Ethiopian TVET-System

# Furniture Making L-I 

Based on Sept. 2012G.C. Occupational standard

# Module Title: - CARRY OUT MEASUREMENTS \& CALCULATIONS <br> TTLM Code: IND-FMK1-TTLM 0919v1 

This module includes the following Learning Guides

LG08: Obtain Measurements
LG Code: IND-FMK1 M03 LO1-LG08
LG09: Perform simple calculations
LG Code: IND-FMK1 M03 LO2-LG09
LG10: Estimate approximate quantities
LG Code: IND-FMK1 M03 LO3-LG10

## Instruction Sheet LG08: Obtain Measurements

This learning guide is developed to provide you the necessary information regarding the following content coverage and topics -
1.1 Purpose of obtain measurements
1.2 Methods of obtaining measurement
1.3 Obtain accurate measurement

This guide will also assist you to attain the learning outcome stated in the cover page. Specifically, upon completion of this Learning Guide, you will be able to -
1.1 Purpose of obtain measurements
1.2 Methods of obtaining measurement
1.3 Obtain accurate measurement

## Learning Instructions:

1. Read the specific objectives of this Learning Guide.
2. Follow the instructions described in number 3 to 7
3. Read the information written in the "Information Sheets 1". Try to understand what are being discussed. Ask you teacher for assistance if you have hard time understanding them.
4. Accomplish the "Self-check 1" in page -. 15
5. Ask from your teacher the key to correction (key answers) or you can request your teacher to correct your work. (You are to get the key answer only after you finished answering the Self-check 1).
6. If you earned a satisfactory evaluation proceed to "Information Sheet 2". However, if your rating is unsatisfactory, see your teacher for further instructions or go back to Learning Activity \#1.
7. Submit your accomplished Self-check. This will form part of your training portfolio.

## Information Sheet-1 <br> Purpose of obtain measurements

## Introduction

## Purposes carry out measurement and calculations

- Every wood work shop should be adequately equipped with a reasonable quantity and Varity of tools and equipment for work to be done efficiently. It is necessary for you to be not only familiar with the names of the tools but able to identify and correctly. to make it easier to understand the correct application of the various tools they are grouped in to classes as follows: holding and supporting tools, geometrical tools, percussion and impelling tools, boring cutting tools, sharing and paring tools and abrading and scraping tools. The discussion centers on their type, description and uses.

## What is Measurement

To measure is the act or process of determining the extent, quantity, degree, capacity, dimension, volume, and so forth, of a substance by comparing it with some fixed standard, which is usually fixed by law. A measure may relate to any of these standards. There are many kinds of measures, and practically all of them are standard, but standards vary in different countries. The measures mentioned in this text are all U.S. standards unless designated otherwise.
The study of measurements is sometimes called menstruation.
Among the many kinds of measures are the following:
_ Linear_Measures of length
_ Square—Used to measure areas
_ Cubic_ Used to measure volume, or volumetric contents
_ Weight-Many systems of weights are standard
_ Time—Almost standardized all over the world
_ Circular or angular_-The same all over the world

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 3 of 51 |
| :---: | :---: | :---: | :---: | :---: |

## Linear Measure

Table 1.1 shows linear measurement (long) equivalents.
Table 1.1

| Measure | Equivalent | Equivalen |
| :--- | :--- | :--- |
| 12 inches | 1 rod |  |
| 3 feet | 1 furlong | 36 inches |
| $51 / 2$ yards | 1 mile1 | $161 / 2$ feet |
| 40 rods | league (land) | 660 feet |
| 8 furlongs | 1 mile | 5280 feet |
| 3 miles | 1 league (land) |  |
|  |  |  |

## Long Measure

The furlong is practically never used, except at racetracks and in some athletic events.
Table 1.2 shows land survey measurement equivalents.
Land Surveyor's Measure

| Measure | Equivalent | Equivalent |
| :--- | :--- | :---: |
| 7.92 inches | 1 link |  |
| 100 links | 1 chain | 66 feet |
| 10 chains | 1 furlong | 660 feet |
| 80 chains | 1 mile | 5280 feet |

The use of the surveyor's chain, or Gunter's chain, was abandoned in the late 1800s and was superseded by the steel tape, which is much more accurate. The chain (meaning 66 feet) is still used by the U.S.

General Land Office, however, when surveying very old deeds. The standard surveyor's tape is often called, from habit, a chain. It is100 feet long and is graduated in feet except for the last foot, whichis divided into tenths and hundredths of a foot.

Table 5-4 shows nautical measurement equivalents.

| Furniture Making L-I | IND-FMK1- TTLM <br> 0919v1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 4 of 51 |
| :---: | :---: | :---: | :---: | :---: |

## Table 5-4 Nautical Measure (U.S. Navy)

## Measure <br> Equivalent

6 feet
120 fathoms
The International Nautical Mile*
3 nautical miles

1 fathom
1 cable length 6076.1033 feet

1 marine league

The knot is a measure of speed, not of length, and is equivalent tol nautical mile per hour. A speed of 16 knots is equal to 16 nautical miles per hour.

## Square Measure

Square measure is used to measure areas. In most (but not all) cases, linear units are used to measure the two dimensions, length and width, and their product is the area in square units. Expressed as an equation: length $\times$ width $=$ area

The two dimensions, length and width, must be measured in the same units, but any unit of linear measurement may be used. If inches are multiplied by inches, the result will be in square inches; if feet are multiplied by feet, the result will be in square feet, and so
forth (see Figure 5-7).For the small areas commonly found in everyday life (such as tabletops or shelves), the unit most commonly used is the square inch. Plywood and lumber are commonly sold by the square foot.
Carpets and other floor coverings and materials and ceilings are measured in square yards. The carpenter measures roofing by the square of $10 \times 10$ feet, or 100 square feet. Tracts of land are usually measured in acres or, for large areas, in square miles.

