpretation*, or interpretation with a "normative" or "directive" function," the goal of which lies in "understanding in order to act," understanding "in view of the aim of regulating behaviour (*l'agire*) on the basis of maxims derived from norms or dogmas, from moral evaluations or psychological situations to be taken into account" (Betti 1955, vol. 2, 790; my translation).

Philology and history usually proceed by means of purely recognitory interpretation. Translations, concert halls, and theatres are all places where reproductive or representative interpretation is performed. Law and religion, as well as legal science and theology, are the areas where normative interpretation is paramount.

3. *Epistemic nature*. Whatever the goal, interpretation is always an *epistemic* process: It is a form of *knowledge*—along with logical inference and

Continental philosophy and epistemology, with particular attention paid to the philosophy and methodology of the moral sciences (*Geisteswissenschaften*) and social sciences.

causal explanation—by means of which interpreters get to *know* the meaning of some representative, sensible form. Accordingly, the view of those legal theorists who, like Kelsen and Merkl, claim interpretation to be an *act of will* (when performed by judges and legal authorities, and also by jurists stepping outside the frame of scientific interpretation: See Section 22.5 in this tome) is to be rejected, since it overlooks the fact that, even in those cases, interpretation is still at bottom a process of cognition—an exercise in retrieval, recognition, and reconstruction—where different "theoretical moments" combine: the "philological moment," concerning the "reconstruction" of "the grammatical and logical nexus" of the interpreted "discourse"; the "critical moment," concerning the elimination of any apparent "inconsistency, incoherence, and contradiction," on the basis of what we would now call the principle of charitable interpretation; the "psychological moment," where the interpreter "moves into the spirit" of the person who created the representative form, in order to "recognise" the acts and thought processes behind it; the "technical moment," concerning the ascertainment of those "ideal instances and powers" which dominated, albeit unconsciously, in the mind of the authors, and which the authors served with their inventive, speculative, constructive activity, in order to contribute to the solution of some "problem" in those instances and powers posed in a given field of learning or practice. The psychological and technical moments in turn confer on the process of interpretation a Janus-like structure: For it should consider its object both retrospectively (as a past experience) and prospectively (as a ring in an ongoing chain of cultural events) (see Betti 1955, chaps. 2, 9).

4. *The standard of correctness*. The standard of epistemic correctness of any piece of interpretive output may be termed *procedural*: It is a matter of *method*, depending on the proper play of the proper interpretive "canons"—which, by the way, is never an automatic, slot-machine process, but always requires interpreter's commitment and effort (the deeper and stronger, the better).

5. *The four fundamental canons*. Identifying the proper interpretive canons is the task of a branch of inquiry in the general theory of interpretation called *hermeneutical deontology* or *hermeneutical methodology*. Taking into account the nature of interpretation as characterized above and its practice, hermeneutical methodology "discovers" four "fundamental canons," which are universal since they hold, and should hold, for any kind of interpretation whatsoever, including legal interpretation: (*a*) the canon of "autonomy and [the] immanent character of the hermeneutic criterion"; (*b*) the canon of "totality and consistency of hermeneutic consideration"; (*c*) the canon of "actuality of the understanding"; and (*d*) the canon of "adequacy of the understanding" or "correspondence of senses and hermeneutical congeniality" (Betti 1955, chap. 9; 1971). The first two canons are *objective*: They pertain to the "object" of interpretation, to what is being interpreted, as well as to the representative forms and their authors. Contrariwise, the latter two canons are *subjective*: They per-

tain to the interpreting "subjects," with the goal of ensuring their "efficient collaboration" in the enterprise.

Autonomy. The first canon prescribes respect for the authors' own mind, spirit, meaning, and purpose that are behind the representative forms, read in such a way as to avoid reading extraneous meanings into them. It is expressed by the saying *Sensus non est inferendus sed efferendus* (we might say "Meaning should not be *up*loaded, but *down*loaded"). It is mirrored by topical distinctions between letter and spirit (*litera enim occidit, spiritus autem vivificat*), expression and will (*vox dicentis* vs. *mens dicentis*), words and energetic meaning-content (*verba* vs. *vis ac potestas*), and words and purposeful thought (*verba* vs. *sententia*), where the latter term should always be given precedence whenever it should find itself at odds with the former. It bears pointing out that respect for author's mind also requires abiding by the canons of interpretation ("criterion"), which is "immanent" in any representative form coming from an author's spirit.

Totality. The second canon, well-known to jurists since the time of Celsus, who worded it for eternity ("*Incivile est, nisi tota lege perspecta, una aliqua particula eius proposita iudicare vel respondere*": "It is against the civil law, without having considered the whole of a law, to adjudicate or counsel only on the basis of some part of it"), prescribes that any representative form be interpreted in a *systematic way*, bringing it back, and tying it, to its several *contexts* as a part, or element, of such unitary wholes. For instance, any statutory clause—besides being itself a micro-system where each word should be read in light of the whole sentence, and viceversa—should be interpreted in light of such contexts as (*a*) the whole legal text it belongs to, (*b*) the system of the language in which it was formulated, (*c*) the intention of its author (in the objective sense we shall see in a moment), (*d*) the system of legal norms as a whole, or any relevant part thereof, (*e*) the set of practical problems and goals it may be regarded as originally dealing with, etc. The canon of totality may be expressed by the following motto: The unity of the whole should be understood by means of its single component parts and, reciprocally, the sense of each of its component parts should be understood as a function of the unity of the whole. The canon may also be called the *principle of hermeneutical reciprocity*, or *principle of reciprocal illumination*, since it mirrors the idea, brought to the fore by Schleiermacher, of a "circle of hermeneutical reciprocity."

Actuality. The third canon requires interpreters to be aware that they understand the meaning of representative forms through their own, present conceptual framework, and on the basis of their own collaborative attitude and "noetic" interest. There is no "naked objectivity" simply to be picked up from the ground; no objective meaning that representative forms simply convey to interpreters, in a passive and mechanical way, like transferring a liquid from one vessel to another. It is Betti's claim that by bringing to the fore the *actuality* canon, or, as we might also say, the *self-awareness* canon,

we do not mean to overlook the autonomy, historicality, and otherness of the object of interpretation as regards the subject […]. It is just a matter of recognizing the *spontaneity* of the interpreting subject, his historicality […], his spiritual totality […], being well aware of the essential *contribution* which the *living spirituality* and the *mental categories* of the interpreting subject do, and should, bring to the interpretive process. (Betti 1955, vol. 1, 317; my translation and italics added)

Adequacy. The fourth, and last, canon—*adequacy of understanding*, *proper hermeneutical correspondence or consonance*—prescribes that the unavoidable spontaneity of the interpreting subject should never "supersede, or impose itself from the outside on, the object of interpretation," for this would undermine its autonomy and "the congenial assimilation of the object on the part of the subject" (Betti 1955, vol. 1, 317ff.; my translation). Accordingly, interpreters ought to make an effort to bring "their own living actuality to an intimate adherence to, and harmony with, the message […] coming from the object, in such a way that both vibrate in perfect *unison*." Open-mindedness, the ability to dominate one's prejudices, humility, abnegation, and a fraternal and congenial disposition to collaborate are all among the basic virtues interpreters should practice in performing their complex and delicate task (see Betti 1955, vol. 1, 317ff.).[7]

6. *Interpretation and integration*. Schleiermacher maintained that interpretation should be conceived as a *two-step* process: *First*, interpreters should come to understand an object *no less than* its author did; *second*, interpreters should come to understand that object *better than* its author did. The latter step Betti calls *hermeneutical integration*, whose necessity and legitimacy would come from the fact that the authors of representative forms usually lack a full and clear awareness of their meanings. In such very common cases, interpreters should step in:

Interpretation is here called to the task of making explicit what was not [explicitly] said but only meant or understood to be implicit, explaining and completing the expressions which have been left fragmentary, gappy, or incomplete [by its authors]; casting light on the motives which were left in the shadow or depicted by a few passages only; developing the discourse or work according to its logical and stylistic coherence; realizing what the law of formation was which the genetic process obeyed, reconstructing its connexions and concatenations: [This is the task] of becoming aware […] of the spiritual totality in which the work was generated and where it finds its historical setting. Now, such a hermeneutical integration has the effect of making the interpreter's understanding more powerful, and providing it with a degree of depth and awareness the author himself could not have reached, given his historical situation and perspective, as well as the limited horizon of interests by which he was moved. (Betti 1955, vol. 1, 338; my translation)

A few points are worth stressing before we move on. First, Betti himself seems to be aware that the epistemic, cognitive nature of the interpretive process is,

[7] And quoting Schleiermacher: "Everybody should be understood according to *his own* thoughts. If that would be unworthwhile, then there would be no sense in dealing with the hermeneutical problem" (Betti 1955, vol. 1, 325; my translation).

at most, a regulative ideal working as an epistemic fiction. Interpreters should proceed *as if* their activity consisted in recognizing and reconstructing ("postulated") objectified meanings. Interpreters should as far as possible abide by the adequacy canon. Second, and unfortunately, the four canons do not seem able to ensure the methodological guidance needed even only to come close to the regulative ideal. They are phrased in such generic, elusive, and metaphorical terms, their interplay is amenable to such a wide variety of competing combinations of more specific directives and interpretive resources that the operative instructions one may pull out of them seem to boil down to an invitation to be honest, careful, reflective interpreters. However, the very standards of honesty, carefulness, and reflection, except for the extreme cases of open, Humpty-Dumpty-style interpretive despotism, are operatively misty, since no bright line may be identified between compliance and violation of the fundamental canons. This I take to be a very serious charge for a methodology purporting to be *prescriptive*. Its import, however, goes beyond ineffective prescription, for it also casts doubt on the theoretical ground of Betti's hermeneutics, suggesting that a different view of the notion of legal interpretation is on the whole preferable. This view gives up the triadic communication model, focussing instead on the *dual* relationship between representative forms and interpreters: Interpretation is, at bottom, a *two*-legged game; furthermore, the *will*-dimension of interpretation is here fully and openly recognized, and any attempt at depicting it in terms of cognition, though in more sophisticated ways, is definitively rejected. This view, which was anticipated by the disenchanted *Wiener* theorists (see Section 22.5 in this tome), will be retrieved and strengthened by the realist side of analytical theories of interpretation (see Sections 24.2 and 24.4 in this tome).

7. *Legal interpretation*. Turning to law, Betti sets forth a methodology where he combines his hermeneutical outlook with ideas from Savigny (see Section 21.3 in this tome) with the jurisprudence of interests (see Section 22.4 in this tome). Legal interpretation is defined as

> an activity aimed at recognizing and reconstructing the meaning to be ascribed, within a legal order, to representative forms which are either the sources of legal evaluations [e.g., statutes, decrees, executive orders], or the matter of such evaluations [e.g., contracts, wills, marriages]. (Betti 1971, 91; my translation; cf. also Betti 1955, vol. 2, 801–2)

It should be conceived, and performed, as a *normative*, *neutral*, *evolutionary integrative* activity geared toward social interests.

For expository purposes, these features may be regarded as casting light on, and corresponding to, as many *principles* in Betti's interpretive code.

The principle of weak normativity. Interpretation should establish which are the proper (right, correct) legal norms expressed by a given legal source (confining the discussion to this side of the issue). In so doing, it is to be regarded as *lawmaking*, in the weak, craftsman-like, and Kantian constructivist sense

of what might be termed *nomopoiesis*. It is not—or at least not necessarily—also *nomothésis*, i.e., the authoritative production of generally binding norms, which is a purely contingent feature, depending on each legal order's system of legal sources.

The principle of hermeneutical neutrality. The nomopoietic function of legal interpretation should be performed according to the *principle of hermeneutical neutrality*, which is a specification for law of the autonomy-of-understanding canon. Interpreters ought not to resort to

> metajuridical instances, [be they] ethical, religious, social, or economic, according to his personal preferences, but ought to *keep to the normative evaluations* which determine the positive legal regulation of human transactions and are *immanent in the legal order*. (Betti 1955, vol. 2, 795; my translation and italics added)

The principle of evolutionary integration. Legal interpretation, as a kind of normative interpretation, should be not only recognitory and reproductive, but also an activity that continuously updates by way of an *evolutionary integration* of the original meaning of norm-formulations, which surely should always be retrieved and recognized in any case:

> In order to be effectively implemented as to the behaviour it means to regulate, any piece of legislation needs to undergo operations—like adaptation, adequation, and complementary integration and development—which, in a continuous renewal, prevent the norm from turning into a dead letter, and keep it alive and in force in the legal order. (Betti 1955, vol. 2, 795; my translation)

In such a way, legal interpretation performs "the function of keeping in *perennial efficiency* as to the *life* of a society the norms, precepts, and normative evaluations which are destined to regulate it and provide it with orientation" (see Betti 1955, vol. 2, 803; my translation and italics added).

To keep within the limits set by the principles of hermeneutical neutrality and weak normativity, however, evolutionary integration and updating should be performed under a (presumed) double constraint: (*a*) the constraint of *systematic interpretation*, i.e., in light of the whole legal system to which the updated norm-formulation belongs, to be regarded, following Savigny (see Section 21.3 in this tome), as a "productive concatenation" and an "organic totality"; (*b*) the constraint of *consequentialist interpretation*, i.e., taking into account the likely "reactions and practical effects" of interpretive outputs (see Betti 1955, vol. 2, 803–4, 806, 817).

The principle of interests-identification. Following Heck, Betti sees the law's basic function as that of providing determinations for conflicts among the interests present in a society, so as to make social life possible and worthwhile. From this standpoint, legislation should be regarded as a device for the resolution of social conflicts on the basis of legislative evaluations and balancings. This view comes immediately to bear on statutory interpretation, which should be conceived as a two-step process. In the first step, statutory interpretation is

historical interpretation (sociological, historico-teleological): It should identify the conflicts of interests and the evaluative criteria by which to resolve them in light of the original sense of the norm-formulation; in the second step, it is a piece of *evolutionary, social interpretation*, since it should identify which conflicts of interests the norm-formulation is to be taken to consider *now*, and how it evaluates and resolves those conflicts (Betti 1955, vol. 2, 819ff.). The latter step, in keeping with the idea of interpretation as a *knowing* activity, is to be performed as a "complementary operation, carrying on with the process of norm-production [*nomogenesi*], subject to previously identified legislative evaluations" (ibid., vol. 2, 824; my translation).

In such a process, *legislative intent* should be considered in a totally *de-psychologized* way: not as "a fiction bringing to life some myth or psychological phantom," but rather as tantamount to "the practical problem to be solved and to those typical interests of the community that get their protection from legislative resolution" (Betti 1955, vol. 2, 824; my translation). By this token, however, legislative intent collapses into the *ratio iuris* of the legislative norm-formulation. Indeed, this is "the original evaluation that is immanent and latent in the letter of the law," liable to *modifications* as time goes by, in the way of *expansion* (embracing "further categories of interests beyond the ones originally considered"), *restriction*, or even complete *annihilation* and *replacement*, due to supervening social changes or new directions taken by the legal order. Starting from the properly identified *ratio iuris*, Betti claims, "it is lawful to proceed to an adaptation and transposition of the legal text in the lively actuality, and to properly [*giustamente*] balance the static interest in stability, conservation, and certainty with the dynamic need for renewal in the way of social evolution" (ibid., vol. 2, 818–9, 824–5, 833; my translation).

In fact, what the "normative power of legislation," i.e., the power of historical, flesh-and-blood legislators, can fully "pervade and grasp" is just the *letter* of the law; but that is only an element in the perennial, non-psychological, socially objective, organicistic, holistic, evolutionary spirit of the law.

8. *Legal gaps*. Legal positivists are used to assuming that legal orders are *complete* ("logically closed") and *consistent* normative systems. But, Betti claims, they are wrong. A careful historical and sociological inquiry suggests that legal orders should properly be regarded as characterized by a *single* fundamental principle. This is the principle of (dynamic) totality (coherence, consistency). Completeness, from the standpoint of that principle, can only be a regulative ideal, "an ideal goal."

There can be three basic kinds of gaps in a law: prediction gaps, evaluation gaps, and collision gaps. *Prediction gaps* (*lacune di previsione*) exist whenever new cases come up that are partly or totally unregulated. *Evaluation gaps* (*lacune di valutazione*) are instead due to the inadequacy of past, express evaluations of conflicts of interests. *Collision gaps* (*lacune di collisione*) come out whenever there is a conflict between incompatible diachronic legislative evaluations.

Collision gaps (antinomies, normative conflicts, as we could also say) should be filled by applying the principle of totality and its traditional specifications: *lex posterior*, *lex specialis*, *lex posterior generalis non derogat priori speciali*, *cessante ratione legis cessat ipsa lex*, etc. Evaluation gaps should be filled, again, by the principle of totality as a tool of corrective (re)interpretation. Prediction gaps should be filled, whenever *a contrario* reasoning seems at odds with the law, by means of *analogy* (*analogia legis*) or, failing that, by appealing to the *general principles of law* (*analogia iuris*), and, more specifically, to their typical "*excess of deontological or axiological content*," to their "*expansive* virtue or force, which is not logical or dogmatic in nature, but rather evaluative and axiological," not "a force of "truth" and theoretical reason, but "[a force] of ethical values and evaluations, gradually maturing and becoming established in relation to contingent historical situations" (Betti 1955, vol. 2, 831ff., 841, 844, 850; my translation).

Due to the evolutionary and integrative nature of interpretation, there is no difference in kind, according to Betti, between interpretation and the filling up of prediction gaps (integration proper): They are both epistemic processes, by means of which interpreters come to know either the correct meaning of a norm-formulation or the correct way of filling a gap. As to the latter activity, updating an old view of the historical school of law, Betti vindicates the epistemological virtue of legal science ("theoretical jurisprudence") and adjudication ("practical jurisprudence"), for they would provide a machinery of collective, public, monitorable discovery of the general legal principles "immanent in the legal order" and the ethical-social values they presuppose and instantiate (see Betti 1955, vol. 2, 854ff.).

23.4.2. Betti vs. Gadamer

As I mentioned earlier, the roots of Betti's hermeneutics are to be found in pre-Heideggerian hermeneutics, historicism, and philosophy. This heritage Betti proudly vindicates both against Heidegger himself ("*maestro dell'arzigogolo e dell'espressione ermetica*" ["master of pointless embellishing and hermetic expression"]: Betti 1955, vol. 1, 243) and against Hans Georg Gadamer, the "classical Heidelberg philologist" and Heideggerian existentialist, universally recognized as the father of the new "philosophical hermeneutics." In 1960, Gadamer published *Wahrheit und Methode* (*Truth and Method*: Gadamer 1960), the manifesto of new hermeneutics. In 1961, Betti wrote a critical review of it: *L'ermeneutica storica e la storicità dell'intendere* (Historical hermeneutics and the historical character of understanding: Betti 1961, see in particular 3, 13ff.). Gadamer replied to Betti in the same year: *Hermeneutik und Historismus* (Hermeneutics and historicism: Gadamer 1961). The basic points of the Betti-Gadamer dispute, as far as they are relevant to a survey of contemporary legal methodologies, may be summed up as follows.

Gadamer claims his philosophical hermeneutics to be a (descriptive) phenomenology of (legal) interpretation, aimed at "the *recognition* of *what is*" (Betti 1961, 3). Now, the "what is" of (legal) interpretation—which Gadamer regards reductively as basically concerned with the application of legal norms to individual cases ("The jurist grasps the meaning of a law on the basis of a given specific case, and in view of it": Betti 1961, 13; my translation)—amounts to the following: (*a*) The practice of (legal) interpretation stresses that everything in it turns on the *historicality of the understanding*—every understanding is determined by the interpreters' own historical conditions, by the historical tradition which they necessarily belong to, and by which they are necessarily affected; (*b*) interpretation is the circular, part-whole process by which interpreters find out which of their initial *Vorurteile* (prejudices)—sense-expectations, or sense-anticipations about the proper meaning of a text—are sound ("true") and which ones are not ("false"); (*c*) the basic interpretive criterion that is, and may be, applied to that end is *anticipation of perfection* (*Vorgriff der Vollkommenheit*), which apparently corresponds to the presumption of sound and reasonable meaning-content, a criterion that in the analytical tradition goes by the name of the principle of *charitable interpretation*; (*d*) (legal) interpretation is a form of *knowledge* ("Even in his case [of a judge], his understanding and interpreting is tantamount to his knowing a meaning and recognizing its validity": Betti 1961, 13–4; my translation), but such knowledge is basically a matter of what might be called intuition within the limits and data offered by the relevant tradition.

Betti regards Gadamer's hermeneutics as heresy, since by its over-insistence on the "historicality" of interpretation, it would undermine "the objectivity of those results which can be achieved by following" the four fundamental canons of "historical hermeneutics."

Betti's criticism is off the mark, insofar as Gadamer sets forth a purportedly hermeneutical *description* of the interpretive process, while Betti (is primarily interested in and) sets forth a *prescriptive* legal methodology. Nonetheless, Betti's concerns are understandable, for Gadamer's view seems to suggest that, among Betti's four fundamental interpretive canons, the paramount one, the one that is likely to be truly effective, is something like the canon of the actuality of understanding.

If looked at through the cold eye of a lawyer disenchanted by over fifty years of anti-formalism (see Sections 22.2 through 22.5 in this tome), the Betti-Gadamer controversy reveals the overall limits of the two hermeneutical approaches to *legal* interpretation: on the one hand, their being affected by wishful thinking in their vindication of interpretive cognitivism, though under the banner of an "anti-intellectualistic," constructivist epistemology (Betti); on the other hand, their being rather shallow on the whole, their concerning at most, and unwarily, the structure of the interpretive process as a psychological, intellectual activity, their taking interpretive cognitivism for granted (Gadamer).

23.4.3. Esser and the German Hermeneutical Movement

Gadamer's ideas contributed to the development of an hermeneutical approach to interpretation in German legal culture. Betti dressed up interpretive cognitivism with an hermeneutical methodology presented as successful in ensuring the objectivity, autonomy, and adequacy of legal interpretation. German hermeneutical legal theorists, by contrast, resorted to Gadamer's view to build a theory of the structure of the interpretive process more in line with interpretive noncognitivism. Josef Esser (1910–1999) paved the way. Arthur Kaufmann (1923–2001) is one of the leading figures. Their basic ideas on legal interpretation will be concisely outlined below.

In his seminal 1972 book *Vorverständnis und Methodenwahl in der Rechtsfindung* (Pre-understanding and the choice of method in law-finding: Esser 1972), Josef Esser forcefully denounced the failure of traditional legal methodology and legal dogmatics, satisfied with canons and construction utterly detached from the reality, and needs, of the practice of interpretation, application, and law-finding. He claimed that the hermeneutical standpoint would provide the theoretical ground needed for a new foundation of legal methodology, laying open the unavoidable dimension of judicial discretion. He worked out a theory of the *structure* of the interpretive process as an intellectual process in the mind of judges and jurists, centred on *pre-understanding* and *hermeneutical circles*.

Pre-understanding is the determinant factor in interpretation. It depends on *legal education* ("conceptual categories" and other notions within the legal tradition), *linguistic knowledge and know-how* (as to both ordinary and technical language), and *social and judicial ideologies* (values and evaluations). It leads to the pre-identification of the optimal solution for the case at hand in terms of its social and moral correctness: In technical terms, it leads to the formulation of *sense-anticipations* or *sense-expectations* about the meaning of the legal source to be interpreted. Interpretive canons come in, in the psychological process of interpretation, right at this moment—*after* some sense-anticipation has been laid down, and in order to test its arguability, reasonableness, and argumentative plausibility, not "in theory," but in terms of the probability of its gaining the consent of the relevant interpretive community. Interpretive canons are put to work, at this stage, within three different but related *hermeneutical circles*: the anticipated-sense/norm-formulation circle (where canons like literal interpretation and legislative intent are usually employed), the legal-norm/legal-system circle (where systematic canons are in order), and the legal-norm/individual-case circle (where equity and substantive justice canons are usually in order).

Arthur Kaufmann put Esser's ideas in a clearer and sounder form.

1. Hermeneutics is *not* a *methodology* but a *philosophy* of legal interpretation.

2. It is, more precisely, a "transcendental philosophy," setting out the conditions that make legal interpretation possible.

3. These conditions boil down to the *pre-understanding* factor introduced by Josef Esser on the basis of Gadamer's philosophical hermeneutics, which amounts to the whole, dynamic, tradition-dependent set of beliefs, attitudes, preferences, ideologies, commitments, etc., making up each interpreter's *personality* and bearing on the way he approaches legal sources to extracting from them the solution to the practical problem at hand.

4. Objectivist conceptions of legal knowledge, claiming a clear-cut subject-object divide affording the possibility of objective interpretive knowledge, are to be rejected as untrue to facts.

5. Every human society is a universe of co-existing and conflicting agents, where the law cannot be anything but an "open system," made not by *objective norms* existing out there, but rather by *intersubjective relations*.

6. Consequently, the central problem for legal interpretation is the problem of *argumentation* and *justification*. But this is a problem for juristic logic and rhetoric, provided one is aware that "legal method" is "irrational, subjective, unscientific" ("not strictly rational, exact, and determinate"), that the only boundaries are the flexible ones provided by "tradition" ("the common ground of the public world in which we find ourselves, of the ensured endurance of public institutions in virtue of which we live": Kaufmann 2007, 106; my translation):

> Only when the interpreter, carrying with him the whole tradition, participates in the horizon of understanding, will he be able to argumentatively ground the interpretive output he had tentatively anticipated (the "hermeneutical circle" or "spiral"). Hermeneutics is not a theory of [legal] argumentation, but it needs one. (Kaufmann 2007, 94; my translation)

In summary, then, "instead of pretending to an ambitious and fictitious objectivity, "the hermeneutical standpoint"contents itself with an honest intersubjectivity" (Kaufmann 2007, 106; my translation).

7. The "principle of honest intersubjectivity" (as we are calling it) should also characterize an hermeneutically inspired *prescriptive methodology* according to which (*a*) statutory interpretation (text-oriented interpretation) and the qualification of individual facts (fact-oriented interpretation) should always be performed *in a related way*, as suggested by the hermeneutical circles, and considering "facts" and "norms" as "brute materials" (Kaufmann 2007, 104; my translation) and (*b*) the judicial justification of interpretive decisions should always avoid any pretense of holding itself out as value-neutral, purely objective, knowledge (see Kaufmann 1975, 1993, 2007).

Chapter 24

THE AGE OF ANALYSIS: LOGICAL EMPIRICISM, ORDINARY LANGUAGE, AND THE SIMPLE TRUTH OF THE MATTER

by Pierluigi Chiassoni

24.1. Foreword

The Age of Analysis, from the 1950s onward, is characterized by theories of legal interpretation and argumentation in which some variety of analytical philosophy is employed to find and develop tools for properly performing philosophical inquiries on those subjects.

Among the "dogmas" which characterize analytical approaches, the following are usually mentioned: (*a*) the pragmatic and logical distinction between descriptive and prescriptive (evaluative, normative) discourse, between is and ought, and what is called Hume's Law; (*b*) the idea of language levels and the language/meta-language distinction; (*c*) the distinction between analytic and synthetic statements, between statements about words and statements about (non-linguistic) facts; (*d*) the distinction between the context of discovery and the context of justification (verification, control); (*e*) the distinction between lexical and stipulative definitions; (*f*) a conventionalist and pragmaticist conception of concepts.

These dogmas will be seen at work, though in different ways and with different emphasis, in the theories of Norberto Bobbio, Alf Ross, Eugenio Bulygin, Jerzy Wróblewski, Giovanni Tarello, and Genoese legal realism, all of which will be considered below.[1]

24.2. The Spell of Logical Positivism

24.2.1. Norberto Bobbio's Linguistic Turn

In Italy analytical legal philosophy is associated with Norberto Bobbio (1909–2004) and his Turin School. The starting point is conventionally considered to be an essay—*Scienza del diritto e analisi del linguaggio* (Legal science and language analysis: Bobbio 1950)—that Bobbio published in 1950. Here, Bobbio transplanted to the field of law the basic ideas the logical empiricists had

[1] On Bobbio see also Section 3.2.3 in this tome, and Section 11.4 in Tome 1 of this volume. On Ross see also Chapter 16 in this tome. On Bulygin see also Section 11.1 in this tome and Section 26.2.1.3 in Tome 1 of this volume. On Wróblewski see also Section 16.3.3 in Tome 1 of this volume. Finally, on Tarello and Genoese legal realism see also Section 11.6 in Tome 1 of this volume.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_52

worked out in their epistemological inquiries on the language of the natural and formal sciences, in order to provide a positive solution to the persistent, embarrassing question of the scientific nature of the doctrinal study of law (legal science, legal dogmatics).

In hindsight, the whole attempt may seem odd; and Bobbio changed his mind later on. But it is worth laying out its basic points, insofar as they are relevant to a history of Continental contemporary theories of interpretation.

The law, Bobbio claims, is a linguistic entity: It is, more precisely, a discourse, namely, the authoritative discourse of the legislator. From this theoretical starting point, endorsing a revolutionary legal ontology, at least as far as the European legal culture of the time is concerned, Bobbio proceeds to reframe the basic tasks of the traditional doctrinal study of law in terms borrowed from logical empiricism's meta-philosophy.

According to logical empiricism, the proper task of philosophy is to analyze and reconstruct the language of natural and formal sciences, in order to make it a perfect, ideal language.

By way of philosophical mimicry, Bobbio applies the same frame to the relation between law and legal science, claiming the proper task of *legal science* to be the analysis and reconstruction of *legislative language*, in order to make it as precise, determinate, and rigorous as possible. The task should be performed in three stages: purifying, completing, and ordering.

The *purification* stage is basically a matter of interpreting legislative norm-formulations. Its point, however, lies in *definition*: Jurists should redefine legislative technical terms whenever their meanings prove indeterminate, imprecise, or sloppy, and make them determinate, precise, and accurate. In so doing, they should keep two points in mind. *First*, legal interpretation (and definition, as an exercise in what might be called one-word interpretation) is an activity totally exhausted within the horizons of language; it consists in passing from one language (the legislator's language) to another language (that of legal science), it consists in explaining and purifying language *by means of* language, it is an activity that cannot really go beyond ("transcend") language, even when it pretends to deal with non-linguistic objects. *Second*, the (re)definitions of technical legal terms in legal science are neither true nor false, but more or less convenient to purposes at hand.

The *completing* stage concerns the filling of legal gaps. This task should be performed by means of the integration techniques—which are *rules for transforming* legislative language—understood by legal scientists to be set, explicitly or tacitly, by positive law.

The *ordering* stage concerns normative conflicts. This task should be performed by means of criteria of conflict resolution, which are another class of rules for transforming legislative language.

It is by now clear why Bobbio's attempt to show the doctrinal study of law to be a real science, based as it was on a pretended analogy with the relation between

science and the philosophy of science, is to be regarded as a failure. Nonetheless, the details of his analysis were—and still are—rich with theoretical insight.

Bobbio himself, in the later essay *Essere e dover essere nella scienza giuridica* (Is and ought in legal science: Bobbio 1970), reaped some benefit from his linguistic conception of law and legal interpretation. In this essay, he sets forth the following theoretical claims (in his terminology, claims of descriptive metalegal science, *metagiurisprudenza descrittiva*):

a) interpretation is a *necessary* step in any use of any piece of legislation whatsoever;

b) interpretation is *not* a *purely cognitive task* but a task involving *ethical value judgements*, which are pervasive in the life of the law—and that is because the language of law is "an imperfect tool, leaving a lot of room for the inventiveness of those who use it";

c) jurists are used to keep *de iure condito* and *de iure condendo* considerations separate, assuming the former to be a matter of pure, neutral, objective knowledge, but they are wrong: *de iure condito* considerations, depending as they do on interpretation, are value-laden and value-committed, too, so there is really no difference in kind from *de iure condendo* considerations;

d) far from being activities purely devoted to the "logical" application and neutral explication of positive law, adjudication and legal science are *sources* of law, if only in a material, sociological, not formal, way.

24.2.2. Eugenio Bulygin's Two-Tier Model

The analytical theory of interpretation advanced by Norberto Bobbio stands on the realistic side of the theoretical spectrum.

In a series of essays, some of them coauthored with Carlos Alchourrón (1931–1996), Eugenio Bulygin (1931–) worked out a purportedly more moderate conception of legal interpretation: This he did against the philosophical background of logical empiricism, while also taking into account the ordinary-language views developed by H. L. A. Hart and Genaro Carrió (see Hart 1961, chap. 7; Carrió 1965), and presenting that conception as a virtuous midpoint between the unwise extremes of interpretive formalism (cognitivism) and interpretive scepticism (realism, non-cognitivism) (see Alchourrón and Bulygin 1971; Bulygin 1986; Alchourrón and Bulygin 1991b; Bulygin 1995a; 1995b; 1995c; 1999; 2006, par. 6.2).

Formalists claim interpretation to be a matter of cognition. Realists claim interpretation to be a matter of decision ("invention," "creation"). But they are both wrong, since legal interpretation is *sometimes* a matter of knowledge, and *sometimes* a matter of decision.

Such a middle-ground, assumedly wise conclusion is argued for on the basis of a two-tier model of the *structure* of interpretive processes, the central points of which run as follows.

1. Jurists use the word *interpretation* to refer, mostly unwarily and confusedly, to four different sets of activities, which should instead be carefully kept separate, namely:

a) activities of *systematization*, or *building of axiomatic-deductive systems*, starting from a previously identified closed set of norms, and consisting in deriving from them their normative consequences as to a given set of generic cases ("universe of cases");

b) activities of *modification of a normative system*, consisting in the filling of its gaps and the resolution of its antinomies, which involve modifications, since they add new norms to the previous set and/or eliminate some of the old ones;

c) activities of *abstract* norm-oriented *interpretation;*

d) activities of *concrete* case-oriented *interpretation*.

Only (*c*) and (*d*) correspond to legal interpretation proper, while (*a*) and (*b*) in fact consist of activities that are different from, and actually do presuppose, interpretation proper.

2. *Abstract interpretation* consists in translating authoritative norm-formulations (provisions, legal sources) into norms ("passing" from sources to norms), usually expressing them in their theoretically appropriate logical form (for instance, in the form of conditional sentences connecting a given normative consequence to the description of some generic case: "If M (murder), then OS (obligatory sanction of twenty years in prison)," or, in symbolic language, "OS/M," "$M \rightarrow OS$," "(x) $(Mx \rightarrow OSx)$"). Abstract interpretation leads to the identification of abstract norms, i.e., of norms considered independently of any individual, concrete case to which they may apply. Abstract norms may work either as the normative premises of judicial decisions or as axioms from which jurists proceed to the systematization and modification of normative sets (see Bulygin 1986; 1995b, 34).

3. *The abstract interpretation* of a provision may be puzzling. Provisions may be *syntactically* and/or *semantically ambiguous*, such that two or more alternative meanings, two or more alternative norms, may be identified in them. In such cases, abstract interpretation fatally involves a *choice* by the interpreter, favouring the one or the other of the available alternative meanings.

4. The ambiguity of provisions is a *given*, something interpreters cannot but recognize by an act of knowledge, for it is a linguistic flaw, a linguistic indeterminacy, dependent on the very syntactical structure and semantics of provisions.

