PART II Manufacturing Formulations

PART III Tablet Coating Formulations

PART IV Composition of Proprietary Products Approved in the United States

Preface to the Series—Third Edition

I am humbled by the wide praise and acceptance of the last two editions of the *Handbook of Pharmaceutical Formulations*, a six-volume series that found home in the R&D laboratories of just about every pharmaceutical company, both generic and branded, and in the classrooms of pharmaceutical technology; and the regulatory agencies used this treatise to compare the quality of pharmaceutical products. In creating this work, back in 2004, my primary objective was to provide a ready source of safe and scalable generic and new pharmaceutical formulations that take a long time to develop and incur a substantial cost, to enable the availability of affordable medicines.

Each of the six volumes in the series has a structured content. Part I includes regulatory guidance, formulation steps, references to active ingredients and excipients, and a self-audit guidance for cGMP compliance. Chapters of common interest to all volumes are distributed across the six volumes, such as the formulations for coating solutions are presented in Volume 5 (OTC), though they are also pertinent to Volume 1 (Compressed Dosage Forms), and global bioequivalence testing guidelines are provided in Volume 4 (Semisolids), though they apply to all volumes. Part II includes scalable formulations and Part III, where applicable, other general formulations. The appendices include a listing of excipients used in FDA approved products and a cGMP compliance self-testing tool. Whereas the main focus of the guidance provided in the handbook pertains to compliance with FDA requirements, these apply equally to EU requirements, and, as a result, to any global agency.

The third edition also gets several significant additions; now each volume includes a self-audit template, several chapters advising how to stay cGMP compliant, including a listing of most common FDA citations to look out for in the audits, a global regulatory focus and an updated list of excipients and the level of their incorporation in the FDA-approved products. The number of formulations is also increased, and the OTC volume now contains several cosmetic formulations, and the semisolid product volume also includes details on chewing gum delivery systems.

The updating of formulations is always cumulative as there is little need to remove any formulation provided previously—if it was right then, it shall remain good now. However, a variety of new drug delivery systems have evolved since the second edition was published, so I have included more details on these formulations, although some of these may not be available to practice due to possible limitations on the intellectual property.

As always, I advise the formulators to be aware of any intellectual property infringements as I cannot provide a guarantee to this effect.

Finally, I wish to acknowledge the leaders of the pharmaceutical world, to whom each of the volumes is dedicated. I have made a few changes to those whom the volumes are dedicated, to recognize those who have since passed away; they provided a role model to me and thousands of leaders and students of pharmacy over the decades of their careers. They are gone, but not without leaving an indelible mark on the profession.

I also consider myself fortunate to have the sponsorship and assistance of the great folks at the CRC Press, more particularly Jessica Poile and Hilary LaFoe. The teams at the CRC Press were very kind to put up with my redundant changes to the manuscript and were extremely generous in their advice in balancing the scientific and practical knowledge and, above all, making sure that the book was framed and published in the highest professional presentation. As always, I take responsibility for any mistakes and errors in my writing, and I am always open to suggestions by the readers to make future editions. I can be contacted at niazi@niazi.com.

Preface to the Series—Second Edition

The science and the art of pharmaceutical formulation keeps evolving as new materials, methods, and machines become readily available to produce more reliable, stable, and release-controlled formulations. At the same time, globalization of sourcing of raw and finished pharmaceuticals brings challenges to regulatory authorities and results in more frequent revisions to the current good manufacturing practices, regulatory approval dossier requirements, and the growing need for cost optimization. Since the publication of the first edition of this book, a lot has changed in all of these areas of importance to pharmaceutical manufacturers. The second edition builds on the dynamic nature of the science and art of formulations and provides an evermore useful handbook that should be highly welcomed by the industry, the regulatory authorities, as well as the teaching institutions.

The first edition of this book was a great success as it brought under one umbrella the myriad of choices available to formulators. The readers were very responsive and communicated with me frequently pointing out to the weaknesses as well as the strengths of the book. The second edition totally revised attempts to achieve these by making major changes to the text, some of which include:

1. Complete, revised errors corrected and subject matter reorganized for easy reference. Whereas this series has six volumes differentiated on the basis of the type of dosage form and a separate inclusion of the U.S. OTC products, ideally the entire collection is needed to benefit from the myriad of topics relating to formulations, regulatory compliance, and dossier preparation.
2. Total number of pages is increased from 1684 to 2726.
3. Total number of formulations is expanded by about 30% with many newly approved formulations.
4. Novel formulations are now provided for a variety of drugs; these data are collected from the massive intellectual property data and suggest toward the future trend of formulations. While some of these formulations may not have been approved in the United States or Europe, these do provide additional choices, particularly for the NDA preparation. As always, it is the responsibility of the manufacturer to assure that the intellectual property rights are not violated.
5. A significant change in this edition is the inclusion of commercial products; while most of this information is culled out from the open source such as the FOIA (http://www.fda.gov/foi/default.htm), I have made attempts to reconstruct the critical portions of it based on what I call the generally acceptable standards. The drug companies are advised to assure that any intellectual property rights are not violated and this applies to all information contained in this book. The freedom of information act (FOIA) is an extremely useful conduit for reliable information and manufacturers are strongly urged to make use of this information. Whereas this information is provided free of charge, the process of obtaining the information may be cumbersome, in which case, commercial sources of these databases can prove useful, particularly for the non-U.S. companies.
6. Also included are the new Good Manufacturing Guidelines (2007) with amendments (2008) for the United States and similar updates for European Union and WHO; it is strongly urged that the companies discontinue using all old documents as there are significant changes in the revised form, and many of them are likely to reduce the cost of GMP compliance.
7. Details on design of clean rooms is a new entry that will be of great use to sterile product manufacturers; whereas the design and flow of personnel and material flow is of critical nature, regulatory agencies view these differently and the manufacturer is advised always to comply with most stringent requirements.
8. Addition of a self-auditing template in each volume of the series. While the cGMP compliance is a complex issue and the requirements diversified across the globe, the basic compliance remains universal. I have chosen the European Union guidelines (as these are more in tune with the ICH) to prepare a self-audit module that I recommend that every manufacturer adopt as a routine to assure GMP compliance. In most instances reading the template by those responsible for compliance with keep them sensitive to the needs of GMP.
9. OTC products cross-referenced in other volumes where appropriate. This was necessary since the regulatory authorities worldwide define this class of drug differently. It is important to iterate that regardless of the prescription or the OTC status of a product, the requirements for compliance with the cGMP apply equally.
10. OTC monograph status is a new section added to the OTC volume and this should allow manufacturers to chose appropriate formulations that may not require a filing with the regulatory agencies; it is important to iterate that an approved OTC monograph includes details of formulation including the types and quantities of active drug and excipients, labeling, and presentation. To qualify the exemption, the manufacturer must comply with the monograph in its entirety. However, subtle modifications that are merely cosmetic in nature and where there is an evidence that

the modification will not affect the safety and efficacy of the products can be made but require prior approval of the regulatory agencies and generally these approvals are granted.

11. Expanded discussion on critical factors in the manufacturing of formulations provided; from basic shortcuts to smart modifications now extend to all dosage forms. Pharmaceutical compounding is one of the oldest professions and whereas the art of formulations has been relegated to more objective parameters, the art nevertheless remains. An experienced formulator, like an artist, would know what goes with what and why; he avoids the pitfalls and stays with conservative choices. These sections of the book present advice that is time tested, although it may appear random at times; this is intended for experienced formulators.
12. Expanded details on critical steps in the manufacturing processes provided but to keep the size of the book manageable, and these are included for prototype formulations. The reader is advised to browse through similar formulations to gain more insight. Where multiple formulations are provided for the same drug, it intended to show the variety of possibilities in formulating a drug and whereas it pertains to a single drug, the basic formulation practices can be extended to many drugs of same class or even of diversified classes. Readers have often requested that more details be provided in the Manufacturing Direction sections. Whereas sufficient details are provided, this is restricted to prototype formulations to keep the size of the book manageable and to reduce redundancy.
13. Addition of a listing of approved excipients and the level allowed by regulatory authorities. This new section allows formulators a clear choice on which excipients to choose; the excipients are reported in each volume pertaining to the formulation type covered. The listing is drawn from the FDA-approved entities. For the developers of an ANDA, it is critical that the level of excipients be kept within the range generally approved to avoid large expense in justifying any unapproved level. The only category for which the listing is not provided separately is the OTC volume since it contains many dosage forms and the reader is referred to dosage form-specific title of the series. The choice of excipients forms keeps increasing with many new choices that can provide many special release characteristics to the dosage forms. Choosing correct excipients is thus a tedious exercise and requires sophisticated multivariate statistical analysis. Whereas the formulator may choose any number of novel or classical components, it is important to know the levels of excipients that are generally allowed in various formulations to reduce the cost of redundant exercises; I have therefore included, as an appendix to each volume, a list of all excipients that are currently approved by the U.S. FDA along their appropriate levels. I suggest that a formulator consult this table before deciding on which level of excipient to use; it does not mean that the excipient cannot be used outside this range but it obviates the need for a validation and lengthy justification studies in the submission of NDAs.
14. Expanded section on bioequivalence submission was required to highlight the recent changes in these requirements. New entries include a comprehensive listing of bioequivalence protocols in abbreviated form as approved by the U.S. FDA; these descriptions are provided in each volume where pertinent. To receive approval for an ANDA, an applicant must generally demonstrate, among other things, equivalence of the active ingredient, dosage form, strength, route of administration and conditions of use as the listed drug, and that the proposed drug product is bioequivalent to the reference listed drug [21 USC 355(j)(2)(A); 21 CFR 314.94(a)]. Bioequivalent drug products show no significant difference in the rate and extent of absorption of the therapeutic ingredient [21 U.S.C. 355(j)(8); 21 CFR 320.1(e)]. BE studies are undertaken in support of ANDA submissions with the goal of demonstrating BE between a proposed generic drug product and its reference listed drug. The regulations governing BE are provided at 21 CFR in part 320. The U.S. FDA has recently begun to promulgate individual bioequivalence requirements. To streamline the process for making guidance available to the public on how to design product-specific BE studies, the U.S. FDA will be issuing product-specific BE recommendations (www.fda.gov/cder/ogd/index.htm). To make this vital information available, an appendix to each volume includes a summary of all currently approved products by the U.S. FDA where a recommendation on conducting bioequivalence studies is made available by the U.S. FDA. When filing an NDA or an ANDA, the filer is faced with the choice of defending the methods used to justify the bioavailability or bioequivalence data. The U.S. FDA now allows application for waiver of bioequivalence requirement; a new chapter on this topic has been added along with details of the dissolution tests, where applicable, approved for various dosage forms.
15. Dissolution testing requirements are included for all dosage forms where this testing is required by the FDA. Surrogate testing to prove efficacy and compliance is getting more acceptance at regulatory agencies; in my experience, a well-designed dissolution test is the best measure of continuous compliance. Coupled with chapters on waivers of bioequivalence testing, this information on dissolution testing should be great value to all manufacturers; it is recommended that manufacturers develop their own in-house specifications, more stringent than those allowed in these listings and the USP.

16. Best-selling products (top 200 prescription products) are identified with an asterisk and a brand name where applicable; in all instances, composition of these products is provided and formulation of generic equivalents. Despite the vast expansion of pharmaceutical sales and shifting of categories of blockbuster drugs, basic drugs affecting gastrointestinal tract, vascular system, and brain remain most widely prescribed.
17. Updated list of approved coloring agents in the United States, Canada, European Union, and Japan is included to allow manufactures to design products for worldwide distribution.
18. Tablet-coating formulations that meet worldwide requirements of color selection are included in the Volume 1 (compressed solids) and Volume 5 (OTC) because these represent the products often coated.
19. Guidelines on preparing regulatory filings are now dispersed throughout the series depending on where these guidelines are more crucial. However, the reader would, as before, need access to all volumes to benefit from the advice and guidelines provided.

As always, comments and criticism from the readers are welcomed and these can be sent to me at Niazi@pharmsci.com or Niazi@niazi.com. I would try to respond to any inquiries requiring clarification of the information enclosed in these volumes.

I would like to express deep gratitude to Sherri R. Niziolek and Michelle Schmitt-DeBonis at Informa, the publisher of this work, for seeing an immediate value to the readers in publishing the second edition of this book and allowing me enough time to prepare this work. The diligent editing and composing staff at Informa, particularly Joseph Stubenrauch, Baljinder Kaur and others are highly appreciated. Regardless, all errors and omissions remain altogether mine.

In the first edition, I had dedicated each volume to one of my mentors; the second edition continues the dedication to these great teachers.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Preface to the Series—First Edition

No industry in the world is more highly regulated than the pharmaceutical industry because of potential threat to a patient's life from the use of pharmaceutical products. The cost of taking a new chemical entity (amortized over the cost of all molecules racing) to final regulatory approval is a staggering $800 million, making the pharmaceutical industry one of the most research-intensive industries in the world. In the year 2004, it is anticipated that the industry will spend about $20 billion on research and development. The generic market of drugs as the new entities come off patent is one of the fastest growing segments of the pharmaceutical industry, with every major multinational company having a significant presence in this field.

Whereas many stages of new drug development are inherently constrained with time, the formulation of drugs into desirable dosage forms remains an area where expediency can be practiced with appropriate knowledge by those who have mastered the skills of pharmaceutical formulations. The Handbook of Pharmaceutical Manufacturing Formulations is the first major attempt to consolidate the available knowledge about formulations in a comprehensive, and by nature a rather voluminous, presentation.

The book is divided into six volumes, based strictly on the type of formulation science involved in the development of these dosage forms: sterile products, compressed solids, uncompressed solids, liquid products, semisolid products, and OTC products. The separation of OTC products even though they may easily fall into one of the other five categories is made to comply with the industry norms of separate research divisions for OTC products. Sterile products require skills related to sterilization of product, and of less importance is the bioavailability issue, which is an inherent problem of compressed dosage forms. These types of considerations have led to the classification of products into these six categories.

Each volume includes a description of regulatory filing techniques for the formulations described. Also included are the current regulatory guidelines on cGMP compliance specific to the dosage form. Advice is offered on how to scale up the production batches.

It is expected that formulation scientists will use this information to benchmark their internal development protocols and cut the race to file short by adopting formulae that have survived the test of time. Many of us who have worked in the pharmaceutical industry suffer from a close paradigm when it comes to selecting formulations—"not invented here" perhaps reigns in the mind of many seasoned formulations scientists subconsciously when they prefer to choose only a certain platform for development. It is expected that with the quick review of possibilities available to formulate made available in this book, scientists will benefit from the experience of others.

For the teachers of formulation sciences, this series offers a wealth of information. Whether it is a selection of a preservative system or the choice of a disintegrant, the series offers a wide choice to study and rationalize.

Many have assisted me in the development of this work that has taken years to compile, and I thank scores of my graduate students and colleagues for their help. A work of this size cannot be produced without errors, although I hope that these errors do not distract the reader from the utility of the book. I would sincerely appreciate if readers point out these mistakes for corrections in future editions.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Preface to the Volume—First Edition

Compressed solids present one of the greatest challenges to formulation scientists, as they offer remarkable marketing opportunities to marketers. A solid oral dosage form is easy to ingest, is relatively more stable than other dosage forms (longer shelf life), and with it, opportunities to design delivery profiles to meet specific therapeutic requirements are offered. As a result, almost two-thirds of all dosage forms fall into this category. The challenge in formulating these products includes finding an optimum medium of compromises that will ensure releases of an active drug at the most desired and consistent rate. The formulation components and process of manufacturing thus take pivotal importance. As a result, the formulations provided in this volume offer a rare opportunity for formulators to start with an optimal composition. Described in this volume are formulations for over 200 of the most widely used drugs for all types of release profiles.

The most significant issues in the formulation of compressed solids are related to bioequivalence. Over the past quarter of a century, the science of evaluating equivalence of products has taken a greater emphasis on testing in human subjects. Although they are expensive to conduct, such trials are now routine, requiring frequent evaluation during the development phases and before marketing new entities. Most frequently, trials are required when establishing generic equivalences. The U.S. FDA may require additional biostudies if there is a change in the manufacturing site or even a change in the specification of a raw material. This aspect of formulation development clearly differentiates the compressed solids category; as a result, chapter 1 in the book deals with the guidelines for bioavailability and bioequivalence testing of pharmaceutical products. Noteworthy are the changes proposed in this guideline from what is the currently accepted methodology; for example, what was long considered necessary, the multiple-dose studies of modified release products, will yield to single-dose studies, which are considered more discriminating. The manufacturers are particularly reminded to understand the changes in the requirements of bioavailability and bioequivalence studies that are on the horizon.

The formulation of compressed solids involves a highly intricate series of events, from the characterization of the active pharmaceutical ingredient, to the choice of excipients, to the selection of processing, compression, and coating equipment and packaging systems appropriate for the specific drug and the dosage form. In chapter 2 of this volume, we highlight what the manufacturers need to be aware of in establishing a manufacturing process based on the formulations presented.

In other volumes of this series, details are provided on various other issues that pertain to the manufacturing of compressed solids, including validation issues, compliance with cGMP, laboratory guidelines, etc. The reader is referred to the other volumes for further understanding of the subject matter.

Compressed solids or tablets are usually applied with coatings, mainly aqueous film coatings, for many reasons, from aesthetics to imparting higher physical-chemical stability. Coating technology is a separate science. Fortunately, the major suppliers of equipment, such as Accela-Cota® and Glatt® and coating materials such as Colorcon® and Rohm®, are very helpful in establishing coating parameters and choosing the right coating materials and formulations. A large number of coating formulations are listed in a separate section in this book, including sugar coating, film coating, and enteric coatings. With such a wide variety available, coating steps are omitted from all formulations where coating is recommended. Instead, the reader is referred to the appropriate section of the book to make an appropriate choice.

The formulations are presented with a scale for each unit, per tablet; and quantities are expressed for 1000 tablets. It is customary for manufacturers to scale formulas for a specific weight, such as 100 or 1000 kg, to match mixing vessel requirements. This can be done roughly by multiplying the weight of each tablet by the quantity desired to calculate the size of the batch. Remember that the actual yield may be different because of differences in the scale and quantity, due to differences in the chemical forms of the drugs used, excesses added, and losses of moisture during manufacturing. Further, the adjustment of quantity based on the potency of the raw material, where pertinent, changes the quantity requirements.

A distinctive feature of this volume is the identification and inclusion of the most popular prescription products. The 200 most widely prescribed drugs (by brand name) are marked with a bracketed number to indicate their rankings. These data are derived from over 3 billion prescriptions filled during 2002 in the United States, comprising the majority of the U.S. prescription market. Because in some instances more than one brand name is prescribed, only the top brand is listed; therefore, the total number of chemical equivalents is less than 200. The compressed solids represent more than an 80% share of this list, therefore expounding the need to elaborate this list in this particular volume. Obviously, for a generic manufacturer, it would be advantageous to enter the market with products that have a wide market, not necessarily the largest margin, and this list will further help in the selection of products. It is noteworthy that in the preparation of an ANDA (Abbreviated New Drug Application), it is important for both regulatory and scientific reasons to keep the selection of excipients as close as possible to the innovator's product. The listing provided here includes every excipient used in the innovator listing. Whereas, in most instances, sufficient details are provided to assist in the formulation of a generic equivalent with exact quantities of excipients and conditions appropriate for processing, the examples provided for other drugs of similar types should be sufficient for an astute formulator to quickly develop these formulations. However, should there be a need for assistance in finalizing the formulation, the reader is invited, without any obligation, to write to the author at niazi@pharmsci.com.

I am grateful to CRC Press for taking this lead in publishing what is possibility the largest such work in the field of pharmaceutical products. It has been a distinct privilege to have known Mr. Stephen Zollo, the senior editor at CRC Press, for many years. Stephen has done more than any editor can to encourage me to complete this work on a timely basis. The editorial assistance provided by the CRC Press staff was exemplary, particularly the help given by Erika Dery, Joette Lynch, and others at CRC Press. Although much care has gone into correcting errors, any errors remaining are altogether mine. I would appreciate it if the readers bring these errors to my attention so that they can be corrected in future editions of this volume (niazi@pharmsic.com).

This book is dedicated to Sidney Riegelman, who was born July 19, 1921, in Milwaukee, Wisconsin. He attended the University of Wisconsin, graduating with a Bachelor of Science degree in pharmacy in 1944 and a Ph.D. in pharmacy in 1948. Following his graduate work, Sid joined the faculty of the School of Pharmacy at the University of California at San Francisco. In 1958, Sid published a series of papers with graduate student Wilfred Crowell, which appeared in the scientific edition of the Journal of the American Pharmaceutical Association under the major heading of "The Kinetics of Rectal Absorption." For these studies, Sid was awarded the Ebert Prize in 1959, which recognized Sid's publications as the best work published in the journals of the American Pharmaceutical Association during the year 1958. Sid's contributions to pharmaceutical sciences, particularly in the field of pharmacokinetics, earned him a revered place in the profession. On April 4, 1981, Sid drowned while scuba diving with his wife at Salt Point, California, a coastal area just north of San Francisco. At the University of California, a plaque is dedicated to Sid "by his graduate students, who honor his scientific achievements and excellence, his inspirations and contagious enthusiasm in research and teaching. We shall always remember Sid as our mentor, scientific father and most importantly, as our beloved friend and confidant."

I had the distinct privilege, both during my graduate studies and later as a faculty member teaching biopharmaceutics and pharmacokinetics, to interact with Sid. When my book, Textbook of Biopharmaceutics and Clinical Pharmcokinetics, was published, Sid called to congratulate me. It was like receiving a call from God—that is how he was revered in the profession. I remember vividly how he would argue in seminars while appearing to be dozing off during the presentation. Sid was a giant: a scientist, a scholar, and, above all, a loving human being. When a professional crisis arose, I called Sid for advice. Instead of telling me what I should do, Sid told me a story about his childhood: "Sarf, my brother was much stronger than I and every time he would run into me, he would take a jab at me, and when I would return his jab, he would knock me down. I complained about this to my father, and my father advised me not to return the jabs. My brother became so frustrated, he started jabbing others." I have never forgotten his advice.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Author

Sarfaraz K. Niazi has been teaching and conducting research in the pharmaceutical industry for over 40 years. He has authored hundreds of scientific papers, scores of textbooks, handbooks and literary books on the topics of pharmaceutical formulation, biopharmaceutics, pharmacokinetic , bioprocessing, and recombinant engineering, as well as poetry and philosophy. He is also an inventor with 100+ patents in the field of bioprocessing, technology, drug and dosage form delivery systems; he is also licensed to practice law before the U.S. Patent and Trademark Office. He has formulated hundreds of products ranging from the most popular consumer products to complex generics and biotechnology-derived products. Dr. Niazi advises regulatory agencies and the pharmaceutical industry and making safe and effective drugs affordable (www.pharmsci.com). He can be contacted at niazi@niazi.com.

Part I

Regulatory and Manufacturing Considerations

Taylor & Francis
Taylor & Francis Group
http://taylorandfrancis.com

1 Bioequivalence Testing
Rationale and Principles

I. BACKGROUND

The bioavailability of a drug is controlled by three factors, namely:

- The rate and extent of release of the drug from the dosage form
- Its subsequent absorption from the solution state
- The biotransformation during the process of absorption

In all quantitative determinations of bioavailability, concentration is measured in blood, plasma, and urine. Plasma concentrations following the oral administration of a drug assume four sequential phases depending on the magnitude of absorption and elimination:

1. Absorption > elimination
2. Absorption = elimination
3. Absorption < elimination
4. Absorption = elimination = 0

The shape of the plasma concentration profile depends on the relative rates of absorption and elimination, and thus, the plasma concentration profiles may be quite different with different routes of administration. Intravenous and sometimes intramuscular routes yield an early peak due to fast or almost instantaneous absorption, whereas oral, subcutaneous, rectal, and other routes may show delayed peaks due to slower rates of absorption. It should be noted that the rate of elimination is considered constant since it depends primarily on the specific nature of the active drug ingredient.

The purpose of bioavailability studies is to demonstrate therapeutic equivalence. However, depending on the mechanism of action, more meaningful comparisons can be made from such parameters as peak plasma concentration or the time to reach peak plasma concentration. For example, in the case of antibiotics, it is important to know how soon the minimum inhibitory concentration is reached and maintained. The choice of single-dose versus multiple-dose study depends on the mechanism of drug action. For example, antidepressants such as imipramine show delayed action, a characteristic of many psychotropic and antihypertensive agents. In these instances, a new product should be judged for its quality from repeated administration, because in these examples, the peak concentration or time to peak concentration is relatively unimportant. It is therefore important to isolate the clinically important parameter, but in all instances, the area under the curve (AUC) must be monitored, since it represents the proportionality to the total amount of drug eliminated from the body and hence, absorbed.

The estimation of bioavailability from plasma concentration profiles requires a thorough understanding of the nature of plasma-level profiles. For example, a higher or earlier peak does not necessarily mean greater overall absorption than from a product giving a smaller or delayed peak. The total absorption of drugs is, therefore, proportional not only to the plasma concentrations achieved but also to the length of time these concentrations persist in the blood. One parameter that characterizes this aspect is the area under the plasma concentration versus time profile.

The major contribution to the AUC for a fast-absorbed formulation is due to the high peak concentration, whereas for a slowly absorbed formulation, the area is mainly because of sustained or prolonged plasma concentration. It should be noted that the area under the plasma concentration versus time profile is only proportional to the total amount of drug absorbed and cannot be used to determine the actual amount of drug administered unless it is compared with a known standard, whereby the extent of absorption is either measured by other methods or assumed to be 100%, as in the case of intravenous administration.

The in vivo bioavailability of a drug product is measured if the product's rate and extent of absorption, as determined by comparison of measured parameters, for example, concentration of the active drug ingredient in the blood, urinary excretion rates, or pharmacological effects, do not indicate a significant difference from the reference material's rate and extent of absorption. For drug products that are not intended to be absorbed into the bloodstream, bioavailability may be assessed by measurements intended to reflect the rate and extent to which the active ingredient or active moiety becomes available at the site of action.

Statistical techniques used in establishing bioequivalence shall be of sufficient sensitivity to detect differences in the rate and extent of absorption that are not attributable to subject variability.

A drug product that differs from the reference material in its rate of absorption, but not in its extent of absorption, may be considered to be bioavailable if the difference in the rate of absorption is intentional, is appropriately reflected in the labeling, is not essential to the attainment of effective body drug concentrations on chronic use, and is considered medically insignificant for the drug product.

Two drug products will be considered bioequivalent drug products if they are pharmaceutical equivalents or pharmaceutical alternatives whose rate and extent of absorption do not show a significant difference when administered at the

same molar dose of the active moiety under similar experimental conditions as either a single dose or multiple doses. Some pharmaceutical equivalents or pharmaceutical alternatives may be equivalent in the extent of their absorption but not in their rate of absorption and yet may be considered bioequivalent, because such differences in the rate of absorption are intentional and are reflected in the labeling, are not essential to the attainment of effective body drug concentrations on chronic use, and are considered medically insignificant for the particular drug product studied.

II. EVIDENCE TO MEASURE BIOEQUIVALENCE

In vivo bioequivalence may be determined by one of several direct or indirect methods. The selection of the method depends upon the purpose of the study, the analytical method available, and the nature of the drug product. Bioequivalence testing should be conducted using the most appropriate method available for the specific use of the product.

The preferred hierarchy of bioequivalence studies (in descending order of sensitivity) is the blood-level study, pharmacologic end-point study, and clinical end-point study. When absorption of the drug is sufficient to measure drug concentration directly in the blood (or other appropriate biological fluids or tissues), and systemic absorption is relevant to the drug action, then a blood (or other biological fluid or tissue)-level bioequivalence study should be conducted. The blood-level study is generally preferred above all others as the most sensitive measure of bioequivalence. The sponsor should provide justification for choosing either a pharmacologic or a clinical end-point study over a blood-level (or other biological fluids or tissues) study.

When the measurement of the rate and extent of absorption of the drug in biological fluids cannot be achieved or is unrelated to drug action, a pharmacologic end-point (i.e., a drug-induced physiologic change which is related to the approved indications for use) study may be conducted. Lastly, in order of preference, if drug concentrations in blood (or fluids or tissues) are not measurable or are inappropriate, and there are no appropriate pharmacologic effects that can be monitored, then a clinical end-point study may be conducted, comparing the test (generic) product with the reference (pioneer) product and a placebo (or negative) control.

Bioavailability may be measured, or bioequivalence may be demonstrated, by several in vivo and in vitro methods. The Food and Drug Administration (FDA) may require in vivo or in vitro testing, or both, to measure the bioavailability of a drug product or establish the bioequivalence of specific drug products. Information on bioequivalence requirements for specific products is included in the current edition of FDA's publication "Approved Drug Products with Therapeutic Equivalence Evaluations" and any current supplement to the publication. The selection of the method used to meet an in vivo or in vitro testing requirement depends upon the purpose of the study, the analytical methods available, and the nature of the drug product. The following in vivo and in vitro approaches, in descending order of accuracy, sensitivity, and reproducibility, are acceptable for determining the bioavailability or bioequivalence of a drug product:

- An in vivo test in humans in which the concentration of the active ingredient or active moiety, and when appropriate, its active metabolite(s), in whole blood, plasma, serum, or other appropriate biological fluid is measured as a function of time. This approach is particularly applicable to dosage forms intended to deliver the active moiety to the bloodstream for systemic distribution within the body.
- An in vitro test that has been correlated with and is predictive of human in vivo bioavailability data.
- An in vivo test in humans in which the urinary excretion of the active moiety, and when appropriate, its active metabolite(s), is measured as a function of time. The intervals at which measurements are taken should ordinarily be as short as possible so that the measure of the rate of elimination is as accurate as possible. Depending on the nature of the drug product, this approach may be applicable to highly metabolized drugs. This method is not appropriate where urinary excretion is not a significant mechanism of elimination.
- An in vivo test in humans in which an appropriate acute pharmacological effect of the active moiety, and when appropriate, its active metabolite(s), is measured as a function of time, if such effect can be measured with sufficient accuracy, sensitivity, and reproducibility. This approach is applicable only when appropriate methods are not available for measurement of the concentration of the moiety, and when appropriate, its active metabolite(s), in biological fluids or excretory products, but a method is available for the measurement of an appropriate acute pharmacological effect. This approach may be particularly applicable to dosage forms that are not intended to deliver the active moiety to the bloodstream for systemic distribution.
- Well-controlled clinical trials that establish the safety and effectiveness of the drug product, for purposes of measuring bioavailability, or appropriately designed comparative clinical trials, for purposes of demonstrating bioequivalence. This approach is the least accurate, sensitive, and reproducible of the general approaches for measuring bioavailability or demonstrating bioequivalence. For dosage forms intended to deliver the active moiety to the bloodstream for systemic distribution, this approach may be considered acceptable only when analytical methods cannot be developed to permit the use of one of the approaches outlined previously. This approach may also be considered sufficiently accurate for measuring bioavailability or demonstrating bioequivalence of dosage forms intended to deliver the active moiety locally (for example, topical preparations for the skin, eye, and mucous membranes; oral dosage

forms not intended to be absorbed, for example, an antacid or radiopaque medium; and bronchodilators administered by inhalation) if the onset and duration of pharmacological activity are defined.
- A currently available in vitro test acceptable to FDA (usually a dissolution rate test) that ensures human in vivo bioavailability.
- Any other approach deemed adequate by FDA to measure bioavailability or establish bioequivalence.

FDA may require in vivo testing in humans of a product at any time if the agency has evidence that the product

- May not produce therapeutic effects comparable to a pharmaceutical equivalent or alternative with which it is intended to be used interchangeably
- May not be bioequivalent to a pharmaceutical equivalent or alternative with which it is intended to be used interchangeably
- Has greater than anticipated potential toxicity related to pharmacokinetic or other characteristics

A list of therapeutic, pharmacokinetic, and physicochemical factors has been compiled to classify which product needs demonstration of bioequivalence by in vivo testing (Table 1.1). A large number of drugs have been classified in this category (Table 1.2). All enteric-coated and controlled-release dosage forms of any solid oral dosage form require in vivo bioavailability testing. It is generally suggested that if more than 25% intrabatch or batch-to-batch variability in bioavailability is observed, in vivo tests will be required for batch certification. Any changes in the manufacturing process, including product formulation or dosage strength change, beyond that suggested in the new drug application (NDA) or abbreviated new drug application (ANDA) and changes in labeling for a new indication or new dosage regimen also require in vivo bioavailability testing.

The pharmacotherapeutic nature of the drug plays an important role in the regulations regarding its bioavailability. Drugs which exhibit narrow therapeutic index, that is, less than a twofold difference between median lethal dose and median effective dose values (or less than a twofold difference between the minimum effective concentration and the minimum toxic concentration in the blood) require careful demonstration of bioavailability and the consistency with which this requirement is met. Further consideration is needed regarding the type of side effects occurring if a toxic level is reached. For example, the therapeutic index (the U.S. FDA prefers to call this the therapeutic range) for salicylates is smaller than that for cardiac glycosides; this does not mean that cardiac glycosides are less toxic. It merely signifies that the concentration of salicylates for therapeutic response is closer to the concentration at which undesirable side effects start to appear. Another consideration along the same line is the potency of the drug in question. Generally, highly potent drugs will require greater control of bioavailability than drugs with lower potency. Because of the logarithmic nature of the response, the curves flatten out at low and high doses. Thus, a highly potent drug used in large doses will show a lower variability in response due to bioavailability factor than a low-potency

TABLE 1.1
Factors Determining the Establishment of Bioequivalence Requirement by the FDA

1. Therapeutic factors: evidence from
   a. Clinical trials
   b. Controlled observations on patients.
   c. Well-controlled bioequivalence studies showing that
      i. The drug exhibits a low therapeutic ratio.
      ii. The drug requires careful dosage titration.
      iii. Bioinequivalence would produce adverse prophylactic or therapeutic effects
2. Pharmacokinetic factors: evidence that the drug entity
   a. Is absorbed from localized sites in the gastrointestinal tract
   b. Is subject to poor absorption
   c. Is subject to first-pass metabolism
   d. Requires rapid dissolution and absorption for effectiveness
   e. Is unstable in specific portions of the gastrointestinal tract
   f. Is subject to dose-dependent kinetics in or near the therapeutic range
3. Physicochemical factors: evidence that the drug
   a. Possesses low solubility in water or gastric fluids
   b. Is dissolved slowly from one or more of its dosage forms
   c. Has bioavailability that may be affected by particle size and/or surface area
   d. Exhibits certain physical-structural characteristics, e.g., polymorphism, solvates, etc., which modify its bioavailability
   e. Has a high ratio of excipients to active ingredients as formulated
   f. Has bioavailability which may be affected by the presence or absence of hydrophilic or hydrophobic excipients and lubricant

TABLE 1.2
Drugs with Potential Bioequivalency Problems

Acetazolamide	Hydroflumethiazide	Propylthiouracil
Acetyldigitoxin	Imipramine	Pyrimethamine
Alseroxylon	Isoproterenol	Quinethiazide
Aminophylline	Liothyronine	Quinidine
Aminosalicylic acid	Menadione	*Rauwolfia serpentina*
Bendroflumethiazide	Mephenytoin	Rescinnamine
Benzthiazide	Methazolamide	Reserpine
Betamethasone	Methyclothiazide	Salicylazosulfapyridine
Bishydroxycoumarin	Methylprednisolone	Sodium sulfoxone
Chlorambucil	Methyltestosterone	Spironolactone
Chlorodiazepoxide	Nitrofurantoin	Sulfadiazine
Chlorpromazine	Oxtriphylline	Sulfadimethoxine
Chlorothiazide	Para-aminosalicylic acid	Sulfamerazine
Cortisone acetate	Para-methadione	Sulfaphenazole
Deserpidine	Perphenazine	Sulfasomidine
Dexamethasone	Phenacemide	Sulfisoxazole
Dichlorphenamide	Phensuximide	Theophylline
Dienestrol	Phenylaminosalicylate	Thioridazine
Diethylstilbestrol	Phenytoin	Tolbutamide
Dyphylline	Phytonadione	Triamcinolone
Ethinyl estradiol	Polythiazide	Trichlormethiazide
Ethosuximide	Prednisolone	Triethyl melamine
Ethotoin	Primidone	Trifluoperazine
Ethoxzolamide	Probenecid	Triflupromazine
Fludrocortisone	Procainamide	Trimeprazine
Fluphenazine	Prochlorperazine	Trimethadione
Fluprednisolone	Promazine	Uracil mustard
Hydralazine	Promethazine	Warfarin
Hydrochlorothiazide		

drug used at a dose level where the response is log-linear. Any such comparison, however, should take into account the relative nature of the slope of the response to dose.

The physicochemical evidence needed to establish bioequivalence includes low water solubility, for example, less than 5 mg/mL, or if dissolution in the stomach is critical to absorption, the volume of gastric fluids required to dissolve the recommended dose (the gastric fluid content is assumed to be 100 mL for adults and is prorated for infants and children). The dissolution rates are also taken into consideration if less than 50% of the drug dissolves in 30 minutes using official methods. Also included under physicochemical evidence are the particle size and surface area of the active drug ingredient. Certain physical-structural characteristics of the active drug ingredient, for example, polymorphism, solvation, etc., are also considered. Drug products which have a high ratio of excipients to active ingredients (e.g., greater than 5:1) may also be subjected to bioequivalency demonstration. Other evidence includes specific absorption sites or where the available dose is less than 50% of an administered dose. Drugs which are rapidly biotransformed in the intestinal wall or liver during absorption, and drugs which are unstable in specific portions of the gastrointestinal tract and hence, require special coating or formulations, are also subjected to bioequivalency requirements, as are drugs which show dose-dependent absorption, distribution, biotransformation, or elimination.

For some dosage forms, such as topical products or oral dosage forms not intended for absorption, inhalations, and solutions, bioequivalency requirements can be waived if there is sufficient evidence that the inactive ingredients do not affect the release and delivery of drugs from the dosage form.

III. PIVOTAL PARAMETERS FOR BLOOD-LEVEL BIOEQUIVALENCE

The sponsor is encouraged to calculate parameters using formulas which involve only the raw data (i.e., so-called *model-independent* methods).

A. Area under the Curve Estimates

The extent of product bioavailability is estimated by the area under the blood concentration versus time curve (AUC). The AUC is most frequently estimated using the linear trapezoidal rule. Other methods for AUC estimation may be proposed by the sponsor and should be accompanied by appropriate literature references during protocol development. For a single-dose bioequivalence study, AUC should be calculated from time 0 (predose) to the last sampling time associated with quantifiable drug concentration (AUC 0–LOQ [limit of quantitation]). The comparison of the test and reference product values for this noninfinity estimate provides the closest approximation of the measure of uncertainty (variance) and the relative bioavailability estimate associated with AUC (0–INF [infinity]), the full extent of product bioavailability. The relative AUC values generally change very little once the absorption of both products has been completed. However, because of the possibility of multifunctional absorption kinetics, it it is not always possible to determine when the available drug has been completely absorbed. Therefore, FDA recommends extending the duration of sampling until such time that AUC (0–LOQ)/AUC (0–INF) = 0.80. Generally, the sampling times should extend to at least three multiples of the drug's apparent terminal elimination half-life, beyond the time when maximum blood concentrations are achieved.

AUC (0–INF) should be used to demonstrate that the concentration–time curve can be quantitated such that AUC (0–LOQ)/AUC (0–INF) $\geq$ 0.80. The method for estimating the terminal elimination phase should be described in the protocol and the final study report. The AUC (0–LOQ)/AUC (0–INF) is calculated to determine whether AUC (0–LOQ) adequately reflects the extent of absorption.

The sponsor should consult with FDA if AUC (0–LOQ)/AUC (0–INF) is determined to be <0.80. If AUC (o–LOQ)/AUC (0–INF) is <<0.80, then a multiple-dose study to steady state may be needed to allow an accurate assessment of AUC (0–INF) (where AUC (0–INF) = AUC (0–t) at steady state and t is the dosing interval).

In a multiple-dose study, the AUC should be calculated over one complete dosing interval AUC (0–t). Under steady-state conditions, AUC (0–t) equals the full extent of bioavailability

of the individual dose AUC (0–INF) assuming linear kinetics. For drugs which are known to follow nonlinear kinetics, the sponsor should consult with FDA to determine the appropriate parameters for the bioequivalence determination.

IV. RATE OF ABSORPTION

The rate of absorption will be estimated by the maximum observed drug concentration (C_{max}) and the corresponding time to reach this maximum concentration (T_{max}). When a steady-state investigation is conducted, data on the minimum drug concentrations (trough values) observed during a single dosing interval (C_{min}) should also be collected. Generally, three successive C_{min} values should be provided to verify that steady-state conditions have been achieved. Although C_{min} most frequently occurs immediately prior to the next successive dose, situations do occur with C_{min} observed subsequent to dosing. To determine a steady-state concentration, the C_{min} values should be regressed over time, and the resultant slope should be tested for its difference from zero.

V. DETERMINATION OF PRODUCT BIOEQUIVALENCE

Unless otherwise indicated by FDA during the protocol development for a given application, the pivotal bioequivalence parameters will be C_{max} and AUC (0–LOQ) (for a single-dose study) or AUC (0–t) (for a multiple-dose study). To be indicative of product bioequivalence, the pivotal metrics should be associated with confidence intervals which fall within a set of acceptability limits.

The sponsor and FDA should agree to the acceptable bounds for the confidence limits for the particular drug and formulation during protocol development. If studies or literature demonstrate that the pioneer drug product exhibits highly variable kinetics, then the generic drug sponsor may propose alternatives to the generally acceptable bounds for the confidence limits. T_{max} in single-dose studies and C_{min} in multiple-dose studies will be assessed by clinical judgment.

VI. ERRORS IN BIOEQUIVALENCE STUDIES

Erroneous conclusions can easily be made if the logic behind bioavailability studies is not clearly understood. The following are the important highlights of the most common errors:

1. When concentrations are monitored in biologic fluids, the specificity of the assay methods is of utmost importance. This is especially applicable to single-dose studies, in which small concentrations should be monitored in order to allow study of the complete elimination of the drug from the body.
2. It is generally assumed that the absorption rates of drugs are higher than the rates of elimination, but there can be exceptions, in which case the terminal plasma concentration profiles would represent both the absorption and elimination processes, and the mathematical/statistical models used should take this into account.
3. The extrapolation of plasma or urinary concentration data to compensate for missing experimental points always introduces some error into the calculations; it is desirable to extend the study to at least three elimination half-lives when plasma concentration is monitored and to at least seven half-lives when monitoring urinary excretion of drugs to estimate their bioavailability.
4. There is often a lack of sufficient data points to characterize the plasma concentration profiles. Significant area can be lost if sufficient points are not collected during the peaking of the concentration. In general, there should be at least three data points before the peak occurs and at least four or five values after the peak, if possible.
5. The variation among individuals in the elimination rates of a drug should be considered. The proportionality between AUC and bioavailability is based on the assumption that the elimination rates are invariant; any deviation from the norm will result in significant error. Correction of this error can be made if the elimination rate constants are calculated for each subject and the AUC is corrected. If a drug is eliminated rapidly, K will be large, accounting for possible underestimation of the AUC.
6. Comparison of data for different studies which may not be well matched in terms of the characteristics of the subject population, study conditions, or routes of drug administration should be done with due consideration of these factors. It is ironic that such cross-study comparisons are both very common and very misleading.
7. When identical drug concentrations are obtained in the plasma following the administration of equimolar doses from different formulations, these formulations are considered bioequivalent, and the principle is referred to as the *superimposition principle*. When using this principle, one must choose a number of subjects in accordance with the statistical criteria which will demonstrate at least 20% differences in the means of values in order to make them clinically significant. This criterion can be applied to the concentration at each sampling time, to the peak concentration, and to the time of the peak concentrations and the AUCs.
8. It should be noted that just because a drug product meets compendial standards of purity and other criteria, its bioavailability is not assured. In fact, compendial requirements fall far short of ensuring the efficiency of dosage forms in releasing drugs. The latest edition of the United States Pharmacopeia (USP) and National Formulary (NF) requires demonstration of sufficient dissolution for many drugs where evidence of dissolution affecting bioavailability has

been suggested. A large number of drugs remain to be included in this list, and it is hoped that eventually, demonstration of bioavailability will become a compendial requirement. The costs of performing bioavailability studies make such requirements impractical for some drugs. However, without such requirements, it is difficult to justify the rejection of a product on the grounds that its chemical equivalence varies by more than 10% when its biologic equivalent is allowed to vary to any degree.

VII. ABSORPTION PROFILING

The following are factors and oral drugs/drug products that should be considered when requesting a waiver of evidence of in vivo bioavailability or bioequivalence documentation. Generally, both in vivo and in vitro testing are necessary for orally administered drug products. In vivo testing is required for all generic drug products with certain exceptions. Based on scientific information, regulatory authorities may waive the requirement for bioavailability or bioequivalence.

1. For certain formulations and under certain circumstances, equivalence between two pharmaceutical products may be considered self-evident, and no further documentation is required. For example:
   a. When multisource pharmaceutical or generic products are to be administered parenterally (e.g., intravenous, intramuscular, subcutaneous, or intrathecal administration) as aqueous solutions and contain the same active substance(s) in the same concentration and the same excipients in comparable concentrations.
   b. When multisource pharmaceutical or generic products are solutions for oral use, contain the active substance in the same concentration, and do not contain an excipient that is known or suspected to affect gastrointestinal transit or absorption of the active substance.
   c. In the case of gas-based multisource pharmaceutical or generic products.
   d. When the multisource pharmaceutical or generic products are powders for reconstitution as a solution, and the solution meets either criterion (a) or criterion (b) in this list.
   e. * When multisource pharmaceutical or generic products are otic or ophthalmic products prepared as aqueous solutions, containing the same active substance(s) in the same concentration and essentially the same excipients in comparable concentrations.
   f. * When multisource pharmaceutical or generic products are topical products prepared as aqueous solutions, containing the same active substance(s) in the same concentration and essentially the same excipients in comparable concentrations.
   g. * When multisource pharmaceutical or generic products are inhalation or nasal spray products, tested to be administered with or without essentially the same device, prepared as aqueous solutions, and containing the same active substance(s) in the same concentration and essentially the same excipients in comparable concentrations. Special in vitro testing should be required to document comparable device performance of the multisource inhalation product.
2. In the event that the applicant cannot provide this information about the reference product, and the drug regulatory authority does not have access to these data, or the data are protected under data exclusivity rights according to local regulations, in vivo studies should be performed.
3. For certain drug products, bioavailability or bioequivalence may be demonstrated by evidence obtained in vitro in lieu of in vivo data. Regulatory authorities should waive the requirement for the submission of evidence obtained in vivo demonstrating the bioavailability of the drug product if the drug product meets one of the following criteria:
   a. The drug product is in the same dosage form, but in a different strength, and is proportionally similar in its active and inactive ingredients to another drug product manufactured at the same site for which the same manufacturer has obtained approval and the following conditions are met:
      i. The bioavailability of this other drug product has been demonstrated.
      ii. Both drug products meet an appropriate in vitro test approved by a drug regulatory authority and/or accepted reference pharmacopeias or have demonstrated in vivo–in vitro correlation (e.g., correlation level A, etc.).
      iii. The applicant submits evidence showing that both drug products are proportionally similar in their active and inactive ingredients. That is, the ratio of active ingredients and excipients between strengths is essentially the same.
   b. The drug product is a reformulated product that is identical, except for a different color, flavor, or preservative that could not affect the bioavailability of the reformulated product, to another drug product for which the same manufacturer has obtained approval and the following conditions are met:
      i. The bioavailability of the other product has been demonstrated.
      ii. Both drug products meet an appropriate in vitro test approved by the regulatory authority.

c. Regulatory authorities, for good cause, may require evidence of in vivo bioavailability or bioequivalence for any drug product if the agency determines that any difference between the drug product and a listed drug may affect the bioavailability or bioequivalence of the drug product. The Bioavailability and Bioequivalence Working Group strongly recommends that in the case of antiretroviral drug products, proof of pharmaceutical equivalence and bioequivalence be required to infer therapeutic equivalence.

*For elements (e), (f), and (g), it is incumbent upon the applicant to demonstrate that the excipients in the multisource product are essentially the same as and in comparable concentrations to those in the reference product.

VIII. PHARMACOKINETIC MEASURES OF SYSTEMIC EXPOSURE

Direct (e.g., rate constant, rate profile) and indirect (e.g., C_{max}, T_{max}, mean absorption time, mean residence time, C_{max} normalized to AUC) pharmacokinetic measures are limited in their abilities to assess the rate of absorption. This guideline, therefore, recommends a change in focus from these direct or indirect measures of absorption rate to measures of systemic exposure. The C_{max} and AUC values can continue to be used as measures for product quality bioavailability and bioequivalence, but more in terms of their capacity to assess exposure than their capacity to reflect the rate and extent of absorption. Reliance on systemic exposure measures should reflect comparable rates and extents of absorption, which in turn, should achieve the underlying statutory and regulatory objective of ensuring comparable therapeutic effects. Exposure measures are defined relative to early, peak, and total portions of the plasma, serum, or blood concentration–time profile.

A. Early Exposure

For orally administered immediate-release drug products, bioequivalence may generally be demonstrated by measurements of peak and total exposure. An early exposure measure may be informative on the basis of appropriate clinical efficacy and safety trials or pharmacokinetic and pharmacodynamic studies that call for better control of drug absorption into the systemic circulation (e.g., to ensure the rapid onset of an analgesic effect or to avoid excessive hypotensive action of an antihypertensive). In this setting, the guidance recommends the use of partial AUC as an early exposure measure. The partial area should be truncated at the population median of T_{max} values for the reference formulation. At least two quantifiable samples should be collected before the expected peak time to allow adequate estimation of the partial area.

B. Peak Exposure

Peak exposure should be assessed by measuring the peak drug concentration (C_{max}) obtained directly from the data without interpolation.

C. Total Exposure

For single-dose studies, the measurement of total exposure should be as follows:

- Area under the plasma/serum/blood concentration–time curve from time 0 to time t (AUC_{0-t}), where t is the last time point with measurable concentration for an individual formulation.
- Area under the plasma/serum/blood concentration–time curve from time 0 to time infinity ($AUC_{0-\infty}$), where $AUC_{0-\infty} = AUC_{0-t} + C_t/l_z$, C_t is the last measurable drug concentration, and l_z is the terminal or elimination rate constant calculated according to an appropriate method; the terminal half-life ($t_{1/2}$) of the drug should also be reported.

For steady-state studies, the measurement of total exposure should be the area under the plasma, serum, or blood concentration–time curve from time 0 to time t over a dosing interval at steady state (AUC_{0-1}), where t is the length of the dosing interval.

IX. STATISTICAL ANALYSIS

The statistical models used in the evaluation of bioequivalence data have been evolving over the past few decades. The standard statistical method of the null hypothesis was the first to be used, whereby no difference is assumed, and the rejection of null indicates a statistically significant difference ($p < 0.05$). A problem arises, since small differences with $p < 0.05$ may be unimportant, and large differences with $p > 0.05$ may be important. This prompted FDA to solve the problem by requesting the power analysis confidence interval test of Schuirman, whereby two one-sided comparisons are made; this also evolved into the use of the famous 75 to 125 rule to deal with individual effects.

FDA advocates the use of 90% confidence intervals as the best available method for evaluating bioequivalence study data. The confidence interval approach should be applied to the individual parameters of interest (e.g., AUC and C_{max}). The sponsor may use untransformed or log-transformed data. However, the choice of untransformed or log-transformed data should be made by the sponsor with concurrence by FDA prior to conducting the study.

X. UNTRANSFORMED DATA

If we let T_1 be the mean for the test drug in period 1, T_2 the mean for the test drug in period 2, and R_1 and R_2 the respective

means for the reference drug, then the estimates for the drugs averaged over both periods are $T=(1/2)(T_1+T_2)$ for the test drug and $R=(1/2)(R_1+R_2)$ for the reference drug. Although both sequence groups usually start with the same number of animals, the number of animals in each sequence group (n_A and n_B) that successfully finish the study may not be equal. These formulas utilize the marginal or least squares estimates of μT and μR, the corresponding means in the target population. These means are not a function of the sample size in each sequence.

An analysis of variance is needed to obtain the estimate of σ^2, the error variance. The estimator, s^2, which will be used in the calculation of the 90% confidence interval should be obtained from the "error" mean square term found in the following analysis of variance (ANOVA) table.

Source	Degrees of freedom
Sequence	1
Animal (sequence)	n_A+n_B-2
Period	1
Formulation	1
Error	n_A+n_B-2
Total	$2n_A+2n_B-1$

Lower and upper 90% confidence intervals are then found by formulas based on Student's *t*-distribution.

$$L=(T-R)-t(n_A+n_B-2);0.05^s\sqrt{\frac{1}{2}\left(\frac{1}{n_A}+\frac{1}{n_B}\right)} \quad (1)$$

$$L=(T-R)-t(n_A+n_B-2);0.05^s\sqrt{\frac{1}{2}\left(\frac{1}{n_A}+\frac{1}{n_B}\right)} \quad (2)$$

The procedure of declaring two formulations bioequivalent, if the 90% confidence interval is completely contained in some fixed interval, is statistically equivalent to performing two one-sided statistical tests ($\alpha=0.05$) at the end points of the interval.

Consider the following example with $L=3$, $U=7$, $T=110$, and $R=100$. By the traditional hypothesis testing approach, the result would be considered statistically significant, since the confidence interval does not include 0. Using the confidence interval approach, the entire confidence interval lies within 17% of *R*. (The lower end of the confidence interval lies within $L/R=3/100=3\%$ of *R*, while the upper end of the confidence interval lies within $U/R=17/100=17\%$ of *R*.) If it were determined by FDA that only differences larger than 20% were biomedically important, then by using the confidence interval approach, the results of this study would be considered adequate to demonstrate bioequivalence.

Now consider an example with $L=-4$, $U=24$, $T=110$, and $R=100$. In this case, by the traditional hypothesis testing approach, the result would not be considered statistically significant, since the confidence interval includes 0. However, the confidence interval extends as far as 24% from *R*. (The lower end of the confidence interval lies within $L/R=-4/100=-4\%$ of *R*, while the upper end of the confidence interval extends to $U/R=24/100=24\%$ of *R*.) If it were determined by FDA that only differences larger than 20% were biomedically important, then the results of this study would be considered inadequate to demonstrate bioequivalence, since the entire confidence interval is not within 20% of *R*.

XI. LOGARITHMICALLY TRANSFORMED DATA

This section discusses how the 90% confidence interval approach should be applied to log-transformed data. In this situation, the individual animal AUC and C_{max} values are log-transformed, and the analysis is done on the transformed data. For a two-period crossover study, the ANOVA models used to calculate estimates of the error variance and the least square means are identical for both transformed and untransformed data. The procedural difference comes after the lower and upper 90% confidence intervals are found by formulas based on Student's *t*-distribution.

The lower and upper confidence bounds of the log-transformed data will then need to be back-transformed in order to be expressed on the original scale of the measurement. One thing to keep in mind when moving between the logarithm scale and the original scale is that the back-transformed mean of a set of data that has been transformed to the logarithm scale is not strictly equivalent to the mean that would be calculated from the data on the original scale of measurement. This back-transformed mean is known instead as the geometric mean.

It may help to see the calculations involved. If the AUC from each animal has been transformed to the logarithm scale, we can express the transformed AUC as lnAUC. Then, the mean on the logarithm scale is as follows:

$$\overline{l\,n}\,AUC_t=\sum_{i=1}^{N}L\,n\,AUC_t/n \quad (3)$$

where

the subscript *i* represents the AUC determinations for the test article
i is the AUC of the *i*th animal
n is the total number of animals receiving the test article

When this mean is back-transformed, it becomes the geometric mean: $e^{(\ln AUC_i)}$. This geometric mean will be on the original scale of the measurement. It will be close to, but not exactly equal to, the mean obtained on the original scale of the measurement. The back-transformation of the confidence bounds is accomplished in the following way:

Lower bound (expressed as a percentage) $=(e^L-1)\times 100$
Upper bound (expressed as a percentage) $=(e^U-1)\times 100$

where

L is the lower 90% confidence interval calculated on the log-transformed data
U is the upper 90% confidence interval calculated on the log-transformed data

As an example, consider the data for AUC from a hypothetical crossover study in the following table:

		Reference article		Test article	
Animal	Crossover sequence	AUC	LogAUC	AUC	LogAUC
1	1	518.0	6.25	317.8	5.76
2	1	454.9	6.12	465.0	6.14
3	1	232.8	5.45	548.4	6.31
4	1	311.1	5.74	334.8	5.81
5	2	340.4	5.83	224.7	5.41
6	2	497.7	6.21	249.2	5.52
7	2	652.0	6.48	625.4	6.44
8	2	464.1	6.14	848.7	6.74
	Mean	433.8	6.03	451.7	8602
	Standard deviation	133.3	0.33	214.3	0.47
	Geometric mean		414.7		

The statistics for AUC will be calculated from the log-transformed data. In this example, *L*, the lower 90% confidence interval calculated on the log scale, is −0.395; *U*, the upper 90% confidence interval calculated on the log scale, is 0.372. To back-transform these intervals and express them as percentages, we do the following:

Back-transformed lower bound:

$$\left(e^{-0.395}-1\right)\times 100 = \left(0.674-1\right)\times 100$$

$$= \left(-0.326\right)\times 100 = -32.6\%$$

Back-transformed upper bound:

$$\left(e^{0.372}-1\right)\times 100 = \left(1.451-1\right)\times 100 = \left(0.451\right)\times 100 = 45.1\%$$

Therefore, the lower end of the confidence bound lies within −32.6% of the geometric mean of the reference article, while the upper end of the confidence interval lies within 45.1% of the geometric mean of the reference article. If it were determined by FDA that the acceptable confidence bound was 80% to 125% of the geometric mean of the reference article in order to demonstrate bioequivalence, then the back-transformed lower bound can be as low as −20%, and the back-transformed upper bound can be as high as 25%. In this example, we would determine that the study had not demonstrated an acceptable level of bioequivalence between the test article and the reference article.

The width of the confidence interval is determined by the within-subject variance (between-subject variance for parallel-group studies) and the number of subjects in the study. In general, the confidence interval for untransformed data should be 80% to 120% (the confidence interval should lie within ±20% of the mean of the reference product). For logarithmically transformed data, the confidence interval is generally 80% to 125% (the confidence interval should lie within −20% to +25% of the mean of the reference product). The sponsor and FDA should determine the acceptable bounds for confidence limits for the particular drug and formulation during protocol development.

APPENDIX: BIOAVAILABILITY AND BIOEQUIVALENCE STUDIES SUBMITTED IN NDAS OR INDS—GENERAL CONSIDERATIONS

I. Introduction

This FDA guidance provides recommendations to sponsors and/or applicants planning to include bioavailability (BA) and bioequivalence (BE) information for drug products in investigational new drug applications (INDs), new drug applications (NDAs), and NDA supplements (referred to as the NDA BA and BE Draft FDA guidance).* This FDA guidance contains advice on how to meet the BA and BE requirements set forth in 21 CFR part 320 as they apply to dosage forms intended for oral administration.† The FDA guidance may also be applicable to non-orally administered drug products when reliance on systemic exposure measures is suitable to document BA and BE (e.g., transdermal delivery systems and certain rectal and nasal drug products).‡ The FDA guidance should be helpful for applicants conducting BA and BE studies during the IND period for an NDA and also for applicants conducting BE studies during the post-approval period for certain changes to drug products that are the subject of an NDA.§ This FDA guidance document is not intended to provide recommendations on studies conducted in support of demonstrating comparability or biosimilarity for biological products licensed under section 351 of the Public Health Service Act.¶

When finalized, this FDA guidance will revise and replace the parts of FDA's March 2003 FDA guidance for industry on *Bioavailability and Bioequivalence Studies for Orally Administered Drug Products – General Considerations* (the March 2003 BA and BE FDA guidance) relating to BA and BE studies for INDs, NDAs, and NDA supplements.** Since the March 2003 BA and BE FDA guidance was issued, FDA has determined that providing information on BA and BE studies in separate FDA guidance according to application type will be beneficial to sponsors and applicants. Thus, FDA is issuing this NDA BA and BE Draft FDA guidance and, as

* This FDA guidance was developed by the Office of Clinical Pharmacology, Office of Translational Sciences, and the Office of New Drugs Quality Assessment, Office of Pharmaceutical Science, in the Center for Drug Evaluation and Research (CDER) at the U.S. Food and Drug Administration (FDA).

† BA and BE information for drug products in abbreviated new drug applications (ANDAs) and ANDA supplements are not the subject of this FDA guidance. FDA has issued a separate draft FDA guidance on this topic entitled *Bioequivalence Studies with Pharmacokinetic Endpoints for Drugs Submitted Under an ANDA* (December 2013) (ANDA BE Draft FDA guidance). The ANDA BE Draft FDA guidance, when finalized, will represent FDA's current thinking on this topic. Many FDA guidance are referenced throughout this document. The FDA guidance referred to in this footnote, as well as others referenced throughout the remainder of the document, can be found on the FDA Drugs FDA guidance Web page at http://www.fda.gov/Drugs/FDA guidanceComplianceRegulatoryInformation/FDA guidance/default.htm. We update FDA guidance periodically. To make sure you have the most recent version of a FDA guidance, check the FDA Drugs FDA guidance Web page.

‡ These dosage forms include tablets, capsules, solutions, suspensions, conventional/immediate-release drug products, and modified (extended, delayed)-release drug products.

§ *Bioequivalence* is a statutory term reflected in the Federal Food, Drug, and Cosmetic Act (FD&C Act) in section 505(j) (21 U.S.C. 355(j)), which requires ANDA applicants to demonstrate, among other things, that the proposed generic product is bioequivalent to its reference listed drug. Section 505(j)(2)(A)(iv) of the FD&C Act; see also section 505(j)(8) of the FD&C Act. There is no similar statutory requirement for an NDA applicant either under section 505(b)(1) or (b)(2) of the FD&C Act to demonstrate bioequivalence of its proposed product to another product. As a scientific matter, however, the same or a similar showing of the bioavailability of two products in the NDA context may be needed for the purposes of evaluating the safety or effectiveness of a product. For ease of the reader, we refer to such evaluations of the relative bioavailability for two or more products as an evaluation of bioequivalence in this FDA guidance.

¶ For information on these types of studies, see FDA's Drugs FDA guidance Web page. See footnote #2 for information on accessing this Web page.

** Revisions to the March 2003 BA and BE FDA guidance include (1) expansion of the section on modified-release products, (2) addition of a section on concomitant administration of drug products and combination drug products, addition of a section on alcoholic beverage effects on modified-release dosage forms, (4) addition of an endogenous substance section, (5) addition of a section on drug products with high intrasubject variability, and (6) removal of references to BE studies conducted for ANDAs. The FDA guidance also makes other revisions for clarification.

previously noted, has issued the ANDA BE Draft FDA guidance for ANDA and ANDA supplements.*

We recognize that this FDA guidance cannot address every issue pertaining to the assessment of BA or BE studies for INDs and NDAs, so we suggest sponsors and applicants contact the appropriate review division for FDA guidance on specific questions not addressed by this FDA guidance.

FDA's FDA guidance documents, including this FDA guidance, do not establish legally enforceable responsibilities. Instead, FDA guidance describe the Agency's current thinking on a topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited. The use of the word *should* in Agency FDA guidance documents means that something is suggested or recommended, but not required.

II. Background

BA assessment of formulations is a component of new drug development. The approaches of evaluating BA and BE discussed in this FDA guidance are designed to aid FDA evaluation of the safety and effectiveness of a product that is the subject of an IND, NDA, or NDA supplement. In this endeavor, we use the totality of information available in the submission, which includes, among other things, information gathered using the principles of BE, exposure-response evaluations, and clinical trial results. The evaluation of BE in the generic drug context, by contrast, is used to support a determination that a generic product may be substituted for its reference listed drug, and involves consideration of different types of data permitted in an ANDA. Accordingly, the approaches discussed in this FDA guidance may differ from similar discussions of BE in the ANDA BE Draft FDA guidance. For example, this NDA BA and BE Draft FDA guidance recommends assessment of the effect of food on BA using the approaches set forth in FDA's 2002 FDA guidance for industry on *Food-Effect Bioavailability and Fed Bioequivalence Studies* (the 2002 Food-Effect FDA guidance). Fasting BE studies generally are sufficient, given the totality of information we consider in evaluating INDs, NDAs, or NDA supplements. In contrast, we recommend in the ANDA BE Draft FDA guidance fed and fasting BE studies that will provide specific information to support a demonstration of BE under section 505(j) of the FD&C Act, and in turn, to support substitutability. Even though the ANDA BE Draft FDA guidance revises and replaces the parts of the 2002 Food-Effect FDA guidance pertaining to ANDAs and ANDA supplements, this NDA BA and BE Draft FDA guidance does not replace the 2002 Food-Effect FDA guidance relating to studies for INDs, NDAs, and NDA supplements.†

A. General

Studies to measure BA and/or establish BE of a product are important elements in support of INDs, NDAs, and NDA supplements. *Bioavailability* means the rate and extent to which the active ingredient or active moiety is absorbed from a drug product and becomes available at the site of action (21 CFR 320.1(a)). BA data provide an estimate of the fraction of the drug absorbed, as well as provide information related to the pharmacokinetics of the drug.

Bioequivalence means the absence of a significant difference in the rate and extent to which the active ingredient or active moiety in pharmaceutical equivalents or pharmaceutical alternatives become available at the site of drug action when administered at the same molar dose under similar conditions in an appropriately designed study (21 CFR 320.1(e)). Studies to establish BE between two products are important for certain formulation or manufacturing changes occurring during the drug development and post-approval stages. In BE studies, the exposure profile of a test drug product is compared to that of a reference drug product.

B. Bioavailability

BA for a given formulation provides an estimate of the relative fraction of the orally administered dose that is absorbed into the systemic circulation. BA for orally administered drug products can be documented by comparing a systemic exposure profile to that of a suitable reference product. A profile can be generated by measuring the concentration of active ingredients and/or active moieties over time and, when appropriate, active metabolites over time in samples collected from the systemic circulation. Systemic exposure profiles reflect both release of the drug substance from the drug product and a series of possible pre-systemic/systemic actions on the drug substance after its release from the drug product.

FDA's regulations at 21 CFR 320.25 set forth guidelines for in vivo BA studies. As provided in this regulation, the reference product for BA studies should be a solution, suspension, or intravenous (IV) dosage form (21 CFR 320.25(d)(2) and (3)). The purpose of conducting a BA study with an oral solution as a reference is to assess the impact of formulation on BA. Conducting a BA study with an IV reference enables assessment of the impact of route of administration on BA and defines the absolute BA of the drug released from the drug product.

C. Bioequivalence

As noted previously, both BA and BE focus on the release of a drug substance from a drug product and subsequent absorption into systemic circulation. As a result, we recommend that approaches to determining BE generally follow approaches similar to those used for BA. Demonstrating BE involves a more formal comparative test that uses specific references with specified criteria for comparisons and predetermined BE limits for such criteria.

1. Preapproval Changes

BE documentation can be useful during the IND period to compare (1) early and late clinical trial formulations; (2) formulations used in clinical trials and stability studies, if different; (3) clinical trial formulations and to-be-marketed drug products, if different; and (4) product strength equivalence, as appropriate. In each comparison, the new formulation,

* See footnote #2.

† Accordingly, the FDA is revising the 2002 Food-Effect FDA guidance.

formulation produced by the new method of manufacture, or new strength is the candidate, or test product and the prior formulation, prior method of manufacture, or prior strength is the reference product. The decision to document BE during drug development is generally left to the judgment of the sponsor, using the principles of relevant FDA guidance (in this FDA guidance, see sections II.C.2, Post-approval Changes, and III.D, In Vitro Studies) to determine when changes in components, composition, and/or method of manufacture suggest that further in vitro and/or in vivo studies be performed.

2. Post-approval Changes

In the presence of certain major changes in components, composition, manufacturing site, and/or method of manufacture after approval, FDA recommends that in vivo BE be demonstrated for the drug product after the change in comparison to the drug product before the change. Under section 506A(c)(2) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 356a(c)(2)), certain post-approval changes that require completion of studies must be submitted in a supplement and approved by FDA before distributing a drug product made with the change.

Information on the types of recommended in vitro dissolution and in vivo BE studies for immediate-release and modified-release drug products approved as NDAs for specified post-approval changes is provided in the following FDA guidance:

- *SUPAC-IR: Immediate Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Control; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*
- *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls, In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*

3. BE Considerations

BE studies are usually conducted using a crossover design. For such studies, intrasubject variability should be considered when determining the study sample size. In cases when a parallel design is necessary to evaluate BE, consideration should be given to total variability, including intersubject variability instead of just intrasubject variability.

A test product might fail to demonstrate bioequivalence because it has measures of rate and/or extent of absorption compared to the reference product outside acceptable higher or lower limits. For example, when the test product results in a systemic exposure that is significantly higher than that of the reference product, the concern is the typically limited experience from a safety standpoint for higher systemic concentrations. When the test product has a systemic exposure that is significantly lower than that of the reference product, the concern is potentially a lack of therapeutic efficacy of the test product.

When the variability of the test product is greater than the reference product, the concern relates to both safety and efficacy, because it may suggest that the performance of the test product is not comparable to the reference product, and the test product may be too variable to be clinically useful.

When BE is not demonstrated, the sponsor should demonstrate that the differences in rate and extent of absorption do not significantly affect the safety and efficacy based on available dose-response or concentration-response data. In the absence of this evidence, failure to demonstrate BE may suggest that the test product should be reformulated, or the method of manufacture for the test product should be changed, or additional safety or efficacy data may be needed for the test product. In some cases, conclusions of BE based on the peak drug concentration (C_{max}) and area under the plasma concentration time curve (AUC) between the test product and the reference product may be insufficient to demonstrate that there is no difference in safety or efficacy if the systemic concentration- time profiles of the test product and the reference product are different (e.g., time to reach peak drug concentration (T_{max}) is different). For example, differences in the shape of the systemic concentration profile between the test and reference products could imply that the test product may not produce the same clinical response as the reference product. In such cases, additional data analysis (e.g., partial AUCs), exposure-response evaluation, or clinical studies may be recommended to evaluate the BE of the two products.

III. Methods to Document BA And BE

Under FDA's regulations, applicants must use the most accurate, sensitive, and reproducible method available to demonstrate BA or BE of a product (21 CFR 320.24(a)). As noted in 21 CFR 320.24, several in vivo and in vitro methods can be used to measure BA and to establish BE. These include, in general order of preference, pharmacokinetic (PK) studies, in vitro tests predictive of human in vivo BA (in vitro-in vivo correlation), pharmacodynamic (PD) studies, studies with clinical benefit endpoints, and other in vitro studies. In addition, where in vivo data are appropriate to demonstrate BA, our regulations provide guidelines on specific types of in vivo BA studies (see 21 CFR 320.25 through 320.29). This FDA guidance predominantly focuses on the use of PK studies to document BA or BE.

A. Pharmacokinetic Studies

1. General Considerations

FDA's regulations generally define BA and BE in terms of rate and extent of absorption of the active ingredient or moiety to the site of action.* For in vivo studies, the regulations also provide for use of PK measures in an accessible biological matrix such as blood, plasma, and/or serum to indicate release of the drug substance from the drug product into the systemic

* 21 CFR 320.1(a) and (e).

circulation.* BA and BE frequently rely on PK measures such as AUC to assess extent of systemic exposure and C_{max} and T_{max} to assess rate of systemic absorption. PK-based comparisons to describe relative BA or make BE determinations are predicated on an understanding that measuring the active moiety or ingredient at the site of action is generally not possible and on an assumption that some relationship exists between the efficacy/safety and concentration of the active moiety and/or its important metabolite(s) in the systemic circulation. A typical study is conducted as a crossover study. The crossover design reduces variability caused by patient-specific factors, thereby increasing the ability to discern differences because of formulation.

2. Pilot Study

If the sponsor chooses, a pilot study in a small number of subjects can be carried out before proceeding with a full-scale BA or BE study. The pilot study can be used to validate analytical methodology, assess PK variability, determine sample size to achieve adequate power, optimize sample collection time intervals, and determine the length of the washout period needed between treatments. For example, for conventional immediate-release products, careful timing of initial samples may avoid a subsequent finding in a full-scale study that the first sample collection occurs after the Cmax. For modified-release products, a pilot study can help determine the sampling schedule needed to assess lag time and dose dumping. The results of a pilot study can be used as the sole basis to document BA or BE provided the study's design and execution are suitable and a sufficient number of subjects have completed the study.