Table 5 - 5 shows square measure equivalents.

## Cubic Measure

Cubic measure is used to determine or appraise volumes. Three dimensions are involved (length, width, and height) and their product is volume. Expressed as an equation:

Length $\times$ width $\times$ height $=$ volume
Table 5-5 Square Measure
Measure Equivalent Equivalent

144 square inches
9 square feet
301/4 square yards
160 square rods

1 square foot
1 square yard
1 square rod
1 acre
272.25 square feet 4840 square yards or 43,560 square feet

As with square measure, the usual linear units (inches, feet, and yards) are ordinarily used to measure these three dimensions.

Most small measurements of capacity (such as small shipping cases or small cabinets) are measured in cubic inches. The contents of buildings, their cubage, are ordinarily expressed in cubic feet. Earthwork (either excavated and loose, or in place) is expressed in cubic yards (see Figure 5-8).

DEPTH LENGTH THICKNESS

Table 5-6 Cubic Measures of Volume

| Measure | Equivalent |
| :---: | :---: |
| 1728 cubic inches | 1 cubic foot |
| 27 cubic feet | 1 cubic yard |

## Dry Measure

Quantities of loose, granular materials (such as grains, some fruits, and certain vegetables) are measured in arbitrary units that, in turn, are defined by means of cubic measures of volume, usually in cubic inches. Their value is sometimes fixed by law.

Table 5-7 shows units of dry measure equivalents for the United States and Table 5-8 shows units of dry measure equivalents for Great Britain and Canada.

## Table 5-7 Dry Measure (United States)

| Measure | Equivalent | Equivalent |
| :--- | :---: | :---: |
| 2 pints | 1 quart | 67.2 cubic inches |
| 8 quarts | 1 peck | 537.61 cubic inches |
| 4 pecks | 1 bushel | 2150.42 cubic inches |

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 6 of 51 |
| :---: | :---: | :---: | :---: | :---: |

## Table 5-8 Dry Measure (British and Canadian)

## Measure Equivalent Equivalent

1 gallon .5 peck 277.42 cubic inches

4 pecks $\quad 1$ bushel 2219.23 cubic inches
The British dry quart is not often used. It is equal to 69.35 cubic inches, or 1.032 U.S. dry quarts. The weight, rather than the volume, of grains is the standard fixed by the U.S. government (Table 5-9).

## Table 5-9 Grain Measure (U.S.)

## Measure

## Equivalent

1 bushel of wheat 60 pounds
1 bushel of barley 48 pounds
1 bushel of oats 32 pounds
1 bushel of rye 56 pounds
1 bushel of corn (shelled) 56 pounds

## Board or Lumber Measure

Timbers an d logs are measured in board or lumber measure. The board foot is 1 foot wide, 1 foot long, and 1 inch thick, there by containing 144 cubic inches. In the retail market, all lumber that is less than 1 inch thick is called one inch. At the sawmills, the full sizes govern the thickness of the saw kerfs; usually about $1 / 4$ inch is allowed for and accounted as sawing loss. Actual finished (dressed) sizes of common lumber and the dimension and timbers for pine are as follows:
_ The standard dressed thickness of 1 -inch boards is $3 / 4$ inch.
_ The standard thickness of 2-inch dimension boards is $11 / 2$ inches.
_ The standard dressed widths of lumber 2 inches thick and less are $1 / 2$ inch less for widths under 8 inches and $3 / 4$ inch less for8-inch widths and wider.
_ The standard dressed widths and thicknesses for lumber and timbers are $1 / 2$ inch less both ways under 8 inches wide and $3 / 4$ inch for 8 -inch widths and over. So, a 2 -inch $\times 8$-inch board would be $11 / 2$ inches $\times 71 / 4$ inches. A 2 -inch $\times 10$-inch board would be $11 / 2$ inches $\times 91 / 4$ inches.

## Measures of Weight

The simplest definition of weight is the force with which a body is attracted toward the earth. It is a quantity of heaviness. The three systems (or standards) of weights used in the United States are:
_ Avoirdupois_Used for almost all ordinary purposes (see Table5-11)

| Furniture Making L-I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 7 of 51 |
| :---: | :---: | :---: | :---: | :---: |

Table 5-11 Avoirdupois Weights

## Measure

## Equivalent

U.S.

| 16 drams | 1 ounce |
| :--- | :---: |
| 16 ounces | 1 pound |
| 100 pounds | 1 hundredweight |
| 20 hundredweights | 1 ton |

Measure
Equivalent
England

| 14 pounds | 1 stone |
| :--- | :--- |
| 112 pounds | 1 hundredweight |
| 20 hundredweight | 1 ton |
| 2240 pounds |  |

Note: The 2240-pound ton is sometimes used in the United States for weighing coal at the mines and at Customs houses for evaluating shipments from England.

Troy-Used in weighing precious metals and jewels (see Table5-12)
_ Apothecaries_Used by pharmacists when compounding drugs (see Table 5-13)

## Table 5-12 Troy Weights

| Measure | Equivalent |
| :--- | :---: |
| 3.086 grains | 1 carat |
| 24 grains | 1 pennyweight |
| 20 pennyweights | 1 ounce |
| 12 ounces | 1 pound |

Table 5-13 Apothecaries Weights
Measure Equivalent

| 20 grains | 1 scruple |
| :--- | :--- |
| 3 scruples | 1 dram |
| 8 drams | 1 ounce |
| 12 ounces | 1 pound |

| Furniture Making L-I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 8 of 51 |
| :---: | :---: | :---: | :---: | :---: |

This standard of weights is fast becoming obsolete, although pharmacists must be familiar with it. Manufacturing pharmacyistsand chemists are rapidly changing to the metric weights, using the metric gram as a basis instead of the apothecaries' scruple ( 1 scruple
$=1.296$ grams).