5. Whenever a choice is necessary, interpreters do not usually decide in a totally arbitrary way, though; rather, taking into account the *rational* ideals of law's consistency and completeness, they tend to select the meaning on the basis of which the law comes out as a gapless and consistent normative set (see Bulygin 1995a).

6. *Concrete* fact-oriented *interpretation* presupposes the prior identification of an abstract norm by means of abstract norm-oriented interpretation, and consists in establishing whether or not an individual case is liable to be subsumed within the generic case to which the abstract norm connects a given normative consequence.

It consists, for instance, in establishing whether or not, given the abstract norm "if M (murder), then OS (obligatory sanction of twenty years in prison)" ("(x) ($Mx \rightarrow OSx$)"), the individual case *a* (Mr. A killing Mr. B by unwittingly pushing into the sea the car where Mr. B was asleep) is a case of "murder," i.e., can be subsumed within the class of behaviours that constitute murder.

7. *Concrete* fact-oriented *interpretation* may likewise be puzzling. This happens whenever the terms by which the generic case is described in the abstract norm (the "descriptive terms" like "murder") prove to be *semantically indeterminate* relative to the individual case at hand because of their actual or potential *vagueness* (open texture). Again, from the standpoint of interpreters, this kind of linguistic indeterminacy is a matter of *discovery*; it usually depends on three different factors: (*a*) the semantic rules governing the uses of the term in ordinary or specialized language, mirrored by its *lexical definition*; (*b*) the semantic rules stipulated for the term by the legislator by means of a *legislative definition*; (*c*) the will of the legislator regarding the meaning of the term, such as that meaning may be ascertained, for example, in light of *travaux préparatoires*.

8. Vagueness is linguistic indeterminacy at the margins. This means that, as to the reference of any descriptive term, we may distinguish between a *core* area of clearly included cases (easy cases), an area of clearly *not included* cases (easy cases), and a penumbra of doubtful cases (hard cases). Accordingly, while performing concrete fact-oriented interpretation, it may happen that the case at hand proves to be either easy or hard. In the former kinds of situations, concrete interpretation is a matter of *knowledge*: Interpreters simply discover the meaning of the relevant descriptive term. In the latter situation, contrariwise, concrete interpretation is a matter of *decision*: Interpreters must *stipulate* the meaning (the semantic rules) of the relevant descriptive term, and so decide whether or not it is applicable to the case at hand.[2]

9. Both abstract and concrete interpretation, as described above, show that there is nothing peculiar about legal interpretation that can make it a special case, substantially different from ordinary language interpretation. On the contrary, they work exactly in the same way as our understanding of ordinary sentences. Sometimes it is a matter of discovery; sometimes it is a matter of decision and stipulation.

Bulygin's model is two-tiered in that he distinguishes, in the ordinary process of interpretation, the two stages of abstract interpretation (identification

[2] "The judge either discovers a preexisting semantic rule or stipulates the rule" (Bulygin 1995a).

of the norm) and concrete interpretation (concretization of the norm by reference to individual facts: fact-qualification). In so doing, he sets forth a model that is more sophisticated than the one-tiered ones proposed by Hart and Carrió, focussing instead exclusively on the concrete interpretation stage.

Unfortunately, Bulygin's model cannot be accepted as a good model for legal interpretation, for the following reasons.

a) It is a syntactic-semantic model of legal interpretation. As such, it overlooks what is perhaps the most important ingredient both in the working of language and in the practice of interpretation, even the interpretation of ordinary sentences: *pragmatics*.

b) From a pragmatic point of view, the use of language is always a commitment-laden activity. It is a game where the participants' performances and moves depend on their *decision* to either cooperate (up to some established point) or not cooperate with others in view of their purposes and interests.

c) Turning to the law, the pragmatic dimension of legal language and legal interpretation appears even more evident. Norm-formulations are devices for settling conflicts among interests; their interpretation is of paramount importance in determining exactly who gets what, and how, and in what measure. Accordingly, it is misleading to portray legal interpreters as creatures dwelling in the heaven of semantic and syntactical rules. It is misleading to suggest—as Bulygin's model does—that, in the law, giving paramount importance to literal (grammatical) interpretation is not a matter of a methodological *choice*, which should be duly justified, but is a simple matter of course. And that is because, as soon as one takes into account the real practice of legal interpretation (as Bobbio, Wróblewski, Ross, and Tarello suggest), what Bulygin depicts as cases in which interpreters have simply *discovered* the abstract and/or concrete meaning of a norm-formulation are as many cases in which they really have *decided* to adhere to the plain, literal, semantic meaning of a norm-formulation; they are cases where judges decided to be *conformist*: to conform to the literal meaning instead of deciding for a different one.

The pretended virtuous middle conception is no middle at all: It is in fact an impoverished, misleading view of legal interpretation, and should be abandoned.

24.3. Analysis as a Plain Tool: Wróblewski's Way

Jerzy Wróblewski (1926–1990) was a pathbreaking pioneer in applying analytical philosophy, basically in an ordinary language version, to legal interpretation, and a master for the generation of legal theorists—like Aulis Aarnio, Robert Alexy, and Aleksander Peczenik (see Sections 25.4 and 25.6 in this tome)—who from the late 1970s developed the so-called "standard theory of legal reasoning."

The core of Wróblewski's theory—which he worked out from the early 1960s until his untimely death—lies in *operative interpretation*: the kind of

interpretation that judges perform whenever the norm-formulation to be applied to the case at hand has a doubtful meaning; whenever the judge is in a *situation of interpretation*, which Wróblewski, adopting a distinction by K. Makkonen, opposes to those *situations of isomorphy*, where the norm is considered applicable to the case in its plain, isomorphic meaning (here the applied norm can be said to be identical with the corresponding norm-formulation: see Wróblewski 1983, 1985, 1992).

The distinction may suggest that Wróblewski, like Bulygin, opts for a virtuous middle conception about the nature of legal (and judicial) interpretation (sometimes cognition, sometimes decision). That suggestion, however, must be rejected. The focus of Wróblewski's theory is on the *discursive side* of interpretation, on interpretation *as discourse*: as an activity whose output is a set of sentences making up judicial opinions, where interpretive sentences (whose usual form is "Norm *N* means *S*," or, in our vocabulary, "Provision *D* means *N*") are formulated along with other sentences providing arguments in support of them. Accordingly, a situation of isomorphy is where the judge deems the case to be so clear-cut, from the standpoint of the legal order and legal culture, that it is possible to apply the relevant norm-formulation without any need to provide arguments. The game is played by being conformist, deciding to be conformist. Contrariwise, situations of interpretation are the doubtful interpretive situations where arguments should be provided.

Focussing on the discursive side of interpretation, on interpretation as reasoning and argumentation, and unlike the hermeneutical theorists (see Section 23.4 in this tome), Wróblewski is not interested in the *structure* of the interpretive process, understood as an intellectual process in the mind of interpreters; rather, he is interested in the *tools* of interpretive reasoning. These tools—methods, canons, arguments, techniques—he chooses to call *directives*. Interpretive reasoning, the reasoning we usually find in judicial opinions, is argumentative, justificatory discourse informed by two ingredients: a given set of *interpretive directives* and a related set of *value judgments*.

There are two kinds of interpretive directives: *first-level* and *second-level* directives.

First-level directives prescribe how interpreters should proceed in order to "ascribe a meaning" to a norm-formulation. Any norm-formulation belongs at once to three different contexts: *first*, as a *linguistic entity*—a norm-formulation is a sentence in a natural language—it belongs to a linguistic system, to a language with its grammar and lexicon; *second*, as a *normative entity*, a norm-formulation belongs to a normative system; *third*, as a *functional entity*—a norm-formulation is a move in the game of law and politics—it belongs to the universe of law's and/or the legislator's goals, purposes, aims, etc. First-level directives are, accordingly, of three different kinds.

Linguistic directives prescribe that norm-formulations be interpreted by taking into account their linguistic nature. For instance: (*a*) norm-formulations

should be given the meaning corresponding to the ordinary meaning of their words, unless there are sufficient reasons for preferring a technical meaning; (*b*) the same term, being used in different norm-formulations, should be given the same meaning, unless there are sufficient reasons to the contrary; (*c*) different terms should be given different meanings, unless there are sufficient reasons to the contrary; (*d*) no part of a norm-formulation should ever be interpreted in such a way to appear idle; (*e*) legislators should be presumed to have used ordinary grammar, unless there are sufficient reasons to the contrary.

Systemic directives prescribe that norm-formulations be interpreted by taking into account their membership in a legal system. For instance: (*a*) norm-formulations should *not* be given a meaning that is as inconsistent with other norms or principles of the system; (*b*) norm-formulations should *not* be given a meaning that is incoherent with other norms or principles of the system; (*c*) norm-formulations should be given a meaning that is as coherent as possible with other norms or principles of the system; (*d*) norm-formulations should not be given a meaning that makes the legal system gappy as to a case at hand.

Functional directives prescribe that norm-formulations be interpreted by taking their functional nature into account. For instance: (*a*) norm-formulations should be given the meaning corresponding to the subjective purpose of the historical legislator; (*b*) norm-formulations should be given the meaning corresponding to their own objective purpose; (*c*) norm-formulations should be given the meaning corresponding to the objective purpose of the relevant legal institute; (*d*) norm-formulations should be given the meaning corresponding to the purpose embedded in their underlying ethical values.

There are two kinds of *second-level* directives: *procedural* and *preferential* directives. *Procedural directives* prescribe to interpreters *how* they should use first-level directives, whenever the use of a plurality of such directives is in order, as when interpreters assume they have the power or the duty to do so. For instance, they may prescribe using linguistic directives first, then functional directives, and finally systemic directives. *Preferential directives* establish an order of preference between the outputs of the linguistic, systemic, and functional interpretation of the same norm-formulation, whenever these outputs do not converge, being instead different and at odds. For instance, they may prescribe the output of functional interpretation to always take precedence over the output of linguistic interpretation.

As Wróblewski makes clear, the selection and use of interpretive directives is not a matter of cognition: It does not, as Betti and Gadamer claimed, costitute a process leading to the objective knowledge of the correct legal meaning of norm-formulations. It is, contrariwise, a process rife with ethical value judgments—as is apparent from the very formulation of some directives (think of the "save for sufficient reasons to the contrary" clause). Indeed, the whole game of legal interpretation is informed by the competition between two fundamental "ideologies." On one side, there is the *static ideology* favouring the

goal of legal certainty, and so the use of those interpretive directives likely to be in accord with it; on the other side, there is the *dynamic ideology*, favouring the goal of substantive justice, and so the use of those interpretive directives likely to be in accord with it.

The whole of Wróblewski's theory of interpretation boils down to, and is summed up in, his reconstruction of the proper logical form of interpretive sentences. That is not "Provision *D* means *N*" but, rather "Provision *D* means *N* in legal language *LL* and/or in context *C*, according to (*a*) the first-level directives DI^1-1, DI^1-2 … DI^1-*n*; (*b*) the second-level procedural and preferential directives DI^2-1, DI^2-2 … DI^2-*n*; and (c) value judgements V_1, V_2, …, V_n that had a bearing on the selection and use of the aforesaid interpretive directives." Perhaps, a better, conceptually clearer arrangement of notions and types of interpretive directives may be set forth.[3] Nonetheless, Wróblewski's theory shows the degree to which an analytical approach can contribute to clear and precise thinking in the misty swamp of legal interpretation, and to the getting rid of worn-out expressions and misleading modes of thought.

24.4. Analysis and Realism

Two self-proclaimed analytical and realist (sceptical, non-cognitivistic) theories of legal interpretation will be considered in turn: the theory of Alf Ross and Genoese realism.

24.4.1. Alf Ross's Fundamental Break

Alf Ross (1899–1979) is to be credited with the first, sophisticated analytical-realistic theory of interpretation in post-WWII Continental jurisprudence. He sets it forth in Chapter 4 of *On Law and Justice* (Ross 1958), perhaps his major jurisprudential work, by which he intended "to carry, in the field of law, the empirical principles to their ultimate conclusions," showing both to fellow legal theorists and to jurists involved in the doctrinal study of law the way of satisfying

> the *methodological demand* that the study of law must follow the traditional patterns of observation and verification which animate all modern empirical science; and the *analytical demand* that the fundamental legal notions must be interpreted as conceptions of social reality, the behaviour of man in society, and as nothing else. (Ross 1958, 9)

A survey of the basic point of Ross's general theory of interpretation ("general theory of legal method") will bring to the fore the powerful insights he was capable of, including by recourse to semiotics and linguistic theory.

[3] For an attempt, see Chiassoni 2007, chap. 2, where the idea of interpretive codes is explored.

1. As an empirical inquiry on "a specific legal system," the *doctrinal study* of interpretation focuses on the "method" actually "followed by the courts." A *general theory* of interpretation, by contrast, aims at working out (*a*) an inventory of interpretive problems, i.e., of those puzzles which typically beset judicial interpretation and their "factual presuppositions"; and (*b*) a classification of the several interpretive styles "that are actually to be found" in a legal culture.

2. *Interpretation* is, in general, the "activity" aimed at "determining" or "expounding the meaning of an utterance," considering it as a component in a process of communication, and usually, but not necessarily, taking into account what "a person," "the author," and "the writer" "intended to communicate" by it.

Such a determination cannot be simply a matter of knowing the language in which the utterance has been formulated (*linguistic interpretation*); it must also be a matter of *interpretation by connection*, which requires (*a*) taking into account the several *connections* of the utterance, its *co-text* and *textual context at large* ("context"), as well as its "nonlinguistic" context ("situation"), "the most important factors in the determination of meaning"; and (*b*) *deciding* which, out of all the possible connections, should be considered relevant to the task. Far from being a passive process of utterance-meaning assimilation, interpretation necessarily involves the interpreters' commitment and cooperation ("the desire to find "good" or "reasonable" meaning in relation to a given situation).

The need for a combination of linguistic interpretation and interpretation by connection is mirrored by what Ross claims should be regarded as "the guiding principle for all interpretation," namely, "the principle of primary meaning-determinative function of the utterance as an entity and the connections in which it occurs" (Ross 1958, 117–23).[4]

3. Interpretation is characterized by *indeterminacy*. Indeed, interpretation by language, context, and situation may point not to a single, determinate meaning, but to several alternative meanings among which interpreters, if they are to get the job done, must *decide*, and must do so on the basis of extra-interpretive considerations. This is usually the case "in the interpretation of directives," such as statutory clauses (see Ross 1958, 120).

4. It is commonly assumed that *subjective interpretation* is different from *objective interpretation*, since the latter purportedly does not pay attention to intention. But that is wrong: "All interpretation starts with the communication [utterance, text] and attempts to arrive at the intention" (Ross 1958, 121). Interpretation is *subjective* when *intention* is understood as the meaning intend-

[4] "Interpretation by connection goes to work with all the facts, hypotheses, and experiences which can throw light on what a person intended to communicate. Interpretation by connection is a study of the circumstantial evidence reminscent of the work of a detective investigating a crime […] it must be decided what according to the circumstances can be accepted as being context and situation" (Ross 1958, 116).

ed by the historical, flesh-and-blood author of the text; when it "studies the way the work [utterance, text] came into being," and looks for "meaning as an historical-psychological fact" (ibid., 122). Subjective interpretation can be described as *genealogical*. Contrariwise, interpretation is *objective* when *intention* is understood in a totally de-psychologised way, and interpreters look for it by means of data which do not take genealogy into account. In this way, objective interpretation looks for the "hypothetical-ideal meaning" of a text (work, utterance) (see ibid., 121–3).

5. Legal interpretation, as the activity aimed "at determining the meaning" of some "enacted law," of some "text" or "written linguistic formula" representing an authoritative legal source, is typically beset by three kinds of problems: *syntactic* problems, generated, e.g., by the use of commas and adjectival phrases; *logical* problems, generated by the presence of a plurality of authoritative norm-formulations, like the problems of *incompatibility* (antinomies, normative conflicts), *redundancy*, and *presupposition* (uncertain reference from one clause to one or more other clauses); and *semantic* problems in a narrow sense, generated by the doubtful meaning of the terms employed in a clause. Furthermore, it is thoroughly dominated by *pragmatic factors*: "considerations based on an evaluation of the practical reasonableness of the result judged in relation to certain presupposed fundamental evaluations" (Ross 1958, 145). The latter point suggests that legal interpretation is a complex activity, where it is worth distinguishing between linguistic interpretation and "pragmatic interpretation." *Linguistic interpretation* is concerned with determining the literal meaning of statutory clauses. It is usually assumed to be totally detached from *pragmatic interpretation* (a position known in contemporary philosophy of language as *literalism*), but that is a sheer mistake. Linguistic interpretation *never* walks alone; rather, it is always accompanied, and dominated, by pragmatic interpretation (a position known in contemporary philosophy of language as *contextualism*). In those very cases where the literal meaning apparently wins the day, linguistic interpretation is nonetheless "co-determined by pragmatic considerations in the form of 'common sense'" (ibid., 146). In other cases, pragmatic interpretation steps in to support *restrictive*, *extensive*, or *specifying* interpretations of statutory clauses, which either fly in the face of their "natural linguistic meanings" or fail to overcome their hopeless ambiguity. Among the typical "evaluations" affecting "pragmatic interpretation" are "foreseeable social effects," "technical acuity," and "harmony" with the legal system and its founding ideologies ("cultural ideas") (see ibid., 148).

6. By means of ever-present, dominating pragmatic interpretation in "the administration of justice," judges necessarily play the "constructive part […] to define more precisely or to correct the directive of the statute" (Ross 1958, 153), even though such a role is "only rarely manifest," being usually performed under the pretence of discovering the objective, true meaning of legal "directives," by means of the proper interpretive principles. However, the il-

lusory, fictional nature of that claim becomes apparent as soon as one realizes that traditional interpretive canons make up a disordered set *bon à tout faire*: an "unsystematic sets of catch phrases (often couched in proverbial forms) and so imprecise in meaning that they can be easily operated in a way that leads to conflicting results" (ibid., 153).

The way interpretive canons actually do work, Ross claims, should not be regarded as a "weakness" but, rather, as an index to a "fundamental truth":

> the maxims of interpretation are not actual rules, but implements of a technique which—within certain limits—enables the judge to reach the conclusion he finds desirable in the circumstances, and at the same time to uphold the fiction that he is only adhering to the statute and objective principles of interpretation. (Ross 1958, 154)

In the title of this section, I mentioned Ross's "Fundamental Break." To achieve it was no exaggeration, and to see that, we need only cast a glance at the theories of interpretation afoot in the early 1950s, and also later on, both within and without the analytical tradition—think, for example, of the hermeneutical theories of Betti and Gadamer or of Bulygin's two-tier model.

24.4.2. Giovanni Tarello and Genoese Analytical Realism

In a 1966 essay, *"Il problema dell'interpretazione": Una formulazione ambigua* ("The problem of interpretation": An ambiguous formulation, Tarello 1974c), Giovanni Tarello, the founder of what will later be known as *realismo genovese* (Genoese realism), outlined a program of investigation he and his disciples were to follow in the years to come (see Tarello 1974a; 1980; 1988c; Guastini 2004, 2008; Comanducci 2010, chaps. 6–10; Chiassoni 1998, 2007). The program ran roughly as follows.

1. The phenomenon of interpretation makes up the core of the everyday working of advanced legal systems, like contemporary Continental ones.

2. Unfortunately—and paradoxically—with only a few notable exceptions, that is widely misunderstood by jurists and neglected by legal theorists.

3. The jurists' misunderstanding may of course be considered a side effect of the legal theorists' neglect. But that would not be the whole story: The reason they misunderstand interpretation is above all that they are the willing and interested executors of a cumbersome assemblage of worn-out ideas from the exegetical school, the historical school, and *Begriffsjurisprudenz*, confusedly mixed up with a few spicy strokes from *Frei Recht*, *Interessenjurisprudenz*, idealistic legal philosophies, and hermeneutical suggestions—*anything*, we could say, *but* the deprecated Kelsenian "formalism."

4. The legal theorists' neglect may in turn be considered the effect of an outdated conception of their task, which rests on a *normativistic prejudice*. It is this prejudice that, for instance, suggests devoting one chapter of their manuals to interpretation alongside other chapters where they deal unrelatedly with

other subjects like the definition of (the concept of) law, the legal norm, the legal system, and the validity and efficacy of legal norms.

5. The normativistic prejudice must be discarded. Interpretation must become a central theoretical concern: Now peripheral, it must instead become a matter of constant concern in the working out of the whole conceptual framework through which we see and act under the law.

Taking account of the American realists, Bobbio, Ross, Scarpelli, Perelman, the analytical philosophy of language, analytical meta-ethics, the history of legal culture (a field in which too he was a master), Tarello carried out a big part of his program in two moves. First, by working out an interpretation-dependent concept of legal norms; second, by working out a realistic theory of interpretation along the lines of Ross's seminal contribution. In the following, I will say a few words on both points. Then I will add an example of an interpretation-dependent theory of gaps, illustrating what Tarello had in mind.

a) *A realistic, interpretation-dependent concept of legal norms*. The first move can be easily explained. It rests on a sharp conceptual and terminological distinction between *provisions* ("disposizioni," "enunciati normativi," authoritative norm-formulations) and *norms*, weaving together a conceptual web of interrelated definitions. *Norms* should properly be regarded as the outputs of the interpretation of provisions. *Provisions* are, in turn, those texts whose meanings, as determined by interpretation, are norms. Interpretation, as a narrowly and properly conceived activity, consists in the ascription of meaning to provisions, so as to determine which norms they do express.

Riccardo Guastini will add to this picture the notion of *implicit* or *tacit norms*: These are the norms that (*a*) cannot be regarded as the meaning of any given provision, and (*b*) are identified by means of logical inference or rhetorical ways of reasoning from previously identified norms.

b) *A realistic theory of interpretation*. Two aspects of Tarello's theory of interpretation are worth considering: his view of the nature of interpretation and his view of the tools of interpretation.

As to the *nature* of interpretation, Tarello remarks that very different activities may go under that name, sometimes unwittingly. *First*, by *interpretation* one could mean the activity consisting in the sheer *recording* of the interpretation-outputs that have been provided by some interpreter in some context. *Second*, by *interpretation* one could mean the activity consisting in the *making of predictions* about the way a certain provision will in fact be interpreted by some interpreter in some context. *Third*, by *interpretation* one could mean the activity consisting in *deciding* the meaning of the provision at hand. *Fourth*, by *interpretation* one could mean the activity consisting in actually *prescribing* the meaning that should be given to the provision at hand. Among these meanings, however, only the third one—interpretation-decision—is to be regarded as providing the proper theoretical notion of interpretation. Only in this case does someone ac-

tually interprets a provision. All other cases, by contrast, are activities which presuppose or anticipate some interpretation-decision and its output.

Turning to the *tools* of interpretation as a justificatory discourse pertaining to interpretation outputs, Tarello makes an inventory of the *interpretive arguments* actually employed in the Civilian tradition, where fifteen different items are included: (1) the argument from analogy (*analogia legis*); (2) the argument *a contrario*; (3) the *a fortiori* argument; (4) the argument from the completeness of the legal order; (5) the argument from the consistency of the legal order; (6) the psychological argument; (7) the historical argument; (8) the teleological argument; (9) the argument *ab exemplo* or from authority; (10) the argument *ab absurdo*; (11) the economic or non-redundancy argument; (12) the systematic argument (where three different arguments are considered in turn); (13) the argument from equity; (14) the naturalistic argument, or from the nature of things; (15) the argument from the general principles of law (*analogia iuris*).

These arguments, Tarello suggests, come in a toolbox from which interpreters may take what suits their present purposes and needs. They may be *strictly interpretive*, when they can be used to argue for a given ascription of meaning to a given provision, or they may instead have an *integrative* function, when they can be used to identify a "new" norm for the case at hand, filling a presumed gap in the law.

c) *A realistic, interpretation-dependent theory of legal gaps.* The several analytical theories of gaps worked out in contemporary jurisprudence by theorists in the civil law tradition appear to converge on the following points.

1. The *existence* of gaps is neither a necessary nor an impossible feature of positive legal orders. It is, on the contrary, a mere *possibility* for every given legal order, or any part thereof (*Contingent existence thesis*).[5]

2. There is no necessary, universal way of filling gaps in the Western legal tradition. On the contrary, whenever a judge thinks there is a gap in the law, she may usually choose among a set of alternative gap-filling techniques, which are likely to lead to different outcomes (*Optional filling-up thesis*).

3. The identification of a gap in the law, by a judge or a jurist, is not the outcome of a purely mechanical or logical operation. On the contrary, it depends—directly or at least indirectly—on empirical and/or interpretive activities. These activities are in turn value-laden and decision-dependent, or at least they may be so in some cases (*optional-identification thesis*).

4. From the perspective of a practice-sensitive and practice-oriented theory, it is worth distinguishing several different concepts of a gap, so as to cast light on, and impart an order to, the fuzzy, everyday intuitions that legal practitioners entertain on the matter (*conceptual-pluralism thesis*).

[5] For instance, in the case of *normative gaps proper*, their existence as to a given set of norms depends (*a*) on the content of the norms in the set and (*b*) on the (explicit or implicit) criteria concerning the legal relevance of cases, neither of which usually varies depending on time and place.

The major differences among the several analytical theories of gaps in the civil law tradition concern the optional-identification thesis and the conceptual-pluralism thesis, respectively.

As to the *optional-identification thesis*, a basic distinction may be drawn between three kinds of theories.

First of all, there are theories that simply *presuppose* the optional-identification thesis, without giving it any due, express consideration (e.g., Bobbio's theory).

Secondly, there are theories that regard the identification of gaps as being *directly* the outcome of a *logical process* consisting in the determination of the solutions provided by previously identified, limited sets of norms for previously identified, limited sets of cases. These theories consider interpretation as an empirical (non-logical) activity which identifies gaps only *in an indirect way*, and which, furthermore, involves decision-making in hard cases only (an example is Alchourrón and Bulygin's theory).

Thirdly, and finally, there are theories that, on the contrary, emphasize the interpretation-dependence of gap-identification and, furthermore, regard interpretation as a necessarily value-laden, decision-involving activity (examples are the theories developed by representatives of the Genoese realistic school).

As to the conceptual-pluralism thesis, provided legal theory should supply legal practice with a set of carefully defined concepts of a gap, several such sets compete in the market.

Taking into account the most influential set of concepts of a gap so far worked out—i.e., the one developed by Alchourrón and Bulygin—, if one adopts the Genoese realism program, with its central point of bringing interpretation to bear on theoretical legal concepts, it is possible to distinguish three basic concepts of a normative gap (i.e., of a gap as a situation where, generally speaking, some norm is assumed to be "missing" for a given case), namely, normative gaps proper, switchover gaps, and adding-up gaps, along the following lines.[6]

d) *Normative Gaps Proper.* A normative gap proper may be characterized as *the absence, from a given set of legal materials* LM_i*, of a norm* N_j *regulating a legally relevant case* C_j *as to a pertinent question of law* QL_j. This characterization makes clear that the absence of a norm is a gap relative to

(*i*) a *given* set of *legal materials* (i.e., materials making up some part of the law; I will make clear this point in a moment);

[6] Though with some changes, the distinction between "normative gaps proper" and "switchover gaps" mirrors a distinction found both in Bobbio ("normative gaps proper" / "ideological gaps") and in Alchourrón and Bulygin ("normative gaps" / "axiological gaps"). The idea of an "adding-up gap" is somehow a new entry, purporting to complement the main distinction above. For a more complex and detailed account of the typology of normative gaps I outline here, see Chiassoni 2007, chap. 3. For an earlier version, see Chiassoni 2004.

(*ii*) a *legally relevant case*, i.e., a class of individual cases for which it is assumed that a legally justified claim to some form of substantive legal regulation may be made in front of a judge; and

(*iii*) a given question of law (*quaestio iuris*) on which depends the specific *content* of the legal regulation that is being brought up in court.

The characterization above, however, is to be regarded as a mere starting point: It is a general notion, needing to be made more precise as to a few relevant points.

Indeed, much confusion about gaps—and the related claims concerning their necessary, impossible, or merely possible existence—may be dispelled, though only in part, by distinguishing carefully between two basic types of normative gaps proper, namely, *explicit* gaps and *implicit* gaps.

An *explicit gap* may be characterized as *the absence*, *from a given set of norm-formulations* NF_i, and *from a set of interpretive directives* ID_k, *of an* explicit *norm* EN_j *regulating a legally relevant case* C_j *as to a question of law QL*.

Contrariwise, an *implicit gap* may be characterized as *the absence, from a given set of norms* SN_y, and *from a set of filling-up directives* FUD_x, *of an* implicit *norm* IN_j *regulating a legally relevant case* C_w, *as to a pertinent question of law* QL_j. By definition, explicit norms are *meanings*: and, more precisely, they are the meanings of norm-formulations.

Accordingly, their identification depends on two basic factors:

(*i*) a norm-formulation, i.e., a sentence enacted by a normative authority, with its syntactic structure and words;

(*ii*) some set of interpretive directives the interpreter uses to translate the norm-formulation into one or more explicit norms.

Accordingly, an explicit gap occurs when, for a given case, no suitable meaning may be ascribed to a given set of norm-formulations on the basis of a given set of interpretive directives.

By definition, implicit norms are derived from previously identified (explicit and/or implicit) norms by means of some norm-creating technique, like analogical, *a contrario* or *a fortiori* reasoning (in their productive versions), so-called legal induction, and appeal to general or fundamental principles of law.

Accordingly, an implicit gap occurs when, for a given case, no suitable implicit norm may be derived from a given set of norms on the basis of a given set of norm-creating directives.

While explicit gaps are usually considered almost a matter of course, implicit gaps are considered to be very rare, if not impossible, events.

A further distinction which it may be useful to make, aside from the one just mentioned between explicit and implicit gaps, is that between *ordinary gaps* and *methodological gaps*.

Very roughly speaking, or*dinary gaps* occur whenever what is (apparently) missing, and needed for, is an *ordinary legal norm*, a norm concerning a person's rights, duties, powers, liberties, etc.

Methodological gaps, by contrast, occur whenever what is (apparently) missing, and needed for, is a *methodological norm*, i.e., some higher-order interpretive, gap-filling, or conflict-resolution directive, establishing which interpretation of a norm-formulation, which way of filling an explicit gap, or which way out of a normative conflict ought to the followed in a given case.

e) *Switchover Gaps*. A switchover gap may be characterized as follows: *The absence*, *from a set of norms* SN_y, *of the* first-best norm FBN_w *which, for reasons of justice and/or public policy, ought to regulate a legally relevant case* C_w *as to a pertinent question of law* QL_w in place of the *second*-best norm SBN_w *which, at least prima facie, regulates it*. Normative gaps proper occur whenever, for a legally relevant case, the law provides no norm whatsoever, whether implicit or explicit.

Contrariwise, switchover gaps occur when, for a legally relevant case, the law provides a norm that it *ought not* to provide (the second-best norm) and, *at the same time*, does *not* provide the norm it *ought* to provide (the first-best norm).

Accordingly, the problem interpreters apparently face, when a switchover gap turns up, is to *replace* the second-best norm (somehow getting rid of it) with the first-best one.

Alchourrón and Bulygin—and many other theorists following in their footsteps—call these gaps *axiological gaps*, so as to emphasize that their existence depends on some pretended value-unfitness of some part of a legal order (Kelsen and Bobbio used the name *ideological gaps* for roughly the same situations).

Such value-unfitness may be either *internal* or *external*.

It is *internal* whenever, by hypothesis, a norm's axiological unfitness is being measured against (higher) principles (or values) that belong to the *same* legal order (e.g., constitutional principles and fundamental rights).

By contrast, a norm's value-unfitness is *external*, whenever, by hypothesis, it is being measured against (higher) principles (or values) that belong to a *different* normative order the interpreter is committed to, such as some natural law system or any other given system of morals.

There are good reasons, I think, to maintain that switchover gaps ("axiological gaps") are nothing but a particular kind of *normative conflict*, though in a disguised form. This latter point, however, would carry us too far afield.[7]

f) *Adding-Up Gaps.* Finally, an adding-up gap may be characterized as *the absence, from a given set of norms* SN_y, *and as concerns a substantive, practical issue* PI_c, *of a norm* for a legally irrelevant, *substantive case* C_w. A case is legally irrelevant when, by hypothesis, it cannot be brought to court making a legally

[7] For further details, see Chiassoni 2007, chap. 3, par. 8, where a more precise definition is provided.

justified claim about its substantive regulation by the law—think, for instance, of those situations that fall within the *de minimis non curat Praetor* rule.

Accordingly, in order to fill an adding-up gap, some change in the criteria for the legal relevance of the case at issue needs to be made first. Adding-up gaps are axiological gaps, where the presence of the missing norm within a given legal order is required by some *external* principle (or value) the interpreter is committed to.

Chapter 25

ADVANCING REASON TO ITS FURTHER BORDERS

by Eveline Feteris

25.1. Introduction

One of the most influential approaches in the theory of legal argumentation of the second half of the 20th century is the approach that conceives legal argumentation as part of a rational discussion in which a legal position is justified according to certain rules for rational discourse. The rationality of the argumentation depends on whether the procedure meets certain formal and material standards of acceptability. Prominent representatives of this approach in legal theory are Aarnio 1977, 1987, Alexy 1989, Peczenik 1983, 1989a, MacCormick 1978, 2005. The idea of approaching legal argumentation from the perspective of rational discourse is based on Habermas' theory of communicative rationality. Starting from this assumption, Aarnio, Alexy, and Peczenik as well as MacCormick integrate ideas from analytical philosophy, speech act theory, hermeneutics, legal theory and legal methodology in a theory of legal argumentation as a theory of rational discourse. In what follows, in Section 25.2, we start with a discussion of MacCormick's institutional theory of legal justification. Then we discuss in Section 25.3 Habermas' theory of rational discourse and the application of his ideas to legal discourse. Then we discuss the theories of Alexy (Section 25.4), Aarnio (Section 25.5) and Peczenik (Section 25.6). After that, the pragma-dialectical approach to the theory of legal argumentation will be discussed (Section 25.7).[1]

25.2. MacCormick's Institutional Theory of Legal Reasoning and Legal Justification

25.2.1. Introduction

In his institutional theory of legal justification Neil MacCormick (1941–2009) tries to formulate a solution for one of the central problems in modern legal theory, the problem of how, in so-called hard cases in which a judge cannot rely on a generally accepted existing rule, a legal decision can be justified rationally. MacCormick specifies the forms of argument a judge must employ when

[1] On Habermas see also Section 10.4 in this tome and Sections 10.3.5 and 10.4.3.2 in Tome 1 of this volume. On Alexy see also Sections 1.4.5.1 and 10.3 in this tome and Sections 10.3.2.2 and 10.4.3.1 in Tome 1 of this volume. On Peczenik see also Section 21.4.2.2 in Tome 1 of this volume.

DOI 10.1007/978-94-007-1479-3_53

formulating a new rule or when interpreting an existing rule drawn form statute or precedent. MacCormick locates the solution of this problem in the more general context of an institutional theory of the rationality of legal decision-making and legal justification and attempts to answer the question which general and which specific legal requirements of rationality play a role in the justification of legal decisions from the perspective of the law as an institutional normative order.