3. Full-Scale Study

General recommendations for a standard BA or BE study based on PK measurements are provided in Appendix A. Nonreplicate crossover study designs are recommended for BA and BE studies of immediate-release and modified-release dosage forms. However, sponsors and/or applicants have the option of using replicate designs for BE studies.

Replicate crossover designs are used to allow estimation of (1) within-subject variance for the reference product, or for both the test and reference products, and (2) the subject by formulation interaction variance component. This design accounts for the inter- occasion variability that may confound the interpretation of a BE study as compared to a non-replicate crossover approach. The recommended method of analysis for nonreplicate or replicate studies to evaluate BE is average BE, as discussed in section IV. Recommendations for conducting and evaluating replicate study designs can be found in the FDA guidance for industry *Statistical Approaches to Establishing Bioequivalence.*

4. Study Population

Subjects recruited for BA or BE studies should be 18 years of age or older and capable of giving informed consent. In general, BA and BE studies should be conducted in healthy volunteers if the product can be safely administered to this population. A study in healthy volunteers is likely to produce less PK variability compared with that in patients with potentially confounding factors such as underlying and/or concomitant disease and concomitant medications. Male and female subjects should be enrolled in BA and BE studies unless there is a specific reason to exclude one sex. Such exclusions could be related to the drug product being indicated in only one sex or a greater potential for adverse reactions in one sex compared to the other. For example, oral contraceptives are evaluated in female subjects because the indication is specific to females. If a drug has the potential to be a teratogen, the drug product should be evaluated in male subjects.

Female subjects enrolled in the study should not be pregnant at the beginning of the study and should not become pregnant during the study. In some instances (e.g., when safety considerations preclude use of healthy subjects), it may be necessary to evaluate BA and BE in patients for whom the drug product is intended. In this situation, sponsors and/or applicants should attempt to enroll patients whose disease process is expected to be stable for the duration of the study.

5. Single-Dose and Multiple-Dose (Steady State) Testing

This FDA guidance generally recommends single-dose PK studies to assess BA and BE because they are generally more sensitive than steady-state studies in assessing rate and extent of release of the drug substance from the drug product into the systemic circulation.

FDA's regulations at 21 CFR 320.27 provide guidelines on the design of a multiple-dose in vivo BA study. This regulation also identifies instances in which multiple-dose BA studies may be required:

i. There is a difference in the rate of absorption but not in the extent of absorption.
ii. There is excessive variability in bioavailability from subject to subject.
iii. The concentration of the active drug ingredient or therapeutic moiety, or its metabolite(s), in the blood resulting from a single dose is too low for accurate determination by the analytical method.
iv. The drug product is an extended-release dosage form.†

We recommend that if a multiple-dose study design is performed, appropriate dosage administration and sampling be carried out to document attainment of steady state.

6. Bioanalytical Methodology

We recommend that sponsors ensure that bioanalytical methods for BA and BE studies be accurate, precise, specific,

* See, e.g., 21 CFR 320.24(b)(1)(i). If serial measurements of the drug or its metabolites in plasma, serum, or blood cannot be accomplished, then measurement of urinary excretion can be used.

† 21 CFR 320.27(a)(3).

sensitive, and reproducible. A separate FDA guidance, *Bioanalytical Method Validation*, is available to assist sponsors in validating bioanalytical methods.*

7. Administration Under Fasted/Fed Conditions

The BA or BE study should be conducted under fasting conditions (after an overnight fast of at least 10 hours) except when tolerability issues are anticipated with fasting. In these cases, we recommend that applicants conduct only a fed study. A separate FDA guidance, *Food-Effect Bioavailability and Fed Bioequivalence Studies* is available to assist sponsors.

8. Moieties to Be Measured

The active ingredient that is released from the dosage form or its active moiety and, when appropriate, its active metabolites† should be measured in biological fluids collected in BA studies.

Measurement of the active ingredient or the active moiety, rather than metabolites, is generally recommended for BE studies because the concentration-time profile of the active ingredient or the active moiety is more sensitive to changes in formulation performance than that of the metabolite, which is more reflective of metabolite formation, distribution, and elimination. The following are instances when an active metabolite(s) should be measured.

- Measurement of a metabolite(s) is necessary when the active ingredient or the active moiety concentrations are too low to allow reliable analytical measurement in blood, plasma, or serum. In this case, the metabolite should be measured in lieu of the active ingredient or active moiety. We recommend that the confidence interval approach be applied to the metabolite data obtained from these studies.
- Measurement of a metabolite(s) is necessary in addition to the active ingredient or active moiety if the metabolite is formed by pre-systemic metabolism and contributes meaningfully to efficacy and/or safety. The confidence interval approach should be used for all moieties measured. However, the BE criteria are only generally applied to the active ingredient or active moiety. Sponsors should contact the appropriate review division to determine which moieties should be measured.

9. Pharmacokinetic Measures of Systemic Exposure

This FDA guidance recommends that systemic exposure measures be used to evaluate BA and BE. Exposure measures are defined relative to peak, partial, and total portions of the plasma, serum, or blood concentration-time profile, as describe here:

Peak Exposure We recommend that peak exposure be assessed by measuring the C_{max} obtained directly from the systemic drug concentration data without interpolation. The T_{max} can provide important information about the rate of absorption. The first point of a concentration- time curve based on blood and/or plasma measurements is sometimes the highest concentration, which raises a question about the measurement of true C_{max} because of insufficient early sampling times. A carefully conducted pilot study may help to avoid this problem. Collection of an early time point between 5 and 15 minutes after dosing followed by additional sample collections (e.g., two to five) in the first hour after dosing may be sufficient to assess early peak concentrations. If this sampling approach is followed, we consider the data to be adequate, even when the highest observed concentration occurs at the first time point.

Total Exposure (Extent of Absorption) For single-dose studies, we recommend that the measurement of total exposure be:

- Area under the plasma, serum, or blood concentration time curve from time zero to time t (AUC_{0-t}), where t is the last time point with a measurable concentration.
- Area under the plasma, serum, or blood concentration time curve from time zero to time infinity ($AUC_{0-\infty}$), where $AUC_{0-\infty} = AUC_{0-t} + C_t/\lambda_z$. C_t is the last measurable drug concentration and λ_z is the terminal or elimination rate constant calculated according to an appropriate method.
- For drugs with a long half-life, truncated AUC can be used (see section VII.D, Long-Half-Life Drugs).

For steady-state studies, we recommend that the measurement of total exposure be the area under the plasma, serum, or blood concentration time curve from time zero to time tau over a dosing interval at steady state (AUC_{0-tau}), where tau is the length of the dosing interval.

Partial Exposure For orally administered drug products, BA and BE can generally be demonstrated by measurements of peak and total exposure. For certain classes of drugs and under certain circumstances (e.g., to assess onset of an analgesic effect), an evaluation of the partial exposure could be used to support the performance of different formulations by providing further evidence of therapeutic effect. This FDA guidance recommends the use of partial AUC as a partial exposure measure. The time to truncate the partial area should be related to a clinically relevant PD measure. We also recommend that sufficient quantifiable samples be collected to allow adequate estimation of the partial area. For questions on the suitability of the PD measure or use of partial exposure in general, we recommend that sponsors and/or applicants consult the appropriate review division.

* See also 21 CFR 320.29.
† See 21 CFR 320.24(b)(1)(i).

10. Comparison of PK measures in BE studies

An equivalence approach is recommended for BE comparisons. The recommended approach relies on (1) a criterion to allow the comparison, (2) a confidence interval for the criterion, and (3) a BE limit. Log-transformation of exposure measures before statistical analysis is recommended. This FDA guidance recommends use of an average BE criterion to compare systemic exposure measures for replicate and non-replicate BE studies of both immediate- and modified-release products. For additional information on data analysis, refer to Appendix A and to the FDA guidance for industry on *Statistical Approaches to Establishing Bioequivalence.*

B. Other Approaches to Support BA/BE

In certain circumstances, other approaches are recommended to support a demonstration of BA/BE. Below are some general considerations regarding these other approaches. Sponsors should consult FDA's guidance for industry for additional information on these methods as well.*

1. In Vitro Tests Predictive of Human In Vivo BA

In vitro-in vivo correlation (IVIVC) is an approach to describe the relationship between an in vitro attribute of a dosage form (e.g., the rate or extent of drug release) and a relevant in vivo response (e.g., plasma drug concentration or amount of drug absorbed). This model relationship facilitates the rational development and evaluation of extended-release dosage forms. Once an IVIVC is validated, the in vitro test serves as a surrogate for BA and/or BE testing, as well as a tool for formulation screening and setting of the dissolution/drug-release acceptance criteria.

Specifically, in vitro dissolution/drug-release characterization is encouraged for all extended-release product formulations investigated (including prototype formulations), particularly if in vivo absorption characteristics are being defined for the different product formulations. Such efforts may enable the establishment of an IVIVC. When an IVIVC or association is established (21 CFR 320.24(b)(1)(ii)), the in vitro test can serve not only as a quality control specification for the manufacturing process, but also as an indicator of how the product will perform in vivo.

Additional information on the development and validation of an IVIVC can be found in the FDA guidance for industry *Extended Release Oral Dosage Forms: Development, Evaluation, and Application of In Vitro/In Vivo Correlations*.

2. Pharmacodynamic Studies

PD studies are not recommended for orally administered drug products when the drug is absorbed into systemic circulation and a PK approach can be used to assess systemic exposure and evaluate BA or BE. PK endpoints are preferred because they are generally the most accurate, sensitive, and reproducible approach. However, in instances where a PK endpoint is not possible, a well- justified PD endpoint can be used to demonstrate BA or BE.

3. Comparative Clinical Studies

Clinical endpoints can be used in limited circumstances, for example, for orally administered drug products when the measurement of the active ingredients or active moieties in an accessible biological fluid (PK approach) or PD approach is not possible. Because these circumstances do not occur very often, use of this approach is expected to be rare.

4. In Vitro Studies

Under certain circumstances, BA and BE can be evaluated using in vitro approaches (e.g., dissolution/drug-release testing) during the preapproval and post-approval phases (see 21 CFR 320.24(b)(5) and (6)). For example, orally administered drugs that are highly soluble and highly permeable, and for which the drug product is rapidly dissolving, documentation of BE using an in vitro approach (dissolution/drug-release studies) may be appropriate based on the Biopharmaceutics Classification System.†

The following FDA guidance provide recommendations on the development of dissolution methodology, setting specifications, and the regulatory applications of dissolution testing:

- *Dissolution Testing of Immediate-Release Solid Oral Dosage Forms*
- *Extended-Release Oral Dosage Forms: Development, Evaluation, and Application of In Vitro/In Vivo Correlations*

In addition, we recommend that sponsors consult other FDA guidance for additional information on when in vitro data may be appropriate to demonstrate BA or BE of a product.

IV. Documenting BA And BE For Various Dosage Forms

This section summarizes the recommendations for documenting BA and BE studies based on the specific dosage forms and whether these evaluations occur pre-approval or post-approval.

A. Solutions and Other Solubilized Dosage Forms

For oral solutions, elixirs, syrups, tinctures, or other solubilized forms, in vivo BA and/or BE are generally self-evident and a requirement of in vivo data for a product may be waived (21 CFR 320.22(b)(3)). In such instances, the applicant would be deemed to have complied with and fulfilled any requirement for in vivo data.‡ Although a comparative study is not necessary, characterization of the pharmacokinetics of the drug is required (21 CFR 314.50(d)(3)). In addition, in vivo BE studies that compare different solution formulations are

* See footnote 2.

† See the FDA guidance for industry on *Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate-Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System*. This document provides complementary information on the Biopharmaceutics Classification System (BCS).

‡ See 21 CFR 320.22(b)(3).

waived based on the assumptions that release of drug substance from the drug product is self-evident and that the solutions do not contain any excipients that significantly affect drug absorption. However, there are certain excipients that may alter the BA (e.g., sorbitol may reduce the BA of drugs, and vitamin E may enhance the BA) in amounts sometimes used in oral liquid dosage forms. In this case, evaluation of in vivo BA and/or BE may be required.

B. Immediate-Release Products

Included in this discussion are capsules, tablets (including conventional, buccal, chewable, orally disintegrating, and sublingual dosage forms), and suspensions.

1. Preapproval Changes

For BA and BE studies, we recommend a single-dose, fasting study be performed. Under certain circumstances, multiple-dose BA studies (see section III.A.5) and/or food effect studies may be necessary (See the FDA guidance for industry *Food-Effect Bioavailability and Fed Bioequivalence).* Unconventional dosage forms (buccal, chewable, orally disintegrating, and sublingual dosage forms) should be administered according to intended label use/instructions. In addition, a BA study may be needed with the unconventional dosage form swallowed intact to assess the impact of accidental swallowing of the intact product. Sampling should adequately capture the T_{max} and C_{max} in addition to total exposure.

We recommend that in vitro dissolution be evaluated for all orally administered products. In vitro dissolution test conditions could be the same or different for unconventional compared to conventional dosage forms. If differences in dissolution data exist, they should be discussed with the appropriate review division.

2. Post-approval Changes

Information on the types of in vitro dissolution and in vivo BE studies needed for approved immediate-release drug products when post-approval changes are made is provided in an FDA guidance for industry entitled *SUPAC-IR: Immediate Release Solid Oral Dosage Forms Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls, In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. We recommend that for post-approval changes, the in vitro or in vivo comparison be made between the post-change and pre-change products.

C. Modified-Release Products

Modified-release (MR) products include extended-release (controlled-release, sustained- release)* and delayed-release products.

Extended-release (ER) products are dosage forms that are designed to extend or prolong the release of active ingredient or active moiety from the drug product and may allow a reduction in dosing frequency as compared to when the drug is administered in an immediate-release (IR) dosage form. These drug products can be developed to reduce fluctuations in plasma concentrations when compared to an IR product. ER products can be capsules, tablets, granules, pellets, or suspensions.

Delayed-release (DR) drug products are dosage forms that release active ingredient or active moiety at a time later than immediately after administration (i.e., these drug products exhibit a lag time in quantifiable plasma concentrations). Typically, coatings (e.g., enteric coatings) are used to delay the release of the drug substance until the dosage form has passed through the acidic medium of the stomach. Generally, DR products are treated as IR products. However, if the DR product has complex release characteristics, the relevant review division should be contacted for additional FDA guidance.

If the drug product is an ER product, the following recommendations apply.

1. Preapproval: BA and BE Studies

FDA's regulations at 21 CFR 320.25(f) address the purpose of a BA study for an extended-release product, which is to determine if certain delineated conditions are met.† This regulation also provides that "the reference material(s) for such a bioavailability study shall be chosen to permit an appropriate scientific evaluation of the extended release claims made for the drug product."‡ Appropriate reference products may include

(1) a solution or suspension of the active drug ingredient or therapeutic moiety, (2) a currently marketed non-controlled-release drug product containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling of the non-controlled release drug product, and (3) a currently marketed ER drug product subject to an approved full NDA containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling of currently marketed ER product.§

In general, the PK profile of the ER product may not match that of the approved IR product (e.g., T_{max} is different) or, in some cases, to another ER product. In such a case, establishing similar PK profiles using C_{max} and AUC may not be sufficient to show that the ER product is bioequivalent to the IR product. Thus, additional safety or efficacy studies or PK/PD assessments may be recommended. This FDA guidance recommends that the following BA studies and food effect BA studies be conducted for an ER drug product submitted as an NDA for the scenarios described below:

* For the purpose of this FDA guidance, the terms *extended*, *controlled*, and *sustained* are used interchangeably.

† 21 CFR 320.25(f)(1).

‡ 21 CFR 320.25(f)(2).

§ 21 CFR 320.25(f)(2)(i), (ii), and (iv). We recommend that a sponsor seeking to use as a reference product "a currently marketed extended release drug product subject to an approved full new drug application containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling proposed for the extended release drug product," under 21 CFR 320.25(f)(2)(iii), consult with the Agency before commencing such a study.

New ER formulation comparison to an already-approved IR product

- For drugs with linear pharmacokinetics over the therapeutic dose range: A fasting study should be conducted comparing the ER product administered as a single dose at the highest strength to the IR reference administered over the least common time interval to achieve equivalent total dose as for the ER product.* If for safety reasons the highest strength cannot be used, a lower strength may be acceptable.
- For drugs with nonlinear pharmacokinetics over the therapeutic dose range: At a minimum, a single dose of the highest and lowest strengths of the ER product should be compared to their corresponding IR references administered over the ER dosing interval. If the relative BA of intermediate ER strengths cannot be inferred based on the above studies, a single-dose fasting study for the intermediate strength(s) of the ER product should be compared to the corresponding IR reference administered over the ER dosing interval.
- When the ER strengths are not proportionally similar in composition, a single- dose fasting dosage strength equivalence assessment study† or a dosage strength proportionality study‡ for the ER product should be conducted.
- A single-dose food-effect study should be conducted on the highest ER strength (see the 2002 Food-Effect FDA guidance).
- A steady state study should be conducted on the highest strength of the ER product compared to an approved IR reference dosed to achieve equivalent total dose as for the ER product.

New ER product (ER_{new}) comparison to an approved ER product (ER_{old}) with a different dosing interval (i.e., where ER_{new} and ER_{old} have unequal dosing intervals)

- The recommendations are the same as outlined in the previous section (Development of a new ER formulation given an already approved IR product) except for the choice of the reference product. In this case, the reference product could be either the approved ER_{old} or IR product.

New ER product (ER_{new}) comparison to an approved ER product (ER_{old}) with the same dosing interval

- A single-dose fasting BE study on the highest strength of the ER_{new} product compared to the ER_{old} product. If ER_{new} and ER_{old} are of different strength, then comparison of ER_{new} versus ER_{old} should be made based on dose using the highest strengths.
- A single-dose, food-effect study should be conducted on the highest ER_{new} strength.
- When the ER_{new} strengths are not proportionally similar in composition, a single- dose fasting dosage strength equivalence assessment study or a dosage strength proportionality study§ for the ER_{new} product should be conducted.
- In some cases, BE between the new and old ER products may not be sufficient to ensure that there is no difference in safety or efficacy if the PK profiles of the two ER products do not match (e.g., T_{max} is different). Additional data analysis or clinical studies may be needed to ensure that the two products are clinically equivalent.

2. *Post-approval Changes*

Information on the types of in vitro dissolution and in vivo BE studies for ER drug products approved in the presence of specific post-approval changes are provided in an FDA guidance for industry *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation.* We recommend that for post-approval changes, the in vitro or in vivo comparison be made between the post- change and pre-change products.

D. Batch Size

For pivotal BE studies, the test batch should be representative of the production batches. Therefore, the size of the test batch should be at least 10% of the planned production batch size, or a minimum of 100,000 units, whichever is larger.

V. Additional Information on in Vitro Approaches

A. In Vitro Studies Conducted in Support of a Waiver of an In Vivo BA or BE Data Requirement

As discussed above, FDA's regulations contemplate that if in vivo BA or BE data are required for a product, a sponsor may seek a waiver of that requirement under certain circumstances.¶

* For example, when a 150-milligram (mg) ER product administered once daily (QD) is being developed that gives an approved 50-mg IR reference product administered three times a day (TID) or a 75-mg product administered two times a day (BID), a comparison of the 150-mg ER product administered as a single dose could be compared to either the 50-mg IR reference product administered TID or 75-mg IR reference product administered BID. In this case, the least common time interval is 24 hours.

† If three strengths, 10, 25, and 50 mg, are being developed for a new ER dosage form, the dosage strength equivalence study should be conducted using 5 × 10 mg, 2 × 25 mg, and 1 × 50 mg to achieve constancy of dose.

‡ If three strengths, 10, 25, and 50 mg, are being developed for a new ER dosage form, the dosage strength proportionality study should be conducted using 1 × 10 mg, 1 × 25 mg, and 1 × 50 mg to achieve constancy of dose and the dosage strength proportionality study should be conducted using 1 × 10 mg, 1 × 25 mg, and 1 × 50 mg.

§ 21 CFR 320.21(b) (giving applicants the option of submitting information that "would permit FDA to waive the submission of evidence demonstrating in vivo bioequivalence") and 320.21(f) (requiring that the information submitted in support of a waiver request "shall meet the criteria set forth in § 320.22").

¶ 21 CFR 320.21(b) (giving applicants the option of submitting information that "would permit FDA to waive the submission of evidence demonstrating in vivo bioequivalence") & 320.21(f) (requiring that the information submitted in support of a waiver request "shall meet the criteria set forth in § 320.22.")

For example, in some instances, in vivo BA or BE is self-evident based on certain characteristics of the drug product (21 CFR 320.22(b)), and therefore, any in vivo data requirement has been deemed to have been met. In other delineated circumstances, an in vivo BA or BE data requirement may be waived, and in vitro data may be accepted in lieu of in vivo data (21 CFR 320.22(d)). For example, an in vivo data requirement may be waived for different strengths of an immediate-release drug product under 21 CFR 320.22(d)(2) when (1) the drug product is in the same dosage form, but in a different strength; (2) this different strength is proportionally similar in its active and inactive ingredients to another drug product for which the same manufacturer has obtained approval; and (3) the new strength meets an appropriate in vitro test as outlined in the regulation.* In addition, for waiving higher strengths, linearity of the pharmacokinetics over the therapeutic dose range should be demonstrated.

This FDA guidance defines *proportionally similar* in the following ways:

- All active and inactive ingredients are in exactly the same proportion between different strengths (e.g., a tablet of 50-mg strength has all the inactive ingredients, exactly half that of a tablet of 100-mg strength, and twice that of a tablet of 25-mg strength).
- For high-potency drug substances (where the amount of active drug substance in the dosage form is relatively low), (1) the total weight of the dosage form remains nearly the same for all strengths (within ± 10% of the total weight of the strength on which a BE was performed), (2) the same inactive ingredients are used for all strengths, and (3) the change in any strength is obtained by altering the amount of the active ingredients and one or more of the inactive ingredients.
- Bilayer tablets are considered to be one formulation even though they consist of two separate layers with different compositions. In assessing the proportional similarity of the different strengths, all components of both layers should be proportionally similar. The fact that only one layer is proportionally similar and the other is not clearly indicates that the products (whole tablet) are not proportionally similar. This is relevant because there can be interactions between the different tablet layers, which can differ across different strengths because of the different size of the layers and the varying amounts of excipients present in each layer.

Exceptions to the above definitions may be possible if adequate justification is provided and discussed with the appropriate review division.

* See also 21 CFR 322.22(d)(3) and (4) for additional bases for waiver. Also, FDA, for good cause, may waive a requirement for the submission of evidence of in vivo bioavailability or bioequivalence if waiver is compatible with the protection of the public health. For full NDAs, FDA may defer a requirement for the submission of evidence of in vivo bioavailability if deferral is compatible with the protection of the public health (21 CFR 320.22(e)).

B. In Vitro Studies Conducted in Support of Demonstrating BA or BE

FDA may determine that in vitro data are the most accurate, sensitive, and reproducible method to demonstrate BA or BE in other contexts (21 CFR 320.24(b)(5) and (6)).† Below we provide additional FDA guidance on the conduct of such studies.

1. Immediate-Release Formulations (Capsules, Tablets, and Suspensions)

In vitro data can be used to compare formulations of drug products under certain circumstances. If an applicant seeks to demonstrate the BA or BE of immediate-release formulations for capsules, tablets, and suspensions using in vitro data, FDA recommends that sponsors generate dissolution profiles for all strengths using an appropriate dissolution method. If the dissolution results indicate that the dissolution characteristics of the product are not dependent on the pH and product strength, dissolution profiles in one medium are usually sufficient to support demonstrating BE. Otherwise, dissolution data in at least three media (e.g., pH 1.2, 4.5, and 6.8) are recommended. The f_2 test should be used to compare profiles from the different strengths of the product (see FDA guidance for industry, *Dissolution Testing of Immediate Release Solid Oral Dosage Forms*). An f_2 value ≥ 50 indicates a sufficiently similar dissolution profile to support a biowaiver. For an f_2 value < 50, discussion with the appropriate review division is recommended to determine whether an in vivo study is needed. The f_2 approach is not suitable for rapidly dissolving drug products (e.g., $\geq 85\%$ dissolved in 15 minutes or less).

Over-encapsulation of clinical trial formulations During the course of drug development, sponsors sometimes have to blind the formulations that they use in the clinical trials. In certain situations, the only difference between the to-be-marketed and clinical trial formulations is that the dosage form is put into a capsule. This over-encapsulation is done mainly for blinding purposes. It may be possible to support bioequivalence of the to-be-marketed and clinical trial formulations using in vitro data only, provided that no other excipients are added to the capsule and the dissolution profiles are comparable in three media: pH 1.2, pH 4.5 and pH 6.8.

Scale-up and post-approval changes Certain formulation changes in components and composition, scale-up, manufacturing site, manufacturing process, or equipment can be made post-approval. Depending on the possible impact of the manufacturing change on the release of the active ingredient from the formulation and its BA, certain manufacturing changes for IR products can be approved based solely on similarity of the dissolution profiles between the postchange and prechange formulations. Information on recommendations for using in vitro dissolution and in vivo BE studies for immediate-release drug products in such circumstances is provided in FDA's FDA guidance for industry

† In such instances, no waiver under 21 CFR 320.21 and 320.22 is necessary.

on *SUPAC IR: Immediate- Release Solid Oral Dosage Forms: Scale-Up and Post-Approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. The same principles described in the FDA guidance can be applied to pre-approval changes in which the to-be-marketed formulation differs from the clinical trial formulation.

2. Modified-Release Formulations

The use of in vitro data may be acceptable for modified-release drug products for which specific post-approval changes are sought is delineated in the FDA guidance for industry *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. The same principles described in the FDA guidance may also apply to pre-approval changes. Additional considerations for use of in vitro data are described below.

Beaded capsules: lower/higher strength For ER beaded capsules where the strength differs only in the number of beads containing the active moiety, a single-dose, fasting BA or BE study, as appropriate, should be carried out on the highest strength. In vivo BA or BE of one or more lower strengths can be demonstrated based on dissolution profile comparisons, with an in vivo BA or BE study only on the highest strength (unless safety reasons preclude the administration of the highest strength to healthy volunteers). The dissolution profiles for each strength should be generated using the recommended dissolution method. If the dissolution method has not been finalized, dissolution profiles should be generated in at least three media (e.g., pH 1.2, 4.5, and 6.8). In vivo BE studies for higher strengths may not be necessary based on (1) clinical safety and/or efficacy data on the proposed dose and the need for the higher strength, (2) linearity of pharmacokinetics over the therapeutic dose range, and (3) the same dissolution procedures being used for all strengths with similar dissolution results. The f_2 test can be used to demonstrate similar profiles among the different strengths of the product.

MR dosage forms: lower strength For MR dosage forms, when the drug product is in the same dosage form but in a different strength and when (1) the drug exhibits linear pharmacokinetics, (2) the various strengths are proportionally similar in their active and inactive ingredients* and (3) the drug-release mechanism is the same, an in vivo BA or BE determination of one or more lower strengths can be demonstrated based on dissolution profile comparisons, with an in vivo BA or BE study only on the highest strength. The dissolution profiles for each strength should be generated using the recommended dissolution method. If the dissolution method has not been finalized, dissolution profiles should be generated in at least three media (e.g., pH 1.2, pH 4.5, and pH 6.8). The dissolution profile should be generated on the test and reference products of all strengths using the same dissolution test conditions.

* If the formulations of all the strengths are not compositionally proportional, in vitro data can be submitted for the middle strength(s) if the following data are acceptable: (1) BA or BE data, as appropriate, for both the highest and the lowest strengths, and (2) in vitro multimedia dissolution comparison profiles using f2 evaluation.

VI. Special Topics

A. Alcoholic Beverage Effects on MR Drug Products

The consumption of alcoholic beverages may affect the release of a drug substance from an MR formulation. The formulation may lose its MR characteristics, leading to more rapid drug release and altered systemic exposure. This more rapid drug release may have deleterious effects on the drug's safety and/or efficacy.

In vitro assessments of the drug release from the drug product using media with various alcohol concentrations should be conducted. Based on the results of the in vitro assessments, an in vivo BA study of the drug product when administered with alcohol may be needed.

B. Enantiomers versus Racemates

During development of a racemic drug product, the racemate should be measured in BA studies. It may also be important to measure the individual enantiomers of the racemate to characterize the pharmacokinetics of the enantiomers. For the development of a specific enantiomer, chiral inversion should be assessed.

Measurement of the racemate using an achiral assay is recommended for BE studies. Measurement of individual enantiomers in BE studies is recommended only when all of the following conditions are met: (1) the enantiomers exhibit different PD characteristics, (2) the enantiomers exhibit different PK characteristics, (3) primary efficacy and safety activity resides with the minor enantiomer, and (4) nonlinear absorption is present (as expressed by a change in the enantiomer concentration ratio with change in the input rate of the drug) for at least one of the enantiomers. In such cases, we recommend that BE criteria be applied to the enantiomers separately.

C. Drug Products With Complex Mixtures as the Active Ingredients

Certain drug products may contain complex drug substances (i.e., active moieties or active ingredients that are mixtures of multiple synthetic and/or natural source components). Some or all of the components of these complex drug substances may not be fully characterized with regard to chemical structure and/or biological activity. Quantification of all active or potentially active components in BA and BE studies may not be possible. In such cases, we recommend that BA and BE studies be based on a select number of components. Criteria for component selection typically include the amount of the moiety in the dosage form, plasma or blood levels of the moiety, and biological activity of the moiety. When PK approaches are infeasible to assess rate and extent of absorption of a

drug substance from a drug product, PD, clinical, or in vitro approaches may be appropriate.

D. Long-Half-Life Drugs

In a BA or PK study involving an IR oral product with a long half-life ($\geq$ 24 hours), adequate characterization of the half-life should include blood sampling over a long period of time. For BA or BE determination of a drug product containing a drug with a long half-life, a nonreplicate, single-dose, crossover study can be conducted, provided an adequate washout period is used. If the crossover study is problematic, a study with a parallel design can be used. For either a crossover or parallel study, we recommend that the sample collection time be adequate to ensure completion of gastrointestinal transit (approximately 2 to 3 days) of the drug product and absorption of the drug substance. C_{max} and a suitably truncated AUC can be used to characterize peak and total drug exposure, respectively. For drugs that demonstrate low intrasubject variability in distribution and clearance, a truncated AUC (e.g., $AUC_{0\text{-}72\ hr}$) can be used in place of $AUC_{0\text{-}t}$ or $AUC_{0\text{-}\infty}$. For drugs that demonstrate high intrasubject variability in distribution and clearance, AUC truncation should not be used. In such cases, we recommend that sponsors and/or applicants consult the appropriate review division.

E. Orally Administered Drugs Intended for Local Action

Documentation of BA and BE when the drug substance produces its effects by local action in the gastrointestinal tract can be achieved either by using pharmacokinetics, an acceptable PD end point, clinical efficacy and safety studies, and/or suitably designed and validated in vitro studies, as appropriate. For such cases, we recommend that sponsors and/or applicants consult the appropriate review division. Additional safety studies may also be recommended to characterize the local safety of the product. The in vitro studies should reflect important clinical effects or should be more sensitive to changes in product performance compared to a clinical study. To ensure comparable safety, additional studies with and without food may help to understand the degree of systemic exposure that occurs following administration of a drug product intended for local action in the gastrointestinal tract.

F. Combination/Coadministered Drug Products

Two or more active ingredients can be formulated as a single drug product, which is referred to as a combination drug product. Generally, the purpose of an in vivo BA study involving a combination drug product is to compare the rate and extent of absorption of each active drug ingredient or therapeutic moiety in the combination drug product to the rate and extent of absorption of each active drug ingredient or therapeutic moiety administered concurrently in separate single-ingredient preparations (21 CFR 320.25(g).

For the purpose of defining BA or determining BE when required, this FDA guidance recommends that the following studies be conducted for a combination drug product:

- A two-treatment, single-dose, fasting study of the combination drug product versus single-ingredient drug products administered concurrently as a single treatment or an approved combination product containing the same active ingredients. This study should use the highest strength of the combination product with matching doses of individual drug products.
- Certain alternative study designs may also be acceptable depending on the specific situation. For instance, in the case of a combination product consisting of two components, a three-treatment study design comparing the combination drug product versus single-ingredient drug products administered separately may be appropriate.
- A single-dose, food-effect study on the combination drug product.

BE studies for the combination product should include the measurement of systemic concentrations of each active ingredient. The confidence interval approach should be applied to each measured entity of the combination drug product and its reference product.

In specific cases, drug products are given in combination (not co-formulated) with the objective of increasing the exposure of one of the drugs (subject drug). The second drug is not intended to have a therapeutic effect and is given only to increase the systemic exposure of the subject drug. When both the subject and second drug are new molecular entities, the BA of each should be assessed separately. If a BE study is needed for the subject drug for any reason, the subject drug should be administered with the second drug for both test and reference products. The corresponding PK results, including confidence intervals for BE criteria, should be applied to the subject drug. It is not necessary to measure the concentrations of the second drug. BE studies that are needed for the second drug should be conducted only with the second drug; the subject drug is not dosed with the second drug. When the combination includes a new molecular entity and an approved product, only the BA of the new molecular entity should be assessed. It is assumed that the BA of the approved product has been previously evaluated.

G. Endogenous Substances

Drug products can be developed that contain compounds that are endogenous to humans (e.g., testosterone). When the endogenous compounds are identical to the drug that is being administered, determining the amount of drug released from the dosage form and absorbed by each subject is difficult. In most cases, it is important to measure and approximate the baseline endogenous levels of the compound in blood (plasma) and subtract these levels from the total concentrations measured from each subject after the drug product is administered. In this way, an estimate of actual drug availability from the drug product can be achieved, and therefore BA and BE can be assessed. Endogenous substances may have homeostatic processes that affect their production and

therefore impact their systemic concentrations. To reduce the complication of these homeostatic processes and to potentially avoid the need for baseline correction, an alternative approach might be to enroll patients in BA and BE studies with low or no production of the endogenous substances instead of healthy volunteers.

Baseline concentrations of the endogenous substance produced by the body are measured in the time period prior to study drug administration. Depending on the proposed indication, subtraction of the time-averaged baseline or time-matched baseline from the post-dose concentration for each subject may be recommended. When the endogenous levels are influenced by diet, strict control of the dietary intake of the compound prior to and during the study may also be appropriate. To achieve a stable baseline, subjects should be housed at the clinic for a sufficient time prior to the study and served standardized meals with similar content of the compound to that of the meals served on the PK sampling day.

In either case, baseline concentrations should be determined for each dosing period, and baseline corrections should be period-specific. If a negative plasma concentration value results after baseline correction, this should be set to 0 prior to calculating the baseline-corrected AUC. Pharmacokinetics and statistical analysis should be performed on both uncorrected and corrected data as appropriate. Because of the complexities associated with endogenous compounds, we recommend that sponsors and/or applicants contact the appropriate review division for additional FDA guidance.

H. Drug Products With High Intrasubject Variability

In addition to the traditional approach and the use of average BE using replicate designs, the use of a reference-scaled BE approach using a replicate design can be considered. This approach should be reserved for drugs that demonstrate a high intrasubject variability (≥30%). The reference-scaled average BE approach adjusts the BE limits of highly variable drugs by scaling to the within-subject variability of the reference product in the study and imposes a limit of 0.8 to 1.25 on the geometric mean ratio.* The appropriate review division should be consulted when planning the use of the reference-scaled BE approach.

Appendix A: General Study Design and Data Handling

The following general approaches are recommended, recognizing that the elements can be adjusted for certain drug substances and drug products.

Study Conduct

- The BA or BE study should be conducted under fasting conditions (after an overnight fast of at least 10 hours). If the BA or BE study needs to be conducted with food, a separate FDA guidance *Food-Effect Bioavailability and Fed Bioequivalence Studies* is available to assist sponsors.
- The test and reference products should be administered with about 8 ounces (240 milliliters) of water to an appropriate number of subjects.
- Generally, the highest marketed strength should be administered as a single unit. If warranted, to achieve sufficient bioanalytical sensitivity multiple units of the highest strength can be administered, provided the total single dose remains within the labeled dose range and the total dose is safe for administration to the study subjects.
- An adequate washout period (e.g., …5 half-lives of the moieties to be measured) should separate each treatment.
- The lot numbers of both test and reference listed products and the expiration date for the reference product should be stated. We recommend that the assayed drug content of the test product batch not differ from the reference product by more than +/– 5 percent. The sponsor should include a statement of the composition of the test product and, if possible, a side-by- side comparison of the compositions of test and reference listed products. In accordance with 21 CFR 320.38, and 21 CFR 320.63, samples of the test and reference listed product must be retained for at least 5 years. For additional information, please refer to the FDA guidance for industry on *Handling and Retention of Bioavailability and Bioequivalence Testing Samples.*
- Before and during each study phase, we recommend that subjects (1) be allowed water as desired except for 1 hour before and after drug administration, (2) be provided standard meals no less than 4 hours after drug administration, and (3) abstain from alcohol for 24 hours before each study period and until after the last sample from each period is collected.

Sample Collection and Sampling Times

- We recommend that under normal circumstances, blood, rather than urine or tissue, be used.

  In most cases, drug or metabolites are measured in serum or plasma. However, in certain cases, such as when an assay of sufficient sensitivity cannot be developed for plasma, whole blood may be more appropriate for analysis. We recommend that blood samples be drawn at appropriate times to describe the absorption, distribution, and elimination phases of the drug. For most drugs we recommend that 12 to 18 samples, including a pre-dose sample, be collected per subject per dose. ***This sampling should continue for at least three or more terminal elimination half-lives of the drug*** to capture 90 percent of the relevant AUC. For multiple-dose studies, sampling should occur across the dose interval and

* For general principles of the reference-scaled approach, refer to Davit B, Conner D. Reference-Scaled Average Bioequivalence Approach. In: Kanfer I, Shargel L, Eds. *Generic Drug Product Development – International Regulatory Requirements For Bioequivalence.* Informa Healthcare, 2010:271–272.

include the beginning and the end of the interval. The exact timing for sample collection depends on the nature of the drug and the rate of input from the administered dosage form. The sample collection should be spaced in such a way that the maximum concentration (C_{max}) of the drug in the blood and terminal elimination rate constant (λ_z) can be estimated accurately.

Three or more samples should be obtained during the terminal log-linear phase to obtain an accurate estimate of λ_z from linear regression. We recommend recording the actual clock time when samples are drawn, as well as the elapsed time related to drug administration.

Subjects with Pre-Dose Plasma Concentrations

- If the pre-dose concentration is $\leq$ 5 percent of C_{max} value in that subject, the subject's data without any adjustments can be included in all PK measurements and calculations. We recommend that if the pre-dose value is > 5 percent of C_{max}, the subject should be dropped from all PK evaluations. The subject data should be reported and the subject should be included in safety evaluations.

Data Deletion because of Vomiting

- We recommend that data from subjects who experience emesis during the course of a study for immediate-release products be deleted from statistical analysis if vomiting occurs at or before 2 times median T_{max}. For modified-release products, subjects who experience emesis at any time during the labeled dosing interval should not be included in PK analysis.

Data Submission and Analysis

The following PK information is recommended for submission:

- Plasma concentrations and time points.
- Subject, period, sequence, treatment.
- Intersubject, intrasubject, and/or total variability, if available.
- For single-dose studies: $AUC_{0\text{-}t}$, $AUC_{0\text{-}inf}$, C_{max}, T_{max}, $\lambda_{z,}$ and $t_{1/2}$.
- For steady-state studies: $AUC_{0\text{-}tau,}$ $C_{maxss,}$ $T_{max,}$ C_{minss} (lowest concentration in a dosing interval), C_{trough} (concentration at the end of the dosing interval), C_{avss} (average concentration during a dosing interval), degree of fluctuation $[(C_{max}\text{-}C_{min})/C_{avss}]$, swing $[(C_{maxss}\text{-}C_{minss})/C_{minss}]$. C_{trough} should be measured for several dosing intervals to assess whether steady-state was achieved.
- In addition to the above information, clearance and volume of distribution should be reported for BA studies.

In addition, we recommend that the following statistical information be provided for $AUC_{0\text{-}t,}$ $AUC_{0\text{-}\infty}$, and Cmax:

- Geometric means
- Arithmetic means
- Geometric mean ratios
- 90 percent Confidence intervals (CI)

We also recommend that logarithmic transformation be provided for measures used for BE demonstration. An FDA guidance for industry, *Statistical Approaches to Establishing Bioequivalence*, is available.

Rounding Off of Confidence Interval Values

We recommend that applicants ***not round off*** CI values; therefore, to pass a CI limit of 80 to 125 percent, the value should be at least 80.00 percent and not more than 125.00 percent.

2 Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate-Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System

*Guidance for Industry**

I. INTRODUCTION

This guidance provides recommendations for sponsors of investigational new drug applications (INDs), and applicants who submit new drug applications (NDAs), abbreviated new drug applications (ANDAs), and supplements to these applications for immediate-release (IR) solid oral dosage forms, and who wish to request a waiver of an in vivo bioavailability (BA) and/or bioequivalence (BE) study requirement. These recommendations are intended to apply to waivers requested during the IND period and the NDA stage or for ANDAs, i.e., (1) subsequent in vivo BA or BE studies of formulations after the initial establishment of the in vivo BA of IR solid oral dosage forms during the IND period, and (2) in vivo BE studies of IR solid oral dosage forms in NDAs, ANDAs, and supplements to these applications.

Regulations at 21 CFR 320 address the requirements for BA and BE data for approval of NDAs, ANDAs, and supplemental applications. Provision for waivers of in vivo BA/BE studies (biowaivers) under certain conditions is provided at 21 CFR 320.22.† This guidance finalizes the guidance for industry on *Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate-Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System*,‡ published in May 2015, and explains when biowaivers can be requested for IR solid

oral dosage forms based on an approach termed the Biopharmaceutics Classification System (BCS).§ This guidance includes biowaiver extension to BCS class 3 drug products, and additional modifications, such as criteria for high permeability and high solubility.

In general, FDA's guidance documents do not establish legally enforceable responsibilities. Instead, guidances describe the Agency's current thinking on a topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited. The use of the word *should* in Agency guidances means that something is suggested or recommended, but not required.

II. THE BIOPHARMACEUTICS CLASSIFICATION SYSTEM

The BCS is a scientific framework for classifying drug substances based on their aqueous solubility and intestinal permeability. When combined with the dissolution of the drug product, the BCS takes into account three major factors that govern the rate and extent of drug absorption from IR solid oral dosage forms: (1) dissolution, (2) solubility, and

* This guidance has been prepared by the Office of Pharmaceutical Quality and the Office of Translational Sciences in the Center for Drug Evaluation and Research (CDER) at the Food and Drug Administration.

† In addition to waiver of an in vivo BE requirement under 21 CFR 320.22, there are certain circumstances in which BE can be evaluated using in vitro approaches under 21 CFR 320.24(b)(6). The scientific principles described in this guidance regarding waiver of an in vivo requirement also apply to consideration of in vitro data under that regulation. In such circumstances, an in vivo data requirement is not waived, but rather, FDA has determined that in vitro data is the most accurate, sensitive, and reproducible for a product, as required under 21 CFR 320.24(a). Nonetheless, for ease of the reader, in this guidance we will refer to either the decision to waive an in vivo BE requirement under 21 CFR 320.22 or the decision to accept in vitro BE data in accordance with 21 CFR 320.24(a) as a "biowaiver."

‡ We update guidances periodically. To make sure you have the most recent version of a guidance, check the FDA Drugs guidance web page at http://www.fda.gov/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/default.htm.

§ See *The Biopharmaceutics Classification System (BCS) Guidance* at: http://www.fda.gov/aboutfda/centersoffices/officeofmedicalproductsandtobacco/cder/ucm128219.htm.

(3) intestinal permeability.* According to the BCS, drug substances are classified as follows:

> Class 1: High Solubility – High Permeability Class 2: Low Solubility – High Permeability Class 3: High Solubility – Low Permeability Class 4: Low Solubility – Low Permeability

In addition, some IR solid oral dosage forms are categorized as having rapid or very rapid† dissolution. Within this framework, when certain criteria are met, the BCS can be used as a drug development tool to help sponsors/applicants justify requests for biowaivers.

Observed in vivo differences in the rate and extent of absorption of a drug from two pharmaceutically equivalent solid oral products may be due to differences in drug dissolution in vivo.[4] However, when the in vivo dissolution of an IR solid oral dosage form is rapid or very rapid in relation to gastric emptying and the drug has high solubility, the rate and extent of drug absorption is unlikely to be dependent on drug dissolution and/or gastrointestinal (GI) transit time. Under such circumstances, demonstration of in vivo BA or BE may not be necessary for drug products containing class 1 and class 3 drug substances, as long as the inactive ingredients used in the dosage form do not significantly affect absorption of the active ingredients.

The BCS approach outlined in this guidance can be used to justify biowaivers for highly soluble and highly permeable drug substances (i.e., class 1) as well as highly soluble and low permeable drug substances (i.e., class 3) in IR solid oral dosage forms that exhibit rapid or very rapid in vitro dissolution using the recommended test methods. The recommended methods for determining solubility, permeability, and in vitro dissolution are discussed below.

A. Solubility

The solubility class boundary is based on the highest strength of an IR product that is the subject of a biowaiver request. A drug substance is considered *highly soluble* when the highest strength is soluble in 250 mL or less of aqueous media within the pH range of 1 - 6.8 at 37 ± 1°C. The volume estimate of 250 mL is derived from typical BE study protocols that prescribe administration of a drug product to fasting human volunteers with an 8 fluid ounce glass of water.

B. Permeability

The permeability class boundary is based indirectly on the extent of absorption (fraction of dose absorbed, not systemic BA) of a drug substance in humans, and directly on measurements of the rate of mass transfer across human intestinal membrane. Alternatively, other systems capable of predicting the extent of drug absorption in humans can be used (e.g., in situ animal, in vitro epithelial cell culture methods). A drug substance is considered to be *highly permeable* when the systemic BA or the extent of absorption in humans is determined to be 85 percent or more of an administered dose based on a mass balance determination (along with evidence showing stability of the drug in the GI tract) or in comparison to an intravenous reference dose.

C. Dissolution‡

An IR drug product is considered *rapidly dissolving* when a mean of 85 percent or more of the labeled amount of the drug substance dissolves within 30 minutes, using *United States Pharmacopeia* (USP) Apparatus 1 at 100 rpm or Apparatus 2 at 50 rpm (or at 75 rpm when appropriately justified (see section III.C.) in a volume of 500 mL or less (or 900 mL when appropriately justified) in each of the following media: (1) 0.1 N HCl or Simulated Gastric Fluid USP without enzymes; (2) a pH 4.5 buffer; and (3) a pH 6.8 buffer or Simulated Intestinal Fluid USP without enzymes.

An IR product is considered *very rapidly dissolving* when a mean of 85 percent or more of the labeled amount of the drug substance dissolves within 15 minutes, using the above mentioned conditions.

III. RECOMMENDED METHODOLOGY FOR CLASSIFYING A DRUG SUBSTANCE AND FOR DETERMINING THE DISSOLUTION CHARACTERISTICS OF A DRUG PRODUCT

The following approaches are recommended for classifying a drug substance and determining the dissolution characteristics of an IR drug product according to the BCS.

A. Determining Drug Substance Solubility Class

An objective of the BCS approach is to determine the equilibrium solubility of a drug substance under physiological pH conditions. The pH-solubility profile of the test drug substance should be determined at 37 ± 1°C in aqueous media with a pH in the range of 1 - 6.8. A sufficient number of pH conditions should be evaluated to accurately define the pH-solubility profile within the pH range of 1 - 6.8. The number of pH conditions for a solubility determination can be based

† Yu LX, Amidon GL, Polli JE, Zhao H, Mehta MU, Conner DP, et al, 2002, Biopharmaceutics classification system: The scientific basis for biowaiver extensions, Pharm Res, 19(7):921–5.

‡ See also the draft guidance for industry *Dissolution Testing of Immediate Release Solid Oral Dosage Forms*. When final, this guidance will represent the FDA's current thinking on this topic.

on the ionization characteristics of the test drug substance to include pH=pKa, pH=pKa+1, pH=pKa - 1, and at pH=1 and 6.8. A sufficient number of pH conditions should be determined for both ionizable and non-ionizable compounds. A minimum of three replicate determinations of solubility in each pH condition is recommended. Depending on study variability, additional replicates may be necessary to provide a reliable estimate of solubility.

Standard buffer solutions described in the USP are considered appropriate for use in solubility studies. If these buffers are not suitable for physical or chemical reasons, other buffer solutions can be used with justification. Solution pH should be verified (measured and adjusted to the target pH if required) after addition of the drug substance to a buffer. Solution pH should also be measured at the end of the equilibrium solubility study.

Methods other than the traditional shake-flask method, such as acid or base titration methods, can also be used with justification supporting the ability of such methods to predict equilibrium solubility of the test drug substance. The concentration of the drug substance in selected buffers (or pH conditions) should be determined using a validated stability-indicating assay that can distinguish the drug substance from its degradation products.* If degradation of the drug substance is observed as a function of buffer composition and/or pH, it should be reported. The solubility class should be determined by calculating the volume of an aqueous medium sufficient to dissolve the highest strength in the pH range of 1 - 6.8. A drug substance should be classified as highly soluble when the highest strength is soluble in ≤250 mL of aqueous media over the pH range of 1 - 6.8. In other words, the highest strength divided by 250 should be less than or equal to the lowest solubility observed over the entire pH range of 1 - 6.8.

For drug products where the highest single dose administered is higher than the highest strength, additional information may be necessary. If the solubility classification is likely to change with the highest single dose as criterion, additional PK dose proportionality information in a wide dose range covering the therapeutic dose range will be necessary.

B. Determining Drug Substance Permeability Class

The permeability class of a drug substance can be determined via human pharmacokinetic studies (mass balance, or absolute BA) which are preferred methods, or through in vivo intestinal perfusion in human subjects. Alternatively, methods not involving human subjects, which include in vivo or in situ intestinal perfusion in a suitable animal model (e.g., rats), and in vitro permeability methods using excised intestinal tissues, or monolayers of suitable epithelial cells, may also be used.

A single method may be sufficient: (i) when the absolute BA is 85 percent or more, or (ii) when 85 percent or more of the administered drug is excreted unchanged in urine, or (iii) when 85 percent or more of the administered drug is recovered in urine as parent and metabolites with evidence indicating stability in the GI tract. When a single method fails to conclusively demonstrate a permeability classification, two different methods may be advisable. In case of conflicting information from different types of studies, it is important to note that human data supersede in vitro or animal data.

1. *Pharmacokinetic Studies in Humans*
   - Mass Balance Studies

Pharmacokinetic (PK) mass balance studies using unlabeled, stable isotopes or a radiolabeled drug substance can be used to document the extent of absorption of a drug. A sufficient number of subjects should be enrolled to provide a reliable estimate of extent of absorption.

When mass balance studies are used to demonstrate high permeability, additional data to document the drug's stability in the GI tract is required, unless 85 percent or more of the drug is excreted unchanged in urine. Please see method details in section III.B.3.

- Absolute Bioavailability Studies

Oral BA determination using intravenous administration as a reference can be used. Depending on the variability of the studies, a sufficient number of subjects should be enrolled in a study to provide a reliable estimate of the extent of absorption. When the absolute BA of a drug is shown to be 85 percent or more, additional data to document drug stability in the GI fluid is not necessary.

2. *Intestinal Permeability Methods*

The following methods can be used to determine the permeability of a drug substance from the GI tract: (1) in vivo intestinal perfusion studies in humans; (2) in vivo or in situ intestinal perfusion studies using suitable animal models; (3) in vitro permeation studies using excised human or animal intestinal tissues; or (4) in vitro permeation studies across a monolayer of cultured epithelial cells.

In vivo or in situ animal models and in vitro methods, such as those using cultured monolayers of animal or human epithelial cells, are considered appropriate for passively transported drugs. The observed low permeability of some drug substances in humans could be caused by efflux of drugs via membrane efflux transporters such as P-glycoprotein (P-gp), breast cancer resistance protein (BCRP) and/or multidrug resistance associated protein 2 (MRP2). When the efflux transporters are absent in these models, or their degree of expression is low compared to that in humans, there may be a greater likelihood of misclassification of permeability class for a drug subject to efflux compared to a drug transported passively. Expression of known transporters in selected study systems should be characterized. Functional expression of efflux systems (e.g., P- gp, BCRP, MRP2) can be demonstrated with techniques such as bidirectional transport studies, demonstrating a higher rate of

* Refer to the guidance for industry *Submitting Documentation for the Stability of Human Drugs and Biologics.*

transport in the basolateral-to-apical direction as compared to apical-to-basolateral direction (efflux ratio >2),*,† using selected model drugs or chemicals at concentrations that do not saturate the efflux system (e.g., digoxin, vinblastine, rhodamine 123, methotrexate). The use of animal or in vitro permeability test methods is recommended only for drug substances that are transported by passive mechanisms (efflux ratio of the test drug should be < 2). PK studies on dose linearity or proportionality may provide useful information for evaluating the relevance of observed in vitro efflux of a drug. For example, there may be fewer concerns associated with the use of in vitro methods for a drug that has a higher rate of transport in the basolateral-to-apical direction at low drug concentrations but exhibits linear PK in humans.

For BCS-based permeability determination, an apparent passive transport mechanism can be assumed when one of the following conditions is satisfied:

- A proportional relationship between the dose (e.g., relevant clinical dose range) and measures of BA (area under the concentration-time curve) or linear PK of a drug is demonstrated in humans.
- Lack of dependence of the measured in vivo or in situ permeability is demonstrated in an animal model on initial drug concentration (e.g., 0.01, 0.1, and 1 times the highest strength dissolved in 250 mL) in the perfusion fluid.
- Lack of dependence of the measured in vitro permeability on initial drug concentration (e.g., 0.01, 0.1, and 1 times the highest strength dissolved in 250 mL) is demonstrated, or lack of dependence on transport direction (i.e., efflux ratio 0.5 to 2) using a suitable in vitro cell culture method that has been shown to express known efflux transporters (e.g., P-gp, BCRP, MRP2).

METHOD SUITABILITY: One of the critical steps in using in vivo or in situ perfusion, or in vitro permeability methods for permeability classification is to demonstrate the suitability of the method. To demonstrate suitability of a permeability method intended for BCS-based permeability determination, a rank-order relationship between experimental permeability values and the extent of drug absorption data in human subjects should be established using a sufficient number of model drugs. For in vivo intestinal perfusion studies in humans, six model drugs are recommended. For in vivo or in situ intestinal perfusion studies in animals, and for in vitro tissue or cell monolayer methods, twenty model drugs are recommended. Depending on study variability, a sufficient number of subjects, animals, excised tissue samples, or cell monolayers should be used in a study to provide a reliable estimate of drug permeability (e.g., a minimum of three per group). This relationship should allow accurate differentiation between drug substances of low and high intestinal permeability attributes.

To demonstrate the suitability of a method, model drugs should represent a range of zero, low (e.g., < 50 percent), moderate (e.g., 50–84 percent), and high (≥ 85 percent) absorption.

Sponsors/applicants may select compounds from the list of drugs and/or chemicals provided in Attachment A, or they may select other drugs for which there is information available on mechanism of absorption and reliable estimates of the extent of drug absorption in humans.

For a given test method with set conditions, selection of a high permeability internal standard with permeability in close proximity to the low/high permeability class boundary may be used to facilitate classification of a test drug substance. For instance, a test drug substance may be determined to be highly permeable when its permeability value is equal to or greater than that of the selected internal standard with high permeability.

After demonstrating suitability of a method and maintaining the same study protocol, it is not necessary to retest all selected model drugs for subsequent studies intended to classify a drug substance. Instead, a low and a high permeability model drug should be used as internal standards (i.e., included in the perfusion fluid or donor fluid along with the test drug substance). These two internal standards are in addition to the fluid volume marker (or a zero permeability compound such as PEG 4000) that is included in certain types of perfusion techniques (e.g., closed loop techniques). The choice of internal standards should be based on compatibility with the test drug substance (i.e., they should not exhibit any significant physical, chemical, or permeation interactions). When it is not feasible to follow this protocol, the permeability of internal standards should be determined in the same subjects, animals, tissues, or monolayers, following (or, if appropriate, in parallel to) evaluation of the test drug substance. The permeability values of the two internal standards should not differ substantially between experiments conducted to demonstrate the assay's method suitability and those for the test drug. For example, the laboratory may set acceptance criteria for the permeability values of its high, low, and zero permeability standard compounds.

At the end of an in vitro test, the amount of drug in the tissue or cell monolayer, apical and basolateral chambers should be determined to assist in calculation of mass balance. If recovery from the apical and basolateral chambers is > 80 percent, there is no need to measure drug in the tissue or cell monolayers.

When intestinal permeability methods are used to demonstrate high permeability, additional data to document the drug's stability in the GI tract is required. Please see method details in section III.B.3.

3. *Instability in the Gastrointestinal Tract*

Determining the extent of absorption in humans based on mass balance studies using total radioactivity in urine does

* KM Giacomini, SM Huang, DJ Tweedie, LZ Benet, KLR Brouwer, X Chu, A Dahlin, R Evers, V Fischer, et al. March 2010, The International Transporter Consortium, Membrane transporters in drug development, *Nature Reviews Drug Discovery*, 9:215–236.

† See the guidance for industry *Drug Interaction Studies—Study Design, Data Analysis, Implications for Dosing, and Labeling Recommendations*. When final, this guidance will represent the FDA's current thinking on this topic.

not take into consideration the extent of degradation of a drug in the GI fluid prior to intestinal membrane permeation. In addition, some methods for determining permeability could be based on loss or clearance of a drug from fluids perfused into the human and/or animal GI tract either in vivo or in situ. Documenting the fact that drug loss from the GI tract arises from intestinal membrane permeation, rather than a degradation process, will help establish permeability. Stability in the GI tract may be documented using simulated gastric and intestinal fluids. Obtaining GI fluids from human subjects requires intubation and may be difficult. Stability in the GI tract may therefore be documented using simulated gastric and intestinal fluids such as Gastric and Intestinal Fluids USP or, with suitable justification, other biorelevant media.

Drug solutions in these fluids should be incubated at 37°C for a period that is representative of in vivo drug contact with these fluids, for example, one hour in gastric fluid and three hours in intestinal fluid. Drug concentrations should then be determined using a validated stability- indicating assay method. Significant degradation (> 5 percent) of a drug in this study could suggest potential instability.

C. Determining Drug Product Dissolution Characteristics and Dissolution Profile Similarity[7]

Dissolution testing should be carried out in USP Apparatus 1 (typically at at 100 rpm) or USP Apparatus 2 (typically at 50 rpm, or at 75 rpm when appropriately justified) using 500 mL (or 900 mL with appropriate justification) of the following dissolution media: (1) 0.1 N HCl or Simulated Gastric Fluid USP without enzymes; (2) a pH 4.5 buffer; and (3) a pH 6.8 buffer or Simulated Intestinal Fluid USP without enzymes. For gelatin capsules and tablets with gelatin coating, Simulated Gastric and Intestinal Fluids USP (with enzymes) can be used.

The dissolution testing apparatus used in this evaluation should conform to the requirements in USP (<711> Dissolution) and FDA's guidance on Mechanical Calibration of Dissolution Apparatus 1 and 2.* Selection of the dissolution testing apparatus (USP Apparatus 1 or 2) during drug development should be based on a comparison of in vitro dissolution and in vivo PK data available for the product. The USP Apparatus 1 (*basket method*) is generally preferred for capsules and products that tend to float, and USP Apparatus 2 (*paddle method*) is generally preferred for tablets. For some tablet dosage forms, in vitro (but not in vivo) dissolution may be slow due to the manner in which the disintegrated product settles at the bottom of a dissolution vessel. In such situations, USP Apparatus 1 may be preferred over Apparatus 2, or alternatively rotation speed for Apparatus 2 may be modified with justification. If the testing conditions need to be modified to better reflect rapid in vivo dissolution (e.g., use of a different rotating speed), such modifications can be justified by comparing in vitro dissolution with in vivo absorption data (e.g., a relative BA study using a simple aqueous solution as the reference product).

A minimum of 12 dosage units of the test and reference drug product for each strength should be evaluated to support a biowaiver request. Samples should be collected at a sufficient number of intervals to characterize the entire dissolution profile of the drug product (e.g., 5, 10, 15, 20, and 30 minutes).

When comparing the test and reference products, dissolution profiles should be compared using a similarity factor (f_2).

$$f_2 = 50 \bullet \log\{[1 + (1/n)\,\Sigma^n (R_t - T_t)^2]^{-0.5} \bullet 100\}$$

The similarity factor is a logarithmic reciprocal square root transformation of the sum of squared error and is a measurement of the similarity in the percent of dissolution between the two curves; where n is the number of time points, R_t is the dissolution value of the reference batch at time t, and T_t is the dissolution value of the test batch at time t.

Two dissolution profiles are considered similar when the f_2 value is $\geq$ 50. To allow the use of mean data, the coefficient of variation should not be more than 20 percent at the earlier time points (e.g., 15 minutes), and should not be more than 10 percent at other time points. Only one measurement should be considered after 85 percent dissolution of both products. In addition, when both test and reference products dissolve 85 percent or more of the label amount of the drug in 15 minutes using all three dissolution media recommended above, the profile comparison with an f_2 test is unnecessary.

IV. BIOWAIVERS BASED ON BCS

This guidance is applicable for BA/BE waivers (biowaivers) based on BCS, for BCS class 1 and class 3 IR solid oral dosage forms.

For BCS class 1 drug products, the following should be demonstrated:

- the drug substance is highly soluble
- the drug substance is highly permeable
- the drug product (test and reference) is rapidly dissolving, and
- the product does not contain any excipients that will affect the rate or extent of absorption of the drug (see section V.A.)

For BCS class 3 drug products, the following should be demonstrated:

- the drug substance is highly soluble
- the drug product (test and reference) is very rapidly dissolving (see section II.C.), and
- the test product formulation is qualitatively the same and quantitatively very similar (see section V.A.)

* See the guidance for industry *The Use of Mechanical Calibration of Dissolution Apparatus 1 and 2 – Current Good Manufacturing Practice (CGMP).*

V. ADDITIONAL CONSIDERATIONS FOR REQUESTING A BIOWAIVER

When requesting a BCS-based biowaiver for in vivo BA/BE studies for IR solid oral dosage forms, sponsors/applicants should note that the following factors can affect their request or the documentation of their request.

A. Excipients

(i) BCS class 1 drug products: Excipients can sometimes affect the rate and extent of drug absorption. In general, using excipients that are currently in FDA-approved IR solid oral dosage forms will not affect the rate or extent of absorption of a highly soluble and highly permeable drug substance that is formulated in a rapidly dissolving IR product. To support a biowaiver request, the quantity of excipients in the IR drug product should be consistent with the intended function (e.g., lubricant). When new excipients or atypically large amounts of commonly used excipients are included in an IR solid dosage form, additional information documenting the absence of an impact on BA of the drug may be requested by the Agency. Such information can be provided with a relative BA study using a simple aqueous solution as the reference product. Excessive quantities of certain excipients, such as surfactants (e.g., polysorbate 80) and sweeteners (e.g., mannitol or sorbitol) may be problematic, and sponsors/applicants are encouraged to contact the review division* when this is a factor.

(ii) BCS class 3 drug products: Unlike for BCS class 1 products, for a biowaiver to be scientifically justified, BCS class 3 test drug product must contain the same excipients as the reference product. This is due to the concern that excipients can have a greater impact on absorption of low permeability drugs. The composition of the test product must be qualitatively the same (except for a different color, flavor, or preservative that could not affect the BA) and should be quantitatively very similar to the reference product. Quantitatively very similar includes the following allowable differences:

- Changes in the technical grade of an excipient
- Changes in excipients, expressed as percent (w/w) of the total formulation less than or equal to the following percent ranges:
  - Filler (± 10%)
  - Disintegrant, Starch (± 6%)
  - Disintegrant, Other (± 2%)
  - Binder (± 1%)
  - Lubricant, Calcium or Magnesium Stearate (± 0.5%)
  - Lubricant, Other (± 2%)
  - Glidant, Talc (± 2%)
  - Glidant, Other (± 0.2%)
  - Film Coat (± 2%)

The total additive effect of all excipient changes should not be more than 10 percent.

B. Prodrugs

Permeability of prodrugs will generally depend on the mechanism and (anatomical) site of conversion to the drug substance. When the prodrug-to-drug (i.e., active moiety) conversion is shown to occur predominantly after intestinal membrane permeation, the permeability of the prodrug should be measured. When this conversion occurs prior to intestinal permeation, the permeability of the drug should be determined. Dissolution and pH-solubility data on both prodrug and drug can be relevant. Sponsors may wish to consult with appropriate review staff[12] before applying the BCS approach to IR products containing prodrugs.

C. Fixed Dose Combinations Containing BCS Class 1, or Class 3, or a Combination of Class 1 and 3 Drugs

(i) If all active components belong to BCS class 1: BCS-based biowaivers are applicable for IR fixed dose combination products if all the drugs in the combination belong to BCS class 1, provided there is no PK interaction† between the components, and the excipients fulfill the considerations outlined in section V.A.(i). If there is a PK interaction, the excipients should fulfill the considerations outlined in section V.A.(ii). Otherwise, in vivo bioequivalence testing is required.

(ii) If all components of the combination belong to BCS class 3 or a combination of class 1 and 3: BCS-based biowaivers are applicable for IR fixed dose combination products in this situation provided the excipients fulfill the considerations outlined in section V.A.(ii). Otherwise, in vivo bioequivalence testing is required.

For fixed drug combination products where BCS classes 1 or 3 are combined with any other BCS class drugs, this biowaiver approach is not applicable.

* When the submission is for an NDA, contact the specific drug product's review division with questions. When the submission is for an ANDA, submit a Controlled Correspondence via email to GenericDrugs@fda.hhs.gov.

† See the guidance for industry *Drug Interaction Studies—Study Design, Data Analysis, Implications for Dosing, and Labeling Recommendations*. When final, this guidance will represent the FDA's current thinking on this topic.

D. Exceptions

BCS-based biowaivers are **not** applicable for the following:

1. *Narrow Therapeutic Index Drugs**
   This guidance does not apply to narrow therapeutic index (NTI) drug products because of the critical relationship between the bioavailable dose and clinical performance. Sponsors should contact the appropriate review division† to determine whether a drug should be considered to have a narrow therapeutic index.
2. *Products Designed to be Absorbed in the Oral Cavity*
   A request for a waiver of in vivo BA/BE studies based on the BCS is not appropriate for dosage forms intended for absorption in the oral cavity (e.g., sublingual or buccal tablets). Similarly, a biowaiver based on BCS for an orally disintegrating tablet can be considered only if the absorption from the oral cavity can be ruled out. The sponsor/applicant can discuss the information required to rule out absorption from oral cavity with the Agency.‡

VI. REGULATORY APPLICATIONS OF THE BCS–BASED BIOWAIVERS

A. INDs/NDAs

Evidence demonstrating in vivo BA or information to permit FDA to waive this evidence must be included in NDAs (21 CFR 320.21(a)). A specific objective of such BA information is to establish in vivo performance of the dosage form used in the clinical studies that provided primary evidence of efficacy and safety. Sponsors/applicants may wish to determine the relative BA of an IR solid oral dosage form by comparison with an oral solution, suspension, or intravenous injection (21 CFR 320.25(d)(2) and 320.25(d)(3)). The BA of the clinical trial dosage form should be optimized during the IND period.

Once the in vivo BA of a formulation is established during the IND period, waivers of subsequent in vivo BE studies, following changes in components, composition, and/or method of manufacture may be possible using the BCS-based waiver approach. BCS-based biowaivers are applicable to the to-be-marketed formulation when changes in components, composition, and/or method of manufacture occur to the clinical trial formulation, as long as the dosage forms exhibit either rapid or very rapid dissolution (as appropriate), have similar in vitro dissolution profiles (see sections II and III), and for a BCS class 3 IR drug product, it meets the criteria for allowabdifferences in composition described previously (see section V). This approach is useful only when the drug substance belongs to BCS class 1 or 3, and the formulations pre- and post-change are pharmaceutical equivalents (under the definition at 21 CFR 320.1(c)). BCS-based biowaivers are intended only for subsequent in vivo BA or BE studies. They do not apply to food effect BA studies or other PK studies. BCS-based biowaivers may be applicable for pharmaceutical alternatives including other oral dosage forms (e.g., powders), if appropriately justified. The sponsor should contact the appropriate review division in such situations.

B. ANDAs

BCS-based biowaivers are appropriate for IR generic drug products that meet the criteria for BCS class 1 or 3 as discussed in section II and III. The proposed drug product (i.e., test product) should exhibit similar dissolution profiles to the reference listed drug product (see sections II and III). The choice of dissolution apparatus (USP Apparatus 1 or 2) should be the same as that established for the reference listed drug product.

C. Supplemental NDAs/ANDAs (Postapproval Changes)

BCS-based biowaivers are appropriate for postapproval changes in components, composition and manufacturing process for an IR solid oral drug product that meets the criteria for BCS class 1 or 3 as discussed above, and both pre- and post-change products exhibit similar dissolution profiles (see sections II and III). This approach is useful only when the drug products pre- and post- change are pharmaceutical equivalents.

VII. DATA TO SUPPORT A BIOWAIVER REQUEST

As described above, the drug product for which a biowaiver is being requested should include a drug substance that is highly soluble (BCS class 1 and BCS class 3) and highly permeable (BCS class 1), and the drug product should be rapidly dissolving (BCS class 1) or very rapidly dissolving (BCS class 3). Sponsors/applicants requesting biowaivers based on the BCS should submit the following information to the Agency for review.

A. Data Supporting High Solubility

Data supporting high solubility of the test drug substance should be developed (see section III.A). The following information should be included in the application:

- A description of test methods, including information on analytical method(s) and composition of the buffer solutions.

* This guidance uses the term *narrow therapeutic range* instead of *narrow therapeutic index*, although the latter is more commonly used.
† See footnote 12.
‡ Ibid.

- Information on chemical structure, molecular weight, nature of the drug substance (acid, base, amphoteric, or neutral), and dissociation constants (pKa(s)).
- Test results (mean, standard deviation, and coefficient of variation) summarized in a table under solution pH, drug solubility (e.g., mg/mL), and volume of media required to dissolve the highest strength.
- A graphic representation of mean pH-solubility profile.

B. Data Supporting High Permeability

Data supporting high permeability of the test drug substance should be developed (Refer to section III.B. of this guidance: Determining Drug Substance Permeability Class). The following information and data should be included in the application:

- A description of test methods, including information on analytical method(s) and composition of the buffer solutions.
- A rationale for the dose or drug concentrations used in studies.
- For human PK studies, information on study design and methods used along with the PK data.
- For direct permeability methods, information supporting the suitability of a selected method that encompasses a description of the study method, criteria for selection of human subjects, animals, or epithelial cell line, drug concentrations in the donor fluid, description of the analytical method, method used to calculate extent of absorption or permeability, and where appropriate, information on efflux potential (e.g., bidirectional transport data).
- A list of selected model drugs along with data on extent of absorption in humans (mean, standard deviation, coefficient of variation) used to establish suitability of a method, permeability values for each model drug (mean, standard deviation, coefficient of variation), permeability class of each model drug, and a plot of the extent of absorption as a function of permeability (mean $\pm$ standard deviation or 95 percent confidence interval) with identification of the low/high permeability class boundary and selected internal standard. Information to support high permeability of a test drug substance (mean, standard deviation, coefficient of variation) should include permeability data on the test drug substance, the internal standards, GI stability information, data supporting passive transport mechanism where appropriate, and methods used to establish high permeability of the test drug substance.