## Circular Measure

This measure is used in astronomy, land surveying, navigation, and in measuring angles of all kinds. Circles of all sizes are divisible into degrees, minutes, and seconds (see Table 5-15). Note that a degree is not a measurement of length. It is $1 / 360$ of the circumference of a circle with any radius. With widespread use of calculators and the need for accuracy in missiles, the degree has now been divided in decimal form rather than minutes and seconds. Most calculators can carry the degree out to 6 places after the decimal point

## Table 5-15 Circular Measures

## Measure Equivalent <br> 60 seconds 1 minute

60 minutes 1 degree
360 degrees 1 circle

## The Metric System

The base, or fundamental, unit in the metric system is the meter.
The meter is defined as the distance between two scribed marks on a standard bar made of platinumiridium kept in the vaults of the International Bureau of Weights and Measures, near Paris, France. Of course, many other standard meter bars have been made from the measurement on this bar. It is permissible and official to use this measurement in the United States, and, in fact, the yard, the basis for the English system of measurement, has been defined as exactly $3600 / 3937$ meter, or 1 meter $=39.37$ inches.

The advantage (and immeasurably greater convenience) of the metric system over the English system of units lies in the fact that it is expressed in tenths, thereby readily allowing the use of decimals. However, the American public is accustomed to the English units, and as recent experience indicates, the system should continue for a long time. The metric system is, of course, in common use all over the world with the exception of some English-speaking countries. The meter is used like the yard to measure cloth and short distances.

Units of other denominations are named by prefixing to the word meter the Latin numerals for the lower denominations and the

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 9 of 51 |
| :---: | :---: | :---: | :---: | :---: |

Greek numerals for the higher denominations, as shown in Table 5-16.
Table 5-16 Denominations

| Lower Denomination |  |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
|  |  |  |  |  |
| Deci | $1 / 10$ | Deka | 10 |  |
| Centi | $1 / 100$ | Hecto | 100 |  |
| Milli | $1 / 1000$ | Kilo | 1000 |  |
| Micro | $1 / 1,000,000$ | Myria | 10,000 |  |

Therefore, 1 decimeter $=1 / 10$ of a meter, 1 millimeter $=1 / 1000$ of a meter, 1 kilometer $=1000$ meters, and so forth. From this explanation of the metric prefixes, the linear equivalents shown in Table 5-17 can easily be understood

## Table 5-17 Metric Table of Linear Measure

Metric

| Denomination | Meter | U.S. Value |  |
| :--- | :--- | :--- | :--- |
|  | 1 millimeter | .001 | .0394 inches |
| 10 millimeters | 1 centimeter | .01 | .3937 inches |
| 10 centimeters | 1 decimeter | .1 | 3.937 inches |
| 10 decimeters | 1 meter | 1. | 39.3707 inches |
|  |  |  | 3.28 feet |
| 10 meters | 1 deka meter | 10. | 32.809 feet |
| 10 deka meters | 1 hectometer | 100. | 328.09 feet |
| 10 hectometers | 1 kilometer | 1000. | .62138 miles |
| 10 kilometers | 1 myriameter | 10,000 | 6.2138 miles |

The kilometer is commonly used for measuring long distances.
The square meter (see Table 5-18) is the unit used for measuring ordinary surfaces, such as flooring or ceilings.

Table 5-18 Metric Table of Square Measure

(dm3) feet
The liter is the unit of capacity, both of liquid and of dry measures,_and is equivalent to a vessel whose volume is equal to a cube whose_edge is $1 / 10$ of a meter, equal to 1.0567 quarts liquid measure, and0.9081 quart dry measure (see Table 5-21).The hectoliter is the unit used for measuring liquids, grain, fruit, and roots in large 036quantities. The gram is the unit of weight equal to the weight of a cube of distilled water, the edge of which is $1 / 100$ of a meter, and is equal to 15.432 troy grains (see Table 5-22).

## Geometry

By definition, geometry is that branch of mathematics that deals with space and figures in space. In other words, it is the science of the mutual relations of points, lines, angles, surfaces, and solids that are considered as having no properties except those arising from extension and difference of situation.

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 11 of 51 |
| :---: | :---: | :---: | :---: | :---: |

## Lines

The two kinds of lines are straight and curved. A straight line is the shortest distance between two points. A curved line is one that changes its direction at every point. Two lines are said to be parallel when they have the same direction. A horizontal line is one parallel to the horizon or surface of the Earth. A line is perpendicular with another line when they are at right angles to each other. These definitions are illustrated in Figure 5-9.

## Angles

An angle is the difference in direction between two lines proceeding from the same point (called the vertex). Angles are said to be right ( 90 degrees) when formed by two perpendicular lines (see

\end{aligned}
$$

Figure 5-10A), acute (less than 90 degrees) when less than a right angle (see Figure 5-10B), and obtuse (more than 90 degrees) when greater than a right angle (see Figure 5-10C).

All angles except right (or 90-degree) angles are called oblique angles. Angles are usually measured in degrees (circular measure) (see Figure 5-10D). The complement of an angle is the difference between 90 degrees and the angle. The supplement of the angle is the difference between the angle and 180 degrees.

## Plane Figures

The term plane figures means a plane surface bounded by straight or curved lines, and a plane (or plane surface) is one in which any straight line joining any two points lies wholly in the surface.

Figure 5-11 defines a plane surface. There is a great variety of plane

## Methods of measurement

Measurements Is the first aid important part before the operation starts there fore knowing how to measure the needs length can save time.