In the justification of legal decisions, MacCormick distinguishes two levels. On the first level, the decision is defended in the *deductive justification* by means of a legal rule and the facts of the case. In clear cases where there is no discussion about the meaning of the legal rule and the classification of the facts, a deductive justification of the first level may qualify as a sufficient justification. In hard cases, the legal rule requires interpretation and deductive justification is possible only after the interpretation problems have been solved. For this reason, a second-order justification is required that shows that the given interpretation can be justified from the perspective of its consequences and the coherence with the rules and values underlying the legal system.

From the perspective of the rationality of the justification the requirement of deductive justification is connected with the rule of law and the requirement of universalization. Since a legal decision must always be based on a universal rule, a rational justification of a legal decision always implies the use of a deductively valid argument. The requirement of a second-order justification is based on the requirement that application of the rule in the concrete case must have acceptable consequences and that it is coherent with the relevant rules and with the legal principles and values these rules.

MacCormick has developed his institutional theory of law and legal reasoning in various books and articles. His most important books in which he develops his ideas that are relevant from the perspective of legal argumentation and justification are *Legal Reasoning and Legal Theory* (MacCormick 1978) and *Rhetoric and the Rule of Law. A Theory of Legal Reasoning* (MacCormick 2005). Furthermore he has collaborated with other authors in developing ideas that also include legal justification: together with Ota Weinberger he has written *Institutional Theory of Law. New Approaches to Legal Positivism* (MacCormick and Weinberger 1986) and together with Robert Summers (1922–2012) he had edited the book *Interpreting Statutes* (Mac Cormick and Summers 1991).

In the following sections we will explain in some detail how these insights are developed in MacCormick's institutional theory of legal justification. In Section 25.2.2 we address the institutional context of legal justification. In Section 25.2.3 we examine the deductive mode of justification, in Section 25.2.4 problems with deductive justification and in Section 25.2.5 the second-order mode of justification.

25.2.2. An Institutional Approach to Law and Legal Justification

In MacCormick's view, the different forms of argumentation to be used in the justification of a legal decision and the criteria of rationality are based on the fundamental values of a particular legal order. The basic value in this context is the rule of law: the requirement that there are properly published and prospective laws, that there is equality of citizens before these laws, and that there is a limitation of official power with respect to them (see MacCormick 2005, 2).

MacCormick considers the law as an institutional normative order which has, as its characteristic features that there is a "legal order" and a "legal system." The legal order as a specific, institutionalized form of normative order implies in his view that

> life proceeds in a given society in an orderly way with reasonable security of mutual expectations among people, on the grounds of reasonable conformity by most people to applicable norms of conduct. This presupposes a conception of law as in some degree systematic and orderly, a body of norms orderly and systematic in character. If people believe in, and orient their conduct toward, a body of norms regarded as a system of law, this is one way of achieving a measure of order and security among them. (MacCormick 2005, 2–3)

This model of a conception of a legal order and a legal system is an "ideal construct" that can only be approximately be realized in the real social world. However, it functions as a standard from which actual legal practices can be judged.

An essential element of the rule of law and the model of law as a legal order and a legal system in the modern liberal-democratic state is the idea of the separation of powers between those who create new norms and those who apply existing norms. In MacCormick's (2005, 5) view, "[t]hose who apply the law, interpreting and developing it as they go along, should be different people from those who enact it." This separation of powers obliges those who apply the law by interpreting and developing it to account for the way in which they use their discretionary space by justifying their decisions according to certain standards of acceptability.

The model based on the idea of an institutional normative order forms the basis for a theory of legal argumentation that must specify the requirements for the way in which judges must apply and interpret the law in cases of dispute or controversy about the meaning of a norm in a practical context and about the way in which the norm must be applied to a particular case, upholding the standard of the rule of law. In his view, the standards of rationality that apply from the perspective of the rule of law implemented in the institutional context of legal justification are the requirements of universalizability and deductive justification, the evaluation of consequences in light of certain relevant legal values, and the coherence with the rules and principles underlying the legal system.

25.2.3. Universalizability and Deductive Justification

The requirement of deductive justification is, in MacCormick's view, based on the requirement of *universalization*. As MacCormick (2005, 99ff.) argues, justification always implies universalization because for particular facts to be justifying reasons they must be subsumable under a relevant principle of action universally stated, even if the universal is acknowledged to be defeasible.[2]

On the first level, *in the deductive justification*, a legal decision is justified by means of a legal rule and the facts of the case. If the facts can be considered as fulfilling the conditions of the rule, the argument underlying the decision is reconstructed by MacCormick as in the form of the legal syllogism as a deductively valid argument. An argument is deductively valid if its form is such that the premises imply (or entail) the conclusion, despite the content of the premises and the conclusion. In MacCormick's view, a legal rule can always be reconstructed as the premise "if p then q," if certain facts obtain ("p"), a certain legal consequence follows ("q"). When the meaning of the rule "if p then q" is clear in a given context and requires no interpretation, and the facts "p" form an unproblematic instantiation of "p" in the rule, we have a *clear case*. The conclusion "q" (the decision) follows clearly from the premises.

An argument of this form is equally valid, whatever the content of its premises. That the argument is valid, however, does not imply that the conclusion is true. It implies only that the conclusion is true (or acceptable) if the premises are both true. If all premises of the argument can be considered true by legal standards, the final conclusion of such a valid argument, the final decision, is also true, that is, legally true. The soundness of the justification is, of course, dependent on the implicit assumption that there are certain "criteria of recognition" on the basis of which a legal rule that functions as the premise "if p then q" can be considered as legally valid. Again, such criteria depend on criteria based on legal sources which can be identified as such. According to MacCormick (1978, 139), deductive justifications are always brought forward within a framework of values which form the "underpinning reasons" for the justification to be sufficient (see also MacCormick 1978, 63–5, 240–1). The other premises are proven "primary facts," or conclusions about "secondary facts" which have been derived deductively from the primary facts together with a premise which is a legal rule.

On the first level of legal justification, the structure of every argument is the same. A justification of the first level always contains a general rule of the form "if p then q" which is applied to certain facts "p" to derive a legal consequence "q." In logical terms, this is a deductively valid argument. The requirement of logical validity is justified by the requirement of formal justice, that similar cases

[2] Cf. Robert Alexy's requirement of universalization for general practical and legal argumentation discussed in Section 25.4.4 below.

should be treated alike. A legal decision must always be based on a general rule of the form "if p then q." A rational justification of a legal decision, therefore, always implies the use of a deductively valid argument. The requirement of deductive validity is a general requirement for every form of rational argument. In fact, according to MacCormick, legal reasoning can be considered as a special, highly institutionalized and formalized type of moral reasoning, owing to the presence of a presupposed framework of values (see MacCormick 1978, 272).

A deductive justification can be sufficient in clear cases in which a judge can appeal to an existing and non-ambiguous legal rule. In such cases a deductive justification of the first level may qualify as a sufficient justification. Often, however, the meaning of an existing rule is not clear in relation to the facts of the case or there is no existing rule applicable. If there is a rule, but its meaning is not clear, it must be interpreted. If there is no legal rule, a new rule can be formulated. In such *hard cases*, a deductive justification is possible only after a new rule has been formulated or if an interpretation of the existing rule has been given. To make the new rule or the interpretation acceptable, further justification is required.

25.2.4. Problems with Deductive Justification

One of the central questions which must be answered in a theory of legal argumentation is: how can the choice or interpretation of a legal rule be justified rationally. When applying a legal rule, several types of problems can occur: *problems of interpretation*, *problems of relevance*, and *problems of classification* (see MacCormick 1978, 73–99).

A *problem of interpretation* occurs when it is unclear whether a certain rule is applicable to certain facts. Rules often prove to be ambiguous or unclear in relation to some disputed or disputable context of litigation. Rules are formulated in language and are bound to be open-textured and vague in relation to at least some contexts. Resolving the ambiguity requires choosing between the two possible interpretations. Once the interpretation has been established, the decision can be justified by means of a deductive justification. But a complete justification is based on the question of how a choice between the two rival interpretations can be defended. According to MacCormick, this choice cannot be defended by means of a deductive justification.

A problem of *relevance* occurs when there is no rule applicable to the facts. For instance, the plaintiff takes the position that a certain decision "q" should be taken on the basis of the facts "p." There is no recognized rule which says that when the facts "p" occur, the legal consequence "q" should follow. In MacCormick's terms, the plaintiff implicitly says that in this case, the rule "if p, then q" should, in effect, be proclaimed. Because there is no existing rule relevant to the present case, the judge must decide whether acknowledgement of this rule can be justified within the overall legal system. Because the judge has

to decide whether the facts are legally relevant, MacComick calls this a problem of relevance. When a problem of relevance occurs, there are two possible rules. The first rule (A) is that the facts justify the required legal remedy, and the second rule (B) is that the facts do not justify the required legal remedy. The party who asserts (A) claims that he ought to be granted a remedy given those facts, implicitly asserts that there is some legal warrant for granting that remedy given those facts. and any such norm can be recast in the form "if (facts) p, then (legal consequence) q." Here again, once the necessary "legal warrant" is established, the given conclusion can be justified by simple deduction therefrom. According to MacCormick it is equally obvious that the argument which justifies the establishment of that legal warrant cannot in turn be similarly deductive in form, because the choice is not based on a generally accepted rule (see MacCormick 1978, 72).

The problem of *classification* arises when it is not clear whether certain "primary facts" (r) which have occurred, can be considered as a substitution of certain legally qualified "secondary facts" "p" in the rule "if p, then q." In the case of a classification problem, the question is how the facts should be translated in legal terms. In MacCormick's view, the problem of classification resembles the abovementioned problem of interpretation, but for technical legal reasons concerning cases of appeal, it is necessary to distinguish the two problems. In certain cases of appeal, only legal questions can be subject of discussion; factual questions cannot be considered. Because a question of classification is considered as a factual question, cases concerning these questions cannot be appealed.

25.2.5. Consequentialist Argumentation and Argumentation from Coherence

When a judge chooses between two possible interpretations of a rule or between two rules of which one is applicable to the case at hand, and the other is not, he must put forward second-order justification. The elements of a second-order justification involve considerations which play a role in the interpretation, relevance-choice, or classification. These considerations differ from the legal rule used in the deductive justification. While a legal rule, which is derived from an accepted legal source, can be considered as an existing valid rule and, therefore, as an acceptable premise, considerations underlying an interpretation or relevance must be justified.

To justify the acceptability of the preferred ruling, the judge is required to test the ruling in the light of its consequences and in the light of its coherence and consistence with accepted legal starting points. First, he must show that the decision can be justified as deducible from a rule which has better consequences than any possible alternative rule. He does this by means of what MacCormick calls a *consequentialist* argument. Second, in weighing the desirability of the consequences of the preferred interpretation of the rule, the

judge must show that the ruling is consistent with such norms (by "explaining" and "distinguishing" unfavourable precedents) and is supported by analogies from existing case law (or statute law) or by "general principles" of the law, preferably authoritatively stated by judges in *obiter dicta*, or by respectable legal writers. In other words, the judge must show that the decision is *consistent* with existing legal norms and *coherent* with general legal principles.

Consequentialist argumentation. The first criterion of acceptability of legal reasoning concerns the requirement that the consequences of the decision must be tested against certain standards of soundness. MacCormick calls the form of justification used to test the consequences of the decision *consequentialist argumentation* by means of which a judge indicates the logical consequences of the rule, especially the consequences in hypothetical cases which could occur when the rule is applied in similar cases. According to MacCormick (2005, 101ff.), consequentialist argumentation concerns the consequences of a universal rule underlying the decision, and not the specific consequences of the decision for the individual parties. According to the rule of formal justice, individual cases should be treated in a way which can also be justified in similar future cases. For this reason, consequentialist argumentation is concerned with the consequences of the choice between rival interpretations of a rule in relation to the law.

The foreseeable legally relevant consequences of a particular ruling have to be evaluated on the basis of certain criteria. According to MacCormick (2005, 112ff.), the standards of evaluation often used in such a context are "justice," "public policy," "common good of the community," "legal expedience," "convenience," and "common sense." In his view, these different criteria make clear that in the evaluation a plurality of standards are applied. Moreover, the standards themselves may be interpreted in different ways. Different branches of law focus on different values or clusters of values. For this reason judges must explain the values against which the consequences are evaluated and why these values are relevant for a specific branch of law.

In MacCormick's (2005, 119) view, the way in which judges must refer to consequences and the way in which they evaluate them also incorporates taking into account what Dworkin calls "the protection of rights." The use of consequentialist argumentation does not necessarily imply that the consequences are only related to certain policies. In using consequentialist argumentation judges evaluate the outcome in relation to fundamental values of the legal order, which also include the consideration of rights. In his view, this coheres with the view that consequentialist argumentation also incorporates what Summers (1978) calls "goal reasons" and "rightness reasons" in the sense that consequentialist arguments refer to legal values (rightness reasons) considered as relevant goals to be pursued by the law.

The need to refer to consequences can also be explained by viewing the law as a goal-oriented enterprise in which governments promote and enact rules

of law in order to repair certain defects in the law or to cure a particular "mischief," or more generally speaking, in order to realize certain socially relevant values. When judges apply and interpret the law they will favour that interpretation of the law that favours the legal value that is supposed to be realized by the rule. In MacCormick's 2005, 132ff. legislation is a teleological purposive activity and for that reason a judge interpreting the law must be oriented at implementing the goals and values that underlie the legal rules. For this reason consequentialist arguments can also be considered as teleological-evaluative arguments in the sense that they refer to the goals and values underlying the rule (see MacCormick 2005, 132–7; MacCormick and Summers 1991, 518–21).

Arguments from coherence. The second criterion of acceptability is the requirement that the justification be coherent as a whole.[3] In MacCormick's view there are two types of test for coherence: The *normative coherence* test checks the coherence of the justification in the context of the legal system conceived as a normative order and the *narrative coherence* test checks the coherence of the narrative inferences from the evidence (see MacCormick 2005, 189).[4] From the perspective of the law as an institutionalized normative order for our purposes the requirement of normative coherence is relevant here. In MacCormick's (2005, 192–3) view, the idea that a set of norms is coherent implies that the norms "make sense" as a rationally related set of norms that are supposed to be instrumental to the realization of a particular common value or can be considered as fulfilling a more or less clearly articulated common principle.[5]

When using *arguments of coherence*, a judge attempts to demonstrate that the decision conforms with legal values embodied in general legal principles. MacCormick (1978, 152ff; 2005, 205ff.) distinguishes two types of argument by means of which coherence can be established: arguments on the basis of legal principles and arguments from analogy. An argument based on a legal principle shows that a ruling is justified by its coherence with a generally accepted legal principle. In situations in which two (or more) legal principles apply, an argument based on a principle might not be sufficient. A choice between the principles has to be made and justified by, for example, a consequentialist argument which shows that the solution would also be acceptable in similar future cases.

In arguments from analogy a ruling is justified by showing that the rule is similar to a rule expressed in another legal decision. To argue that this same rule should be applied, it must first be indicated that the facts are similar to

[3] In MacCormick's (2005, 189, 203) opinion, coherence is related to the requirement of consistency in the sense that the elements of a coherent whole must not be contradictory. However, consistency is not a necessary condition of coherence. For the relation between coherence and consistency see also MacCormick 1978, 220ff.

[4] For a further discussion of narrative coherence see MacCormick 2005, 214ff.

[5] As MacCormick (2005, 193) states, the values and principles together constitute what Aarnio calls a "form of life."

the facts of the previous decision, and second, that the proposed rule and the rule expressed in the earlier case are based on the same legal principle (see MacCormick 1978, 192).

In MacCormick's conception, a well-justified decision meets the different criteria of acceptability. A well-justified decision shows that it does not contradict validly established rules of law, that it is supported by established legal principles or by reasonably close analogy with established rules of law, and it is supported by an argument about the consequences of the decision in relation to the relevant legal values.

25.3. Habermas's Discourse Theory and the Rationality of Legal Discourse

25.3.1. Introduction

In his discourse theory the German philosopher Jürgen Habermas (1929–) (see Habermas 1988, 1990, 1996) has approached the question of the rationality of legal discourse from the perspective of a general theory of rational discourse. In his view, the rationality of legal discourse and the rationality of discourse in everyday life is complementary: On the one hand, legal procedures can promote the rational quality of legal discourse on moral issues in relation to idealized requirements of rational discussion; on the other hand, these idealized requirements should function as a standard for the rationality of legal procedures.

In his *Theory of Communicative Action* (Habermas 1984–1987), he develops a discourse theory that elaborates the rational-discursive elements implicit in social interaction as a form of verbal communication. His analysis depends on the core thesis that such communication involves the exchange of speech acts, through which social actors try to coordinate action by linguistic means. On this view, communicative action depends on the use of language as oriented to mutual understanding. Consequently, only speech acts that are verbally expressed and aimed at mutual understanding can have a function in a rational discussion aimed at rational consensus. His *Moral Consciousness and Communicative Action* (Habermas 1990) further specifies the requirements of rational moral-practical discussions aimed at rational consensus. In this section, we first describe Habermas's ideas about the requirement of a rational consensus developed in his discourse theory and then go on to address the relation between the rationality of moral and legal discourse.

25.3.2. The Theory of Rational Practical Discourse and the Communicative Character of the Rational Acceptability of Moral Claims

To characterize the various ways in which social actors can argue about claims in a rational discussion, Habermas distinguishes the ways in which people can

argue about speech acts. When people exchange information, they presuppose that they meet the normal conditions of verbal communication. Normally such assumptions, in Habermas's terms "claims to validity', are not made the subject of discussion, but information is exchanged against a shared background. The accepted norms for communication are the starting points that form the basis of this common background.[6] If a claim to validity is questioned, the interlocutors can try to restore the consensus by opening a discussion or discourse (*Diskurs*) in which they try to reach a rational agreement about the acceptability of the claim on the basis of arguments. Habermas conceives argumentation as a dialogical process by means of which a proponent tries to convince the opponent of the acceptability of the validity claim. In his view, putting forward a validity claim presupposes an obligation to justify this claim if asked to do so. If the issue concerns a practical matter—one that involves a concrete course of action, general norm, or evaluation rather than a question of empirical truth—then the interlocutors engage in a *practical discourse* with the aim of reaching consensus on the question of whether the relevant normative or evaluative validity claim is justified.

Thus a central question of Habermas's discourse theory is how one can rationally justify moral commands, norms of action, ethical evaluations and the like through practical discussion. Starting from the perspective of communicative rationality, he develops a theory in which the rational acceptability of validity claims (e.g., moral commands, norms of action) depends on the way social actors coordinate their action by reaching agreement on the claim at issue. The bulk of Habermas's efforts to articulate standards for practical discourse have focused on practical discourses concerned with the justification of norms (whether a norm is moral, institutional, legal, etc.). The various forms of such discourses of justification are subject to the following abstract discourse principle (D), which states the general requirement for the validity, or rational justification, of a norm in general:

(D) Only those norms can claim to be valid that meet (or could meet) with the approval of all affected in their capacity *as participants in a practical discourse*. (Habermas 1990, 66; see also Habermas 1996, 107)

For moral discourses of justification, this general procedural principle is supplemented, or further specified, by a moral universalizability principle (U):

(U) *All* affected can accept the consequences and the side effects (the norm's) *general* observance can be anticipated to have for the satisfaction of *everyone's* interests (and these consequences are preferred to those of known alternative possibilities for regulation). (Habermas 1990, 65)

[6] For a discussion of the concept of the "lifeworld" see Habermas 1987, 119–52; 1998, chap. 4.

In order to be valid, every moral norm that claims rational acceptability has to fulfil this condition. Thus (U) functions as a rule of moral argumentation that makes agreement in practical discourses possible whenever matters of concern to all are open to regulation in the equal interest of everyone. Habermas emphasizes that (U) presupposes a communicative context in which social actors need to coordinate their actions by discussing normative validity claims in everyday life. By entering into a process of moral argumentation, the participants can continue their communicative action with the aim of restoring a consensus that has been disrupted. Thus moral argumentation in the context of a practical discourse serves to settle conflicts of action by consensual means.

Participation in a practical discourse in accordance with (D) implies various presuppositions on various levels. Habermas (1990, 87ff.) distinguishes three levels of presuppositions of argumentation: the *logical* level of products, the *dialectical* level of procedures, and the *rhetorical* level of processes. The presuppositions on the logical-semantical level concern the rules of a "minimal logic" and the consistency requirements proposed by Hare and others. These presuppositions have no ethical content. Drawing on Robert Alexy's analysis, Habermas formulates several logical rules concerning the prohibition of contradiction, the requirement of universalizability and the requirement of a consistent use of expressions (see Alexy 1989a). On the procedural level, argumentation involves a process in which proponents and opponents strive to reach an understanding. This level is defined by certain pragmatic presuppositions regarding the sincerity of the speakers and the obligation to provide reasons when attacking a norm not under discussion.[7] On the rhetorical process level, argumentation involves a process of communication aimed at reaching rationality motivated agreement. For this level, Habermas spells out the requirements of a speech situation immune to repression and inequality—thus a form of communication that approximates ideal conditions. These presuppositions (which he originally described as the presuppositions of an "ideal speech situation") specify "the general symmetry conditions that every competent speaker who believes he is engaging in argumentation must presuppose as adequately fulfilled" (Habermas 1990, 88). Again the formulation of these presuppositions are based on Alexy's rationality rules (see Section 25.4.2) which specify the requirements of rational practical discourse. Habermas considers these conditions as more than a potentially question-begging definition in favour of an ideal form of communication. Rather, they articulate inescapable presuppositions of every form of rational practical discourse. Anyone who seriously engages in discourse as a process of rational argumentation aims to *convince* an opponent of the acceptability of a problematic validity claim by producing arguments in a practical discussion that satisfies the aforementioned

[7] Habermas bases the formulation of these presuppositions on the formulation by Alexy 1989a.

pragmatic presuppositions. To be sure, real discussions can, at most, approximate these conditions. However, the ideal of communicative rationality is not a mere theoretical construction or a utopian ideal. According to Habermas, the ideal of communicative rationality is presupposed in every discussion in which the participants try to convince each other with arguments. Furthermore, the ideal functions as a critical instrument for evaluating discussions conducted in everyday life.

25.3.3. The Rationality and Legitimacy of Legal Discourse

Habermas (1990, 92) maintains that discourses take place in particular social contexts and are subject to limitations of time and space. The participants are real human beings driven by other motives in addition to the single permissible motive of the search of truth. Particularly in legal-political domains real discourse is not so pure. For one, the outcome is typically some legal norm or decision binding on a particular group of citizens, with their own particular history and values. Thus Habermas (1996) is of the opinion that meeting the requirements of moral justification is not a sufficient condition for a rational outcome of legal discourses. Outcomes should also cohere with the existing legal order—its structure and decision-making procedures—as well as with various ethical-political and pragmatic standards that form part of the self-understanding and capabilities of a particular society.[8] As Habermas (1996, 233–7; 1988) argues, the law is not subordinate to morality, and therefore legal discourse is not subordinate to moral discourse but is rather intertwined with it. Although legal procedures limit and enable moral argumentation in various ways, legal discourse is not a subset of moral discourse *per se*, but rather implements the broader discourse principle (D) for various legal-political contexts (see Habermas 1988, 247; 1996, 230–7).

With respect to the institutionalization of practical discourse in a legal setting it is important to distinguish idealized rules of discourse (such as those illustrated above) from conventions serving the institutionalization of discourses, conventions that help to actualize the ideal content of the presuppositions of argumentation under empirical conditions. This institutionalization raises the question of how we should regard the rationality or legitimacy of the law and legal processes. Insofar as the law institutionalizes moral discourse, in what respects can legal processes still be considered rational, and what are the implications for the legitimacy of law? Habermas tries to solve the problem of the legitimacy of law by approaching the question of the justification of le-

[8] See Rehg 1994, 219, 222–3, who argues that the legitimacy of law must be measured against a range of idealizations in addition to the moral principle (U), for example the technical-pragmatic assessment of efficient means and strategies and the non-discursive ideals of fair compromise formation.

gal outcomes from the perspective of the communicative rationality of moral-practical discourse. He holds that the relation between law and communicative rationality is a complementary relationship. On the one hand, law institutionalizes moral discourse as a form of conflict resolution within a polity as a legal community, thus complementing the limitations of everyday moral discourse with an impartial procedure for the decisive resolution of legal disputes. On the other hand, because the ideal of rational discussion offers a critical instrument for testing the adequacy of decision-making in constitutional democracies, communicative rationality functions as a methodical tool for determining the legitimacy of law.

25.3.4. Law, Morality, and the Relation between Legal Discourse and Moral Discourse

In approaching the rationality of law from the perspective of discourse theory, Habermas redefines the validity of law in terms of discursive justification: Valid legal norms must be rationally acceptable in the sense defined by the principle of rational discourse (D) and, insofar as justice issues are at stake, by the moral principle of universalizability (U). Thus he rejects the legal positivism that separates law and morality as two unrelated spheres. In opposition to Weber's positivism, Habermas opts for an account that integrates formal-procedural and substantive modes of rationality—such that both the formal and the substantive aspects of law have an implicit moral dimension. On this view, legality derives its legitimacy from a procedural rationality that is based on the idea that legal process should yield impartial solutions that can claim validity for all concerned. This form of rationality consists of an interlocking of moral-practical and institutional legal discourse: Processes of moral-practical argumentation are institutionalized by means of legal procedures (see Habermas 1988, 220, 228).

Following H. L. A. Hart and others, Habermas contends that the law consists of substantive or "primary" norms on the one hand and, on the other hand, procedural or "secondary" norms that serve to institutionalize processes of legislation, adjudication, and administration. These secondary norms institutionalize legal discourse, which operates "not only under the external constraints of legal procedure but also under the internal constraints of a logic of argumentation for producing good reasons" (Habermas 1988, 229).

From this perspective, legal discourse must meet the conditions of communicative rationality for discourse in general; therefore legal discourse is related to moral discourse. As already noted, law is not subordinate to morality but rather constitutes a specific institutionalization of morality defined by legal rules and procedures. But the moral principle becomes relevant for legal discourse insofar as such discourse involves moral reasons. Modern law consists of both legal rules and general legal principles. As Habermas notes, many of

these principles are both legal and moral, as for example in constitutional law, where we find moral principles of natural law reproduced as positive law.

On Habermas's approach, both moral and legal discourses are subject to criteria of discursive rationality captured in the discourse principle (D). In taking this stance he (Habermas 1996, 229ff.) opposes Alexy's (1989a, 212–20) thesis that legal discourse can be considered to be a "special case" or subset of moral discourse. Habermas directs his criticism especially at Alexy's view that the rules of discourse are not selective enough to necessitate single right decisions (at which moral and legal discourses aim), and at his idea that the rationality of legal discourse is relative to the rationality of legislation. In Habermas's opinion Alexy does not explain adequately how what the rules and argument forms taken from actual legal practice can be justified from the perspective of communicative rationality. Habermas argues that Alexy's "special thesis" has "the unpleasant consequence not only of relativizing the rightness of legal decision, but of calling it into question as such" (Habermas 1996, 232). More specifically, Alexy's analysis, as Habermas reads it, loses sight of the deontological character of legal norms and decisions.

Habermas conceives rational discourse as an abstract formulation of the conditions for the rationality of discourse on different kinds of action norms. Moral argumentation and legal-political discourse are both forms of rational discourse subject to the discourse principle (D). For various forms of legal discourse, such as democratic procedures in the area of legislation and court procedures, specific rules of procedure must compensate for the fact that moral discourse cannot guarantee an impartial and decisive solution (Habermas 1996, 234). In his view, procedural law does not regulate normative-legal discourse as such but "secures," in the temporal, social, and substantive dimensions, the institutional framework that clears the way for processes of communication governed by the logic of application discourses (see Habermas 1996, 235).[9] Codes of procedure define the bounds within which parties can deal with the law strategically.

Because law and morality are both governed by discursive criteria of rationality, legal discourses can be conceived as rational discussions that are institutionalized through legal procedures and governed by the same principles of rational discourse as other forms of practical discourse, including moral discourse.

[9] To illustrate this point, he refers to the German Code of Civil Procedure and Code of Criminal Procedure.

25.4. Alexy's Theory of Legal Discourse as a Theory of Rational Practical Discourse in a Legal Context

25.4.1. Introduction

The central question in the work of Robert Alexy is how normative statements, such as legal decisions, can be justified in a rational way. Alexy considers the process of justification of normative statements as a practical discussion or "practical discourse" and the process of justification of legal decisions as "legal discourse." Since a legal discussion in which legal norms are defended is a specific form of general practical discourse, a theory of legal argumentation should be founded on a general theory of this kind.

According to Alexy, a normative statement is true or acceptable if the judgement could be the result of rational discourse. The basic idea is that the rationality of the justification of legal decisions depends on the quality of procedures followed in the justification process. Because the acceptability of normative statements is connected to a certain procedure, he calls his theory a normative procedural theory. Alexy considers legal argumentation as a specific form of practical argumentation and starts out developing a general theory of rational practical discourse that can be implemented further for legal argumentation. The theory of rational practical discourse gives a specification of a procedure for a rational discussion as an ideal model that forms the normative standard to be used in assessing the quality of actual discourses as they occur in everyday practice. On the basis of this general model, in his legal theory Alexy specifies the specific legal implementations, adaptations, limitations, and extensions that are necessary for a theory of rational legal discourse.

Alexy develops his theory of general practical discourse and his theory of legal discourse in Alexy 1989a. In later works, Alexy elaborates on various parts of his theory. In his *Theorie der Grundrechte* (A theory of fundamental rights: Alexy 1986) Alexy elaborates on the distinction between rules and principles, and on weighing and balancing in the context of legal justification.

In the following sections Alexy's theory will be discussed. In Section 25.4.2 we describe the theory of general practical discourse, in Sction 25.4.3 the theory of legal discourse and in Section 25.4.4 the relation between legal and general practical discourse. In Section 25.5.5 we will discuss the role of rules and legal principles in the justification of legal decisions.

25.4.2. The Theory of Rational Practical Discourse

A theory of rational legal discourse requires, according to Alexy, a theory of general practical discourse about the rational justification of normative statements. In order to develop such a theory, in the first part of Alexy 1989a, Alexy investigates theories about the justification of norms and discusses insights from

analytic moral philosophy (including Stevenson, Wittgenstein, Austin, Hare, Toulmin, and Baier); Habermas' consensus theory of truth; the theory of practical deliberation of the Erlangen School; and Perelman's theory of argumentation. In the second part the results of this discussion are integrated into a theory of general practical discourse, consisting of rules and argument forms. In the third part Alexy presents his theory of legal justification, and describes how the general rules and forms can be adapted to the requirements of legal argument.

In the *theory of general rational practical discourse* Alexy formulates five groups of criteria for the rationality of practical discourse, containing a total of twenty two rules and six argument forms. In the first group, the *Basic rules*, the fundamental conditions for the rationality of verbal communication concerned with the correctness of normative statements are formulated. These rules concern adaptations of the logical requirement of non-contradiction, the sincerity condition of speech acts, Hare's principle of *universalisability* and the *Vernunftprinzip* from the Erlangen school concerning the common use of language. In the second group, the *Rationality rules*, the maximum requirements are formulated, derived from Habermas's conditions for the ideal speech situation. As has been explained in Section 25.3.2, Habermas considers a speech situation as ideal if the speakers are not hindered by force in participating in the discussion. In the third group, the *Rules for allocating the burden of argument*, the allocation of the burden of proof is regulated. These rules form expressions of the principle of universalizability that obliges a person to justify treating person A different from person B, Perelman's *principle of inertia* which provides that an accepted opinion should not be abandoned without good reasons. The fourth group contains the *Argument forms* for the justification of singular normative statements and for the justification of rules. These argument forms form a specification of the practical syllogism for the justification of normative statements (see Alexy 1991, 412–7). The rules of the fifth group, the *Justification rules*, describe the forms of criticism the justification of normative statements should be able to stand. These rules specify the requirements for the content of the argument forms. The rules are based on Hare's principle of *universalizability*, Habermas' principle of universalizability and Baier's principle of *universal teachability*. The rules of the sixth group, the *Transition rules*, regulate a transition to other forms of discourse.

The general theory of practical discourse distinguishes three levels of rationality. On the first level, the general idea of practical rationality is formulated. On the second level, this very vague idea is given a more precise interpretation by means of principles of practical rationality. On the third level, the relatively vague and often conflicting principles are defined and co-ordinated into a system of rules (see Aarnio, Alexy, and Peczenik 1981, 267).[10] The theory of general practical discourse is based on six principles formulated on the second

[10] For the distinction between rules and principles see Alexy 1979, 1986, chap. 3.

level: consistency, efficiency, testability, coherence, generalizability, and sincerity. These principles underlie the rules discussed above. A principle can support several rules. Similarly, a rule can be supported by several principles.

The rules of general practical discussions do not guarantee that agreement can be reached on every subject or that any agreement obtained will be final and irreversible. One reason for this is that the rationality rules can only be partially fulfilled. A second reason is that the steps in the argument are not all fixed steps. A third reason is that every discourse must invoke historically given, and hence changeable, normative preconceptions. Critics have remarked that one of the disadvantages of Alexy's theory is that it does not guarantee a final result. According to Alexy, the fact that the theory does not secure a result is one of its advantages. In response to his critics Alexy (1991) observes that a distinction should be made between ideal discussions in which the participants communicate under ideal circumstances, and real discussions in which these circumstances are absent. In an ideal situation practical problems are resolved without time limits and other restrictions affecting the participants. They are also characterized by complete clarity regarding the use of language, participants who are fully informed on factual questions, and participants who are capable and prepared to exchange roles. In real discussions on practical questions, there are usually more than two right answers. However, in real discussions, participants raise claims concerning correctness (irrespective of the question of whether one right answer is indeed possible). Otherwise, their justification would be pointless.

Because there is, in principle, more than one right answer to a practical question, a practical discussion conforming to the rules of general practical discourse can yield two incompatible normative statements N and not-N. This happens when N and not-N are justified on the basis of different value systems. Such an outcome is possible as long as the justifications of the participants who defend N and not-N do not contain contradictions. The prohibition of incompatibility does not guarantee the exclusion of incompatible value systems of different speakers. It implies only that when someone argues that there is one right answer (on the basis of the prohibition of incompatibility), he or she confuses truth with the possibility of proving that something is acceptable from the perspective of a particular value system (see Alexy 1991, 413). Although the rules do not guarantee one right outcome, the theory is not useless for the evaluation of real discussions. The rules can prevent irrational behaviour because they constitute an instrument for a critical assessment of discussions conducted in everyday practice.

25.4.3. The Theory of Legal Argumentation (*by Eveline Feteris and Harm Kloosterhuis*)

As we already indicated, one of the strengths of the theory of general practical discourse is that it leaves the task of shaping the discussion with respect to

the content of the arguments to potential discussants, and that it sets up only requirements to the rationality of the procedure. Legal disputes require a final and clear outcome. Therefore, in law there is a special procedure with legal norms. When a final decision is necessary it is rational to agree on rules which limit the area of what is "discursively possible." Examples of such rules are rules of parliamentary legislation and various rules of legal procedure. In his theory of legal argumentation, Alexy formulates specific legal rules which are designed to guarantee that a rational result can be achieved. In addition to the general requirements of rationality, these rules should also meet such specific legal requirements as legal security, justice, and legitimacy.

