CENG 6101 Project Management

Project Control

Abraham Assefa Tsehayae, PhD

Abraham Assefa Tsehayae (PhD)

Construction Project Management

- 1. Decision to Bid
- 2. Project Planning (develop WBS and CMS)
- 3. Project Estimating and Scheduling
- 4. Resource Allocation and Leveling
- 5. Submit Bid (proceed if awarded contract)
- 6. Estimate then forms basis of budget during construction (both use similar WBS and CBS)
- 7. Schedule forms basis of execution plan (use similar WBS)
- 8. Cost control: compare actual to budgeted costs
- 9. Schedule control: compare actual to planned progress
- 10. Detect deviations and implement timely corrective actions

Job-based Cost Control

Two types of systems for job cost data collection:

- Financial control system: payroll, accounting, etc.
- Cost control system: man-hours spent on work packages, cost and productivity data, data on labour, material, equipment

Where are Cost Data Initiated?

- Labour: time sheets, foreman's daily work report, company's payroll system
- Labour data collected: craft, level (apprentice, journeyman), hours (regular, overtime), work package(s) worked on
- Equipment: equipment time sheets (similar to labour)
- Material: purchase orders, material delivery slips, material cost records (materials management system)

Monitoring Productivity

- Another component of control is tracking productivity on basis of manhours/unit (i.e., input/output)
- Three methods of measuring output:
 - Estimated % complete
 - Physical measurement
 - Earned value

Estimated % Complete

- Based on observation
- Simple and inexpensive
- Subjective and not sensitive to scope changes
- Estimated quantity complete

= total quantity * estimated % complete

Physical Measurement

- Output based on actually counting or measuring number of work units completed (e.g., diameter inches of pipe welds, m³ of earthwork)
- Objective, detailed, accounts for scope changes
- Time consuming, expensive

Earned Value

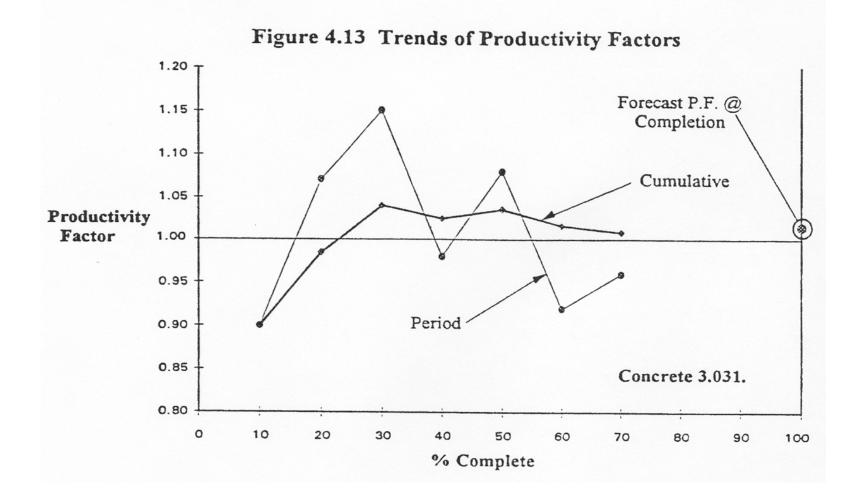

- Actual manhours taken from time sheets
- Actual quantities based on "rules of credit" agreed upon in advance of work being undertaking (for budgeting and payment purposes)
- e.g., 80-20 rule: 20% credit given for commencing activity, 80% credit given for completing activity

- Earned Value
- More common is milestone approach: e.g., formwork activity:
 - Fabricate = 60% credit, Erect = 20% credit, Remove forms = 15% credit, Clean forms = 5% credit
- Rules of credit may reflect effort or work involved

Earned value for manhours

- = earned value for quantities * estimated (budgeted) productivity
- EV (mhrs) = EV (m³) * estimated mhr/m³
- Performance (Productivity) Factor (PF)
 - = Earned value mhrs / Actual mhrs

(PF > 1.0 is good in this case)

- Period PF used for immediate control purposes to remedy trends.
- Cumulative PF used to forecast costs at completion.