C. Data Supporting Rapid, Very Rapid, and Similar Dissolution

For submission of a biowaiver request, an IR product should be rapidly dissolving (BCS class 1) or very rapidly dissolving (BCS class 3). Data supporting rapid dissolution attributes of the test and reference products should be developed (see section III.C). The following information should be included in the application:

- A description of test methods, including information on analytical method(s) and composition of the buffer solutions.
- A brief description of the IR products used for dissolution testing, including information on batch or lot number, expiry date, dimensions, strength, and weight.
- Dissolution data obtained with 12 individual units of the test and reference products using recommended test methods in section III.C for each of the proposed strengths. The percentage of labeled claim dissolved at each specified testing interval should be reported for each individual dosage unit. The mean percent dissolved, range (highest and lowest) of dissolution, and coefficient of variation (relative standard deviation), should be tabulated. A graphic representation of the mean dissolution profiles for the test and reference products in the three media should also be included.
- Data supporting similarity in dissolution profiles between the test and reference products in each of the three media (see section III.C.).
- Dissolution data supporting rapid or very rapid dissolution should be demonstrated for each strength to be marketed.

D. Additional Information

The manufacturing process used to make the test product should be described briefly to provide information on the method of manufacture (e.g., wet granulation versus direct compression).

A list of excipients used, and their intended functions should be provided for both the test and reference products. Ideally, excipients used in the test product should have been used previously in FDA-approved IR solid oral dosage forms. Please refer to section V.A. of this guidance for additional considerations pertaining to new excipients. In addition, it is important to provide a quantitative comparison of excipients between the test and reference product for BCS class 3 drug products.

ATTACHMENT A

This attachment includes model drugs suggested for use in establishing suitability of a permeability method as described in section III. Zero permeability markers and efflux substrates are also identified.

Group	Drug
High Permeability ($f_a \geq 85$ percent)	Antipyrine
	Caffeine
	Ketoprofen
	Naproxen
	Theophylline
	Metoprolol
	Propranolol
	Carbamazepine
	Phenytoin
	Disopyramide
	Minoxidil
Moderate Permeability ($f_a = 50$–84 percent)	Chlorpheniramine
	Creatinine
	Terbutaline
	Hydrochlorothiazide
	Enalapril
	Furosemide
	Metformin
	Amiloride
	Atenolol
	Ranitidine
Low Permeability ($f_a < 50$ percent)	Famotidine
	Nadolol
	Sulpiride
	Lisinopril
	Acyclovir
	Foscarnet
	Mannitol
	Chlorothiazide
	Polyethylene Glycol 400
	Enalaprilat
Zero Permeability	FITC-Dextran (MW $\geq$ 3000)
	Polyethylene Glycol 4000
	Lucifer
	Yellow
	Inulin
	Lactulose
Efflux Substrates	Digoxin
	Paclitaxel
	Quinidine
	Vinblastine

3 Product-Specific Guidance from FDA on the Development of Compressed Dosage Forms

To receive approval for an ANDA, an applicant generally must demonstrate, among other things, that its product has the same active ingredient, dosage form, strength, route of administration, and conditions of use as the listed drug, and that the proposed drug product is bioequivalent to the reference listed drug [21 USC 355(j)(2)(A); 21 CFR 314.94(a)]. Bioequivalent drug products show no significant difference in the rate and extent of absorption of the therapeutic ingredient [21 USC 355(j)(8); 21 CFR 320.1(e)]. Bioequivalence studies are undertaken in support of ANDA submissions with the goal of demonstrating bioequivalence between a proposed generic drug product and its reference listed drug. The regulations governing bioequivalence are provided at 21 CFR in part 320. The U.S. FDA has recently begun to promulgate individual bioequivalence requirements. To streamline the process for making guidance available to the public on how to design product-specific bioequivalence studies, the U.S. FDA continuously issues and updates product-specific guidance that includes bioequivalence testing protocols, dissolution testing and filing of biowaivers. www.accessdata.fda.gov/scripts/cder/psg/index.cfm?event=Home.Letter&searchLetter=A#letterSearchBar

Given in Table 1.3 are the current recommendations for the products of relevance to this specific volume of the book.

4 Guidance on Formulating Compressed Solids

BACKGROUND

Drug substances are most frequently administered as solid dosage formulations, mainly by the oral route. The drug substance's physicochemical characteristics, as well the excipients added to the formulations, all contribute to ensuring the desired therapeutic activity. Tablets and capsules are the most frequently used solid dosage forms, have been in existence since the nineteenth century, and are unit dosage forms, comprising a mixture of ingredients presented in a single rigid entity, usually containing an accurate dose of a drug. There are other types of solid dosage forms designed to fulfill specific delivery requirements, but they are generally intended for oral administration and for systemic delivery. The major solid oral dosage form is the tablet, and these can range from relatively simple, single, immediate-release dosage forms to complex modified-release systems. Tablets offer advantages for both patients and manufacturers (Table 4.1). Most tablets are intended to be swallowed whole and to rapidly disintegrate and release the drug in the gastrointestinal tract. Tablets are classified by their route of administration or their function, form, or manufacturing process. For example, some tablets are designed to be placed in the oral cavity and to dissolve there or to be chewed before swallowing, and there are many kinds of formulation designed for sustained or controlled release (Table 4.2).

TABLET TYPES

Tablets may be uncoated or coated. Uncoated tablets can be chewable tablets, effervescent tablets, lozenge tablets, soluble tablets, and sublingual tablets. Coated tablets are enteric-coated tablets, film-coated tablets, implants, sugar-coated tablets, and modified-release tablet.

Chewable Tablet:
A tablet which is intended to be broken and chewed in between the teeth before ingestion. Antacid and vitamin tablets are usually prepared as chewable tablets. Compressed lozenges (or troches) differ from conventional tablets in that they are nonporous and do not contain disintegrant. As the formulation is designed to release drug slowly in the mouth, it must have a pleasant taste, smoothness, and mouth feel. The choice of binder, filler, color, and flavor is therefore most important. The binder is particularly important in ensuring retardation of dissolution and pleasant mouth feel. Suitable binders include gelatin, guar gum, and acacia gum. Sugars such as sucrose, dextrose, and mannitol are preferred to lactose, and xylitol are often included in sugar-free formulations. In order to ensure adequate sweetness and taste masking, artificial sweeteners including aspartame, saccharin, and sucralose are also included subject to regulatory guidelines. They are given to children who have difficulty in swallowing and to adults who dislike swallowing.

Effervescent Tablet:
Efervescence is the reaction in water of acids and bases to produce carbon dioxide, and effervescent tablets are dissolved or dispersed in water before administration. An effervescent tablet is a tablet that contains acid substances and carbonate or hydrogen carbonate, which react rapidly in the presence of water to release carbon dioxide. Sodium bicarbonate, citric acid, and tartaric acid are added to the active ingredients to make the tablet effervescent. This preparation makes the tablet palatable. The advantages of effervescent formulations over conventional formulations are that the drug is usually already in solution prior to ingestion and can therefore have a faster onset of action. Although the solution may become diluted in the gastrointestinal tract, any precipitation should be as fine particles that can be readily redissolved. Variability in absorption can also be reduced. Formulations can be made more palatable, and there can be improved tolerance after ingestion. Thus, the types of drugs suited to this formulation method are those that are difficult to digest or are irritant to the mucosa. Analgesics such as paracetamol and aspirin and vitamins are common effervescent formulations. The inclusion of buffering agents can aid stability of pH-sensitive drugs. There is also the opportunity to extend market share and to deliver large doses of medication. Essentially, effervescent formulations are produced in the same way as conventional tablets, although due to the hygroscopicity and potential onset of the effervescence reaction in the presence of water, environmental control of relative humidity and water levels is of major importance during manufacture. A maximum of 25% relative humidity (RH) at 25°C is required. Closed material-handling systems can be used, or open systems with minimum moisture content in the ventilating air.

Lozenge Tablet:
Lozenges are tablets that dissolve or disintegrate slowly in the mouth to release drug into the saliva and are intended to produce a continuous effect on the mucous membrane of the throat. There is no disintegrating agent. The quality of the binding agent is increased so as to produce slow dissolution. They are easy to administer to pediatric and geriatric patients and are useful for extending drug form retention within the oral cavity. Suitable sweetening (sugar), coloring, and flavoring agents must be included in this formulation. Gum is used to give strength and cohesiveness to the lozenge and facilitate slow release of the active ingredient.Drug delivery can

TABLE 4.1
Advantages of Tablets as a Dosage Form

Easy to handle
Variety of manufacturing methods; can be mass produced at low cost
Consistent quality and dosing precision; can be self-administered
Enhanced mechanical, chemical, and microbiological stability compared with liquid dosage forms
Tamperproof
Lend themselves to adaptation for other profiles, e.g., coating for sustained release

TABLE 4.2
Types of Tablet Formulations

Formulation type	Description
Immediate-release tablet	Intended to release the drug immediately after administration
Delayed-release tablet	Drug is not released until a physical event has occurred, e.g., change in pH
Sustained-release tablet	Drug is released slowly over extended time
Soluble tablets	Tablet is dissolved in water prior to administration
Dispersible tablet	Tablet is added to water to form a suspension prior to administration
Effervescent tablet	Tablet is added to water, releasing carbon dioxide to form an effervescent solution
Chewable tablet	Tablet is chewed and swallowed
Chewable gum	Formulation is chewed and removed from the mouth after a directed time
Buccal and sublingual tablets	Tablet is placed in the oral cavity for local or systemic action
Orally disintegrating tablet	Tablet dissolves or disintegrates in the mouth without the need for water
Lozenge	Slowly dissolving tablet designed to be sucked
Pastille	Tablet comprising gelatin and glycerin designed to dissolve slowly in the mouth

be either for local administration in the mouth, such as anaesthetics, antiseptics, and antimicrobials, or for systemic effects if the drug is well absorbed through the buccal lining or is swallowed. More traditional drugs used in this dosage form include phenol, sodium phenolate, benzocaine, and cetylpyridinium chloride. Decongestants and antitussives are in many over-the-counter (OTC) lozenge formulations, and there are also lozenges that contain nicotine (as bitartrate salt or as nicotine polac rilex resin), flurbiprofen (Strefen), or mucin for treatment of dry mouth (A.S Saliva Orthana). Lozenges can be made by molding or by compression at high pressures, often following wet granulation, resulting in a mechanically strong tablet that can dissolve in the mouth.

Soluble Tablet:
A tablet that dissolves completely in liquid to produce a solution of definite concentration. Mouth washes, gargles, skin lotions, douches, antibiotics, certain vitamins, and aspirin are given in this formulation.

Sublingual Tablet:
A drug which is destroyed or inactivated within the gastrointestinal tract but can be absorbed through the mucosal tissue of the oral cavity is usually given in this formulation. The tablet is required to be placed below the tongue for the slow release of drug. But for immediate effect, some medicaments are formulated in such a way as to dissolve within 1 to 2 minutes. Nitroglycerin is prepared in such a formulation.

Implant:
A small tablet that is prepared for insertion under the skin by making a small surgical cut into the skin, which is stitched after the insertion of the tablet. This tablet must be sterile. The drug used in this preparation is usually water insoluble, and the tablet provides a slow and continuous release of drug over a prolonged period of time, ranging from 3 to 6 months or even more. Contraceptive tablets are formulated as implants.

Modified-Release Tablet:
Modified-release tablets are either uncoated or coated. They contain special additives or are prepared by a special procedure, which, separately or together, is intended to modify the rate of release of the drug into the gastrointestinal tract. It prolongs the effect of the drug and also reduces the frequency of administration of the drug. Several drugs are available in modified-release tablets, such as indomethacin.

Mini-Tablet:
Mini-tablets are a popular finished dosage form presentation since they offer the benefits of multi-particulates while using established tableting technology, typically rotary presses with minor modifications. Mini-tablets consist of round, cylindrical tablets—typically 2 to 3 mm in diameter—that are produced by direct compression. They provide a smooth substrate for modified-release coating using either conventional perforated coating pans or fluid-bed apparatus. Mini-tablets offer finished dosage form flexibility in that they can be delivered as capsules or sachets or compressed into larger tablets. Mini-tablets are finding increasing use as pediatric and geriatric dosage forms, since they are easier to swallow than conventional tablets and capsules. In addition, they can be used to meet a full range of dissolution profiles, including delayed-release, controlled-release, and combination-release profiles. Mini-tablets are simple to manufacture using conventional processing equipment.

3D Printed Tablets (https://www.fda.gov/drugs/newsevents/ucm588136.htm):
Most drug products are typically manufactured in large quantities using conventional methods that involve large-scale processes and equipment and a long production time. Emerging advanced manufacturing technology may transform the way some pharmaceuticals are made. One such advanced technology is three-dimensional (3D) printing. 3D printing can offer a tantalizing step toward changing the manufacturing processes to offer personalized medicines. 3D printing is a form

of additive manufacturing in which a 3D object is built by depositing building materials in successive layers according to a predesigned 3D geometric structure. 3D printing of pharmaceuticals is a unique approach that allows the manufacture of solid drug products in various shapes, geometric designs, strengths, and spatial distributions of the active and inactive ingredients. 3D structures ranging from a simple one-compartmental design to complex multi-compartmental designs can be produced. The release profile of the active ingredients from these 3D complex drug products can be tailored to meet the needs of specific patients.

Orally Disintegrating Tablets (ODT) (https://www.fda.gov/downloads/Drugs/.../Guidances/ucm070578.pdf):
An ODT has previously been distinguished as a separate dosage form because of the specific, intended performance characteristics of such a product, which are rapid oral disintegration in saliva with no need for chewing or drinking liquids to ingest these products. These characteristics, which are an aid to patient use and compliance, are the primary characteristics that constitute the basis for classifying a product as an ODT. Products labeled as ODTs should match the primary characteristics for this dosage form (identified above). Based on the original product rationale and Agency experience, the FDA recommends that, in addition to the original definition, ODTs be considered solid oral preparations that disintegrate rapidly in the oral cavity, with an in vitro disintegration time of approximately 30 seconds or less, when based on the United States Pharmacopeia disintegration test method or alternative.

Chewable Lozenges:
Chewable lozenges are popular with the pediatric population, since they are“gummy type” lozenges. Most formulations are based on a modified suppository formula consisting of glycerin, gelatin, and water. These lozenges are often highly fruit flavored and may have a slightly acidic taste to cover the acrid taste associated with glycerin. Soft lozenges typically comprise ingredients such as polyethylene glycol (PEG) 1000 or 1450, or a sugar–acacia base. Silica gel can be added to prevent sedimentation, and again, this dosage form requires flavors and sweeteners to aid compliance. Soft lozenges tend to dissolve faster than gelatin bases and can be used if taste masking is not effective.

Coated Tablets:
Tablets are often coated to protect the drug from the external environment, to mask bitter tastes, to add mechanical strength, or to enhance ease of swallowing. A coating can also be used for aesthetic or commercial purposes, improving product appearance and identity.

Enteric-Coated Tablets:
Some drugs are destroyed by gastric juice or cause irritation to the stomach. These two factors can be overcome by coating the tablet with cellulose acetate phthalate. This polymer is insoluble in gastric contents but readily dissolves in intestinal contents. So, there is a delay in the disintegration of the dosage form until it reaches the small intestine. Like coated tablets, enteric-coated tablets should be administered in the whole form. The broken or crushed form of the enteric coated tablet causes destruction of the drug by gastric juice or irritation to the stomach. Enteric-coated tablets are comparatively expensive.

Sugar-Coated Tablets:
Sugar coating can be beneficial in masking tastes, odors, and colors. It is useful in protecting against oxidation, and sugar coating was once very common due to its aesthetic results and cheapness of materials. Its use has declined in recent years due to the complexity of the process and the skills required, but advances in technology have led to a resurgence in popularity. Typical excipients used are sucrose (although this can be substituted with low-calorie alternatives), fillers, flavors, film formers, colorants, and surfactants. It is usually carried out in tumbling coating pans and comprises several stages. The first sealing stage uses shellac or cellulose acetate phthalate, for example, to prevent moisture from reaching the tablet core. This has to be kept to a minimum to prevent impairment of drug release. The subcoating is an adhesive coat of gum (such as acacia or gelatin) and sucrose used to round off the edges, and the tablets can be dusted with substances such as kaolin or calcium carbonate to harden the coating. A smoothing coat is built up in layers using 70% v/v sucrose syrup and often opacifiers such as titanium dioxide, and the tablets are dried between applications. A colorant is added to the final few layers and followed with a final polishing step, which can make further embossing difficult. The coating is relatively brittle, prone to chipping or cracking, and there is a substantial increase in weight, up to 50%, and size of the product.

Compression Coating and Layered Tablets:
A coating can be applied by compression using specially designed tablet presses. The same process can be used to produce layered tablets, which can comprise two or even three layers if complete separation of the ingredients is required. This process is used when physical separation of ingredients is desired due to incompatibility or to produce a repeat-action product. The formulation can also be designed to provide an immediate and a slow-release component. Release rates can be controlled by modification of the geometry, the composition of the core, and the inclusion of a membrane layer. The technique involves using a preliminary compression step to produce a relatively soft tablet core, which is then placed in a large die containing coating material. Further coating material is added and the content compressed. A similar light compression is used for the production of layers, and a final main compression step is used to bind the layers together.

Film-Coated Tablets:
Film coating, although most often applied to tablets, can also be used to coat other formulations, including capsules. Film coating imparts the same general characteristics as sugar coating, but weight gain is significantly less (typically up to 5%), it is easier to automate, and it has the capacity to include organic solvents if required. The main methods involved are modified conventional coating pans, side-vented pans, and fluid-bed coating. Celluloses are often used as film-forming polymers and usually require the addition of a compatible

plasticizer, as glass transition temperatures are higher than the temperatures used in the process. Polyethylene glycol, propylene glycol, and glycerol are commonly used, and colorants and opacifiers can also be added to the coating solution. Specialist coatings such as Opadry fx and Opaglos 2 can be used to give a high-gloss finish to improve brand identity and consumer recognition.

Tablet Wrapping or Enrobing:
Recent innovations in tablet coating include the use of gelatin and nonanimal-derived coatings for tablets that require the formulation of a preformed film that is then used to encapsulate the product (e.g., Banner's Soflet Gelcaps or Bioprogress' Nrobe technology).The coated formulations are tamper evident and can be designed with different colors for branding purposes. They are reported to be preferred by patients due to their ease of swallowing and superior taste and odor-masking properties. An alternative is the Press-fit Geltabs system, which uses a high-gloss gelatin capsule shell to encapsulate a denser caplet formulation.

FORMULATION FACTORS

Solid dose formulations, including tablets, must have the desired release properties coupled with manufacturability and aesthetics and must involve rational formulation design. The dose of the drug and its solubility are important considerations..The manufacturing of compressed solids is a complex process, requiring several steps to render powders compressible, yet easily dispersed, and with the active ingredient dissolved when placed at the site of administration. As a result, formulations that deliver the drugs to the site of action, while maintaining an appropriate stability profile, are valuable. However, a formulation, as described in this volume, requires an understanding of the manufacturing environment conducive to manufacturing a compliant dosage form. The sections in this chapter highlight some of these considerations that would benefit formulators. The topics of interest are presented in alphabetical order for quick reference.

I. ACTIVE PHARMACEUTICAL INGREDIENT

The active pharmaceutical ingredient (API) ultimately controls the quality of a product. The generic manufacturer faces a serious problem when procuring supplies of APIs coming off patent. Whereas Title 35 USC, Section 112, Paragraph 1 for patentability of an invention requires that the inventor fully disclose the invention, the fact is that "full disclosure" does not necessarily mean disclosing steps that do not appear material in the production of the raw material. For example, it is routine practice (though questionable) for inventors of new chemical entities (NCEs) not to describe every step needed to remove impurities, to obtain the correct crystal structure (of a polymorph), or to obtain the correct particle size in the manufacturing process. As a result, generic manufacturers face serious situations when trying to reproduce and replicate a branded product. The issue of impurities is serious, and the regulatory authorities are getting tougher. In most instances, an unidentified peak can result in the rejection of an application. If the manufacturer of an API is unable to control the impurity profile, serious problems can arise in the manufacturing of the products.

II. BIO VERSUS PRODUCTION BATCHES

It is important that the manufacturer compare the drug substance used to manufacture the stability batch, bioequivalence batch, or clinical batch and the drug substance used for commercial batches. Therefore, the specifications, analytical methods, and test results for the lots of the drug substance used to manufacture these batches should be written precisely. Because the safety of the drug may be based upon the types and levels of impurities, and different physical characteristics may affect dissolution or content uniformity, these data must be developed.

III. CLEANING VALIDATION

Solid drug powders can reach into deep cavities of the equipment, making the equipment difficult to clean. It is of utmost good manufacturing practice (GMP) importance that all equipment be entirely disassembled and thoroughly cleaned prior to switching to the manufacture of another drug. Appropriate standards of practice (SOP) validating cleanliness of equipment are required to assure compliance with the GMP. Problems arise in the use of highly potent, water-insoluble drugs, which are difficult to remove.

IV. COATINGS

Tablets may be coated for a variety of reasons, including protection of the ingredients from air, moisture, or light; masking of unpleasant tastes and odors; improvement of appearance; and control of the site of drug release in the gastrointestinal tract. Classically, tablets were coated with sugar applied from aqueous suspensions containing insoluble powders, such as starch, calcium carbonate, talc, or titanium dioxide, suspended by means of acacia or gelatin. For purposes of identification and aesthetic value, the outside coatings may be colored. The finished coated tablets are polished by applying dilute solutions of wax in solvents, such as chloroform or powdered mix. Water-protective coatings consisting of substances such as shellac or cellulose acetate phthalate are often applied out of nonaqueous solvents before the application of sugar coats. Excessive quantities should be avoided. The drawbacks of sugar coatings include the lengthy time necessary for application, the need for waterproofing, which adversely affects dissolution, and the increased bulk of the finished tablet.

These factors resulted in increased acceptance of film coatings. Film coatings consist of water-soluble or dispersible materials, such as hydroxypropyl methylcellulose, methylcellulose, hydroxypropyl cellulose, carboxymethylcellulose sodium, and mixtures of cellulose acetate phthalate and PEGs applied out of nonaqueous or aqueous solvents. The evaporation of the solvents leaves a thin film that adheres directly to the tablet and allows it to retain the original shape,

including grooves or identification codes. Where the drug may be destroyed or inactivated by the gastric juice or where it may irritate the gastric mucosa, the use of "enteric" coatings is indicated. Such coatings are intended to delay the release of the medication until the tablet passes through the stomach.

V. COMPLIANCE WITH REGULATORY REQUIREMENTS

Compliance with the current good manufacturing practices (cGMP) in the manufacturing of solid dosage forms comprises three phases of the validation process: product development, design of the validation protocol, and demonstration runs (validation) of the equipment and process in the manufacture of full-scale commercial production batches. In all preapproval and postapproval inspections, the primary purpose is to assure compliance with validated processes.

The U.S. FDA issued specific guidelines that define process validation as establishing documented evidence that provides a high degree of assurance that a specific process will consistently produce a product while meeting its predetermined specifications and quality attributes. The three components of this definition include documented evidence, consistency, and predetermined specifications. Documented evidence includes the experiments, data, and analytical results that support the master formula, the in-process and finished product specifications, and the filed manufacturing process. With regard to consistency, several batches would have to be manufactured, using the full-scale batch size, to demonstrate that a process meets the consistency test. At least three batches are needed to demonstrate consistency.

VI. COMPRESSION PROCESS CONTROL

Compressed solids are subject to dissolution problems. As a result, compression parameters, such as hardness of tablets, are important. Generally, harder tablets are often difficult to eject and take longer to disintegrate. However, control of friability may require harder tablets. Newer compression equipment has built-in online monitoring of compressed culls. Where such systems are not available, continuous monitoring of compression is required to assure that the batch does not have highly diversified properties, including friability and hardness.

VII. CONTENT UNIFORMITY

Control of the physical characteristics of the excipient is important, because variations in such characteristics may also affect the performance of the dosage form. Changes in particle size of some excipient, for example, may affect content uniformity. Therefore, there is a need to test physical characteristics (particle size) for each batch of excipient. For many single-source excipients, particle size is a supplier specification and is usually tightly controlled. Having established a specification and not testing each lot of excipient upon receipt may be satisfactory in such cases. However, for some multisource excipients and where the dosage formulator expects to shift sources of supply, there may be differences in physical characteristics (particle size) that may affect dose uniformity and dissolution.

VIII. CROSS-CONTAMINATION

Environmental controls for cross-contamination and protection of operators must be considered when creating an appropriate environment. Of prime importance are pressure differentials, relative humidity (often, total grains of moisture are measured), temperature, and air changes. The regulatory requirements for segregation of penicillin and cephalosporin are well established. Similar situations arise when hormones and oncolytics are manufactured. Highly active drugs pose another set of problems, wherein a low level of contamination can seriously affect the health of the operators and also create a cross-contamination situation. Remember, highly potent drugs can contaminate other products easily, because there is always a threshold for preventing contamination. Generally, it is a good idea to manufacture potent drugs in separate areas.

IX. DESEGREGATION OF POWDERS

Differences in particle sizes, particle shapes, hydrophilicities of powder surfaces, strengths of crystal lattice, polymorphic structures, environmental humidities, powder surface electrostatic charges, and the force and the nature of force applied all make a difference to how powders mix and demix. Segregation is a typical characteristic, known for example by the separating of chaff from hay by shaking. The same process applies to mixing pharmaceutical ingredients in a mixer. The aim of mixing is to desegregate different powders, and it may require the use of some surfactants or other excipients to enhance the mixing or desegregation process. Overmixing, which increases electrostatic charges, can lead to segregation, particularly after lubricants are added. Lubricants, by nature, are often hydrophobic (such as magnesium stearate) and readily develop electrostatic charge. The validation process develops a rationale for mixing times at all stages, from the initial mixing to mixing with binding solutions to blending with lubricants. To reduce charges, lubricants are not sifted through finer meshes. Segregation may also occur in a tablet machine hopper, causing serious problems of content uniformity.

X. DISINTEGRATION TEST

A disintegration test is provided to determine compliance with the limits on disintegration stated in the individual monographs, except where the label states that the tablets or capsules are intended for use as troches, or are to be chewed, or are designed as modified-release dosage forms. Determine the type of units under testing from the labeling and from observation, and apply the appropriate procedure to six or more dosage units. Disintegration does not imply complete solution of the unit or even of its active constituent. Complete disintegration is defined as that state in which any residue of the unit, except fragments of insoluble coating or capsule

shell, remaining on the screen of the test apparatus is a soft mass having no palpably firm core.

The apparatus consists of a basket-rack assembly; a 1000 mL, low-form beaker, 138 to 155 mm in height, with an inside diameter of 97 to 110 mm for the immersion fluid; a thermostatic arrangement for heating the fluid between 35°C and 39°C; and a device for raising and lowering the basket in the immersion fluid at a constant frequency rate between 29 and 32 cycles per minute through a distance of not less than 5.3 cm and not more than 5.7 cm. The volume of the fluid in the vessel is such that at the highest point of the upward stroke, the wire mesh remains at least 2.5 cm below the surface of the fluid and descends to not less than 2.5 cm from the bottom of the vessel on the downward stroke. The time required for the upward stroke is equal to the time required for the downward stroke, and the change in stroke direction is a smooth transition rather than an abrupt reversal of motion. The basket-rack assembly moves vertically along its axis. There is no appreciable horizontal motion or movement of the axis from the vertical.

A. Uncoated Tablets

Place one tablet in each of the six tubes of the basket, and operate the apparatus, using water maintained at 37 ± 2°C as the immersion fluid, unless otherwise specified in the individual monograph. At the end of the time limit specified in the monograph, lift the basket from the fluid, and observe the tablets: all the tablets should have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: no fewer than 16 of the total of 18 tablets tested should disintegrate completely.

B. Plain Coated Tablets

Apply the test for uncoated tablets, operating the apparatus for the time specified in the individual monograph.

C. Delayed-Release (Enteric-Coated) Tablets

Place one tablet in each of the six tubes of the basket, and if the tablet has a soluble external coating, immerse the basket in water at room temperature for 5 minutes. Then operate the apparatus using simulated gastric fluid test solution (TS) maintained at 37 ± 2°C as the immersion fluid. After 1 hour of operation in simulated gastric fluid TS, lift the basket from the fluid, and observe the tablets: the tablets should show no evidence of disintegration, cracking, or softening. Operate the apparatus, using simulated intestinal fluid TS maintained at 37 ± 2°C as the immersion fluid, for the time specified in the monograph. Lift the basket from the fluid, and observe the tablets: all the tablets should have disintegrated completely. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: no fewer than 16 of the total of 18 tablets tested should disintegrate completely.

D. Buccal Tablets

Apply the test for uncoated tablets. After 4 hours, lift the basket from the fluid and observe the tablets: all the tablets should have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: no fewer than 16 of the total of 18 tablets tested should disintegrate completely.

E. Sublingual Tablets

Apply the test for uncoated tablets. Observe the tablets within the time limit specified in the individual monograph: all the tablets should have disintegrated. If 1 or 2 tablets fail to disintegrate completely, repeat the test on 12 additional tablets: no fewer than 16 of the total of 18 tablets tested should disintegrate completely.

XI. DISSOLUTION

This test is provided to determine compliance with the dissolution requirements, where stated in the individual dissolution testing monograph, for a tablet or capsule dosage form. Of the various types of available apparatus, use the one specified in the individual monograph. Where the label states that an article is enteric-coated, and a dissolution or disintegration test does not specifically state that it is to be applied to enteric-coated articles, the individual monograph should include how to handle it. For gelatin-coated tablets that do not conform to the dissolution specification, repeat the test as follows. Where water or a medium with a pH of less than 6.8 is specified as the medium in the individual monograph, the same medium specified may be used with the addition of purified pepsin that results in an activity of 750,000 units or less per 1000 mL. For media with a pH of 6.8 or greater, pancreatin can be added to produce not more than 1750 USP units of protease activity per 1000 mL.

XII. DISINTEGRATION AND DISSOLUTION

Disintegration is an essential attribute of tablets intended for administration by mouth, except for those intended to be chewed before swallowing and for some types of extended-release tablets. A disintegration test is provided, and limits on the times in which disintegration is to take place, appropriate for the types of tablets concerned, are given in the individual monographs. For drugs of limited water solubility, dissolution may be a more meaningful quality attribute than disintegration. A dissolution test is required in a number of monographs on tablets. In many cases, it is possible to correlate dissolution rates with the biological availability of the active ingredient. However, such tests are useful mainly as a means of screening preliminary formulations and as a routine quality control procedure.

XIII. DRUG SUBSTANCE CHARACTERIZATION

Characterization of the chemical and physical properties of a drug substance is one of the most important steps in the development of a solid dosage form. The identification of chemical properties, especially impurities, is very important. In addition, the physical properties of the API, such as solubility, polymorphism, hygroscopicity, particle size, density,

etc., must be addressed. The literature and actual experience demonstrate that the physical quality (e.g., particle size of raw materials) can sometimes produce a significant impact on the availability and clinical effect of the dosage form of a drug. Therefore, it is appropriate that the physical characteristics of a drug substance be characterized, the impact of the physical characteristics be determined, and a specification for the bulk drug product be established, if necessary.

XIV. DRYING PROCESS

Manufacturing formulas clearly specify how granules are to be dried. The temperature and length of drying are important, not only for losing a certain amount of moisture but also for achieving a specific granular structure. The end point of granulation is often described in terms of loss on drying (LOD), which is often characterized in terms of the Ohaus or Brabender index (e.g., LOD at 105°C for 1 hour) or an equivalent. Fluid-bed dryers and the newer granulator-vacuum dryers offer different rates of moisture loss and may form granules of different characteristics. The scale-up process should validate any changes in the equipment used and the technique used to dry granules. The validation should include compression tests and stability evaluations.

XV. DYES IN FORMULATIONS

Manufacturers choose to include dyes in formulations for several reasons: for aesthetics, for identification, and for hiding inevitable mottling. Dyes can be included in the cores or in coating solutions when used. The Appendix to this book includes several formulations for coating solutions. Certifiable color additives (FD&C Certified) are available for use in foods or pharmaceuticals as either "dyes" or "lakes." Dyes dissolve in water and are manufactured as powders, granules, liquids, or other special-purpose forms. Lakes are the water-insoluble forms of dyes. Lakes are more stable than dyes and are ideal for coloring products containing fats and oils or items lacking sufficient moisture to dissolve dyes. Typical uses include coated tablets, cake and doughnut mixes, hard candies, and chewing gums. It is imperative that the manufacturer seek clarification of the status of a particular dye or lake before using it, particularly if the product has to be shipped to other countries. Labeling requirements include identification of all color additives. (The Physician's Desk Reference (PDR) is a good source to use to learn which colors are used in a particular product. For generic manufacturers, this is a good starting point.)

XVI. EQUIPMENT

The formulations provided do not specify equipment, and the manufacturer is supposed to select appropriate equipment for the batch size required. The selection of equipment must be based on full knowledge of the limitations of the equipment. The following sections (A–D) briefly describe some issues associated with equipment.

A. Blenders

Many solid oral dosage forms are made by direct compression. Two types of mixers are generally used: low energy and high energy. The low-energy mixers represent the classic type of slow mixers, such as ribbon blenders, tumblers, and the planetary pony pan. The high-energy mixers include some basic features of the low-energy mixer, but also contain some type of high-speed blade, commonly termed an intensifier bar or chopper.

1. Pony Pan

This mixer has historically been used for the manufacture of wet granulations. Because of its open pan or pot, granulating agents, such as starch paste, could be added while mixing. Because it is usually open at the top to allow the mixing blades to penetrate the powder, mixing operations are usually dusty and can lead to potential cross-contamination problems. The usefulness of these mixers is limited to wet granulating. With this type of mixer, there is good horizontal (side-to-side) blending. However, vertical (top-to-bottom) mixing does not occur. Powder placed in the mixer first will be poorly mixed. Segregation or demixing is also a recognized problem. To minimize this problem, some manufacturers empty the pan contents halfway through the mixing cycle in an attempt to turn the powder over at the bottom of the mixer. To alleviate the problem of the lack of mixing along the sides or walls of the pan, manufacturers often use a handheld steel paddle at various times during mixing. This type of mixing is difficult to control and reproduce. Thus, it would be difficult to validate.

The potential for segregation and poor mixing along the sides and particularly the bottom of the pony blender makes this type of blender less desirable for the dry blending of granulations of drug products. Consequently, whenever such dry blending is encountered, the manufacturer should be alert to potential problems with blending validation and content uniformity. Whenever in-process samples of the granulation are collected as part of an investigation or inspection, the formula card and the weight of the dosage unit to be manufactured are needed for calculations.

2. Ribbon

In the ribbon blender, powder is mixed horizontally and vertically. Loading operations can be dusty. However, during the actual blending, it is enclosed, thereby limiting the amount of dust generated to the environment.

The major and potentially the most serious problem with the ribbon blender is that there is a "dead-spot" or zone at the discharge valve in some of these blenders. To compensate for this dead-spot, manufacturers recycle the powder from this area at some point during the mixing process. Obviously, there should be adequate and specific directions and procedures for ensuring that this critical step is performed. Another concern with this mixer is poor mixing at the ends of the center horizontal mixing bar and at the shell wall because of blade clearance. The level of powder placed in this mixer is

normally at the top of the outer ribbon blade, and as with other mixers, care must be taken not to overfill the mixer.

Cleaning problems, particularly at the ends of the ribbon blender where the horizontal bar enters the blender, have been identified. If manufacturers do not disassemble and clean the seals and packing between batches, they should have data to demonstrate the absence of foreign contaminants between batches of different products processed in the blender.

3. Tumbler

Common mixers of this type include the twin-shell and double cone. These mixers exert a gentle mixing action. Because of this mild action, lumps of powder will not be broken up and mixed. Powders may also clump due to static charges, and segregation can occur. Low humidity can contribute to this problem. Blending under very dry conditions was found to lead to charge buildup and segregation, while blending of some products under humid conditions led to lumping. More so than with other mixers, powder charge levels should not exceed 60% to 65% of the total volume of the mixer.

Fabricators of tumbler-type blenders identify the volume as the actual working capacity and not the actual volume of the blender. It is important to correlate the bulk density of the granulation with the working capacity of the blender.

4. High Shear (High Energy)

There are several fabricators of these mixers, including GRAL, Diosna, and Lodige or Littleford. These mixers are highly efficient and ideally suited for wet granulations. The end point of wet granulations can be determined by measurement on a gauge of the work needed to agitate the blend. The mixing vessel is enclosed, and dust only enters the environment when loading.

One of the problems associated with these mixers is the transfer or conversion of products blended in the older types of mixers to these blenders. Mixing times are going to be different, and the physical characteristics of the blend may also be different.

These mixers are efficient. For wet granulations, it is important to control the rate and amount of addition of the solvent. Because of their efficiency, drug substances may partially dissolve and recrystallize upon drying as a different physical form.

An intensifier bar in the center of the blender, which rotates at very high speeds, breaks down smaller and harder agglomerates. A major disadvantage of this type of blender is that the extremely high speed of the intensifier bar generates considerable heat that can sometimes result in the charring of some sugar-base granulations. It should be pointed out that these same comments are applicable to other high-energy mixers, which also rely on high-speed choppers to disperse powders. Also, between-product cleaning of the blender requires disassembly of the intensifier bar.

5. Plastic Bag

Any discussion of mixers would not be complete without addressing the plastic bag. Manufacturers have resorted to the blending or manufacture of a trituration in a plastic bag. Obviously, it is difficult to reproduce such a process, and there is the potential for loss of powder as a result of breakage or handling. When the plastic bag has been used, directions are usually not specific, and one would not know by reading the directions that a plastic bag was employed. The use of a plastic bag cannot be justified in the manufacture of a pharmaceutical product. In fact, it continues to be a popular method, as often mentioned in the formulations described in this treatise.

B. Dryers

Two basic types of dryers are used. One is the oven dryer, where the wet granulation is spread on trays and dried in an oven. The second dryer is the fluid-bed dryer, in which the wet granulation is "fluidized" or suspended in air. A third type, recently introduced, involves drying of granulations in vacuo while being mixed and processed. Generally, the fluid-bed dryer yields a more uniform granulation with spherical particles. However, this may result in compression problems that may require additional compression force to remedy these problems. It is not unusual to see manufacturers change from an oven dryer to a fluid-bed dryer. However, such a change should be validated for equivalency with conducted in vitro testing, such as hardness, disintegration, and comparative dissolution, and stability testing. Major changes in process details will require demonstration of bioequivalence.

Other issues of concern with drying include moisture uniformity and cross-contamination. Tray dryers present more moisture uniformity problems than fluid-bed dryers. Obviously, a dryer should be qualified for heat uniformity and a program developed to assure moisture uniformity in granulations at the end point of drying. With respect to fluid-bed dryers, moisture problems can occur if the granulation is not completely fluidized.

Regarding cross-contamination, oven dryers, particularly those in which air is recirculated, present cross-contamination problems because air recirculates through a common filter and duct. For fluid-bed dryers, the bag filters present cross-contamination problems. To minimize problems, manufacturers should use product-dedicated bags.

C. Tablet Compression Equipment

Another important variable in the manufacturing process is the tablet press or encapsulating machine. The newer dosage form equipment requires granulations with good flow characteristics and good uniformity. The newer tablet presses control weight variation by compression force and require uniform granulation to function correctly. The setup of the microprocessor-controlled tablet press usually includes some type of challenge to the system. For example, a short punch is sometimes placed among the other punches. If the press is operating correctly, it will sound an alarm when a lower- or higher-weight tablet is compressed.

Different tablet compression equipment can cause dose uniformity, weight uniformity, and hardness problems. For

example, vibrations during tablet compression can cause segregation of the granulation in the feed hopper. The speed of the machine can affect fill of the die and tablet weight. Therefore, as previously discussed, it is important to have specific operating directions.

Many unit operations now provide for blending in totes, with discharge of the tote directly into tablet compression equipment. Because of segregation problems at the end of discharge, tablets from the end of compression should be tested for content uniformity. The use of inserts in totes was shown to minimize segregation.

With regard to the newer computer-controlled tablet compression equipment, buckets of tablets are often rejected because of potential weight variation problems. The disposition of these tablets, as well as the granulation and tablets used to set up the press, should be in accordance with written methods. Reworking processes for culls must be validated.

With regard to encapsulation operations, the hygroscopic nature of gelatin capsules and some of the granulations requires humidity controls for storage of the empty capsules and their subsequent filling. Scale-up of capsule products also presented some problems because of the different types of encapsulation equipment. Older equipment that operated on gravity fill, such as the Lilly and Parke-Davis machines, was commonly used for manufacturing capsules in clinical manufacturing areas. When formulations were scaled up to high-speed encapsulation equipment, flow problems and poor weight variation resulted. Additionally, some of the newer equipment provides for the formation of a slug, which could impact dissolution.

D. Coating Equipment

Many tablets are now coated with an aqueous film coat that is usually very soluble. Current technology provides for fixed sprays of the coating solution. The volume of coating solution, rate, and temperature can be controlled by some of the more highly automated operations. However, for many sugar-coated, enteric-coated, and delayed-release products, some portions of the coating process are not highly soluble and are performed manually. Generally, the shellac undercoat used for sugar-coated tablets presented disintegration and dissolution problems, particularly in aged samples.

With respect to poor disintegration, ferrous sulfate tablets probably represent the classical example. Over the years, there have been many recalls from many different manufacturers for poor disintegration of coated ferrous sulfate tablets. Likewise, there have been many problems with poor dissolution attributed to the coating process. Again, the shellac undercoat hardens, and even sometimes cracks, resulting in poor dissolution.

The numbers of applications of coats, volume of coating solution in a specific application, and temperature of the solution during applications are parameters that need to be addressed. For example, the temperature of the application and even heat during drying can cause dissolution failures in aged tablets. Another problem associated with the coating process concerns the heat applied to products that are sensitive to heat. For example, it was shown that estrogen tablets are heat sensitive and exhibited stability problems. Thus, it is important to control this phase of the process.

There are a few products, such as some of the antihistamine tablets, in which the drug substance is applied during the coating process. Other products require the active drug substance to be applied as a dust on tacky tablets as part of the coating process. For these products, it is particularly important to apply the drug in the coating solution in many controlled applications.

Again, it is important as part of the validation of these processes to demonstrate dose uniformity and dissolution and control the parameters of the coating process.

XVII. EXCIPIENTS

Excipients are well defined in the official pharmacopeia. No specific pharmaceutical grades are specified in this book, except where there is a specific reason to do so. However, it is known that different pharmacopeias may have different specifications, such as particle size, impurities, moisture, etc. The harmonization of excipients, a global effort that is underway, would go a long way in making the choice of excipients. The manufacturer is referred to http://www.ipecamericas.org/index.html and the *Handbook of Pharmaceutical Excipients* for further advice. A large number of proprietary excipients are widely used, such as Ac-Di-Sol®, Explotab®, Aerosil®, Ludipress®, Avicel®, etc., and many of these are now part of pharmacopeias. There is a significant advantage, though the cost is high, in using these ingredients, because they offer additional benefits, often reducing processing time. Additionally, the suppliers of these ingredients are always willing to provide formulation support and have large databases, particularly pertaining to stability of drugs, that may be of great value to manufacturers. The following sections (A–F) list the most commonly used excipients in compressed solids.

A. Coating Agent

Carboxymethylcellulose, sodium cellacefate (formerly cellulose acetate phthalate), cellulose acetate, cellulose acetate phthalate (see cellacefate), ethylcellulose, ethylcellulose aqueous dispersion gelatin glaze, pharmaceutical hydroxypropyl, cellulose hydroxypropyl methylcellulose, hydroxypropyl methylcellulose phthalate (see hypromellose phthalate), hypromellose phthalate (formerly hydroxypropyl methylcellulose phthalate), methacrylic acid copolymer, methacrylic acid copolymer dispersion, methylcellulose PEG, polyvinyl acetate, phthalate shellac sucrose, titanium dioxide wax, carnauba wax, microcrystalline zein.

B. Glidant

Calcium silicate, magnesium silicate, silicon dioxide, colloidal talc.

C. Tablet Binder

Acacia alginic acid carboxymethylcellulose, sodium cellulose, microcrystalline dextrin ethylcellulose gelatin glucose, liquid guar gum hydroxypropyl methylcellulose, methylcellulose polyethylene oxide povidone starch, pregelatinized syrup.

D. Diluent

Calcium carbonate, calcium phosphate, dibasic calcium phosphate, tribasic calcium sulfate cellulose, microcrystalline cellulose, powdered dextrates, dextrin, dextrose, excipient, fructose, kaolin, lactitol, lactose, mannitol, sorbitol, starch, pregelatinized sucrose, sugar, compressible sugar, confectioner's sugar.

E. Disintegrant

Alginic acid cellulose, microcrystalline croscarmellose sodium, crospovidone polacrilin, potassium, sodium starch, glycolate starch, starch, pregelatinized.

F. Lubricant

Calcium stearate, glyceryl behenate, magnesium stearate, mineral oil, light PEG, sodium stearyl fumarate stearic acid, stearic acid, purified talc, vegetable oil, hydrogenated type I zinc stearate.

The choice of excipients is made based on three distinct considerations:

- Compatibility with the active drug—Many excipients have active functional groups that can interact with the active drug and enhance its degradation. Even the water of hydration or moisture in the excipients can create difficulties in solid-state degradation of the active drug; so, it is not only the selection of the ingredient but also the grade (such as anhydrous or hydrous) that is important.
- Effect on efficacy—Excipients are known to alter the release patterns (e.g., a strong binder would delay break-up of the tablet) and often bind the drug molecules in the gastrointestinal tract. The evaluation should be made in the full composition of ingredients, because the presence of two ingredients may change their individual characteristics.
- Cost of formulation—Even though excipients contribute a small cost of the total formulation, the declining cost of APIs makes the selection of excipients based on cost an important consideration. This is particularly true when generic manufacturers are filing ANDAs knowing well that they will compete on a price basis. However, the total cost of formulation should not only be calculated on the basis of excipients. Often, the use of expensive excipients reduces process time, eliminates certain process steps, and even allows the use of a cheaper packaging material. The manufacturer must, therefore, calculate the overall manufacturing cost. This aspect of formulation creates unique considerations by the multinational companies doing business worldwide; they are often forced to develop alternate formulations depending on the availability of excipients, manpower cost, and local environmental considerations.

The rule of thumb in the selection of excipients remains—keep it simple and at the bare minimum. The goal of excipient selection should be clearly defined—the dosage form yielding a solution form at a predetermined rate (not necessarily the fastest in all instances).

The formulations described in this volume provide a quantitative listing of excipients recommended. An astute formulator would know the need to alter their quantity based on the type of equipment used to process them, the size of the batch processed at one time, and the quality of compressed product obtained. Therefore, all quantitative listings of excipients must be considered the best starting point, which can be adjusted and optimized, if necessary. In many instances, a range of excipients is allowed, such as in the case of a binder solution, to yield a suitable mass (as is often described in the formulation of wet massing).

Where exact quantities of excipients are not available, but the excipients are identified for an innovator's product, this is still a better starting point than establishing the choice of excipients. Knowledge of the physicochemical characteristics of the API takes a more pivotal role when the information available is limited. Obviously, one can readily identify the role of the identified, but not quantified, excipients. Some experimentation is required. However, as provided throughout this volume, significant knowledge can be gained by benchmarking the formulation. Other similar drugs or excipients should provide a good clue to the starting quantities. It is noteworthy that in obtaining the copies of competitor NDAs through the Freedom of Information Act, some quantities are often redacted, leaving the formulator to guess. However, this should not be a difficult step as long as the quantities of excipients chosen provide a similar weight, thickness, and disintegration and dissolution characteristics.

A common practice by innovator companies, as the NCE gets closer to the patent term expiry, is to patent a variety of formulations; for example, in the case of Augmentin®, the innovator chose to patent a different combination of amoxicillin and clavulanic acid and developed a composition for pediatric therapy. The purpose of this exercise is to keep generic competition out; the generic product in some cases may be the same, but not exactly. The patent-end changes may also include changes in specification, choice of solvent systems used, or other cosmetic changes. However, a generic manufacturer would do well by just following the original formulation (for obvious reasons of regulatory compliance), because this has withstood the test of time. The author recommends that no changes should be made to an otherwise working formula, albeit this may improve processing, until such a time that the generic manufacturer has sufficient experience with the product. Most unusual things can happen when unsuspecting

changes, appearing benign on the surface, are made to proven formulas. Given the cost of bioequivalence study requirements for compressed solids, changes in formulation should not be made unless essential and, even then, only for compliance purposes.

XVIII. DIRECT COMPRESSION

The technology involved in direct compression assumes great importance in the tablet formulations, because it is often the cheapest means, particularly in the production of generics, that the active substance permits. The limiting factors are the physical properties of the active substance and its concentration in the tablets. Even substances such as ascorbic acid that are hardly suitable for direct compression, owing to the friability of their crystals, can normally be directly pressed into tablets at concentrations of 30% to 40%. However, this technique is not as suitable if the content of ascorbic acid is higher. This limit may be shifted upward by special direct compression auxiliaries: for example, Ludipress. Two important alternatives, Ludipress grades and Kollidon VA 64, can be found in the BASF line of pharmaceutical excipients for direct compression.

Ludipress is a speciality derived from lactose, Kollidon 30, and Kollidon CL. It thus combines the properties of a filler, binder, disintegrant, and flow agent and also often acts as a release accelerator. By virtue of its versatility, formulations containing it are usually very simple. It can also be combined with almost all active substances, with the exception of those that enter into a chemical interaction with lactose (Maillard reaction).

Active substances, for example many analgetics, behave very differently with Ludipress when the dosage is extremely high. Acetylsalicylic acid and metamizole can be pressed when little Ludipress has been added; ibuprofen requires a larger amount; and the fraction of Ludipress required in the tablets is too large for paracetamol (= acetaminophen).

An alternative to the Ludipress grades is the outstanding dry binder Kollidon VA 64 together with excipients (for example, calcium phosphate, microcrystalline cellulose, lactose, or starch) and a disintegrant (for example, Kollidon CL). This combination even allows 500 mg of paracetamol to be pressed into good tablets with a weight of 700 mg.

No other dry binder has a binding power and plasticity comparable to those of Kollidon VA 64. Plasticity, in particular, is an important parameter in direct compression. This property of Kollidon VA 64 is not adversely effected by increasing the pressure. The beneficial properties of Kollidon VA 64 can also be exploited for the production of concentrated active substance that is subsequently used for direct tableting. Kollidon VA 64 and Ludipress can also be combined with one another.

XIX. FILL WEIGHTS

Fill weights are provided in all formulations. These may not coincide with scale for many reasons, as described elsewhere: differences in the salt forms, hydrates, or overages added in manufacturing and also to provide the extra margin of variation in filling during fast compression operations.

XX. FINAL PACKAGING

A formulation design does not end with ensuring that good tablets are formed; it must allow for handling during packaging, such as sliding into blister sheets or dropping into bottles. Actual fill runs must be conducted, and then the finished product must be subjected to simulated, and finally, the actual rigors of shipping before finalizing a formulation. Be aware that during shipping, the product may be exposed to diverse and often harsh weather conditions. Silica gel is often placed in the finished packs, or cotton is inserted, mainly to provide moisture or absorb odor (in the case of cotton).

XXI. FINAL TESTING

Finished product testing, particularly assay, content uniformity, and dissolution, is required. In the review of dissolution test results, it is important to eventually see results close to 100% dissolution. In some cases, manufacturers profile the dissolution results only to the specification. However, if lower but still acceptable results are obtained (such as 85%), it is important to continue the test. This can be performed by increasing the speed of the apparatus. If a product completely dissolves, yet only results in a value of 85%, it may indicate some problem with the test. Likewise, high dissolution results (115%) also indicate some problem with the test. Obviously, unusual or atypical results should be explained in the validation report.

XXII. FINES

Solids, when ground to small particle sizes (as when passing through sieves or crushing granules), yield a distribution of various particle sizes. A certain amount of very fine particles, such as those passing #100 mesh, is required to fill in the gaps in a good compaction process; however, a large proportion of fines (as they are called) can create a problem in the flow or compaction of material. As a result, many master formulas require the reworking of fines back to granules. Any such recommendation should be carried out considering the type of processing and equipment used. These are mere suggestions; if a product compacts well, then it has the right proportion of fines.

XXIII. FORMULA EXCESSES

The difference between the scale and the quantity used for manufacturing is a result of either adjustment for the chemical form used (such as salt form for labeled base), hydrate forms (to compensate for additional water), potency variations (such as for antibiotics and biologicals), manufacturing excesses (for losses of drug during manufacturing), stability excesses

(to compensate for loss during the shelf life; this is most important for vitamin products), and solvent/hydration loss (such as during manufacturing).

XXIV. GEOMETRIC DILUTION

In all instances where low-dose drugs are manufactured, the mixing of ingredients should be done in a geometric dilution process; for example, a tablet containing 100 mg per tablet will first require mixing the active drug with a smaller quantity of excipient and then building up the volume to make sure the API is properly distributed. Further consistency to the product is imparted during the mixing of the granulated mixture.

XXV. GRANULATION/MIX ANALYSIS

A critical step in the manufacture of an oral solid dosage form is the blending of the final granulation. If uniformity is not achieved at this stage, then one could assume that some dosage units would not comply with uniformity requirements. The major advantage of blend analysis (from a uniformity perspective) is that specific areas of the blender that have the greatest potential to be nonuniform can be sampled. This is particularly true of the ribbon-type blender and planetary or pony-type mixers.

In some cases, such as for large or tumbler-type blenders, it is impractical to sample from the blender directly. In such cases, granulations or blends could be sampled at the time of blender discharge or directly from drums. If sampling from drums, samples from the top, middle, and bottom of each drum should be collected.

In most cases, sampling thieves are readily available for sampling the small quantities that need to be taken from key areas of the blender or the drums. If samples larger than one dosage unit must be collected, however, adequate provisions must be made to prevent excessive handling manipulation between the time of sampling and the time of analysis.

Good science and logic would seem to dictate that sample sizes of the approximate equivalent weight of the dosage unit should be sampled in order to test for uniformity. Many industrial pharmacy and engineering texts confirm this approach. Large granulation sample sizes, such as 1 oz, will provide little information with respect to uniformity. Generally, further mixing after sampling and prior to analysis can yield misleading results.

The acceptance criteria for granulation dose uniformity testing need to be continuously evaluated. Although many manufacturers evaluate dose uniformity using the compendial dose uniformity specifications (85–115% with a relative standard deviation [RSD] of 6–7.8), such specifications should be tighter where supported by the firm's historical data on the level of blend uniformity with its equipment for a given product. In many cases, compendial assay limits for the finished product (90–110% of label claim) are broad enough for this purpose, and most manufacturers should be able to demonstrate blend assay results well within these limits. If larger sample sizes are taken for assay to evaluate total composite assay, then the specific USP or filed criteria for assay should be used.

In addition to the analysis of blends for dose uniformity and potency, blends are tested for physical characteristics.

A major physical parameter used to demonstrate equivalence between batches is the particle size profile. This is particularly important for comparison of the biobatch with production batches and should be repeated when processes are modified or changed. The particle size profile will provide useful information for demonstrating comparability.

Particle size profiles are particularly important for tablets made by a wet granulation process. The size and even the type of granule can affect the pore size in a tablet as well as its dissolution. For example, dissolution failure may be attributed to a change in the milling screen size, yielding a granulation with larger granules. When coated, larger pores permit increased penetration into the tablet by the coating solution, resulting in slower dissolution.

Another test typically performed on the granulation, particularly when the wet granulation process is used, is LOD and moisture content. If organic solvents are employed, then residual solvent residues are also tested. In the validation of a drying process, LOD levels are determined before, during, and after drying in order to demonstrate times and levels. As with processing variables, levels (specifications) are established in the development phase, with the validation phase used to confirm the adequacy of the process.

XXVI. INGREDIENT WARNING

Whereas many organic solvents are removed, traces may remain, and these may cause reactions, particularly in children; additionally, appropriate consideration should be given to the choice of using lactose, to which some are intolerant, or the use of sulfites or preservatives to which patients may be allergic.

XXVII. IN-PROCESS TESTING

In-process testing is the testing performed on dosage forms during their compression/encapsulation stages to assure consistency throughout these operations. For tablets, individual tablet weights, moisture, hardness (compression force), and disintegration are performed. Because hardness and disintegration specifications are established during development and biobatch production, testing is performed to demonstrate equivalency (comparability) and consistency.

Specifications required to control the manufacturing process must be established and justified. This will require granulation studies, which would include blend uniformity, sieve analysis, and moisture. In the formulations provided in this book, the in-process milestones are not generally identified; the manufacturer is supposed to know this. Critical in-process testing stages for compressed solids are

- Assuring cleanliness of equipment
- Checking and recording temperature where specified for dissolving or mixing ingredients, such as in the making of binder solutions or slurries
- Testing of granules for content uniformity, flow rate, tap density, moisture content (LOD), or other specific testing, as required
- Testing of tablets during compression for weight, thickness, friability, and disintegration
- Final testing of weight, friability, content uniformity, disintegration, and dissolution
- Assay and finished product release

With regard to moisture, some tablets set up (harden) upon aging as a result of poor moisture control and inadequate specifications. For example, this was shown to be a major problem with carbamazepine tablets.

XXVIII. LOSS ON DRYING

This procedure determines the amount of volatile matter of any kind that is driven off under the conditions specified. Mix and accurately weigh the substance to be tested, and unless otherwise directed in the individual monograph, conduct the determination on 1 to 2 g. If the test specimen is in the form of large crystals, reduce the particle size to about 2 mm by quickly crushing. Take a glass-stoppered, shallow weighing bottle that has been dried for 30 minutes under the same conditions to be employed in the determination. Put the test specimen in the bottle, replace the cover, and accurately weigh the bottle and the contents. By gentle, side-wise shaking, distribute the test specimen as evenly as practicable to a depth of about 5 mm and not more than 10 mm in the case of bulky materials. Place the loaded bottle in the drying chamber, remove the stopper, and leave it in the chamber. Dry the test specimen at the temperature and for the time specified in the monograph. (*Note:* the temperature specified in the monograph is to be regarded as being within the range of ±2°C of the stated figure.) Upon opening the chamber, close the bottle promptly, and allow it to come to room temperature in a desiccator before weighing.

If the substance melts at a lower temperature than that specified for the determination of LOD, maintain the bottle with its contents for 1 to 2 hours at a temperature 5°C to 10°C below the melting temperature, and then dry at the specified temperature. Where the specimen under test is a tablet, use powder from no fewer than four tablets ground to a fine powder. Where the individual monograph directs that the LOD should be determined by thermogravimetric analysis, a sensitive electrobalance must be used. Where drying in vacuum over a desiccant is directed in the individual monograph, a vacuum desiccator or a vacuum drying pistol, or other suitable vacuum drying apparatus, must be used. When drying in a desiccator is specified, exercise particular care to ensure that the desiccant is kept fully effective by frequently replacing. Where drying in a capillary-stoppered bottle in vacuum is directed in the individual monograph, use a bottle or tube fitted with a stopper having a 225 ± 25 mm diameter capillary, and maintain the heating chamber at a pressure of 5 mm or less of mercury. At the end of the heating period, admit dry air to the heating chamber, remove the bottle, and with the capillary stopper still in place, allow it to cool in a desiccator before weighing.

Many pharmacopoeial articles are hydrates or contain water in adsorbed form. As a result, the determination of the water content is important in demonstrating compliance with the pharmacopoeial standards. Generally, one of the methods given next is called for in the individual monograph, depending upon the nature of the article. In rare cases, a choice is allowed between two methods. When the article contains water of hydration, method I (titrimetric), method II (azeotropic), or method III (gravimetric) is employed, as directed in the individual monograph.

XXIX. MANUFACTURING YIELDS

The formulas provided here include scale as well as quantities for 1000 tablets; often in a scale-up, yields must be calculated to extrapolate exact quantities needed for a specific batch size; yields vary because of differences in the tablet weight (within the specified range), losses in equipment, and losses to the environment. The exhaust or vacuum can carry with it a lot of product at times.

XXX. MASTER FORMULA

This document must include specific manufacturing directions for the full-scale commercial process, including in-process and finished product specifications. The cGMP-compliant master formula will have room for direct entry onto the documents of all critical parameters, such as temperature, mixing times, LOD, etc., beside signatures of the persons responsible for complying with the specifications. No specific guidelines are provided for the formatting of this document. However, those skilled in assuring compliance with the GMP know the art of capturing most eventualities that may arise in the manufacturing of the product. The key is to assure that no individual discretions are allowed.

XXXI. MULTIPLE-ITEM ENTRIES

In the formulations provided in this book, an ingredient may appear in multiple places; this is necessary so as to identify the different quantities used at different stages and at different times for different purposes. For example, the dry form of starch may be mixed with the drug and then used in the making of a paste for granulation. Similarly, solvents are often listed in many places.

XXXII. MULTIPLE STRENGTHS OF FORMULATIONS

The formulations disclosed in this book handle multiple strengths in two ways: one to adjust the fill weight of tablets and the other to provide a different formulation. There are specific reasons for this. Where the quantity of API is high, a

simple doubling of fill weight might not work, and an adjustment to the excipients will be required. On the other hand are products where the API is less than 1% of the total weight, in which case the formulation remains the same, with one of the major components, such as lactose or dicalcium phosphate, providing compensation for the additional weight. Then, the tablet can be compressed at the same weight.

XXXIII. NOVEL DRUG DELIVERY SYSTEMS

From osmotically driven release of the API to wax matrices to plastic "ghosts" (e.g., Gradumet®), the compressed solid dosage forms offer a variety of possibilities for incorporating novel drug delivery systems. It should be noted that the compression force required to manufacture the dosage form can deform a structured component; on the other hand, the high compression force and the resultant rise in temperature that is inevitable can be used to create unique dosage form designs. One such example is the use of PEG 6000 or 8000 in direct compression formulations. The compression pressures in a typical tableting machine or in a roller compactor are generally high enough to produce sufficient heat to melt the PEGs, which then congeal to provide adequate binding without the need for wet massing. The author has used this technique to formulate a myriad of drugs, particularly those subject to stability problems, such as vitamins. PEGs are compatible with most drugs, are cheap, and dissolve rapidly to release the drug. The author highly recommends using this technique to formulate directly compressible formulations instead of using the direct compression–grade raw materials, which are very expensive. Another technique that lends itself appropriately to solid compression is the use of solid solutions. Many drugs, when melted with water-soluble compounds, such as succinic acid, PEG, etc., congeal in a molecular dispersion, which, when placed in the gastrointestinal environment, releases the drug rapidly—it is already in a solution state. Wax embedding is another process (such as used for diltiazem) for moderating the release of drugs.

Briefly, the formulator has many tools available with which to formulate novel drug delivery systems with compression of solids. These techniques have, however, not been exploited as widely as their potential offers. Young formulators not yet biased by the need to follow a traditional route of formulating are encouraged to experiment with a myriad of possibilities, using components that have well proven their utility but in a different role. Remember, a temperature rise during the compression process is a source of energy that can be put to use.

XXXIV. PARTICLE COATING

Even though solid-state compression excludes moisture, which is the primary starting point in chemical degradation, these dosage forms are not impervious to atmosphere; this protection is generally provided by coating the final compressed dosage form, such as by sealing with waxes. However, there are instances where it may be necessary to coat the particles of the drug before incorporating them into formulations. There can be several reasons for doing this, besides imparting greater stability. It is done to mask the taste, for example, in chewable tablets, to improve flow in tablets comprising a larger proportion of the active drug, to impart specific release characteristics, or to protect the gastrointestinal mucosa (such as in the case of particle-coated iron tablets). Coated particles should be treated as a specialized form of excipient, which must be properly tested for its specifications prior to incorporation in the final dosage form. Most of the particle-coating methods involve a fluid-bed system or coating on a nonpareil bead.

XXXV. PRESERVATIVES IN COMPRESSED SOLID DOSAGE FORMULATIONS

As a rule of thumb, good formulations include only essential components. Because compressed solids have low moisture content, microbiological stability generally does not pose a problem, with few exceptions. However, in the wet granulation process, slurries or pastes are made that are water- based and are often kept for a few hours before being used, requiring the use of preservatives, particularly when gelatin is also used with starch. Generally, a standard combination of propylparabens and methylparabens would do. Preservatives are also included in compressed solids, where the compositions may be highly hygroscopic, resulting in localized liquefaction of powders that might promote microbial growth.

XXXVI. PUNCH SIZE AND SHAPE

The choice of punch size is dependent on the amount of API, the quantity of excipients needed to make it compressible, and what can be reasonably administered. Tablets ranging in weight from less than 100 mg to over 1 g are compressed in 6–15 mm diameter punches. The size is also important, because a proportion between thickness and diameter must be maintained. Thick tablets, such as a long cylindrical product, are difficult to eject from dies. Experienced machine operators know how well a tableting mix compresses on one punch size and shape, and it becomes difficult to compress using other shapes and sizes. Whereas round tablets are the easiest to compress (from a technical viewpoint of design of punches to ejection), manufacturers use all different shapes, from Bugs Bunny–shaped vitamins to diamond-shaped Viagra® tablets.

The formulations provided in this book may have to be altered to meet the compaction requirements of different punch shapes and sizes other than those recommended here. Concave punches (giving convex tablets) are made to reduce the contact of compressed material with the wall of the die. This makes ejection of a tablet easier. However, because of the shape, there may be more picking of tablets. In several formulations described here, biplanar flat, round punches are recommended. The identification marks or logos on the tablets create additional problems in the picking of tablets. The polishing of punches remains an essential part of good tablet compressing. Often, punches wear out fast, depending on the type of compression material used.

Regardless of what the supplier of a punch recommends, a punch must be replaced once it fails to provide the surface quality needed. Punches should ideally be replaced in groups and not individually (except to replace broken items).

XXXVII. REWORKING CULLS

During the setup of machines and through rejection, especially in automated rejection systems, there may be a substantial amount of culls available. In most instances, it would be prudent to just discard them; however, for expensive APIs, reworking can be done. An internal SOP should clearly define the proportion of rework allowed and how the calculations will be made to the bill of materials (BOM).

XXXVIII. SCALE-UP

Whereas the formulations given in this book are robust enough to be scaled up to most sizes, manufacturers may find the need to modify these to comply with scaled-up performance. For example, the quantity of lubricants, the amount of moisture, the size of the granules, etc., are all pertinent.

XXXIX. SEGREGATION

Particulate solids, once mixed, have a tendency to segregate by virtue of differences in the shape, size, and density (other variables are also important) of the particles of which they are composed. This process of separation occurs during mixing as well as during subsequent handling of the completed mix. Generally, large differences in particle size, density, or shape within the mixture result in instability in the mixture. The segregation process normally requires energy input and can be reduced following mixing by careful handling. One of the most common reasons for postblending (after adding lubricants) segregation is overblending. Lubricants develop electric charge very quickly, making compression difficult and altering the dissolution profile. A critical specification in the manufacturing method is the length of blending. Follow this strictly.

XL. SIFTING INGREDIENTS AND GRANULES

Whereas the specifications of starting materials are specified, the powders often form aggregates during storage; a point-of-use check of aggregation is needed. It is a good idea to sift all ingredients through specified sieves before adding them to mixing or blending vessels. For most raw materials, sifting through a #60 sieve (250 mm) is desired. Be aware that passing materials through finer sieves can generate electrostatic charges. Wet mass is passed through a #8 (2.38 mm) sieve, and dried granules are passed through a #16 (1.19 mm) mesh sieve. Lubricants should be sieved through a #60 mesh, except for magnesium stearate, which should not be shifted through an opening smaller than that of a #35 mesh. This is necessary to avoid building up electrical charges. A conversion chart for sieve sizes from U.S. Mesh to inches and microns (or millimeters) follows.

U.S. Mesh	Inches	Microns	Millimeters
3	0.2650	6730	6.730
4	0.1870	4760	4.760
5	0.1570	4000	4.000
6	0.1320	3360	3.360

270	0.0021	53	0.053
325	0.0017	44	0.044
400	0.0015	37	0.037

XLI. SPECIFICATIONS

The development of a product and its manufacturing process and specifications, the design of the validation protocol, and the demonstration (validation) runs of the full-scale manufacturing process require scientific judgment based on good scientific data. The in-process control and product specifications are established during the product development process, with the test batch serving as the critical batch used for the establishment of specifications. Specifications, such as hardness and particle size, should be established before validation of the process; these specifications should be included in the validation protocol. The use of product development runs of the process to establish specifications and demonstrate that the system is validated often causes problems.

XLII. STABILITY TESTING

Even though compressed solids offer a major advantage over other dosage forms in being the most stable, both chemically and physically, complete stability profiles must be developed

every time any change, albeit minor, is made in the formulation, the processing conditions, the equipment used, or even the manufacturing site used. This applies not just to drugs with known stability problems but even to highly stable drugs, such as erythromycin. Subtle alternations in formulation can bring such major unsuspected changes as prolonged disintegration and dissolution. The stability profiles are developed over a span of time to establish not only the chemical stability (providing the labeled quantity) but also the in vitro release characteristics. Stability testing is also required to be conducted in the specific temperature zone areas as dictated by compendia. This creates a significant problem for multinational companies selling products around the world, where different zone temperature stability requirements come into play. A universal formula is often difficult to design for this reason. Generic manufacturers must, therefore, take this aspect into consideration and mimic the formulations used by innovators in the world regions where these products are to be sold. Unfortunately, it is not as easy to obtain this information for formulations sold outside the United States. Some reverse engineering may be in order to accomplish this.

XLIII. STORAGE OF IN-PROCESS MATERIAL

At several stages during the manufacturing, the bulk material would have to be kept in quarantine, awaiting quality control (QC) results, such as LOD measurement, content uniformity of tableting mix, etc. The master formula should specify the conditions of storage and the length of a validated storage period. In some instances, silica gel is to be kept in the drums storing the product. Follow these instructions carefully. In most instances, the bulk should receive a final blending turnover before filling the compression hoppers; this is necessary to avoid any segregation of powders during storage or during transportation to and from the storage facility.

XLIV. TABLET FRIABILITY

This friability determination of compressed, uncoated tablets is generally applicable to most compressed tablets. Measurement of tablet friability supplements other physical strength measurements, such as tablet crushing strength. For tablets with a unit mass equal to or less than 650 mg, take a sample of whole tablets corresponding to 6.5 g. For tablets with a unit mass of more than 650 mg, take a sample of 10 whole tablets. The tablets should be carefully dusted prior to testing. Accurately weigh the tablet sample, and place the tablets in the drum. Rotate the drum 100 times, and remove the tablets. Remove any loose dust from the tablets, as before, and accurately weigh. If tablet size or shape causes irregular tumbling, adjust the drum base so that the base forms an angle of about 10 degrees with the benchtop, and the tablets no longer bind together when lying next to each other, which prevents them from falling freely.

Effervescent tablets and chewable tablets may have different specifications as far as friability is concerned, and these tablets normally require special packaging. In the case of hygroscopic tablets, a humidity-controlled environment (relative humidity less than 40%) is required for testing.

XLV. TABLET MANUFACTURING

Tablets are prepared by three general methods: wet granulation, dry granulation (roll compaction or slugging), and direct compression. The purpose of wet and dry granulation is to improve the flow of the mixture and to enhance its compressibility. Dry granulation (slugging) involves the compaction of powders at high pressures into large, often poorly formed tablet compacts. These compacts are then milled and screened to form a granulation of the desired particle size. The advantage of dry granulation is the elimination of heat and moisture in the processing. Dry granulations can be produced by extruding powders between hydraulically operated rollers to produce thin cakes that are subsequently screened or milled to give the desired granule size.

Excipients are available that allow production of tablets at high speeds without prior granulation steps. These directly compressible excipients consist of special physical forms of substances, such as lactose, sucrose, dextrose, or cellulose, which possess the desirable properties of fluidity and compressibility. The most widely used direct-compaction fillers are microcrystalline cellulose, anhydrous lactose, spray-dried lactose, compressible sucrose, and some forms of modified starches. Direct compression avoids many of the problems associated with wet and dry granulations. However, the inherent physical properties of the individual filler materials are critical, and minor variations can alter flow and compression characteristics so as to make them unsuitable for direct compression.