In the justification of legal decisions, Alexy distinguishes two aspects. In accordance with an accepted distinction in legal theory (see Wróblewski 1974) he distinguishes between an *internal justification* and an *external justification*. An internal justification is concerned with whether the decision follows logically from the premises adduced as justifying it. In an external justification, the acceptability of these premises is defended.[11] According to Alexy, the external justification is the central focus of legal arguments, and therefore forms the central topic of a theory of legal argumentation. The central question in the external justification is whether the arguments used in the internal justification are acceptable according to legal standards.

The basic form of the internal justification that Alexy formulates for legal discourse is a specific implementation of the so-called legal syllogism in which the decision, the normative statement about the legal consequences (3), is justified by referring to a universal norm (1) and a description of the factual conditions (2) for application of the legal consequences described in the norm:

(J.1.1) (1) (x) (Tx — ORx)
(2) Ta
(3) ORa (1), (2)

This basic form of internal justification is applicable only when it is not in question that the universal norm is applicable to the facts. Often it is not clear whether the norm is applicable, because it can be interpreted in several ways. There are three kinds of reasons as to why the universal norm might be unclear. First, an expression used in the norm may prove to be ambiguous. Second, an expression can be vague so that it is unclear whether a particular form of behaviour may be considered as for instance a tort. Third, an expression used in the norm may be evaluatively open. The meaning of such evaluatively open terms should be established in relation to the context in which they are used. In more complex forms of internal justification these problems must be solved by formulating a semantic rule.

[11] See MacCormick's (1978) distinction between deductive and second-order justification.

The rules of internal justification specify the requirement that every legal decision must contain at least one universal norm (J.2.1) and that every decision must follow logically from a universal norm, together with other premises in which, for example, a semantic rule is formulated (J.2.2).[12] They prescribe that as many decompositional steps should be articulated as are necessary to make it possible to use expressions whose application to a given case admit no further dispute (J.2.4) and that the argument must be made complete (J.2.5). The rules of the internal justification guarantee a certain degree of rationality, because they require that assumptions that otherwise would remain implicit should be make explicit. However, the rationality of the justification as a whole is dependent on the acceptability of the premises. The decision about the rationality of the final judgement is therefore dependent on the external justification.

In the external justification the premises of the internal justification are defended. Because these premises can be of quite different kinds, different modes of justification should be distinguished. Justification of a rule of positive law takes place by showing that it meets the criteria of validity of the legal order. A wide variety of procedures can be brought into play in the justification of empirical premises. These range from the methods of empirical science through maxims of rational presumption to rules on the burden of proof in a trial. Finally, what can be called *legal argumentation* or *legal reasoning* serves to justify those premises which are neither empirical statements nor rules of positive law, such as the semantic rules used in the internal justification.

The rules and argument forms of the external justification can be divided into six groups. The first group contains rules for the use of the legal interpretative argument forms. The other groups contain rules for the use of dogmatic argumentation, the use of precedents, and the use of the so-called special legal argument forms such as analogy, *argumentum a contrario*, and *argumentum a fortiori*.[13]

The first and most important group of rules of external justification pertains to argument forms used in the *interpretation* of legal norms (J.3-J.5). These argument forms are based on such *canons of interpretation*, that is the semantic, genetic, teleological, historical and systematic methods of interpretation. The rules relate to the justification of statements used in the internal justification. If the expressions used in the universal norm allow more than one interpretation, the chosen interpretation should be justified by means of one of the forms of external justification.

Since an argument of a particular form is complete only if it contains all the premises belonging to its form, Alexy formulates a "saturation rule" requiring

[12] In what follows, I will refer to Alexy's rules by using his own numbering.

[13] For empirical arguments and general practical arguments Alexy adds no specific rules, but refers to the rules of general practical discourse.

that a full statement of reasons is required in every argument which belongs to the canons of interpretation (J.6). In order to ensure that arguments that express a link with the legal order take precedence over non-legal arguments, Alexy formulates several rules concerning the use of the canons of interpretation. The rule prescribe that arguments that are based on the canons of interpretation must be given due consideration (J.9), that arguments referring to the actual words of the law or the will of the historical legislator take precedence over other arguments unless rational grounds can be given to act differently (J.7), and that the determination of the relative weight of arguments different in form must conform to weighting rules (J.8) (see also section 18.16.6.).

The second group of rules of the external justification concerns the use of propositions from legal dogmatics. The propositions from legal dogmatics may consist of definitions of legal concepts, definitions of other concepts occurring in legal norms, formulations of principles, etc. When justifying an interpretation, propositions taken from legal dogmatics should, if available, be used (J.12). The dogmatic propositions themselves must be justified by recourse to general practical arguments (J.10) and must be consistent with other dogmatic propositions and positive norms (J.11).

The third group of rules relates to the use of precedent, prescribing that a precedent must be cited if this is available (J.13). The basic reason for following precedents is the principle of universalizability, the requirement that we treat like cases alike. If someone wants to make an exception, the burden of argument lies with him or her (J.14). He or she will have to show why the concrete case differs from that decided upon in an earlier decision.

The fourth group of rules contains the rules for special argument forms which are used in legal methodology for the interpretation of legal rules such as *argumentum a contrario* (J.15), analogy argumentation (J.16), *argumentum ad absurdum* (J.17). Also here the "saturation requirement" applies implying that the special legal argument forms must have the reasons stated in full (J.18). These forms of argumentation are a specific implementation of the general argument forms of practical argumentation. (J.15) is a logically valid argument, (J.16) is an application of the principle of universalizability, and (J.17) is a form of argumentation from consequences.

Finally, Alexy discusses the role of general practical arguments in legal argumentation. General (moral) arguments are necessary if no legal arguments are available, they may be used in justifying a choice between two interpretations or in justifying arguments used to complete the interpretative argumentation schemes. Practical arguments may also be used in justifying propositions taken from legal dogmatics. An important function of practical argumentation lies in the justification of a choice between different weighting rules in situations admitting the application of rules which lead to different results. Practical arguments may also be employed in justifying statements used in internal justifications.

25.4.4. Legal and General Practical Discourse

Alexy takes legal argumentation to be a special case of general practical argumentation. This implies, firstly, that the rules and forms of general practical discourse should be implemented in a specific way so as to guarantee a final decision. Secondly, it implies that the legal claim to rationality is weaker than the general claim to rationality: In a legal discussion, the central question is how a normative statement can be justified in a rational way within the framework of the valid legal order (see Alexy 1989a, 289). Thirdly, it implies that legal argumentation is always based on general practical argumentation, but within the limits of the legal order. General practical argumentation is always necessary to justify choices between statements used to complete various legal argument forms (see J.7).

Alexy indicates that various forms of legal discussion exist, and that some differ more from general practical discussions than others. Discussions between legal students, between lawyers and their clients, and debates on legal matters in the media have fewer restrictions than a discussion in legal science (legal dogmatics). A discussion in science is in turn less constrained than a judicial deliberation or a debate in a court of law.

Within the different forms, the extent and kinds of constraint are very different. The freest or least constrained is a discussion of a legal scientific kind. Constraints are greatest in the context of a trial. According to Alexy, however, this does not imply that legal proceedings should be considered as a strategic undertaking. The various forms of legal procedure can be considered as an intermediate form of discussion coming between a rational practical discussion and a strategic undertaking.

According to Alexy, the claim to correctness of a normative statement raised in a legal proceeding can best be characterized by means of the notion "rational discussion'. Participants in legal proceedings claim to be arguing rationally. Parties and their lawyers make claims to correctness even if they are only following their own subjective interests. Although the parties do not try to convince each other, they claim that every rational being should agree with them. They at least claim that in an ideal situation, everyone would agree with them. So, in legal proceedings parties advance claims to correctness in the same way that parties to a rational practical discussion do (see Alexy 1989a, 218–20).

Alexy remarks that whether today's procedural structures of process are to be regarded as rational is a different question. This must not be answered in the negative simply by alluding to the fact that the freedom of the participants in the discussion is limited. Rather more decisive is whether, in view of the need for a decision, the limitations set down by the rules of legal process offer a sufficient chance of arriving at the outcomes which would have resulted under ideal conditions. According to Alexy, it would be possible to discover

which of the various forms of process best satisfy the conditions of a rational discussion only through extensive empirical investigation.

In legal proceedings, there are specific rules which limit the area of what is "discursively possible" left open by the rules of legal discussions. The rules of procedure for legal proceedings (Pg) ensure that only one possibility remains once Pg is finished. In legal proceedings, besides legal arguments legal decisions are required. The necessity of a legal decision does not imply a farewell to reason, though. That a decision is made in the course of a procedure is reasonable, considering the structure of the procedures of general practical discourse, the procedures for establishing legal rules, and the procedures for legal argumentation (see Alexy 1981, 187–8). By making reference to the procedures of general practical discourse and legal argumentation, a rational justification of legal decisions can be offered.

25.5. Aarnio's Theory of the Justification of Legal Interpretations

25.5.1. Introduction

Aulis Aarnio (1937–) addresses the question of how legal interpretations should be justified. Aarnio considers a justification to be rational only if the justification process has been conducted in a rational way, and if the final result of this process is acceptable to the legal community. According to Aarnio, a theory concerning the justification of legal interpretation should contain a *procedural* component specifying the conditions of rationality for legal discussions, and a *substantial* component specifying the material conditions of acceptability for the final result. The procedural component of Aarnio's theory formulates rules for the *rationality* of legal discussions. The substantial component specifies when the result of a legal interpretation can be called acceptable. Aarnio considers such a result acceptable if it is acceptable to a particular legal community in which there is consensus with respect to certain norms and values.

In his first book *On Legal Reasoning* (Aarnio 1977), Aarnio tries to link the rationality of legal interpretations to ideas from Wittgenstein concerning the ordinary use of linguistic expressions. Correspondingly, Aarnio emphasizes the importance of the role of a common use of language and common values in the interpretation of legal rules. In later publications, in *Legal point of view* (Aarnio 1978) and *Denkweisen der Rechtswissenschaft* (The point of view of legal science: Aarnio 1979), and in various articles, he develops an elaborated version of the theory of legal interpretations. In *The Rational as Reasonable. A Treatise of Legal Justification* (Aarnio 1987), he brings together the insights developed in his earlier work.

As a further introduction to Aarnio's conceptual framework, Section 25.5.2 will deal with the concept of an interpretation standpoint, and Section 25.5.3

will show how such a standpoint is justified. The topic of Section 25.5.4 is the distinction between the rationality and acceptability of legal interpretations. Sections 25.5.5 and 25.5.6 examine the role in Aarnio's theory of the concepts rationality and acceptability.

25.5.2. The Interpretation of Legal Norms

In determining the content of a legal norm, it is often necessary to establish the meaning of the text of the law, or of a certain term used in the text of the law, by interpreting this text or term. A statement about the meaning content of a particular expression is in Aarnio's terms called an *interpretation statement* (for example "The expression 'unlawful act' in clause X of statute Y means Z"). A claim expressing an interpretation of a legal rule is called an *interpretation standpoint* (for example "It is rational and correct to accept the statement Z as an interpretation of the expression 'unlawful act' in clause X of statute Y"). When a judge decides what the correct interpretation is of a certain legal norm, he has chosen between several alternative interpretations of this norm. The discretionary power of a judge to choose one of several interpretations is, however, limited. The decision must be in accordance with the requirement of legal certainty. According to Aarnio, this means that the decision must be reached in a proper manner, and should be in accordance with valid law and social norms. To show that he or she has acted in accordance with the requirements of legal certainty, the judge has an obligation to justify his decision, by showing that he has used his discretionary power in an acceptable way.

Because the interpretation of legal norms plays an important role in the legal decision process, Aarnio takes it to be one of the central tasks of legal theory to develop a theory concerning the justification of the interpretation of legal norms. To meet the requirement of legal certainty, the justification process should be conducted in a rational way and the final result should be acceptable to the parties. In his theory of legal interpretations, Aarnio tries to specify the requirements a justification should meet in order to be called rational and acceptable.

Aarnio's theory concerning the justification of legal interpretations forms an analytical proposal in which he develops an idealized model of legal argumentation. It is intended for people who want to meet the requirement of legal certainty. The aim of the idealized model is to provide insight into the language game of legal interpretations, and to make it possible to criticize the way in which this game is played (see Aarnio 1987, 75–6).

Aarnio considers his theory of legal interpretations as an analytical-normative theory. It is analytical because the various concepts used in the justification are analysed, and it is normative because it seeks to formulate the norms for a justification of legal interpretations which meets the requirement of legal certainty.

25.5.3. The Justification of an Interpretation Standpoint

Aarnio considers the justification of an interpretation standpoint as a dialogue (see Aarnio 1987, 108). The starting point of an interpretation dialogue is a disagreement between a person A and a person (or group of persons) B who disagree on the correct interpretation of an expression Li$ and therefore adopt different standpoints with respect to the correct interpretation. A's arguments are aimed at convincing B in a rational way of the acceptability of his standpoint. If A and B agree on rational grounds, the justification has succeeded. Depending on the amount of counter arguments that are brought forward by B, the pro-argumentation of A may consist of different levels of argumentation.

The content of the argumentation depends on the nature of the arguments that A puts forward in defence of his interpretative standpoint. Aarnio distinguishes various ways of justifying an interpretation by using various types of warrants: so-called preparatory material, a systematic interpretation, court decisions, the doctrinal opinion, and practical reasons. When using the legal warrants such as the reference to interpretation methods, jurisprudence, and doctrinal opinions as an argument, the interpreter saying that a certain legal source can be adduced as a support of the interpretation.

Reference to practical reasons is normally presented as the consideration of consequences. This type of reasoning involves the clarification of possible consequences concerning the interpretative alternatives at hand, and placing these consequences in a certain order of preference. Using this type of argument, the interpreter is saying that consequences Ci of Interpretation I1 is the best justified when compared to the consequences Cj of interpretation I2. According to Aarnio, arguments referring to consequences should always be complemented by other arguments citing legal sources, because an interpretation can be justified only when based on legal sources.

The type of argument used and t he way in which the various arguments are combined depend on the type of legal question, the legal sources available, and on the rules of interpretation of the legal system.

25.5.4. Internal and External Justification

Following Wróblewski 1974 and Alexy 1989, Aarnio distinguishes between an *internal* and an *external* justification of an interpretation standpoint. In an internal justification, an interpretation is derived from certain premises in accordance with accepted rules of inference. The validity of the premises and rules of inference is taken for granted. In an external justification, the validity of the premises and the rules of inference are justified.

The central problems of legal justification are concerned with this external justification. The question of whether or not the interpretation follows logi-

cally, or in Aarnio's terms internally, from the material premises and rules of inference and values is, n his view, trivial. The premises, the rules and values, can always be reconstructed afterwards. The central problem of the interpretation of legal norms is the choice and content of the premises, and the way in which the suitable principles of inference of basic values are chosen. The problem of legal discourse is thus concentrated upon the external justification.

25.5.5. The Rationality and Acceptability of Legal Interpretations

Aarnio claims that the justification of a legal interpretation is sound only if the discussion in which it is defended has been conducted in a rational way, and if the final result is acceptable to the legal community. The requirement of *rationality* concerns the discussion procedure. The justification of a legal interpretation is a dialogue between an interpreter and an addressee, and is therefore a form of communication. Following Habermas, Aarnio calls the rationality of an interpretative discussion *communicative rationality*. Communicative rationality is related to two aspects of discursive rationality.

First, rationality is related to the *form* of an argument. An internal justification in which the conclusion follows logically from the premises is rational with respect to its form. This form of logical rationality Aarnio calls *L-rationality.* Second, rationality is related to the discussion *procedure* . A legal external justification is a form of practical discussion, which should be conducted in accordance with certain rules. The rationality of such a discussion is called *D-rationality*. In Aarnio's theory, rationality concerns the logical form of the argument (L-rationality) and the discussion procedure in which the premises are justified (D-rationality).

The requirement of *acceptability* is related to the result of the interpretation (the conclusion of the syllogism), i.e., the content of the interpretation. The result of the interpretation process is acceptable if it is in accordance with the value system of the legal community. A theory of the rational acceptability of legal interpretations should therefore consist of a *procedural* theory of argumentative discussions and a *substantial* theory of material acceptability. In the procedural theory, the general conditions of rational discussions should be formulated. In the substantial theory, it should be specified when the result of a discussion is acceptable to a certain legal community.

25.5.5.1. The Procedural Component of the Theory: The Rationality of Discussions about Legal Interpretations

In the procedural component of his theory, Aarnio follows Alexy in distinguishing five kinds of conditions for a rational discussion: consistency, efficiency, sincerity, generalizability, and support. On the basis of these five conditions Aarnio distinguishes five groups of rules for legal and non-legal discussions.

He also distinguishes two groups of rules for the burden of proof, which are specific for legal discussions.

The rules concerning the rationality of discussions can be divided into five groups of rules. In the first group of rules, the *consistency rules*, the requirement is that each step in the discussion should meet the condition of logical consistency (and therefore, in Aarnio's terms, the requirement of L-rationality). The requirement of logical consistency implies that there be no internal contradictions, that no assertion and its negation can occur within the same justification. According to the prohibition of internal contradiction, it is prohibited to say that X has property P and that X does not have property P at the same time.

In the second group, the *efficiency rules*, the participants in the discussion must use language in the same way. A material difference of opinion can only be resolved rationally if linguistic differences of opinion are removed. According to Aarnio, a linguistic difference of opinion occurs when two participants use the same term to refer to different objects, or when they use different terms to refer to the same object.

In the third group, the *sincerity rules*, various requirements are formulated. First, the demand of honesty, that a discussant may not employ a justification that he knows is defective. A person who consciously makes use of non-valid justifications is not attempting to influence the result on material grounds, but through persuasion. Second is the requirement that everyone who speaks the language in question has a right to participate in the discussion, and that every discussant has the right to question a presented statement. There should be no psychological or physical coercion preventing someone from putting forward his or opinion, and no subject should be excluded from the discussion. Third is the demand of impartiality and objectivity. This means that the interpreter must not only present his or her own views but also arguments that go against his reasoning. In law, this requirement is referred to as *audiatur et altera pars*.

The fourth group, the *generalization rules*, require that a discussant refers only to value judgements that he or she is prepared to generalize in order to cover other similar cases. Violation of the rule of generalization results in *ad hoc* arguments, whose justificatory power may not extend beyond a particular situation. The rule of generalizability implies firstly that one must accept the consequences of a norm one accepts, even if they adversely affect one's own position, and secondly that the consequences of a norm satisfying a given person's interests must be acceptable to everybody else: You must behave in such a way that your act can be generalized.[14]

The fifth group, the *support rules*, contain the requirement that every proposition must be justified on demand.[15] The most important condition for

[14] Cf. Alexy's justification rules discussed in Section 25.4.2.

[15] Cf. Alexy's rationality rules discussed in Section 25.4.2.

a justification is the requirement of coherence. For the justification of a legal interpretation, this implies that the statement should be coherent with the legal sources which are put forward in support. According to Aarnio, coherence implies firstly that statements are not logically contradictory. No individual source of law can be both a pro and a counter argument. Also, a source of law Si% and its opposite -Si% cannot be used as justification. Second, it is required that the justification be relevant to the interpretation . According to Aarnio, a legal source is not relevant to a certain interpretation if it is possible to justify the interpretation without making reference to the legal source.

The rules concerning the burden of proof can be divided in two main groups. The first group includes the procedural rules of justification, which are related to conditions under which someone has the burden of proof. The second group includes rules concerning the burden of proof which relate to the content of the justification.

Aarnio's procedural rules are based on some of Alexy's rules for the burden of proof discussed in Section 25.4.2. They specify that the burden of proof lies with a person who criticizes the prevailing situation and wants a change, that a person who has presented a justification is only obliged to present additional justification if asked to do so, and that a person who refers to a proposition or standpoint that is not relevant to the justification has the burden of proof.

Aarnio's first material rule for the burden of proof is based on Alexy's first rule for the burden of proof. They specify that someone who violates the principle of equal treatment is obliged to present a justification why A and B should be treated differently in similar situations. Furthermore he formulates rules that are based on the Finnish tradition in legal dogmatics for the use of legal sources. These rules specify that if preparatory material is bypassed, the person who does this must justify his behaviour, and that if a person does not refer to the court praxis on the matter in question, he or she must justify such a course of action.

25.5.5.2. The Substantial Component of the Theory: The Acceptability of Legal Interpretations

In the foregoing it was explained how a legal interpretation can be justified in a rational way. Even if the justification process has been conducted rationally, it does not imply that the content of the interpretation is acceptable. In the *substantial* part of his theory dedicated to the *acceptability* of the *result* of an interpretation discussion, Aarnio focuses on when the interpretation is acceptable to a certain legal community.

For a legal interpretation to be acceptable, the interpretation should be *coherent* with legal sources and with interpretation methods which are generally accepted in the legal community. The question of whether an interpretation is coherent with accepted legal sources and interpretation methods is in its turn

dependent on the *consensu*s on starting points, norms, and values within a given legal community.

Aarnio borrows Wittgenstein's notion of "forms of life" and Perelman's notion of "audience" to make clear how the acceptability of an interpretation standpoint is connected to consensus in a certain legal community.

To connect the acceptability of a legal interpretation to the concept of a "form of life," Aarnio makes a link with Wittgenstein's concept of a language game. In Aarnio's view, argumentation always takes place within a certain framework, a *language game*, which has been constructed on a basis which is not called into question. The basis is formed by a "nest" of propositions, which Wittgenstein calls the "picture of the world" (*Weltbild*). This picture of the world, again, is based on a form of life which is formed by the acts which are carried out in the communication between members of the community. A form of life consists of the whole set of values and norms shared by the social community. People belonging to the same form of life share the same norms and values, and people belonging to different forms of life have different norms and values.

According to Aarnio, a rational justification of a legal interpretation is only possible within a form of life. An interpreter can convince an addressee in a rational way only if the addressee belongs to the same form of life. If both the interpreter and the addressee belong to the same form of life, they can understand each other and it should be possible, in principle, to reach rational agreement. If they belong to different forms of life with "family resemblances," they can understand each other, but will not be able to reach agreement on a rational basis.

In principle, there are as many acceptable interpretations of a legal norm as there are forms of life. However, the acceptability of an interpretation is not arbitrary. There is a relation of family resemblances between various forms of life. There are parts of different forms of life which overlap. If there are sufficient family resemblances between two or more forms of life, the members can reach consensus with respect to evaluation criteria. When there is such a consensus, the participants in the discussion not only understand each other, but can also accept each other's opinions, although the acceptance is not based on rational considerations. In such cases Aarnio speaks of a compromise (see Aarnio 1987, 212–3).

To explain how the acceptability of an interpretation standpoint is connected to consensus in a legal community, Aarnio links Wittgenstein's concept of the form of life to Perelman's concept of the audience. A legal interpretation is always directed to a certain addressee. In a legal context, this addressee is the legal community. Following Perelman, Aarnio calls the addressee of a legal interpretation the *audience*. The audience consists of individuals who share a common form of life. Aarnio extends Perelman's concept of the audience as norm for argument acceptability.

In Aarnio's view, the concept of what he calls a *particular ideal audience* a useful elaboration of the idea that the rational acceptability of a justification of an interpretation is both dependent on the general conditions of rationality and on the norms and values shared by the members of a legal community.[16] The audience is particular because it consists of a group of persons who share particular norms and values within a particular form of life. The audience is ideal because it consists of individuals who are able and prepared to evaluate the interpretation in the context of a discussion conducted in accordance with the rules of rational discussion.

It is Aarnio's opinion that the rational acceptability of an interpretation to a particular ideal audience has a social meaning. If the majority of the members of a legal community thinks, in accordance with the requirements of D-rationality, that it is rational and reasonable to accept a certain standpoint, then this standpoint has a greater social relevance in that legal community than an alternative standpoint. The social relevance, however, is not based on persuasion, the use of power or authority, but on the rational force of the justification.

The idea of the acceptance by the majority as a norm for rational acceptability should not be taken to mean that people should have the opportunity to vote on a normative standpoint, or that a standpoint counts as true in a society if the majority votes for it. The majority referred to here is not an ideal concept, but it is composed of the rational persons sharing certain values with respect to a certain legal question. The more rational members of an ideal audience who accept a standpoint, the greater the social relevance of the standpoint.

To sum up, in Aarnio's theory, the form of life has to functions. First, it is a necessary condition for a rational discussion. A rational discussion about values is possible only among people who share certain basic values. Second, it defines the framework within which a rational discussion is possible. Between members of two different forms of life no rational discussion is possible, because a rational discussion is dependent on certain commonly shared values. People belonging to different audiences can persuade each other, but cannot convince each other on rational grounds.

25.6. Peczenik's Theory of Legal Reasoning and Legal Justification

25.6.1. Introduction

In his work on legal argumentation, Aleksander Peczenik (1937–2005) has developed a normative theory of legal reasoning. He has done this by specifying

[16] See Alexy (1989a, 102) in his discussion of Habermas's consensus theory of truth, who remarks that the acceptability of a standpoint is connected with the opinion of people who can enter a discussion; a condition for the truth of an utterance is the potential agreement of all people.

the criteria that must be used in assessing the rationality of legal justification. He analyses the foundations of the legal method by clarifying the implicit underlying assumptions that characterize the process of legal reasoning and legal decision-making as a method for the rational justification of practical decisions in law. He has done this with the aim of clarifying the structure of legal justification by analysing the different stages of the process of legal decision-making. This analysis provides insight into the underlying levels of justification, and in the operations that are carried out on these different levels.

In what follows we will discuss the key components of Peczenik's theory of legal reasoning and justification as developed in Peczenik 1983 and Peczenik 1989 as well as in other publications. We will do this by concentrating on the two components of his theory that are important from the perspective of the rationality of legal justification. The first component, which can be considered as the analytical-reconstructive component, concerns the different levels of the process of legal justification and the operations that underlie the reasoning process on these levels of justification. In this component he reconstructs the underlying structure of the process of legal justification. The importance of this reconstruction lies in the fact that it clarifies the different choices and value judgements that are underlying the decision that a particular legal rule should be applied to a concrete case.

The second component, which can be considered as the normative-evaluative component, concerns the different criteria of rationality and standards of acceptability that should be met for a legal justification to count as a rational justification. The importance of the distinction between the different forms and criteria of rationality lies in the fact that it makes clear that for different aspects of the argumentation different criteria of rationality apply.

25.6.2. The Analytical-Reconstructive Component: The Reconstruction of the Different Levels of the Process of the Justification of Legal Decisions

One of the central problems of the legal method in general, and the theory of legal interpretation and argumentation in particular, is the problem that when applying the law, a judge has a certain discretionary space in selecting legal sources and interpreting these legal sources. For the rationality of legal justification this problem raises the question how in "hard cases" in which the justification is based on a certain discretionary space, a legal decision can be justified in a rational way. In Peczenik's view in hard cases in which a legal rule must be interpreted or a new rule must be created, from a logical perspective there is a "gap" in the reasoning process from the premises to the conclusion. In his terms, a *jump* is made from the facts and the legal material to the decision. To make this jump into a deductively valid argument, a *transformation* must be performed. When the judge interprets the rule, the transformation implies that the legal rule changes; and when the judge creates a new rule,

the transformation implies that a new rule is added. The general idea is that a transformation is performed if the step from the legal rule and the description of the facts can be made deductively valid only by adding a premise that is not generally accepted. A transformation serves to make the relation between the decision, the conclusion of the argument, and the facts, the premises, which normally remains implicit, explicit. In legal reasoning, different forms of such transformations are performed. The nature of the transformations depends on the different levels of the justification on which they are carried out. On the different levels, different forms of inference rules are necessary and for this reason different forms of justification are required. The different levels of justification concern the transformation into the law and the transformation inside the law.

25.6.3. The Various Transformations in the Justification of Legal Decisions

25.6.3.1. The Transformation into the Law

On the first level, the *transformation into the law* is performed. This transformation implies that, starting from a set of non-legal social facts and values, the conclusion is drawn that a particular system of rules is a legal system of valid norms that ought to be observed. With the explanation of the structure of the transformation into the law Peczenik tries to explain which reasoning process is underlying the decision that a system of norms is a legal system that should be obeyed. The reasoning process starts with certain observations about the existence of a certain norm-system and then assigns legal validity to this norm-system as a whole, to the constitution and perhaps to other legal sources. In this process, according to Peczenik, a transformation into the law is performed. The transformation into the law consists of two subtransformations: the *criteria transformation* and the *category transformation*.

The transformation into the law normally remains implicit. In their everyday communication lawyers presuppose that the legal norms which they apply are valid law and thus ought to be observed. However, it is necessary to make all of the steps that normally remain implicit, explicit if the following question arises in a discussion in the context of legal philosophy: "why are legal norms valid law and why must they be observed?"

The criteria transformation and the category transformation are the two sides of the transformation into the law, which are only distinguished because of analytical reasons. The criteria transformation is concerned with the legal "validity" and the stress is on the non-deductive step from the criteria identifying a norm as valid law to the conclusion that this norm N is valid law. The category transformation is concerned with the legal "should."

The first transformation, the *criteria transformation*, implies that particular legal sources are considered to be sources of valid law. This transformation

concerns the "jump" from certain social facts (concerning the legal organization of society) and non-legal values (concerning the minimal moral conditions that must be met for a normative system to be a legal system) to the conclusion that the constitution is a source of valid law. The underlying inference rule that has to be made explicit concerns the assumptions that constitute in Hart's terms the "rule of recognition" that should be reconstructed as an inference rule that makes the argument complete and valid.

The criteria to be fulfilled consist of certain *social facts*, relating to the legal organization of society. They relate to the way in which statutes and other legal rules are created, interpreted, observed and enforced. Furthermore the criteria consist of certain *evaluative and/or normative requirements*, relating to the minimal moral conditions that must be met for a normative system to be a legal system (for example legal certainty and the consideration that the system does not contain or generate too many grossly immoral norms and practices).

The second transformation, the *category transformation,* concerns the jump from the fact that a normative system is considered to be a legal system of valid legal norms to the conclusion that this system of legal norms ought to be observed. The underlying inference rule that has to be made explicit concerns the assumptions that constitute the basic norm, in Kelsen's terms the *Grundnorm,* that must be reconstructed as an inference rule that makes the argument complete and valid.

The *Grundnorm* is considered as an inference rule or transformation rule because the conclusion that certain rules belong to a particular normative system and should be observed from a legal point of view does not follow deductively from the assertion that there are certain social facts and non-legal values. This process of drawing the conclusion that the constitution should be observed, from a set of social facts and non-legal values, is called the *category-transformation*. This transformation is based on an inference rule that if certain criteria are fulfilled, a particular norm N ought to be observed from a legal point of view.

25.6.3.2. The Transformation inside the Law

On the second level, a *transformation inside the law* is performed. This transformation assigns legal validity to the lower legal sources and to concrete decisions. The transformation inside the law consists of three sub-transformations. The first transformation, the *source transformation*, attaches a legal "ought" to a lower legal source by reconstructing the underlying inference rule that explains why the legal source can be considered as valid law. The second transformation, the *general norm transformation*, reconstructs the underlying inference rule on the basis of which the conclusion is drawn that a general legal rule taken from a particular legal source has a particular meaning. Finally, the *decision transformation* reconstructs the underlying inference rule on the basis

of which the conclusion is drawn that, given a particular legal source and certain legal facts, a particular decision is justified.

The *source transformation* attaches a legal "should" to a particular legal source. In easy cases, the legal "should" can be applied to the source by means of a reasoning process which involves no other secondary sources. However, in hard cases the legal source can only be identified and provided with a legal "ought" via a reasoning process that involves secondary sources.

Each legal system has a particular hierarchy of legal sources: must sources, should sources, and may sources. When using a must-source, a lawyer does not need to refer to another legal source, so no further transformation is required. When using should or may sources, a lawyer must refer to other sources. Use of these sources requires justification. This means that a transformation must be performed in which the step from the secondary legal source to the decision is justified. This transformation specifies how legal validity can be assigned to the secondary sources by using certain criteria that are derived from the doctrine of the legal sources of a particular legal system.

The *general norm transformation* is concerned with the question of what the exact meaning is of a general rule taken from a legal source. There are two ways in which a general norm transformation can be performed. First, certain legal sources, for instance parts of a statute, can be adapted by taking away inconsistencies, thus making them more coherent than they were originally. Second, the legal sources can be adapted to certain moral value judgements.

The *decision transformation* implies that on the basis of at least one legal norm taken from a legal source, a transformation is carried out so that the judgement follows deductively from the already established legal source together with a description of the case.

Various decision transformations can be distinguished:

(a) Precise interpretation and subsumption (this transformation is based on Alexy's formulation of the basic form of internal justification): The precise interpretation transformation adds one or more premises to make the argument complete and deductively valid.
(b) Reduction and elimination: These are transformations that change an existing norm such that the norm is not applicable to the concrete case.
(c) Creating a new norm: In the absence of an applicable norm, a more general new norm can be formulated by means of analogy, *argumentum a contrario*, and *argumentum a fortiori*.
(d) Solution of a "collision": With this transformation the conflict between two norms or principles is resolved by formulating a conditional preference formula that resolves the conflict.

25.6.4. Different Levels of Justification and Transformation

The idea of the reconstruction of the various transformations underlying the different levels of the process of legal justification is that all relevant elements in justifying a decision must be made explicit. Normally, only the surface structure is visible: the step from the facts to the decision, sometimes supplemented by a rule. In order to be able to establish whether the assumptions underlying this decision are acceptable from the perspective of legal and general standards of rationality, the complete process of justification, consisting of two levels, must be made explicit. Only in this way legal justification can be submitted to rational critique.

Traditionally, in legal theory only attention was paid to the legal syllogism on the level of the concrete decision, and how this syllogism could be completed and made logically valid. In line with ideas from other authors such as Jerzy Wróblewski, Aulis Aarnio, Robert Alexy, and Neil MacCormick, Peczenik explains that in the justification of legal decisions different levels of justification must be distinguished. The problem of logical validity is not the central problem of legal rationality. By making the so-called *internal justification* complete, every argument can be made into a deductively valid argument. The problem lies in the so-called *external justification* (or second-order justification) in which the acceptability of the premises of the internal justification must be established. In hard cases, in the external justification a judge must specify why the premises of the internal justification can considered to be acceptable from a legal point of view.

Peczenik's claim is that both the internal and external justification are based on inference rules that must be made explicit in the various transformations carried out in the context of the *transformation into the law and inside the law*. He has made clear that under the "surface" level, different implicit transformations are carried out that need to be made explicit from the perspective of a complete justification. For the internal and external justification, for the different inference rules that are made explicit, different forms of justification must be used, and that for these different forms of justification different standards of acceptability apply.

Normally, in the context of legal justification legal theorists are only concerned with what Peczenik calls the transformation inside the law. By also adding the level of the transformation *into the law*, he still has gone a step further and has explained that further forms of justification are required to make the justification complete. In doing so, he has clarified how central important assumptions about the validity of law and the obligation to obey the law, that are central topics of discussion in legal philosophy, underlie the process of legal justification and how they must be made explicit in a complete justification.