(PF < 1.0 is good in this case)

- Earned Value Management (EVM)
 - Developed as Cost/Schedule Planning Control Specification (C/SPCS) by US Air Force in 1966
 - Primary EVM users include US, Europe, England, Canada, Australia, China and Japan.
- Objectives of EVMS
 - Relate time phased budgets to specific contract tasks and/or statements of work
 - Provide the basis to capture work progress assessments against the base line
 - Relate technical, schedule, and cost performances
 - Provide valid, timely, and auditable data/information for proactive project management analysis and action

- Project and Budget Performance
- BCWS (planned value PV) = budgeted cost of work scheduled
- BCWP (earned value EV) = budgeted cost of work performed
- ACWP (actual cost AC) = actual cost of work performed = commitments + payments due + payments made

- Cost Performance
- CV = cost variance
 - CV = BCWP ACWP = EV AC
- CPI = cost performance index (periodic)
 - CPI = BCWP/ACWP = EV/AC
 - CPI < 1.0 indicates cost overrun
 - CPI > 1.0 indicates cost underrun
- Cumulative cost performance index (CPI^C) (sum of periodic values for each index):
 - $CPI^{C} = EV^{C}/AC^{C}$
 - Used to forecast project costs at completion

- Schedule Performance
- SV = schedule variance
 - SV = BCWP BCWS = EV PV
- SPI = schedule performance index (periodic)
 - SPI = BCWP/BCWS = EV/PV
 - SPI < 1.0 indicates behind schedule
 - SPI > 1.0 indicates ahead of schedule
- SPI used to predict project completion date, and in conjunction with CPI to forecast costs at completion

Earned Value Technique

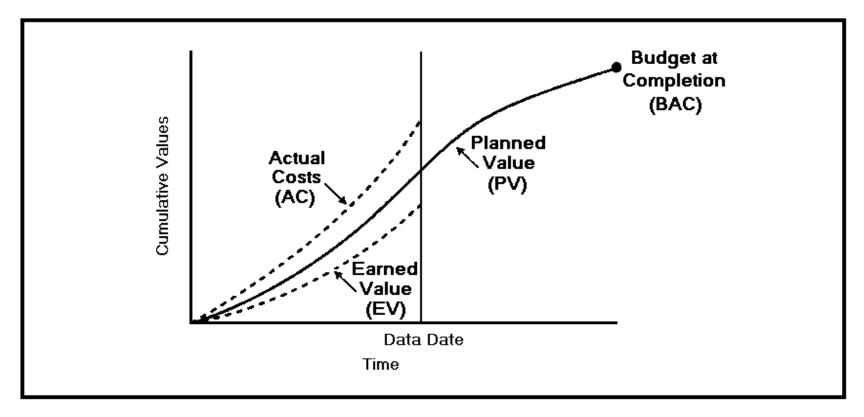

Figure 7-7. Illustrative Graphic Performance Report

Forecasting

- Budget at completion (BAC):
 - BAC = total cumulative PV at completion
- Estimate to complete (ETC): estimate for completing remaining work
- ETC can be calculated based on 3 different scenarios

Scenario 1:

- ETC based on new estimate:
 - Revised estimate for work remaining
 - Original estimate assumptions flawed or no longer relevant

Scenario 2:

- ETC based on atypical variances:
 - ETC = $BAC EV^{C}$
 - Current variances atypical and will not occur in future

Forecasting

Scenario 3:

- ETC based on typical variances:
 - ETC = $(BAC EV^{C})/CPI^{C}$
 - Current variances typical of future variances

Estimate at completion (EAC): projected or anticipated total cost when project is completed. Accordingly, EAC can be calculated based on 3 different scenarios

Scenario 1:

- EAC based on new estimate
 - EAC = AC^{C} + ETC (new estimate)
 - Original estimate assumptions flawed or no longer relevant

Forecasting

Scenario 2:

- EAC based on atypical variances:
 - $EAC = AC^{C} + BAC EV^{C}$
 - Current variances atypical and will not occur in future

Scenario 3:

- EAC based on typical variances:
 - $EAC = AC^{C} + ((BAC EV^{C}) / CPI^{C})$
 - Current variances typical of future variances

Figure 2-6. Work Plan and Status for Project EZ (As of April 30)