XLVI. TABLETS

Tablets are solid dosage forms containing medicinal substances with or without suitable diluents. They may be classed, according to the method of manufacture, as compressed tablets or molded tablets. The vast majority of all tablets manufactured are made by compression, and compressed tablets are the most widely used dosage form in the United States. Compressed tablets are prepared by the application of high pressures, utilizing steel punches and dies, to powders or granulations. Tablets can be produced in a wide variety of sizes, shapes, and surface markings, depending upon the design of the punches and dies. Capsule-shaped tablets are commonly referred to as caplets. Boluses are large tablets intended for veterinary use, usually for large animals. Molded tablets are prepared by forcing dampened powders under low pressure into die cavities. Solidification depends upon crystal bridges built up during the subsequent drying process and not upon the compaction force. Tablet triturates are small, usually cylindrical, molded, or compressed tablets. Tablet triturates were traditionally used as dispensing tablets in order to provide a convenient, measured quantity of a potent drug for compounding purposes. Such tablets are rarely used today. Hypodermic tablets are molded tablets

made from completely and readily water-soluble ingredients and formerly, were intended for use in making preparations for hypodermic injection. They are employed orally, or where rapid drug availability is required, such as in the case of nitroglycerin tablets, sublingually. Buccal tablets are intended to be inserted in the buccal pouch, and sublingual tablets are intended to be inserted beneath the tongue, where the active ingredient is absorbed directly through the oral mucosa. Few drugs are readily absorbed in this way, but for those that are (such as nitroglycerin and certain steroid hormones), there are a number of advantages. Soluble, effervescent tablets are prepared by compression and contain, in addition to active ingredients, mixtures of acids (citric acid, tartaric acid) and sodium bicarbonate, which release carbon dioxide when dissolved in water. They are intended to be dissolved or dispersed in water before administration. Effervescent tablets should be stored in tightly closed containers or moisture-proof packs and should be labeled to indicate that they are not to be swallowed directly.

Chewable tablets are formulated and manufactured so that they may be chewed, producing a pleasant-tasting residue in the oral cavity that is easily swallowed and does not leave a bitter or unpleasant aftertaste. These tablets have been used in tablet formulations for children, especially in multivitamin formulations, and for the administration of antacids and selected antibiotics. Chewable tablets are prepared by compression, usually utilizing mannitol, sorbitol, or sucrose as binders and fillers, and containing colors and flavors to enhance their appearance and taste.

Most compressed tablets consist of the active ingredient and a diluent (filler), binder, disintegrating agent, and lubricant. Approved FD&C and D&C dyes or lakes (dyes adsorbed onto insoluble aluminum hydroxide), flavors, and sweetening agents may also be present. Diluents are added where the quantity of active ingredient is small or difficult to compress. Common tablet fillers include lactose, starch, dibasic calcium phosphate, and microcrystalline cellulose. Chewable tablets often contain sucrose, mannitol, or sorbitol as fillers. Where the amount of active ingredient is small, the overall tableting properties are, in large measure, determined by the filler. Because of problems encountered with the bioavailability of hydrophobic drugs of low water solubility, water-soluble diluents are used as fillers for these tablets. Binders give adhesiveness to the powder during the preliminary granulation and to the compressed tablet. They add to the cohesive strength already available in the diluent. While binders may be added dry, they are more effective when added out of solution. Common binders include acacia, gelatin, sucrose, povidone, methylcellulose, carboxymethylcellulose, and hydrolyzed starch pastes. The most effective dry binder is microcrystalline cellulose, which is commonly used for this purpose in tablets prepared by direct compression. A disintegrating agent serves to assist in the fragmentation of the tablet after administration. The most widely used tablet disintegrating agent is starch. Chemically modified starches and cellulose, alginic acid, microcrystalline cellulose, and cross-linked povidone are also used for this purpose. Effervescent mixtures are used in soluble tablet systems as disintegrating agents. The concentration of the disintegrating agent, method of addition, and degree of compaction play roles in effectiveness. Lubricants reduce friction during the compression and ejection cycles. In addition, they aid in preventing adherence of tablet material to the dies and punches. Metallic stearates, stearic acid, hydrogenated vegetable oils, and talc are used as lubricants. Because of the nature of this function, most lubricants are hydrophobic and as such, tend to reduce the rates of tablet disintegration and dissolution. Consequently, excessive concentrations of lubricant should be avoided. PEGs and some lauryl sulfate salts have been used as soluble lubricants, but such agents generally do not possess optimal lubricating properties, and comparatively high concentrations are usually required. Glidants are agents that improve powder fluidity, and they are commonly employed in direct compression, where no granulation step is involved. The most effective glidants are the colloidal pyrogenic silicas. Colorants are often added to tablet formulations for aesthetic value or for product identification. Both D&C and FD&C dyes and lakes are used. Most dyes are photosensitive, and they fade when exposed to light. The U.S. FDA regulates the colorants employed in drugs.

XLVII. WATER-PURIFIED USP

As a general practice, the water used in wet granulation processes should be of at least the water-purified USP grade. Other grades are acceptable, provided their use can be validated, mainly for the reasons of microbiological quality and the presence of other dissolved solids.

XLVIII. WEIGHT VARIATION AND CONTENT UNIFORMITY

Tablets are required to meet a weight variation test where the active ingredient comprises a major portion of the tablet and where control of weight may be presumed to be an adequate control of drug content uniformity. Weight variation is not an adequate indication of content uniformity where the drug substance comprises a relatively minor portion of the tablet or where the tablet is sugar-coated. Thus, the pharmacopeia generally requires that coated tablets and tablets containing 50 mg or less of active ingredient, comprising less than 50% by weight of the dosage-form unit, pass a content uniformity test, wherein individual tablets are assayed for actual drug content.

XLIX. WET GRANULATION VERSUS DRY GRANULATION OR DIRECT COMPRESSION

Drug powders are often not easily compressible. Even if they are compressible, the small quantity that needs to be dispensed requires the adding of excipients for bulking the product; however, the addition of these compatible bulking agents may render the mixture less compressible. Books have been written on the physics of powder compression. In a nutshell,

the compression of powders involves the breaking of a crystal lattice and the rebonding of lattices to yield a unit structure. Binders provide the bridging gap between and among the ingredients that would rather stay apart (to put it simply). With compression machines, the requirement that powders fill the compression cavities as they are compressed no longer holds. The conundrum with powders is that they must flow easily to fill the cavities, but as the particle size gets smaller, the specific surface area increases, along with interparticulate friction that keeps the powder from flowing (angle of repose), subject to the individual characteristics of the chemical. Therefore, for the powders to easily flow into compression cavities, they must be present in granular form rather than in the form of fine powder. Powders can be converted to granular form by wetting them and drying to form the bonds between particles, particularly in the presence of binding agents (the most popular being starch). The wet granulation process, therefore, involves mixing the powders with a paste of starch (generally approximately 30%) or using polyvinylpyrrolidone (PVP) in an organic solvent to make a wet mass. In most instances, the characteristic of the wet mass is judged by how well it forms a mass as tested. The wet mass is then passed through a coarse mesh, spread on trays, and dried at 50°C to 60°C or directly placed in a fluid-bed dryer. The test of drying is that the LOD ranges from 1% to 3%. This is referred to as *wet granulation*. Dry granulation is a process where the active drug is mixed with ingredients that are inherently granular and compressible or are made by modifications through wet granulation to impart good flow ability and compressibility to the mix. Several APIs are also available in directly compressible grades, often coated to impart an additional element of chemical stability. Directly compressible aspirin or ascorbic acid are good examples. The cost of APIs rendered compressible is obviously higher; however, in the long run, it is cheaper to use directly compressible powders.

L. MULTIVARIATE METHODS IN TABLET FORMULATION

The discussion presented demonstrates that a large number of formulation variables inevitably come into play when formulating a solid dosage form; whereas each dosage form has its own focus on overcoming inherent difficulties, the release from solid dosage forms and their desirability make them the most widely studied. Drugs are mostly administered in formulated forms, and tablets account for more than 80% of all pharmaceutical dosage forms administered. The need to prepare an easily administered dose by mouth or other body cavities in a stable form and one that releases the drug on a timely basis has been the longest challenge for the pharmaceutical industry. As a result, tablets contain a large number of excipients, including fillers or diluents, binders or adhesives, disintegrants, lubricants and glidants, colors, flavors, and sweeteners; it might also be necessary to add miscellaneous components such as buffers, depending on the application. What constitutes an ideal combination of these ingredients is of great value to the formulators, since not only do they have to prepare an effective and stable formulation, but this must be done at the lowest possible cost. This evaluation is best made by using such statistical techniques as multivariate methods.

Multivariate techniques make use of statistical experimental design, especially designs that deal with optimization, where much effort is spent on obtaining detailed knowledge about the investigated domain, which may include the multivariate characterization of the excipients, in terms of both physical and spectral properties, together with principal component analysis (PCA), statistical experimental design in principal properties (PPs), and partial least squares projections to latent structures (PLS) analysis.

Component analysis: An $N \times K$ data matrix consists of N rows and K columns. The samples or objects in the rows are described by measured or calculated variables given in the columns. In a graphical illustration of a data matrix, the objects are a swarm of N points in a coordinate system of K variables. In cases where a number of objects are described by many variables, the variables tend to be correlated to some extent. This is especially true for spectral variables, where a high absorbance at one wavelength is usually accompanied by similar absorbance values at neighboring wavelengths. PCA uses this correlation to describe the variation in the data with a minimum number of orthogonal components. PCA corresponds to the least squares fitting of a straight line ($A = 1$) or an A-dimensional hyperplane to the data in the K-dimensional variable space. Objects are projected onto a subspace of lower dimension and receive new identities, t-values, often referred to as PPs or scores. The variation of the objects is summarized in the $(N \times A)$ matrix, which includes a score vector for each component. Score values from two principal components (PCs) together span a mathematical plane, often referred to as a score plot. Objects are projected onto the plane to form a two-dimensional model of the data. This facilitates the detection of groupings, trends, and outliers (deviating objects) in data sets. The process of detecting and diagnosing outliers is important both when fitting and when interpreting the model. An outlier may be an object that does not fit very well into the model, that is, one for which the distance to the model in X is too large to be accepted. Examining the residuals of that particular object will reveal the cause of the deviation. An outlier may, alternatively, be an object that lies far away from other objects in the score plot. Since PCA is a least squares technique, such an outlier may cause one of the PCs to run through it or very close to it, resulting in a skewed model. Such outliers should be removed on identification. PCA models can be calculated using the nonlinear iterative partial least squares (NIPALS) algorithm. The first component explains as much as possible of the variance, the second component is orthogonal to the first and explains as much as possible of the residual variance, and so on. The diversity of PCA applications makes it a very powerful tool in many situations. PCA can be used as a means to discover trends, groupings, and outliers in many types of data, to classify objects, as well as to reduce the number of dimensions and descriptive variables. The features of the PCA model of most interest in any

particular study will depend on the systems being investigated and the purposes of the study.

MSC and SNV: multiplicative scatter correction (MSC) is a method for linearization and scatter correction of near infrared (NIR). It is assumed that the factors affecting physical light scattering of a particular wavelength differ from the chemical factors affecting light absorption. Hence, a corrected spectrum should include only chemical information. In order to normalize the scatter level, an "ideal" sample, often the average of the data set, is used to correct data for each of the samples. The sample spectrum is regressed onto the average in order to calculate the additive offset and the multiplicative constant. MSC should be used carefully, as all the samples influence the correction terms, so a deviating sample could have adverse effects on the corrections. The standard normal variate transformation (SNV) is a method for removing unwanted variation from NIR spectra. In contrast to MSC, the correction is performed on an individual sample basis, thus eliminating the possible negative effects of a deviating sample. One of the drawbacks of using SNV, as well as MSC, is that potentially interesting information regarding the particle size is lost. In cases where a response matrix exists, there are other methods for removing noise from spectra. The concept of orthogonal signal correction (OSC) is a method for removing information in spectra that is not related to the response prior to investigation.

Missing data can be handled by NIPALS. As a rule of thumb, in order to use this approach, there should be five times as many observations in any row or column as the number of dimensions (A) being calculated. The missing values should also be randomly distributed.

Ultravariate characterization is the basis for multivariate design. Descriptive variables that are used to characterize the excipients (for example) may be either physical properties or other variables. Usually, a homogeneous group of constituents are put in the same group and characterized by the same variables; for example, the class of excipients commonly used as lubricants are described using literature data on relevant physical properties. By applying PCA to the descriptive data, the important information is extracted in a few PCs. The PCs are often referred to as *latent variables* or the PPs of the data set. Each excipient is assigned a score value in each PC. Thus, the excipients are compared and related on a continuous scale of PPs, which are assumed to reflect real differences in excipient properties, and greater distances between excipients along the PCs reflect greater differences in behavior.

LI. PHYSICAL PROPERTIES

Physical properties of the excipients (for example, particle size and bulk volume) influence the properties of the tablet. Determining physical properties of excipients demands a systematic approach and may consume substantial resources. To establish an optimal choice of excipients, screening experiments are conducted to gain knowledge about parameters that influence the measured results. The traditional approaches to experimental design are difficult to implement when choosing factors to use in a screening study investigating more excipients than can possibly be managed in a mixture design. One alternative is to use physical properties as factors (for example, viscosity or some measure of particle size) for each class of excipients. Only a limited number of descriptive variables can be used for each excipient class for a manageable number of experiments. Orthogonal factors can also be difficult to acquire; for example, it would be difficult to find an excipient with both a large mean particle diameter (a high setting in an imaginary design) and high density (also a high setting in such a design). These factors, together with factors such as LOD and particle shape, can clearly make the task of finding excipients representing extreme settings difficult or impossible. Use of a D-optimal selection from a candidate set described in a few variables could be a feasible option. This alternative has not been investigated by the author or reported in the literature. Another alternative is to use qualitative variables. The drawback of this approach is that only a few excipients, that is, levels in the design, can be included before the number of experiments becomes unfeasibly high. Using PPs and multivariate design instead of qualitative factors is a viable alternative if many excipients are to be included in a screening study. In many cases, of course, the resulting model will be less detailed compared with a model derived from a set of experiments where physical properties of one or a few excipients are studied. Nevertheless, it should at least give a good indication of areas in the multivariate domain that should be further explored, which may be sufficient in some cases.

LII. PARTICLE SIZE STUDIES

The particle size of a new drug substance is a critical parameter, as it affects every phase of formulation and its effectiveness. Appropriate particle size is required to achieve optimal dissolution rate in solid dosage forms and control sedimentation and flocculation in suspensions; a small particle size (2–5 μm) is required for inhalation therapy; and content uniformity and compressibility are governed by particle size. As a result, the preformulation studies must develop a specification of particle size as early as possible in the course of studies and develop specifications that need to be adhered to throughout the studies.

Conventional methods of grinding in a mortar or ball milling (where sample quantity is sufficient; generally it is not, and is limited to about 25–100 mg) or micronization techniques are used to reduce the particle size. The method used can have a significant effect on the crystallinity, polymorphic structures (often to amorphous forms), and drug substance stability that can range from discoloration to significant chemical degradation. Changes in polymorphic forms can be determined by performing X-ray powder diffraction (XRPD) before and after milling.

Micronization, where possible, allows increase in the surface area to the maximum, which can impact on the solubility, dissolution, and as a result, bioavailability. Since the aim of most preformulation studies is to determine if a solid dosage form can be administered, knowing that reduction of particle

size, where it changes dissolution rates, can be pivotal in decision making for the selection of dosage forms. In the process of micronization, the drug substance is fed into a confined circular chamber, where it is suspended in a high-velocity stream of air. Interparticulate collisions result in a size reduction. Smaller particles are removed from the chamber by the escaping air stream toward the center of the mill, where they are discharged and collected. Larger particles recirculate until their particle size is reduced. Micronized particles are typically less than 10 μm in diameter. In some instances, micronization can prove counterproductive, where it results in increased aggregation (leading to reduced surface area) or alteration of crystallinity, which must be studied using such methods as microcalorimetry, dynamic vapor sorption (DVS), or inverse gas chromatography (IGC).

The introduction of DVS in 1994 revolutionized the world of gravimetric moisture sorption measurement, bringing outdated time- and labor-intensive desiccator use into the modern world of cutting-edge instrumentation and overnight vapor sorption isotherms. With a resolution down to 0.1 μg, a 1% change in mass of a 10 mg sample on exposure to the humidity-controlled gas flow is both easily discernible and reproducible. DVS is a valued tool for studies related to polymorphism, compound stability, and bulk and surface adsorption effects of water and organic vapors. DVS studies would typically show percent mass increases, but often, a hysteresis loop relationship is observed, where there is crystallization of compound that results in the expelling of excess moisture. This effect can be important in some formulations, such as dry powder inhaler devices, since it can cause agglomeration of the powders and variable flow properties. DVS is a useful study when amorphous forms are involved upon size reduction; in many cases, a low level of amorphous character cannot be detected by techniques such as XRPD; microcalorimetry can detect <10% amorphous content (the limit of detection is 1% or less). The amorphous content of a micronized drug can be determined by measuring the heat output caused by the water vapor inducing crystallization of the amorphous regions.

Excellent instrumentation support and advice is available through Surface Measurement Systems, http://www.smsuk.co.uk/index.php, manufacturer of DVS-Advantage and DVS-1000 and 2000 series of equipment for dynamic vapor interaction studies. The DVS-HT represents the first new generation in gravimetric vapor sorption analyzers for more than a decade by Surface Measurement Systems (5 Wharfside, Rosemont Road, Alperton, Middlesex HA0 4PE, United Kingdom).

A. Particle Size Distribution

Particle size reduction particularly mandates study of particle size distribution studies using such techniques as sieving, optical microscopy in conjunction with image analysis, electron microscopy, the Coulter counter, and laser diffractometers, depending on the anticipated size of the particles. Whereas the size characterization is simple for spherical particles, study of irregular particles required specialized methods. The Malvern Mastersizer Series (http://www.malvern.co.uk/home/index.htm) is an example of an instrument that measures particle size by laser diffraction. The use of this technique is based on light scattered through various angles, which is directly related to the diameter of the particle. Thus, by measuring the angles and intensity of scattered light from the particles, a particle size distribution can be deduced. It should be noted that the particle diameters reported are the same as those that spherical particles would produce under similar conditions. In the former, each particle is treated as spherical and essentially opaque to the impinging laser light.

Two different light scattering methodologies can be used to characterize particles. The classical, also known as "static" or "Rayleigh" scattering or multi-angle light scattering (MALS), provides a direct measure of mass.

Dynamic light scattering (DLS), which is also known as "photon correlation spectroscopy" (PCS) or "quasi-elastic light scattering" (QELS), uses the scattered light to measure the rate of diffusion of the particles. This motion data is conventionally processed to derive a size distribution for the sample, where the size is given by the "Stokes radius" or "hydrodynamic radius" of the protein particle. This hydrodynamic size depends on both mass and shape (conformation). Dynamic scattering is particularly good at sensing the presence of very small amounts of aggregated particles and studying samples containing a very large range of masses. It can be quite valuable for comparing stability of different formulations, including real-time monitoring of changes at elevated temperatures. For submicron materials, particularly colloidal particles, QELS is the preferred technique. Two theories dominate the theory of light scattering: Fraunhofer and Mie. According to Fraunhofer theory, the particles are spherical, nonporous, and opaque; diameter is greater than wavelength; particles are distant enough from each other; there is random motion; and all the particles diffract the light with the same efficiency, regardless of size and shape. The Mie theory takes into account the differences in refractive indices between the particles and the suspending medium. If the diameter of the particles is above 10 μm, then the size produced by using each theory is essentially the same. However, discrepancies may occur when the diameter of the particles approaches that of the wavelength of the laser source.

Although laser light diffraction is a rapid and highly repeatable method of determining the particle size distributions of pharmaceutical powders, the results obtained can be affected by particle shape. Laser light scattering generally reports broader size distribution compared with image analysis. In addition, the refractive index of the particles can introduce an error of 10% under most circumstances and should be accounted for. Another laser-based instrument, relying on light scattering, is the Aerosizer (https://www.merit.com/endoscopy/pulmonary/airway-stents/aerosizer/). The Aerosizer measures particles one at a time in the range of 0.20 to 700 microns. The particles may be in the form of a dry powder or may be sprayed from a liquid suspension as an aerosol. The particles are blown through the system and dispersed in air to

a preset count rate. The Aerosizer operates on the principle of aerodynamic time of flight. The particles are accelerated by a constant, known force due to airflow and are forced through a nozzle at nearly sonic velocity. Smaller particles are accelerated at a greater rate than large particles due to a greater force-to-mass ratio. Two laser beams measure the time of flight through the measurement region by detecting the light scattered by the particles. Statistical methods are used to correlate the start and stop times of each particle in a particular size range (channel) through the measurement zone. The time of flight is used in conjunction with the density of the particles, and calibration curves are established to determine the size distribution of the sample.

LIII. SURFACE AREA

Since the surface area exposed to the site of administration determines how fast a particle dissolves in accordance with the Noyes–Whitney equation, these determinations are important. Also, in those instances where the particle size is difficult to measure, a gross estimation of surface area is the second best parameter to have to characterize the drug. The most common methods of surface area measurement include gas adsorption (nitrogen or krypton) based on what is most commonly described as the Brunauer, Emmett, and Teller (BET) method, applied either as a multipoint or as a single-point determination.

Adsorption is defined as the concentration of gas molecules near the surface of a solid material. The adsorbed gas is called adsorbate and the solid where adsorption takes place is known as the *adsorbent*. Adsorption is a physical phenomenon (usually called physisorption) that occurs in any environmental conditions (pressure and temperature), but only at very low temperature does it become measurable. Thus, physisorption experiments are performed at very low temperature, usually at the boiling temperature of liquid nitrogen at atmospheric pressure. Adsorption takes place because of the presence of an intrinsic surface energy. When a material is exposed to a gas, an attractive force acts between the exposed surface of the solid and the gas molecules. The result of these forces is characterized as physical (or van der Waals) adsorption, in contrast to the stronger chemical attractions associated with chemisorption. The surface area of a solid includes both the external surface and the internal surface of the pores.

Because of the weak bonds involved between gas molecules and the surface (less than 15 KJ/mole), adsorption is a reversible phenomenon. Gas physisorption is considered nonselective, thus filling the surface step by step (or layer by layer) depending on the available solid surface and the relative pressure. Filling the first layer enables the measurement of the surface area of the material, because the amount of gas adsorbed when the monolayer is saturated is proportional to the entire surface area of the sample. The complete adsorption/desorption analysis is called an adsorption isotherm.

Once the isotherm is obtained, a number of calculation models can be applied to different regions of the adsorption isotherm to evaluate the specific surface area (i.e., BET, Dubinin, Langmuir, etc.) or the micro and mesopore volume and size distributions (i.e., BJH, DH, H&K, S&F, etc.).

The surface area of a solid material is the total surface of the sample that is in contact with the external environment. It is expressed as square meters per gram of dry sample. This parameter is strongly related to the pore size and the pore volume; that is, the larger the pore volume, the larger the surface area, and the smaller the pore size, the higher the surface area. The surface area results from the contribution of the internal surface area of the pores plus the external surface area of the solid or the particles (in the case of powders). Whenever significant porosity is present, the fraction of the external surface area to the total surface area is small.

LIV. POROSITY

Most solid powders contain a certain void volume of empty space. This is distributed within the solid mass in the form of pores, cavities, and cracks of various shapes and sizes. The total sum of the void volume is called the porosity. Porosity strongly determines important physical properties of materials, such as durability, mechanical strength, permeability, adsorption properties, etc. The knowledge of pore structure is an important step in characterizing materials and predicting their behavior.

There are two main and important typologies of pores: closed and open pores. Closed pores are completely isolated from the external surface, not allowing the access of external fluids in either liquid or gaseous phase. Closed pores influence parameters such as density and mechanical and thermal properties. Open pores are connected to the external surface and are therefore accessible to fluids, depending on the nature/size of the pore and the nature of the fluid. Open pores can be further divided into dead-end and interconnected pores. Further classification is related to the pore shape, whenever it is possible to determine it. The characterization of solids in terms of porosity consists in determining the following parameters:

- *Pore size:* Pore dimensions cover a very wide range. Pores are classified according to three main groups depending on the access size:
  - Micropores: less than 2 nm diameter
  - Mesopores: between 2 and 50 nm diameter
  - Macropores: larger than 50 nm diameter
- *Specific pore volume and porosity:* The internal void space in a porous material can be measured. It is generally expressed as a void volume (in cubic centimeters or milliliters) divided by a mass unit (grams).
- *Pore size distribution:* It is generally represented as the relative abundance of the pore volume (as a percentage or a derivative) as a function of the pore size.
- *Bulk density:* Bulk density (or envelope density) is calculated by the ratio between the dry sample mass and the external sample volume.

- *Percentage porosity:* The percentage porosity is represented by the ratio between the total pore volume and the external (envelope) sample volume multiplied by 100.
- *Surface area:* See earlier for discussion.

LV. TRUE DENSITY

Density is the ratio of the mass of an object to its volume, and for solids, this term describes the arrangement of molecules. The study of compaction of powders is described by the Heckel equation. The densities of molecular crystals can be increased by compression. Information about the true density of a powder can be used to predict whether a compound will cream or sediment in a suspension such as a metered dose inhaler (MDI) formulation. Therefore, suspensions of compounds that have a true density less than these figures will cream (rise to the surface), and those that are denser will sediment. It should be noted, however, that the physical stability of a suspension is not merely a function of the true density of the material. The true density is thus a property of the material and is independent of the method of determination. In this respect, the true density can be determined using three methods: displacement of a liquid, displacement of a gas (pycnometry), or flotation in a liquid. Liquid displacement is tedious and tends to underestimate the true density; displacement of a gas is more accurate but needs relatively expensive instrumentation. As an alternative, the flotation method is simple to use and inexpensive.

Gas pycnometry is probably the most commonly used method in the pharmaceutical industry for measuring true density. Gas pycnometers rely on the measurement of pressure changes as a reference volume of gas, typically helium, is added to, or removed from, the test cell.

LVI. FLOW AND COMPACTION OF POWDERS

The flow properties of a powder will determine the nature and quantity of excipients needed to prepare a compressed or powder dosage form. This refers mainly to factors such as ability to process the powder through machines. To make a quick evaluation, the compound is compressed using an infrared (IR) press and die under 10 tons of pressure with variable dwell times, and the resulting tablets are tested with regard to their crushing strength after storing the tablets for about 24 hours. If longer dwell times result in higher crushing strength, then the material is likely plastic; elastic material will show capping at low dwell times; brittle material will not show any effect of dwell times. It is recommended that the compressed tablets be subjected to XRPD to record any changes in the polymorphic forms.

There appears to be a relationship between indentation hardness and the molecular structure of organic materials. However, a prerequisite for predicting indentation hardness is knowledge of the crystal structure. As a result, highly sophisticated computational methods and extensive crystallography libraries have recently become available to study this. For example, the Pfizer Research relies on the Cambridge Structural Database (CSD) (http://www.ccdc.cam.ac.uk/), the world repository of small molecule crystal structures. The CSD is the principal product of the Cambridge Crystallographic Data Centre (CCDC). It is the central focus of the CSD System, which also comprises software for database access, structure visualization and data analysis, and structural knowledge bases derived from the CSD. The CSD records bibliographic, chemical, and crystallographic information for organic molecules and metal–organic compounds whose 3D structures have been determined using X-ray diffraction or neutron diffraction. The CSD records results of single crystal studies and powder diffraction studies which yield 3D atomic coordinate data for at least all non-H atoms. In some cases, the CCDC is unable to obtain coordinates, and incomplete entries are archived to the CSD. The CSD is distributed as part of the CSD System, which includes software for search and information retrieval (ConQuest), structure visualization (Mercury), numerical analysis (Vista), and database creation (PreQuest). The CSD System also incorporates IsoStar, a knowledge base of intermolecular interactions that contains data derived from both the CSD and the Protein Data Bank (PDB). Some of the software listed here are available for free use.

X-ray microtomography, such as that available from Skyscan (https://www.bruker.com/products/microtomography/micro-ct-for-sample-scanning/skyscan-1272/overview.html), is used to analyze the effect of compaction on powder particles. It allows for the noninvasive 3D analysis of resulting structures and has shown that the structure may be controlled by the choice of pyrogen and the method of solvent removal. Simple seeding of the substrate surface with drug crystals can be used initially with a view to incorporating more sophisticated substrate polymorph approaches. The Skyscan-1172 represents a new generation in desk-top X-ray micro–computed tomography (CT) scan systems. A novel architecture in which both the sample stage and the X-ray camera are moveable allows an unprecedented combination of image resolution, sample size accommodation, scan speed, and sample throughput. This innovative flexible scanner geometry of the Skyscan-1172 is particularly advantageous over intermediate resolution levels, where scans are around 10 times faster (to obtain the same or better image quality) compared with previous scanners with a fixed source–detector design. The Skyscan-1172 features two X-ray camera options: the high-performance 10 megapixel option and the economy 1.3 megapixel option. The 10 megapixel camera allows the maximum scanning versatility, with an image field width of 68 mm (in dual image camera shift mode) or 35 mm (in standard single camera image mode). A nominal resolution (pixel size) of lower than 1 μm is attainable. A scannable height of around 70 mm allows for either large samples or automatic batch scanning of a column of smaller samples. The system obtains multiple X-ray "shadow" transmission images of the object from different angular views as the object rotates on a high-precision stage. From these shadow images, cross-sectional images of the object are reconstructed by a modified Feldkamp cone-beam algorithm, creating a complete 3D

representation of internal microstructure and density over a selected range of heights in the transmission images. The best micro-CT scan images are obtained from objects in which microstructure coincides with contrast in X-ray absorption of the sample's constituent materials.

LVII. COLOR

The color of a powder sample is used to indicate the presence of solvents, distribution of particle size, and other possible differences in different lots of a new lead compound. In some instances, degradation of drug can be correlated with color changes to such a degree that accurate color measurements can be used as a tool to provide a product specification. The compendia often describe the color of substances but mostly in subjective terms. Historically, the color evaluation has been a subjective measurement; however, newer quantitative measurement systems make this a more objective process. There are two basic methods for measuring the colors of surfaces.

- The first is to imitate the analysis made by the eye in terms of responses to three stimuli. This technique, known as "tristimulus colorimetry," sets out to measure X, Y, and Z directly.
- The second method is to determine reflectance (R) for each wavelength band across the range of the spectrum to which the eye is sensitive and then, to calculate the visual responses by summing products of R and the standard values for distribution of the sensitivity of the three-color responses.

The tristimulus method has theoretical advantages where the materials to be measured are fluorescent, but there are serious practical problems in assuming that a tristimulus colorimeter exactly matches human vision; that is, in eliminating color blindness from the instrument.

Two commonly used types of color measurement equipment are a colorimeter and a spectrophotometer. A tristimulus colorimeter has three main components:

- A source of illumination (usually a lamp functioning at a constant voltage)
- A combination of filters used to modify the energy distribution of the incident/reflected light
- A photoelectric detector that converts the reflected light into an electrical output

Each color has a fingerprint reflectance pattern in the spectrum. The colorimeter measures color through three wideband filters corresponding to the spectral sensitivity curves. Measurements made on a tristimulus colorimeter are normally comparative, the instrument being standardized on glass or ceramic standards. To achieve the most accurate measurements, it is necessary to use calibrated standards of similar colors to the materials to be measured. This "hitching post" technique enables reasonably accurate tristimulus values to be obtained even when the colorimeter is demonstrably colorblind. Tristimulus colorimeters are most useful for quick comparison of near-matching colors. They are not very accurate. Large differences are evident between the various instrument manufacturers. However, colorimeters are less expensive than spectrophotometers.

To get a precise measurement of color, it is advisable to use a spectrophotometer. A spectrophotometer measures the reflectance for each wavelength and allows tristimulus values to be calculated. The advantage over tristimulus colorimetry is that adequate information is obtained to calculate color values for any illuminant and that metamerism is automatically detected. Metamerism is a psychophysical phenomenon commonly defined incompletely as "two samples which match when illuminated by a particular light source and then do not match when illuminated by a different light source." In actuality, there are several types of metamerism, of which sample and illuminant metamerism are most common. In sample metamerism, two color samples appear to match under a particular light source and then do not match under a different light source. Illuminant metamerism appears when different light sources illuminate the same sample and differences are revealed. Observer metamerism refers to each individual perceiving color slightly differently. Geometric metamerism arises when identical colors appear different when viewed at different angles, distances, light positions, etc.

In a spectrophotometer, the light is usually split into a spectrum by a prism or a diffraction grating before each wavelength band is selected for measurement. Instruments have also been developed in which narrow bands are selected by interference filters. The spectral resolution of the instrument depends on the narrowness of the bands used for each successive measurement. In theory, a spectrophotometer could be set up to compare reflected light directly with incident light, but it is more usual to calibrate against an opal glass standard that has been calibrated by an internationally recognized laboratory. Checks must also be made on the optical zero, for example, by measurements with a black light trap, because dust or other problems can give rise to stray light in an instrument (which would give false readings). Spectrophotometers contain monochromators and photodiodes that measure the reflectance curve of color every 10 nm or less. The analysis generates typically 30 or more data points, with which a precise color composition can be calculated.

A large number of suppliers provide colorimeters, including a large array of equipment from HunterLab, whose Labscan XE, with a special adapter for small quantities of powders, offers an excellent choice in preformulation work. The instrument has a 3 mm port and requires 0.4 cm^3 powder to perform the testing (http://www.hunterlab.com/).

LVIII. ELECTROSTATICITY

When subjected to attrition, powders can acquire an electrostatic charge, the intensity of which is often proportional to the physical force applied, as static electrification of two dissimilar materials occurs by the making and breaking of surface contacts (tribo-electrification or friction electrification).

Electrostatic charges are often used to induce adhesive character to bind drugs to carrier systems; for example, glass beads coated with hydroxypropylmethyl cellulose-containing drugs. The net charge on a powder may be either electropositive or electronegative depending on the direction of electron transfer. The mass charge density can vary from 10^{-5} to 100 μC/kg depending on the stress, ranging from gentle sieving to a micronization process. This can be determined using electric detectors to determine polarity as well as the electrostatic field. The electrostaticity results in significant changes in the powder flow properties.

Studies on tribo-electrification and potential charge buildup on equipment and particle surfaces and subsequent adhesion due to static charge often overlook the fact that all materials (whether they have a net surface charge or not) exhibit surface energy forces that are very short range but come into play once surfaces are "touching." These van der Waals forces are due to the dispersive and polar surface energies inherent in material boundaries. Dry powders with mass-median particle sizes larger than around 100 to 200 μm seldom exhibit strong "cohesive" powder behavior, and such powders are usually described as "free flowing." As particle size decreases, however, the amount of surface area per unit mass increases, and surface energy forces have a greater influence on bulk powder flow characteristics. For contacting particles that are smaller than 2 to 20 μm, such forces can be strong enough to cause small amounts of plastic deformation on particle surfaces near the points of contact—even with no applied external loads. The bulk behavior of such fine powders can be dominated by their "cohesivity." It is well known that powders comprised of finer particles are more cohesive, and when very cohesive powders are placed in a rotating drum, they do not usually flow easily, nor do they form a smooth top surface. Instead, cohesive powders build up large overhanging "chunks" that can break off and collapse or cascade in random avalanches onto the material further down the slope. Placing the rotating drum in a centrifuge at an elevated G-level can cause a "nonflowable" cohesive powder to flow.

LIX. CAKING

Powders cake due to agglomeration as a result of factors such as static electricity, hygroscopicity, particle size, impurities of the powder, and storage conditions such as stress temperature, RH, storage time, etc. The mechanisms involved in caking are based on the formation of five types of interparticle bonds: bonding resulting from mechanical tangling, bonding resulting from steric effects, bonds via static electricity, bonds due to free liquid, and bonds due to solid bridges. During the process of micronization, the formation of localized amorphous zones can lead to caking, as these zones are more reactive to the factors described, especially when exposed to moisture; the mechanisms involve moisture sorption due to surface sintering and recrystallization at well below the critical RH. In most instances, increases in RH begin to show some impact at values above 20%, resulting in the most dramatic effects above 75% to 80% RH for powders that are subject to humidity effects.

LX. POLYMORPHISM

Because polymorphism can have an effect on so many aspects of drug development, it is important to fix the polymorph (usually the stable form) as early as possible in the development cycle. Whereas it is not necessary to create additional solid-state forms by techniques or conditions unrelated to the synthetic process for the purpose of clinical trials, regulatory submission of a thorough study of the effects of solvent, temperature, and possibly pressure on the stability of the solid-state forms is advised. A conclusion that polymorphism does not occur with a compound must be substantiated by crystallization experiments from a range of solvents. This should also include solvents that may be involved in the manufacture of the drug product; for example, during granulation.

While it is hoped that the issue of polymorphism is resolved during prenomination and early development, it can remain a concern when the synthesis of the drug is scaled up into a larger reactor or transferred to another production site. It is not unlikely that a metastable form identified in prenomination may not be reproduced in later batches of product because of some unrecorded conditions in the early phases of development. Related substances, whether identified or not, can significantly alter the predominance of a specific polymorph. To develop a reliable, commercial recrystallization process, the following scheme should be followed in the production of candidate drugs:

1. Selection of solvent system
2. Characterization of the polymorphic forms
3. Optimization of process times, temperature, solvent compositions, etc.
4. Examination of the chemical stability of the drug during processing
5. Manipulation of the polymorphic form, if necessary

Many analytical techniques have been used to quantitate mixtures of polymorphs; for example, XRPD has been used to quantitate the various polymorphs. Assay development requires the creation of calibration curves and validation, which can be a difficult task where mixed polymorphs are present and requires study to confirm that there is no polymorphic transformation during analysis or change in the hydration of crystals, if that is also a concomitant problem. Whereas at the preformulation stage, the dosage form considerations are still developing, there is a need to answer questions such as how a polymorph would change should it be subject to manufacturing equipment stress such as granulation or drying of granules, wet or dry granulation, and compression. In addition to the polymorphism of active drugs, excipients such as magnesium stearate can be present in various polymorphic forms that can significantly alter the behavior of active drug in the formulation stages. Studies using XRPD, IR, or scanning

electron microscopy (SEM) should be used for excipients as well as the active drug.

LXI. STABILITY STUDIES TO SELECT OPTIMAL DRUG AND EXCIPIENT COMBINATIONS

- Rapid screens of salts, solvates, hydrates, polymorphs, and cocrystals
- Large-scale preformulation and formulation studies
- Characterization of polymers, food ingredients, and fine particles
- Process optimization monitoring of surface and bulk chemistry
- QC of incoming raw materials
- Investigation of batch-to-batch variations in material formulations
- At-line process analytical technology (PAT) support of production performance to specifications

Whereas microcalorimetery remains the workhorse of studies, the use of IGC is becoming more popular to determine the changes to drug substance on micronization. IGC differs from traditional gas chromatography insofar as the stationary phase is the powder under investigation. The behavior of pharmaceutical solids, during either processing or use, can be noticeably affected by the surface energetics of the constituent particles. Several techniques exist to measure the surface energy: for example, sessile drop and dynamic contact angle measurements. IGC is an alternative technique where the powder surface is characterized by the retention behavior of minute quantities of well-characterized vapors that are injected into a column containing the material of interest. Recently published articles using IGC on pharmaceutical powders have ranged from linking surface energetic data with triboelectric charging to study the effect of surface moisture on surface energetics. Molecular modeling has also recently been used to explore the links between IGC data and the structural and chemical factors that influence surface properties, thereby achieving predictive knowledge regarding powder behavior during processing. In this type of study, a range of nonpolar and polar adsorbates (probes) are used: for example, alkanes, from hexane to decane, acetone, diethyl ether, or ethyl acetate. The retention volume, that is, the net volume of carrier gas (nitrogen) required to elute the probe, is then measured.

IGC is a gas-phase technique for characterizing surface and bulk properties of solid materials. The principles of IGC are very simple, being the reverse of a conventional gas chromatography (GC) experiment. A cylindrical column is uniformly packed with the solid material of interest, typically a powder, fiber, or film. A pulse or constant concentration of gas is then injected down the column at a fixed carrier gas flow rate, and the time taken for the pulse or concentration front to elute down the column is measured by a detector. A series of IGC measurements with different gas-phase probe molecules then allows access to a wide range of physicochemical properties of the solid sample.

6.64	Access of staff and materials to clean areas *only* through air locks?	☐☐☐		1
6.66	Rooms classified according to EC Guide?	☐☐☐		3
	Classification for products to be sterilized:			
6.67	• Solution preparation (EC: class C, with special precautions class D):	Class:		5
6.68	• Filling (EC: under LF in class C):	Class:		5
	Classification for aseptic products:			
6.69	• Handling of starting materials that can be sterile filtered (EC: class C):	Class:		6
6.70	• Handling of starting materials that cannot be sterile filtered (EC: class A in class B):	Class:		6
6.71	• Handling and filling of bulk (EC: class A in Class B):	Class:		6
6.72	All rooms easy to clean and disinfect?	☐☐☐		17
6.73	Doors, windows, frames, lighting, etc. without edges?	☐☐☐		18
6.74	Suspended ceilings (if yes: sealed?)?	☐☐☐		19
6.75	Traps constructed to avoid microbiological contamination?	☐☐☐		21
6.76	Appropriately constructed changing rooms?	☐☐☐		22
6.77	Measures against opening of both doors of air locks?	☐☐☐		23
6.78	Overpressure gradient from cleanest areas to others?	☐☐☐		24
6.79	AHU validated and regularly revalidated?	☐☐☐		25
6.80	Control instruments for pressure gradient?	☐☐☐		26
6.81	Warning system for errors in air supply?	☐☐☐		26
6.82	Recording of pressure gradients?	☐☐☐		26
6.83	Do conveyor belts leave sterile areas?	☐☐☐		28
6.84	Maintenance works outside clean areas possible?	☐☐☐		28
6.85	Cleaning and disinfection procedure after maintenance works?	☐☐☐		29
6.86	Regular revalidation of all equipment and systems?	☐☐☐		30
6.87	Water prepared, circulated, and stored to exclude microbiological contamination?	☐☐☐		31
6.88	Cleaning and disinfection of rooms according to validated SOPs?	☐☐☐		32
	• Disinfection methods?			
6.89	Microbiological monitoring of cleaning and disinfection agents?	☐☐☐		33
6.90	Microbiological monitoring program of production areas?	☐☐☐		35
6.91	Results recorded and considered for the release?	☐☐☐		35
	Personnel and Hygiene			
6.92	Minimal number of personnel in clean areas?	☐☐☐		7
6.93	Special and regular training?	☐☐☐		8
6.94	Regular medical examinations?	☐☐☐		10
6.95	Appropriate clean room clothes (material and design)?	☐☐☐		12
6.96	Protective clothes worn correctly?	☐☐☐		12
6.97	Prohibition of cosmetics, jewelry, and watches?	☐☐☐		13
6.98	New clean room clothes for each working cycle?	☐☐☐		15
6.99	Appropriate washing and sterilization of clothes?	☐☐☐		16
	Operations			
6.100	Validation (media filling) at regular intervals?	☐☐☐		38
	Monitoring of water preparation system, frequency:			
6.101	• Microbiological:			40
6.102	• Chemical:			40
6.103	• Particles:			40
6.104	• Endotoxins:			40
6.105	Microbiological monitoring of starting materials?	☐☐☐		42
6.106	Maximum storage times defined for sterilized equipment?	☐☐☐		45
6.107	Maximum storage time defined between solution preparation and filtration?	☐☐☐		46
6.108	Material transfer to clean areas through double door autoclaves?	☐☐☐		48
	Sterilization Processes			
6.109	All processes validated?	☐☐☐		50
6.110	Sterilized and nonsterilized materials clearly separated?	☐☐☐		54
	Trays and boxes clearly labeled with			
6.111	• Product name and code	☐☐☐		54
6.112	• Batch no.	☐☐☐		54
6.113	• Status: sterilized or nonsterilized	☐☐☐		54

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
	Sterilizers			
6.114	Recording of temperature, pressure, and time?	☐☐☐		55
6.115	Coldest point determined?	☐☐☐		55
6.116	Independent counter check probe?	☐☐☐		55
6.117	Heat-up time for each product determined?	☐☐☐		56
6.118	Sterile cooling media?	☐☐☐		57
6.119	Tightness tests for vacuum autoclaves?	☐☐☐		58
6.120	Clean steam for steam autoclaves?	☐☐☐		58
6.121	Circulated air with overpressure?	☐☐☐		61
6.122	Recirculated air: sterile filtered?	☐☐☐		61
6.123	Ethylene oxide autoclaves: humidity, temperature, and time recorded?	☐☐☐		69
6.124	Ethylene oxide autoclaves: use of bioindicators?	☐☐☐		70
	Filtration			
6.125	Double filtration?	☐☐☐		75
6.126	Integrity testing of filters immediately after use?	☐☐☐		77
6.127	Are results a part of the batch protocol?	☐☐☐		77
6.128	Optical control of each single container of ampoules, vials, and infusions?	☐☐☐		82
	IPC			
6.129	Written IPC procedures and SOPs?	☐☐☐		
	Particle testing of			
6.130	• Rooms?	☐☐☐		
6.131	• Primary packaging materials?	☐☐☐		
6.132	• System of warning and action limits?	☐☐☐		
	Microbiological monitoring of			
6.133	• Rooms?			
6.134	• Personnel?			
6.135	• Equipment?			
6.136	Residual O_2 of ampoules, infusions, and syrups?	☐☐☐		
6.137	Endotoxin testing of water and packaging materials?	☐☐☐		
6.138	Calibration of equipment?	☐☐☐		
6.139	Regular revalidation of equipment?	☐☐☐		
7	**PACKAGING**			
	Operations carried out:			
	• Blistering	☐		
	• Foil packaging	☐		
	• Filling into tablet glasses	☐		
	• Effervescent packaging	☐		
	• Powder filling	☐		
	• Syrup/drops filling	☐		
	• Ointment filling	☐		
	Rooms			
7.1	Suitable for the intended use?	☐☐☐		3
7.2	• Adequate size?	☐☐☐		3
7.3	• Clean?	☐☐☐		3
7.4	Located and designed to exclude external contamination?	☐☐☐		3.1
7.5	Appropriate level of maintenance?	☐☐☐		3.2
7.6	Maintenance works possible without contamination risk?	☐☐☐		3.2
7.7	Appropriate lighting and air-conditioning?	☐☐☐		3.3
7.8	Recording of temperature and humidity?	☐☐☐		
7.9	Protection against the entry of insects or other animals?	☐☐☐		3.4
7.10	Controlled access for authorized personnel only?	☐☐☐		3.5
7.11	Adequate separation of the packaging lines?	☐☐☐		3.15
	Operations			
7.12	Only *one* product per line?	☐☐☐		5.44
7.13	Check list for clearance before processing a new product/new batch?	☐☐☐		5.45

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
7.14	Adequate labeling of the lines (product name and code)?	☐☐☐		5.46
7.15	Check of all materials delivered to the line (quantity, identity, conformity with order)?	☐☐☐		5.47
7.16	Cleaning of primary packaging materials?	☐☐☐		5.48
7.17	Immediate labeling after filling?	☐☐☐		5.49
7.18	Careful check of all printing processes (code and expiry date)?	☐☐☐		5.5
7.19	Special safety measures for off-line printing?	☐☐☐		5.51
7.20	Regular checks of all control devices (code reader, counter, etc.)?	☐☐☐		5.52
7.21	Printings clear and durable?	☐☐☐		5.53
7.22	Balancing of printed packaging materials and bulk?	☐☐☐		5.56
7.23	Destruction of excessive coded packaging material after completion of an order?	☐☐☐		5.57
7.24	Are the finished products kept in quarantine until final release?	☐☐☐		5.58
7.25	Appropriate storage after release?	☐☐☐		5.60
	IPC			
7.26	Checks on identity of bulk and packaging materials?	☐☐☐		5.47
	Regular line checks on			
7.27	• Aspect of the packages?	☐☐☐		5.54a
7.28	• Completeness?	☐☐☐		5.54b
7.29	• Conformity of quantity and quality of materials with packaging order?	☐☐☐		5.54c
7.30	• Correct imprint?	☐☐☐		5.54d
7.31	• Correct function of control devices?	☐☐☐		5.54d
	Are the following IPC checks performed?			
7.32	• Leaking	☐☐☐		
7.33	• Release torque of screw caps	☐☐☐		
7.34	• pH, density, drop weight, viscosity, and sedimentation	☐☐☐		
8	**DOCUMENTATION**			
	Specifications			
8.1	Specifications for raw/packaging materials available?	☐☐☐		4.10
	Do they include			
8.2	• Internal name and code	☐☐☐		4.11
8.3	• Name of supplier and/or manufacturer?	☐☐☐		4.11
8.4	• Reference sample (printed packaging material)?	☐☐☐		4.11
8.5	• Sampling procedure?	☐☐☐		4.11
8.6	• Qualitative/quantitative specifications with limits?	☐☐☐		4.11
8.7	• Storage conditions?	☐☐☐		4.11
8.8	• Maximum storage period?	☐☐☐		4.11
	Goods Receiving?			
8.9	Written procedures for the reception of deliveries?	☐☐☐		4.19
	Do the records of receipt include			
8.10	• Product name on labels and delivery note?	☐☐☐		4.20
8.11	• Internal name and code?	☐☐☐		4.20
8.12	• Receiving date?	☐☐☐		4.20
8.13	• Name of supplier and/or manufacturer?	☐☐☐		4.20
8.14	• Batch number of supplier?	☐☐☐		4.20
8.15	• Total quantity and number of containers?	☐☐☐		4.20
8.16	• Allocated internal batch number?	☐☐☐		4.20
8.17	Sops for labeling, quarantine, and storage conditions of all incoming goods available?	☐☐☐		4.21
	Sops include			
8.18	• Authorized sampling personnel?	☐☐☐		4.22
8.19	• Methods, equipment, and quantities?	☐☐☐		4.22
8.20	• Safety measures?	☐☐☐		4.22
	Master Formulae			
8.21	Are master formulae for each product and batch size available?	☐☐☐		4.3
8.22	Is the master formula approved and signed by the authorized persons?	☐☐☐		4.3

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
	The master formula includes			
8.23	• Product name and code?	☐☐☐		4.14a
8.24	• Description of galenical form, dosage, and batch size?	☐☐☐		4.14b
8.25	• All active ingredients with name, code, and weight?	☐☐☐		4.14c
8.26	• All excipients used during manufacture with name, code, and weight?	☐☐☐		4.14c
8.27	• Yields with limits?	☐☐☐		4.14d
	Does the working procedure include			
8.28	• The production line?	☐☐☐		4.15a
8.29	• Equipment to be used?	☐☐☐		4.15a
8.30	• Reference to methods for cleaning, assembling, and calibration of machines?	☐☐☐		4.15b
8.31	• Detailed stepwise manufacturing prescription?	☐☐☐		4.15c
8.32	• IPCs to be performed with limits?	☐☐☐		4.15d
8.33	• Precautions to be followed?	☐☐☐		4.15e
8.34	Are batch records kept for each batch processed?	☐☐☐		4.17
	Do batch records include			
8.35	• Protocol of line clearance?	☐☐☐		4.17
8.36	• Name of the product and batch no.?	☐☐☐		4.17a
8.37	• Date and time of start and end of production?	☐☐☐		4.17b
8.38	• Name and initials of responsible workers for each step?	☐☐☐		4.17c, d
8.39	• Batch and analytical no. And actual weight of all starting materials?	☐☐☐		4.17e
8.40	• Equipment used?	☐☐☐		4.17f
8.41	• Results of ipcs with initials of person who carries them out?	☐☐☐		4.17g
8.42	• Yields of the relevant manufacturing steps?	☐☐☐		4.17h
8.43	• Detailed notes on problems and process deviations?	☐☐☐		4.17i
8.44	Records on reprocessing of batches?	☐☐☐		
	Packaging Instructions			
8.45	Packaging instructions for each product, package size, and presentation?	☐☐☐		4.16
	Do they include			
8.46	• Product name?	☐☐☐		4.16a
8.47	• Description of galenical form and strength?	☐☐☐		4.16b
8.48	• Package size?	☐☐☐		4.17c
8.49	• List of all packaging materials with code for a standard batch size?	☐☐☐		4.17d
8.50	• Samples of printed packaging materials?	☐☐☐		4.17e
8.51	• Special precautions?	☐☐☐		4.17f
8.52	• Description of the process and equipment?	☐☐☐		4.17g
8.53	• IPCs to be performed with sampling instruction?	☐☐☐		4.17h
8.54	Are packaging batch records kept for each batch or part batch?	☐☐☐		4.18
	Do the packaging batch records include			
8.55	• Protocol of line clearance?	☐☐☐		4.18
8.56	• Name of the product?	☐☐☐		4.18a
8.57	• Date and time when operations have been performed?	☐☐☐		4.18b
8.58	• Name of the responsible person?	☐☐☐		4.18c
8.59	• Initials of workers carrying out operations?	☐☐☐		4.18d
8.60	• Notes on identity checks and conformity with packaging instructions?	☐☐☐		4.18e
8.61	• Results of IPCs?	☐☐☐		4.18e
8.62	• Details of operations and equipment used?	☐☐☐		4.18f
8.63	• Samples of printed packaging materials with codes (MFD, EXP, batch no., etc.)?	☐☐☐		4.18g
8.64	• Record of problems and process deviations?	☐☐☐		4.18h
8.65	• Quantities of packaging materials delivered, used, destroyed, or returned?	☐☐☐		4.18i
8.66	• No. of packs consumed?	☐☐☐		4.18j
	Testing			
	Do the written testing procedures include			
8.67	• Test methods?	☐☐☐		4.23
8.68	• Equipment for testing?	☐☐☐		4.23

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
8.69	Tests documented?	☐☐☐		4.23
	Others			
8.70	Procedures for release and rejection of materials and finished products?	☐☐☐		4.24
8.71	Final release by authorized person?	☐☐☐		4.24
8.72	Records about distribution of each batch?	☐☐☐		4.25
	Procedures and protocols about			
8.73	• Validation?	☐☐☐		4.26
8.74	• Set-up and calibration of equipment?	☐☐☐		4.26
8.75	• Maintenance, cleaning, and disinfection?	☐☐☐		4.26
8.76	• Training records?	☐☐☐		4.26
8.77	• Environmental monitoring of production areas?	☐☐☐		4.26
8.78	• Pest control?	☐☐☐		4.26
8.79	• Complaints?	☐☐☐		4.26
8.80	• Recalls?	☐☐☐		4.26
8.81	• Returned goods?	☐☐☐		4.26
8.82	Instructions for use of manufacturing and testing equipment?	☐☐☐		4.27
	Log books for major equipment including date and name of persons who performed			
8.83	• Validation?	☐☐☐		4.28
8.84	• Calibration?	☐☐☐		4.28
8.85	• Maintenance, cleaning, and repair works?	☐☐☐		4.28
8.86	Chronological records of use of major equipment and manufacturing areas?	☐☐☐		4.29
9	**QUALITY CONTROL**			**6**
	General Requirements			
9.1	Independent QC department available?	☐☐☐		6.1
9.2	Head of QC well qualified and sufficiently experienced?	☐☐☐		6.1
9.3	Qualified personnel available?	☐☐☐		2.1
9.4	Organization charts available?	☐☐☐		2.2
9.5	Job descriptions available?	☐☐☐		2.2
9.6	Responsibilities clearly defined?	☐☐☐		2.2
9.7	Continuous training programs for QC staff?	☐☐☐		2.2
9.8	Initial job training for all employees?	☐☐☐		2.9
9.9	Training records?	☐☐☐		
9.10	QC personnel admitted to the production rooms for sampling, etc.?	☐☐☐		
	QC Laboratories			
9.11	Suitable for the intended use?	☐☐☐		3.26
9.12	Laboratories of adequate size?	☐☐☐		3.26
9.13	Appropriate level of maintenance?	☐☐☐		3.1
9.14	Adequate separation from the production area?	☐☐☐		3.26
9.15	Controlled access of authorized personnel only?	☐☐☐		3.5
9.16	Special laboratory to handle biological samples available?	☐☐☐		3.29
9.17	Special laboratory to handle radioactive material available?	☐☐☐		3.29
9.18	Separate recreation rooms for the personnel available?	☐☐☐		3.3
9.19	Animal laboratories present?	☐☐☐		3.33
9.20	Animal laboratories separated from other areas?	☐☐☐		3.33
9.21	Animal laboratories equipped with a separate air-handling system?	☐☐☐		3.33
	QC Documentation			
9.22	Do procedures exist for			
	• Self inspection?	☐☐☐		
	• Release or rejection of products or raw material?	☐☐☐		
	• Product complaints?	☐☐☐		
	• Product recalls?	☐☐☐		
	• Local stability testing?	☐☐☐		
	• Storage of reference samples?	☐☐☐		
	• Validation of analytical procedures?	☐☐☐		

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
9.23	Specifications available for	☐☐☐		6.7
	• Raw materials?	☐☐☐		
	• Bulk products?	☐☐☐		
	• Packaging materials?	☐☐☐		
9.24	Analytical procedures for every product?	☐☐☐		
9.25	Are Basel methods followed?	☐☐☐		
9.26	Validation of locally developed test methods?	☐☐☐		
9.27	Sampling procedures available for			6.7
	• Raw materials?	☐☐☐		
	• Bulk products?	☐☐☐		
	• Packaging materials?	☐☐☐		
9.28	Suppliers, certificates available?	☐☐☐		6.7
9.29	Calibration program for analytical instruments installed?	☐☐☐		6.7
9.30	Maintenance program for analytical instruments?	☐☐☐		6.7
9.31	Retention system for QC records?	☐☐☐		6.8
9.32	Batch documents stored for expiry + 1 year or 5 years (EEC 75/319, article 22) minimum?	☐☐☐		6.8
9.33	Are original data such as notebooks stored in addition to the batch documents?	☐☐☐		6.1
9.34	Can the original data be traced back easily and quickly from the analytical report number or batch number?	☐☐☐		6.1
9.35	Are trend analyses being performed for			6.9
	• Analytical results?	☐☐☐		
	• Yields?	☐☐☐		
	• Environmental monitoring data?	☐☐☐		
	Sampling			
9.36	Written procedures for taking samples?	☐☐☐		6.11
9.37	Do procedures define			
	• Method of sampling?	☐☐☐		
	• Necessary equipment?	☐☐☐		
	• Quantity of the sample?	☐☐☐		
	• Subdivision of the sample?	☐☐☐		
	• Sample container?	☐☐☐		
	• Labeling of samples?	☐☐☐		
	• Storage conditions?	☐☐☐		
	• Cleaning and storage of sampling equipment?	☐☐☐		
	• Identification of containers sampled?	☐☐☐		
9.38	Are samples representative of the batch they are taken from (sampling plan)?	☐☐☐		6.12
9.39	Are critical steps being surveilled and validated by additional sampling (e.g., at the beginning or end of a process)?	☐☐☐		6.12
9.40	Sample containers labeled with			6.13
	• Name of the content?	☐☐☐		
	• Batch number?	☐☐☐		
	• Date of sampling?	☐☐☐		
	• Batch containers sampled?	☐☐☐		
9.41	Are samples taken by QC/QA?	☐☐☐		
9.42	Reference samples retained for validity +1 year?	☐☐☐		6.14
9.43	Storage of reference samples under the recommended storage conditions?	☐☐☐		6.14
9.44	Finished products stored in the final packaging?	☐☐☐		6.14
9.45	Quantity of the reference sample makes one (better two) complete reanalysis possible?	☐☐☐		6.14
9.46	Sample room secure?	**Y N**		6.14
9.47	Sample room neatly organized and not overcrowded?	**Y N**		6.14
	Testing			
9.48	Are the applied analytical methods validated?	☐☐☐		6.15
9.49	Analytical methods in compliance with the registration?	☐☐☐		6.16
9.50	Are all results recorded and checked for correctness?	☐☐☐		6.16

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
9.51	Are all calculations checked?	☐☐☐		6.16
9.52	Do the testing protocols contain			6.17
	• Name and galenical form of material?	☐☐☐		
	• Batch number?	☐☐☐		
	• Supplier if applicable?	☐☐☐		
	• Specification reference?	☐☐☐		
	• Method reference?	☐☐☐		
	• Analytical results?	☐☐☐		
	• Reference to analytical certificates?	☐☐☐		
	• Date of the analysis?	☐☐☐		
	• Name of the analyst?	☐☐☐		
	• Name of the person verifying the data?	☐☐☐		
	• Statement of release or rejection?	☐☐☐		
	• Date and signature of the release person?	☐☐☐		
9.53	Are all IPC methods in production approved by QC?	☐☐☐		6.18
9.54	Are written methods available for the preparation of reagents and volumetric solutions?	☐☐☐		6.19
9.55	Is a record maintained of standardization of volumetric solutions?	☐☐☐		6.2
9.56	Are reagents for prolonged use labeled with			6.2
	• Date of the preparation?	☐☐☐		
	• Signature of the preparator?	☐☐☐		
9.57	Are unstable reagents labeled with			6.2
	• Expiry date?	☐☐☐		
	• Storage conditions?	☐☐☐		
9.58	Are volumetric solutions labeled with			6.2
	• The last date of standardization?	☐☐☐		
	• Last current factor?	☐☐☐		
9.59	Are reference standards labeled with			6.21
	• Name and potency?	☐☐☐		
	• Suppliers reference?	☐☐☐		
	• Date of receipt?	☐☐☐		
	• Date of expiry?	☐☐☐		
9.60	Are reference standards stored properly and under the control of a designated person?	☐☐☐		
9.61	Are animals used for testing of components, materials, or products			
	• Quarantined before use?	☐☐☐		
	• Checked for suitability?	☐☐☐		
	• Are records maintained showing the history of their use?	☐☐☐		
10	**COMPLAINTS AND PRODUCT RECALLS**			**8**
	Complaints			8.1
10.1	Does a written complaint procedure exist?	☐☐☐		8.2
10.2	Are product complaints carefully reviewed?	☐☐☐		8.1
10.3	Is a person designated to handle complaints and to decide on measures to be taken?	☐☐☐		8.1
10.4	Is each complaint concerning a product recorded with all original details?	☐☐☐		8.3
10.5	Are product complaints thoroughly investigated?	☐☐☐		8.3
10.6	Is a responsible QC person involved in the study?	☐☐☐		8.3
10.7	Is it considered that other batches might be concerned as well?	☐☐☐		8.4
10.8	Are decisions and measures as a result recorded?	☐☐☐		8.5
10.9	Is this record added to the corresponding batch documents?	☐☐☐		8.5
10.10	Are the complaint records regularly revised with respect to specific or recurring problems?	☐☐☐		8.6
10.11	Are the authorities informed of serious quality problems with a product?	☐☐☐		8.7
	Recalls			8.8
10.12	Does a written recall procedure exist?	☐☐☐		8.9

[a] 1. Fulfilled or available; 2. partially fulfilled; 3. not fulfilled or not available.

GLOSSARY

Acceptance Criteria: Numerical limits, ranges, or other suitable measures for acceptance of test results.

Active Pharmaceutical Ingredient (API) (or Drug Substance): Any substance or mixture of substances intended to be used in the manufacture of a drug (medicinal) product and that, when used in the production of a drug, becomes an active ingredient of the drug product. Such substances are intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure and function of the body.

Air Lock: An enclosed space with two or more doors, which is interposed between two or more rooms, for example, of differing classes of cleanliness, for the purpose of controlling the airflow between those rooms when they need to be entered. An air lock is designed for use either by people or for goods and/or equipment.

API Starting Material: A raw material, intermediate, or API that is used in the production of an API and that is incorporated as a significant structural fragment into the structure of the API. An API Starting Material can be an article of commerce, a material purchased from one or more suppliers under contract or commercial agreement, or produced in house. API Starting Materials are normally of defined chemical properties and structure.

Authorized Person: The person recognized by the national regulatory authority as having the responsibility for ensuring that each batch of finished product has been manufactured, tested, and approved for release in compliance with the laws and regulations in force in that country.

Batch (or Lot): A specific quantity of material produced in a process or series of processes so that it is expected to be homogeneous within specified limits. In the case of continuous production, a batch may correspond to a defined fraction of the production. The batch size can be defined either by a fixed quantity or by the amount produced in a fixed time interval.

Batch Number (or Lot Number): A unique combination of numbers, letters, and/or symbols that identifies a batch (or lot) and from which the production and distribution history can be determined.

Batch Records: All documents associated with the manufacture of a batch of bulk product or finished product. They provide a history of each batch of product and of all circumstances pertinent to the quality of the final product.

Bioburden: The level and type (e.g., objectionable or not) of microorganisms that can be present in raw materials, API starting materials, intermediates, or APIs. Bioburden should not be considered contamination unless the levels have been exceeded or defined objectionable organisms have been detected.

Bulk Product: Any product that has completed all processing stages up to, but not including, final packaging.

Calibration: The demonstration that a particular instrument or device produces results within specified limits by comparison with those produced by a reference or traceable standard over an appropriate range of measurements. The set of operations that establish, under specified conditions, the relationship between values indicated by an instrument or system for measuring (especially weighing), recording, and controlling, or the values represented by a material measure, and the corresponding known values of a reference standard.

Limits for acceptance of the results of measuring should be established.

Clean Area: An area with defined environmental control of particulate and microbial contamination, constructed, and used in such a way as to reduce the introduction, generation, and retention of contaminants within the area.

Computer System: A group of hardware components and associated software, designed and assembled to perform a specific function or group of functions. A process or operation integrated with a computer system.

Consignment (or Delivery): The quantity of a pharmaceutical(s) made by one manufacturer and supplied at one time in response to a particular request or order. A consignment may comprise one or more packages or containers and may include material belonging to more than one batch.

Contamination: The undesired introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or on to a starting material or intermediate during production, sampling, packaging or repackaging, and storage or transport.

Contract Manufacturer: A manufacturer performing some aspect of manufacturing on behalf of the original manufacturer.

Critical: Describes a process step, process condition, test requirement, or other relevant parameter or item that must be controlled within predetermined criteria to ensure that the API meets its specification.

Critical Operation: An operation in the manufacturing process that may cause variation in the quality of the pharmaceutical product.

Cross-Contamination: Contamination of a material or product with another material or product. Contamination of a starting material, intermediate product, or finished product with another starting material or product during production.

Deviation: Departure from an approved instruction or established standard.

Drug (Medicinal) Product: The dosage form in the final immediate packaging intended for marketing. (See ICH Guidance Q1A.)

Drug Substance: See Active Pharmaceutical Ingredient.

Expiry Date (or Expiration Date): The date placed on the container/labels of an API designating the time during which the API is expected to remain within established shelf-life specifications if stored under defined conditions, and after which it should not be used.

Finished Product: A finished dosage form that has undergone all stages of manufacture, including packaging in its final container and labeling.

Impurity: Any component present in the intermediate or API that is not the desired entity.

Impurity Profile: A description of the identified and unidentified impurities present in an API.

In-Process Control: Checks performed during production in order to monitor and, if necessary, to adjust the process to ensure that the product conforms to its specifications. The control of the environment or equipment may also be regarded as a part of in-process control.

Intermediate: A material produced during steps of the processing of an API that undergoes further molecular change or purification before it becomes an API. Intermediates may or may not be isolated. Partly processed product that must undergo further manufacturing steps before it becomes a bulk product.

Large-Volume Parenterals: Sterile solutions intended for parenteral application with a volume of 100 mL or more in one container of the finished dosage form.

Lot: See Batch.

Lot Number: See Batch Number.

Manufacture: All operations of receipt of materials, production, packaging, repackaging, labeling, relabeling, quality control, release, storage, and distribution of APIs and related controls.

Manufacturer: A company that carries out operations such as production, packaging, repackaging, labeling, and relabeling of pharmaceuticals.

Marketing Authorization (Product License, Registration Certificate): A legal document issued by the competent drug regulatory authority that establishes the detailed composition and formulation of the product and the pharmacopoeial or other recognized specifications of its ingredients and of the final product itself, and includes details of packaging, labeling, and shelf life.

Master Formula: A document or set of documents specifying the starting materials with their quantities and the packaging materials, together with a description of the procedures and precautions required to produce a specified quantity of a finished product as well as the processing instructions, including the in-process controls.

Master Record: A document or set of documents that serve as a basis for the batch documentation (blank batch record).

Material: A general term used to denote raw materials (starting materials, reagents, and solvents), process aids, intermediates, APIs, and packaging and labeling materials.

Mother Liquor: The residual liquid that remains after the crystallization or isolation processes. A mother liquor may contain unreacted materials, intermediates, levels of the API, and/or impurities. It may be used for further processing.

Packaging: All operations, including filling and labeling, that a bulk product has to undergo in order to become a finished product. Filling of a sterile product under aseptic conditions or a product intended to be terminally sterilized, would not normally be regarded as part of packaging.

Packaging Material: Any material intended to protect an intermediate or API during storage and transport. Any material, including printed material, employed in the packaging of a pharmaceutical, but excluding any outer packaging used for transportation or shipment. Packaging materials are referred to as primary or secondary according to whether or not they are intended to be in direct contact with the product.

Pharmaceutical Product: Any material or product intended for human or veterinary use presented in its finished dosage form or as a starting material for use in such a dosage form, that is subject to control by pharmaceutical legislation in the exporting state and/or the importing state.

Procedure: A documented description of the operations to be performed, the precautions to be taken and measures to be applied directly or indirectly related to the manufacture of an intermediate or API.

Process Aids: Materials, excluding solvents, used as an aid in the manufacture of an intermediate or API that do not themselves participate in a chemical or biological reaction (e.g., filter aid, activated carbon, and so on).

Process Control: See In-Process Control.

Production: All operations involved in the preparation of a pharmaceutical product, from receipt of materials, through processing, packaging, and repackaging, and labeling and relabeling, to completion of the finished product.

Qualification: Action of proving and documenting that equipment or ancillary systems are properly installed, work correctly, and actually lead to the expected results. Qualification is part of validation, but the individual qualification steps alone do not constitute process validation.

Quality Assurance (QA): The sum total of the organized arrangements made with the object of ensuring that all APIs are of the quality required for their intended use and that quality systems are maintained.

Quality Control (QC): Checking or testing that specifications are met.

Quality Unit(s): An organizational unit independent of production that fulfills both Quality Assurance and Quality Control responsibilities. This can be in the form of separate QA and QC units or a single individual or group, depending upon the size and structure of the organization.

Quarantine: The status of starting or packaging materials, intermediates, or bulk or finished products isolated physically or by other effective means while a decision is awaited on their release, rejection, or reprocessing.

Raw Material: A general term used to denote starting materials, reagents, and solvents intended for use in the production of intermediates or APIs.

Reconciliation: A comparison between the theoretical quantity and the actual quantity.

Recovery: The introduction of all or part of previous batches (or of redistilled solvents and similar products) of the required quality into another batch at a defined stage of manufacture. It includes the removal of impurities from waste to obtain a pure substance or the recovery of used materials for separate use.

Reference Standard, Primary: A substance that has been shown by an extensive set of analytical tests to be authentic material that should be of high purity.

Reference Standard, Secondary: A substance of established quality and purity, as shown by comparison with a primary reference standard, used as a reference standard for routine laboratory analysis.

Reprocessing: Subjecting all or part of a batch or lot of an in-process drug, bulk process intermediate (final biological bulk intermediate), or bulk product of a single batch/lot to a previous step in the validated manufacturing process due to failure to meet pre-determined specifications. Reprocessing procedures are foreseen as occasionally necessary for biological drugs and in such cases, are validated and preapproved as part of the marketing authorization.

Retest Date: The date when a material should be reexamined to ensure that it is still suitable for use.

Reworking: Subjecting an in-process or bulk process intermediate (final biological bulk intermediate) or final product of a single batch to an alternate manufacturing process due to a failure to meet predetermined specifications. Reworking is an unexpected occurrence and is not preapproved as part of the marketing authorization.

Self-Contained Area: Premises that provide complete and total separation of all aspects of an operation, including personnel and equipment movement, with well-established procedures, controls, and monitoring. This includes physical barriers as well as separate airhandling systems, but does not necessarily imply two distinct and separate buildings.

Signature (Signed): See definition for signed.

Signed (Signature): The record of the individual who performed a particular action or review. This record can be initials, a full handwritten signature, a personal seal, or an authenticated and secure electronic signature.

Solvent: An inorganic or organic liquid used as a vehicle for the preparation of solutions or suspensions in the manufacture of an intermediate or API.

Specification: A list of detailed requirements to which the products or materials used or obtained during manufacture have to conform. They serve as a basis for quality evaluation.