We have four methods of measures in any components of building

1. End to end (effective span): it is measurements of a length from end to end of the components

It is known as installation length.
2. End to center: it is measures w/c is taken from the center of structure of building to the end or from the end to center.
3. Center to center: it is the distance $b / n$ the center of two components of building

It is known as construction length
4. Clear span: it is the distance $b / n$ two any components of building are internal

## Various lines: straight, curved, parallel, an perpendicular.

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 15 of 51 |
| :---: | :---: | :---: | :---: | :---: |

Various angles: right, acute, obtuse, and complement and supplement of an angle.

A plane surface means that every point on a straight line joining any two points in the surface lies in the surface

## 3 Obtaining Accurate Measurement

## Measuring and Marking Tools

The starting point of good craftsmanship is proper measuring and marking. Accurate cutting and shaping will be wasted if the project has not been laid out with precision. Some general rules of thumb apply to all measuring and marking tasks. Whether you are using a rule or a square, measure from as few reference surfaces as possible to minimize repeating an error or adding to it. Also, read scales from a straight-on eye position, rather than on an angle, to prevent parallax error, which leads to imprecise readings. And, when scribing the end line of a measurement, use a V-shaped mark, rather than a simple dot or line, to locate your endpoint exactly.

## 1.1 purpose of obtaining measurements

Measurements are hand tools that are used to get the appropriate measurements of materials a job.

## 1.2 geometrical tools

Geometrical tools are those that are used for measuring marking out, setting out and testing of a job at various stages.

## Among the common tools are

| - The rule | - Panel gauges | - Sliding bevel |
| :--- | :--- | :--- |
| - Straight age | - Calipers | - Mortise gauge |
| - Marking knife | - Try square | - Cutting gauge |
| - Using compasses | - Miter square | - Combination square |
|  |  | - Marking gauge |

## 1.1 measuring and laying out tools (Geometrical tools)

These types of tools are those that are used for

- Measuring - Setting out and
- Marking out - Testing of a job at various stages

Among the common tools are:-

- The rule
- Straight edge
- Marking gauge - Cutting gauge
- Sliding bevel - Panel gauges

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 17 of 51 |
| :---: | :---: | :---: | :---: | :---: |

- Marking knife
- Using compasses
- Combination square - Mortise gauge
- Miter square - Try square

## Measuring and Marking Tools

The starting point of good craftsmanship is proper measuring and marking. Accurate cutting and shaping will be wasted if the project has not been laid out with precision. Some general rules of thumb apply to all measuring and marking tasks. Whether you are using a rule or a square, measure from as few reference surfaces as possible to minimize repeating an error or adding to it. Also, read scales from a straight-on eye position, rather than on an angle, to prevent parallax error, which leads to imprecise readings. And, when scribing the end line of a measurement, use a V-shaped mark, rather than a simple dot or line, to locate your endpoint exactly
1.Rule: - is measuring that is used for setting out checking a work piece. The common

Forms of rule are: - 75 mm four fold
-50 mm four fold

- 50 mm two fold and
- 25 mm type

Straight edge: - is made either from steel or wood. It has perfect straight and parallel edges. It is mostly used for testing the evenness of surface and edge of a work -piece or job.
2.Marking knife: - is mad up of tool steel with one end angled and beveled. the cutting edge is used for marking a cut line across the shoulders of joints such as tenons, and trenches to guide sawing or chiseling. the cut line is drown in conjunction with a try square and must be squire (at $90^{\circ}$ ) with the face edge
3.compasses: - is a metal (steel) tool in a form of a pair of dividers its main application is for setting out arcs and circles and a work piece or j 5.
4. Calipers:- are of two kinds

1. Inside calipers and
2. out side calipers

| Furniture Making L-I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 18 of 51 |
| :---: | :---: | :---: | :---: | :---: |

the inside calipers are mainly used for checking diameters of holes or slats whilst the out side calipers are used for out side diameters of cylindrical objects
6. try-square:-costing of two main parts the blade made of tempered tool steel and the stack made of wood it is used for testing the square ness of surfaces and edges of quark-pieces, outside and inside corners of joints or carcasses, and for marking lines at right-angles to a given surface or edge.
7. Miter square:- has a blade and stack as a try square but the blade is fixed at $45^{\circ}$.
8. sliding bevel:- the blade but is slated and is not permanently fixed in the stack but passes through a slat in the stack and held at a required angle by a screw or level is used for testing and setting out bevels or angles other than $45^{\circ}$ and $90^{\circ}$.
9. Combination square:-consists of a steel graduated blade and a stack often referred to as the head. The head (stack) has two edges, $90^{\circ}$ and $45^{\circ}$ The blade has a square along its length that fits in to a pin in the stock and slide to any length and held in position by a spring loaded screw.
10. Making gauge: - comprises a wooden (beech) stack that slide along the stem a wooden (beech) steam that passes through the center of the block. it is used for making line parallel to a face or an edge of a work piece.
11. Mortise gauge:- is similar to the making gauge and has similar parts stack stem and thumbscrew, but two spurs instead of one. it is used for making two lines parallel to a face or edge of work piece, particularly when marking out mortises and tenon, or the pins and sockets of bridle joints.
12. Cutting gauge:-- consists of a stack, stem, thumbscrew but has a cutting blade instead of a pointed super. It it main use is for cutting blade lines parallel to the end of a work piece i.e. cutting across the grain

TAPES

## Hook rule

Usually scaled in both directions. The hook
at one end facilitates accurate outside mea-
sures from an edge; inside measures can
be taken from the straight end.