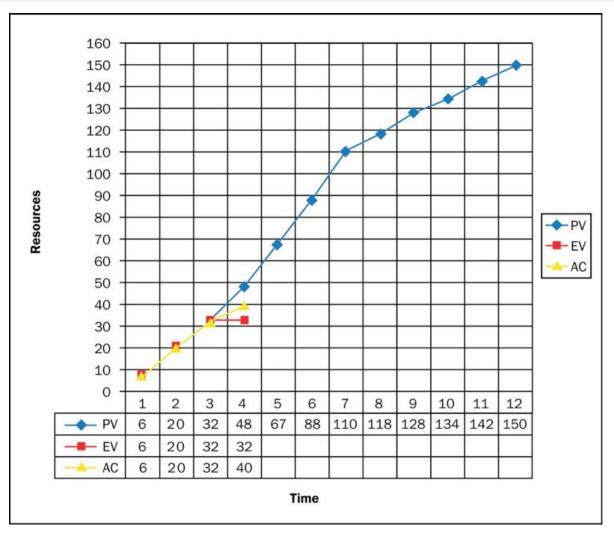

Figure 2-7. Cumulative Planned Value, Earned Value, and Actual Cost for Project EZ (As of April 30)

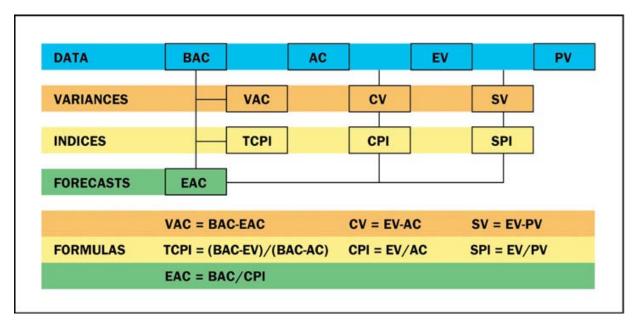

Figure 3-1. EVM Performance Measures

| Project Management Question | EVM Performance Measures |
|---|--------------------------------------|
| How are we doing time-wise? | Schedule Analysis & Forecasting |
| - Are we ahead or behind schedule? | - Schedule Variance (SV) |
| - How efficiently are we using time? | - Schedule Performance Index (SPI) |
| - When are we likely to finish work? | - Time Estimate at Completion (EACt) |
| How are we doing cost-wise? | Cost Analysis & Forecasting |
| - Are we under or over our budget? | - Cost Variance (CV) |
| - How efficiently are we using our resources? | - Cost Performance Index (CPI) |
| | |

- Schedule Analysis and Forecasting
 - $SV = EV PV = 32 48 = -16 \{unfavourable\}$

•
$$SV\% = \frac{SV}{EV} = -\frac{16}{48} = -33\% \{unfavourable\}$$

•
$$SPI = \frac{EV}{PV} = \frac{32}{48} = 0.67 \{unfabourable\}$$

•
$$EAC_t = \frac{(\frac{BAC}{SPI})}{(\frac{BAC}{months})} = \frac{\frac{150}{0.6667}}{\frac{150}{12}} = 18 \text{ months} > 12 \text{ months}$$

Cost Analysis and Forecasting

•
$$CV = EV - AC = 32 - 40 = -8 \{unfavourable\}$$

•
$$CV\% = \frac{CV}{EV} = -\frac{8}{32} = -25\% \{unfavourable\}$$

•
$$CPI = \frac{EV}{AC} = \frac{32}{40} = 0.80 \{unfabourable\}$$

•
$$EAC = \frac{BAC}{CPI} = \frac{150}{0.80} = 187.50 > 150$$

• $TCPI = \frac{BAC - EV}{BAC - AC} = \frac{150 - 32}{150 - 40} = 1.07 \rightarrow For the project to achieve the BAC, performance must improve from a CPI of 0.80 to a TCPI (To-Complete PI) of 1.07$

- Other Approaches to Output Measurement
 - Elapsed time vs. estimated duration
 - Resource usage vs. estimated usage
 - Budget spent to date vs. total budget
- Problems with above approaches?