25.6.5. The Normative-Evaluative Component: The Deep Justification of Legal Reasoning

In Peczenik's view, normally, legal argumentation occurs within the framework of the starting points that are tacitly accepted in a legal community. In the "contextually sufficient legal justification" legal sources, construction rules, interpretation rules, and argumentation rules are used which are considered to be generally accepted. To justify the use of these legal starting points in the justification, the choice of the starting points must be defended in the *deep justification*.

This deep justification must begin by demonstrating that the legal justification meets the general requirements of rationality. But meeting the requirements of rationality is not sufficient: The decision must also be in keeping with the starting points of the legal community.

To explain what the deep justification amounts to, Peczenik has integrated insights from legal theory and legal philosophy concerning the different standards of rationality of law. Also here his co-operation with Aulis Aarnio and Robert Alexy has been important, because he has integrated insights from these two authors in his ideas about the deep justification of legal justification. In doing so, he has shown how a coherent and systematic foundation of a theory of legal justification can be developed.

25.6.5.1. The Rationality of Legal Argumentation

To clarify the function and role of different forms and standards of rationality developed in different traditions in legal theory, following Aarnio, Peczenik distinguishes three forms of rationality: logical rationality (L-rationality), supportive rationality (S-rationality), and discursive rationality (D-rationality). The importance of the distinction between these different forms of rationality is that it makes clear to what aspects of the justification process the different standards apply.

The standard of *logical rationality* implies that the conclusion of a legal argument follows logically from a set of premises that are logically consistent and linguistically correct. This standard of rationality applies to the formal aspect of the reasoning process, that is, the way in which a conclusion is drawn from certain premises. The transformation of a jump into a deductively valid argument is aimed at meeting the standard of logical rationality on the different levels of the justification process. In comparison with traditional approaches of legal reasoning that concentrated only on the legal syllogism, Peczenik has explained that the justification process incorporates more levels of justification to which the standard of logical rationality applies. With this approach he accords with a tradition in legal theory in which legal reasoning is considered as a special form of rational practical reasoning.

The standard of *supportive rationality* concerns the support of a legal decision by a coherent set of arguments. Coherence is the degree to which a set of statements constitutes a support for a standpoint. The degree to which a set of statements constitutes a support depends on various criteria. These criteria are: the number of supportive relations, the length of the supportive chains, the amount of strongly supported statements, the amount of relations between the supported chains, the amount of preference-relations between the various principles, the amount of support-relations between the statements, and the degree of generality of the arguments and concepts used in the justification.

The standard of *discursive rationality* concerns the procedural rationality of legal reasoning.

The requirement of coherence only relates to the material aspects of legal argumentation, but does not guarantee procedural rationality of legal reasoning. Therefore, the justification of a legal decision must also satisfy the requirements of procedural rationality. The idea that the rationality of legal argumentation is also dependent on procedural criteria of rationality is a new development in legal theory in the 1970's initiated by authors such as Aulis Aarnio, Robert Alexy, and Peczenik. This development fits in a more general tradition in general argumentation theory and philosophy in which practical argumentation is considered as part of a practical discussion aimed at a rational consensus.[17] The idea is that the rationality of argumentation is not only dependent on logical and material criteria of acceptability regarding the product of the argumentation process, but also on the question whether the discussion procedure in which the argumentation occurs meets certain standards of procedural rationality.

In Peczenik's view, a legal decision meets these requirements of discursive rationality if the justification aims at reasonable consensus, which implies that the rules formulated by Alexy 1989 for general practical and legal discussions are observed. A discussion in accordance with Alexy's rules is a discussion in which decisions are grounded on a coherent set of arguments. Thus a discussion that meets the requirements of D-rationality, also meets the requirement of S-rationality.

25.6.5.2. The Legal Ideology

Apart from satisfying the requirements of rationality, a legal decision must also be in keeping with the starting points of a legal community. Using Ludwig Wittgenstein's and Aulis Aarnio's terminlogy, Peczenik is of the opinion that what people consider to be acceptable is dependent on their *form of life*. This form of life is the ultimate basis for a legal justification and cannot be justified in its turn.

[17] For philosophy see Habermas's (1990, 1996) theory of rational discourse. For argumentation theory see the pragma-dialectical theory of van Eemeren and Grootendorst (1992, 2004).

This basis, the *legal ideology*, consists of a set of (often tacitly) accepted starting points. The "degree of acceptance" of the components of the legal ideology may vary. Some parts are explicitly formulated in statutes and other legal sources. Another part is implicit and can be derived from the practice of judges, legal authorities, and lawyers. This part can be considered as a set of generally accepted source norms and argumentation norms, which every lawyer would accept under the ideal conditions of a rational discussion. A third part consists of the basic norms, source norms, and argumentation norms which some lawyers would accept under the ideal conditions of a rational discussion. A fourth part consists of basic norms, source norms, and argumentation norms, which some lawyers would accept under non-ideal conditions of a rational discussion.

The legal ideology is not a static whole, but changes under the influence of legal practice. The legal ideology is not a coherent system, but a collection of normative and cognitive convictions that one tries to organize coherently. The ideology consists of various, mutually incoherent, sub-systems. What belongs to the legal ideology depends on the *audience*. Using Aarnio's terminology, what is considered to be a part of the legal ideology is dependent on the form of life to which the members of a legal community belong.

In Peczenik's theory, the methodological function of the legal ideology is to offer a theoretical construction that is designed to transform the actions and internalized norms of lawyers and laymen into a coherent whole. Lawyers and laymen act as if they have accepted the legal ideology.

25.7. The Pragma-Dialectical Theory of Legal Argumentation in the Context of a Critical Discussion

25.7.1. Introduction

In a pragma-dialectical perspective, legal argumentation is considered part of a rational critical discussion aimed at the resolution of a dispute. The aim of this approach is to develop a model for the analysis and evaluation of legal argumentation as a specific, institutionalized form of argumentation. The pragma-dialectical approach to legal argumentation is based on the ideas of van Eemeren and Grootendorst developed in their pragma-dialectical theory of argumentation in various book and articles, among which Eemeren and Grootendorst 1992, Eemeren 2010.

Starting from the general theory, various authors such as Feteris, Jansen, Kloosterhuis, and Plug have applied the theory to the context of legal argumentation. Feteris has analysed the legal process as a specific implementation of a critical discussion and has described how the different stages of a critical discussion are represented in a legal discussion in a legal process. Feteris, Jansen, Kloosterhuis, and Plug have further developed models for the rational

reconstruction of various forms of complex argumentation that are based on methods of legal interpretation and on the application of specific legal argument forms such as analogy argumentation, *a contrario* argumentation, teleological-evaluative argumentation and argumentation from unacceptable consequences, and arguments based on *obiter dicta*.

In this chapter, in Section 25.7.2, we will describe the basic ideas of the general theory of argumentation. Sections 25.7.3 and 25.7.4 will discuss the legal theory of argumentation and the pragma-dialectical analysis and evaluation of legal argumentation.

25.7.2. The General Theory of Argumentation as Part of a Critical Discussion

The pragma-dialectical theory of argumentation is based on an approach that combines a pragmatic and a dialectical perspective on argumentation. The pragmatic perspective regards argumentation as a goal-oriented form of language and analyses the discussion-moves in a critical discussion as speech acts which have a certain function in the resolution of the dispute. The dialectical perspective implies that argumentation is considered to be part of a critical exchange of discussion moves aimed at subjecting the point of view under discussion to a critical test. A resolution in a critical discussion of this nature means that a decision is reached as to whether the protagonist has defended successfully his point of view on the basis of shared rules and starting points against the critical reactions of the antagonist, or whether the antagonist has attacked it successfully.

The core of the pragma-dialectical theory consists of an ideal model for critical discussions and a code of conduct for rational discussants. The *ideal model* specifies the stages which must be passed through to facilitate the resolution of a dispute, and the various speech acts which contribute to the process. In the *confrontation stage* the exact subject of dispute is established; in the *opening stage* the participants reach agreement concerning the discussion rules, starting points and evaluation methods; in the *argumentation stage* the initial point of view is defended against critical reactions and the argumentation is evaluated; and in the *concluding stage* the final result is determined.

The *code of conduct for rational discussants* specifies rules for the resolution of disputes in accordance with the ideal model. These rules acknowledge the right to put forward and cast doubt on a standpoint, the right and the obligation to defend a standpoint by means of argumentation, the right to maintain a standpoint which is successfully defended in accordance with shared starting points and evaluation methods, and the obligation to accept a standpoint which is defended in this way.[18]

[18] For a full exposition of the pragma-dialectical rules, see van Eemeren and Grootendorst 1984, 151–75.

The model for critical discussion provides a theoretical instrument for the analysis and evaluation of argumentative discourse that specifies the elements which play a role in the resolution of a difference of opinion. The model forms a *heuristic tool* in finding the elements which serve a function in the resolution process and thus identifies the elements relevant for the resolution of a dispute. The model also forms a *critical tool* for determining whether the discussion has been conducive to the resolution of the dispute and for identifying the factors in the discussion process which offer a positive and a negative contribution. Thanks to these characteristics, the pragma-dialectical theory provides a suitable theoretical instrument for the analysis and evaluation of argumentation.

To establish whether the argumentation put forward in defence of a standpoint is sound, an analysis must first be made of the elements which are important to the evaluation of the argumentation. In the evaluation based on this analysis, an answer must be found to the question whether the arguments can withstand rational critique. In an analytical overview (that can be compared to a rational reconstruction) an analysis of the argumentation is made in which the elements which are relevant for a rational evaluation are represented.[19]

In the analysis and evaluation of argumentative discourse the following points that are crucial for the resolution of the difference of opinion need to be addressed:

(1) the standpoints at issue in the difference of opinion and the positions adopted by the parties;
(2) the arguments adduced by the parties;
(3) the argumentation structure of the arguments;
(4) the argumentation schemes used in the argumentation;
(5) observation of the rules for critical discussion.

In the analysis it is established what the points at issue in the discourse are and which positions are adopted with respect to these issues; which arguments are adduced explicitly, implicitly, or indirectly; which relations exist between the arguments advanced in favour of a standpoint; which argumentation schemes (symptomatic argumentation, analogical argumentation, causal argumentation) are underlying the argumentation.

In the evaluation of the content of the argumentation it is established whether the different parts of the argumentation are successfully defended against the relevant points of critique. It is first established whether the argumentation schemes have been correctly chosen and applied. For each argumentation scheme, there is a set of critical questions which must be answered

[19] See MacComick and Summers 1991, 21–3 about the rational reconstruction of legal argumentation.

satisfactorily for the argumentation to be acceptable.[20]In the evaluation of the procedure of the discussion it is established to what extent all rules for critical discussion have been observed. This amounts to checking whether one or more participants have committed a *fallacy*, which is considered as a violation of a discussion rule, and to what extent the resolution of the dispute has been hindered by this violation.[21]

In order to establish how people in actual argumentative practice try to persuade others of the acceptability of their standpoint, a dialectical analysis of the discourse must be combined with a rhetorical analysis. Arguers not only try to achieve the dialectical goal of resolving a difference of opinion in a reasonable way, they also try to achieve the rhetorical goal of winning adherence from the intended audience. The way in which arguers try to reconcile these goals van Eemeren (2010) considers as *strategic manoeuvring* which implies that arguers try to adept the choice from the topical potential of argumentation schemes and starting points that are acceptable from a dialectical perspective to their rhetorical ends of convincing the audience.

The technique of strategic manoeuvring as described by van Eemeren amounts to an attempt to reconcile the dialectical goal of defending a standpoint in light of the relevant forms of critique on the basis of argumentation schemes and starting points that belong to the common commitments, with the rhetorical goal of winning the adherence from the audience. As long as the choice made to win the adherence of the audience is in keeping with the dialectical requirements the strategic manoeuvring can be considered as a constructive contribution to a critical discussion. However, if the arguer chooses to let the rhetorical aims of gaining the adherence by the audience have preference over the dialectical aims, the strategic manoeuvring derails and constitutes a violation of the rules of critical discussion.

25.7.3. Legal Argumentation as Part of a Critical Discussion

In the legal part of the pragma-dialectical theory, the aim is to develop an application of the pragma-dialectical theory for the analysis and evaluation of argumentation in a legal context. In a pragma-dialectical approach, legal argumentation is considered as a specific institutionalized form of argumentation, and legal discussions are considered as specific, institutionalized forms of argumentative discussion. In this conception, legal argumentation is considered as part of a critical discussion aimed at the resolution of a dispute.[22] The

[20] For a more extensive discussion of the evaluation on the basis of argumentation schemes see van Eemeren and Grootendorst 1992, 94–102.

[21] For a more extensive treatment of fallacies as violations of the discussion rules see van Eemeren and Grootendorst 1992, 102–217.

[22] For a more extensive account of the analysis of a legal process in terms of a critical discussion see Feteris 1990, 1991, 1993.

behaviour of the parties and the judge is viewed as an attempt to resolve a difference of opinion. In a legal process (for example a civil process and a criminal process) between two parties and a judge the argumentation is part of an explicit or implicit discussion. The parties react to or anticipate certain forms of critical doubt. A characteristic specific to a legal process is that in addition to the discussion between the parties, there is an (implicit) discussion between the parties and the judge, which is aimed at checking whether the protagonist's claim can be defended against the critical reactions that the judge puts forward in his official capacity as an institutional antagonist. The judge must check whether the claim is acceptable in the light of the critical reactions of the other party and whether it is acceptable in the light of certain legal starting points and evaluation rules which must be taken into account when evaluating arguments in a legal process. These institutional critical questions which the judge must apply in the evaluation, can be considered as institutional forms of doubt put forward by the judge in his official capacity. In the defence of their standpoints, the parties anticipate these possible critical questions of the party and the judge.

When the decision is presented by the judge, it is submitted to a critical test by the audience to whom it is addressed. This multiple audience consists of the parties, higher judges, other lawyers, and the legal community as a whole. Therefore, the judge must present arguments in support of his decision in order to justify it. He must specify the facts, the legal rule(s), and further considerations (such as interpretation methods, priority rules, legal principles, etc.) underlying his decision. From a pragma-dialectical perspective, the justification forms part of the discussion between the judge and possible antagonists (the party who may want to appeal the decision and the judge in appeal). In his justification the judge anticipates various forms of critical reactions which may be put forward by these antagonists.

The resolution process in a legal process can be regarded as a critical discussion in which the five stages which have to be passed through in a pragma-dialectical critical discussion, are represented. The first stage of a legal process in which the parties advance their points of view can be considered as the *confrontation stage*. Here the judge remains passive. The second stage, the *opening stage*, in which the participants reach agreement on shared starting points and discussion rules, is largely implicit in a legal process. This stage is represented by the institutionalized system of discussion rules that are laid down in codes of procedure and starting points that consist of material legal rules, legal principles, propositions of legal dogmatics, etc. In the third stage, the *argumentation* stage, the parties defend their standpoints in accordance with the rules of procedure and provide proof if asked to do so. In this stage the judge (or jury) evaluates the quality of the argumentation and the proof. In the final stage of the process, the *concluding stage*, the judge has to decide whether the claim has been successfully defended against the critical counter arguments. If the facts

can be considered as proven and if the judge decides that there is a legal rule which connects them to the claim, he will grant the claim. If the facts cannot be considered as established according to legal standards of proof, or if there is not a legal rule applicable, the judge will reject the claim.

In a legal process, the way in which the stages of a pragma-dialectical critical discussion are represented and the way in which the discussion is conducted can be regarded as a process of dispute resolution by means of critically testing a standpoint in the light of certain forms of critical doubt. However, there are some crucial differences which require attention. In a critical discussion the parties jointly ensure that the discussion rules are being observed and they jointly decide on the result of the evaluation and the outcome of the discussion. In a legal process, for reasons of impartiality, it is the task of the judge to ensure that the rules of procedure are observed. It is also the task of the judge to evaluate the argumentation and to render a decision on the final outcome. So, in a legal process the judge does alone what the parties to a critical discussion do jointly. Because of specific legal goals, such as legal certainty, legal security, and equity, there are some procedures in law which differ in certain respects from the rules and procedures of a critical discussion. These rules and procedures must guarantee that the conflict can be resolved by a neutral third party within a certain time limit.[23]

25.7.4. The Analysis and Evaluation of Legal Argumentation in the Context of a Critical Discussion

The first step in the analysis of the argumentation involves establishing the nature and content of the difference of opinion and the standpoints adopted by the participants. Compared with a dispute in the standard form of a critical discussion, the difference of opinion in a legal process is more complex because it always consists of various disputes: one between the participants and one between the party who initiates the proceedings and the judge. From a pragma-dialectical perspective, the participants adopt various positions with respect to the claim put forward by the party who initiates the proceedings. The judge is obliged to adopt a neutral standpoint with respect to the statements of the parties and thus, in pragma-dialectical terms, adopts a neutral standpoint.

The second step in the analysis must determine the arguments put forward in reaction to various forms of critical doubt and the relations between these arguments. In a legal context, the argumentation put forward as a justification of a legal decision may consist of different levels, depending on the forms of critique the judge must react to.

[23] Cf. the discussion of the relation between legal discourse and moral discourse in Habermas's theory in Section 25.3.4.

On the first level, the justification implies that the decision (1) is defended by showing that the facts (1.1) can be considered as a concrete implementation of the conditions which are required for applying the legal rule (1.1').[24] In clear cases, such a single argumentation may suffice as a justification of the decision. Often, the argumentation is more complex because one of the elements of the main argumentation of the first level must be supported by further argumentation. The supporting may consist of proof for the facts (1.1) or a justification of the applicability of the legal rule (1.1'). In pragma-dialectical terms, a second-order justification supporting the classification of the facts or the interpretation of a legal rule can be considered as complex subordinate argumentation.[25]

In the second-order justification the interpretation decision about the legal rule (1.1) is justified by second-order argumentation consisting of a justification in which the judge uses one or more interpretation methods. This argumentation may be more or less complex, depending on the choices a judge makes and on the argumentative steps that are required to make the justification complete. The judge may, for example choose to weigh certain interpretations on the basis of the consequences of the different solutions, which implies that the argumentation must be reconstructed as complex argumentation consisting of different horizontally linked lines of argumentation: the two interpretations, the weighing rule, as well as subordinate argumentation supporting the different lines of argument (see Feteris 2005, 2008a, 2008b, 2008c, 2008d for a discussion of this complex form of argumentation).

For different forms of argumentation used in the second-order argumentation authors have described which argumentative steps are required for a sufficient justification. Feteris 2005 develops a model for the rational reconstruction of teleological argumentation, teleological-evaluative argumentation, and consequentialist argumentation and describes the interaction between the various elements of the justification, Jansen (see Jansen 2005, 2008, 2009) develops a model for different forms of *a contrario* argumentation and *reductio ad absurdum*, Kloosterhuis (see Kloosterhuis 2005, 2006) develops a model for different forms of analogy argumentation and reductio ad absurdum, and Plug (see Plug 1994, 1995, 1996) develops a model for various forms of complex argumentation, among which argumentation on the basis of *obiter dicta*.

The last step concerns the evaluation of the argumentation. Regarding the evaluation of the content of the argumentation, in pragma-dialectical terms it is established whether the argumentation schemes used in the argumentation have been correctly chosen and applied. For various implementations of

[24] See Kloosterhuis 2006, 28ff. for a further description of the elements of the argumentation on the first level of a legal justification and the logical analysis.

[25] For a more extensive description of the pragma-dialectical analysis of the second-order justification see Feteris 1999, 176ff.; Kloosterhuis 2006, 41ff.

the basic forms of argumentation schemes (symptomatic, analogy, and causal argumentation) in a legal context such as analogy argumentation, teleological argumentation, consequentialist argumentation, etc. which are used for justifying the interpretation of a legal rule it must be established whether this form of argumentation is correctly chosen (for example in Dutch criminal law analogical interpretation of statutory rules is not allowed) and whether the form of argumentation is applied correctly (for example whether an analogy relates to relevant similarities). Feteris, Jansen, and Kloosterhuis have developed criteria for the evaluation of different forms of legal argumentation such as analogy argumentation, teleological argumentation, consequentialist argumentation.

25.7.5. Strategic Manoeuvring in Legal Argumentation

In the presentation of the justification of their decision, judges often try to present their decision as a self-evident result of the application of the law to the facts of the case. However, this application is often less self-evident than it is presented. In their justification judges often make use of what is in pragma-dialectical terms called *strategic manoeuvring* by trying to reconcile dialectical and rhetorical goals. The way in which judges present their justification can be analysed and evaluated from the perspective of the strategic manoeuvring in a critical discussion. The advantage of such an analysis is that it can be clarified how judges make an expedient choice from the options that constitute the starting points of a legal discussion in a particular context, how they to exploit certain presentational devices, and to what extent their justification can still be considered a constructive contribution to a rational discussion or whether the contribution "derails" and must be considered as a fallacy.

Feteris (2008c, 2009 and Kloosterhuis 2009 describe for the legal context how such strategic manoeuvring can be analysed and evaluated. A form of strategic manoeuvring often used in a legal context consist of the weighing of a literal interpretation of a legal rule with an interpretation that is based on teleological-evaluative considerations. From the perspective of legal certainty it is important that the judge applies the law as it is formulated by the legislator. This implies that, when he wants to depart from the literal application of a legal rule, it is important that the judge shows that his interpretation is still in line with the intention of the legislator. For different forms of legal justification Feteris and Kloosterhuis explain what it implies that judges try to reconcile dialectical and rhetorical goals and which techniques of strategic manoeuvring are used in the choice of argumentation schemes, starting points, and presentational devices. They show when judges remain within the limits of a rational discussion and when the attempt to manoeuvre strategically constitute a move that cannot be considered as a constructive contribution to a resolution of the dispute and must, for that reason, be considered as a fallacious move.

Chapter 26

LAW AND LOGIC IN THE 20TH CENTURY

by Jan Woleński

26.1. Introduction

Law and legal practice are commonly regarded as highly regular and logically ordered. So the problem arises of how legal phenomena are related to logic. Legal systems are said to be consistent or inconsistent; logical interpretation is one of the fundamental strategies in establishing the content of legal prescriptions, and the nature of legal definitions is constantly being discussed by jurists. The three issues just mentioned are all typical logical questions pertaining to law and its life. Although various conceptual and methodological aspects of the relation between law and logic have always occupied legal theoreticians to some extent, the enormous development of logic over the last 150 years has perhaps made them more vivid now than in past centuries. Yet there is controversy over whether legal logic is peculiar or is a kind of universal logic that can be applied to special fields. For example, some jurists say that, owing to the peculiarities of law force, legal logic has its own rules or standards. It is claimed in particular that law uses some presumptions that deliberately go against facts. For instance, if two or more persons die in the same airplane accident, it is assumed that they lost their lives at the same time, even though that may be empirically false. However, other lawyers maintain that counterfactual assumptions are made everywhere and are not peculiar to law. This chapter discusses legal logic from a historical perspective. I will review formal attempts at giving some answers to theoretical issues stemming from the alleged peculiarities of legal discourse and arguments, and I will also review exemplary ways of applying logic to juristic matters. But let me start by making some preliminary stipulations and explanations.

26.2. Logic and Legal Logic

I will understand legal logic as the logic that underlies legal systems and legal practice. By legal system I understand any system of valid legal obligations, prohibitions, and permissions. The concept of legal validity is here taken for granted. I will not draw a distinction between legal systems created by enacting statutes and ones that evolve out of concrete judicial decisions. Otherwise stated, I will not attribute any special importance to the distinction between

* I am indebted to Erica Calardo for several suggestions which helped me to improve this paper.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_54

continental and common law. Legal practices comprise statements based on law, as well as acts of legal interpretation. In order to simplify the discussion that follows, I will not take account of jurisprudence, that is, its general part (legal theory) and the so-called doctrinal study of law (or *Rechtsdogmatik*, in the German tradition).[1] Consequently, I will assume that there is no problem employing logic in the study of law (logic as an element external to law), but, on the other hand, everything interesting in the relation between law and logic is internal to law.

Although I took a simplified account of law, this model cannot also be applied to logic. I should therefore be more explicit about logic itself. Listed below are the most important views that constantly recur in the history of logic (I will keep some German words here, too):[2]

(1) dialectic (analysis and synthesis of concepts; Plato);
(2) analytic (deduction; Aristotle);
(3) *organon* (methods of reasoning; Aristotle);
(4) canonic (norms for gaining knowledge; Epicurus);
(5) *medicina mentis* (a descriptive and normative account of mental capacities; Cicero);
(6) *Vernuftslehre* (the rules of pure reason; the *philosophia rationalis* tradition);
(7) *Kunstlehre* (the art of arguing; Husserl);
(8) *Wissenschaftslehre* (the theory of science; Petrus Hispanus: *ars artium scientia scientiarum ad omniam aliarum scientiarum methodorum principiam viam habent*);
(9) The theory of thinking (Arnauld, Nicole).

The views listed above express a variety of points. Logic is theoretical or descriptive on some accounts (like the as dialectic and analytic accounts), but practical or normative on others (e.g., *organon* and *Kunstlehre*). Another important distinction is the medieval one between *logica docens* (logic as theory) and *logica utens* (applied logic). In Petrus Hispanus's characterization, the principal feature of logic is its universality. Since Leibniz, logic has typically been connected with projects devoted to a *logica magna* or a *characteristica universalis* as schemes providing a methodological and linguistic framework for the whole of science. The variety of topics covered by logic in its various approaches is aptly illustrated by a well-knwn tripartite division of logical sub-

[1] I should emphatically stress that my stipulations about law and jurisprudence are extremely simplified and made *ad usum* for this chapter. For a more sophisticated and detailed account, the reader should consult the systematic volumes devoted to these questions in this *Treatise*, namely, Pattaro 2005, Peczenik 2005b, Rottleuthner 2005, Sartor 2005, Shiner 2005.

[2] This list is taken from Risse 1980.

jects (logic in a broad sense) into semiotics (the logical theory of language), formal logic (a collection of logical systems, or logic *sensu stricto*), and the methodology of science (this organization of logic is often employed in teaching). From this perspective, the different views of logic are not mutually exclusive. For example, (2) is formal logic, but the rest covers either logic *sensu largo* or its particular branches, mostly semiotics or the methodology of science. All the accounts (1) through (9) are applicable to legal logic as well. Legal logic can be understood as dialectic (the synthesis of legal concepts), analytic (deduction as applied to legal matters), *organon* (a general theory of legal reasoning), canonic (legal epistemology), *medicina mentis* (how jurists should solve the problems pertaining to their discipline), *Vernuftslehre* (the theory of juristic reason), *Kunslehre* (the art of legal argumentation), *Wissenschaftslehre* (like *organon*), or *Denklehre* (the art of legal thinking).

From the contemporary point of view, formal logic is at the centre of all logical topics. It is understood as the investigation of various systems of deduction, methods of proof, or models of demonstrative inference. This study abstracts from the content of arguments and focuses on their form. Otherwise stated, logic is concerned with deductive, correct, or demonstrative inference and investigates it with reference to its structural properties, which is related to its logical form and disregards substantive aspects. Logic in the above sense investigates various logical systems, as well as their syntax and semantics. More particularly, formal logic studies the principles of logical consequence as the relation that holds between sentences or sets of sentences. The most important thing is the link between syntax and semantics, under the principle that if $X \vdash A$ (A is a logical consequence of the set X; B is formally, that is, deductively derivable from X; B is derivable from X according to some definitely prescribed rules of inference), then $X \models A$ must be true (provided that every element of X is true). This principle establishes the soundness (adequacy or correctness) of logical consequence. The $\vdash$ relation is syntactic in its nature and acts in virtue of the form of sentences in abstraction of their content. The $\models$ relation, by contrast, is semantic (and is therefore often called the relation of semantic consequence), because it is explicated by the concept of truth. Informally speaking, (α) establishes that a logical consequence is truth-preserving (infallible), that is, it never leads from truths to falsehoods. The converse property, that is, if $X \models A$, then $X \vdash A$, expresses a system's semantic completeness, or the property that every truth is derivable. The relation between syntax and semantics is in any event of the utmost importance for an understanding of contemporary logic.

The foregoing remarks drastically restrict the scope of logic. Yet some doubts arise in this context. In particular, it is obvious that people derive conclusions in ways that do not fall under any model of deduction. They use induction, analogy, statistics, persuasion, rhetoric, and the like, all of which all are examples of fallible modes of argumentation. These strategies immediately

lead to the problem whether such modes are correct and in which circumstances. Although it is clear that fallible modes of reasoning are not always correct, the question is how to define their correctness, if that is even possible. Even if we say that the fallible models of argument exceed formal logic and should be investigated in semiotics, the philosophy of science, or the methodology of science, the problem remains. Let me add that syntax and semantics as related to the distinction between $\models$ and $\vdash$ are qualified as formal when contrasted with informal (or less formal) approaches in these fields, which are usually included in semiotics. This consideration shows that the distinction between logic in the broad sense and logic in the narrow sense is vital and difficult to avoid. Assuming that informal logic or rhetoric is accepted, we can now consider how it is related to formal logic. One way to frame this relation is to say that informal logic and rhetoric belong to logic broadly construed, but another option consists in maintaining that there is an intimate difference between formal logic and the study of argumentation, because the latter appeals at least in part to content and context. Any discussion about the application of logic to various subjects must be conscious of the distinctions outlined above. Although we can have different views about the relation between informal logic and rhetoric, on the one hand, and formal logic, on the other side, we should recognize that there are two different concepts of logical validity, one clear and attached to deduction, the latter less clear (this is the most optimistic qualification, since it can be regarded as irreparably obscure) and applied to nondeductive modes of reasoning. Many misunderstandings concerning the place of logic in human mental activities stem from a conflation of both kinds of validity with the adjective *logical* added to both.[3]

The foregoing diagnosis, perhaps more than any other, concerns the logical problems that come up in law. As noted, common wisdom suggests that legal activities and their results (legal texts and sentences) are logically regular to a high degree. We say that legal decisions are, or at least should be, rational and justified or that legal codes are, or at least should be, logically correct, that is, consistent, precise, and well-systematized. In general, law has always been held up as a model of logicality and rationality. Lawyers developed special modes of reasoning, like *argumentum a maiori ad minus* (see the list at the beginning of this section), which are regarded as constituting legal logic. We now face the problem of the nature of legal reasoning, that is, of the modes of argument generated by legal logic. Are they inferences falling under the schemata of formal logic? Or are they perhaps modes of rhetorical technique? And what is legal logic? Is it an application of general logic to legal activities or is it a *sui generis* legal *Kunstlehre*, *Denklehre*, or even *Vernuftslehre* aimed at convincing courts, other authorities, or audiences about some statements and decisions?

[3] A particularly important treatment of legal logic from the point of view of informal thinking and rhetoric is offered in Perelman 1979.

Legal logic can thus be seen to be a highly instructive example of the very general problem of the essence of logic and the nature of the application of logic to special subjects. In fact, under items (1) through (8) in the above list of how logic can be understood, the modes of logic can be illustrated by examples taken from the domain of law (see Krawietz 1980). Take Kelsen, for example. As a faithful Kantian scholar, he was influenced by neo-Kantianism and understood legal logic as the *Vernuftslehre*. He looked for transcendental elements in legal thinking, the very principles of legal reason. Clearly, this project came up against enormous difficulties in explaining how we ought to understand the validity of the rules of legal transcendental logic (note that the term *validity* in this context means something entirely different from *legal validity* as the state of affairs when law is in force). Let me add that the dialectic between the formal and informal aspects of logic can depend in a very general sense on peculiar cultures in logic: The former, for example, seem to be more important in the tradition of common law.

Since I will be focusing on the history of formal legal logic, I should devote some remarks to legal logic as an application of formal logic (deductive models of inference) to legal matters.[4] This issue inspires various basic philosophical controversies. One of them concerns the question whether logical relations can hold between normative sentences (as a preliminary example, I will take "ought" sentences: Let us call them normatives) and sentences that have no normative import. Intuitively, we should be inclined to accept without any serious doubt the following inference (*****):

(*a*) Everybody who has committed a crime ought to be punished.
(*b*) A person *x* committed a crime.

(*c*) *x* ought to be punished.

This inference exemplifies a model of the so-called legal syllogism, where (*a*) is a general normative sentence, (*b*) a singular statement asserting what *P* did, and (*c*) a singular normative sentence. The inference coded by (*) can be considered a derivation of a singular normative sentence (*c*) from two premises: a general normative sentence (*a*) and a descriptive statement (*b*). In fact, (*****) looks like an instance of *dictum de omni*, that is, an inference from the general to the particular. Similarly, if we say that no action can be obligatory and non-

[4] A general theoretical account of legal logic based on cognitive science can be found in Sartor 2005, chaps. 14–5, where legal logic is embedded in the broader perspective of legal reasoning. I do not follow Sartor's approach for two reasons. First, the cognitive theory of legal reasoning does not exhaust all the historical attempts to establish a logic for law and, second, I am inclined to draw a sharper contrast than Sartor between the formal and the informal in legal reasoning. See Brkić 1985 for a more logic-oriented treatment and Grabowski 1999 for a pragmatic approach.

obligatory at the same time, we are bringing the principle of non-contradiction into the normative domain, a principle quite analogous to the *metalogical* one of noncontradiction.

If we say that at least some elements of logical schemes such as (*****) are normative, while others are not, we will be confronted with the question of the relation between normatives and declaratives. This is the is/ought problem (**IOP**), one of the most famous in general jurisprudence as well as in theoretical ethics, or metaethics. Another example concerns so-called conditional obligations (as well as that of permissions). We frequently say that if something happens, something else is obligatory; for instance, if person *x* earns income, he or she should (ought to, is obliged to) pay taxes. Now, are (*i*) If *A*, then *OB* (*B* is obligatory) and (*ii*) *O* (If *A*, then *B*) equivalent? One more example may be in order. We are certainly entitled to say (*d*) *A* and *B* are obligatory (it ought to be that *A* and *B*) if, and only if, *A* is obligatory and *B* is obligatory. But how can we justify the equivalence in (*d*)? The following historical survey makes it necessary to review various attempts to build formal theories by which to justify the validity of models like (*****), by solving (**IOP**), answering question concerning the equivalence of (*i*) and (*ii*) or justifying (*d*), or offering preparatory, mostly semantic, considerations about such formal work.[5] Since the question of the nature of normative discourse is common to law and morality, some metaethics will be discussed as well. In order to have a convenient label, I will refer to normative logic (**NL**) as the logic in which normatives occur.

26.3. Notes on Normatives

Grammar distinguishes declaratives sentences (declaratives), questions, and imperatives. This division of all correct sentences (correct on the level of syntax as a part of grammar) takes into account the mood of sentences.[6] Only declaratives are considered true or false, and for this reason logicians count only declaratives as sentences in the logical sense. This means that sentences in the logical sense form a subset of the class of the sentences in the grammatical sense. Consequently, questions and imperatives cannot be assessed as true or false. We have a simple criterion by which to tell whether a sentence is such in the logical sense: Let *A* be a sentence in the grammatical sense; prefix "it is true that" or "it is false that" to *A*; and check whether the resulting expression

[5] Note, however, that I do not pretend this survey to be exhaustive. See Horovitz 1972, Kalinowski 1972, Weinberger 1958, for more extensive information. Lenk 1974 collects a useful bibliography. Huisjes 1981 can also be consulted.