Page 21 of 51
 AND GAUGES
 angles from 0 to $360^{\circ}$; can also

One of the handiest of woodworking devices; used to mark and verify both $90^{\circ}$ and $45^{\circ}$ angles. Handle features a bubble rule for checking level and plumb; removable blade functions as straightedge and ruler. Some models include a detachable scribing pin in the handle.

## Carpenter's square

A rigid steel square usually 16 inches by 24 inches; each arm is calibrated along both edges. Used for checking and marking $90^{\circ}$ angles.
 blade pivots to read angles from 0 to $180^{\circ}$.

## Sliding bevel

Used to transfer angles (from a protractor to a table saw blade for bevel cutting, for example) or to compare angles; the blade slides and pivots and may be locked at any angle.

For taking precise inside and outside measurements. For outside measurement, long fingers are adjusted to grip item to be measured; for inside measurement, short fingers are spread until they contact sides. Dial provides reading; available with English or metric scales.

## Carpenter's level

Used to check whether surfaces are level (horizontal) or plumb (vertical); available in various lengths with either traditional bubble gauges or an electronic display.
 el angles.

## Contour gauge

Used to copy and transfer curved profiles. Closely spaced sliding pins duplicate the contour when the gauge is pressed against the surface.

Directions: Answer all the questions listed below. Use the Answer sheet provided in the next page:

1. Write kind of Calipers:- with their use

## Note: Satisfactory rating - 2 points <br> Unsatisfactory - below 1 points

You can ask you teacher for the copy of the correct answers.

Score $=$ $\qquad$
Rating: $\qquad$

## Instruction Sheet LG09: Performing simple calculations

This learning guide is developed to provide you the necessary information regarding the following content coverage and topics -

- Performing purpose of calculations
- Performing simple calculations
- Involving simple calculations (length, perimeter, mass and volume

This guide will also assist you to attain the learning outcome stated in the cover page. Specifically, upon completion of this Learning Guide, you will be able to -

- Perform purpose of calculations
- Perform simple calculations
- Involve simple calculations( length, perimeter, mass and volume

## Learning Instructions:

1 Read the specific objectives of this Learning Guide.
2 Follow the instructions described in number 3 to 7.
3 Read the information written in the "Information Sheets 1". Try to understand what are being discussed. Ask you teacher for assistance if you have hard time understanding them. 4 Accomplish the "Self-check 1" in page -. 30

5 Ask from your teacher the key to correction (key answers) or you can request your teacher to correct your work. (You are to get the key answer only after you finished answering the Self-check 1).

6 If you earned a satisfactory evaluation proceed to "Information Sheet 2". However, if your rating is unsatisfactory, see your teacher for further instructions or go back to Learning Activity \#1.
7 Submit your accomplished Self-check. This will form part of your training portfolio.

Information Sheet-1

## Performing purpose of calculation

### 2.1 Performing purpose of calculations

When a client has a job they want done, they will usually want to know in advance how much it is going to cost them. Before you can work this out, you need to have a clear idea of exactly what the client wants.
A variety of things may need to be clarified. For instance, if they want some furniture to be built, you could ask the following questions.
$\square$ what size and shape is the furniture to be?
$\square$ What materials is it to made of?
$\square$ what special features, if any, are wanted?

## Measurement (Metric and English system)

Measurement :- is the process or the result of determining that ratio of a physical quantity such as a length of a mass to a unit of Measurement such as the meter or the kilo gram.

* The SI unit for the four basic quantities
- Length
- Time
- Mass
- Temperature are:
$\checkmark$ Meter $\{\mathrm{M}\}$ : SI UNIT of length
$\checkmark$ SECOND \{S\}: SI UNIT of Time
$\checkmark$ KLOGRAM \{KG\}: SI UNIT of Mass
$\checkmark \operatorname{KELVIN}\{\mathrm{K}\}$ :SI UNIT of Temperature
* There are two types of SI unit base unit \&derived unit (World wide the metric system is the universal system of measurements (System International $=\mathbf{S I}$ ) with standard units for length, weight, time, temperature, etc.
$\checkmark$ Based unit are the simple measurements for time, length, mass, temperature \& amount of substance electric current and length intensity.
$\checkmark$ Derived units are constructed from the base units
Unit of measurement -there are basically three kinds of measurements
A. Linear measurement -in the most any measuring practice measurements of distance in by

Centimeter, Meter kilometer etc. Length $1 \mathrm{~cm}=10 \mathrm{~mm}$
B. Angular measurement:-in the most of engineering practice the angular measurement in by done.

- Degree $\left({ }^{\circ}\right)$
- Minute (')

| Furniture Making L- I | IND-FMK1-TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 25 of 51 |
| :---: | :---: | :---: | :---: | :---: |

－Second（＂）
A circumference of circle is divided in to 360 parts which is called one degree and one degree is to 60 ports is called minute each minute is again divided is to 60 ports and each ports is called second ．i．e． 1 circle 360 degree $\left\{360^{\circ}\right.$ \}
1 degree 60 minute $\left\{60^{\prime}\right\}$
1 minute $60 \sec \{60 "\}$
C．VOLOUM：－in the quantity of three dimensional spaces enclosed by closed boundary the standard unit of volume is the cubic meter $\{\mathrm{m} 3\}$

$$
\begin{aligned}
1 \text { liter } & =1000 \mathrm{~cm} 3=0.001 \mathrm{~m} 3 \\
1 \mathrm{~m}^{3} & =1000 \text { liter }
\end{aligned}
$$

## Information Sheet－2

－Perform simple calculations
－Perform simple calculations
－the simple calculation consist Addition ，substruction division and multiplication in order to obtain mathematical explanation（,,$+- \mathbf{x} \cdot \div$ ）
－example $200+200=400$
－ $200-100=100$
－ $100 \times 10=1000$
－ $100 \div 10=100$
－Example
$10 \mathrm{~cm}=$ ？？inches
Choose conversion factor：
$\frac{2.54 \mathrm{~cm}}{1 \text { inch }}$ or $\frac{1 \text { inch }}{2.54 \mathrm{~cm}}$