- Cost Performance Index (CPI): Stability Fact or Fiction
- Christensen, David S., and Kirk Payne. 1992. "CPI Stability – Fact or Fiction?" Journal of Parametrics 10:27-40 (April).
- It has long been asserted that the CPI does not change more than 10 percent once the contract is 50 percent complete.
- Stable CPI:
 - Is evidence that the contractor's management control systems, particularly the planning, budgeting, and accounting systems, are functioning properly.
 - "Estimated at Completion," are reliable.
 - Capability of a contractor to recover from a cost overrun by comparing the CPI with other key indicators, such as the To-Complete Performance Index.

- Cost Performance Index (CPI): Stability Fact or Fiction
- Hypothesis Testing
- Once a contract is 50 percent or more complete, the CPI is stable.
 - 1. Range of the CPI after 50% complete, if < 0.20 CPI is stable;
 - 2. An interval of plus and minus 10 percent of the CPI at the 50% point, within the interval stable.
 - Sensitivity of the results at earlier points of completion (40, 30, 20, 10, and 0 %) and narrower intervals (7.5 and 5.0 %).
- Data:
 - Database of U.S Air Force Systems Command Aeronautical Systems Division (ASD), and consisted of cost performance data from 26 cost performance reports for seven aircraft procurement programs.

- Cost Performance Index (CPI): Stability Fact or Fiction
- Results
- CPI range was stable from the 50 % completion point

• Shall Ethiopian Road Authority Use S-Curves

Almgena - Butajira

• Shall Ethiopian Road Authority Use S-Curves

Awash - Hirna

- Problems and Pitfalls of EVM (Baldwin and Bordoli, 2014):
- Requirements for the system are not clearly identified and documented
- Progress is not monitored against updated schedules
- Progress of the construction work is incorrectly assessed
- Cost analysis is performed with inaccurately allocated cost data
- There is no agreed understanding of what comprises the PV of the work
- Failure to prepare a fully completed WBS integrated with cost estimate and time schedule

- Critical Chain Project Management (CCPM)
 - CCPM is based on the concept of a project buffer and argues that managers should manage production by monitoring the buffer time available and allocating resources to critical chain tasks.
 - CCPM was presented by Goldratt, 1997. Since then, CCPM has been used successfully across different industries including the construction industry.
 - Goldratt argued that resource dependencies determine the critical chain as much as activity dependencies.
 - Defines the constraint for multiple projects as the constraining company resource. It links projects through this resource, using buffers to account for activity duration variability.
- Control: buffers as an immediate and direct measurement tool to control the project schedule.

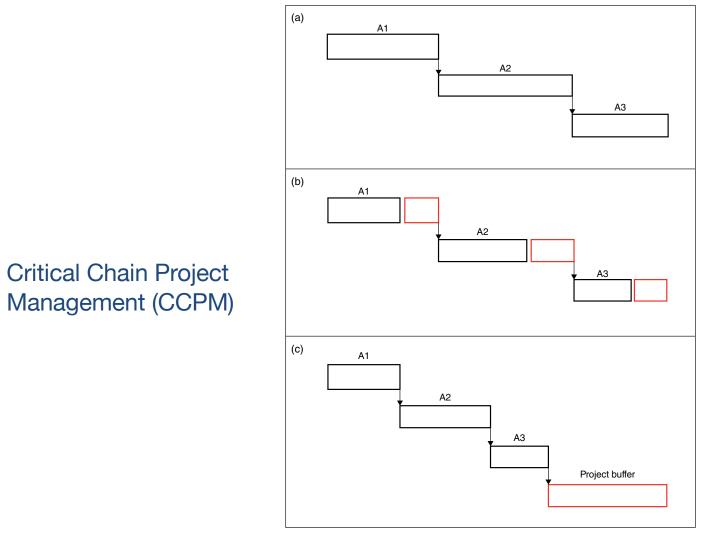

Figure 5.1 The critical chain project buffer. (a) Critical path activities with original duration. (b) Critical path activities with best estimate duration. (c) Revised critical path with the project buffer.