Standard Operating Procedure (SOP): An authorized written procedure giving instructions for performing operations not necessarily specific to a given product or material (e.g., equipment operation, maintenance, and cleaning; validation; cleaning of

premises and environmental control; sampling and inspection). Certain SOPs may be used to supplement product-specific master and batch production documentation.

Starting Material: Any substance of a defined quality used in the production of a pharmaceutical product, but excluding packaging materials.

Validation: A documented program that provides a high degree of assurance that a specific process, method, or system will consistently produce a result meeting predetermined acceptance criteria. Action of proving, in accordance with the principles of GMP, that any procedure, process, equipment, material, activity, or system actually leads to the expected results (see also Qualification).

Validation Protocol: A written plan stating how validation will be conducted and defining acceptance criteria. For example, the protocol for a manufacturing process identifies processing equipment, critical process parameters/operating ranges, product characteristics, sampling, test data to be collected, number of validation runs, and acceptable test results.

Yield, Expected: The quantity of material or the percentage of theoretical yield anticipated at any appropriate phase of production based on previous laboratory, pilot-scale, or manufacturing data.

Yield, Theoretical: The quantity that would be produced at any appropriate phase of production, based upon the quantity of material to be used, in the absence of any loss or error in actual production.

Appendix B

FORMULATION EXCIPIENTS

Introduction

In addition to the active ingredients, solid oral dosage forms will also contain a range of substances called excipients. The role of excipients is essential in ensuring that the manufacturing process is successful and that the quality of the resultant formulation can be guaranteed. The appropriate selection of excipients and their relative concentrations in the formulation is critical in development of a successful product.

Although they are often categorized as inert, preformulation studies can determine the influence of excipients on stability, bioavailability, and processability. Excipients are categorized into groups according to their main function, although some may be multifunctional, and examples of common excipients used in the manufacture of tablets and capsule are detailed in Table A1.

Because there is such a wide selection available, rational choice of the necessary excipients and their concentration is required. Consideration must also be given to cost, reliability, availability, and international acceptability. Although generally considered inert, formulation incompatibility of excipients is also necessary. Lactose, for example, can react with primary and secondary amines via its aldehyde group by Maillard condensation reaction [6], and calcium carbonate is incompatible with acids due to acid–base chemical reaction and with tetracyclines due to complexation. Additionally, excipients can contribute to the instability of the active substance through moisture distribution.

Despite the importance of drug–excipient compatibility testing, there is no generally accepted method available for this purpose. After identification of any major known incompatibilities, a compatibility screen needs to be proposed. Issues such as sample preparation, storage conditions, and methods of analysis should be addressed and factorial design applied to reduce the number if tests required. Drug–excipient compatibility studies can be performed with minimal amounts of materials. Usually, small amounts of each material are weighed into a glass vial, in a ratio representative of the expected ratio in the formulation. The vials can be sealed as is or with additional water, either in an air environment or oxygen-free (nitrogen head space) environment, and stored in the presence or absence of ambient light, at various temperatures. Factorial or partial factorial design experiments can be set up to determine important binary and multiple component interaction factors. This information helps determine which excipients should be avoided and whether oxidation or light instability in the formulation is a consideration. Controls consist- ing of the active pharmaceutical ingredient (API) alone in the various conditions also should be run to determine whether the API is susceptible alone or must have the mediating excipient or water additives for instability.

Diluents

An inert substance is frequently added to increase the bulk of a tablet for processing and handling. The lower weight limit for formulation of a tablet is usually 50 mg. Ideally, diluents should be chemically inert, nonhygroscopic, and hydrophilic. Having an acceptable taste is important for oral formulations, and cost is always a significant factor in excipient selection.

Lactose is a common diluent in both tablets and capsules, and it fulfils most of these criteria but is unsuitable for those who are lactose intolerant. Various lactose grades are commercially available which have different physical properties such as particle size distribution and flow characteristics. This permits the selection of the most suitable material for a particular application. Usually, fine grades of lactose are used for preparation of tablets by wet granulation or when milling during processing is carried out, since the fine size permits better mixing with other formulation ingredients and facilitates more effective action of the binder.

Diluents for direct compression formulations are often subject to prior processing to improve flowability and compression, for example, amorphous lactose, but this can contribute to reduced stability especially under high-humidity conditions when reversion to the crystalline form is more likely.

Microcrystalline cellulose (Avicel) is purified partially depolymerized cellulose, prepared by treating cellulose with mineral acids. In addition to being used as a filler, it is also used as dry binder and disintegrant in tablet formulations. Depending on the preparation conditions, it can be produced with a variety of technical specifications depending on particle size and crystallinity. It is often used as an excipient in direct compression formulations but can also be incorporated as a diluent for tablets prepared by wet granulation, as a filler for capsules and for the production of spheres.

Diluents, although commonly presumed inert, do have the ability to influence the stability or bioavailability of the dosage form. For example, dibasic calcium phosphate (both anhydrous and dihydrate forms) is the most common inorganic salt used as a filler–binder for direct compression. It is particularly useful in vitamin products as a source of both calcium and phosphorous. Milled material is typically used in wet-granulated or roller-compacted formulations. The coarse-grade material is typically used in direct compression

TABLE A1
Excipients Used in Solid Dose Formulations

Classification	Example
Fillers/diluents	Lactose, sucrose, glucose, microcrystalline cellulose
Binders	Polyvinyl pyrrolidone, starch, gelatin, cellulose derivatives
Lubricants	Magnesium stearate, stearic acid, polyethylene glycol, sodium chloride
Glidants	Fine silica, talc, magnesium stearate
Antiadherents	Talc, cornstarch, sodium dodecylsulfate
Disintegrants and superdisintegrants	Starch, sodium starch glycollate, cross-linked polyvinyl pyrrolidone
Colorants	Iron oxide, natural pigments
Flavor modifiers	Mannitol, aspartame

formulations. It is insoluble in water, but its surface is alkaline and it is therefore incompatible with drugs sensitive to alkaline pH. Additionally, it may interfere with the absorption of tetracyclines.

Binders

Binders (or adhesives) are added to formulations to promote cohesiveness within powders, thereby ensuring that the tablet remains intact after compression as well as improving the flow by forming granules. A binder should impart adequate cohesion without retarding disintegration or dissolution. Binders can be added either as a solution or as a dry powder. Binders added as dry powders are mixed with other powders prior to agglomeration, dissolving in water or solvent added during granulation, or added prior to compaction. Solution binders can be sprayed, poured, or mixed with the powder blend for agglomeration and are generally more effective, but further dry binder can be added prior to tableting. Starch, gelatin, and sugars are used along with gums, such as acacia and sodium alginate, and are used at concentrations between 2 and 10% w/w. Celluloses and polyvinyl pyrrolidone (PVP) are also utilized, often as dry binders.

Lubricants

Lubricants can reduce friction between the tablet and the die wall during compression and ejection by interposing an intermediate film of low shear strength at the interface between the tablet and the die wall. The best lubricants are those with low shear strength but strong cohesive tendencies perpendicular to the line of shear [8]. The hydrophobic stearic acid and stearic acid salts, primarily magnesium stearate, are the most widely used and are included at concentrations less than 1% w/w in order to minimize any deleterious effects on disintegration or dissolution. They should be added after the disintegrant to avoid coating it and preferably at the final stage prior to compression to ensure mixing time is kept to a minimum. Hydrophilic lubricants such as polyethylene glycols (PEGs) and lauryl sulfates can be used to redress the issues with dissolution but may not be as efficient as their hydrophobic counterparts.

Glidants and Antiadherents

Like lubricants, glidants are fine powders and may be required for tablet compression at high production speeds to improve the flow properties of the material into the die or during initial compression stages. They are added in the dry state immediately prior to compression and, by virtue of their low adhesive potential, reduce the friction between particles. Colloidal silica is popular, as are starches and talc.

Antiadherents can also be added to a formulation that is especially prone to sticking to the die surface (or picking). Water-insoluble lubricants such as magnesium stearate can be used as antiadherents, as can talc and starch.

Disintegrants

Disintegrants are added to a formulation to overcome the cohesive strength imparted during compression, thus facilitating break up of the formulation in the body and increasing the surface area for dissolution. They can be either intragranular, extra- granular, or both, and there is still a lack of understanding concerning their precise mechanism of action. On contact, disintegrants can draw water into the tablet, swelling and forcing the tablet apart. Starch, a traditional and still widely used disintegrant, will swell when wet, although it has been reported that its disintegrant action could be due to capillary action [6]. Levels can be increased beyond the normal 5% w/w to 15–20% w/w if a rapid disintegration is required. Surfactants can also act as disintegrants promoting wetting of the formulation, and sodium lauryl sulfate can be combined with starch to increase effectiveness.

Tablet disruption following production of carbon dioxide is another mechanism used to enhance disintegration. This uses a mixture of sodium bicarbonate and a weak acid such as citric acid or tartaric acid and is exploited for effervescent formulations.

Superdisintegrants

Compared to the more traditional starch, newer disintegrants are effective at much lower levels and comprise three groups: modified starches, modified cellulose, and cross-linked povidone. Their likely mechanism of action is a combination of proposed theories including water wicking, swelling, deformation recovery, repulsion, and heat of wetting [9]. Superdisintegrants are so called because of the relatively low levels required (2–4% w/w). Sodium starch glycollate

(Primojel, Explotab) is made by cross-linking potato starch and can swell up to 12-fold in less than 30 s. Crospovidone is completely insoluble in water, although it rapidly disperses and swells in water, but does not gel even after prolonged exposure. It rapidly exhibits high capillary activity and pronounced hydration capacity with little tendency to form gels and has a greater surface area–volume ratio compared to other disintegrants. Micronized versions are available to improve uniformity of mix. Croscarmellose sodium, a cross-linked polymer of carboxymethyl cellulose sodium is also insoluble in water, although it rapidly swells to 4–8 times its original volume on contact with water.

Added Functionality Excipients

Adverse physiochemical and mechanical properties of new chemical entities prove challenging for formulation development. There is an increasing demand for faster and more efficient production processes. Also, biotechnological developments and various emerging protein-based therapies are broadening the definition for excipient products. Although the description of excipients from inactive ingredients is shifting toward functionally active materials and will continue to grow in this area, the introduction of improved versions of long-existing excipients is probably the more successful development. New single-component and coprocessed products have been introduced, for example, filler–binders. In addition, there have been advances in the understanding of how such substances act and hence how they can be optimally designed. Excipients for use in direct compression product forms or physically or chemically modified excipients used in relatively new drug delivery systems, such as patches or inhalation systems, are examples of these developments.

Colorants

Colorants are frequently used in uncoated tablets, coated tablets, and hard and soft gelatin capsules. They can mask color changes in the formulation and are used to provide uniqueness and identity to a commercial product. Concerns over the safety of coloring agents in formulations generally arise from adverse effects in food substances. Colorants are therefore subject to regulations not associated with other pharmaceutical excipients. Legislation specifies which colorants may be used in medicinal products and also provides for purity specifications. The number of permitted colors has decreased in recent years, and a list of approved colorants allowed by regulatory bodies can vary from country to country.

Colorants can be divided into water-soluble dyes and water-insoluble pigments. Some of the insoluble colors or pigments can also provide opacity to tablet coatings or gelatin shells, which can promote stability of light-sensitive active materials. Pigments such as the iron oxides, titanium dioxide, and some of the aluminum lakes are especially useful for this purpose.

Water-soluble dyes are usually incorporated within the granulation process to ensure even distribution throughout the formulation, but there can be an uneven distribution due to migration of the dye during drying processes. Therefore, water-soluble dyes can also be adsorbed into a carrier such as starch or lactose and dry blended prior to the final mix. Water-insoluble pigments are more popular in direct compression and are dry blended with the other ingredients.

Lakes are largely water-insoluble forms of common synthetic water-soluble dyes and are prepared by adsorbing the sodium or potassium salt of a dye onto a very fine substrate of hydrated alumina, followed by treatment with a further soluble aluminum salt. The lake is then purified and dried. Lakes are frequently used in coloring tablet coatings since they are more stable and have greater opacity than a water-soluble dye.

LIST OF EXCIPIENTS USED IN FDA APPROVED PRODUCTS

Ingredient	Route	Dosage Form	Quantity	Unit
1-(PHENYLAZO)-2-NAPHTHYLAMINE	ORAL	TABLET	0.2	MG
ACACIA	BUCCAL/SUBLINGUAL	TABLET	9.1	MG
ACACIA	ORAL	TABLET	0.001	MG

Appendix C

DISSOLUTION TESTING REQUIREMENTS OF COMPRESSED DOSAGE FORMS

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Abacavir Sulfate	Tablet	II (Paddle)	75	0.1 N HCl	900	5, 10, 15, and 30	03/22/2006
Abacavir Sulfate/Dolutegravir Sodium/Lamivudine	Tablet	II (Paddle)	85	0.01 M Phosphate Buffer with 0.5% sodium dodecyl sulfate (SDS), pH 6.8	900	Abacavir and lamivudine: 10, 15, 20, 30 and 45; Dolutegravir: 5,15, 25, 35 and 45.	05/28/2015
Abacavir Sulfate/Lamivudine	Tablet	II (Paddle)	75	0.1 N HCl	900	10, 20, 30, and 45	01/03/2007
Abacavir Sulfate/Lamivudine/ Zidovudine	Tablet	II (Paddle)	75	0.1 N HCl	Acid Stage: 900 mL; Buffer Stage: 1000 mL	5, 10, 15, 30 and 45	01/03/2007
Abemaciclib	Tablet	II (Paddle)	75	0.01 N HCl	900	5, 10, 15, 20 and 30	11/16/2017
Abiraterone Acetate	Tablet	II (Paddle)	50	0.25% SLS in 56.5 mM phosphate buffer, pH 4.5	900	10, 20, 30, 45 and 60	02/28/2013
Acamprosate Calcium	Tablet (Delayed Release)	I (Basket)	180	Acid Stage: 0.1 N HCl Buffer Stage: "Citrate-sodium hydroxide" buffer pH 6.8 (150 ml of 2N NaOH, 21.014 gm of citric acid and ultra-pure water to 1000 ml) (Method B)	Media 1: 750 mL pH 1.1 ± 0.1; Media 2: 950 mL pH 6.0 ± 0.1; Media 3: 1000 mL pH 7.5 ± 0.1	120 (Acid) 30, 60, 90, 120, and 180 (buffer)	12/20/2005
Acarbose	Tablet	II (Paddle)	75	Water (deaerated)	900	10, 15, 20, 30 and 45	03/22/2006
Acetaminophen	Tablet (Extended Release)			Refer to USP			03/03/2011
Acetaminophen/Aspirin/ Caffeine	Tablet			Refer to USP			06/25/2015
Acetaminophen/Butalbital	Tablet	II (Paddle)	50	Water (deaerated)	900	15, 30, 45, 60 and 90	01/03/2007
Acetaminophen/Butalbital/ Caffeine	Tablet			Refer to USP			01/14/2008
Acetaminophen/Caffeine/ Dihydrocodeine Bitartrate	Tablet	II (Paddle)	50	Water	900	10, 15, 30, 45 and 60	07/25/2007
Acetaminophen/Hydrocodone Bitartrate	Tablet			Refer to USP (provide individual unit data).			08/15/2013
Acetaminophen/Oxycodone	Tablet			Refer to USP			01/14/2008
Acetaminophen/ Oxycodone HCl	Tablet (Extended Release)	II (Paddle) with sinker	100	0.1 N HCl	900	0.25, 0.5, 1, 2, 4, 6 and 8 hours	11/19/2015
Acetaminophen/ Pentazocine HCl	Tablet	I (Basket)	100	Water (deaerated)	900	10, 20, 30, 45 and 60	01/12/2004
Acetaminophen/ Propoxyphene HCl	Tablet			Refer to USP			01/15/2010
Acetaminophen/Propoxyphene Napsylate	Tablet			Refer to USP			01/15/2010
Acetaminophen/Tramadol HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	03/04/2006
Acetazolamide	Tablet			Refer to USP			07/21/2011
Acetazolamide	Tablet			Refer to USP			07/14/2008
Acetylcysteine	Tablet (Effervescent)			Develop a dissolution method			07/28/2016
Acyclovir	Tablet			Refer to USP			06/18/2007

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Acyclovir	Tablet (Buccal)	I (Basket)	60	Phosphate Buffer, pH 6.0	1000	1, 2, 3, 5, 7, 9 and 12 hours	08/27/2015
Adefovir Dipivoxil	Tablet	II (Paddle)	50	0.01 N HCl	600	10, 20, 30, 45 and 60	04/10/2008
Afatinib Dimaleate	Tablet	II (Paddle)	75	McIlvaine Buffer pH 4.0	900	5, 10, 15, 20 and 30	05/28/2015
Albendazole	Tablet			Refer to USP			08/15/2013
Albendazole	Tablet (Chewable)	II (Paddle)	50	0.1 N HCl	900	10, 15, 20, 30 and 45	03/17/2016
Albuterol Sulfate	Tablet			Refer to USP			09/03/2008
Albuterol Sulfate	Tablet (Extended Release)	II (Paddle)	50	0.1 N HCl	900	1, 2, 4, 6, 9 and 12 hours	04/09/2007
Alendronate Sodium	Tablet			Refer to USP			01/14/2008
Alendronate Sodium/ Cholecalciferol	Tablet	II (Paddle)	For Alendronate: 50; For Cholecalciferol: 75	For Alendronate: Deaerated Water; For Cholecalciferol: 0.3% SDS in USP Water	For Alendronate: 900; For Cholecalciferol: 500	10, 15, 20, 30 and 45	11/25/2008
Alfuzosin HCl	Tablet (Extended Release)	II (Paddle)	100	0.01 N HCl	900	1, 2, 12, 20 hours	06/18/2007
Aliskiren Hemifumarate	Tablet	I (Basket)	100	0.01 N HCl	500	10, 20, 30 and 45	09/03/2008
Aliskiren Hemifumarate/ Amlodipine Besylate	Tablet	I (Basket)	100	0.01 N HCl, pH 2.0	500	10, 15, 20, 30 and 45	06/07/2012
Aliskiren Hemifumarate/ Amlodipine Besylate/ Hydrochlorothiazide	Tablet	I (Basket)	100	0.01 N HCl	900	10, 15, 20, 30 and 45	06/07/2012
Aliskiren Hemifumarate/ Hydrochlorothiazide	Tablet	I (Basket)	100	0.1 N HCl	900	10, 15, 20, 30 and 45	10/08/2009
Aliskiren Hemifumarate/ Valsartan	Tablet	I (Basket)	100	Phosphate Buffer, pH 6.8	1000	5, 10, 15, 20, 30 and 45	12/23/2010
Allopurinol	Tablet			Refer to USP			07/25/2007
Almotriptan Malate	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, and 30	01/20/2006
Alogliptin Benzoate	Tablet	II (Paddle)	50	0.01 N HCl	900	5, 10, 15, 20 and 30	02/14/2014
Alogliptin Benzoate/ Metformin HCl	Tablet	II (Paddle)	50	0.01 N HCl	900	5, 10, 15, 20 and 30	11/19/2015
Alosetron HCl	Tablet	II (Paddle)	50 (for 1 mg) & 75 (for 0.5 mg)	Water (deaerated)	500	10, 20, 30 and 45	01/26/2006
Alprazolam	Tablet			Refer to USP			06/18/2007
Alprazolam	Tablet (Extended Release)	I (Basket)	100	1% Phosphate Buffer, pH 6.0	500	1, 4, 8, 12 and 16 hours	02/08/2007
Alprazolam	Tablet (Orally Disintegrating)	II (Paddle)	50	70 mM Potassium Phosphate Buffer, pH 6.0	500	2, 5, 10, 15 and 20	10/06/2008
Amantadine HCl	Tablet	II (Paddle)	50	Water (deaerated)	500	10, 20, 30, 45 and 60	01/12/2004
Ambrisentan	Tablet	II (Paddle)	75	0.05 M Acetate Buffer, pH 5.0	900	5, 10, 15, 30, and 45	05/20/2009
Amiloride HCl	Tablet			Refer to USP			06/07/2012
Amiloride HCl/ Hydrochlorothiazide	Tablet			Refer to USP			06/07/2012
Aminocaproic Acid	Tablet			Refer to USP			08/27/2015
Amiodarone HCl (Test 1)	Tablet	II (Paddle)	100	1% SLS in water	1000	10, 20, 30, 45, 60 and 90	01/12/2004
Amiodarone HCl (Test 2)	Tablet	I (Basket)	50	Acetate Buffer, pH 4.0, with 1% Tween 80	900	10, 20, 30, 45, 60 and 90	01/12/2004
Amitriptyline HCl	Tablet			Refer to USP			01/14/2008

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Amlodipine Besylate	Tablet	II (Paddle)	75	0.01 N HCl	500	10, 20, 30, 45 and 60	01/14/2004
Amlodipine Besylate	Tablet (Orally Disintegrating)	II (Paddle)	50	0.01 N HCl	500	5, 10, 15 and 20	10/06/2008
Amlodipine Besylate/ Atorvastatin Calcium	Tablet	II (Paddle)	75	Phosphate Buffer, pH 6.8	900	5, 10, 15 and 30	04/02/2009
Amlodipine Besylate/ Hydrochlorothiazide/ Olmesartan Medoxomil	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8	900	5, 10, 15, 20, 30 and 45	07/21/2011
Amlodipine Besylate/ Hydrochlorothiazide/ Valsartan	Tablet			Refer to USP			07/28/2016
Amlodipine Besylate/ Olmesartan Medoxomil	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8	900	10, 20, 30 and 45	08/11/2008
Amlodipine Besylate/ Perindopril Arginine	Tablet	II (Teflon coated paddle)	75	0.01 N HCL	1000	5, 10, 15, 20 and 30	03/17/2016
Amlodipine Besylate/ Telmisartan	Tablet	II (Paddle)	75	Telmisartan: Phosphate Buffer, pH 7.5; Amlodipine: 0.01N HCl, pH 2	Telmisartan: 900; Amlodipine: 500	Telmisartan: 10, 15, 20, 30 and 45; Amlodipine: 10, 15, 20, 30 and 45	08/05/2010
Amlodipine Besylate/Valsartan	Tablet			Refer to USP			07/28/2016
Amoxicillin	Tablet			Refer to USP			01/31/2013
Amoxicillin	Tablet (Extended Release)	II (Paddle)	100	3 Stage dissolution: 50 mM potassium phosphate monobasic buffer at pH 4.0 (0–2 hours), 6.0 (2–4 hours) and 6.8 (4 hours and beyond)	900	0.25, 0.5, 1, 2, 2.25, 2.5, 3, 4, 4.25, 4.5, 5 and 6 hours	10/21/2010
Amoxicillin/Clavulanate Potassium	Tablet			Refer to USP	As appropriate	0, 0.5, 1, 2, 3, 4 and 5 hours	10/04/2012
Amoxicillin/Clavulanate Potassium	Tablet (Chewable)			Refer to USP			01/14/2008
Amphetamine	Tablet (Extended Release, Orally Disintegrating)	II (Paddle	75	Acid Stage: 0.1 N HCl; Buffer Stage: Phosphate Buffer, pH 6.8	Acid Stage: 900 mL; Buffer Stage: 1000 mL	Acid Stage: 10, 15, 30, 45, 60, 90, 120; Buffer Stage: 5, 10, 15, 30 and 45	07/28/2016
Amphetamine Aspartate/ Amphetamine Sulfate/ Dextroamphetamine Saccharate/ Dextroamphetamine Sulfate	Tablet	I (Basket)	100	Deionized Water	500	10, 20, 30 and 45	11/25/2008
Anastrozole	Tablet	II (Paddle)	50	Water	900	5, 10, 15, and 30 and 45	01/03/2007
Apixaban	Tablet	II (Paddle)	75	0.05 M Sodium Phosphate Buffer with 0.05% SLS, pH 6.8	900	5, 10, 20, 30 and 45	05/09/2013
Apremilast	Tablet	II (Paddle)	60	0.15% SLS in 25 mM Sodium Phosphate Buffer, pH 6.8	900	10, 15, 20, 30, and 45	05/18/2017
Aripiprazole	Tablet			Refer to USP			06/30/2016
Aripiprazole	Tablet (Orally Disintegrating)	II (Paddle)	75	Acetate Buffer, pH 4.0	1000	10, 20, 30 and 45	08/11/2008
Armodafinil	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	01/14/2008

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Asenapine Maleate	Tablet (Sublingual)	II (Paddle)	50	Acetate Buffer, pH 4.5	500	1, 2, 3, 4 and 5	05/09/2013
Aspirin/Omeprazole	Tablet (Delayed Release)	I (Basket)	100	Acid Stage: 0.1 N HCl (degassed); Buffer Stage: Phosphate Buffer, pH 6.8 (degassed)	Acid Stage: 900; Buffer Stage: 900	Acid Stage:120; Buffer Stage:10, 20, 30, 45, 60 and 75	12/22/2016
Aspirin/Butalbital/Caffeine	Tablet			Refer to USP			06/24/2010
Aspirin/Caffeine/Orphenadrine Citrate	Tablet	I (Basket)	75	Water (deaerated)	900	10, 20, 30, 45 and 60	01/15/2004
Aspirin/Hydrocodone Bitartrate	Tablet	II (Paddle)	75	Acetate Buffer, pH 4.5	900	10, 20, 30, 45, 60 and 90	01/15/2004
Aspirin/Meprobamate	Tablet	I (Basket)	100	Water (deaerated)	900	10, 20, 30, 45, 60 and 90	01/15/2004
Aspirin/Methocarbamol	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30, 45, 60 and 90	01/15/2004
Aspirin/Oxycodone HCl	Tablet			Refer to USP			01/15/2010
Atazanavir Sulfate/Cobicistat	Tablet	II (Paddle)	75	0.05 M Citrate Buffer (pH 2.8)	1000	Atazanavir: 10, 15, 20, 30 and 45; Cobicistat: 5, 10, 15, 20 and 30	12/24/2015
Atenolol	Tablet			Refer to USP			02/14/2014
Atenolol/Chlorthalidone	Tablet			Refer to USP			02/14/2014
Atorvastatin Calcium	Tablet	II (Paddle)	75	0.05 M Phosphate buffer, pH 6.8	900	5, 10, 15 and 30	01/15/2004
Atorvastatin Calcium/ Ezetimibe	Tablet	II (Paddle), with option to use a sinker for 20/10 mg strength	75	Phosphate buffer, pH 6.8 with 0.2% w/v Tween 80	900	5, 10, 15, 20, 30 and 45	05/15/2014
Atovaquone	Tablet	II (Paddle)	50	40% isopropanol buffered to pH 8.0 with potassium dihydrogen phosphate	900	10, 20, 30, 45, 60 and 90	06/18/2007
Atovaquone/Proguanil HCl	Tablet	II (Paddle) with PEAK vessels	50	40% isopropranol buffered to pH 8.0 with potassium dihydrogen phosphate	900	15, 30, 45 and 60	08/17/2006
Atropine Sulfate/ Diphenoxylate HCl	Tablet			Develop dissolution method(s) to characterize the dissolution of both components			12/22/2016
Avanafil	Tablet	II (Paddle)	50	Simulated gastric fluid without pepsin.	900	5, 10, 15, 20 and 30	04/02/2015
Axitinib	Tablet	II (Paddle)	75	0.01 N HCl	900	5, 15, 30, 45 and 60	08/14/2014
Azathioprine	Tablet			Refer to USP			04/08/2010
Azilsartan Kamedoxomil	Tablet	II (Paddle)	50	Phosphate Buffer, pH 7.8 (deaerated)	900	5, 10, 15, 20, 30 and 45	05/09/2013
Azilsartan Kamedoxomil/ Chlorthalidone	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8 containing 1.0% Tween 80,	900	5, 10, 15, 20, 30 and 45	05/09/2013
Azithromycin	Tablet			Refer to USP			12/22/2016
Baclofen	Tablet			Refer to USP			12/15/2009
Baclofen	Tablet (Orally Disintegrating)	II (Paddle)	25	50 mM Acetate Buffer, pH 4.5	500 mL (10 mg) or 1000 mL (20mg)	5, 10, 15 and 30	07/14/2008
Balsalazide Disodium	Tablet	II (Paddle)	100	Water (degassed)	1000	10, 20, 30, 45, 60, 75, 90 and 120	07/31/2013
Bedaquiline Fumarate	Tablet	I (Basket)	150	0.01 N HCl	900	10, 15, 20, 30 and 45	06/06/2013
Benazepril HCl	Tablet	II (Paddle)	50	Water (deaerated)	500	10, 20, 30 and 45	01/16/2004

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Benazepril HCl/ Hydrochlorothiazide	Tablet	I (Basket)	100	0.1 N HCl	500	10, 20, 30 and 45	01/16/2004
Bendroflumethiazide/Nadolol	Tablet			Refer to USP			07/25/2007
Benzphetamine HCl	Tablet	II (Paddle)	50	Water	900	10, 20, 30, and 45	06/20/2007
Bepridil HCl	Tablet	I (Basket)	100	0.1 N HCl	900	10, 20, 30, 45 and 60	01/16/2004
Bethanechol Chloride	Tablet			Refer to USP			10/06/2008
Bicalutamide	Tablet	II (Paddle)	50	1% SLS in water	1000	10, 20, 30, 45 and 60	12/15/2005
Bisacodyl/Polyethylene glycol 3350/Potassium Chloride/ Sodium Bicarbonate/Sodium Chloride	Tablet (Delayed Release), For Solution,	II (Paddle)	100	Acid stage: 0.1 N HCl: Buffer stage: 0.05 M Phosphate buffer, pH 6.8, with 0.15% sodium lauryl sulfate (SLS) [only for Bisacodyl Tablets]	Acid stage: 900 mL; Buffer stage: 900 mL	Acid stage: 60; Buffer stage: 10, 20, 30, 45 and 60	03/02/2017
Bisoprolol Fumarate	Tablet			Refer to USP			06/18/2007
Bisoprolol Fumarate/ Hydrochlorothiazide	Tablet	II (Paddle)	75	0.1 N HCl	900	5, 10, 20, 30 and 45	01/20/2004
Bosentan	Tablet	II (Paddle)	50	1% SLS in water	900	15, 30, 45 and 60	09/02/2010
Bosentan	Tablet (For Suspension)	II (Paddle)	75	0.1 N HCl with 0.5% sodium dodecyl sulfate (SDS), pH 1.1	900	5, 10, 15, 20 and 30	11/16/2017
Bosutinib Monohydrate	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 15, 20, 30 and 45	06/25/2015
Brexpiprazole	Tablet	II (Paddle)	50	0.05 M Acetate buffer, pH 4.3	900	10, 15, 20, 30 and 45	10/20/2016
Brigatinib	Tablet	II (Paddle)	70	50 mM Potassium Phosphate Buffer, pH 7.2	900	5, 10, 15, 20, 30 and 45	11/02/2017
Brivaracetam	Tablet	II (Paddle	50	Phosphate Buffer, pH 6.4	2.5 and 5 mg tablets: 500 mL; 10, 25, 50, 75 and 100 mg tablets: 900 mL	5, 10, 15, 20 and 30	07/28/2016
Bromocriptine Mesylate	Tablet			Refer to USP			07/25/2007
Budesonide	Tablet (Extended Release)	II (Paddle)	100	Acid Stage: 0.1 M HCl containing 0.5% Macrogol Cetostearyl Ether; Buffer Stage: pH 7.2 phosphate buffer containing 0.5% Macrogol Cetostearyl Ether.	Acid Stage: 500 mL; Buffer Stage: 1000 mL	Acid Stage: 2 hours; Buffer Stage: 1, 2, 4, 6, 8 and 10 hours	04/02/2015
Bumetanide	Tablet			Refer to USP			07/14/2008
Buprenorphine HCl	Tablet (Sublingual)	I (Basket)	100	Water	500	2, 5, 8, 10, 15, and until at least 80% of the labeled content is dissolved	04/09/2007
Buprenorphine HCl/ Naloxone HCl	Tablet (Sublingual)	I (Basket)	100	Water	500	1, 3, 5, 7.5, 10, 15 and 20	07/01/2010
Bupropion HCl	Tablet			Refer to USP			08/15/2013
Bupropion HCl	Tablet (Extended Release)			Refer to USP			07/25/2007
Bupropion Hydrobromide	Tablet (Extended Release)	I (Basket)	75	0.1 N HCl	900	1, 2, 4, 6, 8 and 10 hours	06/10/2009
Buspirone Hydrochloride	Tablet			Refer to USP			07/21/2009
Busulfan	Tablet	II (Paddle)	50	Water (Deaerated)	500	5, 10, 15 and 30	07/14/2008
Cabergoline	Tablet	II (Paddle)	50	0.1 N HCl	500	5, 10, 15 and 30	01/20/2004
Cabozantinib S-Malate	Tablet	II (Paddle	75	0.01 N HCl with 0.375% Triton X-100 (degassed)	900	5, 10, 15, 20 and 30	07/28/2016

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Calcium Acetate	Tablet			Refer to USP			01/14/2008
Canagliflozin	Tablet	II (Paddle)	75	0.75% sodium lauryl sulfate (SLS) in water	600	5, 10, 15, 20 and 30	06/02/2016
Canagliflozin (Can)/Metformin HCl (Met)	Tablet (Extended Release)	Met: I (Basket, 40 mesh): Can: I (Basket, 10 mesh [with option of tablet holder])	Met: 100: Can:100	Met: Simulated Gastric Fluid [SGF] without enzyme, pH 1.2; Can: 0.1% (w/v) polysorbate 20 in 0.05 M sodium phosphate buffer pH 6.8 (50 mg); 0.2% (w/v) polysorbate 20 in 0.05 M sodium phosphate buffer pH 6.8 (150 mg)	Met: 900: Can: 900	Met: 1, 2, 4, 6, 8 10 and 12 hours: Can: 10, 15, 20, 30, 45 and 60 minutes;	12/22/2016
Canagliflozin/Metformin HCl	Tablet	II (Paddle)	Canagliflozin: 75; Metformin: 50	Canagliflozin (50 mg): 0.025% Polysorbate 20; Canagliflozin (150 mg):0.075% Polysorbate 20; Metformin: Phosphate buffer, pH 6.8	Canagliflozin (50 mg): 900; Canagliflozin (150 mg): 900; Metformin: 1000	Canagliflozin: 10, 15, 20, 30 and 45; Metformin: 5, 10, 15, 20 and 30	05/28/2015
Candesartan Cilexetil (16 mg, 8 mg and 4 mg)	Tablet	II (Paddle)	50	0.35% Polysorbate 20 in 0.05 M Phosphate Buffer, pH 6.5	900	10, 20, 30, 45 and 60	06/20/2007
Candesartan Cilexetil (32 mg)	Tablet	II (Paddle)	50	0.70% Polysorbate 20 in 0.05 M Phosphate Buffer, pH 6.5	900	10, 20, 30, 45 and 60	06/20/2007
Candesartan Cilexetil/ Hydrochlorothiazide (16/12.5 mg)	Tablet	II (Paddle)	50	0.35% Polysorbate 20 in phosphate buffer pH 6.5	900	10, 20, 30, 45 and 60	01/29/2010
Candesartan Cilexetil/ Hydrochlorothiazide (32/12.5 mg and 32/25 mg)	Tablet	II (Paddle)	50	0.70% Polysorbate 20 in phosphate buffer pH 6.5	900	15, 20, 30, 45 and 60	01/29/2010
Capecitabine	Tablet			Refer to USP			11/02/2017
Captopril	Tablet			Refer to USP			10/20/2016
Carbamazepine	Tablet			Refer to USP			12/24/2015
Carbamazepine	Tablet (Chewable)	II (Paddle	75	1% SLS in Water	900	15, 30, 45, 60 and 90	12/23/2010
Carbamazepine	Tablet (Extended Release)			Refer to USP			01/14/2008
Carbidopa	Tablet	I (Basket)	50	0.1 N HCl	750	10, 15, 20, 30 and 45	08/14/2014
Carbidopa/Entacapone/ Levodopa	Tablet	I (Basket)	Carbidopa and Levodopa: 50; Entacapone: 125	For both Carbidopa and Levodopa: 0.1 N HCl, For Entacapone: Phosphate buffer pH 5.5	Carbidopa and Levodopa: 750 ml. Entacapone: 900 ml	10, 20, 30, 45 and 60	01/03/2007
Carbidopa/Levodopa	Tablet			Refer to USP			01/14/2008
Carbidopa/Levodopa	Tablet (Extended Release)	II (Paddle)	50	0.1 N HCl	900	0.5, 0.75, 1, 1.5, 2, 2.5, 3 and 4 hours	08/15/2013
Carbidopa/Levodopa	Tablet (Orally Disintegrating)	II (Paddle)	50	0.1 N HCl	750	5, 10, 15, 30, and 45	07/25/2007
Carglumic Acid	Tablet	II (Paddle)	100	0.05M Phosphate Buffer, pH 6.8	750	5, 10, 15, 20 and 30	08/15/2013
Carisoprodol	Tablet			Refer to USP			01/29/2010
Carvedilol	Tablet	II (Paddle)	50	SGF without enzyme	900	10, 20, 30 and 45	01/21/2004
Carvedilol	Tablet			Refer to USP			12/24/2015
Cefaclor	Tablet (Chewable)			Refer to USP			03/03/2011
Cefaclor	Tablet (Extended Release)			Refer to USP			03/03/2011
Cefadroxil	Tablet			Refer to USP			09/02/2010

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Cefditoren Pivoxil	Tablet	II (Paddle)	75	Simulated Gastric Fluid without enzyme	900	5, 10, 15, 20 and 30	01/15/2010
Cefixime	Tablet			Refer to USP			12/23/2010
Cefixime	Tablet (Chewable)	II (Paddle	25	Phosphate Buffer, pH 7.2	900	10, 15, 20, 30, and 45	12/23/2010
Cefpodoxime Proxetil	Tablet			Refer to USP			07/25/2007
Cefprozil	Tablet			Refer to USP			07/25/2007
Cefprozil	Tablet			Refer to USP			10/04/2012
Cefuroxime Axetil	Tablet			Refer to USP			07/25/2007
Cetirizine HCl	Tablet (Orally Disintegrating)			Refer to USP			03/17/2016
Cetirizine HCl	Tablet (Regular & Chewable)	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	03/04/2006
Cetirizine HCl/ Pseudoephedrine HCl	Tablet (Extended Release)	I (Basket)	100	0.1 N HCl	500	0.17, 0.25, 0.5, 1, 2, 6 and 8 hours	06/18/2007
Chlorambucil	Tablet	II (Paddle)	75	0.1 N HCl	900	10, 20, 30, and 45	08/17/2006
Chlorpheniramine Maleate	Tablet (Extended Release)	III (Reciprocating Cylinder)	27 dpm	Row 1: Test Fluid 1 (0.1N HCl) for 1st hour. Row 2: Test fluid 2 (Phosphate Buffer, pH 7.5) for 5th hour	Row 1: 250 mL. Row 2: 250 mL	1 hour for test fluid 1, and 4 hours for test fluid 2	07/25/2007
Chlorpheniramine Maleate/ Codeine Phosphate	Tablet (Extended Release)	II (Paddle)	50	Simulated gastric fluid (SGF) without enzyme (pH 1.2)	900	0.5, 1, 2, 4, 6, 8 and 12 hours	10/20/2016
Chlorpheniramine Maleate/ Ibuprofen/Phenylephrine HCl	Tablet	II (Paddle)	50	50 mM Potassium Phosphate Buffer, pH 6.5 (degassed)	900	5, 10, 15, 20 and 30	06/25/2015
Chlorpheniramine Maleate/ Ibuprofen/ Pseudoephedrine HCl	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.5	900	10, 20, 30 and 45	02/20/2004
Chlorpromazine HCl	Tablet			Refer to USP			01/05/2012
Chlorthalidone	Tablet			Refer to USP			04/15/2008
Chlorzoxazone	Tablet			Refer to USP			01/14/2008
Cilostazol	Tablet	II (Paddle)	75	0.3% SLS in water	900	15, 30, 45, 60 and 90	08/17/2006
Cinacalcet HCl	Tablet	II (Paddle)	75	0.05 N HCl	900	10, 20, 30 and 45	01/26/2006
Ciprofloxacin HCl	Tablet			Refer to USP			09/02/2010
Ciprofloxacin HCl	Tablet (Extended Release)	I (Basket)	100	0.1 N HCl	900	1, 2, 4, and 7 hours or until at least 80% released	01/14/2008
Ciprofloxacin/Ciprofloxacin HCl (AB)	Tablet (Extended Release)	II (Paddle)	50	0.1 N HCl	900	15, 30, 60, and 120	01/14/2008
Citalopram HBr	Tablet			Refer to USP			01/14/2008
Clarithromycin	Tablet			Refer to USP			07/25/2007
Clarithromycin	Tablet (Extended Release)			Refer to USP			10/06/2008
Clobazam	Tablet	II (Paddle)	75	0.1 N HCl (degassed)	900	5, 10, 20, 30, 45 and 60	07/31/2013
Clomiphene Citrate	Tablet			Refer to USP			08/15/2013
Clonazepam	Tablet			Refer to USP			04/08/2010
Clonazepam	Tablet (Orally Disintegrating)	II (Paddle)	50	Water	900	5, 10, 15, 30, and 45	07/25/2007

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Clonidine (0.1 mg)	Tablet (Extended Release)	II (Paddle) with sinker	50	Acid stage: 0.01 N HCl; Buffer stage: Phosphate Buffer, pH 7.0	Acid stage: 500; Buffer stage: 500	Acid stage: 1 and 2 hours; Buffer stage: 1, 2, 4, 6, 10, 14 and 16 hours	01/26/2012
Clonidine (EQ. 0.17 mg and EQ. 0.26 mg)	Tablet (Extended Release)	II (Paddle)	50	500 mL 0.1N HCl for the 1st hour, then add 400 mL 0.27M Sodium Phosphate (Dibasic) buffer solution	Acid stage: 500; Buffer stage: 900	1, 2, 3, 6, 9, 12, 16, 20 and 24 hours	07/01/2010
Clonidine HCl	Tablet			Refer to USP			06/18/2007
Clonidine HCl (0.1 mg & 0.2 mg)	Tablet (Extended Release)	II (Paddle) with sinker	50	Acid stage: 0.01 N HCl; Buffer stage: Phosphate Buffer, pH 7.0	Acid stage: 500; Buffer stage: 500	Acid stage: 1 and 2 hours; Buffer stage: 1, 2, 4, 6, 10, 14 and 16 hours	08/27/2015
Clopidogrel Bisulfate	Tablet			Refer to USP			07/25/2007
Clorazepate Dipotassium	Tablet			Refer to USP			01/31/2013
Clotrimazole	Tablet (Vaginal)	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	01/24/2004
Clozapine	Tablet			Refer to USP			07/21/2011
Clozapine	Tablet (Orally Disintegrating)	II (Paddle	50 RPM (12.5 mg, 25 mg and 100 mg); 75 RPM (150 mg and 200 mg)	pH 4.5 Acetate Buffer	900	5, 10, 15, 20, and 30	06/09/2011
Cobicistat	Tablet	II (Paddle)	75	50 mM Sodium Acetate Buffer, pH 4.5	900	5, 10, 15, 20 and 30	08/27/2015
Cobicistat (Cobi)/Darunavir Ethanolate (Drv)	Tablet	Cobi: II (Paddle): Drv: II (Paddle)	Cobi: 75; Drv:75	Cobi: 0.05 M Citrate Phosphate Buffer, pH 4.2; Drv: 0.05 M Sodium Phosphate Buffer, pH 3.0, 2% Tween 20	Cobi: 900 mL; Drv: 900 mL	Cobi: 5, 10, 15, 20 and 30; Drv: 10, 15, 20, 30 and 45	10/20/2016
Cobicistat/Elvitegravir/ Emtricitabine/Tenofovir Alafenamide Fumarate	Tablet	II (Paddle)	100	0.05 M sodium citrate buffer pH 5.5 containing 2.0% w/v polysorbate 80	1000	5, 10, 15, 20 and 30	10/20/2016
Cobicistat/Elvitegravir/ Emtricitabine/Tenofovir Disoproxil Fumarate	Tablet	II (Paddle) with sinker	100	0.01 N HCl with 2% w/w Polysorbate 80	1000	5, 10, 15, 20 and 30	06/25/2015
Cobimetinib Fumarate	Tablet	II (Paddle)	50	50 mM Acetate Buffer, pH 4.5	900	5, 10, 15, 20 and 30	06/30/2016
Codeine Sulfate	Tablet			Refer to USP			09/01/2011
Colchicine	Tablet			Refer to USP			08/05/2010
Colesevelam HCl	Tablet			Disintegration Testing as per USP <701> in various media such as deionized water, simulated gastric fluid, and simulated intestinal fluid.			10/28/2010
Crofelemer	Tablet (Delayed Release)	II (Paddle)	75	Acid stage: 0.1 N HCl; Buffer stage: Sodium phosphate buffer, pH 6.8	Acid stage: 750; Buffer stage: 1000	Acid stage: 2 hours; Buffer stage:: 5, 10, 20, 30 and 45 minutes	06/02/2016
Cyclobenzaprine HCl	Tablet			Refer to USP			07/25/2007
Cyclophosphamide	Tablet	I (Basket)	100	Water (deaerated)	900	10, 20, 30, 45 and 60	01/24/2004
Cyproheptadine HCl	Tablet			Refer to USP			05/28/2015
Daclatasvir Dihydrochloride	Tablet	II (Paddle)	75	Phosphate Buffer, pH 6.8 with 0.75% Brij 35	1000	10, 15, 20, 30 and 45	03/17/2016
Dalfampridine	Tablet (Extended Release)	II (Paddle)	50	Phosphate Buffer, pH 6.8	900	0.5, 1, 2, 4, 6, 8, 10 and 12 hours	06/07/2012

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Dapagliflozin Propanediol	Tablet	II (Paddle)	60	Acetate Buffer, pH 4.5	1000	5, 10, 15, 20 and 30	05/28/2015
Dapagliflozin Propanediol/ Metformin HCl	Tablet (Extended Release)	I (Basket- 20 mesh)	100	Phosphate Buffer, pH 6.8	1000	Dapagliflozin: 5, 10, 15, 20, 30 and 45 minutes: Metaformin: 0.5, 1, 2, 3, 4, 6, 8, 10 and 12 hours	08/27/2015
Dapsone	Tablet			Refer to USP			12/23/2010
Darifenacin Hydrobromide	Tablet (Extended Release)	I (Basket)	100	0.01N HCl Comparative dissolution data should also be provided in 900 ml pH 4.5 buffer, pH 6.8 buffer, and water using Apparatus I (Basket) at 100 RPM.	900	1, 4, 8, 12, 16, 20 and 24 hours	01/20/2006
Darunavir Ethanolate	Tablet	II (Paddle)	75	2% Tween-20 in 0.05 M Sodium Phosphate Buffer, pH 3.0	900	10, 20, 30, and 45	09/13/2007
Dasabuvir Na/Ombitasvir/ Paritaprevir/Ritonavir	Tablet (Extended Release)	III (Reciprocating Cylinder [40 mesh (for bottom and top of the inner tube)]	25 dpm	15 mM hexadecyltrimethylammonium bromide (CTAB) in 0.03M Sodium Phosphate Buffer, pH 6.8	250	Ombitasvir/Paritaprevir/ Ritonavir: 10, 15, 20, 30, 45, 60 and 90 minutes;Dasabuvir: 1, 2, 3, 6, 9, 12, 15, 18, 21 and 24 hours	10/20/2016
Dasatinib	Tablet	II (Paddle)	60	pH 4.0 Acetate buffer containing 1% Triton X-100	1000	10, 15, 30 and 45	10/30/2009
Deferasirox	Tablet	II (Paddle)	75	0.5% Tween 20 in Phosphate Buffer, pH 6.8	900	5, 10, 15, 20 and 30	03/17/2016
Deferasirox	Tablet (for Oral Suspension)	II (Paddle)	50	Phosphate buffer pH 6.8 with 0.5% Tween 20	900	10, 20, 30 and 45	06/21/2006
Deferiprone	Tablet	II (Paddle)	50	0.1 N HCl	1000	5, 10, 20, 30, 45 and 60	06/25/2015
Delafloxacin Meglumine	Tablet	II (Paddle)	60	0.05 M Phosphate Buffer, pH 7.4 (degassed)	900	5, 10, 15, 20 and 30	11/16/2017
Delavirdine Mesylate	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.0 containing 0.6% w/v SDS	900	10, 20, 30, 45 and 60	12/03/2007
Demeclocycline HCl	Tablet			Refer to USP			07/25/2007
Desipramine HCl	Tablet			Refer to USP			01/31/2013
Desloratadine	Tablet	II (Paddle)	50	0.1 N HCl	500	15, 20, 30 and 45	03/04/2006
Desloratadine	Tablet (Orally Disintegrating)	II (Paddle)	50	0.1 N HCl	900	3, 6, 10, 15	06/18/2007
Desloratadine/ Pseudoephedrine Sulfate (2.5 mg/120 mg)	Tablet (Extended Release)	II (Paddle)	50	First hour: 0.1 N HCl; After 1 hour: 0.1M Potassium Phosphate Buffer pH 7.5	1000	For Desloratadine: 10, 20, 30 and 45; For Pseudoephedrine Sulfate: 1, 2, 6 and 8 hours	04/02/2009
Desloratadine/ Pseudoephedrine Sulfate (5 mg/240 mg)	Tablet (Extended Release)	II (Paddle)	50	First hour: 0.1 N HCl; After 1 hour: 0.1M Potassium Phosphate Buffer pH 7.5	1000	For Desloratadine: 10, 20, 30 and 45; For Pseudoephedrine Sulfate: 1, 2, 4, 8, 16 and 24 hours	04/02/2009
Desmopressin Acetate	Tablet	II (Paddle)	75	Water (deaerated)	500	10, 20, 30 and 45	12/15/2005
Desogestrel/Ethinyl Estradiol	Tablet			Refer to USP			11/04/2008

Dolutegravir Sodium (50 mg)	Tablet	II (Paddle)	50	0.01M pH 6.8 phosphate buffer containing 0.25% w/v sodium dodecyl sulfate (SDS)	900	5, 10, 15, 20, 30 and 45	10/18/2018
Donepezil HCl	Tablet			Refer to USP			03/17/2016
Donepezil HCl	Tablet (Orally Disintegrating (ODT))	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	03/04/2006
Donepezil HCl (23 mg)	Tablet	II (Paddle	50	0.05 M Phosphate Buffer, pH 6.8	900	1, 2, 3, 4, 6, 8 and 10 hours	12/23/2010
Doxazosin Mesylate	Tablet	II (Paddle)	50	0.01 N HCl	900	10, 20, 30, 45 and 60	01/27/2004
Doxazosin Mesylate	Tablet (Extended Release)	II (Paddle)	75	SGF without enzyme	900	1, 2, 4, 6, 8, 12 and 16 hours	01/03/2007
Doxepin HCl	Tablet	II (Paddle)	50	Simulated Gastric Fluid w/o enzyme (pH 1.1–1.3)	900	5, 10, 15, 20, 30 and 45	09/02/2010
Doxycycline Hyclate	Tablet			Refer to USP			03/17/2016
Doxycycline Hyclate (120 mg and 60 mg)	Tablet (Delayed Release)	I (Basket)	100	Acid stage: 0.06 N HCl; Buffer stage: Neutralized Phthalate Buffer, pH 5.5	Acid stage: 900 mL; Buffer stage: 900 mL	Acid stage: 10, 20, 30, 45 and 60; Buffer stage: 5, 10, 15, 20, 30 and 45	03/27/2018
Doxycycline Hyclate (150 mg and 75 mg)	Tablet	II (Paddle)	75	Water	900	5, 10, 15, 20 and 30	05/28/2015
Doxycycline Hyclate (200 mg, 150 mg, 100 mg, 80 mg and 75 mg)	Tablet (Delayed Release)			Refer to USP			05/28/2015
Doxycycline Hyclate (50 mg)	Tablet (Delayed Release)	I (Basket)	100	Acid stage: 0.06 N HCl; Buffer stage: Neutralized Phthalate Buffer, pH 5.5	900	Acid stage: 5, 10, 15, 20 and 30; Buffer stage: 5, 10, 15, 20 and 30	05/28/2015
Doxylamine Succinate/ Pyridoxine HCl	Tablet (Extended Release)	II (Paddle)	100	Acid stage: 0.1 N HCl: Buffer stage: 0.2M sodium phosphate buffer pH 6.8	Acid stage: 1000 mL; Buffer stage: 1000 mL	Acid stage: 5, 10, 15, 30, 60, 120 minutes; Buffer stage: 5, 10, 15, 20 and 30 minutes	01/19/2017
Dronedarone HCl	Tablet	II (Paddle) with sinker	75	pH 4.5 Phosphate buffer	1000	10, 15, 20, 30, 45, 60, 90 and 120	02/25/2015
Drospirenone/Estradiol	Tablet	II (Paddle)	50	Water	900	10, 20, 30, and 45	01/03/2007
Drospirenone/Ethinyl Estradiol	Tablet			Refer to USP			07/28/2016
Drospirenone/Ethinyl Estradiol/Levomefolate Calcium	Tablet	II (Paddle)	50	Phosphate buffer pH 6.8, saline with 0.03% ascorbic acid	900	5, 10, 15, 20 and 30	07/28/2016
Efavirenz	Tablet	II (Paddle)	50	2% SLS in water	1000	10, 15, 30, 45, 60	06/18/2007
Efavirenz 600 mg; Emtricitabine 200 mg; Tenofovir Disoproxil Fumarate 300 mg	Tablet	II (Paddle)	100	2% SLS in water	1000	10, 20, 30, and 45	01/03/2007
Elbasvir/Grazoprevir	Tablet	I (Basket)	100	Phosphate Buffer, pH 6.8 with 0.45% (w/v) Polysorbate 80	900	10, 15, 20, 30, 45 and 60	07/28/2016
Eletriptan Hydrobromide	Tablet	I (Basket)	100	0.1 N HCl	900	5, 10, 15 and 30	04/02/2009
Eltrombopag Olamine	Tablet	II (Paddle)	50	0.5% Polysorbate 80 in Phosphate Buffer, pH 6.8	900	10, 15, 20, 30, 45, and 60	06/07/2012
Eluxadoline	Tablet	I (Basket)	100	0.05M Phosphate Buffer, pH 4.5	900	5, 10, 15, 20 and 30	03/17/2016

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Elvitegravir	Tablet	II (Paddle) with sinker	75	2.0% w/v Polysorbate 80 in 0.01 N HCl (pH 2.0) at 37°C	700 mL for 85 mg tablets; 1000 mL for 150 mg tablets 1000 mL for 150 mg tablets	10, 20, 30, 45 and 60	12/24/2015
Empagliflozin	Tablet	II (Paddle)	75	0.05 M Phosphate Buffer, pH 6.8	900	5, 10, 15, 20 and 30	05/28/2015
Empagliflozin/Metformin HCl	Tablet (Extended Release)	I (Basket)	100	Phosphate Buffer, pH 6.8	900	Metformin: 1, 2, 4, 6, 8, 10 and 12 hours: Empagliflozin: 10, 15, 20, 30, 45 and 60 minutes;	01/19/2017
Empagliflozin/Linagliptin	Tablet	II (Paddle)	50	pH 6.8 Phosphate Buffer	900	10, 15, 20, 30 and 45	12/24/2015
Empagliflozin/Metformin HCl	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8 (degas)	900	5, 10, 15, 20 and 30	06/30/2016
Empagliflozin/Metformin Hydrochloride	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8 (deaerated)	900	5, 10, 15, 20 and 30	10/20/2016
Emtricitabine/Rilpivirine HCl/ Tenofovir Alafenamide Fumarate	Tablet	II (Paddle	75	Rilpivirine (RPV): 0.5% Polysorbate 20 in 0.01 N HCl; Emtricitabine (ETC) and Tenofovir alafenamide (TAF): 50 mM Sodium Citrate, pH 5.5,	RPV: 1000 mL; ETC and TAF: 500 mL	5, 10, 15, 20, 30 and 45	07/28/2016
Emtricitabine/Rilpivirine HCl/ Tenofovir Disoproxil Fumarate	Tablet	II (Paddle) with sinker	75	0.5%(w/w) polysorbate 20 in 0.01N HCl (pH 2.0)	1000	Emtricitabine and Tenofovir: 5, 10, 15, 20 and 30; Rilpivirine: 10, 20, 30, 45, 60, 75, 90 and 120	01/15/2015
Emtricitabine/Tenofovir Alafenamide Fumarate	Tablet	II (Paddle	75	50 mM Sodium Citrate buffer, pH 5.5	500	5, 10, 15, 20, 30 and 45	07/28/2016
Emtricitabine/Tenofovir Disoproxil Fumarate	Tablet	II (Paddle)	50	0.01 N HCl	900	5, 10, 15, 30 and 45	01/03/2007
Enalapril Maleate	Tablet			Refer to USP			09/03/2008
Entacapone	Tablet	II (Paddle)	50	Phosphate Buffer, pH 5.5	900	10, 20, 30 and 45	01/29/2004
Entecavir	Tablet	II (Paddle)	50	Phosphate buffer pH 6.8 (50mM)	1000	10, 20, 30, and 45	06/21/2006
Eplerenone	Tablet	II (Paddle)	50	0.1 N HCl	1000	10, 20, 30 and 45	12/19/2005
Eprosartan Mesylate	Tablet	II (Paddle)	75	0.2 M Phosphate Buffer, pH 7.5	1000	15, 30, 45 and 60	07/14/2008
Eprosartan Mesylate/ Hydrochlorothiazide	Tablet	II (Paddle)	75	0.2 M Phosphate Buffer, pH 7.5	1000	10, 20, 30 and 45	02/19/2008
Erlotinib HCl	Tablet	II (Paddle)	75	0.02% Tween 80 in 0.01 N HCl	1000	5, 10, 15, 20, 30 and 45	10/18/2018
Erythromycin	Tablet			Refer to USP			12/24/2015
Erythromycin	Tablet (Delayed Release)			Refer to USP			10/31/2013
Escitalopram Oxalate	Tablet	II (Paddle)	75	0.1 N HCl	900	10, 20, 30 and 45	02/20/2004
Eslicarbazepine Acetate	Tablet	II (Paddle)	100	Acetate Buffer, pH 4.5	1000	5, 10, 15, 20, 30 and 45	08/27/2015
Esomeprazole Magnesium	Tablet (Delayed Release)	II (Paddle)	100	Acid stage: 0.1 N HCl; Buffer stage: Phosphate Buffer, pH 6.8	Acid stage: 300; Buffer stage: 1000	Acid stage: 120; Buffer stage: 10, 20, 30, 45 and 60	10/20/2016
Estazolam	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	01/27/2004
Esterified Estrogens	Tablet	II (Paddle)	50	Water	900	15, 30, 45, 60, 90, 120 and 180	02/19/2008
Estradiol/Norethindrone Acetate	Tablet			Refer to USP			01/05/2012

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Glipizide	Tablet			Refer to USP			08/05/2010
Glipizide	Tablet (Extended Release)	II (Paddle)	50	Simulated Intestinal Fluid without pancreatin, pH 7.5	900	1, 2, 4, 8, 16 hours and until at least 80% dissolved	04/10/2008
Glipizide/Metformin HCL	Tablet			Refer to USP			12/18/2008
Glyburide (Micronized)	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 7.5	900	10, 20, 30, 45 and 60	02/02/2004
Glyburide (Non-micronized)	Tablet	II (Paddle)	75	0.05 M Borate Buffer, pH 9.5	500	10, 20, 30, 45 and 60	02/02/2004
Glyburide/Metformin HCl	Tablet			Refer to USP			01/14/2008
Glycopyrrolate	Tablet			Refer to USP			07/25/2007
Granisetron HCl	Tablet	II (Paddle)	50	Phosphate buffer, pH 6.5	500	10, 20, 30, 45 and 60	06/05/2006
Griseofulvin (Microcrystalline)	Tablet			Refer to USP			01/15/2010
Griseofulvin (Ultramicrocrystalline)	Tablet			Refer to USP			11/04/2008
Guaifenesin	Tablet (Extended Release)	I (Basket)	75	0.1 N HCl	900	1, 2, 4, 6 and 12 hours	01/03/2007
Guaifenesin/Pseudoephedrine Hydrochloride	Tablet (Extended Release)	I (Basket)	50	0.01 N HCl	900	1, 2, 6, and 12 hours	11/25/2008
Guanfacine	Tablet (Extended Release)	II (Paddle)	75	HCl Buffer, pH 2.2	900	1, 2, 4, 6, 8, 10, 12, 16, 20 and 24 hours	07/01/2010
Haloperidol	Tablet			Refer to USP			11/25/2008
Homatropine Methylbromide/ Hydrocodone Bitartrate	Tablet			Refer to USP			10/30/2009
Hydralazine HCl	Tablet			Refer to USP			04/10/2008
Hydrochlorothiazide	Tablet			Refer to USP			07/25/2007
Hydrochlorothiazide/Irbesartan	Tablet	II (Paddle)	50	0.1 N HCl	1000	10, 20, 30 and 45	09/24/2008
Hydrochlorothiazide/Lisinopril	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	02/03/2004
Hydrochlorothiazide/Losartan Potassium	Tablet	I (Basket)	100	Water (deaerated)	900	10, 20, 30, 45 and 60	02/03/2004
Hydrochlorothiazide/ Metoprolol Succinate	Tablet (Extended Release)	II (Paddle)	Hydrochlorothiazide: 100; Metoprolol succinate: 75	Hydrochlorothiazide: 0.1N HCl; Metoprolol succinate: Phosphate Buffer, pH 6.8	Hydrochlorothiazide: 500; Metoprolol succinate: 500	Hydrochlorothiazide: 10, 15, 20, 30, and 45 minutes; Metoprolol succinate: 1, 2, 4, 6, 8, 12, 16, 20 and 24 hours	10/31/2013
Hydrochlorothiazide/ Metoprolol Tartrate	Tablet			Refer to USP			01/05/2012
Hydrochlorothiazide/ Moexipril HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	02/10/2004
Hydrochlorothiazide/ Olmesartan Medoxomil	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.8	900	5, 10, 15, 20, 30, 45 and 60	07/09/2007
Hydrochlorothiazide/ Quinapril HCl	Tablet	I (Basket)	100	Water (deaerated)	900	5, 10, 20 and 30	02/03/2004
Hydrochlorothiazide/ Spironolactone	Tablet			Refer to USP			08/27/2009
Hydrochlorothiazide/ Telmisartan	Tablet			Refer to USP			06/30/2016

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Hydrochlorothiazide/ Triamterene	Tablet			Refer to USP			07/31/2013
Hydrochlorothiazide/Valsartan	Tablet			Refer to USP			07/28/2016
Hydrocodone Bitartrate	Tablet (Extended Release)	I (Basket-10 mesh)	100	Simulated gastric fluid (SGF) without enzyme (pH 1.2)	900	1, 2, 4, 8, 12, 16, 20 and 24 hours	04/14/2016
Hydrocodone Bitartrate/ Ibuprofen	Tablet	II (Paddle)	50	Phosphate Buffer, pH 7.2	900	5, 10, 15 and 30	02/04/2004
Hydrocortisone	Tablet			Refer to USP			05/09/2013
Hydromorphone HCl	Tablet			Refer to USP			07/25/2007
Hydromorphone HCl	Tablet (Extended Release)	VII (Reciprocating holder) (Sample holder-Cage)	30 cycles per min	Water	50	1, 2, 4, 6, 8, 10, 12, 16, 20 and 24 hours	05/26/2016
Hydroxyzine HCl	Tablet			Refer to USP			07/25/2007
Ibandronate Sodium	Tablet	II (Paddle)	50	Water	500	5, 10, 15, 30 and 45	01/03/2007
Ibuprofen	Tablet			Refer to USP			07/25/2007
Ibuprofen	Tablet (Chewable)	II (Paddle)	50	0.05 M Phosphate Buffer, pH 7.2	900	10, 20, 30 and 45	02/04/2004
Ibuprofen/Oxycodone HCl	Tablet	I (Basket)	100	Phosphate buffer, pH 7.2	500	10, 20, 30 and 45	04/09/2007
Ibuprofen/Phenylephrine HCl	Tablet	II (Paddle)	50	50 mM Potassium Phosphate Buffer, pH 6.5, (degassed)	900	10, 15, 20, 30 and 45	01/05/2012
Idelalisib	Tablet	II (Paddle)	75	0.01 N HCl	750	5, 10, 15, 20 and 30	08/27/2015
Iloperidone	Tablet	II (Paddle)	50	0.1 N HCl	500	5, 10, 15, 30, 45 and 60	08/05/2010
Imatinib Mesylate	Tablet	II (Paddle)	50	0.1 N HCl	1000	5, 10, 15, 20 and 30	09/22/2011
Imipramine HCl	Tablet			Refer to USP			01/14/2008
Indapamide	Tablet			Refer to USP			04/15/2008
Irbesartan	Tablet			Refer to USP			08/11/2008
Isocarboxazid	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	02/04/2004
Isoniazid	Tablet			Refer to USP			04/15/2008
Isosorbide Dinitrate	Tablet			Refer to USP			06/25/2015
Isosorbide Dinitrate	Tablet (Extended Release)			Refer to USP			06/25/2015
Isosorbide Dinitrate/ Hydralazine HCl	Tablet	I (Basket)	100	0.05 N HCl	900	10, 15, 20, 25, 30 and 45	06/10/2009
Isosorbide Mononitrate	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 15 and 30	02/04/2004
Isosorbide Mononitrate	Tablet (Extended Release)			Refer to USP			11/25/2008
Isradipine (10 mg)	Tablet (Extended Release)	II (Paddle)	50	0.2% Lauryl Dimethylamine Oxide (LDAO) in water	1000	2, 4, 8, 12, 16 and 24 hours	02/25/2004
Isradipine (5 mg)	Tablet (Extended Release)	II (Paddle)	50	0.2% Lauryl Dimethylamine Oxide (LDAO) in water	500	2, 4, 8, 12, 16 and 24 hours	02/25/2004
Itraconazole	Tablet	II (Paddle)	75	0.1 N HCl	900	5, 15, 30, 45, 60, 75 and 90	08/15/2013
Ivabradine HCl	Tablet			Develop a dissolution method			05/18/2017
Ivacaftor	Tablet	II (Paddle) with sinker	65	50 mM Sodium Phosphate Buffer with 0.7% Sodium Dodecyl Sulfate (SDS), pH 6.8	900	5, 10, 15, 20 and 30	06/25/2015

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Ivacaftor/lumacaftor	Tablet	Lumacaftor: II (Paddle); Ivacaftor: II (Paddle)	Lumacaftor:65; Ivacaftor: 65	Lumacaftor: 0.5% (w/v) CTAB in 50 mM Sodium Acetate Trihydrate buffer (pH 4.5); Ivacaftor: 0.4% (w/v) SLS in 50 mM Sodium Phosphate buffer (pH 6.8)	Lumacaftor: 900; Ivacaftor: 900	5, 10, 15, 20 and 30	03/17/2016
Ivermectin	Tablet	II (Paddle)	50	0.5% SDS in 0.01 M Monobasic Sodium Phosphate, pH 7.0	900	10, 20, 30, 45 and 60	02/04/2004
Ketoconazole	Tablet	I (Basket)	100	Simulated gastric fluid w/o pepsin	800	15, 30, 45, 60 and 90	01/03/2007
Ketoprofen	Tablet	II (Paddle)	50	SIF Buffer without enzyme, pH 7.4	900	10, 20, 30, 45 and 60	02/05/2004
Ketorolac Tromethamine	Tablet			Refer to USP			04/15/2008
Labetalol HCl	Tablet			Refer to USP			08/27/2009
Lacosamide	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 15, 20, 30 and 45	06/07/2012
Lamivudine (for 100 mg & 150 mg)	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	03/22/2006
Lamivudine (for 300 mg only)	Tablet	II (Paddle)	75	0.1 N HCl	900	5, 10, 15 and 30	03/22/2006
Lamivudine 150 mg/ Zidovudine 300mg Tablets and Abacavir Sulfate 300 mg Tablets-co-packaged	Tablet	II (Paddle)	75	0.1 N HCl	900	5, 10, 15, 20, 30 and 40	01/03/2007
Lamivudine/Raltegravir Ka	Tablet	II (Paddle)	75	Water	900	10, 15, 20, 30 and 45	10/20/2016
Lamivudine/Stavudine/ Nevirapine	Tablet	II (Paddle)	75	0.1 N HCl	900	10, 20, 30, 45 and 60	01/03/2007
Lamivudine/Zidovudine	Tablet			Refer to USP			11/02/2017
Lamivudine/ Zidovudine + Efavirenz	Tablet (Copackage)	II (Paddle)	Lamivudine and Zidovudine: 75 Efavirenz: 50	Lamivudine and Zidovudine: 0.1 N HCl Efavirenz: 2% SLS in water	Lamivudine and Zidovudine: 1000 Efavirenz: 900	10, 20, 30, and 45	01/03/2007
Lamivudine/ Zidovudine + Nevirapine	Tablet (Copackage)	II (Paddle)	50	Lamivudine and Zidovudine: water Nevirapine: 0.06 M HCl (pH 1.2)	900	10, 15, 30, 45 and 60	01/03/2007
Lamivudine/Zidovudine/ Nevirapine	Tablet	II (Paddle)	50	0.01 N HCl	900	10, 15, 30, 45 and 60	01/03/2007
Lamotrigine	Tablet (Chewable dispersible)	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	01/14/2008
Lamotrigine	Tablet (Extended Release)			Refer to USP			02/18/2016
Lamotrigine	Tablet (Regular)	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	03/04/2006
Lansoprazole	Tablet (Delayed Release, Orally Disintegrating)	II (Paddle)	75	Acid Stage: 0.1 N HCl; Buffer Stage: Phosphate Buffer, pH 6.8 with 5 mM Sodium Dodecyl Sulfate	500 (Acid), 900 (Buffer)	60 (Acid), 10, 20, 30 and 45 (Buffer)	11/04/2008
Lapatinib Ditosylate	Tablet	II (Paddle)	55	2% Polysorbate 80 in 0.1 N HCl	900	10, 15, 30 and 45	10/30/2009
Ledipasvir/Sofosbuvir	Tablet	II (Paddle)	75	1.5% Polysorbate 80 in 10 mM Potassium Phosphate Buffer with 0.0075 mg/mL Butylated Hydroxytoluene (BHT), pH 6.0	900	5, 10, 15, 20, 30, 45 and 60	08/27/2015
Leflunomide	Tablet	II (Paddle)	100	Water (deaerated)	1000	10, 20, 30 and 45	02/05/2004
Leflunomide (100 mg)	Tablet	II (Paddle)	100	Water (deaerated) + 0.6% Polyoxyethylene Lauryl Ether	1000	10, 20, 30 and 45	05/31/2007