Although these are both equivalent，choose the one with the desired unit in the numerator（top）

## Example 2

－ $10 \mathrm{~cm} \times \underline{1 \text { inch }}=$ $\qquad$
2.54 cm
$10 \mathrm{~cm} \times 1$ inch $=10 \times 1$ inch $=3.93 \mathrm{in}$
$2.54 \mathrm{~cm} \quad 2.54$
Convert the millimeters to
＊meters．
＊ $400 \mathrm{~mm}=0.4 \mathrm{~m}$
＊ $1200 \mathrm{~mm}=1.2 \mathrm{~m}$
＊Find the area of one board． $0.4 \times 1.2=0.48 \mathrm{~m} 2$
＊Multiply the area of one board
＊by the number of boards of this
＊size that are needed．
＊ $3 \times 0.48=1.44 \mathrm{~m} 2$

## Instruction Sheet

## LG10: Estimate approximate quantities

This learning guide is developed to provide you the necessary information regarding the following content coverage and topics -

- Types and standard unit packaging of material
- Quantities of materials suitable for the work
- Bill of quantity/ relevant furnishing material cost estimates $\pm 10 \%$

This guide will also assist you to attain the learning outcome stated in the cover page. Specifically, upon completion of this Learning Guide, you will be able to -

- Types and standard unit packaging of material
- Quantities of materials suitable for the work
- Bill of quantity/ relevant furnishing material cost estimates $\pm 10 \%$

## Learning Instructions:

1. Read the specific objectives of this Learning Guide.
2. Follow the instructions described in number 3 to 7 .
3. Read the information written in the "Information Sheets 1". Try to understand what are being discussed. Ask you teacher for assistance if you have hard time understanding them.
4. Accomplish the "Self-check 1 " in page -. 40
5. Ask from your teacher the key to correction (key answers) or you can request your teacher to correct your work. (You are to get the key answer only after you finished answering the Self-check 1).
6. If you earned a satisfactory evaluation proceed to "Information Sheet 2". However, if your rating is unsatisfactory, see your teacher for further instructions or go back to Learning Activity \#1.
7. Submit your accomplished Self-cheek

- Types and standard unit packaging of material

Being able to estimate the cost of a job is an important part of any business. Clients need a 'quote' before they give you the job.

Before you can give them this information you need to be able to work out the costs involved in the job.

In this section you will learn how to:

- estimate the amount of material you need for a job
- calculate the cost of these materials
- estimate the total cost of the job.

## The section is divided into six parts

Before you start the work must be consider the following activity

- Materials
- Dimensions
- Quantities
- Costs
- Estimating a job

## List all the materials

Materials You Will Use When Making Furniture Can Vary Widely
Depending On The Job. However The Types Of Materials You
Might Need To Work With Include:

- Timber
- Manufactured Board/Particleboard
- MDF
- Plywood

## Preparing Bill of quantity

After a final drawing or print is ready, several additional steps must be taken before construction can begin. You must first make a list called a bill of materials, materials list, or stock bill. The procedure for making the list is known as stock billing. The list includes the following (now always in this order):
a. Number of pieces
b. Name of part
c. Finish size in thickness, width, and length
d. Materials (This may not be necessary if only one kind of lumber, plywood or other material is involved.)
e. Rough or cut - out size, also called the stock-cutting list. (Sometimes a separate form is used for the stock - cutting list; if this is done, the number of pieces, name of part, and materials information should be repeated.)

It is standard practice to list the pieces in order of thickness, width, and length, but in the furniture industry this is sometimes reversed. Lumber thickness depends on whether the boards are purchased rough or surfaced two sides (S2S). Materials as plywood, hardboard or particleboard, the finish cut, and the cutout or rough thickness are the same. For solid lumber, the width of the cut - out or rough size is usually $1 / 8$ " to $1 / 4$ " greater; from $1 / 2$ " to 1 " is normally added to the length.

## Points to Remember in Stock Billing

- The net sizes are the actual or finish size of the part and are given in thickness, width, and length.
- Rough or cut - out size is the size that must be cut from the standard piece of lumber. This size allows the amount needed for machining.

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919v1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 37 of 51 |
| :---: | :---: | :---: | :---: | :---: |

- In the lumber order always list plywood, particleboard, hardboard, softwood, and hardwood separately.
- Always write sizes in $\mathrm{cm} / \mathrm{mm}$.

| Self-Check -2 | Written Test |
| :---: | :---: |

Directions: Answer all the questions listed below. Use the Answer sheet provided in the next page:

## 1. write the list Preparing Bill of quantity

1. $\qquad$ -
2. $\qquad$
3. $\qquad$
4. $\qquad$
5. $\qquad$

Note: Satisfactory rating - 3 points
Unsatisfactory - below 3 points
You can ask you teacher for the copy of the correct answers.

Information Sheet-3

- Bill of quantity/ relevant furnishing material cost estimates $\pm 10 \%$

## Bill of Materials, Cut List and PICK LIST

## Bill of materials

A Bill of materials is a complete list of material (solid wood hard ware finishing Material) required to make a project a detailed bill of material

## I. Preparing bill of materials

Preparing bill of materials:-is detailed list the materials one needs to build a project. The materials needed to build a furniture article, such as /include.

* Lumber
* Plastics
* Metal hard ware
* Wooden materials such as ply wood, particle boards, veneers
* Glue materials, finishing materials, glasses
* Fasteners such as bolts, screws or nails.