Variance Analysis

- Variance Analysis
- Variance analysis conducted for labour and material
- Variance can result from variation in actual vs. planned: (1) unit cost = cost/price variance (2) quantity consumed = usage variance
- Quantity and cost variance differ depending on order of calculation (net variance is same)
- Can result in owner-contractor and contractorsubcontractor disputes

Variance Analysis

Adapted from:

Construction Cost Analysis and Estimating, Ostwald, 2001, Prentice Hall

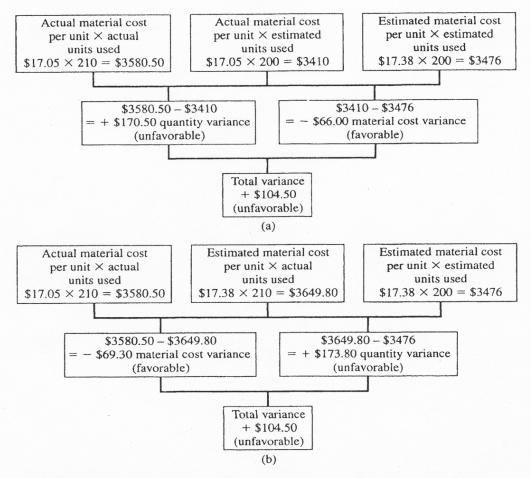

Figure 9.7 Finding material cost variance: (a) quantity first, and (b) unit cost first.

Suggested Method for Variance Analysis

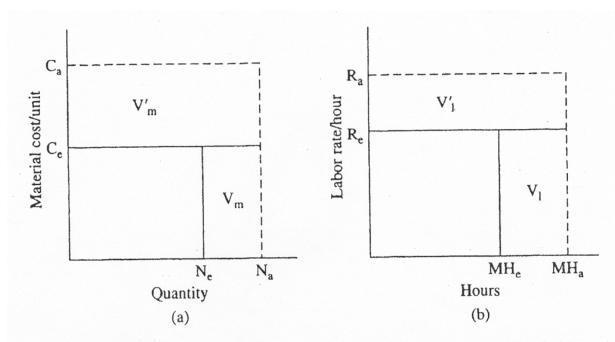

Figure 9.8 (a) Variance for material; and (b) variance for labor.

$$V_m = (N_a - N_e)C_e$$

$$V'_m = (C_a - C_e)N_a$$
(9.9)

net material variance = $V_m + V'_m$

where

 V_m = variance for material due to quantity change, dollars

 V'_m = variance for material due to cost-per-unit change, dollars

 N_a = actual quantity, number

 N_e = estimated quantity, number

 C_e = estimated material dollars per unit

 C_a = actual material dollars per unit

| | Number of Units | \$/Unit | Total |
|----------|--------------------|---------|-----------|
| Estimate | 200 | 17.38 | \$3476.00 |
| Actual | 210 | 17.05 | 3580.50 |

Material Variance

 $V_m = (210-200)$ units * \$17.38/unit = \$173.80 overrun $V'_m = (\$17.05/unit - \$17.38/unit) * 210$ units = -\$69.30 underrun $V_{m_{net}} = V_m + V'_m = \$173.80 - \$69.30 = \104.50 overrun

$$V_{l} = (MH_{a} - MH_{e})R_{e}$$

$$V'_{l} = (R_{a} - R_{e})MH_{a}$$
(9.10)

net labor variance = $V_l + V'_l$

where

 V_l = variance for labor due to difference from estimated man hours, dollars

 V'_{l} = variance for labor due to difference from estimated hourly labor rate, dollars

 MH_a = actual total hours for job

 MH_e = estimated total hours for job

 R_a = actual labor hourly rate, dollars per hour

 R_e = estimated labor hourly rate, dollars per hour

| | Wage Rate, \$/hr | Hours | Total |
|----------|------------------|-------|------------|
| Estimate | \$18.67 | 283 | \$5,283.61 |
| Actual | 17.32 | 325 | 5,629.00 |

Labour Variance

 $V_{l} = (325-283) \text{ mhrs * } 18.67/\text{mhr} = 784.14 overrun $V_{l} = ($17.32/\text{mhr} - $18.67/\text{mhr}) * 325 \text{ mhrs} = -438.75 underrun $V_{l_{net}} = V_{l} + V_{l} = $784.14 - $438.75 = 345.39 overrun

Factors Influencing Original Plan

- Changes in time or cost objectives for completion
- Changes in operating policies
- Changes in technical specifications
- Changes in construction methods
- Changes in owner's needs
- Revised activity time estimates
- Inaccurate planning of activity relationships
- Failure of suppliers or contractors to deliver on time
- Reassessment of resource requirements and usage
- Unexpected technical difficulties, environmental conditions, market fluctuations