[6] Sometimes *four* moods are distinguished: the indicative (declaratives and questions), the imperative, the subjunctive, and the infinitive. Since the imperative mood is the most important for the discussion that follows, I will stick to the simpler tripartite categorization, which seems more suitable for logic. See Atienza and Manero 1998, Opałek 1986, Kutschera 1973 for more extensive surveys of normatives.

is syntactically correct. Thus, "Snow is white" is a logical sentence, because the expression "It is true (or false) that snow is white" is a correct sentence, but "Close the door!" does not qualify as a logical sentence, because the expression "It is true (or false) that close the door!" doesn't hold up syntactically. Unfortunately, this criterion has no straightforward application to normatives: On the one hand, there is nothing incorrect about the sentence "It is true that nobody ought to use violence," but, on the other hand, philosophers and lawyers have advanced several arguments to demonstrate that normatives are neither true nor false. In broad strokes, some people claim that we have a conflict between grammar and intuition, while others argue that so long as the content is conveyed through the use of correct grammar, normatives should be subsumed under declaratives.

Let us note that legal (and moral) texts do not help very much. Legal codes are very frequently written in the indicative mood. Suppose we are reading the sentence "Anyone who kills another person is punished by such and such penalty." If this sentence should appear in a newspaper, it can be interpreted as a sociological assertion, and someone may even remark that this statement is sometimes true but generally false. On the other hand, if the same sentence is found in a legal code, we will understand it to express a prohibition against killing, coupled with a duty of competent authorities to punish those who kill. As simple as this example may be, it aptly illustrates how we cannot rely on the grammatical form of legal prescriptions in solving our problem. But other cases are more complex. Suppose a statute that is valid in country **C** says that the country's yearly [budget] is passed by its Parliament no later than on the last day of December of the preceding year. We have at least two contents in this rule. First, it states that only the Parliament has a right (is competent) to pass the [budget] and, second, that passage must take place before New Year's Day. This right is to be carefully distinguished from your or my right to go to the cinema, because you or I can go to cinema or abstain from doing so, but Parliament cannot simply say, "Well, we don't have enough time to put together the project for the [budget], we will return to the matter after January 1st." This raises the problem of how many normative moods there are.[7]

At this point I should introduce the term norm, because most of the discussion that follows makes reference to it.[8] Since theories of norms are usually packaged in more or less extensive philosophical boxes, I will also point out some problems of that kind, though without entering being too long. Most general accounts of norms identify them as linguistic entities or their meanings. The simplest theory of norms sees them as explicit or implicit impera-

[7] See Heinze 2003 for a more detailed formal analysis of this question.

[8] The same problems arises with evaluative sentences, such as "*X* is good." There are several other deep problems related to emotivism and cognitivism, an example being the naturalistic fallacy.

tives. In jurisprudence, it is legal positivism that stands behind the imperative account of norms. Like all imperatives, norms have "givers," who can historically be identified by empirical sources or who at least are presumed to have existed. Norms express the will of norm-givers. Although the older imperative theory (J. Bentham, J. Austin) was unclear about the question of the truth or falsity of norms (see below), later versions of this view (notably, logical empiricism) use emotivism as a basis on which to explain why imperatives do not fall under the category of declaratives. In fact, emotivism covers a variety of positions. Radical emotivism, proposed by early logical empiricism (notably, Alfred Ayer: 1910–1989) regarded imperatives as emotive acclamations (such as "Ah!" or "Oh!"), completely devoid of any descriptive function. This view was replaced by moderate emotivism in Charles Stevenson (1908–1979), conceding that imperatives are generated by emotions coupled with some cognitive states. But emotivism is not the only kind of noncognitivism. Another kind sees norms as a special semantic category of sentences. On this view, norms are still neither true nor false, but they have a quite definite and intelligible meaning, or sense (see Weinberger 1974, 2–10). A variant of this idea constructs norms as the senses (meanings) of normative sentences, that is, functioning in a special nonindicative mood (see Wróblewski 1964). This view is certainly modelled by a famous distinction between sentences and propositions. Yet, as the proponents of this theory in its both of its versions insist, we need to carefully distinguish genuine norms—expressions of the form "It ought to be that A"—from norms of the type "It ought to be that A according to a normative system NS," such as the legal system of a given country or a moral code. The normative mood also includes imperatives.

The cognitivist theory of normatives takes truth and falsity as normal logical values of norms. Cognitivism sometimes appeals to Platonism or other forms of objective idealism by regarding norms as assertions of ideal duties, rights, etc. (Kelsen's normativism can be analyzed among these lines), but sometimes the view is based on religion (as in the case of neo-Thomism): Norms are true or false because the obligations and permissions they express are created by God. Even in this context a distinction can be drawn between normative sentences and norms as their meanings, the claim can be made that the difference between genuine and relative norms is substantial (see Kalinowski 1972, 20). Subjective cognitivism analyzes norms as assertions about the inner state of acting subjects; this view was popular in metaethics of the second half of the 19th century (Edvard Westermarck, 1862–1939), but it was almost unknown in legal philosophy. There have also been proposals to reduce all norms to instrumental norms. A rule is instrumental in case it says that if someone wants to achieve goal G, he or she should (ought) perform action B. One could interpret the utilitarian theory of law as reductive in this sense. Since, on the instrumentalist view, instrumental norms are based on social regularities, they inherit their truth or falsehood from more fundamental empiri-

cal assertions. American realism—with its predictive account of obligation: *A* is obligatory if its violation results in a sanction decided by legal authorities—introduces another kind of reductionism, based on philosophical pragmatism. All such cognitive reductions eliminate genuine norms in favour of relative ones.

Another reduction has been proposed by the nonlinguistic theory of norms (see Opałek and Woleński 1987). On this view, norms are neither linguistic expressions nor proposition-like entities but human, individual, or collective decisions, that is, concrete spatiotemporal events. They are expressed by appropriate linguistic devices—such as "I (he, she, we, they) order, permit, etc., that *A*"—that are either first-person or third person singular or plural sentences, which can be considered as primary normative sentences. Such sentences are true or false and inform us about the duties, obligations, permissions, rights, or competences brought into being by norms. Since it is always possible to depersonalize original normative sentences, the content of every normative system can be captured by a suitable set of sentences of the type "It is obligatory, prohibited, permitted, legal, etc., that *A*." Imperatives, on the nonlinguistic theory, are considered abbreviations of first-person normatives. This account assumes the correctness of the von Wright thesis:

> Can all norms be formulated in terms of deontic [i.e., normative] sentences? […] It is reasonable to think that the answer to [this] question is affirmative. One could make a partial definition of "norm" that every norm is to the effect that something ought to or may or must not be or be done. It would then follow, trivially, that every norm can become expressed in a deontic sentence. (Wright 1963, 100)

Although von Wright did not subscribe to the nonlinguistic theory of norms, his thesis is crucial in this account.

An interesting attempt to systematize theories of norms divides them into hyletic and expressive (see Alchourrón and Bulygin 1981). On the former account, norms are language-independent entities expressed by certain utterances understood as normative sentences. Although such sentences serve prescriptive functions, norms are propositions playing a similar role in traditional semantics, in that they are applied to indicative statements. This theory recognizes that there are norms that are not formulated. On the expressive theory of norms, norms originate by a prescriptive use of language. Thus, no norm exists unless it is linguistically formulated, and every norm is grounded in a command. An important aspect of this distinction is that it can be used to treat the problem of the truth or falsity of normatives as a separate issue, which can depend on many further assumptions. For example, the nonlinguistic view proposes that the truth and falsity of normatives be analyzed via conditions for the felicity of performative acts. Although this theory considers normative statements true or false, it does not subscribe to traditional cognitivism, because normatives express noncognitive states. This view also resembles imperativism,

for it assumes that every norm has its source in the decisions of norm-givers. The nonlinguistic account of norms is thus a radicalization of the expressive theory.

Finally, I should indicate some additional problems arising from normatives.[9] As noted, we have a variety of normative moods. This fact is evinced by a considerable amount of words, such as *duty*, *obligation*, *right*, *permission*, *competence*, *ought*, *must*, *should*, *order*, *need*, *can*, *allow*, *may*, and *admit*, as well as by sentences like "It is permitted that *A*" and "*A* must be done." It should be observed, in particular, that the complements of normative verbs can be either nominal, infinitive, or propositional. Are some perhaps equivalent to the others? Unfortunately, ordinary intuitions do not suffice for univocal stipulations. In a logical system, for example, "It ought to be the case that *A*" is replaceable by "It *must* be the case that *A*," but the common usage frequently considers the former somehow weaker than the latter. Another example of a controversial issue is that of permissive norms. One of our earlier examples suggests that there is a norm that permits Parliament to pass [the budget]. On the other hand, if I say that I can go to the cinema, we wouldn't ordinarily be able to claim that there is a norm allowing me to do that. Now, if a father says to his son, "You may go to the cinema" in a situation in which that was previously prohibited, it may be argued that a norm was issued. However, it is still unclear whether the revocation of a prohibition counts as another norm. The next and last example in this section concerns primary and secondary normative moods. For example, it can be argued that obligations and prohibitions are primary, since "*A* is permitted" means, in the simplest case, "*A* is nonobligatory and nonprohibited." On the other hand, Parliament's permission to enact the budget seems to involve a complex of normative moods, specifically, that Parliament may pass the state bill, that it possesses a specific competence, and that no other authority has the competence in question. Hence, the problem arises whether all (or perhaps only some) normative moods are reducible to the primary ones. Clearly also involved here is the problem of negating normatives is. For example, we have external negations, like "It is not the case, that *x* ought to do *A*" and internal negations, like "It ought not to be the case that *A*." The latter expresses a prohibition against doing *A*, but former does not, and it is open to question whether it is a norm at all. On the other hand, the sentence "Do not do *A*" is a prohibition in the imperative mood; in this case, the external negation seems to preserve the imperative status. It is in order to aid the effort of working out such issues that the various **NL** systems have been developed.

[9] For a more detailed analysis, see Alchourrón and Bulygin 1971 and Weinberger 1974.

26.4. The Jörgensen Dilemma

Jörgen Jörgensen (1894–1969), a Danish philosopher and logician, formulated a general dilemma (**JD**) for **NL**.[10] He noted that, on the one hand, according to a generally accepted definition of logical inference, only sentences that are capable of being true or false can function as premises or conclusions in an inference, but, on the other hand, it seems evident that a conclusion in the imperative mood may be drawn from two premises one of which or both of which are in the imperative mood. This second claim (**) is illustrated by Jörgensen with the following example: "Keep your promise; this promise is yours; therefore, keep this promise." So we have here the following sequence of apparently true assertions:

(1) Only true or false sentences can function as premises or conclusions in inferences.
(2) Imperatives are neither true nor false.
(3) Imperatives cannot function as premises or conclusions of inferences.
(4) There are intuitively correct inferences, such as (*) in which imperatives occur.
(5) Imperatives can function as premises or conclusions in inferences.

A simple inspection of the foregoing assertions will show that the sequence (1) through (5) is inconsistent: To see this, one need only compare (3) and (5) or (1) and (4).[11] Clearly, although **JD** was formulated for imperatives, it is easily transformable to norms. Thus (4) becomes the assertion, instantiated by (*), that there are intuitively correct inferences in which norms occur.

Assertion (1) follows from a definition of logical inference (that is, an inference based on the concept of entailment as truth-preserving); let me use the symbol **SL** (standard logic) for a reference. Assertion (2) is dictated by elementary grammar, which distinguishes declaratives, imperatives, and questions and attributes truth and falsity (as logical values) exclusively to items in the first category. Thus imperatives sentences are neither true nor false. Assertion (3) is entailed by (1) and (2). Note that we do not need to add "sound" to "inferences" in (1) and (3), because truths and falsities may form sound or unsound inferences alike. Otherwise stated, sequences of imperatives do not form inferences at all, and that situation cannot be improved by adding declaratives. This means that mixed imperative-declarative sequences cannot be considered inferences, either. Assertion (4) is pointed out by examples such as (*). Since this model is correct, it automatically should be regarded as a genuine inference. Finally, assertion (5) follows from (4).

[10] See Jörgensen 1937–1938. The name "Jörgensen dilemma" was coined by Ross (1941).
[11] See also Weinberger 1958, 66–8.

Although **JD** was formulated not very long ago, it is a very good starting point for a systematic historical analysis, because it points to some solutions for **NL**. In general, most people accept (4), that is, the assertion that there are intuitively correct normative inferences. This suggests several possible solutions to the problem of **NL**.[12] The simplest one is proposed by traditional cognitivism and consists in taking normatives to be regular declaratives and applying **SL** (propositional, predicate, or syllogistic calculus) to them. This position is frequently adopted by textbooks of legal logic (see Klug 1966). Proponents of this strategy seem to be saying, "Don't worry about the peculiarities of normatives and rely on **SL**." Another view sees logic as an abstract syntactic calculus and interprets it by either normatives or declaratives.[13] Thus, **NL** is independent of semantic views about normatives and so is coherent with cognitivism and noncognitivism alike. Both of these solutions have a weak point, in that they ignore relations between normative concepts, such as that permission is entailed by obligation and has no connection with **IOP**. This encourages the construction of more-sophisticated systems, such as deontic logic. If we accept (1) and (4), we will have to look for a special semantic basis of the logic of norms (imperatives). This can lead either to simple counterparts of **SL** or to advanced systems of **NL,** in both cases based on noncognitivism. **IOP** has a straightforward solution if one assumes that normatives are neither true nor false. On this assumption, normatives by definition cannot be inferred from declaratives, and **IOP** simply disappears. This way or otherwise, the crucial problem consists in the semiotic status of (*a*), (*b*), and (*c*) as elements of (*****). Everyone agrees that any normative sentence exhibits the structure expressed by the expression **N***A*, where **N** refers to a normative operator and *A* is its argument; the basic instances of **N** are obligation (denoted by **O**), prohibition (**F**), permission (**P**), and permission not or nonobligation (**P**¬). Since *A* is usually taken as a sentential operator, **N** functions as a unary sentence-forming functor (some deviations from this treatment will be noted in what follows). In order to make for easier comparisons between proposed **NL**s, I will use this unified symbolism without invoking original notations, unless additional symbols are included in such **NL**s. The symbols ¬, ∧, ∨, →, ↔, ∀, ∃ stand for negation, conjunction, disjunction, implication, equivalence, the universal quantifier, and existential quantifier. We will also assume the typical definition of well-formed formulas, but without getting into the details.

[12] As will be illustrated later, these solutions sometimes overlap.

[13] See Weinberger 1974, passim. Note, however, as will be discussed shortly, that this author has some reservations about this relation.

26.5. Prehistory of Normative Logic[14]

Aristotle formulated a definition of sentences in the following way:

> A sentence is a significant portion of speech, some parts of which have an independent meaning, that is to say, as an utterance, though not as the expression of any positive judgment. […]. Every sentence has a meaning, not as being the natural means by which a physical faculty is realized, but, as we have said, by convention. Yet every sentence is not a proposition; only such are propositions as have said, by convention. Yet every sentence is not a proposition; only such are propositions as have in them either truth or falsity. Thus a prayer is a sentence, but is neither true or false.
>
> Let us therefore dismiss all other types of sentence but the proposition, for the last concerns our present inquiry, whereas the investigation of the others belongs rather to the study of rhetoric or poetry. (Aristotle, *De Interpretatione,* 16b, 17a.)

This passage is important because it introduces the distinction between propositions and sentences in the grammatical sense. Aristotle used the term *apofantikos* (proposition, or *oratio enuntiativa*, in Pacius's Latin translation of Aristotle) and *logos* (sentence, speech, or *oratio*, in Pacius's Latin translation of Aristotle). Although imperatives are not mentioned here, one can assume that the Stagirite would classify them as sentences, which are not propositions. His dismissal of "other types of sentences" suggests that he thought they are excluded from formal logic.

Another contribution Aristotle made to **NL** lies in his analysis of practical syllogism (for which he used the term *praxis*, usually translated as "action" or as "syllogism of action," and equivalent in Latin to the Schoolmen's *syllogism operabilis*). The problem was framed by Aristotle as follows:

> Action requires the combination of universal and particular beliefs.
> […]. One belief (a) is universal; the other (b) is about particulars, and because they are particulars perception controls them. And in the cases where these two beliefs result in (c) one belief, it is necessary in purely theoretical beliefs for the soul to affirm what has been concluded, and in beliefs about production (d) to act at once on what has been concluded. If, e.g., (a) everything sweet must be tasted, and (b) this particular thing, is sweet, it is necessary (d) for someone who is able and also unhindered also to act on this at the same time. (Aristotle, *Nicomachean Ethics*, 1047b.)

Clearly, Aristotle was considering a purely logical question in this passage. In particular, he was not formulating any rule concerning the formal validity of the practical syllogism, save for a remark that the major premise must indicate

[14] This section covers material from antiquity to the early 20th century. The reason for including the prehistory of **NL** in this chapter is that the previous historical volumes were rather selective on legal logic. The only exception is Errera 2007, offering an extensive treatment of the syllogistic method in medieval juristic thought. However, the author does not enter into the theoretical problems of normative logic. I should note that my exposition is informal: I am not making any attempt to formalize it.

the purpose of an action in order to make inferences about the action. Interestingly, (c) that is, the statement "this particular sweet thing must be tasted" is not even explicitly formulated. It seems, therefore, that for Aristotle sound actions are based on inferences, and he seems to be more interested in rationality than in logical matters. Yet we have here a model in which normative sentences occur, and it was in Aristotle's writings that this kind of inference was first distilled.

The Stoics explicitly distinguish propositions and imperatives:

> the Stoics maintained that truth and falsity exist in "expression." And they say that "expression" is "that which subsists in conformity with a rational presentation," and that a rational presentation is one in which it is possible to establish by reason the presented object. And of expressions they term some "defective," others "self-complete"; the defective we may now pass over, but of self-complete there are, as they assert, several varieties; for in fact "jussive," such as we utter in giving an injunction, as for example—Come thou hither, O lady dear; others, "declaratory," such as we utter when making a statement, as for example—"Dion is walking about"; and others "interrogations," which we utter when asking a questions, as for instance—"Where does Dion dwell?" (Sextus Empiricus, *Against Logicians*, II, 70–2.)

The fundamental term of Stoic semiotics was *lekton*. Disregarding whether *lekta* should be considered as words (or complexes of words) or as thoughts, we can say that they are meaningful expressions. The Stoics divided *lekta* into complete (autonomous) and incomplete (non-autonomous). This division is not equivalent to that between *categoramata* and *syncategoramata*, because nouns belong not to *categoremata* but to complete expressions. Stoic autonomous *lekta* can be equated with sentences in the grammatical sense and they include propositions, questions, and imperatives, among other types of expressions. It seems that the Stoics were the first to introduce the standard division of grammatical sentences into propositions, questions, and imperatives (injuctions, προστάοσσντα).

An interesting historical issue concerns the problem of whether and how Stoic logic influenced Roman legal thinking. It is well-known that many leading Roman jurists subscribed to Stoicism as the *vera philosophia*. Let me recall Ulpian's definition of jurisprudence (a definition adopted in the Justinianian Code): *Iuris prudentia est divinarum atque humanarum rerum notitia, iusti atque iniusti scientia* (Jurisprudence is concerned with divine and human matters and is conceived as the science of what is just and unjust), which is simply a reiteration of the Stoic definition of philosophy as knowledge of the natural order, in keeping with the pantheism espoused by Chrisippus and his Roman followers. Similarly, the Stoic moral teaching stands behind the view of the function of law as that which helps us *honeste vivere, alterum non laedere, suum quique tribuere* (live honestly, not harm others, and give everyone his own). Much less is known about the influence that Stoic logic and methodology had on legal interpretation in Roman law. However, some principles such as Cicero's *Lex iubet ea, quae facienda sunt, prohibetque contraria* (Law makes obligatory what should be done and prohibits the contrary), seem to

follow some intuitions about obligation and permission as modal concepts and could be motivated by Stoic semiotic ideas. The quoted formula by Cicero is preceded by *Lex est ratio summa* (Law is supreme reason), which certainly also carries Stoic ideas. On the other hand, other rules—such as Cicero's *Lex retro not agit* (The law does not act retroactively)—may instead be informed by the idea of justice. So great care must be exercised in tracing out the logical and ethical aspects of Roman legal thinking. In any event, there is still research to be done before we can have a detailed analysis of the logical and philosophical sources of Roman law, especially as concerns the methods for defining legal terms and the principles of legal interpretation.[15]

Since medieval contributions to **NL** are summarized in a previous volume of this Treatise (see footnote 14), I will offer only few remarks on this period. In principle, the Schoolmen, notably Thomas Aquinas, followed Aristotle, particularly his idea of the practical syllogism as a guide for acting rationally. It has quite recently been discovered that medieval logicians elaborated some rudiments of deontic logic (Knuuttila 1981). Peter Abelard considered necessities (or that which must be done as a matter of necessity) as nature's demands or imperatives. He also observed that conditionals with permitted or obligatory antecedents and prohibited consequents are consistent but irrational. William of Ockham, Robert Holcot, and Roger Rosetus realized that permission (*licitum*) is definable by obligation (*obligatum*) or prohibition (*illicitum*); for example, "It is permitted that *A*" means the same as "It is not obligatory that not-*A*." Rosetus argued for a rule making it possible to derive "If *A* is obligatory, then *B* is obligatory" from "If *A*, then *B*." Medieval deontic logicians also noted some problems with ommisions (abstaining from an action) and kinds of permission. Finally, it should be noted that the Late Middle Ages gave currency to terms such *dialectica legalis* and *topica legalia*.

A significant contribution to **NL** can be found in Leibniz (see Burkhardt 1980, 414–2; Kalinowski 1974; Lenzen 2004, chap. 1), who regarded this field as a part of applied logic. In particular, Leibniz envisaged a formalization of Roman law as a theory in the style of Euclid's geometry; this was part of his program for a *characteristica universalis*. The task that Leibniz set for himself was clearly practical, less theoretical, since he wanted develop exact tools that would be useful in solving controversies between parties of contracts. He also identified formal analogies between five sets of concepts, namely, (*a*) *iustum* (just), *iniustum* (not just), *aequm* (just according to law), and *omissibile* (not required by law); (*b*) *licitum* (permitted), *illicitum* (non-permitted), *debitum* (obligatory), and *indebitum* (non-obligatory); (*c*) *possible*, *impossibile*, *necessarium*, and *contingens*; (*d*) *quidam* (some), *non-quidam* (none), *omnis* (all), and *quidam non* (not all); and (*e*) *potest* (can), *non potest* (cannot), *non potest non* (cannot but, or must), and *potest non* (must not). Technically speaking, these

[15] Some information in this regard is offered in Giaro 2007.

dependencies establish analogies between legal terms, deontic concepts, alethic modalities, and quantifiers (all of them analyzed as elements in categorical sentences and sentences expressing the modalities of action). These analogies generate various definitions, such as "obligatory" being defined as "not permitted not." Leibniz also formulated some principles combining various modalities, such as that *aequm* entails *potest*. Unfortunately, Lebniz's magnificent work on **NL** has until recently been forgotten.

Contrary to the fate of Lebniz's contribution, Hume's treatment of **IOP** became famous and influential. Writes Hume:

> I cannot forbear adding to those reasonings an observation, which may, perhaps, be found of some importance. In every system of morality, which I have hitherto met with, I have always remark'd that the author proceeds for some time in the ordinary way of reasoning, and establishes the being of a God, or makes observations concerning human affairs; when of a sudden I am surpris'd to find, that instead of usual copulations of propositions, *is*, and *no t*, I meet with no proposition that is not connected with an *ought*, or *ought not*. This change is imperceptible; but is, however, of the last consequence. For as this *ought*, or *ought not*, expresses some new relation or affirmation, 'tis necessary that it shou'd be observ'd and explain'd; and at the same time that a reason should be given, for what seems altogether inconceivable, how this new relation can be a deduction from others, which are entirely different from it. (Hume 1888, 469)

Perhaps it is important to note that Hume considered ought-sentences as indicatives. The Hume thesis (or "Hume guillotine," as it is sometimes called)—a thesis according to which is-sentences do not entail ought-sentences—plays a crucial role in all debates around **NL**.[16] This statement was formulated by Hume as a problem for the theory of deduction by observing that normatives introduce a new relation. Yet he did not offer any solution. On the philosophical side, the Hume thesis has been strengthened by Kant and Neo-Kantians with their strong separation between *Sein* and *Sollen*.

The next important contributor to **NL** and its problems was Bernard Bolzano (1781–1848), who used a very broad concept of a proposition:

> In my view, questions, wishes, entreaties, etc. and even mere exclamations, in the sense which they get through their context, must be regarded as genuine, though often obscurely stated, propositions. Take the case of question, e.g. "What is the ratio between the diameter and the circumference of a circle?" Of course, this question asserts nothing about that which is in question, but it nevertheless states something, namely our desire to be instructed about the subject of the question. Hence it may be either true or false. […]. It is true, of course, that we occasionally say "I do not assert this, I merely ask." It would seem that in such a statement we contrast question with assertion or judgment. Upon closer inspection, however, it turns out that the meaning of such a statement is actually this: "I do not *assert* that this or that is the case, but I merely *ask*, i.e. I assert that I desire to know, whether or not it is the case." Hence this case confirms that a question is a complete proposition. Just as something is asserted in every question, so also in every wish, command, etc. Hence they should all be called propositions. (Bolzano 1972, 25)[17]

[16] See Schurz 1997 and Stuhlmann-Laeisz 1983. These books also survey arguments against the Hume thesis.

[17] Originally published in German in 1837 under the title *Wissenschaftslehre*.

Bolzano's general view is as follows. Every indicative propositional content can be asserted, desired, asked, commanded, etc. Hence, we have the general pattern "I (or another pronoun) […] that *A*," where […] may be filled by a verb referring to an attitude or modality. Thus, normatives as imperatives can be fit into a paradigm pattern.

Bolzano also addressed normatives as ought-sentences and the related concept of logical consequence, asking,

> is it probable that for every set of truths from which another follows as consequence from them as ground, there is an infinite number of other sets of truths from which other truths follow in the same way, so that the distinctive character of the very ideas of which these sets of truths are composed never has any influence on the type of ground-consequence relation between them?—The following example seems to me prove the opposite. Anyone who does not deny the existence of a relationship of ground and consequence in general will be inclined to grant that there is a certain practical truth of the form: One ought to do (or will) *A*, which is so constituted that all of the other practical truths, e.g. one should not lie, etc. can be derived from as a consequence from its ground by the addition of some theoretical proposition, For *A* to happen, *X* is necessary. But that first truth (the so-called highest moral law) also appears to have a ground. For if *A* were impossible, there could be no obligation to will it. Consequently the obligation to do *A* is grounded either wholly or partly in the truth that *A* is possible. We may assume, however, that the truth just stated by itself, or a set of truths in which [it] is only one part, is the complete ground of that supreme moral law; then it is clear that it does not follow from its ground by any of the usual rules of inference. "One should do *A*" flows as a consequence from a set of truths in combination, but none of them can already include the concept of should within it (state an obligation, because otherwise it would be a practical truth). Therefore we can see distinctly that none of the usual rules of inference would justify us in accepting it as part of the conclusion. (Bolzano 1973, 271)

For Bolzano, "ought" normatives fall under the general pattern "One ought to do *A*." Bolzano follows Kant here and says that ought implies can. But that is only part of the problem. Let us assume that we have a particular obligation, for example, (*) "One should not lie." There is no special problem with grounding (*) by deriving it from the supreme moral law. Yet we should offer a ground for this supreme law. Bolzano observes a dilemma. The supreme moral law cannot be grounded by an ought-sentence, because in that case it would not be supreme. On the other hand, the supreme moral law cannot be grounded by the usual rules of inference, because these rules concern is-sentences in Hume's sense. Bolzano does not decide whether the supreme moral law should be accepted axiomatically or whether it needs to be supplemented with usual rules of inference, but his analysis seems to add something important to the **IOP** problem in Hume's formulation. In particular, Bolzano delineated ways of solving the question and observed that in some cases it is important to compose sets of premises, because the nature of premises (is-sentences, ought-sentences, etc.) appears relevant.

Gottlob Frege (1848–1925) applied his famous distinction between *Sinn* (sense) and *Bedeutung* (reference) to imperatives as well:

A subordinate clause with "that" after "command," "ask," "forbid," would appear in direct speech as an imperative. Such clause has no reference but only a sense. A command, a request, are indeed not thoughts, yet they stand on the same level as thoughts. Hence in subordinate clauses depending upon "command," "ask," etc., words have their indirect reference. The reference of such a clause is therefore not a true value but a command, a request, and so forth. (Frege 1960, 68.)

Although Frege said nothing about normative inferences, he indicated an important semantic point. He denied that imperatives are thoughts. Consequently, they have no references as truth-values (the True, the False). In fact, imperatives have no references if they function in direct speech, but they do have a sense. For example, the sentence "Close the door!" has a sense but no reference. The situation changes if we consider the utterance "I command that you close the door," because it contains an indirect reference, namely, the imperative demanding that the door be closed. This comports with Frege's general view that the direct sense of sentences used in direct speech becomes the indirect reference of complexes in *oratio obliqua*.

It was Jules Poincaré (1854–1912) who put forward the first explicit logical proposal concerning the structure of normative inferences.[18] According to Poincaré, a correct logical inference with an imperative as its conclusion requires an imperative premise as the major assumption. In his words:

If the premises of a syllogism are both in the indicative mood, the conclusion will also be in the indicative. For the conclusion to have been stated in the imperative, at least one of the premises must itself have been in the imperative. (Poincaré 1913, 103; my translation)

This observation conjures up Aristotle's previously quoted remark about the character of the major premise in a practical syllogism, but Poincaré explicitly refers to imperatives. Otherwise stated, the rule that imperative conclusions require imperative premises can be regarded as a metalogical principle that Poincaré defined for a language in which imperatives and declaratives alike occur. Although it is not explicit in Poincaré, he would probably agree that the same rule holds for the relation of non-normative declaratives and normative declaratives. In any event, Poincaré's rule, broadly interpreted, in a way partly solves the problem raised by Bolzano. If we have any ought-sentence as a conclusion, its derivation is possible by applying the usual rules of inference to a set of premises having at least one ought-sentence. On the other hand, the Poincaré rule says nothing about grounding the supreme normative rules, if any exist. It is fair to say that logic does not solve Kelsen's famous problem concerning the *Grundnorm*.

Alois Höfler (1853–1922)—a member of the Brentano school (he was trained as a mathematician and a physicist but later turned to philosophy—re-

[18] This question is discussed by Poincaré in the context of scientific morality and immoral science, which for grammatical reasons he considers to be impossible.

discovered analogies between normative concepts and alethic modalities (see Höfler 1917).[19] He observed in particular that obligation (*A*), prohibition (*E*), permission (*I*, on non-prohibition), and permission not (*O*, or non-obligation) form a logical square formally analogical to that which describes the dependencies between modal sentences and categoricals. It is interesting that Höfler designated normative sentences by the same letters that are traditionally used in speaking about categorical sentences, namely, *A* (obligation, universal affirmative), *E* (prohibition, universal negative), *I* (permission, particular affirmative), and *O* (permission not, particular negative), though he also employed another notation. He then formulated several laws based on the normative logical square, such as that obligation implies permission or that obligation and non-obligation are inconsistent. Normatives were similarly treated by Höfler as categoricals, for example, he worked with forms such as "Every (some) *S* can be (ought be) *P*," where *can* takes a normative, not an alethic, meaning. Hence Höfler's **NL** contains an amount of normative syllogistic.

Another scheme of normative interrelations was put forward by Wesley Hohfeld (1879–1918) (Hohfeld 1919; see also Moritz 1960), who observed that normative concepts have correlatives and opposites. For example, rights in the strict sense should be distinguished from privileges, because whereas the former have correlates in the duties of other parties, the latter do not have this property. Further, rights cannot be equated with powers, enabling specific persons to make changes in legal relations, or with immunities, legally defending persons against the powers exercised by others. Consequently, Hohfeld introduces two groups of relations involving correlates and opposites. Firstly, a right (or claim) has a duty as its correlative and no-right as its opposite; privilege (liberty) is correlated with a no-right and opposed to duty. We always have here either some action or some omission; for example, if someone has a duty (to do or abstain from doing something), it means that another party has a correlative right. Secondly, power takes liability as its correlative and disability as its opposite, but to have the privilege of not doing something (of a non-doing) is correlative to liability, and an absence of power is opposed to immunity. In the second case, the possibility of doing or not doing something results from powers and immunities. Hohfeld was guided by legal, not logical, intuitions, and this probably explains why he was able to propose a fairly rich table of normative concepts and relations. Hohfeld's account is also interesting because it was the first logical analysis of some logical issues in law related to the legal culture that shaped American common law.

The last author discussed in this section is Edmund Husserl (1859–1938), who considered norms as proper objects of of normative science, but he also formulated some general remarks:

[19] See, in this regard, the previous discussion of medieval logicians and Leibniz.

> We must now ask what is meant by […] "shall be" or "should be" as opposed to what is. The original sense of "shall" or "should," which relates to a certain wish or will, a certain command, is plainly too narrow, e.g. You shall listen to me, *X* should come to me. […]. If we say "A soldier should be brave," this does not mean that we or anyone else are wishing or willing, commanding or requiring this. […] "A soldier should be brave" rather means that only a brave soldier is a "good' soldier," which implies (since the predicates "good" and "bad" divide up the extension of the concept "soldier") that a soldier who is not brave is a "bad" soldier. *Since* this value-judgment holds, everyone is entitled to demand of a soldier that he should be brave […]. We may in general take as identical or at least as equivalent the forms "An *A* should be *B*" and "An *A* that is not *B* is a bad *A*," or "Only an *A* which is a *B* is a good *A*." (Husserl 1901, 34; my translation)

Thus, Husserl's theory of normatives is not imperative, because he clearly contrasts *shall* and *should* with the imperative mood. Although Husserl equates normatives with evaluatives, the most important semantic consequence of his approach lies in the indicative character of the former and so in their being suitable for as truths or falsities.

Husserl makes also some logical observations:

> Negative statements of what should not be are not to be taken as negations of corresponding affirmative statements, as too, in the ordinary sense, the denial of a demand does not amount to a prohibition. […]. The following forms are […] equivalent: "An *A* should not be *B*" and "An *A* which is *B* is in general a bad *B*" or "Only an *A* which is not *B* is a good *A*."
>
> That "should" and "should not" are mutually exclusive follows formally from their interpretations, and the same holds of the propositions that judgements regarding what should be entail no assertion regarding correspondingly is.
>
> The just clarified judgements of normative form are plainly not the only ones that one would allow to count as such, even if the word "shall" does not occur in their expression. It is inessential if, instead of saying "*A* should (or should not) be," we also are able to say "*A* must (or may not) be *B*" and "*A* may be *B*." We touch more substance if we point to the two new formulas "*A* need not be *B*" and "*A* may be *B*," which are in contradictory opposition to the above forms. "May not" is therefore the negation of "should," or, what is the same, of "must"; "may" the negation of "should not," or, what is the same, of "may not," as can readily be seen from the interpreting value-judgments: "An *A* need not be *B*" = "An *A* that is not *B* is not therefore a bad *A*"; "An *A* may be *B*" = "An *A* that is *B* is not therefore a bad *A*." (Husserl 1901, 34–5; my translation)

The logic resulting from this passage is obviously modal, as can similarly be said of Höfler. In particular, Husserl distinguished contraries (e.g., *should* and *should not*) and contradictories (e.g., *may not* and *should*). He is also believed to be the first author to have observed the converse of Hume's guillotine, that is, the lack of entailment from what should be to what is.