The lumber list indicates the names of the parts, numbers of piece in an article, kind of wood (materials) rough sizes, and finished stock sizes

Purpose of bill of materiel

* Name of description each parts
* Kind materiel (sold wood ply wood mahogany oak veneer etc...),
* Size amount each materiel,
* Cost of each material ,
* If you are using a bill f material that is not complete, add necessary information, (working drawing)

Use working drawing is guide to fill out of bill of material because working drawing is show the dimension of each part,

It al so help determine the kind of materials needed,

* Hear is a sample Bill of material generated with the Tabul

## CUTT WAST (PICK LIST)

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 39 of 51 |
| :---: | :---: | :---: | :---: | :---: |

II. Preparing cost list

Preparing lumber order: is a cost list prepared in a tabular form and shows the prices of all the materials. Before preparing the cost list for lumber \& wooden materials such as ply wood, particle boards, sliced veneer, hard boards. The quantities of some types of wood necessary to make simple furniture can easily be determined .however, estimating the amounts \& figuring the cost become more difficult when larger quantities of wood in different sizes $\&$ shapes are to be used.

## BILL OF MATERIALS (format 1)

| No. of <br> Pieces | Part <br> Name | Material | Finish Size |  |  | Rough Size |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | T | W | L | T | W | L |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |

Form for a bill of materials, materials list, or stock bill
Cutting lists of a project All dimensions are given in MM (format 2)

| No | Name of parts | Types of Materials | No of pieces | dimensions |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Initial dimension |  |  | final dimension |  |  |
|  |  |  |  | T | W | L | T | W | L |
| 1 |  |  |  |  |  |  |  |  |  |
| 2 |  |  |  |  |  |  |  |  |  |
| 3 |  |  |  |  |  |  |  |  |  |
| 4 |  |  |  |  |  |  |  |  |  |
| 5 |  |  |  |  |  |  |  |  |  |
| 6 |  |  |  |  |  |  |  |  |  |

## Rule of allowance

* In length add ( $15 \mathrm{~mm}-25 \mathrm{~mm}$ ).
* In width ( $6 \mathrm{~mm}-10 \mathrm{~mm}$ ).
* In thickness(2mm-5mm) ,
* Same parts do not need as much extra materials long part,

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 40 of 51 |
| :---: | :---: | :---: | :---: | :---: |

* Rough dimension included in cost calculation but not all because little lumber need in anther projects construction,(reuse)
* Remember = it allowance better to have too want gust a little too match

## Plan of procedure

Is a necessary step fore building the project.

* The plane also including a list the necessary tool\& machines it al so used to solve the kind of problem is best solve be fore you being construction
* The Plan of procedure keep you 'track' during construction.
* With out plan it is too easy to make mistakes or forget step.
* With out plan it is also easy to waste precious shop time during what to do next, making a Plan of procedure is easy and will actually save your time
* Make a plan of procedure by simple thinking your project through the building process.
* This will help you identify the order in which each parts should be made, with this information you should be able to make organized plan of procedure.
* As you list each step .you need not too detailed, complex step , however, may need same special notes, you know the step are clear and complete if the someone else cane follow the plan to make the project

Directions: Answer all the questions listed below. Use the Answer sheet provided in the next page:

1. What is Preparing bill of materials: $\qquad$
2. What is Preparing lumber order

## Note: Satisfactory rating -2 points

 Unsatisfactory - below 1 pointsYou can ask you teacher for the copy of the correct answers.
Answer Sheet

Score $=$ $\qquad$
Rating: $\qquad$

## Lo3 Estimate approximate quantities

Lumber list +supply material list
Lumber list is consists of both the cut out size \& finished stock list
Before preparing the cost list for lumber, it is necessary to determine the amount consumed in the production of the object in: $\mathrm{M}^{3}, \mathrm{M}^{2,} \mathrm{M}$ or per standard board
$>$ For lumber, particle board, hard board, it is necessary to estimate cost per $\mathrm{m}^{3}$ or per standard board sheet.
$>$ For ply wood, sliced veneer, Formica, its cost estimated per $\mathrm{m}^{2}$ or per standard sheet.
The lumber is sold in cubic inch of lumber in its rough state .apiece of wood linch thick, 12inches wide \&12inches long contains this amount of lumber.
To determine the cost of solid wood boards in this system is used the following formula:

## Pcs (No) $x$ thickness (inch) $x$ width (inch) $x$ length (inch) $=b d f t$ (board feet)

## 12

Or $\frac{\# \mathrm{pcs} \times \text { T" } \mathrm{xW"x} \text { "" }}{12}=\mathrm{bdft}$
Example : to find the board feet in three pieces, 1 "x 10 "x 4 "

$$
\underline{3 \times 1 \times 10 \times 4}=10 \mathrm{bdft}
$$

$$
12
$$

Thus, the total cost of one kind of lumber is determined by adding the exact board foot amounts \& multiplying by the cost per board foot.

The cost per board foot is derived from the lumber prices that are most frequently quoted as the price per 100@or(m)board foot.