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Lesinurad	Tablet	II (Paddle)	75	pH 4.5 sodium acetate buffer with 1% SLS	900	10, 20, 30 and 45	03/17/2016
Letermovir	Tablet	II (Paddle)	75	25 mM Na Acetate Buffer, pH 4.5 with 0.6% Tween-80	900	10, 15, 20, 30, 45 and 60	02/08/2018
Letrozole	Tablet			Refer to USP			04/10/2008
Letrozole/Ribociclib	Tablet	II (Paddle)		0.01N HCl, (degassed) [Ribociclib]; 0.1N HCl [Letrozole]		10, 15, 20, 30, 45 and 60	11/02/2017
Leucovorin Calcium	Tablet			Refer to USP			07/14/2008
Levetiracetam	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 15 and 30	02/05/2004
Levetiracetam	Tablet (Extended Release)	I (Basket)	100	0.05 M Phosphate Buffer, pH 6.0	900	1, 2, 4, 6, 8 and 12 hours	04/02/2009
Levetiracetam	Tablet, for Suspension	II (Paddle)	50	Phosphate Buffer, pH 6.8 (degas)	900	2.5, 5, 10, 15 and 20	03/02/2017
Levocarnitine	Tablet			Refer to USP	900		08/27/2015
Levocetirizine Dihydrochloride	Tablet	II (Paddle)	50	Water	900	10, 20, 30 and 45	08/11/2008
Levofloxacin	Tablet			Refer to USP			07/28/2016
Levonorgestrel	Tablet	II (Paddle)	75	0.1 N HCl with 0.1% SLS	1000	10, 20, 30, 45, 60 and 90	02/05/2004
Levothyroxine Sodium	Tablet			Refer to USP			07/25/2007
Linagliptin	Tablet	I (Basket)	50	0.1 N HCl	900	5, 10, 15, 20, 30 and 45	08/15/2013
Linagliptin/Metformin HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20, 30 and 45	05/15/2014
Linagliptin/Metformin HCl	Tablet (Extended Release)	I (Basket)	100	Simulated Gastric Fluid (SGF) without enzyme (pH 1.2) (degassed)	900	Linagliptin 10, 15, 20, 30 and 45 minutes; Metformin: 1, 2, 4, 6, 8 and 12 hours	07/28/2016
Linezolid	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.8	900	5, 10, 20, 30 and 45	01/14/2008
Liothyronine Sodium	Tablet			Refer to USP			06/18/2007
Lisinopril	Tablet			Refer to USP			01/14/2008
Lithium Carbonate	Tablet			Refer to USP			04/10/2008
Lithium Carbonate	Tablet (Extended Release)			Refer to USP			01/14/2008
Lomefloxacin HCl	Tablet	II (Paddle)	50	0.01 N HCl	900	10, 20, 30 and 45	02/05/2004
Loperamide HCl	Tablet			Refer to USP (provide individual unit data).			06/25/2015
Loperamide HCl	Tablet (Chewable)	II (Paddle)	50	0.2 M Acetate Buffer, pH 4.7	500	5, 10, 15, 20 and 30	06/25/2015
Loperamide HCl/Simethicone	Tablet	II (Paddle)	75	0.1N HCl	500	10, 15, 20, 30 and 45	08/27/2015
Lopinavir/Ritonavir	Tablet (Combination)			Refer to USP			01/15/2015
Loratadine	Tablet (Chewable)	II (paddle)	50	0.1 N HCl	500	15, 30, 45 and 60	07/14/2008
Loratadine	Tablet (Orally Disintegrating)	I (Basket)	50	SGF without enzyme	900	2, 4, 6 and 10	07/14/2008
Loratadine/Pseudoephedrine Sulfate (10 mg/240 mg)	Tablet (Extended Release)	I (Basket)	75	900 mL 0.1 N HCl for one hour, then replace the medium with 900 mL 0.05 M phosphate buffer at pH6.8 containing 0.01% sodium lauryl sulfate.	900	Loratadine:10, 15, 20, 30 and 45; Pseudoephedrine: 1, 2, 4, 8, 12, 16, 18 and 24 hours	08/05/2010
Loratadine/Pseudoephedrine Sulfate (5 mg/120 mg)	Tablet (Extended Release)	II (Paddle)	50	900 mL 0.1 N HCl for one hour, then replace with 900 mL 0.05 M phosphate buffer at pH 8.2 containing 0.01% sodium lauryl sulfate	900	Loratadine:15, 20, 30, 45, 60 and 90; Pseudoephedrine: 1, 2, 4, 8, 12 and 16 hours	08/05/2010
Lorazepam	Tablet			Refer to USP			01/14/2008

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Lorcaserin HCl	Tablet	II (Paddle)	50	0.1 N HCl (deaerated)	900	5, 10, 15, 20 and 30	12/22/2016
Lorcaserin HCl	Tablet (Extended Release)	I (Basket)	100	0.1 N HCl (deaerated)	900	1, 2, 4, 5, 8 12, 16 and 20 hours	10/20/2016
Losartan Potassium	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	02/06/2004
Losartan Potassium	Tablet			Refer to USP			01/05/2012
Lovastatin/Niacin	Tablet (Extended Release)	I (Basket)	100	For Niacin: Water; for Lovastatin: 0.05 M phosphate buffer, pH 7.0 with 0.5% sodium dodecyl sulfate	900	For Niacin: 0.5, 1, 2, 3, 6, 9, 12, 20 and 24 hours; For Lovastatin: 15, 30, 45 and 60 min	01/14/2008
Lurasidone HCl	Tablet	II (Paddle)	50	McIlvaine buffer, pH 3.8 [(0.025 M Citric acid Solution+0.05M Na2HPO4 solution (3:2)] Measure the pH and adjust to 3.8, if necessary. Degas before use.	900	5, 10, 15, 20 and 30	01/31/2013
Macitentan	Tablet	II (Paddle)	75	Phosphate Buffer, pH 6.8 with 0.1% of Cetrimonium bromide (CTAB)	900	10, 15, 20, 30 and 45	05/28/2015
Magnesium Hydroxide/ Omeprazole/Sodium Bicarbonate	Tablet (Chewable)	II (Paddle)	150	0.029 M sodium phosphate buffer w/0.5% SDS, pH 7.4	900	15, 30, 45, and 60	02/19/2008
Magnesium Hydroxide/ Omeprazole/Sodium Bicarbonate	Tablet (Chewable)	II (Paddle)	150	pH 7.4 Phosphate Buffer with 0.5% SDS	900	15, 30, 45, 60 and 90	10/06/2008
Maraviroc	Tablet	I (Basket)	100	0.01 N HCl	900	10, 15, 20, 30 and 45	10/21/2010
Mebendazole	Tablet (Chewable)	II (Paddle)	75	0.1 N HCl containing 1% Sodium Lauryl Sulfate	900	15, 30, 45, 60, 90 and 120	10/06/2008
Mebendazole (500 mg)	Tablet (Chewable)	II (Paddle)	75	1% Sodium Lauryl Sulfate (SLS) in 0.01 N HCl	900	5, 10, 15, 30, 45 and 60 minutes	12/22/2016
Mecamylamine HCl	Tablet			Refer to USP			02/15/2018
Meclizine HCl	Tablet	I (Basket)	100	0.01 N HCl	900	10, 20, 30, 45 and 60	08/27/2009
Meclizine HCl	Tablet (Chewable)	I (Basket)	100	0.01 N HCl	900	10, 20, 30, 45 and 60	04/08/2010
Medroxyprogesterone Acetate	Tablet			Refer to USP			12/24/2015
Mefloquine HCl	Tablet	I (Basket)	100	SGF without enzyme	900	10, 20, 30, 45 and 60	02/06/2004
Meloxicam	Tablet	II (Paddle)	75	Phosphate Buffer, pH 7.5	900	10, 20, 30, 45 and 60	02/20/2004
Melphalan	Tablet			Refer to USP			07/14/2008
Memantine HCl	Tablet	I (Basket)	100	0.1 N HCl with NaCl (12 g NaCl in 6 L water adjust pH to 1.2 with HCl)	900	10, 20, 30 and 45	12/16/2005
Meprobamate	Tablet			Refer to USP			11/25/2008
Mercaptopurine	Tablet	II (Paddle)	50	0.1 N HCl	900	20, 30, 45, 60, 90 and 120	02/06/2004
Mesalamine (1.2 gram)	Tablet (Delayed Release)	II (Paddle)	100	Acid stage (A): 100 mM HCl Buffer stage (B): Phosphate Buffer, pH 6.4 Buffer stage (C): Phosphate Buffer, pH 7.2	Acid stage (A): 750 mL; Buffer stage (B): 950 mL; Buffer stage (C): 960 mL	Acid stage (A): 2 hours; Buffer stage (B): 1 hour; Buffer stage (C): 1, 2, 4, 6 and 8 hours	06/10/2009
Mesalamine (400 mg and 800 mg)	Tablet (Delayed Release)			Refer to USP			11/05/2010
Mesna	Tablet	II (Paddle)	50	0.06 N HCl	500	5, 10, 15, 20 and 30	02/09/2004

Metaxalone	Tablet			Refer to USP			10/20/2016
Metformin HCl	Tablet			Refer to USP			04/10/2008
Metformin HCl	Tablet (Extended Release)			Refer to USP			12/12/2008
Metformin HCl/ Pioglitazone HCl	Tablet	II (Paddle)	50	pH 2.5 McIlvaine buffer (0.1 M Citric acid adjusted to pH 2.5 with 0.2 M Na2HPO4)	900	10, 20, 30 and 45	01/03/2007
Metformin HCl/Saxagliptin	Tablet (Extended Release)	I (Basket)	100	Phosphate Buffer, pH 6.8	1000	Metformin: 1, 2, 3, 4, 6, 8, 10 and 12 hours. Saxagliptin: 5, 10, 15, 20 and 30 minutes	01/26/2012
Metformin HCl/Sitagliptin Phosphate	Tablet	II (Paddle)	75	0.025 M NaCl	900	10, 15, 20 and 30	10/06/2008
Metformin/Repaglinide	Tablet	II (Paddle)	50	Citric acid/phosphate buffer, pH 5.0	900	5, 10, 15, 20 and 30	10/30/2009
Methadone HCl	Tablet			Refer to USP			07/14/2008
Methazolamide	Tablet	II (Paddle)	100	pH 4.5 Acetate Buffer	900	10, 15, 20, 30 and 45	05/28/2015
Methenamine Hippurate	Tablet			Refer to USP			07/31/2013
Methimazole	Tablet			Refer to USP			01/14/2008
Methocarbamol	Tablet			Refer to USP			08/15/2013
Methotrexate Sodium	Tablet			Refer to USP			04/02/2009
Methscopolamine Bromide	Tablet			Refer to USP			02/15/2018
Methylergonovine Maleate	Tablet			Refer to USP			03/17/2016
Methylnaltrexone Bromide	Tablet	II (Paddle)	50	0.1 N HCl	1000	5, 10, 15, 20 and 30	10/20/2016
Methylphenidate	Tablet (Extended Release, Orally Disintegrating)	II (Paddle)	75	Acid Stage: 0.1 N HCl; Buffer Stage: Phosphate Buffer, pH 6.8	Acid Stage: 900 mL; Buffer Stage: 1000 mL	Acid Stage: 15, 30, 60, 120 minutes; Buffer Stage: 1, 2, 3, 4, 6 and 8 hours	11/16/2017
Methylphenidate	Tablet (Extended Release)			Refer to USP			02/14/2014
Methylphenidate HCl	Tablet			Refer to USP (provide individual unit data).			
Methylphenidate HCl	Tablet (Chewable)	I (Basket)	100	Water	900	15, 30, 45 and 60	03/25/2010
Methylphenidate HCl	Tablet (Extended Release, Chewable)	II (Paddle)	75	0.4M KH2PO4 solution (degas)	900	0.25, 0.5, 1, 2, 3, 4, 6, 8 hours	03/17/2016
Methylprednisolone	Tablet			Refer to USP			01/29/2010
Methyltestosterone	Tablet	II (Paddle)	50	Water	900	10, 20, 30, 45, 60 and 75	07/31/2013
Metoclopramide HCl	Tablet			Refer to USP			07/15/2009
Metoclopramide HCl	Tablet (Orally Disintegrating)	I (Basket)	50	Water	900	5, 10, 15, 20, 30 and 45	04/08/2010
Metolazone	Tablet	II (Paddle)	75	2% SLS in 0.05 M Sodium Phosphate Buffer, pH 7.5	900	30, 60, 90, 120 and 150	02/10/2004
Metoprolol Succinate	Tablet (Extended Release)			Refer to USP			07/25/2007
Metoprolol Tartrate	Tablet			Refer to USP			07/25/2007
Metronidazole	Tablet			Refer to USP			08/05/2010
Miconazole	Tablet (Buccal)	I (Basket)	60	0.5% SDS (Sodium dodecylsulfate) in water-pH adjusted to 6.5±0.5	1000	1, 2, 4, 6, 8, 10 and 12 hours	10/28/2010
Midodrine HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	02/06/2004
Mifepristone	Tablet	II (Paddle)	75	0.01 N HCl	900	5, 10, 15, 20 and 30	01/14/2008

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Mifepristone [300 mg]	Tablet	II (Paddle)	50	pH 1.8 KCl Buffer	900	10, 15, 20, 30 and 45	03/17/2016
Miglitol	Tablet	II (Paddle)	75	Water	900	10, 20, 30, and 45	03/03/2011
Milnacipran HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 15, 30, 45 and 60	08/05/2010
Minocycline HCl	Tablet			Refer to USP			07/25/2007
Minocycline HCl	Tablets, ER	I (Basket)	100	0.1 N HCl	900	1, 2, 4, 6 hours and until 80% of drug released	01/14/2008
Minocycline HCl (135 mg and 105 mg)	Tablet (Extended Release)	I (Basket)	100	pH 2.1 Buffer (Degassed)	900	15, 30, 45, 60, 90, 120, 180 and 210	11/02/2017
Minoxidil	Tablet			Refer to USP			04/15/2008
Mirabegron	Tablet (Extended Release)	I (Basket)	100	Phosphate Buffer, pH 6.8	900	1, 3, 5, 7, 8.5, 10 and 12 hours	05/09/2013
Mirtazapine	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	02/10/2004
Mirtazapine	Tablet (Orally Disintegrating (ODT))	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	03/04/2006
Misoprostol	Tablet	II (Paddle)	50	Water (deaerated)	500	5, 10, 20 and 30	02/10/2004
Mitotane	Tablet			Refer to USP			06/10/2009
Modafinil	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	02/10/2004
Moexipril HCl	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 15 and 30	02/10/2004
Molindone HCl	Tablet			Refer to USP			07/25/2007
Montelukast Sodium	Tablet	II (Paddle)	50	0.5% SDS in water	900	5, 10, 20 and 30	04/09/2007
Montelukast Sodium	Tablet (Chewable)	II (Paddle)	50	0.5% SDS in water	900	5, 10, 20 and 30	03/04/2006
Morphine Sulfate	Tablet	II (Paddle)	50	Deionized Water	900	5, 15, 20 and 30	01/15/2010
Morphine Sulfate	Tablet (Extended Release)	I (Basket)	100	Simulated Gastric Fluid [SGF] without enzyme	900	0.25, 0.5, 1, 1.5, 2, 4, 6 and 8 hours	10/20/2016
Morphine Sulfate (AB)	Tablet (Extended Release)	I (Basket)	50	Water (deaerated)	900	1, 2, 3, 6, 9 and 12 hours	12/23/2010
Morphine Sulfate (BC)	Tablet (Extended Release)	I (Basket)	100	Water	500	1, 2, 4, 6, 8, 10 and 12 hours	12/23/2010
Moxifloxacin	Tablet	II (Paddle)	50	0.1 N HCl	900	15, 30, 45 and 60	06/18/2007
Mycophenolate Mofetil	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	02/10/2004
Mycophenolic acid	Tablet (Delayed Release)	II (Paddle)	50	Acid Stage: 0.1 N HCl; Buffer Stage: Buffer Solution, pH 6.8 (After initial 120 mins., 250 mL of 0.2 M sodium phosphate solution is added to acid stage medium. The pH of the mixture is adjusted to 6.8 using 0.2 M sodium phosphate, 2 N sodium hydroxide, or concentrated HCl acid solution if necessary.)	750 (Acid), 1000 (Buffer)	120 (Acid), 10, 20, 30, 45 and 60 (Buffer)	12/19/2008
Nabumetone	Tablet			Refer to USP			07/25/2007
Nadolol	Tablet			Refer to USP			04/02/2009
Naldemedine	Tablet	II (Paddle)	50	Mixture of pH 6.8 phosphate buffer [25 mM disodium hydrogen phosphate] solution and water (1:1)	500	5, 10, 15, 20 and 30	11/02/2017
Naloxegol Oxalate	Tablet	II (Paddle)	50	0.1 N HCl	500	5, 10, 15, 20 and 30	05/28/2015
Naltrexone HCl	Tablet			Refer to USP			04/15/2008

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Naltrexone HCl/ Bupropion HCl	Tablet (Extended Release)	II (Paddle)	50	Water (degassed)	900	0.5, 1, 1.5, 2, 3, 4, 6 and 8 hours	09/03/2015
Naproxen	Tablet			Refer to USP			07/25/2007
Naproxen	Tablet (Delayed Release)			Refer to USP			12/15/2009
Naproxen Sodium	Tablet			Refer to USP			10/04/2012
Naproxen Sodium	Tablet (Extended Release)	II (Paddle)	50	Phosphate Buffer, pH 7.5	900	0.5, 1, 2, 3, 4, 6, 8, 10, 12 and 14 hours	04/08/2010
Naproxen Sodium/ Diphenhydramine HCl	Tablet	II (Paddle)	75	0.1M Sodium Phosphate buffer, pH 7.4 (deaerated)	900	5, 10, 15, 20 and 30	06/25/2015
Naproxen Sodium/ Diphenhydramine HCl	Tablet	II (Paddle)	75	0.1M Sodium Phosphate Buffer, pH 7.4	900	5, 10, 15, 20, 30 and 45	05/28/2015
Naproxen Sodium/Sumatriptan Succinate	Tablet	I (Basket)	75	Phosphate Buffer, pH 6.8	900	10, 15, 20, 30 and 45	07/01/2010
Naproxen/Esomeprazole Magnesium	Tablet (Delayed Release)	II (Paddle) with sinkers	Naproxen::50 rpm Esomeprazole:: 75 rpm	Naproxen:: Acid Stage: 0.1M HCl; Buffer Stage: 0.05M Phosphate buffer, pH 6.8. Sampling for Acid stage: Transfer the un-dissolved tablet & sinker to the vessel containing the buffer stage medium. Add, 10 mL of 10 M NaOH to each vessel of the remaining acid stage medium. Continue rotation at 100 rpm for 30 minutes, withdraw aliquot and analyze. Esomeprazole (second set of tablets) (without pre-exposure to acid stage):: 0.05M Phosphate buffer, pH 7.4	Naproxen::Acid Stage: 1000; Buffer Stage: 1000; Esomeprazole::900	Naproxen:: Acid stage: 120; Buffer stage: 10, 20, 30, 45, 60, 75 and 90; Esomeprazole::10, 20, 30, 45, 60, 75 and 90	06/06/2013
Naratriptan HCl	Tablet			Refer to USP			07/25/2007
Nateglinide	Tablet	II (Paddle)	50	0.01 N HCl with 0.5% (w/v) SLS	1000	10, 20, 30 and 45	01/03/2007
Nebivolol HCl	Tablet	II (Paddle)	50	0.01 N HCl	900	10, 20, 30 and 45	01/15/2010
Nebivolol/Valsartan	Tablet	I (Basket)	100	67 mM Phosphate Buffer pH 6.8 with 0.5% SDS	900	5, 10, 15, 20 and 30	10/20/2016
Nefazodone HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	01/03/2007
Nelfinavir Mesylate	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20, 30, 45, 60 and 90	01/03/2007
Neomycin Sulfate	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.8	900	15, 30, 45 and 60	01/14/2008
Nevirapine	Tablet			Refer to USP			09/13/2007
Nevirapine	Tablet (Extended Release)	I (Basket)	75	0.04 M Sodium phosphate buffer pH 6.8 containing 2% sodium lauryl sulfate	900	1, 2, 3, 4, 5, 6, 8, 10, 12, 16 and 20 hours	01/31/2013
Niacin	Tablet (Extended Release)	I (Basket)	100	Water	900	1, 3, 6, 9, 12, 15, 20 and 24 hours	06/10/2009

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Niacin/Simvastatin	Tablet (Extended Release)	Niacin: I (40 mesh rotating Basket); Simvastain: I (10 mesh rotating Basket)	100	Niacin: Water; Simvastatin: 0.5% SDS in 0.01 M Sodium Phosphate, pH 7.0	900	Niacin: 1, 3, 6, 9, 12, 15, 18, 20 and 24 hours; Simvastatin: 10, 20, 30, 45 and 60	01/15/2010
Nifedipine	Tablet (Extended Release)			Refer to USP			07/25/2007
Nilutamide	Tablet			Develop a dissolution method			05/20/2009
Nisoldipine	Tablet (Extended Release)	II (Paddle) with option to use a sinker	50	HCl with SLS (32.5 ± 0.1 g Sodium Lauryl Sulfate in 6489 mL of purified water containing 17.0 mL HCl, pH adjusted to 1.20 ± 0.05 with HCl)	900	1, 4, 8, 12, 15, 18 and 24 hours	04/02/2009
Nitazoxanide	Tablet	II (Paddle)	75	Phosphate buffer at pH 7.5 with 6% hexadecyltrimethyl ammonium bromide, bath temperature at 25°C	900	10, 20, 30, 45, 60	01/03/2007
Nitisinone	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8	2 mg tablets: 500 mL; 5 mg and 10 mg tablets: 900 mL	10, 15, 20, 30, 45, 60, 75 and 90	02/15/2018
Nitroglycerin	Tablet (Sublingual)	II (Paddle)	50	Phosphate Buffer, pH 6.5	500	1, 3, 5, 8, and 10	01/15/2010
Norethindrone	Tablet			Refer to USP			10/08/2009
Norethindrone Acetate	Tablet			Refer to USP			08/27/2009
Nystatin	Tablet	II (Paddle)	75	Water with 0.1% SLS	900	15, 30, 45, 60 and 90	01/03/2007
Obeticholic Acid	Tablet	II (Paddle)	75	0.08% polysorbate 80 in 50mM sodium phosphate dibasic buffer, pH 6.8	900	5, 10, 15, 20, 30 and 45	11/02/2017
Ofloxacin	Tablet	I (Basket)	100	0.1 N HCl	900	10, 20, 30 and 45	02/12/2004
Olanzapine	Tablet			Refer to USP			01/15/2015
Olanzapine	Tablet (Orally Disintegrating)			Refer to USP			01/15/2015
Olmesartan Medoxomil	Tablet			Refer to USP			11/02/2017
Ombitasvir/Paritaprevir/ Ritonavir and Dasabuvir Sodium	Tablet	II (Paddle)	75	Ombitasvir, paritaprevir, ritonavir: 0.05 M sodium phosphate buffer, pH 6.8 with 0.3% polyoxyethylene 10 lauryl ether; Dasabuvir sodium: 0.05 M Sodium Phosphate buffer, pH 6.8 with 15 mM cetyl triethylammonium bromide (CTAB)	900	Ombitasvir, paritaprevir, ritonavir: 10, 20, 30, 45, 60, 90, 120 and 150; Dasabuvir: 5, 10, 15, 20 and 30	08/27/2015
Ombitasvir/Paritaprevir/ Ritonavir	Tablet	II (Paddle) with sinker	75	0.05M Sodium Phosphate Buffer, pH 6.8 with 0.3% (w/v) Polyoxyethylene 10 Lauryl Ether (POE10LE)	900	10, 20, 30, 45, 60, 90, 120, 150 and 180	06/30/2016
Ondansetron	Tablet (Orally Disintegrating)			Refer to USP			06/18/2007
Ondansetron HCl	Tablet	II (Paddle)	50	Water (deaerated)	500	5, 10, 15 and 30	02/12/2004
Orphenadrine Citrate	Tablet (Extended Release)			Refer to USP			08/27/2009
Osimertinib Mesylate	Tablet	II (Paddle)	50	0.2% NaCl solution in water [adjust to pH 1.3]	900	10, 15, 20, 30 and 45	10/20/2016
Ospemifene	Tablet	II (Paddle)	50	2% Sodium Dodecyl Sulfate (SDS) in Water	900	10, 20, 30, 45, 60 and 75	06/02/2016

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Oxaprozin	Tablet			Refer to USP			03/17/2016
Oxcarbazepine	Tablet (Extended Release)	II (Paddle) with sinker	75	1.0% SDS in Deionized Water (degassed)	900	1, 2, 4, 6, 8 and 10 hours	08/15/2013
Oxcarbazepine (150 mg)	Tablet	II (Paddle)	60	0.3% SDS in water	900	10, 20, 30, 45, 60 and 90	02/12/2004
Oxcarbazepine (300 mg)	Tablet	II (Paddle)	60	0.6% SDS in water	900	10, 20, 30, 45, 60 and 90	02/12/2004
Oxcarbazepine (600 mg)	Tablet	II (Paddle)	60	1% SDS in water	900	10, 20, 30, 45, 60 and 90	02/12/2004
Oxybutynin Chloride	Tablet (Extended Release)			Refer to USP			12/24/2015
Oxycodone HCl	Tablet			Refer to USP			01/14/2008
Oxycodone HCl	Tablet (Extended Release)			Refer to USP			03/17/2016
Oxycodone HCl/Naloxone HCl	Tablet (Extended Release)	II (Paddle)	50	Simulated Gastric Fluid [SGF, pH 1.2] without enzyme	900	0.25, 0.5, 1, 2, 4, 6, 8, 10 and 12 hours	12/22/2016
Oxymorphone HCl	Tablet (Extended Release)	II (Paddle) with sinker	50	45 mM Phosphate Buffer, pH 4.5	900	1, 2, 4, 6, 8 and 10 hours	02/14/2014
Oxymorphone HCl	Tablets	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	01/14/2008
Paliperidone	Tablet (Extended Release)	II (Paddle)	50	Modified SGF, pH 1.0 [NaCl (0.2% w/w) in 0.0825N HCl]	500	1, 2, 4, 6, 8, 12, 14, 18 and 24 hours	08/27/2009
Pancrelipase	Tablet	II (Paddle)	50	Phosphate Buffer, pH 4.5	900	10, 20, 30, 45 and 60	06/02/2016
Pantoprazole Sodium	Tablet (Delayed Release)			Refer to USP			07/21/2009
Paroxetine	Tablet (Extended Release)			Refer to USP			11/19/2015
Paroxetine HCl	Tablet			Refer to USP			01/14/2008
Pazopanib HCl	Tablet	II (Paddle)	75	50 mM Sodium Acetate buffer, pH 4.5, containing 0.75% SDS	900	10, 15, 30, 45 and 60	08/05/2010
Pemoline	Tablet	II (Paddle)	75	Water (deaerated)	900	10, 20, 30, 45, 60 and 90	02/13/2004
Penbutolol Sulfate	Tablet			Refer to USP			06/24/2010
Penicillin V	Tablet			Refer to USP			06/09/2011
Penicillin V Potassium	Tablet			Refer to USP			06/09/2011
Pentoxifylline	Tablet (Extended Release)			Refer to USP			06/09/2011
Perampanel	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	05/15/2014
Pergolide Mesylate	Tablet	II (Paddle)	50	Simulated gastric fluid TS with cysteine without enzymes	500	10, 20, 30 and 45	03/04/2006
Perindopril Erbumine	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	06/20/2007
Perphenazine	Tablet			Refer to USP			12/15/2009
Phendimetrazine Tartrate	Tablet			Refer to USP			05/20/2009
Phenelzine Sulfate	Tablet	II (Paddle)	50	Simulated Gastric Fluid without enzymes, pH 1.2	900	10, 20, 30 and 45	03/25/2010
Phentermine HCl	Tablet	II (Paddle)	50	Water	900	10, 20, 30, 45 and 60	08/27/2009
Phentermine HCl	Tablet			Refer to USP			07/15/2009
Phentermine HCl	Tablet (Orally Disintegrating)	II (Paddle)	50	Water	500 mL (15 mg) or 900 mL (30 mg and 37.5 mg)	5, 10, 15, 20 and 30	07/31/2013
Phenytoin	Tablet (Chewable)			Refer to USP			01/14/2008
Phytonadione	Tablet			Develop a dissolution method			03/25/2010
Pilocarpine HCl	Tablet	II (Paddle)	50	0.1 N HCl	500	10, 20, 30, 45 and 60	01/20/2004
Pimavanserin Tartrate	Tablet	I (Basket)	100	0.1 N HCl	900	5, 10, 15, 20 and 30	07/28/2016

Ponatinib HCl	Tablet	I (Basket)	50	pH 2.1, KCl/HCl buffer (degassed)	900	10, 15, 20, 30, 45 and 60	09/03/2015
Posaconazole	Tablet (Delayed Release)	II (Paddle)	75	Acid Stage: 0.01 N HCl: Buffer Stage: 50 mM phosphate buffer, pH 6.8 with 0.37% Polysorbate 80 (after 120 minutes, to the acid stage, add 250 mL of 0.2M Phosphate Buffer, 1.46% Polysorbate 80)	Acid Stage: 750 mL; Buffer Stage 1000 mL	Acid Stage: 120; Buffer Stage: 10, 15, 20, 30 and 45	06/25/2015
Potassium Chloride	Tablet (Extended Release)			Refer to USP			07/25/2007
Potassium Citrate	Tablet			Refer to USP			08/05/2010
Pramipexole Dihydrochloride	Tablet	II (Paddle)	50	0.023 M Citrate/0.155 M Phosphate Buffer, pH 6.8	500	5, 10, 15, 30 and 45	10/09/2007
Pramipexole Dihydrochloride	Tablet (Extended Release)	I (Basket)	100	0.05 M phosphate buffer, pH 6.8	500	1, 2, 4, 6, 9, 12, 16, 20 and 24 hours	09/02/2010
Prasugrel HCl	Tablet	II (Paddle)	75	Citrate-Phosphate buffer (0.023M Citric acid+0.026M Sodium Phosphate, Dibasic), pH 4.0	900	10, 15, 20, 30 and 45	10/04/2012
Pravastatin Sodium	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 20 and 30	02/13/2004
Praziquantel	Tablet			Refer to USP			06/25/2015
Prednisolone	Tablet			Refer to USP			11/25/2008
Prednisolone Sodium Phosphate	Tablet (Orally Disintegrating)	II (Paddle)	50	22 mM Sodium Acetate Buffer, pH 4.5	500	5, 15, 30, 45 and 60	09/03/2008
Prednisone	Tablet			Refer to USP			12/24/2015
Prednisone	Tablet (Delayed Release)	II (Paddle) with sinker	100	Water	500	1, 2, 3, 3.5, 4, 4.5, 5, 5.5, 6, 7, 8 and 10 hours	07/31/2013
Pregabalin	Tablet (Extended Release)	II (Paddle)	50	0.06 M HCl	900	1, 2, 4, 6, 8, 10, 12, 16 and 24 hours	02/08/2018
Primaquine Phosphate	Tablet			Refer to USP			05/28/2015
Primidone	Tablet			Refer to USP			01/14/2008
Promethazine HCl	Tablet			Refer to USP			07/25/2007
Propafenone HCl	Tablet			Refer to USP			11/02/2017
Propranolol HCl	Tablet			Refer to USP			03/03/2011
Propylthiouracil	Tablet			Refer to USP			06/07/2012
Protriptyline HCl	Tablet			Refer to USP			01/14/2008
Pseudoephedrine HCl	Tablet (Extended Release)			Refer to USP			01/14/2008
Pseudoephedrine HCl/ Triprolidine HCl	Tablet			Refer to USP			01/15/2010
Pyrazinamide	Tablet			Refer to USP			10/20/2016
Pyridostigmine Bromide	Tablet			Refer to USP			06/10/2009

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Pyridostigmine Bromide	Tablet (Extended Release)	II (Paddle)	50	Water	900	1, 2, 4, 6, 8 and 12 hours	06/10/2009
Pyrimethamine	Tablet			Refer to USP			06/25/2015
Quetiapine Fumarate	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	02/18/2004
Quetiapine Fumarate	Tablet (Extended Release)	I (Basket, with 20 mesh)	200	0.05M citric acid and 0.09 N NaOH (pH 4.8) [solution A]. At 5 hrs, pH adjusted to 6.6 by addition of 100 mL of 0.05M dibasic sodium phosphate and 0.46N NaOH [solution B]	900 [solution A]. 1000 [final]	1, 2, 4, 6, 8, 10, 12, 16, 20, and 24 hours	01/31/2013
Quinapril HCl	Tablet			Refer to USP			07/25/2007
Rabeprazole Sodium	Tablet (Delayed Release)	II (Paddle)	100	700 mL 0.1 N HCl (Acid stage), after two hours add 300 mL of 0.6 M Tris buffer; adjust to pH 8.0 (Buffer stage) with 2 N HCl or 2 N NaOH . Stabilize the samples with the addition of 0.5 N NaOH	Acid stage: 700; Buffer stage: 1000	Acid stage: 120; Buffer stage: 10, 20, 30, and 45	09/22/2011
Raloxifene HCl	Tablet	II (Paddle)	50	0.1% Polysorbate 80 in water	1000	10, 20, 30 and 45	02/18/2004
Raltegravir Potassium	Tablet	II (Paddle) with option to use a sinker	100	Water (Deaerated)	900	15, 30, 45, 60 and 120	04/02/2009
Raltegravir Potassium	Tablet (Chewable)	II (Paddle)	50	Water(deareated)	900	5, 10, 15, 20 and 30	05/28/2015
Ramelteon	Tablet	II (Paddle)	50	Water	900	10, 20, 30 and 45	04/02/2009
Ramipril	Tablet	II (Paddle)	50	0.1 N HCl	500	5, 10, 15 and 30	09/03/2008
Ranitidine HCl	Tablet			Refer to USP			07/25/2007
Ranitidine HCl	Tablet (Effervescent)			Develop a dissolution method			04/08/2010
Ranolazine	Tablet (Extended Release)	II (Paddle)	50	0.1 N HCl	900	0.5, 2, 4, 8, 12, 20, and 24 hours	06/03/2008
Rasagiline Mesylate	Tablet	II (Paddle)	50	0.1 N HCl	500	10, 15, 30 and 45	01/29/2010
Regorafenib	Tablet	II (Paddle)	75	Acetate Buffer pH 4.5 with 0.1% Sodium Dodecyl Sulfate (SDS)	900	10, 15, 20, 30 and 45	06/25/2015
Repaglinide	Tablet			Refer to USP			07/25/2007
Ribavirin	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30 and 45	02/18/2004
Ribociclib	Tablet	II (Paddle)	50	0.01N HCl (Degassed)	900	10, 15, 20, 30, 45 and 60	11/02/2017
Rifapentine	Tablet	II (Paddle)	50	0.8% SLS in Phosphate Buffer, pH 7.0	900	10, 20, 30, 45, 60 and 90	02/25/2004
Rifaximin (200 mg)	Tablet	II (Paddle)	75	0.1M sodium phosphate buffer pH 7.4 containing 0.45% Sodium Lauryl Sulfate	1000	10, 20, 30, 45, 60, 90 and 120	07/21/2011
Rifaximin (550 mg)	Tablet	II (Paddle)	75	0.1M sodium phosphate buffer pH 7.4 containing 0.8% Sodium Lauryl Sulfate	1000	10, 20, 30, 45, 60, 90 and 120	07/21/2011
Rilpivirine HCl	Tablet	II (Paddle)	75	0.5% Polysorbate 20 in 0.01N HCl (pH=2.0)	900	10, 20, 30, 45 and 60	08/15/2013
Riluzole	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	02/18/2004
Rimantadine HCl	Tablet	II (Paddle)	50	Water	900	10, 20, 30, and 45	01/03/2007
Riociguat	Tablet	II (Paddle)	75	pH 6.8 Phosphate Buffer with 0.1% Sodium Lauryl Sulfate [SLS]	900	5, 10, 15, 20 and 30	12/24/2015
Risedronate Sodium	Tablet			Refer to USP			07/01/2010

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Risedronate Sodium	Tablet (Delayed Release)	II (Paddle)	75	Acid stage: 0.1 N HCl; Buffer stage: Phosphate buffer, pH 6.8	Acid stage: 500; Buffer stage: 500	Acid stage: 120; Buffer Stage: 10, 15, 20, 30 and 45	01/26/2012
Risedronate Sodium/Calcium Carbonate	Tablet (Copackaged)			For Risedronate Tablets: Refer to USP; For Calcium Carbonate Tablets: Refer to USP.			07/01/2010
Risperidone	Tablet	II (Paddle)	50	0.1 N HCl	500	10, 20, 30, 45 and 60	03/04/2006
Risperidone	Tablet (Orally Disintegrating)	II (Paddle)	50	0.1 N HCl	500	5, 10, 15	07/23/2004
Ritonavir	Tablet			Refer to USP			01/15/2015
Rivaroxaban (10 mg)	Tablet	II (Paddle)	75	Acetate Buffer pH 4.5, 0.2% sodium dodecyl sulfate (SDS)	900	10, 15, 20, 30 and 45	01/15/2015
Rivaroxaban (15 and 20 mg)	Tablet	II (Paddle)	75	Acetate Buffer pH 4.5, 0.4% SDS	900	10, 15, 20, 30 and 45	01/15/2015
Rizatriptan Benzoate	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 15 and 30	02/18/2004
Rizatriptan Benzoate	Tablet (Orally Disintegrating)	II (Paddle)	50	Water (deaerated)	900	5, 10 and 15	02/18/2004
Roflumilast	Tablet	II (Paddle)	50	1.0% SDS (sodium dodecyl sulfate) in Phosphate Buffer, pH 6.8	1000	5, 10, 15, 20, 30 and 45	08/15/2013
Rolapitant HCl	Tablet	II (Paddle)	50	0.05 M Sodium Acetate buffer, pH 4.0	900	10, 15, 20, 30 and 45	10/20/2016
Ropinirole HCl	Tablet			Refer to USP			05/15/2014
Ropinirole HCl	Tablet (Extended Release)	II (Paddle)	100	pH 4.0 Citrate-THAM Buffer	500	1, 2, 4, 6, 8, 12, 16, 20 and 24 hours	08/27/2009
Rosiglitazone Maleate	Tablet	II (Paddle)	50	0.01M Acetate Buffer, pH 4.0	900	10, 20, 30 and 45	02/24/2004
Rosuvastatin Calcium	Tablet	II (Paddle)	50	0.05 M Sodium Citrate Buffer pH 6.6 ± 0.05	900	10, 20, 30 and 45	11/10/2010
Rucaparib	Tablet	II (Paddle)	75	0.01 N HCl	900	5, 10, 15, 20 and 30	01/19/2017
Rufinamide	Tablet			Refer to USP			08/15/2013
Ruxolitinib Phosphate	Tablet	II (Paddle)	75	0.1 N HCI	900	5, 10, 15, 20 and 30	06/25/2015
Sacubitril/Valsartan	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8[degassed]	900	10, 15, 20, 30 and 45	03/17/2016
Safinamide Mesylate	Tablet	II (Paddle)	100	0.1 N HCL with Sodium Chloride [2% (wt/vol) solution], pH 1.2	900	5, 10, 15, 30, 45 and 60	11/02/2017
Sapropterin Dihydrochloride	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 20	10/06/2008
Saquinavir Mesylate	Tablet	II (Paddle)	50	Citrate Buffer (pH 3.0)	900	10, 20, 30 and 45	09/13/2007
Saxagliptin HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20, 30 and 45	08/15/2013
Selegiline HCl	Tablet (Orally Disintegrating)	I (Basket)	50	Water	500	5, 10, 15 and 20	10/06/2008
Selexipag	Tablet	II (Paddle)	50	Phosphate Buffer, pH 6.8	900	5, 10, 15, 20 and 30	03/17/2016
Sertraline HCl	Tablet	II (Paddle)	75	0.05 M Sodium Acetate Buffer, pH 4.5	900	10, 20, 30 and 45	02/20/2004
Sevelamer Carbonate	Tablet			Disintegration Testing in 0.1 N HCl as per USP <701>			10/06/2008
Sevelamer HCl	Tablet			Disintegration Testing in 0.1 N HCl as per USP <701>			04/09/2008
Sildenafil Citrate	Tablet	I (Basket)	100	0.01 N HCl	900	5, 10, 15 and 30	03/04/2006
Simvastatin	Tablet			Refer to USP			06/18/2007
Simvastatin	Tablet (Orally Disintegrating)	II (Paddle)	75	0.15% SDS Buffer, pH 6.8	900	5, 10, 15 and 30	09/03/2008
Sirolimus	Tablet	Basket (20 mesh)	120	0.4% SLS in water	500	10, 20, 30, 45, 60 and 120	03/14/2007
Sitagliptin Phosphate	Tablet	I (Basket)	100	Water	900	5, 10, 15, 20 and 30	07/01/2010

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Sitagliptin Phosphate/ Simvastatin	Tablet	II (Paddle) with stainless steel stationary quadrangular hanging basket	100	10 mM Sodium phosphate buffer containing 1% Tween 80 with 50 µg/ mL Butylated hydroxyanisole	900	5, 10, 15, 20, 30, and 45	10/31/2013
Sodium Phosphate Dibasic Anhydrous/Sodium Phosphate Monobasic Monohydrate	Tablet	II (Paddle)	100	Water (deionized)	900	20, 30, 45, 60 and 90	01/15/2010
Sofosbuvir	Tablet	II (Paddle)	75	0.05 M Phosphate Buffer, pH 6.8	900	5, 10, 15, 20 and 30	05/28/2015
Sofosbuvir/Velpatasvir	Tablet	II (Paddle)	75	50 mM sodium acetate buffer,pH 5.0, with 0.5% w/v Cetyltrimethyl ammonium bromide (CTAB)	900	5, 10, 15, 20 and 30	10/20/2016
Solifenacin Succinate	Tablet	II (Paddle)	50	Water	900	10, 15, 30 and 45	02/19/2008
Sorafenib Tosylate	Tablet	II (Paddle)	75	0.1 M HCl with 1% SDS	900	5, 10, 15, 20 and 30	06/10/2009
Spironolactone	Tablet			Refer to USP			04/15/2008
Sucralfate	Tablet	II (Paddle)	75	0.1 N HCl/0.067 M KCl, pH 1.0	900	15, 30, 45, 60, 180, 240 and 480	04/02/2009
Sucroferric Oxyhydroxide	Tablet (Chewable)	II (Paddle)	50	0.1 N HCl	900	10, 15, 20, 30, 45 and 60	11/02/2017
Sulfadiazine	Tablet			Refer to USP			07/14/2008
Sulfamethoxazole/ Trimethoprim	Tablet			Refer to USP			01/14/2008
Sulfasalazine	Tablet			Refer to USP			12/15/2009
Sulfasalazine	Tablet (Delayed Release)			Refer to USP			12/15/2009
Sumatriptan Succinate	Tablet	II (Paddle)	30	0.01 N HCl	900	5, 10, 15 and 30	03/04/2006
Suvorexant	Tablet	II (Paddle) with sinker	75	0.4% Sodium Lauryl Sulfate in Water	900	5, 10, 15, 20, 30 and 45	09/03/2015
Tacrolimus	Tablet (Extended Release)	II (Paddle)	100	0.005% HPC in Water with 0.50% SLS adjusted to pH 4.5	900	0.5, 1, 2.5, 4.5, 6.5, 8.5 and 12 hours	06/30/2016
Tadalafil	Tablet	II (Paddle)	50	0.5% Sodium Lauryl Sulfate	1000	10, 20, 30 and 45	01/26/2006
Tamoxifen Citrate	Tablet			Refer to USP			04/02/2009
Tapentadol HCl	Tablet	I (Basket)	75	0.1 N HCl	900	10, 20, 30, 45 and 60	10/28/2010
Tapentadol HCl	Tablet (Extended Release)	II (Paddle) with sinker	100	0.05 M Phosphate Buffer of pH 6.8, Simulated intestinal fluid (without enzyme)	900	0.5, 1, 2, 3, 4, 6, 8, 10 and 12 hours	10/31/2013
Tedizolid Phosphate	Tablet	II (Paddle)	60	0.05 M phosphate buffer pH 6.8	900	5, 10, 15, 20 and 30	06/02/2016
Telaprevir	Tablet	II (Paddle)	50	1% SLS in Water	900	5, 10, 15, 20 and 30	05/09/2013
Telbivudine	Tablet	II (Paddle)	50	0.1 N HCl	900	15, 30 and 45	04/02/2009
Telithromycin	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30 and 45	01/03/2007
Telmisartan	Tablet			Refer to USP			01/05/2012
Tenofovir Alafenamide Fumarate	Tablet	II (Paddle)	75	50 mM Sodium Acetate buffer pH 4.5	500	5, 10, 15, 20 and 30	01/19/2017
Tenofovir Disoproxil Fumarate	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, and 45	01/03/2007
Terazosin HCl	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30, 45 and 60	02/20/2004
Terbinafine HCl	Tablet	II (Paddle)	50	Citrate Buffer, pH 3.0 adjusted with HCl	500	10, 20, 30 and 45	02/20/2004

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Teriflunomide	Tablet	II (Paddle)	50	0.05 M Phosphate Buffer, pH 6.8	1000	5, 10, 15, 20, 30 and 45	05/15/2014
Testosterone	Tablet, buccal, (Extended Release)	II (Paddle, may use sinker)	60	1% sodium dodecyl sulfate in double distilled water	1000	1, 2, 4, 6, 10, 12 and 24 hours	01/03/2007
Tetrabenazine	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 30 and 45	09/01/2011
Tetracycline HCl	Tablet			Refer to USP			01/29/2010
Theophylline (100 mg and 200 mg)	Tablet (Extended Release)	II (Paddle)	50	SGF without Enzyme, pH 1.2 during 1st hour. Phosphate Buffer at pH 7.5 from end of hour 1 through the duration of testing	900	1, 4, 8, 12 hours	10/06/2008
Theophylline (300 mg and 450 mg)	Tablet (Extended Release)	II (Paddle)	50	SGF without Enzyme, pH 1.2 during 1st hour. Phosphate Buffer at pH 7.5 from end of hour 1 through the duration of testing	900	1, 4, 8, 12 hours	10/06/2008
Theophylline (600 mg and 400 mg)	Tablet (Extended Release)	I (Basket)	100	SGF without enzyme, pH 1.2 during 1st hour. SIF without enzyme from end of hour 1 through the duration of the testing	900	1, 2, 4, 8, 12 and 24 hours	10/06/2008
Thioguanine	Tablet			Refer to USP			07/15/2009
Tiagabine HCl	Tablet	II (Paddle)	50	Water	900	5, 10, 15, 20 and 30	01/03/2007
Ticagrelor	Tablet	II (Paddle)	75	0.2% w/v Polysorbate 80 in water	900	10, 20, 30, 45, 60 and 75	06/25/2015
Ticlopidine HCl	Tablet	II (Paddle)	50	Water (deaerated)	900	10, 20, 30, 45 and 60	02/19/2004
Timolol Maleate	Tablet			Refer to USP			07/31/2013
Tinidazole	Tablet	I (Basket)	100	Water (Deaerated)	900	10, 20, 30 and 45	01/03/2007
Tiopronin	Tablet	I (Basket)	100	0. 08N HCl containing 0.2% w/v NaCl	900	10, 15, 20, 30 and 45	03/02/2017
Tipiracil HCl/Trifluridine	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	11/02/2017
Tizanidine HCl	Tablet	I (Basket)	100	0.1 N HCl	500	5, 10, 15 and 30	02/20/2004
Tofacitinib Citrate	Tablet	I (Basket)	100	0.1N HCl	900	5, 10, 15, 20 and 30	06/25/2015
Tofacitinib Citrate	Tablet (Extended Release)	II (Paddle) with option to use a sinker	50	Phosphate Buffer, pH 6.8	900	1, 1.5, 2, 2.5, 3, 4, 6 and 8 hours	07/28/2016
Tolcapone	Tablet			Refer to USP			05/09/2013
Tolterodine Tartrate	Tablet	II (Paddle)	50	SGF without enzymes, pH 1.2	900	5, 10, 15 and 30	02/20/2004
Tolvaptan	Tablet	II (Paddle)	50	0.22% Sodium Lauryl Sulfate (SLS) in Water	900	10, 15, 20, 30 and 45	02/14/2014
Topiramate	Tablet	II (Paddle)	50	Water (deaerated)	900	5, 10, 20 and 30	02/19/2004
Toremifene Citrate	Tablet	II (Paddle)	50	0.02 N HCl	1000	10, 20, 30 and 45	02/20/2004
Torsemide	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	02/20/2004
Tramadol HCl	Tablet	I (Basket)	100	0.1 N HCl	900	10, 20, 30 and 45	02/19/2004
Tramadol HCl	Tablet (Extended Release)	I (Basket)	75	0.1 N HCl	900	2, 4, 8, 10 and 16 hours	01/03/2007
Trametinib Dimethyl Sulfoxide	Tablet	II (Paddle)	60	pH 4.5, 50 mM Sodium Acetate with 0.75% Sodium Lauryl Sulfate [SLS]	500	5, 10, 15, 20 and 30	12/24/2015
Trandolapril	Tablet	II (Paddle)	50	Water (deaerated)	500	10, 20, 30, 45 and 60	02/20/2004
Trandolapril/Verapamil HCl	Tablet (Extended Release)	II (Paddle)	50	For Trandolapril: Water; For Verapamil: 0–1 hour Gastric Fluid w/o Pepsin pH = 1.2, 1–8 hour Intestinal Fluid w/o Pancreatin	For Trandolapril: 500; For Verapamil: 900	For Trandolapril: 5, 10, 20, 30 and 45; For Verapamil: 1, 2, 3.5, 5 and 8 hours	12/19/2008

(*Continued*)

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (minutes)	Date Updated
Tranexamic Acid	Tablet	II (Paddle	50	Water	900	15, 30, 45, 60, 90 and 120	12/23/2010
Tranylcypromine Sulfate	Tablet			Refer to USP			10/31/2013
Trazodone HCl	Tablet			Refer to USP			12/15/2009
Trazodone HCl	Tablet (Extended Release)	II (Paddle)	50	Water	900	1, 2, 3, 5, 8, 10, 12, 16, 20 and 24 hours	03/02/2017
Treprostinil Diolamine	Tablet (Extended Release)	I (Basket)	100	0.05 M Phosphate Buffer, pH 6.8 (deaerated)	500	1, 2, 4, 6, 8, 12, 16, 20 and 24 hours	06/02/2016
Trimethoprim	Tablet			Refer to USP			01/29/2010
Trospium Chloride	Tablet	II (Paddle)	50	0.1 N HCl	1000	10, 20, 30 and 45	12/03/2007
Ulipristal Acetate	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15, 20 and 30	01/31/2013
Ursodiol	Tablet			Refer to USP			04/15/2008
Valacyclovir Hydrochloride	Tablet	II (Paddle)	50	0.1 N HCl	900	10, 20, 30, 45 and 60	08/27/2009
Valganciclovir HCl	Tablet			Refer to USP			01/15/2015
Valsartan	Tablet			Refer to USP			07/28/2016
Vandetanib	Tablet	II (Paddle)	50	pH 1.2 Buffer [0.05 M KCl in water, adjust the pH with HCl or NaOH]	1000	5, 10, 15, 20 and 30	06/25/2015
Vardenafil HCl	Tablet	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	12/20/2005
Vardenafil HCl	Tablet (Orally Disintegrating)	II (Paddle)	50	0.1 N HCl	900	5, 10, 15 and 30	05/15/2014
Varenicline Tartrate	Tablet	I (Basket)	100	0.01 N HCl	500	5, 10, 15 and 30	12/03/2007
Vemurafenib	Tablet	II (Paddle)	75	1% hexadecyltrimethylammonium bromide (HTAB) in 0.05 M Phosphate Buffer, pH 6.8	900	10, 15, 20, 30 and 45	05/28/2015
Venetoclax	Tablet	III (Reciprocating Cylinder) [Bottom Screen: 200 mesh stainless steel]	20 dpm	Phosphate Buffer, pH 6.8 with 0.4% sodium dodecyl sulfate (SDS) [3 small drops of antifoaming agent may be used]	250	0.25, 0.5, 0.75, 1, 1.5, 2, 3, 3.5 and 4 hours	07/28/2016

Compressed Solids Formulations

ACETAMINOPHEN AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetaminophen (fine powder)	500.00
65.00	2	Anhydrous caffeine	65.00
15.00	3	Maize starch	15.00
10.00	4	Povidone (PVP K-30)	10.00
5.00	5	Croscarmellose sodium (Ac-Di-Sol)	5.00
33.00	6	Maize starch	33.00
8.00	7	Povidone (PVP K-90)	8.00
1.00	8	Polysorbate 80 (Tween 80)	1.00
10.00	9	Microcrystalline cellulose (Avicel™ PH102)	10.00
7.00	10	Sodium starch glycolate (Primojel®)	7.00
5.00	11	Croscarmellose sodium (Ac-Di-Sol)	5.00
2.00	12	Stearic acid (fine powder)	2.00
4.00	13	Talc (fine powder)	4.00
—	14	Purified water	155.00

Manufacturing Directions

1. Sift items 1 to 5 through a stainless steel 630 µm sieve. Load into mixer. Mix for 5 minutes at low speed.
2. Dissolve items 7 and 8 in 115 g of purified water (80–90°C) in a vessel.
3. Prepare slurry of item 6 in 40 g of purified water (25–30°C).
4. Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C.
5. Add the binder (item 4) to the paste.
6. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes.
7. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules into stainless steel trays for drying.
8. Dry the wet granules at 55°C for 8 hours. After 2 hours of drying, scrape the semidried granules to break the lumps to promote uniform drying. Check the loss on drying (LOD) (limit: 1.5–2.0%). If required, dry further at 55°C for 1 hour.
9. Grind the dried granules through a 1.25 mm sieve, using a granulator at medium speed. Collect in stainless steel drums.
10. Load the granules into blender. Sift items 9 to 11 through a 500 µm sieve, using a suitable sifter, and add it to the blender. Mix for 2 minutes.
11. Sift items 12 and 13 through a 500 µm sieve.
12. Add 5 to 10 g of granules from bulk. Mix in.
13. Check temperature and humidity before compressing (recommended: relative humidity 55–60% at a temperature not exceeding 27°C).
14. Compress the granules using a rotary tableting machine. Average weight of tablet is 665.00 mg.

ACETAMINOPHEN AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetaminophen (crystalline)	500
50.00	2	Caffeine (Knoll)	50
90.00	3	Avicel™ PH101	90
10.00	4	Kollidon® 30	10
20.00	5	Kollidon® CL	20
10.00	6	Polyethylene glycol (PEG-6000) (powder)	10

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force.
2. Compress into 683 mg tablets, using 12 mm biplanar punches.
3. If the flowability of the powder mixture for tableting is not high enough, some Aerosil 200 should be added.

ACETAMINOPHEN AND CODEINE TABLETS (TYLENOL)*

Each Tylenol with codeine tablet contains
No. 2 codeine phosphate, 15 mg; acetaminophen, 300 mg
No. 3 codeine phosphate, 30 mg; acetaminophen, 300 mg
No. 4 codeine phosphate, 60 mg; acetaminophen, 300 mg

* Tylenol inactive ingredients: powdered cellulose, magnesium stearate, sodium metabisulfite, pregelatinized starch, starch (corn).

ACETAMINOPHEN AND DIPHENHYDRAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
325.00	1	Acetaminophen (fine powder)	325.00
26.00	2	Diphenhydramine HCl	26.00
50.00	3	Maize starch	50.00
07.00	4	Povidone (PVP K-30)	7.00
50.00	5	Microcrystalline cellulose (Avicel™ PH101)	50.00
42.00	6	Cornstarch	42.00
10.00	7	Povidone (PVP K-30)	10.00
09.50	8	Cellulose (powdered)	9.50
65.50	9	Cellulose (microcrystalline) (Avicel™ PH102)	65.50
20.00	10	Sodium starch glycolate (Primojel®)	20.00
08.00	11	Stearic acid (fine powder)	8.00
05.00	12	Talc (fine powder)	5.00
02.00	13	Magnesium stearate	2.00
—	14	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 5 through a 630 µm stainless steel sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 7 in 135 g of purified water (80–90°C) in a vessel.
4. Prepare a slurry of item 6 in 45 g of purified water (25–30°C).
5. Add the slurry to the vessel to make a translucent paste.
6. Cool to 45°C to 50°C.
7. Add the binder (item 4).
8. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.)
9. Unload the wet granules into stainless steel trays for drying.
10. Dry the wet granules in an oven at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break the lumps to promote uniform drying. Check the LOD (limit: 1–2%). If required, dry further at 55°C for 1 hour.
11. Grind the dried granules through a 1.25 mm sieve at medium speed.
12. Collect in stainless steel drums. Load the granules into blender.
13. Sift items 8 to 10 through a 500 µm sieve, using a suitable sifter, and add mixture to blender. Mix for 2 minutes.
14. Sift items 11 to 13 through a 500 µm sieve. Add 5 to 10 g of granules from bulk.
15. Mix in polyethylene bag for 1 minute. Add to blender. Blend for 1 minute.
16. Check the temperature and humidity before compressing (limit: temperature not exceeding 27°C; relative humidity 55–65%).
17. Compress the granules with a rotary tableting machine. Compress to an average tablet weight of 620 mg.
18. Disintegration time is not more than (NMT) 15 minutes; friability NMT is 1.0%.
19. Coating: Use one of the hydroxypropyl methylcellulose (HPMC) aqueous formulations described in the Appendix, such as Yellow Opadry.

ACETAMINOPHEN AND ORPHENADRINE CITRATE TABLETS (450 MG/35 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
450.00	1	Acetaminophen powder	450.00
35.00	2	Orphenadrine citrate, 5% excess	35.00
66.00	3	Starch (maize)	66.00
20.00	4	Microcrystalline cellulose (Avicel™ PH 102)	5.00
7.50	5	Aerosil 200	7.50
0.25	6	Dye yellow	0.25
16.00	7	PVP K30	16.00
5.00	8	Aerosil 200	5.00
7.50	9	Glycerin	7.50
10.00	10	Gelatin powder	10.00
25.00	11	Primojel®	25.00
12.00	12	Avicel™ PH 102	12.00
2.00	13	Aerosil 200	2.00
2.00	14	Magnesium stearate	2.00
—	15	Water, purified, ca	464 mL

Manufacturing Directions

1. Load items 7 and 6 into a mixer, add 50% of item 15, and mix for 10 to 15 minutes at medium speed.
2. Add item 5 into step 1 slowly, while stirring at medium speed, and disperse well.
3. Add item 9 and mix for 3 minutes.
4. In a separate vessel, add item 10 and the remaining 50% of item 15; mix for 5 minutes at medium speed.
5. Add step 3 into step 4 and mix for 2 to 3 minutes.
6. In a separate mixer, load items 1 to 5 and mix and chop for 3 minutes at slow speed.
7. Add the solution from step 5 to step 6 and mix for 2 to 3 minutes.
8. Dry the wet mass in a fluid-bed dryer at 60°C for 60 minutes until a loss on drying rate of 1.5% to 2.5% is reached.
9. Pass the dried granules through a 6 mm sieve followed by a 1.5 mm sieve in a granulator.

10. Add to the granules items 11 to 13, previously sieved through a 500 µm sieve. Mix for 3 minutes.
11. Add item 14, previously sieved through a 250 µm sieve, and blend for 1 minute.
12. Compress using 12.7 mm round flat punches to a fill weight of 660 mg.

ACETAMINOPHEN AND PHENPROBAMATE TABLETS (200 MG/200 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
200.00	1	Acetaminophen powder <0.5 mm	200.00
200.00	2	Phenprobamate	200.00
35.00	3	Microcrystalline cellulose (Avicel™ PH 101)	35.00
20.00	4	Kollidon VA 64	20.00
10.00	5	Kollidon CL	10.00
5.00	6	Magnesium stearate	5.00
6.00	7	Aerosil 200	6.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 475 mg tablets, using 12 mm biplanar punches.

ACETAMINOPHEN AND PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ caplet)	Item	Material Name	Quantity/ 1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
50.00	3	Cornstarch	50.00
7.00	4	Povidone (PVP K-30)	7.00
50.00	5	Microcrystalline cellulose (Avicel™ PH101)	50.00
42.00	6	Cornstarch	42.00
10.00	7	Povidone (PVP K-30)	10.00
9.50	8	Cellulose (powdered)	9.50
60.00	9	Cellulose (microcrystalline) (Avicel™ PH102)	60.00
20.00	10	Sodium starch glycolate (Primojel®)	20.00
8.00	11	Stearic acid (fine powder)	8.00
5.00	12	Talc (fine powder)	5.00
2.00	13	Magnesium stearate	2.00
—	14	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 5 through a stainless steel 630 µm sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 7 in 135 g of purified water (80–90°C) in a vessel.
4. Prepare a slurry of item 6 in 45 g of purified water (25–30°C).
5. Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C. Add the binder (item 4).
6. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules into stainless steel trays for drying.
7. Dry the wet granules in oven at 55°C for 10 hours.
8. After 2 hours of drying, scrape the semidried granules to break up the lumps for uniform drying.
9. Check the LOD (limit: 1–2.0%). If required, dry further at 55°C for 1 hour.
10. Transfer the dried granules to stainless steel drums.
11. Grind the dried granules through a 1.25 mm sieve, using granulator at medium speed. Collect in stainless steel drums. Load the granules into blender.
12. Sift items 8 to 10 through a 500 µm sieve, using a suitable sifter, and add to blender. Mix for 2 minutes.
13. Sift items 11 to 13 through a 500 µm sieve.
14. Add 5 to 10 g of granules.
15. Mix in a polyethylene bag for 1 minute. Add to blender. Blend for 1 minute. Unload in stainless steel drums.
16. Compress into 620 mg tablets, using 6 mm capsule-shaped punches.
17. Coat: the formula for the coating solution is determined to obtain a weight gain of 10 mg per caplet, considering evaporation and loss during the coating operation.

ACETAMINOPHEN CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
300.00	1	Acetaminophen, milled (Hoechst)	300.00
600.00	2	Sucrose, milled	600.00
550.00	3	Kollidon® CL-M	550.00
30.00	4	Orange flavor (FDO)	30.00
30.00	5	Strawberry flavor (FDO)	30.00
60.00	6	Kollidon® 30	60.00
QS	7	Ethanol (96%)	~425.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 and 7, pass through a sieve, and press with medium-compression force.
2. Average weight of tablet is 1620 mg, obtained using a 20 mm biplanar punch.
3. Taste is sweet, fruity, and only very slightly bitter.

ACETAMINOPHEN, CHLORPHENIRAMINE MALEATE, AND PSEUDOEPHEDRINE CAPLETS

Bill of Materials

Scale (mg/caplet)	Item	Material Name	Quantity/1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
2.10	3	Chlorpheniramine maleate	2.10
50.00	4	Cornstarch	50.00
7.00	5	Povidone (PVP K-30)	7.00
50.00	6	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
42.00	7	Cornstarch	42.00
10.00	8	Povidone (PVP K-30)	10.00
9.50	9	Powdered cellulose	9.50
77.90	10	Cellulose (microcrystalline) (Avicel™ PH102)	77.90
20.00	11	Sodium starch glycolate (Primojel®)	20.00
8.00	12	Stearic acid (fine powder)	8.00
5.00	13	Talc (fine powder)	5.00
2.00	14	Magnesium stearate	2.00
—	15	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 6 through a 630 µm stainless steel sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 8 in 135 g of item 15 (80–90°C) in a vessel.
4. Prepare a slurry of item 7 in 45 g of item 15 (25–30°C). Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C.
5. Add the binder (item 5) to step above.
6. Mix at low speed over a period of 3 minutes. Scrape sides and blades.
7. Mix and chop at low speed for 1 or 2 minutes. Check the end point of granulation. If required, add additional item 15 to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules in stainless steel trays for drying.
8. Dry the wet granules at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying. Check the LOD (limit: 1.0–2.0%). If required, dry further at 55°C for 1 hour.
9. Grind the dried granules through a 1.25 mm sieve at medium speed. Collect in stainless steel drums.
10. Load the granules into blender.
11. Sift items 9 to 11 through a 500 µm sieve, using suitable sifter, and add mixture to blender. Mix for 2 minutes.
12. Sift items 12 to 14 through a 500 µm sieve.
13. Add 5 to 10 g of granules from bulk. Mix in a polyethylene bag for 1 minute.
14. Add to blender. Blend for 1 minute.
15. Check temperature and humidity before start of compression; temperature should not exceed 27°C and recommended relative humidity is 55% to 65%.
16. Compress the granules using rotary tableting machine. Tablet weight is 640 mg.
17. Coating: select an appropriate coating such as Opadry HPMC. The formula for the coating solution is determined to obtain a weight gain of 10 mg per caplet, considering evaporation and loss during coating operation.

ACETAMINOPHEN, DEXTROMETHORPHAN, AND PSEUDOEPHEDRINE CAPLETS

Bill of Materials

Scale (mg/caplet)	Item	Material Name	Quantity/1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
15.50	3	Dextromethorphan HBr	15.50
50.00	4	Cornstarch	50.00
7.00	5	Povidone (PVP K-30)	7.00
50.00	6	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
42.00	7	Cornstarch	42.00
10.00	8	Povidone (PVP K-30)	10.00
9.50	9	Cellulose (powdered)	9.50
64.50	10	Cellulose (microcrystalline) (Avicel™ PH102)	64.50
20.00	11	Sodium starch glycolate (Primojel®)	20.00
8.00	12	Stearic acid (fine powder)	8.00
5.00	13	Talc (fine powder)	5.00
2.00	14	Magnesium stearate	2.00
—	15	Purified water	180.00

Manufacturing Directions

Follow the manufacturing directions provided for acetaminophen, chlorpheniramine, and pseudoephedrine caplets.

ACETAMINOPHEN, DEXTROPROPOXYPHEN HYDROCHLORIDE TABLETS (325 MG/32 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
325.00	1	Acetaminophen	325.000
32.00	2	Dextropropoxyphen hydrochloride	32.500
8.00	3	Povidone (K29–32)	8.000
7.50	4	Starch (maize)	7.500
QS	5	Water, purified	80.00 mL
10.00	6	Cellulose microcrystalline (Avicel™ PH 101)	10.000
5.00	7	Talc purified	5.000
2.00	8	Magnesium stearate	2.000
QS	9	Coating solution white opaque Methocel-Ethocel	160.000 mL

Manufacturing Directions

1. Granulation
   a. Pass acetaminophen, dextropropoxyphen, and starch through a 595 µm aperture screen, transfer to a suitable mixer, and mix for 10 minutes.
   b. Warm the water and dissolve the povidone.
   c. Slowly add the povidone solution to the mixer and mix until a suitable-consistency mass is obtained. Add extra water if needed.
   d. Pass the mass through a 4 mm aperture screen on an oscillating granulator and dry in a tray dryer at 105°C until the LOD is below 2% (Brabender, 105°C, 1 hour) or the equivalent.
   e. Pass the granules through a 1.59 mm aperture screen on a suitable comminuting mill, at medium speed, with knives forward into tared polyethylene-lined drums.
2. Lubrication
   a. Transfer the dried granulation to a suitable blender.
   b. Screen the cellulose microcrystalline, talc, and povidone through a 595 µm aperture screen, add to the blender, and blend for 5 minutes.
   c. Screen the magnesium stearate through a 400 µm aperture screen and add it to the blender. Blend for 2 minutes.
   d. Discharge the granule into polyethylene-lined drums, seal, and weigh for yield.
3. Compression
   a. Compress using 14.5 × 7.5 mm capsule-shaped punches. Weight of 10 tablets is about 4.05 g, not more than 3% variation; thickness is 5.2 to 5.8 mm (range not more than ± 5%); hardness is 8 kPa; and disintegration time not more than 15 minutes in water.
   b. Collect in clean, tared polyethylene-lined drums, and weigh for yield.
4. Coating
   a. Pan spray: Binks Bullow L450 spray gun or equivalent, fitted with a No. 63B material nozzle, a No. 66SF or 66SD atomizing nozzle, or a No. 39 needle.
      i. Divide tablets and solution.
      ii. Load into pan and preheat for 3 hours to 48°C.
      iii. Apply the solution at 10 to 21 psi, with a liquid pressure of 5 to 10 psi, to give a flow rate of 350 to 500 mL/min at a pan speed of 20 to 25 rpm. Rotate pan and commence spraying with continuous application of hot air at 46°C to 49°C (damper fully open). Ensure that the tablet bed does not become too hot. Tablets should be put only just above room temperature. You must switch off hot air when a coating solution is not being sprayed. Continue applying the solution until the average tablet weight has increased by 8 mg. When this weight gain is achieved, roll the tablets in cool air until dry. When completely dry, remove the tablets from the pan, and transfer to polyethylene-lined drums. Leave the drums open for at least 6 hours in a dust-free area.
   b. Accela Cota: Airless high-pressure spray system with two guns. Nozzle type: 0.018 in. (0.45 mm) orifice diameter with a 65° spray angle, pan speed of 5 rpm, inlet temperature of 70°C, inlet airflow set at quarter to half available flow, and exhaust sufficient to maintain coating drum under negative pressure (set water gauge at 7 in.).
      i. Divide tablets and solution.
      ii. Load tablets, rotate pan occasionally, and warm tablets until the exhaust temperature is 38°C to 42°C. Do not rotate longer than is necessary to achieve even warming.
      iii. Adjust the pump pressure to give an application rate of approximately 500 to 600 mL/min. Commence spraying with the coating solution. Adjust the pressure to maintain the exhaust temperature of 38°C to 42°C.
      iv. When the average weight gain of 8 mg is obtained, the tablets are dried: reduce pan speed to 7 rpm and maintain the inlet temperature and exhaust settings for 5 minutes. If the exhaust temperature reaches 45°C, switch off heat and control rotation for another 10 minutes; occasionally rotate the pan to ensure even cooling. Remove tablets when the exhaust temperature is 28°C to 32°C.

v. Ensure that tablets are thoroughly dry, and unload into polyethylene-lined drums; leave the drum unsealed for 1 hour in a dust-free humidity-controlled area.

ACETAMINOPHEN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
500.00	1	Acetaminophen (powder <300 µm)	500.00
500.00	2	Sodium bicarbonate	500.00
430.00	3	Tartaric acid (powder)	430.00
200.00	4	Dextrose	200.00
QS	5	Flavoring	QS
20.00	6	Kollidon® 30	20.00
—	7	Isopropanol	100.00 mL
60.00	8	PEG-6000 (powder)	60.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 5 with solution of items 6 and 7.
2. Pass through a 0.8 mm sieve, add item 8, and then mix.
3. Press to tablets (average weight, 1700 mg; 16 mm diameter biplanar tablet).

ACETAMINOPHEN FAST-DISSOLVING TABLET

Manufacturing Directions

1. To the vortex of a rapidly stirred vessel containing 2.85 kg of deionized water is added 300 g of croscarmellose sodium, forming slurry. This slurry is mixed for 10 minutes.
2. Concurrently, 5.0 kg of powdered acetaminophen is placed in the bowl of a mixer.
3. At the conclusion of the mixing time for the slurry of croscarmellose sodium, the slurry is added slowly to the acetaminophen in the mixer bowl, forming a granulation, which is then placed in trays and dried at 70°C in an oven for 3 hours.
4. The dry granulation is then passed through a U.S. Standard 14 mesh screen (1410 µm).
5. Dry granulation (4796 g) is then placed in a twin-shell blender, and to this are added 1584 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of a calcium sodium alginate complex) and 1584 g of microcrystalline cellulose (Avicel™ PH-302).
6. This is thoroughly blended for 10 to 15 minutes, after which 36.24 g of magnesium stearate is added and mixed for an additional 5 minutes.
7. Prior to being added to the blender, the magnesium stearate had been passed through a U.S. Standard 30 mesh screen.
8. The resulting blend is compressed into caplet-shaped tablets with an average weight of 0.884 g and an average thickness of 7.869 mm (0.3098 in.).
9. The hardness of these tablets averaged 11.98 kPa. Friability of these tablets is measured at 0.433% after 10 minutes and 0.847% after 19 minutes.
10. The average disintegration time is 26 seconds in 10 mL of deionized water, forming a suspension with minimal shaking.

ACETAMINOPHEN, IBUPROFEN, AND ORPHENADRINE TABLETS (250 MG/200 MG/200 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Acetaminophen (powder <300 µm)	250.00
200.00	2	Ibuprofen	200.00
200.00	3	Orphenadine hydrochloride	200.00
200.00	4	Ludipress®	200.00
5.00	5	Magnesium stearate	5.00
5.00	6	Aerosil 200	5.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high-compression force.
2. Compress into 761 mg tablets, using 12 mm planar punches.

ACETAMINOPHEN, IBUPROFEN, AND ORPHENADINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Acetaminophen (powder <300 µm)	250.00
200.00	2	Ibuprofen	200.00
100.00	3	Orphenadine hydrochloride	100.00
200.00	4	Ludipress®	200.00
5.00	5	Magnesium stearate	5.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve and mix.
2. Press with high-compression force.
3. Tablet weight is 761 mg for a 12 mm biplanar tablet.