26.6. Attempts at NL Construction from 1926 to 1951

It was Ernst Mally (1879–1918), a student of Meinong in Graz, who in 1926 proposed the first formal **NL** system (see Lokhorst and Goble 2004, Mally 1926; cf. Morscher 1998, Woleński 1998a). Roughly speaking, Mally's **NL** is an extension of **SL**; more specifically, it is a classical propositional calculus with quantifiers binding sentential variables and two constants, the *verum* (denoted

by 1) and the *falsum* (denoted by 0), where $0 \leftrightarrow \neg 1$.[20] Mally distinguished "It ought to be the case that A"—or, equivalently, "Let it be that A" (he used the symbol $A!$ for the imperative mood), that is, $\mathbf{O}^{\rightarrow}A$—and $\mathbf{O}A$, the latter being understood as an unconditional obligation. He also introduced the context "A requires B" ($A\mathbf{R}B$) and "A mutually require**s** B" ($A\mathbf{R}^{=}B$). We have the following three definitions: (*i*) $A\mathbf{R}B =^{\text{df}} A \rightarrow \mathbf{O}^{\rightarrow}A$; (*ii*) $A\mathbf{R}^{=}B =^{\text{df}} A\mathbf{R}B \wedge B\mathbf{R}A$; and (*iii*) $\mathbf{F}A =^{\text{df}} \neg\mathbf{O}A$. The last definition indicates that Mally completely neglected permissions. That can be explained by noting that he considered the normative status of a state of affairs as either obligatory or prohibited. Moreover, since his system was conceived as the logic of the will, as well as the logic of oughtness, $\mathbf{O}^{\rightarrow}A$ can be read as "A is desirable" or (in the first-person form) "I want A to be the case." Although this reading is to some extent justified, it is clear that Mally overlooked the modal status of normative operators. On the other hand, he considered the normatives as indicative sentences.

Mally presents his system as an axiomatic construction. Axioms are as follows (verbally and formally):

(I) If A requires B and if B implies C, then A requires C.
$(A\mathbf{R}B \wedge B \rightarrow C) \rightarrow A\mathbf{R}C$*p

(II) If A requires B and if B requires C, then A requires B and C.
$(A\mathbf{R}B \wedge B\mathbf{R}C) \rightarrow A\mathbf{R}B \wedge C$

(III) A requires B if, and only if, it is obligatory that A imply B.
$A\mathbf{R}B \leftrightarrow \mathbf{O}(A \rightarrow B)$

(IV) Something is obligatory.
$\exists A(\mathbf{O}^{\rightarrow}A)$*p

(V) Nothing is obligatory and prohibited.
$\neg(\mathbf{O}A \wedge \mathbf{F}A)$

Mally derives several theorems from (I) through (V), among them $A\mathbf{R}B \rightarrow A\mathbf{R}1$, $A\mathbf{R}B \leftrightarrow \neg B\mathbf{R}\neg A$; $\mathbf{O}^{\rightarrow}A \wedge (A \rightarrow B) \rightarrow \mathbf{O}^{\rightarrow}B$, $\mathbf{O}^{\rightarrow}A \wedge \mathbf{O}^{\rightarrow}B \leftrightarrow \mathbf{O}^{\rightarrow}(A \wedge B)$; and $\forall A(\mathbf{F}A\mathbf{R}\neg A)$. Mally himself found the theorem $\mathbf{O}A \leftrightarrow 1$ highly surprising, because it entails $\mathbf{O}^{\rightarrow}A \leftrightarrow A$. The last formula means that what is factual is obligatory (imperative) and, conversely, it seems to abolish Hume's thesis about the separation of Ought and Is.[21]

Mally's logic was criticized by Karl Menger (1902–1985), an Austrian mathematician and a member of the Vienna Circle. His main point was as follows:

> This result [that is, $\mathbf{O}^{\rightarrow}A \leftrightarrow A$] seems, however, to be detrimental to Mally's theory. It indicates that the introduction of the sign ! [$\mathbf{O}^{\rightarrow}$ in my notation] is superfluous in the sense that it may

[20] I do not follow Mally's original notation.

[21] Let me note that the last difficulty disappears if axiom IV is formulated as above. Mally's original version is unclear, because it can be interpreted as postulating that every factuality ought to be.

cancelled or inserted in any formula at any place we please. But this result (in spite of Mally's philosophical justification) clearly contradicts not only the common use of the word "ought" but also some of Mally's own correct remarks on this concept, for example his comparison of $p \rightarrow (!p$ or $!q)$ and $p \rightarrow (p$ or $q)$. Mally is quite right that these two propositions are not equivalent according to the ordinary use of the word "ought." But by virtue of the equivalence of p and $!p$, they are equivalent in his theory. (Menger 1939, 97)

Leaving aside the question whether this criticism is fully correct or not, I should want to turn to Menger's own proposals.[22] As a devout logical empiricist, Menger denied that logic directly applies to commands, so he proposed that obligations be reduced to conditionals in the form $\neg A \rightarrow \mathbf{S}$, where **S** refers to a sanction. Thus, $\mathbf{O}A$ is read "If not-A, then sanction **S** is performed" or "Unless p, something unpleasant will happen (e.g., you will be punished). Menger's basic observation is that people do not command necessities or inconsistencies. Thus, we have a metarule "If $\mathbf{O}A$, then A is neither tautological nor inconsistent." According to Menger, all propositions that are neither necessary (tautological) nor inconsistent can be divided into asserted, negated, or doubtful (neither asserted nor negated). We have a new metarule, namely, "A is obligatory (commanded) if, and only if, it is doubtful." This suggests that the logic in which the doubtful is involved is three-valued, where the doubtful is associated with the third value. Menger stressed that Mally's critical formula is not valid in his logic, and for this reason the three-valued logic of commands has an obvious advantage over the two-valued logic. Although Menger did not flesh out his account in the form of theorems, he did manage to justify some modal connections, such as $\mathbf{O}A \rightarrow \mathbf{P}A$.

In the 1930s, **NL** became a focus of attention by some philosophers and logicians. Among them was whom the previously mentioned Jörgensen, who justified normative inferences by transforming commands into indicatives [occuring] in the themes of the former and then using **SL**. The same approach was suggested in a more sophisticated manner by Dubislaw (1937), Hofstadter and McKinsey (1939), Rand (1939), and Hofstadter (1944)—all proposals that came out at approximately the same time. These authors shared the previously mentioned view growing out of the Vienna Circle that only indicatives are suitable for logic in the proper sense. So in order for imperatives to be subjected to a logical treatment, they have to be transformed in a way. Once grammatical formulations are found, propositional variables can be substituted by the corresponding translations of the command in question and **NL** tautologies can be generated. The Mally problem disappears, because no admissible substitution yields the formula $\mathbf{O}A \leftrightarrow A$. On the other hand, the weakness of this approach lies in the impossibility of formulating the square of opposition for nor-

[22] I am considering his proposals in Menger 1939, disregarding the ideas expressed in Menger 1939. In fact, Menger was more interested in optative logic (the logic of wishing) than in the calculus of commands.

matives. An improvement was introduced by Albert Hofstadter (1910–1989) and John C. C. McKinsey (1908–1953), who distinguished between normative and non-normative (descriptive) functions of connectives. This step made it possible to define well-formed formulas in **NL**. The same authors introduced some normative axioms, such as a formula expressing the distributivity of **O** over the conjunction.

The first period of the reported development of **NL** was summarized by Ross (1941), and his views became very influential among lawyers. Alf Ross (1899–1979) took Jörgensen's dilemma seriously and outlined ways of solving it:[23]

> It seems only possible to solve the dilemma in one of the two following ways: *either* by showing that the presupposed delimitation of the logical domain is too narrow, and this may well be extended so as to include also the practical inferences […]; or by showing that the examples given of practical syllogism are only apparently logical (pseudo-logical). In connection with the latter possibility it should be recalled that these possibilities of inferences are based solely on a certain feeling of evidence, that is a feeling that what takes place in these inferences is of the same nature as that which takes place in the well-known logical inferences. However, such feeling may be due to an illusion, and on closer investigation facts can appear to be essentially different in reality. (Ross 1941, 34–5)

Clearly, on Ross's proposal for grounding **NL**, its possible foundations, semantic in essence, need to be carefully stated and examined.

Ross outlined three possible ways of constructing the semantics for normatives (imperatives in his language): (*a*) via the concept of objective validity; (*b*) via the concept of satisfaction; and (*c*) via the concept of subjective validity. The first solution consists in replacing truth with objective validity and falsity with objective invalidity. This step is presumably justified because imperatives are not subject to verification and falsification. On the other hand, the process of legitimation can be thought of as leading to "the objective determination of the validity or invalidity" of normatives. However, says Ross, we cannot hope to define validity without reference to a normative authority. This does not suffice for objective validity, because this concept requires an appeal to impersonal norms. Ross concludes that, since any belief in impersonal norms invokes religious-moral metaphysics, it cannot be taken as the foundation for logic. Solution (*b*), adopted by Jörgensen and Dubislaw, consists in assuming that normative OA is satisfied if, and only if, A is true; otherwise, it is not satisfied. Ross says that this approach dodges the problem rather than solves it. The reason is that the correspondence between truth and satisfaction (falsity non-satisfaction) needs to be *justified* rather than adopted *a priori*. Moreover, obvious differences exist between the properties of satisfaction (**S**) and normatives; for example, the equivalence (**) $\mathbf{S}(A \vee B) \leftrightarrow (\mathbf{S}A \vee \mathbf{S}B)$ does not hold for **O**. Finally, if the subjective validity of normatives lies in the existence of

[23] As previously noticed, it was Ross himself who introduced the term "the Jörgensen dilemma." For a general overview of Ross's legal philosophy see Chapter 16 in this tome.

some psychological phenomena, the lack of such phenomena does not account for the distinction between the validity of $\neg \mathbf{O}A$ and the invalidity of $\mathbf{O}\neg A$.

Ross observed a special problem related to the disjunctive connective. If **NL** is parallel to **SL** via validity (objective or subjective or satisfaction), the pattern (**RP**) $\mathbf{O}A \rightarrow \mathbf{O}(A \vee B)$ is logically correct; that is, if $\mathbf{O}A$ is valid (satisfied), then so is $\mathbf{O}(A \vee B)$. In Ross's own example (usually called Ross's paradox), if "Slip the letter into the letterbox!" is valid (satisfied), then "Either slip the letter into the letterbox or burn it! is also valid (satisfied), because, according to (*) and its consequences for $\mathbf{O}(A \vee B)$, the latter formula is (valid) satisfied if either $\mathbf{O}A$ or $\mathbf{O}B$ is valid (satisfied). Ross comments on this example in the following way with reference to satisfaction (but the same comment can be easily extended to validity):

> from the imperative $\mathbf{I}(x)$ we may infer the imperative $\mathbf{I}(x \vee y)$, e.g. from: Slip the letter into the letter-box! we may infer, slip the letter into the letter box or burn it! It will be seen that, interpreted as a satisfaction function, this inference is unimpeachable: If the first imperative is satisfied (if the letter has been slipped into the letter-box), then the other imperative too has been satisfied (it is then true that either has the letter been slipped into the letter-box or it has been burnt). But it is equally obvious that this inference is not immediately conceived to be logically valid. Similar results are arrived at by applying the other truth-function, but I do not find it necessary to pursue this question. (Ross 1941, 38; see also 40–1)

Since Ross's paradox (**RP**) became very popular among logicians and legal philosophers, two remarks seem in order here (though I will return to this paradox and to the similar other ones). First, Ross used the "either/or" connective, that is, exclusive disjunction (the sentence "Either *A* or *B*" is true if, and only if, *A* is true and *B* false or *A* is false and *B* true). However, that is not necessary, since by the same argument (**RP**) can be generated by inclusive disjunction (in fact, contrary to Ross's original version, it was previously formulated in just this way). Second, Ross did not explain why "it is equally obvious" that we have to do with a paradox. A folk interpretation (among legal theorists) is that consistent duties can, via (**RP**), lead to inconsistent duties. The idea is that from any obligation we can infer a conclusion asserting the existence of mutually inconsistent duties.

Ross's ultimate verdict about **NL** is negative:

> Imperatives can be constituent parts of genuine logical inferences, but, if so, it is simply a question of a "translation" of logical inferences concerning indicative sentences about the psychological facts which define the "validity" of an imperative.
>
> Imperatives can in certain cases be constituent parts of pseudo-logical inferences. In those cases the inference assumes the character of a specific practical inference, but actually it will be only pseudo-logical. If the tacitly assumed premise is included, the inference becomes really logical, but the inference then loses its character of being specifically logical. (Ross 1941, 45)

According to Ross, this conclusion falsifies a popular view of the application of law on the basis of the practical syllogism. On this view, legal norms are major

premises and assertions of facts are minor premises. Thus, lawyers and judges, among others, apply law via the practical syllogism by subsuming particular cases under general rules. Ross argues that this view is mistaken, because "minor premises" should be considered not as recognitions of facts but as acts of decision governed by purposes and by linguistic usage. In any event, there is no room for **NL**.

Ross's conclusion was strongly rejected by Kalinowski (1953), who proposed a logic of normatives (a theory of normative propositions) but regarded them as true or false. He justified this view by a cognitivism based on neo-Scholastic philosophy. The scheme **N***xa* is read as "A person *x* stands in a normative relation to action *a*." **N** can be specified by **O**, **F**, **P**, **P**¬, **I** (defined as **P** ∧ **P**¬), and **V** (defined as **O** ∨ **F**), which are the binary propositional functors of two nominal arguments. Actions can be good (v^*), wrong (f^*), or neutral (1/2*); if *a* is good, –*a* (non-*a*) is wrong, and vice versa, and if *a* is neutral, so is non-*a*. Valuations of sentences are defined with respect to valuations of actions. Assume that **O***A* has the form **O***xa* (or forms analogous to it for other functors). Then **O***A* is true for $a = v^*$, and is otherwise false; **F***A* is true for $a = f^*$, and is otherwise false; **P***A* is true for $a = v^*$ or $v^* = ½^*$, and is otherwise false; **P***A* is true for $a = v^*$ or $a = ½^*$, and is otherwise false; **P**¬*A* is true for $a = ½^*$, and is otherwise false; **I***A* is true for $a = ½^*$ or $a = f^*$, and is otherwise, false; and **V***A* is true for $a = v^*$ or $a = f^*$, and is otherwise false. Propositions (normatives) are thus true or false, although actions are three-valued. The system $\mathbf{K}_1$ containing all laws of opposition is axiomatized by propositional calculus plus the formula ¬**P***x-a* → **P***xa*. The addition of relation symbols and quantifiers yields the system $\mathbf{K}_2$, which—together with suitable definitions, as of contract—makes it possible to formalize legal systems and check normative reasoning.

26.7. Deontic Logic: The Standard System

Deontic logic as a legitimate logical theory arose exactly in the mid-20th century.[24] Georg H. von Wright (1916– 2003) was guided by formal analogies between various modalities:

> So-called modal concepts might conveniently be divided into four main groups. There are the alethic modes or modes of truth. These are concepts such as the necessary (the necessarily true), the possible (the possibly true), and the contingent (the contingently true). There are epistemic modes or modes of knowing. There are concepts such as verified (that which is known to be true), the undecided, and the falsified (that which is known to be false). There are the deontic

[24] See Wright 1951. Von Wright informs us that the word *deontic* was suggested by Broad. In fact, Mally used the word *Deontik* as a noun. Von Wright seems not to be aware of this fact, and the quotation that follows suggests that he is similarly unaware of some anticipations of the logical analysis of normative modalities.

modes or modes of obligation. These are concepts such as the obligatory (that which we ought to do), the permitted (that which we are allowed to do), and the forbidden (that which we must not to do). As a fourth main group of modal categories one might add the existential modes or modes of existence. These are concepts such as universality, existence, and emptiness (or properties of classes).

There are essential similarities but also characteristic differences between the various groups of modalities. They deserve, therefore, a special treatment. The treatment of the existential modes is usually known as quantification theory. The treatment of the alethic modes covers most of what is traditionally known as modal logic. The epistemic modes have not to any great extent and the deontic modes hardly at all been treated by logicians.

In the present paper an elementary formal logic of deontic logic will be outlined. (Wright 1951, 58.)

Although affinities between deontic concepts and other modalities or quantifiers had already been noted, von Wright's deontic logic is the first such logic presented in the contemporary modal setting.

This system (usually labelled "old system," or **OS**) is an extension of standard propositional calculus.[25] Von Wright himself was interested in finding a decision procedure for deontic tautologies similar to the matrix method used in propositional calculus. I will disreagard this route and turn straight to the axiomatic approach informally outlined by von Wright. There are three principles he adopts:

(D1) the principle of permission, which says that for any A, either A is permitted or $\neg A$ is permitted; $\mathbf{P}A \vee \mathbf{P}\neg A$;
(D2) permission is distributive over disjunction: $\mathbf{P}A \vee \mathbf{P}B \leftrightarrow \mathbf{P}(A \vee B)$;
(D3) the principle of deontic contingency, under which is not true that tautologies are obligatory and inconsistencies prohibited: $\neg\mathbf{O}(A \vee\neg A)$, $\neg\mathbf{F}(A \wedge \neg A)$.

Provided that we have propositional calculus, **OS** is axiomatized by (D1) and (D2) plus the rule of extensionality: if $A \leftrightarrow B$ is logically valid (A and B are logically equivalent), then $\mathbf{P}A \leftrightarrow PB$ is logically valid ($\mathbf{P}A$ and $\mathbf{P}B$ are logically equivalent), plus definitions $\mathbf{O}A =^{df} \neg\mathbf{P}\neg A$, $\mathbf{F}A =^{df} \mathbf{O}\neg A$, axiomatize **OS**. Every propositional tautology becomes a theorem of **OS** once variables are replaced with deontic formulas, as in $\mathbf{O}A \wedge \mathbf{O}B \rightarrow \mathbf{O}A$. No iterated formulas (such as $\mathbf{PO}A$) or mixed formulas (such as $A \rightarrow \mathbf{O}B$) are admitted.

Deontic logic would very soon become a legitimate part of formal logic,[26] with essential contributions by many leading logicians, among whom Alan

[25] Von Wright interpreted propositional variables as referring to actions and to connectives as forming the so-called performance function. This treatment was later replaced by treating variables as referring to sentences about actions. I will follow the latter interpretation.

[26] Deontic logic is considered a branch of philosophical logic devoted to formal investigations of various philosophically relevant concepts, particularly the modal ones.

Ross Anderson (1925–1973), Jaakko Hintikka (1929–), Stig Kanger (1924–1988), Saul Kripke (1940–), Arthur Prior (1914–1969), and Krister Segerberg (1936–).[27] The basis for further investigations became standard deontic logic (**SDL**), which is an improvement on **OS**.[28] Take any propositional calculus with ¬, ∨, ∧, →, and ↔ as connectives. The deontic formula as such is defined as having the form **O***A*, where *A* is a propositional formula, and ¬*D*, *D* ∧ *E*, *D* ∨ *E*, *D* → *E*, and *D* ↔ *E*, where *D* and *E* are deontic formulas (iterated and mixed formulas are excluded). Take as axioms the formulas (*a*) **O***A* → ¬**O**¬*A*, (*b*) **O***A* ∧ **O***B* ↔ **O**(*A* ∧ *B*), and (*c*) ¬**O**¬T where T is an arbitrary tautology. Add the definitions **P***A* =^{df} ¬**O**¬*A* and **F***A* =^{df} **O**¬*A*. Take propositional inference rules (detachment and substitution, though the latter is redundant for axiomatizations by schemes, as in the present exposition) and reformulate them for deontic formulas (extensionality is provable in **SL**). All these steps generate **SDL**. The axiom can be rewritten as (*a*') **O***A* → **P***A*; note that the square of oppositions for deontic formulas is a part of **SDL**. Axiom (*c*) is a novelty here. It says (via the definition of **O**) that tautologies are permitted. On the other hand, **O**T is not a theorem of **SDL**, though one can prove (*i*) **O***A* → **O**T. This last formula means that if something is obligatory, the same status must be ascribed to tautologies. By definition, if something is obligatory, inconsistencies are prohibited. Analogies between deontic and other modalities, especially alethic ones, are very well illustrated by the fact that **O***A* ∨ **O**B → **O**(*A* ∨ *B*) and **P**(*A* ∧ *B*) →**P***A* ∧ **P***B*, but converse dependencies do not hold, as is the case with necessity and possibility.

Von Wright's approach was syntactic and was eventually supplemented by an intuitive semantic consideration. The situation changed after the semantics of possible worlds were envisaged.[29] Its deontic version can be presented as follows (I will not enter into formal details). Let us assume that we have the ordered triple (the Kripke frame) **S** = <**K**, **W***, **R**>, where **K** is a non-empty set of items called possible worlds, **W*** is a distinguished element of **K** (usually interpreted as the real world), and **R** is a binary relation defined on **K** (the accessibility or alternativeness relation). **S** is a deontic frame if, and only if, **R** is not reflexive, that is, if it is not generally true that **WRW**. In particular, we assume that not-(**W*RW***). This assumption immediately excludes *A* → **O***A* as valid, even if the syntax would allow that; thus, Hume's thesis is immediately justified. Now we offer the following definition: **O***A* is true in **W*** if, and only if, *A* is true in every world **W**, such that **WRW***. Intuitively, the sentence

[27] For more detailed surveys of the various proposals and for historical details, especially as concerns the results achieved by the logicians just mentioned, see Hilpinen 1971 (collecting several seminal articles published after Wright 1951 and before 1971); Conte, Hilpinen, and von Wright 1977 (also a collection of articles); Al-Hibri 1978, Hilpinen 1981, McNamara 2006, Åqvist 1987, 2002.

[28] I am choosing the simplest version of **SDL**, based on **O** as the only deontic primitive.

[29] See Woleński 1990 for a historical account of deontic possible-world semantics.

"It is obligatory that *A*" is true in the real world **W*** if, and only if, *A* is true in every world **W** that is a deontic alternative to **W***, that is, in the world in which all obligations that are valid in the real world are satisfied. Accordingly, the sentence *PA* is true in **W*** if, and only if, there is a world **W** such that **WRW*** and *A* is true in **W**. Under these constraints, the converse of Hume's thesis—namely, the formula $\mathbf{O}A \rightarrow A$—is excluded from the stock of deontic tautologies. Our definition justifies the axiom PT and the axiom $\mathbf{O}A \rightarrow \mathbf{O}$T. These semantics do not exclude anarchistic worlds, meaning worlds in which nothing is obligatory. On the other hand, only non-anarchistic universes are non-trivial. Clearly, this case requires the situation in which some normative order is imposed on the real world. Normative systems can thus be said to generate deontic perspectives.

26.8. The Issues Discussed in Deontic Logic

26.8.1. Paradoxes

Ross's paradox (**RP**), is easily provable in **SDL**, as are its counterparts for permission and prohibition, that is, the formulas (*a*) $\mathbf{P}A\ \mathbf{P}(A \vee \mathrm{B})$ and (*b*) $\mathbf{F}A \rightarrow \mathbf{F}(A \wedge B)$. The latter formula is sometimes called the good Samaritan paradox, because it says that if something is prohibited, for example robbing person *X*, it is also prohibited to rob *X* and help this person (that is, to play the role of the good Samaritan). There are several other puzzles. Prior (1954) formulated the paradox of derived obligation. Note that in **SDL** we can prove the formula (*c*) $\mathbf{O}A \rightarrow \mathbf{O}(A \rightarrow B)$. Up to this point, (*c*) has simply been a special variant of Ross's formula, that is, $\mathbf{O}A \rightarrow \mathbf{O}(A \vee \mathrm{B})$**.** However, think about our intuitions about the concept of commitment, as in the case of the conditional obligation: What ought to be done if something else happens? Assume that it is obligatory to do $\neg A$, for example, to abstain from lying. By (*c*), this entails that it is obligatory to do *B*, provided that one performs *A*, but it is difficult to accept this conclusion. The fourth problem was indicated by Chisholm (1963) and it is called the paradox of the contrary-to-duty imperative. Assume the following sentences as intuitively admissible:

(*) It should be the case that someone, say *X*, is willing to help his or her friends.
(**) It should be the case that if *X* decides to help, *X* will make it known that he or she will be doing so.
(***) If *X* is not willing to help, *X* should not make it known that that is the case.

Now, assume that (*d*) *X* is *not willing to help*. Consider the following formalization: (*) $\mathbf{O}A$; (**) $\mathbf{O}(A \rightarrow B)$; (***) $\neg A \rightarrow \mathbf{O}\neg B$; (d) $\neg A$. Now, (***) and (*d*)

imply $\mathbf{O}\neg B$, but (*) and (***) entail $\mathbf{O}B$. Via $\mathbf{O}A \rightarrow \mathbf{P}A$ and the definition of **P** by **O**), the latter formula leads to $\neg\mathbf{O}\neg A$ and gives rise to a contradiction.

26.8.2. Lessons from Paradoxes[30]

I will offer a separate treatment of **RP** and its versions of permission and prohibition, along with the rest of the puzzles. The simplest response to **RP** is that it amounts to nothing more than the so-called paradoxes of material implication ($A \rightarrow A\ B$, $\neg A \rightarrow (A \rightarrow B)$) (see Woleński 1998b). The argument is as follows. Assume we have an **NS** consisting of an explicitly stated $\mathbf{O}A$ and its logical consequences. Since $\mathbf{O}(A \vee B)$ is a consequence of $\mathbf{O}A$, the former also belongs to **NS**. It can be satisfied by doing either A or B or both. However, **NS** is obeyed only if $\mathbf{O}A$ is satisfied, and this cannot be realized by doing A or B or by doing A and B, unless A is logically equivalent to B or B logically entails B. This reasoning can easily be generalized to any **NS** based on an arbitrary set **NS*** of explicitly stated obligations. The semantics of possible worlds gives an exact justification for this approach. Take an arbitrary consistent $\mathbf{NS}^* = \{\mathbf{O}A_1, \ldots, \mathbf{O}A_n\}$.[31] **NS*** determines a set of deontic alternatives to the real world which are subject to the normative regulation generated by **NS**. Clearly, all $A_1, \ldots, A_n$ must be true in the set of deontic alternatives. In particular, it may happen that, although for some $1 \leq i \leq n$, $\mathbf{O}(A\ B)$ is true in the real world, it is not true in every deontic alternative to it, because its truth appeals to the truth of B, contradicting A. In particular, although burning the letter satisfies "the letter should be either mailed or burnt," the model of the last disjunction is not in this case a deontic alternative. Thus, there is no harm if contradictions or permissions to breach obligations are introduced by Ross's formula.

Not everybody is satisfied with the solution just stated. One of the challenges is as follows (see Wright 1968, 21). In the ordinary meaning, $\mathbf{P}(A \vee B)$ entails or seems to entail $\mathbf{P}(A\ B)$. This kind of permission is called "the free-choice permission." Since $\mathbf{O}A$ implies $\mathbf{O}(A \vee B)$, the former has $\mathbf{P}(A \wedge B)$ as its logical consequence. Hence, we derive $\mathbf{O}A \rightarrow \mathbf{P}A$, and assuming that A is obligatory, we conclude that A is permitted as well. On the other hand, if $\mathbf{P}A$, then $\mathbf{P}\neg A$. Bearing in mind that $\mathbf{O}A$ can be defined as $\neg\mathbf{P}\neg A$, we have a contradiction, because $\mathbf{O}A$ implies $\neg\mathbf{O}A$. Of course, one can say that this argument plays on the ambiguity of **P**. That much is true, but the problem is whether **SDL** formalizes the "proper" notion of permission. Two other explanations of **RP** are that **SDL** does not properly capture the meaning of dis-

[30] The topic is discussed in Al-Hibri 1978, 22–99; Åqvist 1987, 57–69; Nortmann 1989. In fact, every survey of deontic logic contains a discussion of paradoxes.

[31] The consistency requirement excludes trivial cases in which a set of deontic sentences has no models.

junction and that it fails to account for the fact that obligations are sometimes temporally ordered.[32] The same question can be formulated for other paradoxes. How to formalize the concept of commitment? The formula $\mathbf{O}(A \rightarrow B)$ is the only admissible candidate in the standard system. On the other hand, $A \rightarrow \mathbf{O}B$, excluded by the syntax of **SDL**, seems to be more suitable from an intuitive point of view. Unfortunately, its inclusion in deontic logic immediately leads to inconsistencies, that is, to real paradoxes, and not only to ambiguities. Thus, the lessons that can be extracted from deontic puzzles lie in the serious challenges they pose.

26.8.3. Some Problems in Deontic Logic

This subsection collects several problems in deontic logic. Some of them are suggested by paradoxes; others are not. Since I have to be brief, I will restrict this discussion to the most basic elements, without going into detail.[33] I begin with a problem relating to commitment. Although the formula $A \rightarrow \mathbf{O}B$ has some advantages over $\mathbf{O}(A \rightarrow B)$ as a formal rendering of a conditional norm, some doubts remain. Since the implication $A \rightarrow \mathbf{O}B$ is true if A is false, it is hard to consider it a satisfactory account of commitment, because it seems that the falsity of A makes any talk of commitment meaningless. Von Wright (1968) sought to solve this problem by developing a dyadic deontic logic (sometimes called "the new system of deontic logic"). The main idea is as follows. We introduce a new symbol A/B, to be read "A given that B." Thus, the formulas $\mathbf{P}A/B$ and $\mathbf{O}A/B$ have the meaning "It is permitted that A given that B" and "It is obligatory that A given that B," respectively. This machinery makes it possible to distinguish among several kinds of conditional permissions and obligations, for example, "In some possible world in which it is true that B, some possible world is permitted in which it is true that A"; "In every possible world in which it is true that A is such that it is permitted in some possible world"; and "In every possible world in which it is true that A is such that it is permitted in some possible world in which it is true that B." Further, a distinction can be made between "In all possible worlds in which it is true that B, no possible world is permitted in which it is not true that A" and "Some possible world in which it is not true that A is such that A is not permitted in any possible world in which it is true that B." Now, the formula $\mathbf{P}(A \vee B) \rightarrow \mathbf{P}(A \wedge B)$ holds for the second concept of permission but not for the first one. On the other hand, Ross's formula is not provable in the system on the basis of that understanding of permission, and this logic requires the latter meaning of obligation. Thus, **RP** disappears, and free-choice permissions are formalized. Other approaches to normative conditionals are offered in Cornides 1974 (based

[32] See K. Hansen 2001 on disjunction and Segerberg 2006 on duties and time.

[33] For a more comprehensive discussion, see the works cited at footnote 30.

on preference logic), Forrester 1996 (based on causal implication), and Goble 1999 (based on relevant logic).

Permission denoted by **P** signifies non-prohibition and is often described as weak. Another kind of permission is also considered and characterized as strong (**P'**).[34] The minimal constraint is (*) **P'***A* → **P***A* (weak permission implies strong permission). Alchourrón and Bulygin (1984) claim that we should distinguish between the normative and extranormative sphere. The former comprises what is obligatory, prohibited, and strongly permitted, while the latter can be identified with the weakly permitted. Opałek and I have (Opałek and Woleński 1984) argued that a distinction should be drawn between strong and weak normative operators: Obligation or prohibition, or both, should be regarded as strong; whereas standard permission or indifference, or both, should be regarded as weak. The reason is that having a set of obligations, we determine a deontic perspective, but that perspective cannot be achieved by permissions or indifferences. Otherwise stated, if we have a normative system **NS**, its content will not change by adding weak permissions or indifference. The same conclusion seems to hold for strong permission. One should not deny that there is no need to consider the special case of permission, as when an obligation is cancelled or changed. For instance, when an authority says that an exception is introduced to such and such a regulation, it means that a hitherto prohibited action is now permitted. But in this case we can avoid the word *permission* and consequently speak of obligations. There is therefore no need to introduce strong permission as a new deontic operator.

The rise and development of deontic logic has made it possible to shed new light on the problem of the logic of norms. Most specialists seem to subscribe to the following view:

> In my opinion we are now justified in saying that all these attempts to reconcile the atheoretical thesis [i.e., the thesis that natural-language normative and value-sentences are neither true nor false] with adequate systems of deontic and imperative logic fail and, moreover, are doomed to failure: every available evidence supports the view that we must appeal to the notion of *truth in a model* when trying to understand and articulate the logic of normative as well as imperative sentences in normative discourse—the notion is just as indispensable in the present field as it is in others. (Åqvist 1973, 131)

Of course, this verdict concerns **NL** as a specific system different from deontic logic. On several occasions von Wright reiterated his previously mentioned view that the content of ordinary normatives, neither true nor false, can be reproduced by deontic statements (see, e.g., Wright 1991). Ross (1968, 139–84) reiterated his earlier view about the insufficiency of the theoretical foundations of imperative logic, but he also responded to deontic logic. In particular, he

[34] I report here the views expressed in Alchourrón and Bulygin 1984, 1988, Opałek and Woleński 1973, 1984, 1991.

pointed out the problem of negation in the normative sphere.[35] Consider the formulas $\neg \mathbf{N}A$ and $\mathbf{N}\neg A$. The former represents the external deontic negation; the latter, the internal one. The two are equivalent in **SDL** (as well as in other similar systems), but from an intuitive point of view they differ. The reason is that they sometimes yield deontic counterparts of norms (utterances having a directive meaning) deriving from other norms; thus, for example, "It is obligatory that people not rob others" can be derived from "It is prohibited to rob others"; but sometimes that is not so, as in the case of "It is not obligatory to go to the cinema," which can express either a permission not or a prohibition. This shows that although deontic logic can be considered a correct logic of normative indicatives, it cannot cover all the facts that populate the normative discourse. Ross considered the von Wright translation unjustified.

There have been other proposals worth a brief mention. Chellas (1969) tried to build a semantics for imperatives by extending the traditional concept of a model; the resulting system was in effect a kind of deontic logic. Stenius (1963) proposed a compromise solution consisting in a dual interpretation—descriptive and prescriptive—of logical formalism. Weinberger (1991) accepts that parallelism but points out several difficulties connected with it, among them the differences between $\mathbf{O}A \wedge \mathbf{O}A$ and $\mathbf{O}(A \wedge B)$ and between material implication and the normative conditional. For Kalinowski (1972, 202–3), the logic of norms is prior to deontic logic, and the former makes the latter possible, though it must be repeated that in his view norms ought to be constructed as true or false. Attempts to construct a special logic of imperatives have been made by Rescher (1966), with a theory based on the concept of coverage, and Lorenzen (1969), whose theory rests on his idea of operative logic. Anderson (1956, 1958) proposed a reduction of deontic logic to alethic modal logic together with an interpretation of the concept of obligation. This idea is interesting for lawyers because it seems to be related to American realism and the treatment of obligation. For Anderson, $\mathbf{O}A$ can be defined by the formula $(A \rightarrow \mathbf{S})$ to be read as "It is necessary that if A is not realized, then a sanction (bad thing) **S** [ought to happen] (note that this idea was anticipated by Menger). Further, we have the equivalence $\mathbf{P}A \leftrightarrow \Diamond (A \wedge \neg \mathbf{S})$. Thus, A is permitted if it is possible for A to be realized and the sanction does not follow. Anderson assumes a relatively weak system of modal logic (the Feys-von Wright system) and shows that **SDL** is derivable if we add the axiom $\neg \mathbf{S}$, which says that sanctions are avoidable. We can now see that Anderson's definition of obligation is very close to the view of duties as predictions of sanctions. A different way of combining deontic and alethic modalities was attempted by Fenstad (1959) in order to formalize the principle "ought implies can." Several other paths in the development of deontic logic can be mentioned, examples being efforts to fuse deontic logic and the logic of action (see

[35] This question had previously been discussed in Weinberger 1957.