Example : 1000bdftof lumber costs $\$ 350$,so that the cost per bdft will be

$$
350 / 1000=0.350 \text { or } 35 \text { cents. }
$$

There fore, the cost of $10 \mathrm{bdft}=10 \times 35=\$ 3.50$.
Pcs (no)thickness( m )width $(\mathrm{m})$ length $(\mathrm{m})=\mathrm{m}^{3}$
Or \# pcs x Tm x Wm x Lm =m ${ }^{3}$
Example ; to find the cubic meters in three pieces of lumber $20 \mathrm{mmx} 30 \mathrm{mmx} 1500 \mathrm{~mm}=$

$$
3 \times 0.02 \times 0.3 \times 1.5=0.027 \mathrm{~m}^{3}
$$

If the cost of 1 m 3 lumber is 450 Birr , the cost of $0.275 \mathrm{~m}^{3}$ is

$$
0.0275 / 1 \times 4510=12.15 \text { Birr }
$$

## Needed Materials

__ Slid wood, __ kilo of vanish, ___ sheet of sand paper,
$\qquad$ Kilo of glue, $\qquad$ kilo of Nile .etc...

To calculate the cost future, the ff procedures:-

* Know the quantity of material used to construct the project type ,
* Know the unit of price fore each materials,
* the calculate the cost material used to cost the project add
$25 \%$ wastage for wood,
$5 \%$ wastage for ply wood chip wood hard wood soft wood Formica, add cost a labour $20 \%$ of a total martial cost ,
* add martial cost of overhead expenses $15-20 \%$ of total martial cost ,
* add martial cost + overhead expenses, this will be cost price of the project,
* by add a profit $20-25 \%$ of cost price to the cost price ,
* Selling price including .overhead expenses. Equipment power consumed. telephone and other expenses

## OPERATION SHEET \# 1

## OBTAINE MESURMENT

Purpose: To measure is the act or process of determining the extent, quantity, degree, capacity, dimension, volume, and so forth, of a substance by comparing it with some fixed standard, which is usually fixed by law. A measure may relate to any of these standards.

## Equipment, Tools and Materials:

| The rule | - Panel gauges | - Sliding bevel |
| :--- | :--- | :--- |
| - Straight age | - Calipers | - Mortise gauge |
| - Marking knife | - Try square | - Cutting gauge |
| - Using compasses | - Miter square | - Combination square |
|  |  | - Marking gauge |

## Procedure:

## Obtain measurement

Every wood work shop should be adequately equipped with a reasonable quantity and Varity of tools and equipment for work to be done efficiently. It is necessary for you to be not only familiar with the names of the tools but able to identify and correctly. to make it easier to understand the correct application of the various tools they are grouped in to classes as follows: holding and supporting tools, geometrical tools, percussion and impelling tools, boring cutting tools, sharing and paring tools and abrading and scraping tools. The discussion centers on their type, description and uses.

Measurements are hand tools that are used to get the appropriate measurements of materials a job.

## Order of Obtain measurement

Select your measurement tools
Check the measurement tools up \& down
Select marking tool
Measure \& marking the true length

| Furniture Making L - I | IND-FMK1- TTLM <br> 0919 v 1 | Author/Copyright: Federal <br> TVET Agency | Version -1 <br> Sept. 2019 | Page 45 of 51 |
| :---: | :---: | :---: | :---: | :---: |

Measuring from edge to edge
When taking external measurements with a tape measure, hook the tip over one edge of the workpiece and read off the dimension against the opposite edge.

## Taking internal measurements

When measuring between two components, the hook riveted to a retractable tape measure slides backward to align with the tip of the tape. Read off the dimension where the tape enters its case, then add the length of the case to arrive at the true measurement.

## Using pinch rods

Another way to gauge the distance between components is to bridge the gap with two battens held side by side. Draw a mark across both battens to register their relative positions - then, without releasing your grip, transfer them to the work.

If you suspect a board is twisted or "winding," hold a steel rule across each end; if the rules appear to be parallel, the board is flat.

Dividing a workpiece into equal parts
You can divide a workpiece into equal parts using any rule or tape measure. To divide a board into quarters, for example, align the tip of the rule with one edge and the fourth division with the opposite edge, then mark off the divisions between.

## Checking a surface is flat

To check that a panel is flat, place a straightedge on the surface. A bump will cause the tool to rock; chinks of light showing beneath the straightedge indicate hollows. Turn the straightedge to various angles to gauge whether the entire surface is flat.

| :---: | :---: | :---: | :---: | :---: |

## Plan of procedure

## Project coffee table

Tool required，hand saw hand plane
Screwdriver．clamp ．．．
Machine required，circular saw drill．Mortise ，band saw jig saw ．．．

## Procedure

1．Cut top \＆base to rough size
2．cut \＆the leg \＆rails of the table
3．make joint the the rails
4．make joints the legs
5．assembling（try）the leg \＆rails
6．assembling the two parts with glue and clamping
7．assembling the four parts with glue and clamping
8．cutting the top of the table
9．laminate the top of the table
10．assembling the top \＆the legs
11．sanding all parts
12．apply finish
13，deliver to the stored at finishing room ，

## OPERATION SHEET \# 3

Purpose: Preparing lumber order: is a cost list prepared in a tabular form and shows the prices of all the materials. Before preparing the cost list for lumber \& wooden materials such as ply wood, particle boards, sliced veneer, hard boards. The quantities of some types of wood necessary to make a simple furniture can easily be determined .however, estimating the amounts \& figuring the cost become more difficult when larger quantities of wood in different sizes \& shapes are to be used.

## Equipment, Tools and Materials:

Meter. Solid wood. Play wood .chip wood
Calculator. Paper, pencil etc.

## Procedure:

Measure check the type of wood
Know the cost of material in ( $1 \mathrm{~m}^{2}$ Or $1 \mathrm{~m}^{3)}$
Calculate the given amount need wood
Estimate the the
materiel cost
labor cost
overhead cost
profit cost
Estimate total selling price

## COST ESTMATION

Other supply cost (metal, plastic, hard ware, finishing materials)

| Item | Quantity | Size | Unit cost | Total <br> cost | Cost summary | remark |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Solid <br> wood | 0.015 m 3 | $2.5 * 30^{*} 400 \mathrm{~cm}$ | 225 birr | 121.5 <br> birr | Lumber cost <br> 261.5 birr <br> Supply cost 90 |  |