ACETAMINOPHEN MICROSPHERE TABLET

Manufacturing Directions

1. Formulation: Acetaminophen (APAP) powder (melting point 169–170.5°C) 85%, carnauba wax 7.5%, Pluronic F68 7.5%.
2. Pluronic is milled through a FitzMill, using a 40 mesh screen.
3. All of the ingredients are blended at 60 Hz of slow speed, with chopper, for 10 minutes.
4. The blend is then subjected to liquiflash processing at 60 Hz and 37% nominal power, using the 5 in. V-groove heater head.
5. The collected microspheres are sieved.
6. The fraction passing through a 40 mesh sieve and retained on 120 mesh sieve is coated.
7. The microspheres selected are coated in a fluid-bed coater for taste-masking at a 30% coating level with a coating solution containing a 1:1 ethyl cellulose/hydroxypropyl cellulose blend in acetone:isopropyl alcohol solvent.
8. A preblend of 78.25% sucrose, 11.0% sorbitol, 10.0% xylitol, and 0.75% Tween (Polysorbate) 80 is prepared.
9. The floss preblend is processed using the 5 in. crown head at a temperature of 250°C and rotational speed of 60 Hz (3600 rpm).
10. The floss collected is mixed with 2% lactose (w/w) for 2 minutes at 100 rpm and 200 proof ethanol sprayed in a quantity equal to 0.5% (w/w) of the quantity of the floss.
11. The floss is then dried at 45°C for 90 minutes with intermittent mixing.
12. The dried floss is screened through a 20 mesh screen.
13. APAP taste-masked microspheres (step 5) 47.97, floss (step 6) 48.88, grape flavor 0.70, citric acid 1.50, acesulfame potassium 0.20, silicon dioxide 0.25, and sodium stearyl fumarate 0.50 are processed.
14. The coated APAP microspheres are blended with the sieved floss for 5 minutes in a mixer, followed by the addition of flavors, sweeteners, and citric acid for another 3 minutes.
15. Thereafter, silicon dioxide is added, and the mix blended for another 2 minutes. The final addition, sodium stearyl fumarate, is followed by blending for an additional 2 minutes.
16. The blend is then tableted using flat-faced bevel edge punches (tablet weights are 255 mg for 9 mm punch tooling, equivalent to 80 mg APAP dose, and 510 mg for 12 mm punch tooling, equivalent to 160 mg APAP dose).
17. The hardness values ranged from 0.5 to 2.0 kPa.

ACETAMINOPHEN, NOREPHEDRINE, AND PHENYLTOLOXAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Acetaminophen (crystalline) (Merck)	300.00
25.00	2	Norephedrine hydrochloride (Knoll)	25.00
22.00	3	Phenyltoloxamine	22.00
200.00	4	Cornstarch	200.00
25.00	5	Kollidon® 30	25.00
—	6	Ethanol (96%)	QS
25.00	7	Kollidon® CL	25.00
5.00	8	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 5 and 6.
2. Dry, pass through a 0.8 mm sieve, and add items 7 and 8.
3. Press with high-compression force.
4. Tablet weight is 601 mg for 12 mm biplanar tablet.

ACETAMINOPHEN, NOREPHEDRINE, AND PHENYLTOLOXAMINE TABLETS (300 MG/25 MG/22 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Acetaminophen crystalline	300.00
25.00	2	Norephedrine hydrochloride	25.00
22.00	3	Phenyltoloxamine	22.00
200.00	4	Starch (maize)	200.00
25.00	5	Kollidon® 30	25.00
—	6	Alcohol	QS
25.00	7	Kollidon® CL	25.00
5.00	8	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate the mixture of items 1 through 4 with a solution of items 5 and 6.
2. Dry, pass through a 0.8 mm sieve, add items 7 and 8, and press with high-compression force.
3. Compress into 601 mg tablets, using 12 mm planar punches.

ACETAMINOPHEN, PHENYLPROPANOLAMINE, DEXTROMETHORPHAN, AND CHLORPHENIRAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Acetaminophen	200.00
12.50	2	Phenylpropanolamine hydrochloride (10% excess)	13.75
10.00	3	Dextromethorphan hydrobromide (10% excess)	11.00
1.00	4	Chlorpheniramine maleate (10% excess)	1.10
64.65	5	Cellulose (microcrystalline) (Avicel™ PH101)	64.65
28.00	6	Sodium starch glycolate (pH 5.5–7.5)	28.00
17.00	7	Povidone (PVP K-29–32)	17.0
—	8	Distilled purified water	~80.0 mL
2.00	9	Magnesium stearate	2.00
125.00	10	Acetaminophen	125.00
50.00	11	Ascorbic acid; use item 12	—
56.25	12	Sodium ascorbate (special grade) (20% excess)	67.50
24.00	13	Sodium starch glycolate (pH 5.5–7.5)	24.00
15.00	14	Povidone (PVP K-29–32)	~15.00
—	15	Alcohol SD 3A (200 proof)	75.0 mL

Manufacturing Directions

1. Dissolve chlorpheniramine and povidone (item 7) in the purified water.
2. Pass phenylpropanolamine, dextromethorphan, and an equal portion of Avicel™ (item 5) through a 790 µm screen to break any agglomerates.
3. Blend the screened items in a suitable mixer for 5 minutes.
4. Load acetaminophen (item 1), sodium starch glycolate (item 6), remaining Avicel™ (item 5), and blended items from the previous step into a suitable planetary mixer.
5. Blend for 10 minutes.
6. Granulate the blend from the solution above.
7. Add the granulating solution in three equal portions, massing for 5 minutes after each addition.
8. Pass the wet mass through a 4.2 mm screen onto paper-lined trays.
9. Dry at 50°C until the granule LOD is 1% to 1.5%.
10. Pass the dried granules through an oscillating granulator fitted with a 790 µm screen.
11. Load the dried granules into a suitable blender.
12. Pass the magnesium stearate through a 600 µm screen and add to the blender.
13. Blend for 5 minutes.
14. Compress to the following specifications: tablet weight of 291.0 mg and tablet thickness of 4.20 to 4.40 mm.

ACETAMINOPHEN, PROPOXYPHENAZONE, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Acetaminophen powder	250.00
150.00	2	Propoxyphenazone (isopropyl antipyrine)	150.00
50.00	3	Anhydrous caffeine	50.00
120.00	4	Avicel™ PH102	120.00
5.00	5	Pharmacoat® 603	5.00
3.25	6	Magnesium stearate	3.25
9.75	7	Talcum	9.75
1.30	8	Silicic acid	1.30
7.00	9	Methocel E-15	7.00
32.50	10	Esmaspreng fine	32.50
21.20	11	Maize starch	21.20
—	12	Water purified	QS

Manufacturing Directions

1. Place into a suitable vessel 5.00 g of Pharmacoat and 74.00 g of purified water; stir until homogeneous aqueous mucilage is obtained.
2. Mix in another vessel 250 g of acetaminophen powder and 17.50 g of Esmaspreng fine; add the above granulating solution and knead for approximately 10 minutes until an evenly moist mass of soft lumps is obtained.
3. Granulate by means of centrifugal granulator with 10 mm screen; dry the moist granulate overnight on trays in drying oven at 45°C (relative humidity of 20–30%).
4. Crush the dried cake through an oscillator with a 1.5 mm perforated plate.
5. In a suitable container, add 65 g of deionized water and 7.0 g of Methocel.
6. Stir until homogeneous aqueous mucilage is obtained.
7. Mix into another vessel 150 g of isopropyl antipyrine, 50 g of caffeine, 15 g of Esmespreng fine, and 5.0 g of maize starch.
8. Pass through a centrifugal granulator with 1.0 mm screen; place the mixture into another vessel and knead for approximately 10 minutes until an evenly moist mass of small lumps is obtained.

9. Granulate through centrifugal granulator with 10 mm perforated screen.
10. Dry moist granulate overnight on trays in drying oven at 45°C (relative humidity of 10–20%).
11. Crush the dried granules through oscillator with a 1.5 mm perforated plate; store in airtight container.
12. Mix into a tumbling mixer 4.875 g of talc, 1.625 g of magnesium stearate, 0.65 kg of silicic acid, and 60.00 g of Avicel™ PH102.
13. Pass through a 0.5 mm round sieve, load acetaminophen granulate and isopropyl antipyrine/caffeine granulate, and add premixture of talc into blender.
14. Mix the mixture well for 30 minutes (relative humidity of 30–35%).
15. Store mix in airtight container.
16. Compress 650 mg tablet to 12.8–13.2 mm; hardness, 6 to 20 kPa; disintegration time, 5 minutes.

ACETAMINOPHEN, SALICYLAMIDE, CAFFEINE, AND CODEINE TABLETS (150 MG/200 MG/50 MG/10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Salicylamide	200.00
150.00	2	Acetaminophen powder	150.00
50.00	3	Caffeine anhydrous	50.00
10.00	4	Codeine phosphate	10.00
130.00	5	Starch (maize)	130.00
5.00	6	Gelatin powder	5.00
8.00	7	PVP K30	8.00
1.00	8	Aerosil 200	1.00
30.00	9	Starch (maize)	30.00
—	10	Water, purified	300 mL
10.00	11	Talc powder	10.00
19.00	12	Starch (maize), dried	19.00
1.00	13	Aerosil 200	1.00

Manufacturing Directions

Note: The binding solution is prone to microbiological growth. Use only freshly prepared and properly stored solution.

1. Place item 6 and about 25 mL of item 10 into a vessel to dissolve item 6. Mix for 10 minutes.
2. In a separate vessel, add and dissolve items 9 and 7 in about 12 mL of water.
3. Place item 5 into a vessel; add about 40 mL of cold item 10 and 20 mL of hot (70–75°C) water, after first dissolving in cold water.
4. In a separate vessel, place items 1 to 5 after passing them through a 630 µm sieve. Mix for 5 minutes at medium speed.
5. Add binding solution from step 3 and mix at medium speed. Continue until a satisfactory mass is obtained.
6. Dry the wet mass in a fluid-bed dryer at 50°C for 45 minutes to 1.5% to 2.5% LOD.
7. Pass the dried granules through a 1.5 mm sieve.
8. Load granules in a cone blender and mix for 5 minutes.
9. Add items 11 to 13 (passed through a 500 µm sieve) to blender, and blend for 5 minutes.
10. Compress into 634 mg tablets, using 12.7 mm flag bevel-edge punches.

ACETAMINOPHEN SUSTAINED-RELEASE TABLETS

Manufacturing Directions

1. Dissolve 300 g of acetaminophen and 60 g of hydroxypropyl methylcellulose in a mixture of 720 g of methanol and 720 g of dichloromethane.
2. Introduce 300 g of Celphere 102 (mean particle diameter of approximately 127 µm, particle diameter of approximately 50–150 µm) to a fluidized bed granulator and coat with the solution by the side spraying method (spraying liquid volume 14 g/min, spraying air pressure 3 kg/cm^2, product temperature 32°C, and inlet temperature 45°C) to obtain acetaminophen particles.
3. Separately, dissolve 48 g of ethyl cellulose and 12 g of hydroxypropyl methylcellulose in a mixture of 57 g of purified water and 1083 g of methanol.
4. Introduce acetaminophen particles (300 g) to a fluidized bed granulator and coat with this solution by side spraying (spraying liquid volume of 8 g/min, spraying air pressure of 3 kg/cm^2, product temperature of 38°C, and inlet temperature of 67°C) to obtain sustained-release fine particles.
5. Granulate 66 g of these sustained-release fine particles and 314.25 g mannitol that have been pulverized by a pin mill pulverizing device (spraying liquid volume 15 g/min, spraying air pressure of 1.1 kg/cm^2, product temperature of 30°C, inlet temperature of 38°C, and spraying cycle of 30 seconds spraying and 30 seconds drying) with an aqueous 30% w/w solution containing 67.5 g of maltose in a fluidized bed granulator to obtain the final composition.
6. After further mixing 2.25 g of magnesium stearate with the composition that is obtained, make 450 mg tablets containing 25 mg acetaminophen per tablet under a tableting pressure of 25 kg/punch and an initial hardness of 2.0 kPa, using a rotary tableting machine.
7. Next, keep these tablets for 24 hours while heating and humidifying at 25°C/75% RH, using a thermostatic chamber at constant humidity. Then, dry for 3 hours at 30°C and 40% RH.
8. The tablets obtained should show a hardness of 3.5 kPa and disintegration time in the buccal cavity of 12 seconds.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetaminophen (fine powder)	500.00
44.15	2	Maize starch	44.15
0.84	3	Potassium sorbate	0.84
18.00	4	Povidone (PVP K-30)	18.00
4.00	5	Aerosil® 200	4.00
12.00	6	Gelatin (powder)	12.00
4.00	7	Glycerol	4.00
30.00	8	Cellulose (powder)	30.00
12.00	9	Primojel®	12.00
8.00	10	Stearic acid (fine powder)	8.00
2.00	11	Magnesium stearate	2.00
5.00	12	Talc (fine powder)	5.00
QS	13	Purified water	QS

Manufacturing Directions

1. Binder solution: Prepare in several batches. Add items 3 to 5 with about 50% quantity of water, dissolve item 1 in water, add item 4, and dissolve at medium speed. Avoid foaming.
2. Add item 5 and mix for 3 minutes.
3. Dissolve item 6 in 70°C to 80°C purified water, and mix until clear. Avoid foaming.
4. Add item 7 and mix gently; add to mixture from previous step.
5. Mix items 1 and 2 for 5 minutes.
6. Add binding solution and mix at slow speed until granules form; add extra water if necessary.
7. Dry in fluid-bed dryer at 55°C for 30 minutes; after 15 minutes, scrape granules to break up lumps to promote uniform drying. Dry to 1% to 1.5% LOD.
8. Grind through a 3.0 mm sieve and then through a 1.0 mm sieve; load into a double-cone blender.
9. Pass cellulose powder, Primojel®, and stearic acid through a 500 µm sieve; bag-mix magnesium stearate and fine talc powder, and pass through a 250 µm sieve; then add portion of granules from the bulk to the bag and mix for 1 minute.
10. Add both of these parts to the granules.
11. Compress into 17.6×7.2 mm caplet punches of 10 to 14 kPa hardness and 5.8 to 6.0 mm thickness.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetaminophen (crystalline)	500.00
137.00	2	Avicel™ PH102	137.00
35.00	3	Kollidon® VA 64	35.00
21.00	4	Kollidon® CL	21.00
3.00	5	Magnesium stearate	3.00
4.00	6	Aerosil® 200	4.00

Manufacturing Directions

1. Pass the lubricant through a 200 mm sieve and mix all other components.
2. Pass through 0.8 mm sieve, add the lubricant, and press with a high-compression force of 25 to 30 kN.
3. Fill 699 mg.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (g/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500	1	Acetaminophen (crystalline)	500
150	2	Avicel™ PH102	150
20	3	Kollidon® VA 64	20
15	4	Kollidon® CL	15
15	5	PEG-6000 (powder)	15
2	6	Aerosil® 200	2

Manufacturing Directions

1. Pass the lubricant through a 200 µm sieve and mix all other components.
2. Pass the mix through a 0.8 mm sieve, add the lubricant, and press with a high-compression force of 25 to 30 kN.
3. Weight should be 703 mg.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetaminophen (powder)	500.00
30.00	2	Dicalcium phosphate	30.00
12.00	3	Kollidon® CL	12.00
20.00	4	Kollidon® VA 64	20.00
10.00	5	Kollidon® 90F	10.00
—	6	Ethanol (96%)	70 mL (max.)
12.00	7	Kollidon® CL	12.00
10.00	8	Polyethylene glycol (powder)	10.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with the solution of items 5 and 6.
2. Dry, sieve, and mix with items 7 and 8.
3. Press with high-compression force of 25 to 30 kN.
4. Tablet weight is 587 mg for an 11 mm biconvex tablet.

ACETAMINOPHEN TABLETS, CHEWABLE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
89.90	1	Acetaminophen; use acetaminophen particles coated with cellulose acetate and PVP	89.90
246.00	2	Mannitol granular	246.00
30.00	3	Microcrystalline cellulose	30.00
9.00	4	Aspartame	9.00
1.27	5	Dyes	1.27
2.10	6	Citric acid	2.10
2.30	7	Flavor	2.30
4.40	8	Magnesium stearate	4.40

Manufacturing Directions

1. Acetaminophen is coated with a layer of a taste-masking composition with a thickness of about 3 to 10 μm. The coating should be substantially free of cracks, holes, and other imperfections when examined under a scanning electron microscope at 100 to 500× magnification.
2. Load items 1 to 7 in a suitable blender and mix for 20 minutes.
3. Add item 8 to step 2 and blend for 2 minutes.
4. Compress the appropriate quantity.

ACETAMINOPHEN TABLETS FOR CHILDREN

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
210.00	1	Acetaminophen (Merck)	210.00
168.00	2	Avicel™ PH101	168.00
13.00	3	Kollidon® VA 64	13.00
6.00	4	Kollidon® CL	6.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Tablet weight is 401 mg for a 12 mm biplanar tablet.

ACETAMINOPHEN–TRAMADOL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Acetaminophen	200.00
20.00	2	Tramadol hydrochloride	20.00
50.40	3	Microcrystalline cellulose	50.40
19.20	4	Povidone K-90	19.20
4.80	5	Croscarmellose sodium	4.80
3.20	6	Colloidal silicon dioxide	3.20
3.20	7	Magnesium stearate	3.20

Manufacturing Directions

1. Mix the above amounts of items 1 through 6 listed in above formulation in a mixer, such as a high-shear mixer granulator or planetary mixer, to obtain homogeneity.
2. Granulate the mix in water or other suitable granulation fluids and dry in a dryer.
3. Mill the dried granular mass
4. Compress the lubricated granular mass into mini-tablets, with tablet weight of 160 mg for mini tablets and for regular tablet 320 mg.
5. Encapsulate the mini-tablets in a capsule containing two immediate-release mini-tablets and two sustained-release mini-tablets.

ACETAMINOPHEN–TRAMADOL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Acetaminophen	300.00
30.00	2	Tramadol hydrochloride	30.00
8.80	3	Microcrystalline cellulose	8.80
17.60	4	Povidone K-90	17.60
35.20	5	Sodium alginate (Keltone LV)	35.20
39.60	6	Hydroxypropyl methylcellulose 4 KM	39.60
4.40	7	Colloidal silicon dioxide	4.40
4.40	8	Magnesium stearate	4.40

Manufacturing Directions

1. For a portion of sustained release, mix the suitable amounts of items 1 through 3 and 7 and 8 listed in this formulation in a mixer, such as a high-shear mixer granulator or planetary mixer, to obtain homogeneity.
2. Granulate the mix is then granulated in water or other suitable granulation fluids and dry in a dryer. Mill the dried granular mass.
3. Compress the lubricated granular mass into mini-tablets, using a tablet press for individual tablet weight of 220 mg for mini tablets and for regular tablet 440 mg.
4. Encapsulate the mini-tablets in a capsule containing two immediate-release mini-tablets and two sustained-release mini-tablets.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Acetylsalicylic acid (crystalline)	250.00
250.00	2	Acetaminophen (crystalline)	250.00
50.00	3	Caffeine	50.00
50.00	4	Kollidon® 90°F	50.00
—	5	Isopropanol	QS
5.00	6	Magnesium stearate	5.00
16.00	7	Kollidon® CL	16.00

Manufacturing Directions

1. Granulate items 1 to 3 with the solution of items 4 and 5; dry and sieve through a 0.8 mm screen.
2. Add items 5 and 6 and press with low-compression force (hardness is 45 N); 12 mm biplanar tablet has an average weight of 670 mg.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (crystalline)	400.00
100.00	2	Acetaminophen (crystalline)	100.00
30.00	3	Caffeine	30.00
100.00	4	Ludipress®	100.00
20.00	5	Kollidon® CL	20.00
30.00	6	PEG-6000 (powder)	30.00
5.00	7	Stearic acid	5.00

Manufacturing Directions

1. Mix all components and pass through a 0.8 mm sieve.
2. Press with a compression force of 116 N; 12 mm biplanar tablet has an average weight of 683 mg.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLET (250 MG/250 MG/50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Acetaminophen (Merck)	250.00
50.00	2	Caffeine powder	50.00
250.00	3	Acetylsalicylic acid	250.00
60.00	4	Kollidon® VA 64	60.00
20.00	5	Kollidon® CL	20.00
3.00	6	Aerosil® 200	3.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. Granulate the active ingredients and Kollidon® VA 64 in a roller compactor.
2. Pass the granules together with magnesium stearate, Aerosil® 200, and Kollidon® CL through an 800 μm sieve.
3. Blend for 10 minutes in a mixer.
4. Compress into tablets with a force of about 12 kN.

ACETYLSALICYLIC ACID AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Acetylsalicylic acid (crystalline)	250.00
250.00	2	Acetaminophen (crystalline)	250.00
60.00	3	Avicel™ PH101	60.00
15.00	4	Kollidon® 30 (or Kollidon® VA 64)	15.00
25.00	5	Kollidon® CL	25.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with medium-compression force.
3. Tablet weight is 605 mg for a 12 mm biplanar tablet.

ACETYLSALICYLIC ACID AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Acetylsalicylic acid (40 mesh)	250.00
250.00	2	Acetaminophen (40 mesh)	250.00
15.00	3	Avicel™ PH102	15.00
7.20	4	Croscarmellose sodium (Ac-Di-Sol)	7.20
7.20	5	Stearic acid	7.20
4.00	6	Fumed silica	4.00

Manufacturing Directions

1. Screen all ingredients through a 0.8 mm sieve.
2. Blend all ingredients in a V-blender and mix for 10 minutes.
3. Compress to 670 mg tablet weight, using appropriate tooling.

ACETYLSALICYLIC ACID AND ASCORBIC ACID TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
325.00	1	Acetylsalicylic acid (crystalline) (Merck)	325.00
250.00	2	Ascorbic acid (powder) (BASF)	250.00
120.00	3	Sorbitol (crystalline)	120.00
40.00	4	Avicel™ PH101	40.00
25.00	5	Kollidon® VA 64	25.00
20.00	6	Kollidon® CL	20.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with medium- to high-compression force (hardness is 92 N); 12 mm biplanar tablet has an average weight of 790 mg.

ACETYLSALICYLIC ACID AND ASCORBIC ACID TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
325.00	1	Acetylsalicylic acid (crystalline) (Merck)	325.00
250.00	2	Ascorbic acid (powder) (BASF)	250.00
100.00	3	Avicel™ PH101	100.00
12.00	4	Kollidon® VA 64	12.00
30.00	5	Kollidon® CL	30.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with medium- to high-compression force (hardness is 100 N); 12 mm biplanar tablet has an average weight of 726 mg.

ACETYLSALICYLIC ACID + PARACETAMOL (=ACETAMINOPHEN) TABLETS (250 MG + 250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Acetylsalicylic acid	250.00
250.00	2	Acetaminophen	250.00
60.00	3	Avicel™ PH 101	60.00
15.00	4	Kollidon® VA 64	15.00
3.00	5	Macrogel 6000 Powder	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.

ACETYLSALICYLIC ACID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Acetylsalicylic acid crystalline	500.00
200.00	2	Avicel™ PH 101	200.00
15.00	3	Kollidon® 30	15.00
25.00	4	Kollidon® CL	25.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (crystalline) (Merck)	400.00
99.00	2	Ludipress®	99.00
1.00	3	Stearic acid	1.00
15.00	4	Kollidon® CL	15.00

Manufacturing Directions

1. Mix all components and pass through a 0.8 mm sieve.
2. Press with low-compression force (hardness is 90 N); 12 mm biplanar tablet has an average weight of 516 mg.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Acetylsalicylic acid, 40 mesh	400.00
55.60	2	Cellulose (microcrystalline) (Avicel™ PH101)	55.60
21.40	3	Starch (pregelatinized)	21.40
2.20	4	Stearic acid	2.20
10.00	5	Croscarmellose sodium (Ac-Di-Sol)	10.00
3.20	6	Fumed silica	3.20

Manufacturing Directions

1. Screen about half of item 1 through a mill, using 12 mesh screen with knives forward.
2. Preblend items 2 to 6 with 25% of item 1, and pass the mixture through the mill.
3. Pass the balance of item 1 through the mill.
4. Mix all the ingredients in a V-blender for 10 minutes and compress using 13/32 in. tooling.
5. For enteric coating, coat with Aquateric (FMC) dispersion.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	2	Avicel™ PH101	200.00
15.00	3	Kollidon® 30	15.00
25.00	4	Kollidon® CL	25.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with low-compression force (hardness is 61 N); 12 mm biplanar tablet has an average weight of 707 mg.

ACETYLSALICYLIC ACID TABLETS, BUFFERED

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (40 mesh)	400.00
40.00	2	Magnesium hydroxide	40.00
40.00	3	Aluminum hydroxide	40.00
135.00	4	Cellulose (microcrystalline) (Avicel™ PH101)	135.00
15.30	5	Stearic acid	15.30
15.30	6	Croscarmellose sodium (Ac-Di-Sol)	15.30
18.50	7	Hydroxy coatings	18.50

Manufacturing Directions

1. Screen all ingredients except item 7 through a 40 mesh sieve.
2. Blend items 2 and 3 in a V-blender for 10 minutes.
3. Coat items 2 and 3 using Aquacoat (FMC) aqueous polymer dispersion in a fluid-bed column with a 10% by weight formula.
4. Blend 50% of item 1 with items 4 and 5 for 10 minutes in a V-blender.
5. Add remaining item 1 and blend again for 10 minutes.
6. Blend item 7 with the mixture from the previous step for 10 minutes.
7. Add item 6 and blend for 7 minutes.
8. Compress into 625 mg tablets to the desired hardness using appropriate tooling.

ACETYLSALICYLIC ACID + VITAMIN C TABLETS (400 MG + 250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Acetylsalicylic acid crystalline	400.00
250.00	2	Ascorbic acid	250.00
100.00	3	Ludipress®	100.00
20.00	4	Kollidon® CL	20.00
3.00	5	Macrogol 6000 powder	3.00

Manufacturing Directions

Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.

ACYCLOVIR FAST MELT

Manufacturing Directions

1. Add and mix Acyclovir 50%, sodium bicarbonate 18%, citric acid anhydrous 18%, anhydrous lactose 7%, xylitol 5%, Crodesta F160 2%.
2. Dry these ingredients to reduce moisture.
3. The ingredients are then blended for 10 minutes and extruded in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) to form granules containing the effervescent ingredients.
4. Granules are then screened and blended with the following ingredients: ACY-EFG (30–60 mesh) 50%, microcrystalline cellulose 18%, Fujicalin SG 18%, L-HPC LH-1110%, aspartame 3%, redberry flavor 0.4%, magnesium stearate 0.5%, Cab-O-Sil M5P 0.1%.
5. Mix the ingredients in step 4 for 5 minutes prior to compression.
6. Acyclovir tablets are then compressed to a hardness of approximately 1 to 3 kPa, and tablets disintegrate in water in approximately 20 to 45 seconds.

ACYCLOVIR TABLETS (ZOVIRAX)

Each 800 mg tablet of Zovirax contains 800 mg of acyclovir and the inactive ingredients FD&C Blue No. 2, magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate. Each 400 mg tablet of Zovirax contains 400 mg of acyclovir and the inactive ingredients magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate.

ACYCLOVIR TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
800.00	1	Acyclovir	800.00
240.00	2	Lactose	240.00
100.00	3	Microcrystalline cellulose (Avicel™ PH 101)	100.00
24.00	4	Povidone	24.00
32.00	5	Sodium starch glycolate	32.00
8.00	6	Magnesium stearate	8.00
—	7	Alcohol	48.00

Manufacturing Directions

1. Pass items 1 to 3 through 250 μm mesh in a granulating vessel.
2. In a separate container, mix items 4 and 5 in item 6; now, add the solution to step 1. Pass the wet mass through an 8 mesh screen, dry, and size the granules.
3. Compress 1204 mg.

ACYCLOVIR WATER-DISPERSIBLE TABLETS (800 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
800.00	1	Acyclovir	800.00
100.00	2	Microcrystalline cellulose (Avicel™ PH 101)	100.00
53.00	3	Veegum F	53.00
42.00	4	Sodium starch glycolate	42.00
9.40	5	Magnesium stearate	9.40
—	6	Alcohol	QS

Manufacturing Directions

1. Pass items 1 to 4 through 250 µm mesh into a granulating vessel.
2. Add a sufficient quantity of item 6 to make a wet mass. Pass it through a granulator, dry, and then pass through an 11 mesh sieve.
3. Pass item 5 through a 250 µm sieve and add to step 2.
4. Compress into 1004 mg tablets, using a suitable punch.

ALBENDAZOLE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Albendazole	200.00
84.00	2	Starch (maize)	84.00
101.25	3	Lactose monohydrate	101.25
5.00	4	Sodium starch glycolate (Primojel®)	5.00
13.00	5	Povidone (PVP K-30)	13.00
5.00	6	Saccharin sodium	5.00
1.00	7	Polysorbate 80 (Tween 80)	1.00
110.00	8	Microcrystalline cellulose (Avicel™ PH 102)	110.00
50.00	9	Sodium starch glycolate (Primojel®)	50.00
5.00	10	Vanilla dry flavor	5.00
5.00	11	Blood orange dry flavor	5.00
4.00	12	Stearic acid	4.00
2.00	13	Magnesium stearate	2.00
2.75	14	Colloidal silicon dioxide (Aerosil 200)	2.75
2.00	15	Sodium lauryl sulfate	2.00
—	16	Alcohol (ethanol 95%)	105.00
—	17	Purified water	73.33

Manufacturing Directions

Note: Avoid overmixing the lubricants; otherwise, hardness will be reduced.

1. Dissolve item 7 in item 16 by spatula. Dissolve items 5 and 6 in item 17 by stirring with a stirrer. Add item 7 (Tween 80) solution in items 5 and 6 (PVP–saccharin) solutions, while mixing with a stirrer.
2. Sift items 1 to 4 through a 500 µm stainless steel sieve. Collect in a polyethylene bag.
3. Load the sifted powder into the mixer. Mix for 2 minutes at low speed.
4. Add the binding solution from steps 1 and 2, while mixing at low speed over a period of 2 minutes. Scrape the sides and blades of the mixer. Mix and chop at low speed for 2 minutes. Check the end point of granulation. If required, add item 17 to get the end point. (The end point of the granulation is the point when the wet mass consists of few or no lumps of granules.) Unload the wet mass on stainless steel trays to dry.
5. Dry the wet granules in an oven at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break the lumps for uniform drying.
6. Check the LOD. The limit is 1.0% to 1.5%.
7. Grind the dried granules through a 1.25 mm sieve, using the granulator at medium speed.
8. Sift items 8 to 11 through a 500 µm sieve. Add the sieved powder from step 1. Mix manually for 2 minutes.
9. Mix items 12 to 15 in a polyethylene bag. Sift through a 250 µm stainless steel sieve. Collect in a polyethylene bag. Add into step 1. Mix manually for 1 minute.
10. Compress into 10 tablets with weight = 5.900 g ± 2% and hardness = 9 to 11 kPa.
11. Coat using the hydroxypropyl methylcellulose (HPMC) system and add a finishing coat. (See the Appendix.)

ALBENDAZOLE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Albendazole	100.00
288.00	2	Ludipress®	288.00
4.00	3	Magnesium stearate	4.00
8.00	4	Aerosil® 200	8.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.

ALENDRONATE TABLETS (FOSAMAX)

Fosamax tablets for oral administration contain either 6.53, 13.05, or 52.21 mg of alendronate monosodium salt trihydrate, which is the molar equivalent of 5, 10, and 40 mg, respectively, of free acid, and the following inactive ingredients: microcrystalline cellulose, anhydrous lactose, croscarmellose sodium, and magnesium stearate.

ALENDRONATE TABLETS, EFFERVESCENT (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Alendronate; use alendronate sodium	13.05
650.00	2	Citric acid anhydrous	650.00
367.00	3	Sodium bicarbonate granular	367.00
40.00	4	Sodium carbonate anhydrous	40.00
25.00	5	Flavor	25.00
5.00	6	Color	5.00
7.50	7	Sodium benzoate	7.50
—	8	Water, purified	2.00

Note: For other strengths, adjust with lactose.

Manufacturing Directions

1. Premix sodium benzoate with sodium bicarbonate and alendronate sodium. Mix the color with sodium carbonate. Place citric acid in a bowl of a suitable blender.
2. Slowly add 2 mg of water to the citric acid and mix thoroughly to form a moist blend. Add to the blend, in sequence, while mixing, the sodium bicarbonate mix and the sodium carbonate–color mix. Mix until uniformly distributed.
3. Compress tablets using suitably sized tooling. Cure the tablets, cool, and package in aluminum foil.

ALENDRONATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
13.05	1	Sodium alendronate	13.05
103.95	2	Lactose anhydrous	103.95
80.00	3	Microcrystalline cellulose granular	80.00
2.00	4	Sodium carboxymethyl cellulose	2.00
1.00	5	Magnesium stearate	1.00

Manufacturing Directions

1. First, blend alendronate with one-third of microcrystalline cellulose and with one-half of anhydrous lactose.
2. Blend the premixture obtained with both remaining excipients and mix again.
3. Add sodium salt of carmellose under mixing, to be followed with magnesium stearate to finish the mixture blending.
4. When homogenized by the fourth mixing, subject the mixture to compression.

ALENDRONATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
13.05	1	Sodium alendronate	13.05
11.15	2	Maize starch	11.15
104.50	3	Mannitol	104.50
1.30	4	Magnesium stearate	1.30

Manufacturing Directions

1. Blend a mixture containing alendronate, mannitol, maize starch, and microcrystalline cellulose in a container at the stirrer speed of 14 rpm and under normal temperature and humidity (25°C, 60% RH).
2. Add magnesium stearate to the premixed mixture.
3. After homogenization, compress the precompression mixture on a rotary compression machine to form flat (cylindrical) or oval-shaped tablets of 130 mg in mass.

ALENDRONATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
13.05	1	Sodium alendronate	13.05
42.00	2	Calcium hydrogen phosphate	42.00
62.50	3	Granulated microcrystalline cellulose	62.50
11.15	4	Maize starch	11.15
1.30	5	Magnesium stearate	1.30

MANUFACTURING DIRECTIONS

1. See formulation instructions for previous formulation.

ALENDRONATE SODIUM TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Alendronate: use alendronate sodium	52.00
10.00	2	Polyvinyl pyrrolidone	10.00
100.00	3	Lactose anhydrous	100.00
1.50	4	Sodium stearyl fumarate	1.50
—	5	Water, purified	100.00

Manufacturing Directions

1. Pass items 1 to 3 through a 500 µm sieve and blend for 10 minutes.
2. Add item 2 and mix it well with item 5. Add to this to step 1 to granulate, dry, size, and then add item 4.
3. Compress into 163.50 mg tablets, using a suitable punch.

ALLOPURINOL TABLETS, 100 MG (ZYLORIC)

Each scored white tablet contains 100 mg of allopurinol and the inactive ingredients lactose, magnesium stearate, potato starch, and povidone. Each scored peach tablet contains 300 mg of allopurinol and the inactive ingredients cornstarch, FD&C Yellow No. 6 Lake, lactose, magnesium stearate, and povidone.

ALLOPURINOL TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Allopurinol	100.000
1.00	2	Sorbitan monooleate	1.000
73.00	3	Starch (maize)	73.000
100.00	4	Lactose	100.00
10.00	5	Starch (maize)	10.000
8.00	6	Sodium starch glycolate	8.000
QS	7	Purified water (deionized), approximately	65.00 mL
4.50	8	Talc purified	4.5000
1.50	9	Silicon dioxide	1.5000

Manufacturing Directions

Caution: Wear gloves, mask, and protective glasses during all manufacturing operations.

1. Granulation
   a. Prescreen the allopurinol through a 75 µm aperture screen and transfer it to a suitable mass mixer. Dissolve the sorbitan monooleate in 10 mL of water and add the solution to the mixer. Mix until the allopurinol is wetted.
   b. Pass the wetted allopurinol through a 2.00 mm aperture screen on an oscillating granulator and dry in a tray dryer at 50°C until the LOD (Brabender 105°C, 1 hour or equivalent) is less than 2%.
   c. Rescreen the dried allopurinol through a 75 µm aperture screen and transfer it to the mass mixer. Add the starch (item 3) and lactose and mix for 15 minutes.
   d. Add the starch (item 5) to about 15 mL of water and mix until a smooth slurry, free from lumps, is formed.
   e. Heat 40 mL of water to boiling. Reduce the heat, and then, while mixing, add the slurry from step 1d. Continue mixing well until a smooth translucent paste is formed. Allow to cool to 50°C before moving to the next step in the process. (*Caution:* Control the heat to avoid charring of the paste.)
   f. Add half of the starch paste from step 1e to the blended powders in the mixer and mix for 1 minute. Stop mixing, and scrape the blades and sides of the mixer. Add the second half of the starch paste and mix for another 1 minute. Stop mixing, scrape the blades and sides of the mixer, and examine the mass.
   g. If necessary, add more water at 50°C, in small quantities, mixing for 1 minute after each addition, until a good wet, holding mass is formed. (*Caution:* Do not overwet or overmix the mass.)
   h. Pass the mass through a 2.00 mm aperture screen on an oscillating granulator and dry in a tray dryer at 50°C until the LOD (Brabender 105°C, 1 hour or equivalent) is in the range of 1% to 2%.
   i. Arrange for sample.
   j. Pass the granules through a 595 µm aperture screen on an oscillating granulator into tared, polyethylene-lined drums, seal, and weigh.
2. Lubrication
   a. Transfer the dried granulation to a suitable blender.
   b. Screen the sodium starch glycolate, talc, magnesium stearate, and colloidal silicon dioxide through a 595 µm aperture screen. Add to the blender and blend for 15 minutes.
   c. Discharge the granule into polyethylene-lined drums, seal, and weigh for yield.
3. Compression
   a. Compress using 9.52 mm (0.375 in.) diameter concave punches with the bisect on the upper punch.
   b. Compress to the following specifications:

i. Weight of 10 tablets—3.025 g
ii. Weight variation—Average weight differs from theoretical weight by not more than 3%
iii. Thickness—3.5 to 4.3 mm (range: not more than 5%)
iv. Hardness—NTL 8 kPa
v. Disintegration time—Not more than 15 minutes in water

ALLOPURINOL TABLETS (300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Allopurinol	300.00
180.00	2	Lactose	180.00
20.00	3	Povidone (K 29)	20.00
50.00	4	Starch (maize)	50.00
QS	5	Water, purified (deionized)	65.00 mL
20.00	6	Croscarmellose sodium	20.00
30.00	7	Starch (maize), dried	30.00

Manufacturing Directions

Caution: Wear gloves, mask, and protective glasses during all manufacturing operations.

1. Granulation
   a. Transfer allopurinol, lactose, povidone, and starch (item 4) to a suitable mass mixer. Mix for 15 minutes and then pass through a 250 µm sieve aperture screen.
   b. Return the screened mix from step 1 to the mixer and add sufficient water until a good wet, holding mass is formed. Pass the mass through a 2.00 mm aperture screen on an oscillating granulator and dry in a tray dryer at 50°C until the LOD (Brabender 105°C, 1 hour or equivalent) is in the range of 1% to 2%.
   c. Pass the granules through a 595 µm aperture screen on an oscillating granulator into tared, polyethylene-lined drums, seal, and weigh.
2. Lubrication
   a. Transfer the dried granulation to a suitable blender.
   b. Screen the croscarmellose sodium and dried starch through a 595 µm aperture screen and add to the blender. Blend for 15 minutes.
   c. Discharge the granule into polyethylene-lined drums, seal, and weigh for yield.
3. Compression: Compress using 11.11 mm (0.4375 in.) diameter concave punches with the bisect on the upper punch. (Weight of 10 tablets: 6.00 g; weight variation: average weight differs from theoretical weight by not more than 3%.)

ALPRAZOLAM TABLETS (0.25 MG/0.50 MG/1.0 MG), XANAX

Each Xanax tablet, for oral administration, contains 0.25, 0.5, 1, or 2 mg of alprazolam and the following inactive ingredients: cellulose, cornstarch, docusate sodium, lactose, magnesium stearate, silicon dioxide, and sodium benzoate. In addition, the 0.5 mg tablet contains FD&C Yellow No. 6, and the 1 mg tablet contains FD&C Blue No. 2.

ALPRAZOLAM TABLETS (0.25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.25	1	Alprazolam, with excess	0.252
82.50	2	Dicalcium phosphate	82.50
2.25	3	Starch (maize)	2.25
2.25	4	Gelatin	2.25
33.50	5	Starch (maize)	33.50
0.082	6	Propylparaben	0.082
0.082	7	Methylparaben	0.082
1.00	8	Magnesium stearate	1.00
1.00	9	Sodium starch glycolate	1.00
0.30	10	Dye yellow	0.30
—	11	Water, purified, ca	100 mL

Manufacturing Directions

1. Place items 2 and 5 in a suitable vessel after sifting through an 80 mesh sieve. Mix for 2 minutes.
2. Sift item 1 through a 60 mesh sieve and add to step 1. (*Note:* Because of the small quantity of item 1, use a geometric dilution method to mix the entire amount.)
3. Mix for 5 minutes.
4. In a separate vessel, sift (through 80 mesh) and place items 3, 4, 6, 7, and 10 and then mix for 2 minutes. Add a sufficient quantity of item 11 to form a suitable lump-free paste.
5. Add step 4 into step 3, and knead and chop to prepare a suitable mass without lumps.
6. Spread the wet mass from step 5 on trays and dry at 50°C for 12 hours to an LOD of not more than 2%; dry for an additional hour if necessary.
7. Pass dried granules through 20 mesh.
8. Sift items 8 and 9 through a 250 µm sieve screen and add to step 7. Blend for 2 minutes.
9. Compress into 125 mg tablets, using 6 mm punches. For 0.5 mg and 1.0 mg strengths, adjust with item 2 and compress the same weight and size.

ALUMINUM ACETYLSALICYLATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Aluminum acetylsalicylate, excess	255.00
213.00	2	Mannitol	213.00
28.00	3	Cornstarch	28.00
10.00	4	Kollidon® 90F	10.00
5.00	5	Lutrol E 6000	5.00
—	6	Isopropanol, QS	50.00 mL
23.00	7	Kollidon® CL	23.00
5.00	8	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 to 6.
2. Dry, pass through a 0.8 mm sieve, and mix with items 7 and 8.
3. Compress with medium-compression force; 12 mm biplanar tablet has an average weight of 540 mg.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Aluminum hydroxide (Rorer)	200.00
200.00	2	Magnesium hydroxide (Rorer)	200.00
100.00	3	Lactose monohydrate	100.00
30.00	4	Kollidon® VA 64	30.00
QS	5	Water	260.00 mL
315.00	6	Sucrose (crystalline)	315.00
100.00	7	Sorbitol (crystalline) (Merck)	100.00
60.00	8	PEG-6000 (powder)	60.00
12.00	9	Aerosil® 200	12.00
6.00	10	Talc	6.00
6.00	11	Magnesium stearate	6.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 4 and 5.
2. Dry and pass through a 0.8 mm sieve, add items 6 to 11, and press with high-compression force (20 kN).
3. The 16 mm biplanar tablet has an average weight of 1013 mg.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
320.00	1	Aluminum hydroxide (dried gel)	320.00
320.00	2	Magnesium hydroxide powder	320.00
32.00	3	Sucrose	32.00
288.40	4	Mannitol	288.40
QS	5	Povidone (Plasdone®) (10% solution in equal parts water and alcohol)	QS
12.90	6	Glycerin	12.90
19.20	7	Magnesium stearate	19.20
6.40	8	Fumed silica	6.40
0.30	9	Oil of peppermint	0.30

Manufacturing Directions

1. Mix items 1 to 4 in a suitable blender, add items 5 and 6, and use this combination to moisten the mix of items 1 to 4.
2. Granulate by passing through a 20 mesh screen.
3. Add and thoroughly mix items 7 to 9, and compress using 0.5 in., flat-face, beveled-edge punches.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
405.00	1	Aluminum hydroxide gel (dried)	405.00
100.00	2	Magnesium hydroxide powder	100.00
108.00	3	Mannitol	108.00
38.80	4	Sorbitol powder	38.80
2.50	5	Saccharin sodium	2.50
16.70	6	Povidone (PVP K-30)	16.70
7.00	7	Magnesium stearate	7.00
2.00	8	Mint flavor (dry)	2.00
299.00	9	Purified water	299.00

Manufacturing Directions

1. Dissolve items 4 and 5 in 59.0 g of purified water by using stirrer.
2. Add item 6 while mixing until clear solution is obtained.

3. Add items 1 to 3 into mixer and mix for 5 minutes, with mixer and chopper at high speed.
4. Dilute concentrated binding solution with 240.0 g of purified water.
5. Add binding solution at a rate of 9 to 11 g/min to the dry powders in the mixer while mixing at low speed. Mix for 2 to 3 minutes. Scrape the sides, blade, and lid of the mixer. Mix and chop at low speed for an additional 2 to 3 minutes or until the granules stop flying around the chopper. Add extrapurified water, if required, and continue mixing until a satisfactory mass is obtained. Record extra quantity of purified water added.
6. Unload the wet mass into a clean Aeromatic bowl for drying. Avoid big lump formation, as this leads to nonuniform drying.
7. Dry the wet mass in an Aeromatic fluid-bed dryer at 60°C for 120 minutes. After 30 minutes of drying, scrape the semidried granules to break the lumps for uniform drying. Check the LOD (limit: NMT 5.5%).
8. Pass the dried granules through 1.5 mm sieve, using granulator at medium speed. Collect in stainless steel drums. Set aside 7 to 9 g of granules for later step.
9. Load the rest of the granules into blender. Pass items 8 and 7 through a sifter, using a 250 µm sieve. Collect in a polyethylene bag.
10. Add about 7 to 9 g of granules and mix gently.
11. Load into blender and blend for 3 minutes.
12. Check temperature and humidity of the room before beginning compression (humidity limit: NMT 60%; temperature: 25 ± 1°C).
13. Compress the granules using a rotary tableting machine. Compress into 680 mg tablets, using 12.7 mm, flat, beveled-edge punches.

ALUMINUM HYDROXIDE, MAGNESIUM CARBONATE (OR OXIDE), AND SIMETHICONE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
576.00	1	Sucrose	576.00
157.00	2	Aluminum hydroxide	157.00
160.00	3	Magnesium carbonate (or oxide)	160.00
97.00	4	Magnesium oxide	97.00
45.00	5	Kollidon® 90F	45.00
22.00	6	Aerosil® 200	22.00
300.00	7	Simethicone suspension (30%)	300.00
9.00	8	Menthol	9.00
1.00	9	Saccharin sodium	1.00
49.00	10	Talc	49.00
13.00	11	Magnesium stearate	13.00

Manufacturing Directions

1. Granulate mixture of items 1 to 6 with the simethicone suspension, dry, sieve through a 0.8 mm screen, add items 8 to 11, and press with high-compression force.
2. Tablet has an average weight of 1295 mg.

ALUMINUM HYDROXIDE AND MAGNESIUM SILICATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
120.00	1	Aluminum hydroxide dried gel (Giulini)	120.00
250.00	2	Magnesium trisilicate	250.00
232.00	3	Ludipress®	232.00
6.00	4	Aerosil® 200	6.00
6.00	5	Magnesium stearate	6.00
12.00	6	Cyclamate sodium	12.00
1.50	7	Menthol	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with a compression force of 20 kN.
2. Because of the poor flowability of the powder, the tableting machine should be equipped with a special technical device to provide a continuous and homogeneous filling of the dies.
3. The 16 mm biplanar tablet has an average weight of 640 mg.

AMBROXOL HCL SUSTAINED-RELEASE PELLETS RELEASING TABLETS

Formulation for 500 tablets: ambroxol HCl/Kollicoat® SR 30D pellets, 250.0 g; microcrystalline cellulose Vivapur® 200, 250.0 g; magnesium stearate, 2.5 g.

Manufacturing Directions

1. Mix the ingredients together, pass through a 0.8 mm sieve, and compress into tablets with a force of about 15 kN. This gives 500 tablets.

AMINOPHYLLINE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Aminophylline	100.00
196.00	2	Starch (maize)	196.00
2.00	3	Talc	2.00
3.00	4	Magnesium stearate	3.00
QS	5	Water, purified	QS

Manufacturing Directions

1. Place item 2 in a suitable vessel and add a sufficient quantity of item 5 to prepare a 30% smooth slurry.
2. Add item 1 into step 1 and mix well to form a suitable mass.
3. Pass the wet mass through a 6 mesh sieve to granulate.
4. Dry the granules at 60°C for 10 hours to an LOD of not more than 3%.
5. Pass the dried granules through a 1.19 mm sieve and transfer to a blending vessel.
6. Sift items 3 and 4 through a 250 μm sieve and add to step 5. Blend for 2 minutes.
7. Compress into 300 mg tablets, using 9 mm punches.

4-AMINO-1-HYDROXYBUTYLIDENE-1,1-BIS PHOSPHONIC ACID TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	4-Amino-1-hydroxybut ylidene-1,1-bisphosphonic acid; use monosodium trihydrate	6.55
110.45	2	Lactose anhydrous	110.45
80.00	3	Microcrystalline cellulose	80.00
1.00	4	Magnesium stearate	1.00
2.00	5	Croscarmellose sodium type A	2.00

Manufacturing Directions

1. Premix the active ingredient (equivalent to 5 mg of anhydrous free acid per tablet) with one-third quantity of the microcrystalline cellulose and one-half the quantity of the anhydrous lactose in a ribbon blender for 5 minutes at 20 rpm.
2. To the premix add the remaining two-thirds of the microcrystalline cellulose and the remaining one-half of the anhydrous lactose. Blend for 10 minutes at 20 rpm.
3. Add croscarmellose sodium to the blended powders in step 2 and mix for 5 minutes at 20 rpm.
4. Add item 4 to the mixture after passing it through a 90 mesh screen and blend for an additional 5 minutes at 20 rpm.
5. Compress into 192 mg tablets, using a suitable punch.

AMINOSALICYLIC ACID TABLETS

Formulation: 5-Aminosalicylic acid (5-ASA), 73.3%; sodium chloride, 11.7%; povidone, 4.4%; alcohol SDA-3A, QS; lactose, 8.8%; calcium stearate/sodium lauryl sulfate, 1.76%; sodium starch glycolate, 0.29%.

Manufacturing Directions

1. Mill sodium chloride through a Whistler mill, using a small slotted screen.
2. Combine 5-ASA with the sodium chloride and mix for 5 minutes in a ribbon blender. Mill the powder blend through a FitzMill at high speed (1B band) and return to the ribbon blender.
3. Add povidone/alcohol solution to the powder blend while the mixer is running to form a wet mass.
4. Pass the wet mass through a FitzMill (1/2 in., perforated band) with hammers forward at high speed. Tray and dry the wet granulation for 16 hours at 55°C. Pass the dried mixture through a FitzMill (2A band) with knives forward at medium speed.
5. Place the resultant blend in a ribbon blender. Pass lactose, calcium stearate/sodium lauryl sulfate, and sodium starch glycolate through a 40 mesh screen.
6. Add the screened powders to the ribbon blender and mix for 5 minutes.
7. On a conventional tablet press, compress the finished granulation into 3/8 in. tablets, using standard concave tooling. The tablets should meet the target weight requirements, be about 0.175 in. thick, and have a hardness of 8 to 15 kPa and a friability of NMT 0.4%.
8. Place 100 kg of compressed tablets into an Accela-Cota pan and warmed to about 40°C exhaust temperature.
9. Disperse 5 kg of Opadry Enteric (Colorcon, Inc.) in an alcohol (SDA-3A) and water mixture (composition of alcohol/water is 25.5 and 2.8 kg, respectively).
10. Spray coat this solution on tablets using an air-atomization system as follows: two spray guns at 35 psi each set to deliver about 60 g/min, maintaining an exhaust temperature of 35°C to 45°C. The coated tablets are dried in the Accela-Cota pan for 1 hour at 35°C to 45°C.
11. Polish the tablets in the pan, using 1 g powdered carnauba wax.

AMIODARONE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.000	1	Amiodarone hydrochloride	200.000
86.000	2	Lactose monohydrate	86.000
27.500	3	Starch (maize)	27.500
8.500	4	Povidone (PVP K-30)	8.500
25.000	5	Starch (maize)	25.000
2.000	6	Magnesium stearate	2.000
1.000	7	Colloidal silicon dioxide (Aerosil 200)	1.000
—	8	Purified water	116.67

Manufacturing Directions

Note: Avoid overmixing lubricants, because this reduces hardness.

1. Sieving and dry mixing: Sift items 1, 3, and 2 through a 500 µm stainless steel sieve. Load into the mixer. Mix for 5 minutes at low speed.
2. Preparation of binder
   a. Dissolve item 4 in 16.67 g of item 8 by using a stirrer at a slow speed in a stainless steel container.
   b. Pass item 5 through a 250 µm sieve.
   c. Make a homogeneous slurry of item 5 in 25.0 g of item 8 (30°C) in a stainless steel container. Ensure that it is free of lumps.
   d. Heat 75.0 g of item 8 to 90°C in a stainless steel container. Add the slurry from step 2. Stir until complete gelatinization occurs. Cool to 50°C.
   e. Add the solution from step 2 into step 3 and stir for 5 minutes.
   f. Check the quantity of the binder: theoretical weight, 150 g. Adjust the weight with purified water by mixing if required.
3. Kneading
   a. Knead the powder in a mixer (Diosna) with the binder, while mixing at low speed over a period of 2 minutes. Scrape the sides and the blades. Mix and chop at low speed for 2 minutes.
   b. Check the end point of granulation. If required, add more purified water to get the end point. (The end point of the granulation is the point when the wet mass consists of few or no lumps of the granules.)
   c. Unload the wet granules in a stainless steel tray for drying.
4. Drying
   a. Dry the wet granules at 550°C for 5 hours.
   b. Check the LOD: the limit is 1.0% to 1.5%. If required, dry further at 550°C for 1 hour. Check the LOD.
   c. Transfer the dried granules to a polyethylene bag.
5. Grinding: Grind the dried granules through a 1.25 mm sieve, using a granulator at medium speed. Collect in a polyethylene bag.
6. Lubrication
   a. Sift items 6 and 7 through a 250 µm mesh in a stainless steel sieve. Collect in a polyethylene bag. Take approximately 66.67 g of granules from step 5 into the polyethylene bag. Mix manually. Add into step 5. Mix for 1 minute.
   b. Store in a polyethylene bag.
7. Compression and specifications: Compress the granules by using a rotary tableting machine, 10 mm round plain convex punch. (Weight of 10 tablets: 3.5 g ± 3%.)

AMITRIPTYLINE TABLETS (50 MG), ELAVIL®

Elavil® (amitriptyline HCl) is supplied as 10, 25, 50, 75, 100, and 150 mg tablets and as a sterile solution for intramuscular use. Inactive ingredients in the tablets are as follows: calcium phosphate, cellulose, colloidal silicon dioxide, hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose, magnesium stearate, starch, stearic acid, talc, and titanium dioxide. The 10 mg amitriptyline HCl tablets also contain FD&C Blue No. 1. The 25 mg amitriptyline HCl tablets also contain D&C Yellow No. 10, FD&C Blue No. 1, and FD&C Yellow No. 6. The 50 mg amitriptyline HCl tablets also contain D&C Yellow No. 10, FD&C Yellow No. 6, and iron oxide. The 75 mg amitriptyline HCl tablets also contain FD&C Yellow No. 6. The 100 mg amitriptyline HCl tablets also contain FD&C Blue No. 2 and FD&C Red No. 40. The 150 mg amitriptyline HCl tablets also contain FD&C Blue No. 2 and FD&C Yellow No. 6.

AMITRIPTYLINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Amitriptyline	50.00
20.00	2	Starch (maize)	20.00
20.00	3	Lactose monohydrate	20.00
15.00	4	Dicalcium phosphate	15.00
2.00	5	Magnesium stearate	2.00
3.00	6	Talc	3.00
20.00	7	Starch (maize)	20.00
—	8	Water, purified, ca	100 mL

Manufacturing Directions

1. Sift items 1 to 4 through a 250 µm sieve and place in a suitable mixer.
2. In a separate vessel, place item 2 and add item 8 at 80°C. Mix until a good paste is formed. Cool to 50°C.
3. Add step 2 into step 1, and knead and chop until granules are formed without lumps.
4. Spread the wet mass onto trays and dry in an oven at 50°C for 15 hours to an LOD of not more than 1.5%.
5. Pass the dried granules through an 18 mesh screen and transfer to a suitable blender.
6. Pass item 5 though a 250 µm sieve and item 7 through a 500 µm sieve; add to step 5 and blend for 2 minutes.
7. Compress into 130 mg tablets, using a suitable punch.
8. Coat the tablet with an organic base coating. (See Appendix.)

AMLODIPINE BESYLATE TABLETS

Amlodipine besylate tablets are formulated as white tablets equivalent to 2.5, 5, and 10 mg of amlodipine for oral administration. In addition to the active ingredient, amlodipine besylate, each tablet contains the following inactive ingredients: microcrystalline cellulose, dibasic calcium phosphate anhydrous, sodium starch glycolate, and magnesium stearate.

AMLODIPINE BESYLATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.50	1	(–)Amlodipine	0.50
183.00	2	Lactose anhydrous	183.00
15.00	3	Starch pregelatinized	15.00
1.50	4	Magnesium stearate	1.50

Manufacturing Directions

1. Sieve the active ingredient, (–)amlodipine, through a suitable sieve, and blend with lactose and pregelatinized maize starch.
2. Add suitable volumes of purified water to granulate.
3. After drying, screen the granules and blend with the magnesium stearate.
4. Compress using 7 mm diameter punches to a total weight of 200 mg. Adjust the formula for other strengths with lactose (2.5 and 5.0 mg).

AMLODIPINE FREE BASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.5	1	Amlodipine base	2.5
31.50	2	Calcium hydrogen phosphate anhydrate	31.50
62.05	3	Microcrystalline cellulose	62.05
2.00	4	Sodium starch glycolate	2.00
1.00	5	Magnesium stearate	1.00

Manufacturing Directions

1. Sieve amlodipine base through a 500 µm screen, and sieve other excipients through an 850 µm screen.
2. Mix all excipients except magnesium stearate in a free fall mixer for 15 minutes at about 25 rpm.
3. Add magnesium stearate and mix the powder blend for another 5 minutes at about 25 rpm. Compress into 2.5 mg and 10 mg tablets with total weight of 100 and 400 mg, respectively.

AMLODIPINE MALEATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
3.21	1	Amlodipine maleate	3.21
31.50	2	Calcium hydrogen phosphate anhydrous	31.50
62.05	3	Microcrystalline cellulose	62.05
2.00	4	Sodium starch glycolate	2.00
1.00	5	Magnesium stearate	1.00

Manufacturing Directions

1. Mill amlodipine maleate to a particle size of 10 to 20 µm.
2. Sieve amlodipine maleate is sieved through a 500 µm screen and other excipients through an 850 µm screen.
3. Mix all excipients except magnesium stearate in a free fall mixer for 15 minutes at about 25 rpm. Check value of pH at 20% aqueous slurry (should be around 5.9).
4. Add magnesium stearate and mix the powder blend for another 5 minutes at about 25 rpm.
5. Compress tablets at approximately 100 mg to give 2.5 mg strength and proportionally higher for amounts up to 10 mg per tablet.

AMOXICILLIN AND CLAVULANATE POTASSIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Amoxicillin; use amoxicillin trihydrate compacted, with excess	587.50
125.00	2	Clavulanate; use clavulanate potassium with Avicel™ (1:1)	305.00
25.00	3	Sodium starch glycolate	25.00
30.00	4	Aerosil® 200	30.00
10.00	5	Sodium carmellose	10.00
10.00	6	Talc	10.00
5.00	7	Magnesium stearate	5.00

Manufacturing Directions

1. Dry item 1 at 45°C for 2 hours.
2. Dry items 6, 7, 5, and 3 at 80°C for 4 hours.
3. Sift items 1 to 7 through a 40 mesh screen, place in a drum mixer, and mix for 30 minutes.
4. Slug the mixture in step 3 using 16 mm punches and a hardness of 6 to 7 kPa.
5. Break the slugs by passing through 2.5 mm mesh sieves on a mill.
6. Transfer the comminuted slugs to a blender and add items 6 and 7 for 15 minutes.
7. Compress using 19×9 mm punches.
8. Coat the tablets with HPMC organic coating. (See Appendix.)

AMOXICILLIN FAST-DISINTEGRATING TABLETS

1. Mix 970 g of cefaclor (as monohydrate) and 30 g of microcrystalline cellulose and sodium carboxymethyl cellulose (Avicel™ RC591) for 5 minutes in a planetary mixer.
2. Gradually, add about 320 mL of water to this blend, and continue mixing for another 5 minutes.
3. Dry the wet granulate in a fluidized bed dryer at an air inlet temperature of 50°C and subsequently sieve through a 1.00 and a 0.630 mm screen, respectively.
4. Mix 864 g of the granulate obtained in step 3 with 98 g of a mixture of microcrystalline cellulose and cross-linked polyvinylpyrrolidone (1:1), flavors, and sweetening agents in a TURBULA mixer for 10 minutes.
5. After a lubricant is added, continue mixing for another 3 minutes, and compress the mixture into tablets with a mean weight of 625 mg. Friability, <0.01%; hardness, 6.9 kPa; disintegration time, 22 seconds.

AMOXICILLIN AND POTASSIUM CLAVULANATE TABLETS (250 MG/62.5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Amoxicillin; use amoxicillin trihydrate	293.75
62.50	2	Clavulanic acid; use potassium clavulanate with Avicel™ (1:1)	152.500
23.00	3	Polyplasdone XL, dried	23.00
23.00	4	Syloid AL1	23.00
4.50	5	Magnesium stearate	4.50
450.00	6	Microcrystalline cellulose	450.00

Manufacturing Directions

1. Polyplasdone XL, dried, is present as a disintegrant. Syloid AL1 is a desiccant used to prevent hydrolytic degradation of the actives. Magnesium stearate is present as a lubricant. Microcrystalline cellulose is a tablet binder and disintegrant.
2. Mill amoxicillin trihydrate, using a swing hammer mill at fast speed through a 0.063 in. screen, with knives forward.
3. Mix the milled amoxycillin trihydrate with potassium clavulanate, polyplasdone, Syloid AL1, part of magnesium stearate, and part of microcrystalline cellulose.
4. Slug the blend from step 3, or use a roller compactor.
5. Mill the compacts or flake from step 4 through a swing hammer mill at medium speed, with knives forward, and fitted with a 0.063 in. screen.
6. Blend granules with remaining magnesium stearate and remaining microcrystalline cellulose.
7. Compress to a core weight of 450 mg and a hardness of 15 to 20 kPa.
8. Provide a film subcoating with an aqueous suspension of hydroxypropyl methylcellulose, further coated with a Eudragit enteric coating, and finally, with a further overcoating of hydroxypropyl methylcellulose. (See Appendix.)

AMOXICILLIN TABLETS (250 MG/500 MG/1 G), ACID TRIHYDRATE

Tablets: each tablet contains 500 or 875 mg of amoxicillin as the trihydrate. Each film-coated, capsule-shaped, pink tablet is embossed with AMOXIL, centered over 500 or 875, respectively. The 875 mg tablet is scored on the reverse side. The inactive ingredients are colloidal silicon dioxide, crospovidone, FD&C Red No. 30 Aluminum Lake, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline

cellulose, polyethylene glycol, sodium starch glycolate, and titanium dioxide.

Chewable tablets: each cherry-/banana-/peppermint-flavored tablet contains 125, 200, 250, or 400 mg of amoxicillin as the trihydrate. The 125 and 250 mg pink oval tablets are imprinted with the product name AMOXIL on one side and 125 or 250 on the other side. The inactive ingredients are citric acid, cornstarch, FD&C Red No. 40, flavorings, glycine, mannitol, magnesium stearate, saccharin sodium, silica gel, and sucrose. Each 125 mg chewable tablet contains 0.0019 mEq (0.044 mg) of sodium; the 250 mg chewable tablet contains 0.0037 mEq (0.085 mg) of sodium. Each 200 mg chewable tablet contains 0.0005 mEq (0.0107 mg) of sodium; the 400 mg chewable tablet contains 0.0009 mEq (0.0215 mg) of sodium. The 200 and 400 mg pale pink, round tablets are imprinted with the product name AMOXIL and 200 or 400 along the edge of one side. The inactive ingredients are aspartame, crospovidone, FD&C Red No. 40 Aluminum Lake, flavoring, magnesium stearate, and mannitol.

AMOXICILLIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Amoxicillin (871 mcg/mg activity)[a]	287.00
28.50	2	Cellulose microcrystalline NC (Avicel™ PH 101)	28.50
20.00	3	Povidone K 29–32	20.00
QS	4	Alcohol 190 proof, approximately	70.00 mL
3.50	5	Magnesium stearate	3.50

[a] Adjust according to potency. Adjust the tablet size as given in the following to yield 1 g, 500 mg, and 250 mg tablets.

Manufacturing Directions

Caution: Handle with extreme care. Protect face and hands, because some individuals may be sensitive, and reactions may occur.

1. Granulation
   a. Pass amoxicillin through a 595-Hm aperture screen using a FitzMill, with knives forward, at medium speed.
   b. Place the following ingredients in a suitable mixer: cellulose microcrystalline, sodium starch glycolate, and milled amoxicillin. Mix for 30 minutes.
   c. Add 100 g of alcohol and mix for an additional 15 minutes.
   d. Dissolve povidone in approximately 150 g of alcohol. Add povidone solution to the mixture from step 3, with continuous mixing. Mix for 15 minutes until a suitable granulating mass is obtained. If necessary, add more alcohol.
   e. Pass the wet mass through a 4.76 mm aperture screen.
   f. Spread the wet granulation onto trays. Oven dry at 38°C or until the LOD is 2% to 3.5% (vacuum 60°C, 3 hours).
   g. Pass the dry granulation through a 1.2 mm aperture screen in an oscillating granulator.
2. Lubrication
   a. Load half of the amount of dried granulation into a suitable mixer. Pass magnesium stearate through a 500-Hm aperture screen and add to the mixer. Mix for 10 minutes.
   b. Add the balance of granulation and mix for an additional 5 minutes.
   c. Fill into polyethylene-lined drums.
3. Compression
   a. Compress into 1 g tablets, using 20×9 mm bisected ovaloid punches (thickness 9.6–10.6 mm; hardness not less than 15 kPa).
   b. Compress into 500 mg tablets, using 18×8.5 mm ovaloid punches (thickness is 6.5–6.7 mm; hardness is 12–18 kPa).
   c. Compress into 250 mg tablets, using 10.3 mm diameter punches (thickness is 5.1–5.3 mm; hardness is 12 kPa).

AMOXICILLIN TRIHYDRATE AND CLAVULANATE POTASSIUM TABLETS (500 MG/125 MG) AUGMENTIN

Each Augmentin tablet contains 0.63 mEq of potassium. Each 125 mg chewable tablet and each 5 mL of reconstituted Augmentin 125 mg/5 mL oral suspension contain 0.16 mEq of potassium. Each 250 mg chewable tablet and each 5 mL of reconstituted Augmentin 250 mg/5 mL oral suspension contain 0.32 mEq of potassium. Each 200 mg chewable tablet and each 5 mL of reconstituted Augmentin 200 mg/5 mL oral suspension contain 0.14 mEq of potassium. Each 400 mg chewable tablet and each 5 mL of reconstituted Augmentin 400 mg/5 mL oral suspension contain 0.29 mEq of potassium.

Inactive ingredients:

Chewable tablets—colloidal silicon dioxide, flavorings, magnesium stearate, mannitol, and one or more of the following: aspartame, D&C Yellow No. 10, FD&C Red No. 40, glycine, sodium saccharin, and succinic acid.

Tablets—colloidal silicon dioxide, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, sodium starch glycolate, and titanium dioxide.

AMPHETAMINE SALTS TABLETS

This is a single-entity amphetamine product combining the neutral sulfate salts of dextroamphetamine and amphetamine, with the dextroisomer of amphetamine saccharate, and D,L-amphetamine aspartate.

Each Tablet Contains	5 mg	10 mg	20 mg	30 mg
Dextroamphetamine saccharate	1.25 mg	2.5 mg	5 mg	7.5 mg
Amphetamine aspartate	1.25 mg	2.5 mg	5 mg	7.5 mg
Dextroamphetamine sulfate	1.25 mg	2.5 mg	5 mg	7.5 mg
Amphetamine sulfate	1.25 mg	2.5 mg	5 mg	7.5 mg
Total amphetamine base equivalence	3.13 mg	6.3 mg	12.6 mg	18.8 mg

Inactive ingredients: sucrose, lactose, cornstarch, acacia, and magnesium stearate.

AMPICILLIN TABLETS (250 MG)

Formulation: Ampicillin trihydrate, 250 g; Ludipress®, 250 g; magnesium stearate, 10 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force at 500 mg.

APOMORPHINE AND NICOTINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Apomorphine hydrochloride	4.00
1.00	2	Nicotine base	1.00
4.00	3	Acesulfame-K	4.00
37.50	4	Microcrystalline cellulose	37.50
2.50	5	Peppermint flavor	2.50
2.00	6	Chocolate natural flavor	2.00
3.00	7	Citric acid	3.00
13.00	8	Hydroxypropyl methylcellulose	13.00
80.00	9	Mannitol	80.00
3.00	10	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all ingredients through a 35 mesh screen (sieve opening of about 0.51 mm) to ensure granulation.
2. Prepare a solution containing apomorphine HCl, citric acid, half the acesulfame-K, half the peppermint flavor, and half the chocolate flavor by dissolving the ingredients into a mixture of equal volumes of purified water and ethanol, USP.
3. Mix the solution until clear and then absorbed into the listed amount of microcrystalline cellulose (Avicel™ 302).
4. Mix the resulting wet mass, labeled "part A," in a porcelain dish at room temperature (20°C) for 30 minutes, and then partially dry to obtain a solid mass.
5. Next, granulate the mass by screening through a 50 mesh (ASTM) (sieve opening of about 0.297 mm) stainless steel screen. Dry the wet granules at about 60°C to 70°C for about 1 to 1.5 hours. Pass the resulting dried granules through a 35 mesh screen (sieve opening of about 0.51 mm).
6. Separately, add nicotine to and blend with all the remaining ingredients except for the magnesium stearate. More specifically, add nicotine to the second half of the acesulfame-K, half the peppermint flavor, half the chocolate flavor, the hydroxypropyl methylcellulose (Methocel E4M, premium), and the mannitol.
7. The resulting blend is labeled "part B." Combine parts A and B and mix for about 5 minutes in a V-shaped blender. Next, add magnesium stearate to the blender and blend continuously for about 2 minutes.
8. Remove the final mix from the blender and compress into 150 mg tablets.

APOMORPHINE AND PROCHLORPERAZINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Apomorphine hydrochloride	4.00
5.00	2	Prochlorperazine hydrochloride	5.00
4.00	3	Acesulfame-K	4.00
37.50	4	Microcrystalline cellulose	37.50
2.50	5	Peppermint flavor	2.50
2.00	6	Chocolate natural flavor	2.00
3.00	7	Citric acid	3.00
10.00	8	Hydroxypropyl methylcellulose	10.00
80.00	9	Mannitol	80.00
3.00	10	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all ingredients through a 35 mesh screen (sieve opening of about 0.51 mm) to ensure granulation.
2. Prepare a solution containing prochlorperazine HCl, citric acid, half the acesulfame-K, half the peppermint flavor, and half the chocolate flavor by

dissolving the ingredients into a mixture of equal volumes of purified water and ethanol, USP.
3. Mix the solution until clear and then absorb into the listed amount of microcrystalline cellulose (Avicel™ 302).
4. Mix the resulting wet mass, labeled "part A," in a porcelain dish at room temperature (20°C) for 30 minutes and then partially dry to obtain a solid mass.
5. Next, granulate the mass by screening through a 50 mesh (sieve opening of about 0.297 mm) stainless steel screen. Dry the wet granules at about 60°C to 70°C for about 1 to 1.5 hours. Pass the resulting dried granules through a 35 mesh screen (sieve opening of about 0.51 mm).
6. Separately, add nicotine to and blend with all the remaining ingredients except for magnesium stearate. More specifically, add nicotine to the second half of the acesulfame-K, half the peppermint flavor, half the chocolate flavor, the hydroxypropyl methylcellulose (Methocel E4M, premium), and the mannitol.
7. The resulting blend is labeled "part B." Combine parts A and B and mix for about 5 minutes in a V-shaped blender. Next, add magnesium stearate to the blender, and continue blending for about 2 minutes.
8. Remove the final mix from the blender and compress into 150 mg tablets.