Maintain Site Records

- Maintain daily site diary
- Lost time per day due to exceptional rain, cold or heat
- Labour on site
- Issued instructions, drawings
- Material and Equipment on site
- Daywork record
- Daily Report_CBE_HQB21112017 .pdf

Key Performance Indicators (KPIs): Used to measure the overall performance on projects

- Client satisfaction
- Defects
- Safety
- Time and cost predictability
- Productivity and Production
- Profitability

Meetings: Part of the Control Process

- Weekly progress meetings
- Monthly site meetings
- Subcontract coordination meetings

Monthly Site Meeting Agenda

| Personnel attending and apologies for absence | Confirmation of minutes of previous meeting | Matters arising from minutes | Confirmation of matters raised at intermediate site visits |
|---|---|---|---|
| Weather report - record of inclement weather to date | Progress report | Drawings and information requirements | Construction queries - related to materials or design |
| Design issues - anticipate future requirements | Subcontractor and specialist supplier report | Health and safety report | Variation orders and dayworks |
| Financial review | Project completion date review | Any other business | Date and time of next meeting |
| Sc | ource: Cooke and Willia | ums (2009) | |

Change Control

- Changes required to: (1) correct errors or omissions (2) changes in scope due to economic or functional reasons
- Project manager must establish formal procedure for control of changes
- Authorization of changes required → becomes a change order
- Risky for contractor to implement changes prior to obtaining written authorization

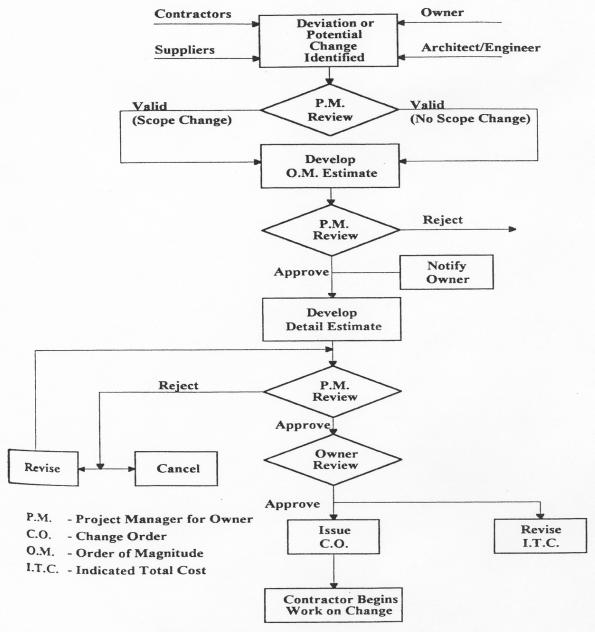

FIGURE 14.1 Change Control Procedure

FIGURE 14.2 Contract Change Order

Updating the Schedule

Why do it?

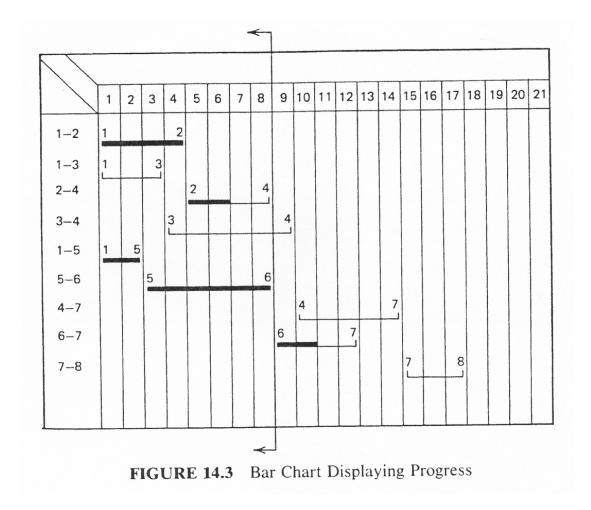

- To reflect current project status
 - To implement corrective action
 - To revise plan for future activities
 - To develop recovery plan
- To restore its usefulness as a forecasting and communication tool
 - To reflect current status
 - To plan resource requirements
 - To communicate with the client
 - To coordinate subs, materials, procurement
 - For progress payments
- To explain and quantify delays
 - For damages/bonuses
 - For potential claims