Bailhache 1991, Wright 1963, 1968), develop a deontic syllogistic (see Ziemba 1973), supplement deontic logic with temporal operators (see van Eck 1981), and constructing a defeasible **NL** suited to be applied in artificial intelligence and computer science (see Mayer and Wieringa 1993, Nute 1997).

26.9. Logic and Legal Arguments

Several of the extensions of deontic logic mentioned at the end of the last section were meant to build tools with which to analyze arguments occurring in legal interpretations (see, for example, Hage 1997, 2005, Prakken 1997, Royakkers 1998). Older approaches sought to instead analyze some special juristic procedures by relying on various branches of standard logic, including propositional calculus, predicate logic, the theory of relations, and perhaps other tools, such as the logic of questions (see, for example, Klug 1966, Tammelo and Schreiner 1974–1977, Wagner and Haag 1970, Weinberger 1970, Ziembiński 1973). The older ideas and the more recent ones have something in common by virtue of their rejecting naive deductivism, the view that the interpretation and application of law must be based on the use of the practical syllogism. Another view that has gained some consensus over the last fifty years is that legal arguments are not purely logical schemes but complex principles of applied logic. The problem concerns the formal tools to be used in reasoning about exceptions, the consistency of normative systems, gaps in the law, and derived duties or permissions. Prakken proposes defeasible logic and non-monotonic reasoning, Royakkers recommends a dynamic logic, and Hage works with sets of reasons formalized in predicate logic and serving to check the consistency (coherence) of legal systems.

I will illustrate some elementary problems by taking the *argumentum a majori ad minus* (**ARMA)** and the *argumentum a minori ad majus* (**ARMI**) as examples. Both have a relatively well-defined formal structure. We can easily show that both are mutual transpositions, that is, they fall under the scheme $(A \rightarrow B) \leftrightarrow (\neg A \rightarrow \neg B)$. In fact, the following statement (in which the full caps are intended for emphasis in making the point more explicit)

> (**ARMA**) If MORE of something is permitted, then LESS of it is permitted, too.

is equivalent to the statement

> (**ARMI**) If LESS of something is prohibited (not permitted), then MORE of it is prohibited (not permitted).

Clearly, neither form is deductive in general. The main question is what *MORE* and *LESS* mean. Some cases can be treated logically. For instance, one

can say that "*A* and *B*" is more than *A* or *B*. Since deontic logic warrants the rule $\mathbf{P}(A \wedge B) \rightarrow \mathbf{P}A$, this special instance of (**ARMA**) is originally almost deductive—almost because we decide on extralogical grounds that the conjunction of two or more actions expresses MORE than those actions taken separately. However, neither MORE nor LESS express generally logical concepts, and both always require a special interpretation guided by legal interests. Thus, although the formulas

(**ARMA'**) $(\mathbf{P}A \wedge (A \text{ is MORE than } B)) \rightarrow \mathbf{P}B$
(**ARMI'**) $(\neg\mathbf{P}A \wedge (A \text{ is LESS than } B)) \rightarrow \neg\mathbf{P}B$

are perfectly deductive patterns and fall under the *modus ponens* rule, MORE and LESS must be additionally explained. For example, although, intuitively speaking, playing football on the grass is something more than walking on it (in that it does more damage to the grass), it can happen that playing soccer is permitted but walking is not, as in the example of rules on the use of soccer stadiums during play. This example aptly illustrates how the formal and informal aspects of legal reasoning are interrelated. And that should not come as a surprise. In any application of formal logic, one must decide whether a given mode is not only valid but also materially correct. It seems that—except for trivial cases and the *argumentum a contrario*, which is based on the rule of transposition for implication (or even equivalence)—traditional forms of legal inference are not reducible to pure logic. However, when we add supplementary premises (such as presumptions and exceptions), we are always able to transform specific legal arguments into perfectly constructed deductive patterns. Now, the various proposals for extending pure deontic logic discussed in the foregoing can be said to offer tools for such an analysis of legal arguments.[36]

[36] This point was anticipated in Kalinowski 1959.

Chapter 27

RECENT DEVELOPMENTS IN LEGAL LOGIC

by Davide Grossi and Antonino Rotolo

27.1. Introduction

Studies on legal logic are one of the most cultivated topics in legal theory during the last four decades. This is perhaps due to the fact that logics of norms are now a subject of several efforts driven by different research communities other than the traditional in legal and moral philosophy. In particular ICT scholars (especially in artificial intelligence and law, deontic logic in computer science, and normative multi-agent systems) have intensively worked on many questions relevant for legal reasoning.

In the remainder of the chapter we will briefly offer a survey of major recent achievements of this joint and interdisciplinary effort.[1] Section 27.2 presents some research directions on the concept of obligation that go beyond Standard Deontic Logic. Section 27.3 illustrates attempts that, moving from Alchourrón and Bulygin (1971), connect the logic of obligations to the one governing normative systems. The two subsequent sections deal with crucial questions that have been remarkably discussed especially within the community of artificial intelligence and law: the idea of legal defeasibility (Section 27.4), and the problem of legal dynamics (Section 27.5).

27.2. The Logic of Obligations: Beyond Standard Deontic Logic

27.2.1. Contrary-to-Duty Obligations and Preferences

One of the main research themes of deontic logic in the last four decades is about reasoning with contrary-to-duty (CTD) obligations, i.e., obligations that regulate of the violation of other obligations (see Carmo and Jones 2002). Examples of CTDs are "you ought not to kill, but if you kill you ought to do it in self-defense," or "you ought to return your books to the library on time, but if you do not you ought to pay a fine." Roughly, CTDs have to do with sub-ideal, or reparatory obligations.

As it was previously mentioned, Standard Deontic Logic forces consistency of obligations through the principle $\mathbf{O}A \rightarrow \mathbf{P}A$, which is characterized in Kripke frames by having serial ideality relations, i.e., by imposing the constraint that ideal alternatives always exist for each situation. It soon became

[1] The following sections are a shortened and updated version of parts of Grossi and Rotolo 2011.

E. Pattaro, C. Roversi (eds.), *A Treatise of Legal Philosophy and General Jurisprudence*,
DOI 10.1007/978-94-007-1479-3_55

apparent, however, that this semantics was not able to satisfactorily capture a key notion of CTD. That this notion is impossible to capture in SDL was made manifest in the literature by a number of scenarios—often called, with a stretch, paradoxes (see Hilpinen 2001, Åqvist 1984, Carmo and Jones 2002, Makinson 1999).

A simple workaround the problem was offered by a semantics proposed by Hansson 1969 (see D. Lewis 1974), the first articulated paper on the semantics of deontic concepts. The idea is to substitute the serial ideality relation by a total preorder $\succcurlyeq$, i.e., a reflexive, transitive and total binary relation, with the following intuitive reading: $s \succcurlyeq s'$ means that state s is at least as good/ideal as s'.[2] Now the most ideal states are the maximal of such an order, and sub-ideality can easily be represented by considering the maximals of some subset of states. On this basis, dyadic obligations of the type "it is obligatory that A under condition B" are interpreted in any world s of any model M as follows:

$$M, s \Vdash \mathbf{O}(A \mid B) \text{ IFF } \mathrm{Max}_{\succcurlyeq}(\|B\|_M) \subseteq \|A\|_M \qquad (1)$$

where $\|.\|_M$ denotes the truth-set function of $M = \langle S, \succcurlyeq, V\rangle$ and $\mathrm{Max}_{\succcurlyeq}$ the function extracting the maximals of a given set. A CTD will then be represented by taking condition B to be the violation of some other obligation. Formula 1 gave rise to a whole line of investigation into the so-called preference-based semantics of deontic logic, the value of which is that the semantic structures involved are quite flexible: Depending on the properties of the preference or ideality relation, different deontic logics can be obtained. This semantic approach has been fruitfully renewed in the 1990's for example by Prakken and Sergot (1996) and van der Torre (1997), and most recently by works such as J. Hansen 2005 and Grossi et al. 2014, which have confirmed the vitality of this line of inquiry.[3]

27.2.2. Beyond Obligation and Permission

Obligation and permission are only two of the rich family of concepts that play a role in normative, and in particular legal, reasoning. A first rich source of analysis of related concepts (eminently the notions of right and power) can be found in Hohfeld's (1911) theory. The sort of analysis proposed by Hohfeld is exemplified by what are sometimes called the Hohfeldian squares, of which these are the two main examples:

[2] Other conditions could obviously be imposed on the relation, typically yielding orderings that are weaker than total preorders.

[3] Interestingly, from the end of the 1960's, the very same idea behind Formula 1 has reappeared in many other branches of philosophical logic like, eminently, conditional logic and doxastic logic. In conditional logic, the expression $\max(\|B\|_M) \subseteq \|A\|_M$ has been used to give a semantics for counterfactual conditionals $B \Rightarrow A$ (Stalnaker 1968, D. Lewis 1973), and in doxastic logic, to give a semantics for conditional beliefs $B(A \mid B)$.

Right	—	Duty		Power	—	Liability
‖		‖		‖		‖
No-right	—	Privilege		Disability	—	Immunity

Right and duty (i.e., obligation) are viewed as correlatives: if I (the bearer) has a right against *j* (the counterparty) that A is brought about, then *j* has the obligation toward *i* to bring about *A*. A privilege is the opposite of an obligation, e.g., *j* is not obliged toward *i* to bring about *A*. Similarly is no-right the opposite of right and the correlative of privilege. After the advent of deontic logic, it became clear that these notions could be object of formal analysis. In fact, Hohfeld's line of research has later been systematically pursued within logic in work devoted to the analysis of so-called *directed obligations*, viz. obligations where bearers and counterparties are made explicit in a specially designed deontic logic (cf. Herrestad and Krogh 1995), and by what has come to be known as the Kanger-Lindahl theory of normative positions, which has developed into a rich blend of modal deontic and action logics able to formalize a complex array of deontic and legal concepts.[4]

While the formal analysis of the first square could build on deontic logic as the underlying framework for a logic of obligation, a formal analysis of the second square appeared more problematic. The quest for such analysis was programmatically set by Jones and Sergot (1996) in a paper that sparked an interesting line of research at the interface of logic, philosophy and artificial intelligence in the last fifteen years (see Grossi and Jones 2013).

The issue addressed by Jones and Sergot consists in the formal characterization of a notion of *legal power* as involved in sentences such as "the president has the power to declare a state of emergency." This notion of power is viewed as grounded in the so-called constitutive rules, viz. legal rules such as "18 years of age counts as age of majority" or "the president's signature counts as the enactment of the bill." For instance, the latter rule establishes that the president has the power to enact a legislative bill. As extensively argued for instance in Searle 1995, these rules—often called counts-as conditionals—represent the basic brick of complex institutions such as legal systems, and Jones and Sergot (1996) developed a first logical analysis of them.

27.3. Normative Systems

Another influential formal account of deontic notions, complementary to the (modal) logic-based approaches we discussed in the previous section, is the one sparked by Alchourrón and Bulygin (1971). The key feature of this ap-

[4] See Kanger and Kanger 1966 for an early exposition and Sergot 2001 for a recent version of the theory.

proach is to study norms—viewed as dyadic constructs connecting a fact to a deontic consequence (e.g., Formula 1)—not as formulae in some logical language, but rather as primitive ordered pairs ⟨*condition, consequence*⟩. A large number of such pairs would constitute an interconnected system called a normative system.

Viewed as parts of a bigger system norms are therefore considered to be uninterpretable if taken in isolation—unlike in logical semantics—and they acquire meaning only by relating to other norms in the system. The focus falls then on the problem of normative reasoning and its most characteristic features, such as: defeasibility, to which we will come back in detail in Section 27.4; the validity of closure principles (e.g., *nullum crimen sine lege*); the problem of handling legal gaps.

The basic idea behind normative systems goes hand in hand with the thesis according to which norms do not bear truth-values, and hence that deontic logics do not actually deal with norms, but rather with normative propositions, i.e., statements to the effect that certain norms exist. For instance, in this view, **O***A* would actually mean something like "there exists a norm commanding *A*."[5] In what follows we sketch, very briefly, the basic ideas behind two of the approaches that in recent years have taken up and developed the normative systems approach to the analysis of norms: input/output logics and normative systems algebras.

27.3.1. Input/Output Logic

Input/output logics (henceforth IOL) are a formalism introduced in (Makinson and van der Torre 2000) that has been applied to the study of normative systems in a long series of papers (e.g., Boella and van der Torre 2004) by viewing them as rule-based process of manipulation of inputs (factual premisses) into outputs (normative conclusions).

The key idea behind the application of IOL to the analysis normative systems consists in representing conditional norms simply as ordered pairs (*a*, *b*) where *a* represents the antecedent of the rule, and *b* its consequent: "if *a* then *b*" where a has factual content and b normative content, viz. an obligation or a permission. Typically, both *a* and *b* are taken to be formulae from propositional logic. Each set of such ordered pairs can be seen as an inferential mechanism which, given an input, determines an output based on those connections.

Various definitions can be given of how to produce the output on the basis of a set of pairs, and all consist in ways of closing the given set of pairs by

[5] See Section 26.4 in this tome. The significance of the problem has recently been reemphasized in Hansen et al. 2007, and a new approach to the problem emerged from the view of norms as "dynamic" operators—speech acts—modifying ideality orders. We will briefly come back to this latter point in Section 27.5.

adding new pairs in accordance to some principles, of which we give two very simple examples:

$$SI: \frac{(a, b)}{(a \wedge c, b)} \qquad CT: \frac{(a, b), (a \wedge b, c)}{(a, c)} \tag{2}$$

where *SI* stands for strengthening of the input—essentially an antecedent strengthening property—and *CT* stands for cumulative transitivity. Formally, given a set *NORM* of pairs, a closure operation *C* defined in terms of some of the above principles, and a set of facts *A*, the output of *NORM* given *C* and a set of input formulae *I* is:

$$out_C(NORM, A) = \{b \mid (a, b) \in C(NORM) \text{ and } s \in A\} \tag{3}$$

Intuitively, *NORM* represent the norms of a normative system and *C* the principles according to which the system makes the norms interact with one another. As the reader might have already noticed, this represents a very high-level abstraction of the workings of a normative system. Depending on the (many) ways the output operation is defined, IOL can be used to capture vary different principles for reasoning with norms (among which defeasibility, Section 27.4). This modeling freedom brought IOL to be applied not so much to the study and analysis of normative reasoning in *actual* legal systems, but rather to the specification of artificial normative systems in the field of artificial intelligence (see the aforementioned Boella and van der Torre 2004).

27.3.2. Algebras of Normative Systems

Lindahl and Odelstad (2000) advocate an algebraic analysis of normative systems. The approach is very close in spirit to the one, discussed above, of IOL. However, the formal machinery deployed is not based on logic and hinges on several algebraic and order-theoretical notions. In this section we provide just a brief sketch of the basic technical ideas underpinning the framework.

According to this approach norms can be seen—exactly as in IOL—as simple pairs $\langle a, b\rangle$ connecting (factual) conditions to (normative) consequences. Both conditions *a* and consequences *b* are taken to be elements of a set *X* upon which a Boolean algebra $\langle X, \sqcap, -, \bot\rangle$ is defined. Within such a structure, the normative relation between condition *a* and consequence *b* is given by extending the preorder yielded by the algebra.[6] The idea is that while the preorder—let us call it $\preccurlyeq$—represents some form of logical implication, normative

[6] A preorder can always be associated to a given Boolean algebra in the following way:

$$a \preccurlyeq b \text{ iff } a \sqcap b = a \tag{4}$$

systems add on the top of it the possibility of drawing more conclusions by some form of "legal" implication—let us call it ϱ. In other words, each normative system introduces, by stipulation, a consequence relation which is stronger than the logical one: $\preccurlyeq \subseteq \varrho$. The intuition is that, for instance, the fact that being obliged to pay taxes follows from having a paid job is not a matter of logic, but a matter of stipulation.

Therefore, in Lindahl and Odelstad's view normative systems can be studied as Boolean algebras supplemented by a binary relation ϱ. This is, in a nutshell, the key idea behind the approach. Space limitation prevents us to provide more details. It should be mentioned, however, that Lindahl and Odelstad 2000 was followed by a number of papers developing an extensive theory of normative systems on the ground of the simple intuition we have sketched above.[7]

27.4. Defeasibility in Legal Reasoning

One key idea of most logical accounts of the law is that legal reasoning is defeasible, namely, that we may have reasons to abandon certain legal conclusions even though there was no apparent mistake in previously supporting them (Sartor 2005). In legal theory, H. L. A. Hart (1951, 152) was the first who illustrated this idea by saying, for instance, that "there are positive conditions required for the existence of a valid contract" but there are reasons that can defeat that existence claim, "even though all these conditions are satisfied." The concept of defeasibility may have in the law different connotations.

27.4.1. Meanings of "Defeasibility" in the Law

Consider art. 2051 of the Italian civil code: "A person is liable for damage caused by things in his custody except where he shows evidence of a fortuitous case." This legal provision states that the fault is not required to show the liability of the receiver for damage caused by things in safekeeping, thus highlighting the fact that the applicability conditions of legal norms include both conditions that should be proved and conditions that should not be refuted (in this case, the fact that the receiver is at fault) (Sartor 1995).

Conditions of the latter type can be explicit, like in the above provision, but are most often implicit. In general, the fact is that the statement of a norm can never mention all the relevant issues that might possibly be of relevance for its application, and in particular all its possible exceptions. This "openness" to possible exceptions is a characteristic feature of legal norms and is known to be a peculiar aspect of legal *defeasibility*.

In the literature, defeasibility of legal norms breaks down, roughly, into the following issues:

[7] An interesting recent contribution is, for instance, Lindahl and Odelstad 2008.

(*i*) *Conflicts*. Norms can conflict, namely, they may lead to incompatible legal effects. Conceptually, conflicts can be of different types, according to whether two conflicting norms: (1) are such that one is an exception to the other (i.e., one is more specific than the other); this type of conflict can be solved using the principle *lex specialis*, which gives priority to the more specific norms (i.e., the exceptions); (2) have a different ranking status; this type of conflict can be solved using the principle *lex superior*, which gives priority to the norm from the higher authority; (3) have been enacted at different times; this type of conflict can be solved using the principle *lex posterior*, which gives priority to the norm enacted later.

(*ii*) *Exclusionary norms*. Some norms provide one way to explicitly undercut other norms, namely, to make them inapplicable.

(*iii*) *Contributory reasons or factors*. It is not always possible to formulate precise norms, even defeasible ones, for aggregating the factors relevant for resolving a legal issue. For example: "The educational value of a work needs to be taken into consideration when evaluating whether the work is covered by the copyright doctrine of fair use."

There are however more general reasons why legal reasoning should be viewed as defeasible. In fact, not all legal norms distinguish different types of applicability conditions (what should be proved and what should not be refuted), or not all norms admit exceptions or can be defeated. Independently of this, one may argue that legal reasoning is part of human cognition, which is defeasible (Pollock 1995) or that, even when norms seem to support indisputable conclusions, they are used in legal disputes or, more generally, in legal argumentative settings where arguments and counter-arguments dialectically interact.

When looking at the law through an argumentative lens, we may distinguish inference-based defeasibility, process-based defeasibility, and theory-based defeasibility (Prakken and Sartor 2004).

Inference-based defeasibility covers the fact that legal conclusions, though correctly supported by certain pieces of information, cannot be derived when the knowledge base including those information is expanded with further pieces of information.

Process-based defeasibility addresses the dynamic aspects of defeasible reasoning. As for legal reasoning, a crucial observation here is that it often proceeds according to the norms of legal procedures, such as those regulating the allocation of the burden of proof.

Theory-based defeasibility regards the evaluation and the choice of theories which explain and systematize the available legal input information (such as a set of precedents): when a better theory becomes available, inferior theories are to be abandoned.

The remainder of this section briefly discusses aspects of the first two types of defeasibility. As for the third type (theory-based defeasibility), the interested reader can still find a good primer in Prakken and Sartor 2004, sec. 4.

27.4.2. Defeasibility and Argumentation: Layers in the Law

Defeasible reasoning has been largely investigated in philosophy, logic and AI by usually working on the concept of *inference-based defeasibility* (Makinson 2005). In this sense, defeasibility is formally interpreted within non-monotonic logics, namely, in logics whose underlying consequence relation does not enjoy monotonicity, i.e., that conclusions do not decrease if more knowledge is added. Since non-monotonicity means that a logic lacks a property, its positive interpretation is open to many options. In regard to modeling legal reasoning, since the Nineties the most preferred one (especially in the AI&Law community) has been to develop argumentation systems (see, e.g., Gordon 1995, Lodder 1999, Prakken and Sartor 1996, Bench-Capon et al. 2000, Gordon et al. 2007).[8]

The advantage of this approach is that it intuitively captures the dialectal nature of legal reasoning by clearly considering its different layers. In particular, this approach at least distinguishes a logical layer, a dialectical layer, and a procedural layer of legal arguments (Prakken and Sartor 2002, Prakken and Vreeswijk 2002).

The *logical layer* deals with the underlying language that is used to build legal arguments. Many languages and reasoning methods can be used for this purpose, such as deduction, induction, abduction, analogy, and case-based reasoning.[9] If the underlying language refers to logic **L**, arguments can roughly correspond to proofs in **L** (Prakken and Sartor 2002). It may be argued that most (legal) argumentation systems are based on a *monotonic* consequence relation, since each single argument cannot be revised but can only be invalidated by other arguments (or better, counter-arguments) (Prakken and Vreeswijk 2002): it is the exchange of arguments and counter-arguments that make the system non-monotonic. However, this is not strictly required: when the underlying logic is itself non-monotonic, an argumentation system can be simply seen as an alternative way to compute conclusions in that non-monotonic logic (Governatori et al. 2004).[10]

[8] Although it does not consider the most recent proposals, a still good introductory discussion can be found in Prakken and Sartor 2002.

[9] The application of these reasoning methods in the law have been studied by legal logicians, but space reasons prevent us to handle here this discussion. See Sartor 2005.

[10] If we embed within this language any deontic operators, we will obtain a way to deal with the defeasibility of the corresponding deontic concepts (Nute 1998). In general, various forms of interaction can be found among defeasibility, deontic concepts and normative systems. See Sartor 2005.

Suppose we resort to a rule-based logical system where rules have the form $\phi_1, \ldots, \phi_n \Rightarrow \phi$ and represent defeasible legal norms. An argument for a legal conclusion ϕ can typically have a tree-structure, where nodes correspond to literals and arcs correspond to the rules used to obtain these literals; hence, the root corresponds to ϕ, the leaf nodes to the primitive premisses, and for every node corresponding to any literal ψ, if its children are $\psi_1, \ldots, \psi_n$, then there is a rule whose antecedents are these literals (Governatori et al. 2004).

Argumentation systems, however, do not need in general to specify the internal structure of their arguments (Dung 1995), so this assumption applies, too, to the legal domain. In this perspective, any (legal) argumentation system **A** is a structure $(A, \rightsquigarrow)$, where **A** is a non-empty set of arguments and $\rightsquigarrow$ is binary attack relation on A: for any pair of arguments a and b in A, $a \rightsquigarrow b$ means that a attacks b. This leads us to discuss the dialectical layer.

The *dialectical layer* addresses many interesting issues, such as when legal arguments conflict, how they can be compared and what legal arguments and conclusions can be justified.

Different types of attacks and defeat relations can apply to legal arguments. Pollock (1995)'s original distinction between *rebutting* and *undercutting* is almost universally accepted in the legal-argumentation literature (Prakken and Sartor 2002 and 2004). An argument A_1 rebuts an argument A_2 when the conclusion of A_1 is equivalent to the negation of the conclusion of A_2. The rebutting relation is symmetric. For example, if arguments are built using rules representing legal norms (regulating, for example, smoking in public spaces), a conflict of this type at least corresponds to a clash between the conclusions obtained from two norms (for example, one prohibiting and another permitting to smoke). The undercutting is when an argument challenges a rule of inference of another argument. This attack relation is not symmetric and occurs when an argument A_1 supporting the conclusion ϕ has some ground ψ but another argument A_2 states that ψ is not a proper ground for ϕ. To put it very simple, if one builds an argument A_1 for ϕ using the rules $\Rightarrow \psi$ and $\psi \Rightarrow \phi$ but we contend that ψ is the case, then we undercut A_1.

Conflicts between legal arguments can be solved using specific legal-domain dependent priority criteria such as, as we said, *lex specialis*, *lex superior*, and *lex posterior*. However, such criteria can conflict, too, so some researchers argued that they must be defeasible (Prakken and Sartor 1997, Prakken 1997).

In general, assessing conflicting legal arguments cannot work if we only examine single pairs of arguments. In fact, we need to consider all the arguments to establish what legal conclusions win and are justified in a legal dispute. Argumentation theory usually distinguishes among *justified*, *defensible* and *overruled* arguments. Justified arguments are those which basically survive from all attacks, the defensible ones leave the dispute undecided, and the overruled ones are those defeated by a justified argument (Prakken and Vreeswijk 2002).

Doing so, we may have to capture interesting complex argumentative patterns. For instance, consider this argumentation system:

$$A = \{A_1, A_2, A_3\}, \qquad \rightsquigarrow = \{\langle A_1, A_2\rangle, \langle A_2, A_1\rangle, \langle A_3, A_2\rangle\}$$

The argument A_1 is attacked and defeated by the argument A_2 but it may be reinstated when a third argument A_3 attacking A_2 comes into play (Prakken and Vreeswijk 2002). This is an example of a reasoning pattern known in argumentation theory as *reinstatement*, which is relevant, for instance, in legal evidential reasoning: suppose Henry was killed yesterday and John was charged with that crime. Tom argues that John did not kill yesterday Henry, but Nino testifies that John indeed killed him. Tom original argument can be reinstated by another testimony showing that that Nino was drunk yesterday.

Another interesting pattern regards the so-called floating conclusions (Horty 2002). Consider the following two arguments (represented as chains of rules):

$$\begin{aligned} A_1 \; & testimonyA \Rightarrow JohnShootHenry \Rightarrow guilty \\ A_2 \; & testimonyB \Rightarrow JohnPoisonHenry \Rightarrow guilty \end{aligned} \tag{5}$$

The two arguments lead to the same conclusion but one sub-argument of A_1 attacks one sub-argument of A_2 and vice versa (assuming that the fact that John shot Henry excludes that John poisoned Henry and vice versa). One may say that John is anyway guilty, whatever argument we may prefer, but we can also argue that the two testimonies undermine each other, so no conclusion could be obtained.

The procedural layer considers the ways through which conclusions are dynamically reached in legal disputes. Indeed, disputes can be reconstructed in the form of dialogues, namely of players' dialectical moves (Gordon 1995, Prakken 2001). Legal disputes in turn are regulated by procedural rules stating what dialogue moves (claiming, challenging, conceding, etc.) are possible, when they are legal, what effects the players get from them, and under what conditions a dispute terminates (Gordon 1995, Lodder 1999; see in general Walton and Krabbe 1995) (in general, see Walton and Krabbe 1995).[11]

A basic and fundamental question of the procedural layer regards how to govern and allocate the burden of proof (Prakken 2001). For example, basic dialogue protocols of 2-player civil disputes are defined on account of the requirement that the plaintiff begins the dispute with his claim and has to pro-

[11] The idea that justice depends on formal procedures governing public deliberation and dialogues has been defended, among others, in Rescher 1977 and Rawls 1971 and, in the law, in Alexy 1989a.

pose, to win, at least one justified argument which support, such a claim. The burden of the defendant is not in principle the same, as it may be sufficient in most cases for her to oppose to the plaintiff argument moves that are only defensible counter-arguments. The concept of legal burden of proof is very complex and its logical treatment is difficult: The interested reader can refer to Prakken and Sartor 2008. Even more complex is to handle the interplay between the dialectical and the procedural layers (Prakken 2001). To appreciate this, consider the example on floating conclusions of Formula 5. Here, players, if dynamically modeled at the procedural layer would certainly postpone their judgment and subsequently challenge both the testimonies and test their credibility (Prakken and Sartor 2004).

27.5. Legal Dynamics

One peculiar feature of the law is that it necessarily takes the form of a dynamic normative system. Despite the importance of norm-change mechanisms, the logical investigation of legal dynamics is still much underdeveloped. However, recent contributions exist and this section is devoted to a brief sketch of this rapidly evolving literature.

27.5.1. AGM-based Approaches

In the Eighties a promising research effort was devoted by Alchourrón, Gärdenfors, and Makinson to develop a logical model (AGM) for modeling norm change. As is well-known, the AGM framework distinguishes three types of change operation over theories. Contraction is an operation that removes a specified sentence ϕ from a given theory Γ (a logically closed set of sentences) in such a way as Γ is set aside in favour of another theory $\Gamma^{-}\phi$ which is a subset of Γ not containing ϕ. Expansion operation adds a given sentence ϕ to Γ so that the resulting theory $\Gamma^{+}\phi$ is the smallest logically closed set that contains both Γ and ϕ. Revision operation adds ϕ to Γ but it is ensured that the resulting theory $\Gamma^{*}\phi$ be consistent (Alchourrón et al.1985). Alchourrón, Gärdenfors and Makinson argued that, when Γ is a code of legal norms, contraction corresponds to norm derogation (norm removal) and revision to norm amendment.

AGM framework has the advantage of being very abstract but works with theories consisting of simple logical assertions. For this reason, it is perhaps suitable to capture the dynamics of obligations and permissions, not of legal norms. In fact, it is essential to distinguish norms from obligations and permissions (Boella et al. 2009, Governatori and Rotolo 2010): the latter ones are just possible effects of the application of norms and their dynamics do not necessarily require to remove or revise norms, but correspond in most cases to instances of the notion of *norm defeasibility* (Governatori and Rotolo 2010).

Recently, some research has been carried out to reframe AGM ideas within rule-based logical systems, which take this distinction into account (Stolpe 2010, Rotolo 2010). However, also these attempts suffer from some drawbacks, as they fail to handle the following aspects of legal norm change: (1) the law usually regulate its own changes by setting specific norms whose peculiar objective is to change the system by stating what and how other existing norms should be modified; (2) since legal modifications are derived from these peculiar norms, they can be in conflict and so are defeasible; (3) legal norms are qualified by temporal properties, such as the time when the norm comes into existence and belongs to the legal system, the time when the norm is in force, the time when the norm produces legal effects, and the time when the normative effects hold.

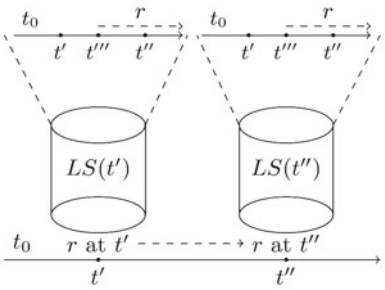

Figure 1. Legal System at t' and t''

Hence, legal dynamics can be hardly modeled without considering defeasibility and temporal reasoning. Some works (see, e.g., Governatori and Rotolo 2010) have attempted to address these research issues. All norms are qualified by the above mentioned different temporal parameters and the modifying norms are represented as defeasible meta-rules, i.e., rules where the conclusions are temporalized rules.

If t_0, t_1, …, t_j are points in time, the dynamics of a legal system *LS* are captured by a time-series $LS(t_0)$, $LS(t_1)$, …, $LS(t_j)$ of its versions. Each version of *LS* is called a norm repository. The passage from one repository to another is effected by legal modifications or simply by temporal persistence. This model is suitable for handling complex modifications such as retroactive changes, i.e., changes that affect the legal system with respect to legal effects which were also obtained before the legal change was done. The dynamics of norm change and retroactivity need to introduce another time-line within each version of *LS* (the time-line placed on top of each repository in Figure 1). Clearly, retroactivity does not imply that we can really change the past: this is "physically" impossible. Rather, we need to set a mechanism through which we are able to reason on the legal system from the viewpoint of its current version but as if it were revised in the past: when we change some $LS(i)$ retroactively, this

does not mean that we modify some $LS(k)$, $k < i$, but that we move back from the perspective of $LS(i)$. Hence, we can "travel" to the past along this inner timeline, i.e., from the viewpoint of the current version of *LS* where we modify norms. Figure 1 shows a case where the legal system *LS* and its norm *r* persist from time t' to time t''; however, such a norm *r* is in force in *LS* (it can potentially have effects) from time t''' (which is between t' and t'') onwards.

27.5.2. Dynamic Logic Approaches

Inspired by recent theoretical and technical developments in the logical study of dynamics—especially the dynamics of informational attitudes such as knowledge and belief[12]—some scholars have proposed models for the "dynamification" of several kinds of deontic logics.

At the heart of these approaches lies the notion of structure transformation. Let us for instance go back to the semantic analysis of obligation that we gave in Section 27.2.1 which was based on an ideality ordering. This semantics lends itself easily to a view of obligation dynamics based on ways of manipulating that ideality ordering. To make a simple example, following van Benthem et al. 2014, the enactment of a command that *A* be the case could be rendered by the modification of that ideality ordering in such a way that all *A*-states are ranked as more ideal than all $\neg A$-states. The upshot is the modeling of different forms of norm dynamics in terms of different operations on their semantic structures. Other recent contributions along these lines, although based on different structures, are for instance Aucher et al. 2009 and 2010.

It is finally worth observing that the approaches based on dynamic logic offer a perspective which is in a way complementary to the one described in Section 27.5.1. Unlike the approaches above, they are—at the present state-of-the-art—blind to much of the fine-grained temporal structure of norm change. At the same time, however, they have the advantage of maintaining a clear link with the underlying logical semantics of deontic notions. How the two perspectives can be technically bridged is very much an open issue.

27.6. Conclusions

We can see in recent works of legal logic how the lines of research we have touched upon in the above sections cover the different functions of normative reasoning in the law: the theory of normative systems and of defeasibility are attempts to address the first two functions concerning the structure and hierarchies of norms and, respectively, their conditions of application; the theory of legal dynamics provides a way of understanding norm change; finally, deontic logic, can be viewed as a transversal endeavor towards the understanding of

[12] See van Benthem 2011 for a recent comprehensive overview.

the deep fine-grained structure of normative notions as they are presupposed by the above attempts.

We find it worth concluding by pointing the interested reader to those which we consider the main events and forums in the field, and that can be an excellent source of further information, especially on ongoing researches. These are the biannual DEON[13] and ICAIL,[14] the annual JURIX,[15] and the *Journal of Artificial Intelligence and Law*.[16]