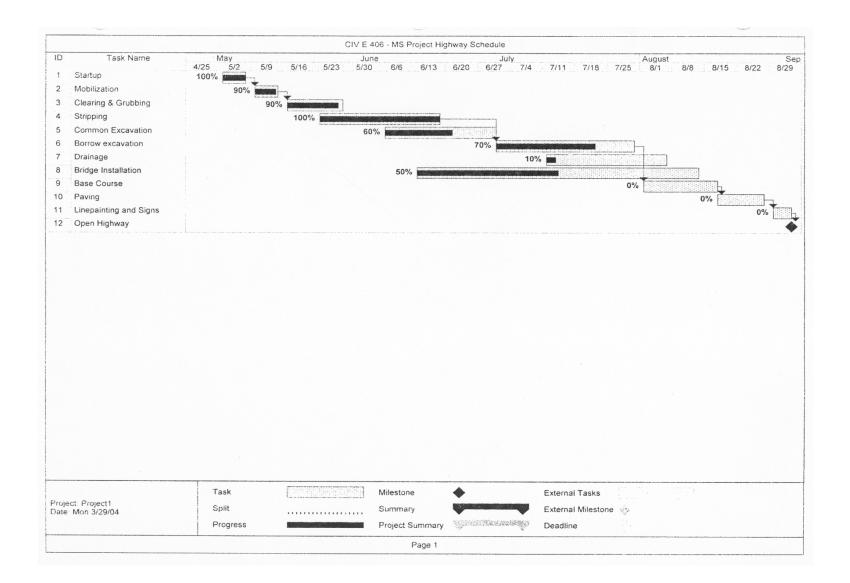

Updating the Schedule

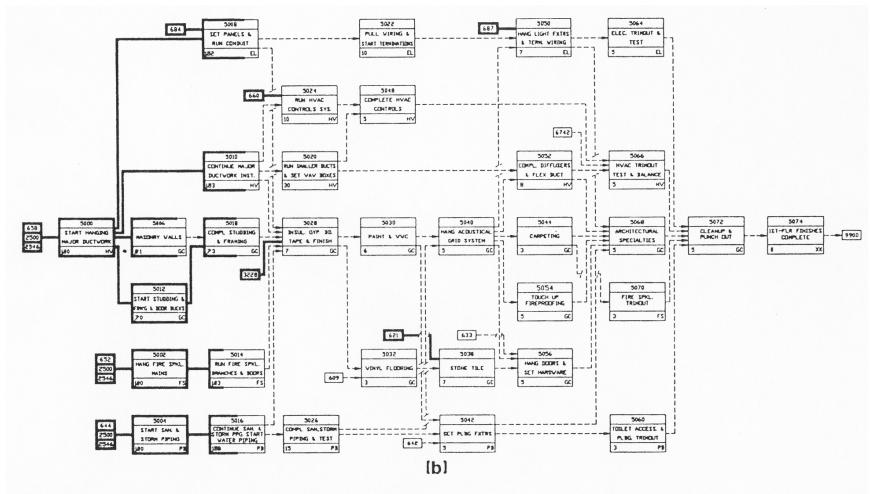

How to do it?

- Walk the site record actual start/finish times, % complete for each activity
- Mark project status on bar chart or network diagram
- Revise activity durations on partially completed activities
- Revise activity logic if necessary
- Recalculate the schedule
- Develop a recovery plan, if necessary

Always keep a baseline copy of the original project plan, schedule, and progress curves.

Project Closeout

Data to Collect at Project Closeout

- "As-built" CPM network from design to construction
- Crew composition, mhrs per unit measure
- Equipment usage per unit measure
- Materials consumed per unit measure
- Overhead expenditure as % total job cost
- Learning curve effects
- Progress at different stages in project
- Special difficulties, problems encountered
- Effective techniques and corrective actions
- Evaluation of consultants', contractors', subcontractors' performance
- Comparison of sub-element cost in design estimates with actual costs at completion
- Actual vs. estimated contingency and profit