ASPARAGUS EXTRACT + PARSLEY EXTRACT TABLETS (200 MG + 200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Asparagus extract powder	200.00
200.00	2	Parsley extract powder	200.00
200.00	3	Sorbitol crystalline	200.00
20.00	4	Kollidon® VA 64	20.00
10.00	5	Kollidon® CL	10.00
4.00	6	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press to tablets with low-compression force at 636 mg.

ASPARTAME EFFERVESCENT TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
00.00	1	Aspartame	20.00
10.40	2	Sorbitol crystalline	10.40
14.30	3	Tartaric acid powder	14.30
18.70	4	Sodium carbonate	18.70
1.70	5	Kollidon® 25	1.70
1.10	6	PEG 6000 powder	1.10

Manufacturing Directions

1. Mix all components and pass through a 0.5 mm sieve.
2. Press to tablets at 66 mg.

ASPARTAME TABLETS (25 MG), DC

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
27.00	1	Aspartame	27.00
76.00	2	Ludipress®	76.00
12.00	3	Kollidon® CL	12.00
1.00	4	Magnesium stearate	1.00
3.00	5	Lutrol F68	3.00

Manufacturing Directions

1. Mix all components and pass through a 0.8 mm sieve.
2. Press to tablets with low-compression force at 120 mg.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Aspartame	20.00
4.00	2	Cellulose (microcrystalline) (Avicel™ PH101), NF	4.00
4.00	3	Sodium starch glycolate (pH 5.5–7.5), NF International	4.00
0.50	4	Silicon dioxide (colloidal)	0.50
0.50	5	Povidone (PVP K-29–32), USP	0.50
14.00	6	Anhydrous alcohol (isopropyl, refined), USP	~14.00
34.00	7	Lactose (granulated)	34.00
4.00	8	Leucine, USP	4.00
3.00	9	Sodium benzoate (powder), NF	3.00

Manufacturing Directions

1. Place aspartame, cellulose microcrystalline, sodium starch glycolate, silicon dioxide, and povidone in a suitable mixer.
2. Blend for 20 minutes or until uniform.
3. While mixing, slowly add isopropyl alcohol to blended powders until a suitable granulating mass is obtained. Avoid overwetting.
4. Pass wet mass through a 2.38 mm screen on an oscillating granulator and spread onto paper-lined trays.
5. Oven dry at 45°C to 50°C until LOD is NMT 1.2%.
6. Pass dried granulation through an 840-Hm screen on an oscillating granulator.
7. Load dried granulation into a suitable mixer.
8. Add granulated lactose, leucine, and sodium benzoate, and blend for ~10 minutes.
9. Discharge into polyethylene-lined drums.
10. Compress tablets in a low-humidity area not to exceed 40% relative humidity at 23°C.
11. Compress, using 7/32 in. concave punches, to the following specifications: weight of 10 tablets is 0.7 g; thickness of a tablet is 2.9 to 3.3 mm.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25	1	Aspartame	25
25	2	Dibasic calcium phosphate	25
3	3	Kollidon® VA 64	3
10	4	Water	10
3	5	Kollidon® CL	3
3	6	PEG-6000 (powder)	3

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with items 4 and 5.
2. Pass through a 0.8 mm sieve and mix with item 6.
3. Press to tablets (60 mg in weight) with a 5 mm biplanar shape.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Aspartame	27.00
76.00	2	Ludipress®	76.00
12.00	3	Kollidon® CL	12.00
1.00	4	Magnesium stearate	1.00
3.00	5	Lutrol F 68	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with low-compression force.
2. Each 8 mm biplanar tablet has an average weight of 120 mg.

ASPARTAME TABLETS, EFFERVESCENT

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
20.00	1	Aspartame	20.00
10.40	2	Sorbitol (crystalline)	10.40
14.30	3	Tartaric acid (powder)	14.30
18.70	4	Sodium bicarbonate	18.70
1.70	5	Kollidon® 25	1.70
1.10	6	PEG-6000 (powder)	1.10

Manufacturing Directions

1. Mix all items, pass through a 0.5 mm sieve, and press to tablets.
2. Each 6 mm biplanar tablet has an average weight of 66 mg.

ASPIRIN, ACETAMINOPHEN, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
225.00	1	Aspirin (40 mesh)	225.00
250.00	2	Acetaminophen (20 mesh)	250.00
30.00	3	Caffeine (granular)	30.00
100.00	4	Cellulose (microcrystalline) (Avicel™ PH-102)	100.00
45.00	5	Anhydrous lactose	45.00
10.00	6	Croscarmellose sodium (Ac-Di-Sol)	10.00
5.00	7	Fumed silica	5.00
10.00	8	Stearic acid	10.00

Manufacturing Directions

1. Mix items 1 to 6 in a suitable blender.
2. Pass the mixture through a mill, using a 12 mesh screen with knives forward.
3. Add items 7 and 8, and blend the milled mixture for 20 minutes in a V-blender.
4. Compress to tablet weight of 675 mg.

ASPIRIN, ACETAMINOPHEN, CAFFEINE, AND SALICYLAMIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Aspirin (40 mesh)	200.00
100.00	2	Salicylamide	100.00
100.00	3	Acetaminophen (40 mesh)	100.00
60.00	4	Caffeine (Granular)	60.00
150.00	5	Cellulose (microcrystalline) (Avicel™ PH101)	150.00
13.00	6	Stearic acid, USP	13.00
3.00	7	Fumed silica	3.00

Manufacturing Directions

1. Screen all ingredients through a 20 mesh sieve.
2. Blend all the ingredients in a V-blender for 20 minutes.
3. Compress into 615 mg tablets, using 5/8 in. tooling.

ASPIRIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
325.00	1	Aspirin	325.00
25.52	2	Starch 1500	25.52
21.33	3	Microcrystalline cellulose (50 μm)	21.33
6.33	4	Powdered cellulose	6.33

Manufacturing Directions

1. Blend in a twin-shell blender.
2. Compress into 378.00 mg tablets.

ATENOLOL TABLETS

Formulation: Atenolol, 100.00 mg; citric acid (anhydrous), 4.00 mg; microcrystalline cellulose, 169.00 mg; sodium starch glycolate, 3.00 mg; magnesium stearate, 4.00 mg. Total 280.00 mg.

Manufacturing Directions

1. Dissolve citric acid in purified water to provide a 20% citric acid solution.
2. Granulate atenolol with this solution in a planetary mixer, and dry the resultant granules in a tray dryer to less than 3% by weight loss on drying.
3. Hammer mill the atenolol/citric acid premixture and blend with the other excipients. Compress this material into 280 mg tablets.

ATENOLOL TABLETS (50 MG/100 MG), TENORMIN

Tenormin is available as 25, 50, and 100 mg tablets for oral administration. The inactive ingredients are magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate.

ATENOLOL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Atenolol	50.00
87.50	2	Magnesium carbonate heavy	87.50
29.70	3	Starch (corn)	29.70
3.30	4	Sodium lauryl sulfate	3.30
30.00	5	Starch (corn)	30.00
2.00	6	Gelatin	2.00
5.00	7	Magnesium stearate	5.00
QS	8	Purified water	QS

Note: This formula is used for both 50 and 100 mg strengths; see following for fill weights to obtain the correct strengths.

Manufacturing Directions

1. Massing
   a. Mix starch (item 5) with approximately 27.3 mL of purified water (item 8) in a glass or stainless steel vessel, avoiding the formation of lumps.
   b. Boil the remaining 52.8 mL of purified water (item 8), and add the mix from step 1 with continuous stirring until a gel is formed. Further heat may be necessary. (*Note:* A mix temperature greater than 95°C must be exceeded before a gel is formed.)
   c. Pass gelatin through a 1.59 mm aperture, add water at 50°C, dissolve, and add to step 2.
   d. Add sodium lauryl sulfate to step c without excessively mixing (to avoid foaming).
   e. Mill the atenolol through a 1.59 mm aperture screen at medium speed with knives forward, then load into a suitable mixer.
   f. Pass magnesium carbonate heavy, starch (corn) (item 3) through a 1.00 mm aperture stainless screen, and add to the mixer. Mix at 60 rpm for 10 minutes.

g. Pass the mixed powders from step f through a 1 mm aperture stainless steel screen, and return to the mixer.
h. Add, in one load, the starch and gelatin and sodium lauryl sulfate gel from step d at 70°C to 80°C, and mix for 5 minutes at 60 rpm.
i. Stop the mixer and inspect the mass. Add the extra 6.88 mL of purified water (item 8) at 50°C to complete the granulation while mixing. Mix for a further 5 minutes at 60 rpm.

2. Drying/granulation: Proceed to step a or b.
   a. Oven drying
      i. Pass the wet mass through a granulator fitted with a 4.76 mm aperture stainless steel screen. Collect the granules on paper-lined trays.
      ii. Dry the granules in a hot air oven at 60°C (not more than 65°C). After 1 hour of drying, pass the granules through a granulator fitted with a 2.38 mm aperture stainless steel screen. Collect the granules on paper-lined trays and return to the hot air oven at 60°C.
   b. Fluid-bed drying
      i. Pass the wet mass through a granulator fitted with a 4.76 mm aperture stainless steel screen into the fluid-bed dryer bowl.
      ii. Dry the granules in the fluid-bed dryer at 60°C for 30 minutes, turning over after 15 minutes. Then, pass the granules through a granulator fitted with a 2.38 mm aperture stainless steel screen, and then return to the fluid-bed dryer bowl with the air inlet and outlet fully open. Proceed to step c in the preceding list.
   c. Continue drying the granules until the LOD is between 1.5% and 2%.
   d. Pass the dried granules through a granulator fitted with a 1 mm aperture stainless steel screen. Collect the granules in a polyethylene-lined drum, and close securely.
3. Lubrication
   a. Place the dried granules from step 2 ("drying/granulation") in a suitable blender.
   b. Add magnesium stearate and the remainder of the starch via a 0.6 mm aperture stainless steel screen, and mix for 25 minutes.
   c. Transfer to a polyethylene-lined drum and close securely until ready for compression.
4. Compression: Compress on a suitable tablet machine using round punches—weight of 10 tablets is 2.075 g for 50 mg strength and 4.15 g for 100 mg strength; hardness more than 5 kPa; disintegration time not more than 15 minutes.
5. Coating: Use either organic coating or aqueous Methocel as needed. Follow with a clear gloss.

ATENOLOL TABLETS (90 MG)

Formulation: Atenolol (Stober), 93.0 g; Ludipress®, 287.0 g; Kollidon® CL, 52.0 g; magnesium stearate, 2.2 g; Aerosil® 200, 0.9 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with low-compression force at 436 mg.

ATORVASTATIN TABLETS (10 MG/20 MG), ATORVASTATIN CALCIUM LIPITOR

Lipitor tablets for oral administration contain 10, 20, or 40 mg of atorvastatin and the following inactive ingredients: calcium carbonate, USP; candelilla wax, Food & Chemicals Codex (FCC); croscarmellose sodium, NF; hydroxypropyl cellulose, NF; lactose monohydrate, NF; magnesium stearate, NF; microcrystalline cellulose, NF; Opadry White YS-1-7040 (hydroxypropyl methylcellulose, polyethylene glycol, talc, titanium dioxide); polysorbate 80; and simethicone emulsion.

ATORVASTATIN CALCIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Atorvastatin; use atorvastatin calcium trihydrate	10.00
36.00	2	Calcium carbonate	36.00
65.00	3	Lactose monohydrate	65.00
30.00	4	Microcrystalline cellulose (Avicel™ PH 102)	30.00
3.00	5	Polyvinylpyrrolidone (Povidone K-30)	3.00
0.40	6	Polysorbate 80 (Tween 80)	0.40
4.00	7	Croscarmellose sodium (Ac-Di-Sol)	4.00
0.60	8	Magnesium stearate	0.60
—	9	Purified water	QS

Manufacturing Directions

1. Sift atorvastatin calcium trihydrate, calcium carbonate, lactose monohydrate, and Avicel™ PH 102 through a 0.500 mm stainless steel sieve.
2. Dissolve PVP K-30 and Polysorbate-80 in purified water (50°C) by slow stirring until it becomes clear. Cool the solution to 30°C. This is the granulating solution.

3. Knead the powder mix with granulating solution to get the desired granules.
4. Dry the granules to a targeted LOD of 2%.
5. Pass the dried granules through a 16 mesh screen.
6. Sift Ac-Di-Sol and magnesium stearate through 0.500 mm.
7. Load the ground granules from step 5 and the powder mix from step 6 into a suitable blender. Blend for 1 minute.
8. Compress into 150 mg tablets, using 12 mm punches. For 20 mg strength, compress 300 mg in 15 mm punches.
9. Prepare a hypromellose and polyethylene glycol 4000 solution in the mixture of purified water and ethanol 95%. Keep overnight for complete gelation. (See Appendix.)
10. Add talc and titanium dioxide into step 9, and homogenize for a uniform coating dispersion.
11. Coat the tablets using the coating dispersion Accel-Cota to a targeted weight.

ATTAPULGITE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
475.00	1	Attapulgite (regular)	475.00
275.00	2	Attapulgite (colloidal)	275.00
12.00	3	PVPK30	12.00
7.00	4	Ac-Di-Sol	7.00
15.00	5	Kollidon® CL	15.00
30.00	6	Sucrose	30.00
50.00	7	Klucel® EF	50.00
40.00	8	Sucrose	40.00
35.00	9	Ac-Di-Sol	35.00
25.00	10	Kollidon® CL	25.00
14.00	11	Talc (fine powder)	14.00
5.00	12	Pectin	5.00
7.00	13	Glyceryl behenate	7.00
5.00	14	Aerosil® 200	5.00
5.00	15	Magnesium stearate	5.00
—	16	Purified water	32.00
—	17	Ethanol (95%)	23.00

Manufacturing Directions

Caution: Use face-mask, hand gloves, and clean uniform. Avoid dust and inhalation of powder.

1. Dissolve sucrose (item 6) in purified water by using an appropriate stirrer at slow speed in a stainless steel container.
2. Dissolve Klucel® EF in the ethanol by using an appropriate stirrer at slow speed in stainless steel container.
3. Mix the contents of steps 1 and 2 in a stainless steel drum by using an appropriate stirrer at slow speed.
4. Take item 8 (sucrose) and pass through a FitzMill using sieve number 24250 (impact forward, high speed). Collect the sieved contents in a stainless steel drum.
5. Add items 1 to 5 and sift the material through a 500 µm sieve using a Russell sifter.
6. Mix for 3 minutes.
7. Add the binding solution prepared earlier at a speed of 6 to 8 kg/min to the dry powder in an appropriate mixer at slow speed. After addition, scrape sides and blades, and then mix and chop further for 1 minute at slow speed. Check for satisfactory wet mass. Add additional purified water, if required, to obtain satisfactory wet mass.
8. Spread the granules onto stainless steel trays to a thickness of 1/4th of the tray thickness and load the trays on the trolley.
9. Load the trolleys into the oven and dry the granules at 55°C for 16 hours.
10. After 4 hours of drying, stir the granules on the trays and change the position of the trays for uniform drying.
11. Check the LOD of dried granules (limit: 2.5–3.5%).
12. The LOD should be strictly maintained; otherwise, tablet hardness and friability are affected. If required, dry further to obtain the desired LOD.
13. Grind the dried granules first using a 2.5 mm sieve and then with a 1.25 mm sieve.
14. Load the ground material into a double-cone blender.
15. Sift items 9, 10, 12, and 14 through a 500 µm sieve and add mixture to the double-cone blender.
16. Mix for 5 minutes.
17. Sift items 11, 13, and 15 through a 250 µm sieve and collect in a polyethylene bag.
18. Add about 2 to 3 kg bulk granules from earlier step, mix, and add to the double-cone blender.
19. Mix for 1 minute.
20. Compress the granules using an 18 × 8 mm, oblong, capsule-shaped, parallel, concave, plain punch for a 1- g tablet weight of hardness 12 to 18 kPa.
21. Coat the tablets using one of the HPMC coating solutions (see Appendix).

AZITHROMYCIN CHEWABLE TABLETS

Formulation: Azithromycin dihydrate (1619.870 g, 60% of total composition), FD&C Red No. 40 (1.125 g), magnesium oxide (309.757 g, 11.5% of total composition), calcium gluconate (46.4160 mg, 1.7% of total composition), and sodium starch glycolate (139.248 g) are combined in an eight-quart V-blender and blended for 30 minutes.

Manufacturing Directions

1. Pass the blend through a Fitzpatrick JT Comminutor fitted with a #0 plate (0.027 in. opening) at medium speed with the hammers forward.
2. Return the mixture to the blender and blend for an additional 30 minutes. Transfer the blend to an eight-quart Hobart Planetary Mixer (Model C-100) and mix at slow (#1) setting.
3. During mixing, wet mass the mixture by adding 50 g of hydroxypropyl cellulose solution (prepared by adding 45 g of hydroxypropyl cellulose to 405 g of warm (60°C) water with stirring). Add water (108 g), and mix the mixture for 10 minutes. Add an additional 85 g of water to the granulation to achieve the end point.
4. Continue the mixer at the slow setting for an additional 5 minutes to granulate the mass. Transfer the wet mixture to a polyethylene-lined tray and heat at 50°C in a forced air oven overnight (16 hours).
5. Pass the dried mass through a Fitzpatrick JT Comminutor fitted with a #2A plate (0.093- in. opening) at slow speed with the knives forward.
6. Transfer the granulation to an eight-quart V-blender, add flavors, and blend the flavored granulation for 30 minutes.
7. Add magnesium stearate (45 g), and blend the mixture for 5 minutes. Compress the mixture into tablets to achieve a final tablet weight of 750 mg.

AZITHROMYCIN DIHYDRATE TABLETS (600 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
630.00	1	Azithromycin dihydrate equivalent to azithromycin 600 mg	630.00
107.25	2	Dibasic calcium phosphate anhydrous, DC grade	107.25
50.00	3	Pregelatinized starch	50.00
35.00	4	Sodium croscarmellose	35.00
12.75	5	Sodium lauryl sulfate	12.75
15.00	6	Magnesium stearate	15.00
16.00	7	Hypromellose	16.00
5.00	8	Triacetin	5.00
7.00	9	Lactose	7.00
2.00	10	Titanium dioxide	2.00
—	11	Water, purified	200.00

Manufacturing Directions

1. Pass item 1 and 75% of item 5 (=9.5 g) through 0.5 mm sieve and place in a tumbler. Mix for 5 minutes.
2. Pass item 2, item 3, and 70% of item 4 (=24.5 g) through 0.5 mm sieve and add to step 1.
3. Mix the contents of step 1 for 10 minutes, using tumbler.
4. Pass 50% of item 6 (=7.5 g) through 0.250 mm sieve and add to step 3.
5. Mix the contents of step 4 for 2 minutes.
6. Slug the granules of step 5 with a suitable punch (18.0 mm, round).
7. Grind the slug into granules with 1.25 mm sieve followed by 3 mm sieve.
8. Place the granules of step 7 in a tumbler.
9. Pass the remaining quantity of item 5 and item 4 through 0.5 mm sieve and add to step 8.
10. Mix the contents of step 9 for 5 minutes.
11. Pass the remaining quantity of step 6 through 0.250 mm sieve and add to step 10.
12. Mix the contents of step 11 for 2 minutes.
13. Compress into 850 mg tablets, using a suitable punch (19.5 mm × 9.5 mm, oblong).
14. Place item 11 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
15. Add items 8 through 10 to step 14 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
16. Load core tablets from step 13 in coating pan and apply coating dispersion from step 15 to get 2.75% to 3.25% weight gain.

AZITHROMYCIN TABLETS (250 MG), ZITHROMAX

Zithromax is supplied for oral administration as film-coated, modified capsule-shaped tablets containing azithromycin dihydrate equivalent to 250 mg of azithromycin and the following inactive ingredients: dibasic calcium phosphate anhydrous, pregelatinized starch, sodium croscarmellose, magnesium stearate, sodium lauryl sulfate, hydroxypropyl methylcellulose, lactose, titanium dioxide, triacetin, and D&C Red No. 30 Aluminum Lake.

AZITHROMYCIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Azithromycin, 5% excess	262.50
22.50	2	Microcrystalline cellulose	22.50
5.00	3	Sodium carmellose	5.00
10.00	4	Starch (maize)	10.00
3.50	5	Talc	3.50
3.50	6	Magnesium stearate	3.50
3.50	7	Aerosil® 200	3.50
1.00	8	Sodium lauryl sulfate	1.00
32.50	9	Starch (maize)	32.50

Manufacturing Directions

1. Sift items 1 to 3 through a 250 μm sieve and place in a mixer.
2. Mix for 15 minutes.
3. Place item 4 in a suitable vessel, add hot item 10 (80°C), and mix. Allow to cool to room temperature.
4. Add the contents of step 3 to those of step 2, and mix to make wet mass without lumps.
5. Spread wet mass on trays and dry at 50°C for 12 hours.
6. Pass dried granules through a 20 mesh screen and transfer to a tumble mixer.
7. Add items 5 to 9 (sifted through a 250 μm sieve) and mix for 2 minutes.
8. Compress into 340 mg tablets, using 16×6 mm punches.
9. Coat tablets with HPMC methylene chloride coating. (See Appendix.)

BENAZEPRIL HYDROCHLORIDE TABLETS LOTENSIN

Lotensin is supplied as tablets containing 5, 10, 20, and 40 mg of benazepril for oral administration. The inactive ingredients are cellulose compounds, colloidal silicon dioxide, crospovidone, hydrogenated castor oil (5, 10, and 20 mg tablets), iron oxides, lactose, magnesium stearate (40 mg tablets), polysorbate 80, propylene glycol (5 and 40 mg tablets), starch, talc, and titanium dioxide.

BENAZEPRIL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Benazepril hydrochloride	20.00
32.90	2	Lactose monohydrate	32.90
5.00	3	Starch, pregelatinized	5.00
1.00	4	Silicon dioxide colloidal	1.00
2.00	5	Crospovidone	2.00
10.00	6	Microcrystalline cellulose	10.00
4.00	7	Hydrogenated castor oil	4.00
—	8	Water, purified	QS

Manufacturing Directions

1. Mill items 1 to 3 and blend together.
2. Add water to granulate the blend, screen wet granules, and oven dry.
3. Mill dried granules after mixing with items 5 to 7.
4. Screen item 4 and add to step 3; blend for 1 minute.
5. Compress.
6. Coat using HPMC 2910 3 cps (4.88 mg) and polysorbate 80 (0.119 mg) in aqueous dispersion; dust tablets with talc.

BENZAFIBRATE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Benzafibrate	200.00
84.00	2	Lactose monohydrate	84.00
25.00	3	Starch (maize)	25.00
5.800	4	Methocel E5	5.80
13.00	5	Gelatin	13.00
14.90	6	Microcrystalline cellulose (Avicel™ PH 102)	14.90
14.90	7	Primojel®	14.90
6.90	8	Talc	6.90
5.80	9	Magnesium stearate	5.80
QS	10	Water, purified, ca	80 mL

Manufacturing Directions

1. Dissolve item 5 into 50% of item 10 at 70°C to 80°C by mixing at medium speed and avoiding foam formation.
2. Cool to 50°C prior to use.
3. In a separate mixer, drymix items 1 to 4 at medium speed for 5 °minutes.
4. Add the gelatin solution from step 2 slowly to the powder mix; add more of item 10, if necessary, to achieve a satisfactory mass, avoiding big lumps.
5. Spread the granules on stainless steel trays to a 10 mm thickness, and load in the oven for drying at 55°C for 12 hours to an LOD of not more than 1%.
6. Grind the dried granules through a 1.25 mm sieve in a granulator and transfer to a double-cone blender.
7. Pass items 6 to 8 through a 250 μm sieve in a sifter, load the mixture in a double-cone blender (step 6), and blend for 5 minutes.
8. Pass item 9 through a 250 μm sieve sifter and collect in a bag. Take a small amount of granules from step 7, mix with item 9 manually, and then add the mixture to the double-cone blender in step 7.
9. Compress into 370 mg tablets, using 11 mm round, concave punches.
10. Coat the tablets with hypromellose. (See Appendix.)

BERBERINE TABLETS (5 MG)

Formulation: Berberine sulfate, 5.7 g; lactose monohydrate, 54.1 g; Ludipress®, 54.1 g; magnesium stearate, 1.2 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.

BERBERINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Berberine sulfate	5.70
54.10	2	Lactose monohydrate	54.10
54.10	3	Ludipress®	54.10
1.20	4	Magnesium stearate	1.20

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. The 6 mm biplanar tablet has an average weight of 115 mg.

BETAMETHASONE TABLETS (0.50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.50	1	Betamethasone base, 10% excess	0.55
20.00	2	Maize starch	20.00
85.90	3	Lactose monohydrate	85.95
3.00	4	Maize starch	3.00
0.50	5	Magnesium stearate	0.50
QS	6	Purified water	25.00

Manufacturing Directions

1. Pass item 2 through a 250 µm sieve, and make a homogeneous slurry in cold purified water (5 kg) to ensure it is free of lumps.
2. Add the slurry to a container with water (20 kg) at 80°C, stir until completely gelatinized, and cool to 50°C.
3. Mix item 1 gradually with item 3 and pass through a 250 µm sieve; pass item 4 through a similar sieve and mix the powders for 15 minutes.
4. Add starch paste and mix for 10 minutes; pass the wet mass through a FitzMill sieve 24205 at medium speed.
5. Dry granules at 55°C for 10 hours; do not exceed a moisture content of 2%. Pass dried granules through a 1 mm sieve into a double-cone blender.
6. Pass item 5 through a 250 µm sieve, mix with granules, and mix for 1 minute.
7. Compressed average tablet weight is 1.10 g; hardness not less than 2.0 kPa.

BETA-CAROTENE EFFERVESCENT TABLETS (7 MG)

Formulation: Lucarotin® dry powder 10% CWD (BASF), 70 g; Ludipress®, 113 g; citric acid, anhydrous, 200 g; sodium bicarbonate, 120 g; sodium carbonate, 12 g; sodium cyclamate, 20 g; aspartame, 15 g; orange flavor, 20 g; polyethylene glycol 6000, powder, 30 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium- or high-compression force at maximum 30% of relative atmospheric humidity.

BETA-CAROTENE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
7.00 mg	1	Beta-carotene; use Lucarotin® CWD (dry powder, 10%) (BASF)	70.00
113.00 mg	2	Ludipress®	113.00
200.00 mg	3	Anhydrous citric acid	200.00
120.00 mg	4	Sodium bicarbonate	120.00
12.00 mg	5	Sodium carbonate	12.00
20.00 mg	6	Sodium cyclamate	20.00
15.00 mg	7	Aspartame	15.00
20.00 mg	8	Orange flavor	20.00
30.00 mg	9	PEG-6000 (powder)	30.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with medium- or high-compression force at maximum 30% relative humidity.
3. Use 12 mm biplanar punches for 602 mg tablets.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Beta-carotene (dry powder, 10% with excess)	160.00
240.00	2	Ludipress®	240.00
175.00	3	Dicalcium phosphate, granulated with 5% Kollidon® 30	175.00
6.00	4	Kollidon® CL	6.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 400 mg tablets, using 12 mm biplanar punches.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Beta-carotene (dry powder, 10%)	150.00
175.00	3	Dicalcium phosphate, granulated with 5% Kollidon® 30	175.00
100.00	4	Avicel™ PH101	100.00
5.00	5	Kollidon® CL	5.00
2.50	6	Aerosil® 200	2.50
20.00	7	Talc	20.00
2.50	8	Calcium arachinate	2.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with a medium-compression force.
2. Compress into 502 mg tablets, using 12 mm biplanar punches.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Beta-carotene (dry powder, 10%)	220.00
250.00	2	Avicel™ PH101	250.00
20.00	3	Kollidon® CL	20.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, and press with a low-compression force.
2. Compress into 518 mg tablets, using 12 mm biplanar punches.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Beta-carotene (dry powder, 10%)	100.00
250.00	2	Ascorbic acid (crystalline) (BASF)	250.00
280.00	3	Sodium ascorbate (crystalline)	280.00
500.00	4	Vitamin E acetate (dry powder, SD 50)	500.00
600.00	5	Sorbitol (crystalline)	600.00
500.00	6	Ludipress®	500.00
350.00	7	Fructose	350.00
50.00	8	PEG-6000 (powder)	50.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with high-compression force.
2. The 20 mm biplanar tablet has an average weight of 2.6 g.

BETA-CAROTENE + VITAMIN C + VITAMIN E CHEWABLE TABLETS (10 MG + 500 MG + 250 MG)

Formulation: Beta-carotene dry powder 10%, 100 g; ascorbic acid, crystalline (BASF), 250 g; sodium ascorbate, crystalline, 280 g; Vitamin E acetate dry powder SD 50, 500 g;

(BASF) sorbitol, crystalline, 600 g; Ludipress®, 500 g; fructose, 350 g; polyethylene glycol 6000, powder, 50 g.

Manufacturing Directions

1. Mix all components, pass through a sieve and press with high-compression force at 2600 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E EFFERVESCENT TABLETS (12 MG + 150 MG + 25 MG)

Formulation: Lucarotene dry powder 10% CWD G/Y (BASF), 120 g; ascorbic acid, crystalline (BASF), 150 g; dry vitamin E acetate 50% DC (BASF), 50 g; Ludipress® LCE, 705 g; Kollidon® VA64, 50 g; citric acid, anhydrous, 450 g; sodium bicarbonate, 320 g; polyethylene glycol 6000, powder, 75 g; orange flavor (Dragoco), 50 g; aspartame (Searle), 30 g.

Manufacturing Directions

1. Mix all components, and pass through a sieve.
2. Press with high-compression force at a maximum of 30% of relative atmospheric humidity at 2.045 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E TABLETS (12 MG + 250 MG + 125 MG)

Formulation: Beta-carotene dry powder 10%, 125 g; ascorbic acid, crystalline (BASF), 125 g; sodium ascorbate, crystalline (BASF), 141 g; Vitamin E acetate dry powder SD 50, 250 g; (BASF) Ludipress® or Sorbitol, crystalline, 119 g; polyethylene glycol 6000, powder, 5 g; orange flavor (FDO), 15 g; Sodium cyclamate, 10 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with medium-compression force at 790 mg.

BETA CAROTENE + VITAMIN C + VITAMIN E TABLETS (7 MG + 60 MG + 25 MG)

Formulation: Betavit® dry powder 10% (BASF), 75 g; ascorbic acid, powder (BASF), 60 g; vitamin E acetate dry powder 50%, 50 g; sorbitol, crystalline, 240 g; Kollidon® CL, 30 g; magnesium stearate, 5 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and then press with low-compression force at 497 mg.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
12.00	1	Beta-carotene (dry powder, 10% with excess)	125.00
125.00	2	Ascorbic acid (crystalline) (BASF)	125.00
141.00	3	Sodium ascorbate (crystalline) (BASF)	141.00
250.00	4	Vitamin E acetate (dry powder, SD 50)	250.00
119.00	5	Ludipress® or sorbitol (crystalline)	119.00
5.00	6	PEG-6000 (powder)	5.00
15.00	7	Orange flavor (FDO)	15.00
10.00	8	Sodium cyclamate	10.00

Manufacturing Directions

1. Mix all components, and pass through a sieve.
2. Press with medium-compression force.
3. Compress into 790 mg tablets, using 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
6.00	1	Beta-carotene; use Betavit® (dry powder, 10% with excess) (BASF)	65.00
100.00	2	Ascorbic acid (powder) (BASF)	100.00
60.00	3	Vitamin E acetate (dry powder, 50%)	60.00
369.00	4	Ludipress®	369.00
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Press with medium- or high-compression force.
3. Compress into 790 mg tablets, using 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
6.00	1	Beta-carotene; use Betavit® (dry powder, 10% with excess) (BASF)	65.00
100.00	2	Ascorbic acid (powder) (BASF)	100.00
60.00	3	Vitamin E acetate (dry powder, 50%)	60.00
233.00	4	Sorbitol (crystalline) (Merck)	233.00
30.00	5	Kollidon® VA 64	30.00
8.00	6	Kollidon® CL	8.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with medium- or high-compression force.
3. Compress into 502 mg tablets, using 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
7.00	1	Beta-carotene; use Betavit® (dry powder, 10% with excess) (BASF)	75.00
60.00	2	Ascorbic acid (powder) (BASF)	60.00
50.00	3	Vitamin E acetate (dry powder, 50%)	50.00
240.00	4	Sorbitol (crystalline)	240.00
30.00	5	Kollidon® CL	30.00
5.00	6	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve and mix.
2. Press with low-compression force.
3. A colorant pigment should be added to obtain a homogeneous appearance of tablets.
4. Use 12 mm biplanar punches for 497 mg tablets.

BIRB 796 TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	BIRB 796	100.00
200.00	2	β-cyclodextrin	200.00
225.00	3	Microcrystalline cellulose	225.00
165.00	4	Lactose	165.00
7.50	5	Colloidal silicon dioxide	7.50
30.00	6	Starch, pregelatinized	30.00
15.00	7	Sodium starch glycolate	15.00
7.50	8	Magnesium stearate	7.50

Note: Item 2 can be replaced with item 4 (a total of 365 mg of lactose).

Manufacturing Directions

1. Load items 1 to 7 in a suitable mixer after passing through a 250 µm sieve; mix for 10 minutes.
2. Add item 8 and blend for 3 minutes.
3. Compress into 750 mg tablets, using a 15 mm biplanar punch.

BISACODYL DELAYED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
05.00	1	Bisacodyl	5.00
20.00	2	Cellulose (microcrystalline) (Avicel™ PH102)	20.00
45.27	3	Lactose (spray dried)[a]	45.27
04.00	4	Maize starch (dried)[b]	4.00
00.73	5	Magnesium stearate	0.73

[a] Particle size distribution: minimum, 98% 250 µm, 30% to 60% 100 µm; maximum 15% 45 µm.

[b] LOD NMT 4.5%, when dried at 120°C for 4 hours.

Manufacturing Directions

Handle bisacodyl carefully; it can cause itching if it comes into contact with skin. Overmixing of lubricants reduces the hardness. Check the temperature and relative humidity of the room before beginning processing. Limit relative humidity to 50% to 60% and temperature to 27°C to 30°C.

1. Mix items 1 and 2 in a stainless steel drum for 2 to 3 minutes.
2. Pass the mixed powder through a 500 µm sieve using sifter.
3. Collect in stainless steel drum.
4. Pass item 3 through a 500 µm sieve using sifter.
5. Collect in stainless steel drum.

6. Load the sieved material into the drum mixer, and mix for 5 minutes.
7. Mix items 4 and 5 in a polyethylene bag for 1 minute.
8. Pass the mix through a 250 μm sieve.
9. Collect in a polyethylene bag.
10. Add 3 to 5 g powder to it, and mix for 1 minute.
11. Add this mixture, and mix for 1 minute in a drum blender.
12. Check the moisture content (limit: 1.0–1.5%).
13. Compress the granules using a rotary tableting machine; 6 mm biconvex tablets have an average weight of 750 mg and hardness of 4 to 5 kPa.
14. Apply enteric coating.

BISMUTH SUBSALICYLATE AND CALCIUM CARBONATE TABLETS

Formulation: Bismuth subsalicylate, 262.5 mg; microcrystalline cellulose, NF, 213.3 mg; calcium carbonate, 67.5 mg; mannitol, 67.5 mg; sodium starch glycolate, 40.5 mg; polyvinyl pyrrolidone, 13.5 mg; magnesium stearate, 5.4 mg; polysorbate 80, 3.4 mg; silica, 0.7 mg; dye, 0.7 mg. Total 675.0 mg.

Manufacturing Directions

1. The ingredients are added to a mixer or granulator in the following order: part of microcrystalline cellulose, calcium carbonate, part of sodium starch glycolate, polysorbate 80, dye, and bismuth subsalicylate.
2. After adding bismuth subsalicylate and mixing at high shear, the mixture is dried at 86°C to less than 2% moisture.
3. Additional powders (microcrystalline cellulose, sodium starch glycolate, mannitol, and polyvinyl pyrrolidone) are added, and granules are formed by spraying water (approximately 10% by weight of the composition) onto the mixture under high shear.
4. After additional drying to less than 3% moisture, silica (glidant) and magnesium stearate (lubricant) are added and mixed for about 1 minute.
5. Caplets are then formed on a rotary tablet press.

BISMUTH SUBSALICYLATE SWALLOW TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
262.50	1	Bismuth subsalicylate	262.50
213.30	2	Microcrystalline cellulose	213.30
67.50	3	Calcium carbonate	67.50
67.50	4	Mannitol	67.50
40.50	5	Sodium starch glycolate	40.50
13.50	6	Polyvinylpyrrolidone	13.50
5.40	7	Magnesium stearate	5.40
3.40	8	Polysorbate 80	3.40
0.70	9	Silica	0.70
0.70	10	Dye	0.70

Manufacturing Directions

1. Mix the ingredients in a mixer in the following order: part of microcrystalline cellulose, calcium carbonate, part of sodium starch glycolate, polysorbate 80, dye, and bismuth subsalicylate.
2. After adding bismuth subsalicylate and mixing at high shear, dry the mixture at 86°C to less than 2% moisture.
3. Add additional powders (microcrystalline cellulose, sodium starch glycolate, mannitol, and polyvinylpyrrolidone), and form granules by spraying water (approximately 10% by weight of the composition) onto the mixture under high shear.
4. After additional drying to less than 3% moisture, add silica (glidant) and magnesium stearate (lubricant) and mix for about 1 minute.
5. Form caplets on a rotary tablet press.

BISOPROLOL FUMARATE AND HYDROCHLOROTHIAZIDE TABLETS

Each bisoprolol fumarate HCTZ 2.5 mg/6.25 mg tablet for oral administration contains bisoprolol fumarate 2.5 mg and hydrochlorothiazide 6.25 mg. Each bisoprolol fumarate HCTZ 5 mg/6.25 mg tablet for oral administration contains bisoprolol fumarate 5 mg and hydrochlorothiazide 6.25 mg. Each bisoprolol fumarate HCTZ 10 mg/6.25 mg tablet for oral administration contains bisoprolol fumarate 10 mg and hydrochlorothiazide 6.25 mg. Inactive ingredients include colloidal silicon dioxide, cornstarch, dibasic calcium phosphate, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, and titanium dioxide. The 5 mg/6.25 mg tablet also contains red and yellow iron oxide. The 2.5 mg/6.25 mg tablet also contains crospovidone, pregelatinized starch, and yellow iron oxide.

BRAN SUCROSE GELATIN CALCIUM CARBONATE TABLETS

Manufacturing Directions

1. Prepare gelatin-sucrose syrup by placing the following ingredients in a mixing kettle equipped with a heater and agitator: distilled water, 24,000.0 g; gelatin, 3,000.0 g; sucrose, granular, 31,995.0 g.
2. Heat the mixture up to about 150°F with agitation until solution is effected, and the gelatin-sucrose syrup is then slowly stirred and held at a temperature of about 150°F until needed.
3. Comminute wheat bran in a Schutz-O'Neill Airswept Pulverizer to provide a particle size whereby a minimum of 94% passes through a United States Standard 20 mesh screen and a maximum of 60% passes through a United States Standard 80 mesh screen. (The required amount of bran for the batch is calculated by the following formula: 44250 g × 100/(100 – percent moisture in bran).)

4. After pulverizing, transfer the bran to a heavy-duty double sigma arm mixer and mix with 1500 g of calcium carbonate, and add the previously prepared gelatin-sucrose syrup rapidly thereto with stirring.
5. When the bran appears to be damp, stir the mixture for a 30 minute period and then stop.
6. Add powdered sucrose (16,600.0 g) and agitate the mixture for an additional 2 to 5 minutes.
7. Discharge the wet mix through an Ambrette screw extruder and spread the extrudate on drying trays and dry in an oven at 225°F to 3% moisture content.
8. Granulate the dried extrudate ing a FitzMill (2A plate) and then press into 1 g tablets by a conventional tableting machine.

BRAN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Bran wheat (milled <1 mm)	250.00
200.00	2	Ludipress®	200.00
5.00	3	Kollidon® 30	5.00
4.00	4	Aerosil® 200	4.00
4.00	5	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with medium-compression force.
2. If the bran is not milled, the hardness of the tablet is higher, but the content uniformity is lower.
3. Compress into 477 mg tablets, using 12 mm punches.

BROMHEXINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
8.00	1	Bromhexine HCl	8.00
78.00	2	Lactose monohydrate	78.00
30.40	3	Cornstarch	30.40
3.00	4	Gelatin (powder)	3.00
QS	5	Purified water	12.00
0.60	6	Magnesium stearate	0.60

Manufacturing Directions

Note: The binding solution is susceptible to microbiological growth, and so prepare the solution immediately before the granulation process. Protect bromhexine HCl from light.

1. Make slurry in a separate container by dissolving item 4 in hot item 5 (70–80°C).
2. Mix for 10 minutes using stirrer at medium speed.
3. Pass items 2, 1, and 3 through a 630 µm sieve using a sifter.
4. Load the sieved material into the mixer.
5. Mix, using mixer and chopper, for 5 minutes at high speed. Add binding solution to the dry powders in the mixer while mixing at low speed.
6. After the addition is complete, mix for an additional 4 minutes at low speed or until a satisfactory mass is obtained.
7. Spread the wet granules onto the trays.
8. Load the trolleys into the drying oven.
9. Dry the granules at 60°C for 10 hours.
10. Turn the granules after 4 hours of drying in order to obtain uniform drying.
11. Transfer the dried granules into stainless steel drums.
12. Check moisture content (limit: NMT 2.0%).
13. Pass the dried granules through first a 1.5 mm and then a 1.0 mm sieve using a granulator. Collect in stainless steel drums.
14. Load the granules into the blender.
15. Pass item 6 through a 250 µm sieve using a sifter, and add to the granules in blender; blend for 2 minutes.
16. Compress the granules using a rotary tableting machine.
17. Use a 7 mm flat, beveled edge punch to compress 1.20 g per tablet at a hardness of not less than (NLT) 3.0 kPa.

BROMAZEPAM TABLETS (3 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
3.00	1	Bromazepam	3.00
0.23	2	Aluminum lake erythrosine (19.4%)[a]	0.23
1.80	3	Talc	1.80
100.00	4	Microcrystalline cellulose (Avicel™ PH 102)	100.00
94.37	5	Lactose crystalline	94.37
0.60	6	Magnesium stearate	0.60

[a] If a different dye is used, adjust the weight with lactose crystalline (item 5).

Manufacturing Directions

1. Place item 1 and 3% of item 5 in a mixer and mix for 10 minutes.
2. Pass the mixture through an oscillating granulator with a 0.5 mm screen.

3. Rinse the oscillator with 2% of item 5 and add it to the mixture in step 2.
4. In a separate mixer, add item 2 (if used), item 3, and 5% of item 4, and then mix for 3 minutes.
5. Pass the mixture in step 4 through a mill at medium speed.
6. Transfer the mixture in steps 5 and 3 into an oscillating granulator, add the balance of item 5, add item 3, pass through a 0.5 mm sieve, and then mix for 1 hour.
7. Transfer the mixture to a blender, add item 6, and blend for 30 minutes.
8. Compress at 4 to 5 ton pressure into 200 mg tablets, using 9 mm × 2.5 mm cylindrical biplanar punches.

BROMHEXINE TABLETS (8 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
8.00	1	Bromhexine hydrochloride	8.00
78.00	2	Lactose monohydrate	78.00
30.40	3	Starch (maize)	30.40
3.00	4	Gelatin	3.00
—	5	Water, purified, ca	120 mL
0.60	6	Magnesium stearate	0.60

Manufacturing Directions

1. Place item 4 in a suitable vessel, add item 5 at 70°C to 80°C to dissolve item 4, and mix for 10 minutes.
2. Place items 1 to 3 in a suitable container after passing them through a 630 µm sieve. Mix and chop for 5 minutes.
3. Add binding solution from step 1 to the mixer in step 2, and mix for 5 minutes at high speed and then slow speed until a suitable mass is obtained (add more of item 5 if needed).
4. Spread the wet mass on trays and dry at 60°C for10 hours, turning granules over every 4 hours until not more than 2% moisture remains.
5. Pass the dried granules through a 1.5 mm sieve and then a 1.0 mm sieve.
6. Pass item 6 through a 250 µm sieve, add to step 5, and blend for 2 minutes.
7. Compress into 120 mg tablets, using 7 mm flat punches.

BROMOCRIPTINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
6.00	1	Bromocriptine mesylate, with excess	6.10
205.50	2	Ludipress®	205.50
2.20	3	Magnesium stearate	2.20

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force.
2. Compress to 214 mg tablets, using 9 mm biconvex punches.

BUFLOMEDIL HYDROCHLORIDE TABLETS (150 MG/300 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
300.00	1	Buflomedil hydrochloride	300.00
74.00	2	Lactose	74.00
14.00	3	Povidone K 29–32	14.00
2.00	4	Magnesium stearate	2.00
QS	5	Water, purified	55.00 mL

Note: For 150 mg strength, adjust all components proportionally.

Manufacturing Directions

1. Granulation
   a. Dissolve povidone in purified water, using a glass or stainless steel vessel.
   b. Pass through a 500 µm aperture screen and add buflomedil hydrochloride and lactose. Load into a suitable planetary or ribbon mixer. Mix at 15 to 30 rpm for 10 minutes.
   c. Granulate the mixed powders with povidone solution, adding 20 mL aliquots every 2 to 3 minutes, with a mixer speed of 30 rpm.
   d. Stop the mixer and inspect the mass. Additional purified water may be added to complete the granulation.
   e. Pass the wet mass through a suitable granulator fitted with a 2000 µm aperture stainless steel screen. Collect granules on paper-lined trays and spread out evenly, 1/2 to 1 in. (1–2.5 cm) deep.
   f. Dry the granules in a hot air oven at 40°C for 3 hours or until the LOD is between 0.7 and 2.8%.

2. Lubrication
   a. Pass the dry granules through a 100 µm aperture stainless steel screen and load into a cone or ribbon blender.
   b. Mix the magnesium stearate with one scoopful of granules from the previous step and add to the bulk. Blend for 10 minutes at 20 to 30 rpm, and empty the blender into polyethylene-lined drums for compression.
3. Compression: The tablet can be compressed using 9.5 mm or 11.11 mm punches: 385.40 mg per tablet. The weight of a 150 mg tablet is 246 mg.
4. Coating: Use a clear CAP/Carbowax coating to control the release of the active ingredient. (See Appendix.)

BUFLOMEDIL HYDROCHLORIDE TABLETS (600 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Buflomedil hydrochloride	600.00
160.00	2	Sodium calcium alginate (Kelset)	160.00
30.00	3	Povidone K 29–32	30.00
QS	4	Water, purified, ca	300 mL
4.35	5	Magnesium stearate	4.35

Manufacturing Directions

Caution: Wear a face mask and rubber gloves. When wet, alginate materials result in slippery surfaces—exercise care.

1. Granulation (standard method using planetary or horizontal mixer). (*Note:* Temperature of the water used should not exceed 30°C, so cool it if necessary.)
   a. Pass any agglomerated materials through a 375 µm screen.
   b. Load buflomedil, sodium alginate, sodium calcium alginate, and povidone into suitable mixing equipment. Blend for 10 minutes. Add while mixing 250 mL water over a period of 5 to 10 minutes and then mix for 5 minutes. Add additional water in small portions with mixing, until granulation is complete. Record the amount of water added. Stop mixing and allow the mixture to stand for approximately 5 minutes. (The granulation end point occurs when the mass is of a slightly wet but crumbly consistency. Avoid overwetting. The quantity of water and the mixing time must be sufficient to dissolve the povidone.)
   c. Load granules onto paper-lined oven trays, and dry at 50°C until the LOD is 3% to 5% (IR balance or similar at 100°C for 15 minutes). The drying time is 5 to 8 hours depending on tray loading. Should the LOD be above 5% at the completion of the drying period, increase the temperature of the drying oven to 60°C and continue until the LOD is satisfactory. It is important that you do not increase the temperature until the initial drying period is complete.
   d. After drying, screen granules through an 840 µm screen fitted on the oscillating granulator. Pack into tightly sealed polyethylene-lined drums and store in an air-conditioned area.
2. Lubrication
   a. Blend magnesium stearate with a portion of granules and then screen through a 600 µm screen fitted to the oscillating granulator. Incorporate the remaining granules by serial dilution, mixing between additions. Do not overblend.
3. Compression: Compress into oval-shaped tablets.
4. Coating: Coat using Methocel coatings. (See Appendix.)

BUPROPION HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Bupropion hydrochloride	150.00
9.00	2	Kollidon® 90F	9.00
171.00	3	Purified water	171.00
3.20	4	Stearic acid	3.20

Manufacturing Directions

1. First, dissolve povidone in water.
2. Place bupropion hydrochloride in the top spraying chamber of Glatt GPCG1 fluidized-bed apparatus. Spray the solution of povidone onto the active ingredient, with the following parameters: Air flow = 100–110 m^3/h, liquid flow = 6–7 g/min, inlet temperature = 65°C, and spraying pressure = 2.8 bar.
3. Once the granulation is completed, pass granules through a sieve (1 mm mesh), and weigh, add, and blend stearic acid in a drum mixer (Turbula T2C, Bachofen, Switzerland). Press the resulting mixture into tablets (7 mm diameter and 7 mm curvature) with average hardness being between 60 and 120 N.
4. Coat the tablet cores (step 3) with the following formulation: tablet cores (step 3) 162.20 mg, Ethocel PR100 (ethyl cellulose) 7.05 mg, Kollidon® 90F (povidone USP) 7.05 mg, PEG 1450 2.10 mg, denatured alcohol 210.00 mg to give total dry weight of 178.40 mg.
5. Ethocel, povidone, and PEG 1450 are first dissolved in denatured alcohol. The coating solution is then sprayed onto the tablet cores in a coating pan (Vector LCDS), with the following spraying parameters: air flow = 100–110 m^3/h, liquid flow = 6–7 g/min, inlet temperature = 65°C, and spraying pressure = 2.8 bar.

BUPROPION HYDROCHLORIDE TABLETS, WELLBUTRIN

Immediate-release tablets—Wellbutrin is supplied for oral administration as 75 mg (yellow-gold) and 100 mg (red) film-coated tablets. Each tablet contains the labeled amount of bupropion HCl and the following inactive ingredients: (a) 75 mg tablet—D&C Yellow No. 10 Lake, FD&C Yellow No. 6 Lake, hydroxypropyl cellulose, hydroxypropyl methylcellulose, microcrystalline cellulose, polyethylene glycol, talc, and titanium dioxide. (b) 100 mg tablet—FD&C Red No. 40 Lake, FD&C Yellow No. 6 Lake, hydroxypropyl cellulose, hydroxypropyl methylcellulose, microcrystalline cellulose, polyethylene glycol, talc, and titanium dioxide.

Sustained-release tablets—(a) Wellbutrin SR: Wellbutrin SR tablets are supplied for oral administration as 100 mg (blue) and 150 mg (purple), film-coated, sustained-release tablets. Each tablet contains the labeled amount of bupropion HCl and the following inactive ingredients: carnauba wax, cysteine hydrochloride, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, and titanium dioxide and is printed with edible black ink. In addition, the 100 mg tablet contains FD&C Blue No. 1 Lake and polysorbate 80; the 150 mg tablet contains FD&C Blue No. 2 Lake, FD&C Red No. 40 Lake, and polysorbate 80. (b) Zyban: Zyban (bupropion HCl for smoking cessation) is supplied for oral administration as 150 mg (purple), film-coated, sustained-release tablets. Each tablet contains the labeled amount of bupropion HCl and the following inactive ingredients: carnauba wax, cysteine HCl, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, and titanium dioxide and is printed with edible black ink. In addition, the 150 mg tablet contains FD&C Blue No. 2 Lake and FD&C Red No. 40 Lake.

BUPROPION HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Bupropion hydrochloride	100.00
68.50	2	Microcrystalline cellulose	68.50
6.90	3	Sodium starch glycolate	6.90
3.80	4	L-Cysteine hydrochloride	3.80
17.30	5	Talc	17.30
0.20	6	Silicon dioxide colloidal	0.20
—	7	Water, purified	8.00
—	8	Alcohol SD3A anhydrous	24.00

Manufacturing Directions

1. Sift bupropion hydrochloride, microcrystalline cellulose, and sodium starch glycolate through a 30 mesh Russell-Finex sifter.
2. Blend the sifted items in 1 for 15 minutes in a slant-cone blender.
3. In a separate container, dissolve cysteine hydrochloride in purified water.
4. Add item 8 to step 3 and mix thoroughly.
5. Add to step 1 in a granulating vessel: make a wet mass, and dry granules in a fluid-bed dryer until the LOD is between 1% and 2%.
6. Sift dried granule through a 20 mesh Russell-Finex sifter.
7. Sift items 4 and 6 and blend with step 6.
8. Compress into 172.6 mg tablets, using round 7.8 mm punches.

BUPROPION TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Bupropion hydrochloride uncoated	100.00
121.30	2	Pharmatose DCL	121.30
15.00	3	Methocel A4M	15.00
121.30	4	Pharmatose DCL21	121.30
27.00	5	Talc	27.00
0.70	6	Magnesium stearate	0.70
85.00	7	Kollidon® SR	85.00

Manufacturing Directions

1. Mix, granulate, and compress into 334.00 mg tablets.

BUSPIRONE FAST-MELT TABLETS

Formulations: Mix buspirone, 8%; sodium bicarbonate, 25%; citric acid anhydrous, 25%; Avicel™ PH113, 12%; anhydrous lactose, 17%; xylitol, 11%; Crodesta F160, 2%.

Manufacturing Directions

1. Dry all ingredients at 40°C to 60°C to significantly reduce the moisture content of each material.
2. Blend for 10 minutes and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
3. Mix BUS-EGF (20–80 mesh) 50%, microcrystalline cellulose (Avicel™ PH113) 31%, mannitol (Mannogen 3215) 10%, Ac-Di-Sol 5%, aspartame 3%, redberry flavor 0.4%, magnesium stearate 0.5, and fumed silicon dioxide 0.1%.

4. Screen and blend for 5 minutes prior to compression.
5. Compress buspirone tablets to a hardness of approximately 1–3 kPa. Tablets should disintegrate in water in approximately 15–35 seconds.

BUSPIRONE HYDROCHLORIDE TABLETS, BUSPAR

Buspar is supplied for oral administration in 5 mg and 10 mg, white, ovoid-rectangular, scored tablets. Buspar tablets, 5 mg and 10 mg, contain the following inactive ingredients: colloidal silicon dioxide, lactose, magnesium stearate, microcrystalline cellulose, and sodium starch glycolate.

BUSPIRONE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Buspirone hydrochloride	15.00
7.00	2	Polyvinylpyrrolidone	7.00
1.50	3	Silicon dioxide	1.50
150.00	4	Lactose	150.00
1.50	5	Glyceryl behenate	1.50
	6	Water QS	

Manufacturing Directions

1. Place buspirone and lactose in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend glyceryl behenate in a drum mixer.
4. Press the resulting mixture 175 mg tablets.
5. Coat these tablet cores with the following formulation: ethyl cellulose 10.00, hydroxypropyl cellulose 10.00, stearic acid 2.00, and alcohol 188.00 g.
6. Dissolve ethocel, povidone, and stearic acid in denatured alcohol (188 g). Spray the coating solution onto the tablet cores in a coating pan.

BUSPIRONE HYDROCHLORIDE TABLETS, CONTROLLED-RELEASE (30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Buspirone hydrochloride	30.00
120.00	2	Polyvinyl chloride	120.00
11.00	3	Polyvinyl acetate C10-V7	11.00
1.60	4	Magnesium stearate	1.60
—	5	Alcohol	QS

Manufacturing Directions

1. Dry mix buspirone hydrochloride with polyvinyl chloride.
2. Granulate the powder mixture with a solution of polyvinyl acetate in ethanol.
3. Mill dried granules and compress into 7 mm round tablets (162.60 mg).

CARBENOXOLONE TABLETS

Formulations: Carbenoxolone sodium, 20 mg; mannitol, 400 mg; alginic acid, 200 mg; sodium alginate, 200 mg; aluminum hydroxide, dried gel, 80 mg; sodium bicarbonate, 70 mg; magnesium trisilicate, 20 mg; magnesium stearate, 12 mg; gum acacia, 35 mg; peppermint oil, 2 mg. Total 1039 mg.

CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Caffeine powder	150.00
36.00	2	Cellulose (microcrystalline) (Avicel™ PH-102)	36.00
46.00	3	Anhydrous lactose	46.00
48.50	4	Di-Pac granular	48.50
3.00	5	Croscarmellose sodium (Ac-Di-Sol SD-711)	3.00
1.50	6	Fumed silica	1.50
0.75	7	Stearic acid	0.75
0.75	8	Magnesium stearate	0.75
1.20	9	Flavor	1.20

Manufacturing Directions

1. Screen items 1,7, and 8 separately through a 40 mesh sieve.
2. Blend items 1 to 6 and 9 in a V-shaped blender, and mix for 3 minutes.
3. Add item 8 to the blender and mix for another 5 minutes.
4. Compress, using 7 kg pressure and 3/8 in., flat, beveled-edge punches to produce tablets with an average weight of 311 mg.

CALCIUM AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Anhydrous calcium phosphate (dibasic)	500.00
133 IU	2	Vitamin D (as vitamin D3) (3.33 µg/tablet)	3.33 mg
15.00	3	Starch (pregelatinized, NF)	15.00
55.00	4	Cellulose (microcrystalline, NF)	55.00
6.00	5	Magnesium stearate, NF	6.00
5.00	6	Talc (powder), USP	5.00
12.00	7	Wax (hydrogenated vegetable oil) (Sterotex K)	12.00
15.50	8	Sodium starch glycolate, NF	15.50

Manufacturing Directions

1. Pass one half of the dibasic calcium phosphate through a mesh screen into a blender.
2. Premix by hand the pregelatinized starch with vitamin D3 beadlets in a suitable container, and sift through a mesh screen into the blender.
3. Pass the microcrystalline cellulose and the remaining calcium phosphate through a mesh screen into the blender.
4. Mix for 20 minutes.
5. Discharge approximately one-third of the granulation into polyethylene-lined drums.
6. Mix the magnesium stearate, talc, hydrogenated vegetable oil wax, and sodium starch glycolate.
7. Mill through a 40 mesh screen into the blender.
8. Return granulation from step 5 to the blender. Blend together.
9. Compress.

CALCIUM CARBONATE AND GLYCINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Calcium carbonate (precipitated)	400.00
200.00	2	Glycine (aminoacetic acid)	200.00
QS	3	Starch	QS
6.50	4	Mineral oil (light)	6.50
QS	5	Purified water	QS

Manufacturing Directions

1. Add starch to a planetary mixer, and add 10 times the quantity of purified water.
2. Heat to boil with constant stirring until a thick, translucent white paste is formed. Use this paste in granulation.
3. Place calcium carbonate and glycine in a sigma-blade or a planetary mixer, and mix for 10 minutes.
4. Granulate this powder with the starch paste until a suitable mass is obtained.
5. Force the wet mass through a 12 mesh screen onto dryer trays.
6. Dry in an air-forced oven at 130°F to 140°F or in a fluid-bed dryer.
7. Pass the dried granules through a 12 mesh screen, then through an 18 mesh screen.
8. Pass the granules over a 30 mesh screen, remove the portion passing through the screen, and regranulate.
9. Place the particles retained on 30 mesh screen in a tumble mixer, add mineral oil, and mix for 8 minutes.
10. Compress into 640 mg tablets, using 7/16 in. punches.

CALCIUM CARBONATE AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Calcium (elemental); use calcium carbonate (90%) for direct compression	1665.00
0.235	2	Vitamin D3 (200.00 IU); use vitamin D3 beadlets	0.282
4.16	3	Magnesium stearate	4.16
83.25	4	Sodium starch glycolate	83.25

Manufacturing Directions

1. Make a premix of vitamin D3 successively in three portions of calcium carbonate (total amount equivalent to ~3% of total calcium carbonate), using geometric dilution.
2. Mix for 10 minutes each time (total time: 30 minutes).
3. Add the premix to the sodium starch glycolate. Mix for 10 minutes.
4. Set the blend aside, protected from light, until the next step.
5. Pass the magnesium stearate through a 420 µm aperture screen, if required, and blend it with another portion of calcium carbonate (~10% of total calcium carbonate).
6. Mix for 5 minutes. Set aside.
7. Add the blended material to the balance of the calcium carbonate. Mix for 10 minutes.

8. Add the premix to blend from above. Mix for 5 minutes.
9. Compress on specially shaped, 0.8100 × 0.3700 in., ovaloid, bisected punches with a monogram on one side.
10. Theoretical weight of 10 tablets = 17.527 g.
11. Coat using one of the HPMC formulae (see Appendix).

CALCIUM CARBONATE CHEWABLE TABLETS

Formulations: Granulated calcium carbonate (93.3% calcium carbonate, 6.3% glucose, and 0.4% gelatin), 42.87%; magnesium stearate, 2.50%; colored speckles, 0.75%; flavorants, 0.78%; MPD (3(1-menthoxy) propane-1,2-diol), 0.07%; WS-3 (methyl-*p*-menthane-3-carboxamide), 0.05%; aspartame, 0.198%; sodium saccharin, 0.102%; mannitol, QS.

Manufacturing Directions

1. Dry blend the ingredients in a mixer until homogeneous and then, direct compress in a tableting machine to approximately 8.5 Strong Cobb units hardness to produce chewable antacid tablets each weighing 1.25 g (500 mg calcium carbonate per tablet).
2. These tablets may also be prepared by using granulated calcium carbonate, which is a 50/50 coblend of calcium carbonate/mannitol.

CALCIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Calcium carbonate (precipitated)	500.00
65.00	2	Kollidon® 30	65.00
97.00	3	Water	97.00
32.00	4	Kollidon® CL	32.00
53.00	5	Ludipress®	53.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with the water (item 3).
2. Pass through a 0.8 mm sieve, mix the dry granules with items 4 and 5, and press with low-compression force.
3. Fill 656 mg into 12 mm planar punches.

CALCIUM CHEWABLE TABLETS (200 MG CA)

Formulation: Calcium gluconate (Merck), 845.0 g; calcium citrate (Merck), 500.0 g; Ludipress® LCE, 297.5 g; citric acid anhydrous, fine granular, 100.0 g; polyethylene glycol 6000, powder, 80.0 g; orange flavor (Dragoco), 30.0 g; Aerosil® 200, 17.0 g; aspartame, potassium (Searle), 5.0 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force at 2417 mg.

CALCIUM D-PANTOTHENATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Calcium D-pantothenate (BASF)	610.00
150.00	2	Sorbitol (crystalline)	150.00
140.00	3	Avicel™ PH101	140.00
30.00	4	Kollidon® CL	30.00
50.00	5	PEG-6000 (powder)	50.00
QS	6	Flavors	QS

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force.
2. Compress into 987 mg tablets, using 12 mm biplanar punches.
3. Kollidon® CL may be omitted and the tablet weight adjusted.

CALCIUM D-PANTOTHENATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Calcium D-pantothenate (BASF)	100.00
150.00	2	Ludipress®	150.00
10.00	3	Kollidon®	10.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve.
2. Press into 252 mg tablets using medium-compression force and biplanar 8 mm punches.

CALCIUM D-PANTOTHENATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
280.00	1	Calcium D-pantothenate (BASF)	285.00
50.00	2	Avicel™ PH101	50.00
150.00	3	Dibasic calcium phosphate	150.00
20.00	4	Kollidon® CL	20.00
3.00	5	Stearic acid	3.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Press into 518 mg tablets using medium-compression force and 12 mm biplanar punches.

CALCIUM EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
634.00	1	Calcium lactate	634.00
610.00	2	Calcium gluconate	610.00
185.21	3	Calcium carbonate	185.21
400.00	4	Sodium bicarbonate	400.00
468.25	5	Tartaric acid	468.25
46.25	6	Povidone (Kollidon® 30)	46.25
11.75	7	Povidone (Kollidon® 30)	11.75
QS	8	Isopropyl or ethyl alcohol (96%)	QS
97.50	9	Crospovidone (Kollidon® CL)	97.50
46.25	10	PEG-6000	46.25
QS	11	Flavor	QS

Manufacturing Directions

1. Granulate items 1 to 6 in a solution of items 7 and 8.
2. Dry, sieve, and mix well with items 9 to 11.
3. Compress at low pressure to form 2.5 g tablets, 20 mm in diameter.

CALCIUM GLUCONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
350.00	1	Calcium gluconate (powder)	360.00
117.00	2	Lactose monohydrate	117.00
11.00	3	Kollidon® 30	11.00
QS	4	Isopropanol	90.00
25.00	5	Kollidon® CL	25.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with item 4.
2. Dry, pass through a 0.8 mm sieve, and mix with items 5 and 6.
3. Press into 500 mg tablets using high-compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Calcium glycerophosphate	500.00
117.50	2	Cornstarch	117.50
15.00	3	Kollidon® 90F	15.00
60.00	4	Water	60.00
15.00	5	Kollidon® CL	15.00
2.50	6	Magnesium stearate	2.50

Manufacturing Directions

1. Granulate items 1 to 3 with item 4; dry, sieve, and mix with items 5 and 6.
2. Press into 650 mg tablets using medium- to high-compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Calcium glycerophosphate	200.00
297.50	2	Ludipress®	297.50
2.50	3	Magnesium stearate	2.50
QS	4	Aerosil® 200	QS

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Press into 470 mg tablets using high-compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS (200 MG)

Formulation: Calcium glycerophosphate, 200.0 g; Ludipress®, 297.5 g; magnesium stearate, 2.5 g; Aerosil® 200, QS.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force at 470 mg.

CALCIUM PHOSPHATE TABLETS FOR CATS AND DOGS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Dicalcium phosphate	400.00
100.00	2	Wheaten flour	100.00
1.00	3	Citric acid crystalline	1.00
262.00	4	Lactose monohydrate	262.00
QS	5	Flavors	QS
30.00	6	Kollidon® 30F	30.00
150.00	7	Water	150.00 mL
4.00	8	Magnesium stearate	4.00

Manufacturing Directions

1. Granulate items 1 to 6 in item 7, dry, add item 8, and pass through a 0.8 mm sieve.
2. Compress 800 mg tablets, using 12 mm biplanar punches.

CALCIUM PHOSPHATE TABLETS FOR CATS AND DOGS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Dicalcium phosphate	400.00
100.00	2	Wheaten flour	100.00
1.00	3	Citric acid crystalline	1.00
272.00	4	Lactose monohydrate	272.00
QS	5	Flavors	QS
20.00	6	Kollidon® 90F	20.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Press with medium- to high-compression force (20 kN).
3. Compress into 800 mg tablets, using 12 mm biplanar punches.

CAPTOPRIL TABLETS (25 MG), CAPOTEN

Capoten is available in potencies of 12.5, 25, 50, and 100 mg as scored tablets for oral administration. Inactive ingredients include microcrystalline cellulose, cornstarch, lactose, and stearic acid.

CAPTOPRIL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Captopril	25.00
91.00	2	Ludipress®	91.00
2.00	3	Kollidon® CL	2.00
2.00	4	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force to meet the following specifications.
2. Compress into 122 mg tablets, using 8 mm biplanar punches.

CARBAMAZEPINE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.000	1	Carbamazepine	208.00
25.880	2	Microcrystalline cellulose (Avicel PH 101)	25.880
9.000	3	Croscarmellose sodium (Ac-Di-Sol)	9.000
1.520	4	Carboxymethyl cellulose sodium (CMC sodium)	1.520
1.500	5	Poloxyl 40 stearate	1.500
0.500	6	Colloidal silicon dioxide (Aerosil® 200)	0.500
6.000	7	Sodium starch glycolate (Primojel®)	6.000
7.000	8	Croscarmellose sodium (Ac-Di-Sol)	7.000
0.600	9	Magnesium stearate	0.600
—	10	Purified water	104.000

Carbamazepine 8.0 mg/tablet added to compensate the assay (98.0–102.0%) and LOD of the material.

Manufacturing Directions

Note: Avoid overmixing lubricants; otherwise, hardness is reduced. *Critical note:* Hardness is critical for this product. Increasing or decreasing hardness from the specified limit will affect the dissolution.

1. Sieving and dry mixing: Sift items 1 to 3 through a 630 µm stainless steel sieve in the sifter. Load into the mixer. Mix for 5 minutes at low speed.
2. Preparation of the binder: Dissolve item 5 in 104 g of item 10 ((55–65°C). Cool to 30°C. Dissolve item 4 while stirring with a stirrer. Check the weight (theoretical weight: 107.02 g).
3. Kneading
   a. Knead the powder mix with the binding solution at a rate of 28 to 32 g/min while mixing at low speed. Scrape sides and blades. Mix and chop at low speed for 2 minutes. Check the end point of granulation, consisting of free-flowing granules with little lumps. If required, add more purified water to get to the end point.
   b. Sift the granules in the granulator through a 3.5 mm stainless steel sieve, and follow by sifting through a 1 mm stainless steel sieve.
   c. Unload the wet granules into stainless steel trays for drying.
4. Drying
   a. Dry the wet granules in an oven at 55°C for 8 hours.
   b. Check the LOD (limit: 0.5% to 1%).
   c. If required, dry further at 55°C for 1 hour.
5. Grinding and lubrication
   a. Grind the dried granules through a 1 mm sieve using a granulator at medium speed. Collect in stainless steel drums. Load the granules into a drum blender.
   b. Sift items 6 to 8 through a 500 µm sieve, using a sifter, and add it to the drum blender. Mix for 2 minutes.
   c. Sift item 9 through a 250 µm sieve. Add 4 to 8 g granules from the bulk (step 5a). Mix in a polyethylene bag for 1 minute. Add to blender and blend for 1 minute.
   d. Unload in stainless steel drums. Check and record the weight of the granules (theoretical weight: 260 g).
6. Compression
   a. Check temperature and humidity before starting compression.
   b. Limits are that the temperature should not exceed 27°C, and the recommended relative humidity is 55% to 60%.
   c. Compress the granules using a rotary tableting machine. At 9 mm, the weight of 10 caplets is 2.6 g ± 2%.

CARBAMAZEPINE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Carbamazepine	200.00
300.00	2	Ludipress®	300.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 496 mg tablets, using 12 mm biplanar punches.

CARBETAPENTANE TANNATE AND CHLORPHENIRAMINE TANNATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Carbetapentane tannate	60.00
5.00	2	Chlorpheniramine tannate	5.00
65.00	3	Starch	65.00
150.00	4	Methyl cellulose	150.00
32.00	5	Polygalacturonic acid	32.00
65.00	6	Dibasic calcium phosphate dehydrate	65.00
25.00	7	Povidone	25.00
5.40	8	Talc	5.40
3.93	9	FD&C Red 40 Aluminum Lake 40%	3.93
1.00	10	D&C Blue No. 1 Aluminum Lake 29%	1.00
4.00	11	Magnesium stearate	4.00
QS	12	Alcohol denatured 190 proof	QS

CARBIDOPA AND LEVODOPA TABLETS SINEMET

The inactive ingredients are cellulose, magnesium stearate, and starch. Tablets Sinemet 10–100 and 25–250 also contain FD&C Blue No. 2. Tablets Sinemet 25–100 also contain D&C Yellow No. 10 and FD&C Yellow. Sinemet CR (carbidopa–levodopa) is a sustained-release combination of carbidopa and levodopa for the treatment of Parkinson's disease and syndrome. The inactive ingredients in Sinemet CR 50–200 are D&C Yellow No. 10, magnesium stearate, iron oxide, and other ingredients. Inactive ingredients in Sinemet CR 25–100 are magnesium stearate, red ferric oxide, and others. The Sinemet CR tablet is a polymeric-based drug delivery system that controls the release of carbidopa and levodopa as it slowly erodes. Sinemet CR 25–100 is available to facilitate titration and as an alternative to the half-tablet of Sinemet CR 50–200.

CARBIDOPA AND LEVODOPA TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Carbidopa	25.00
100.00	2	Levodopa	100.00
224.00	3	Microcrystalline cellulose (Avicel™ PH 101)	224.00
15.00	4	Croscarmellose sodium	15.00
3.00	5	Silicon dioxide colloidal	3.00
3.00	6	Magnesium stearate	3.00
50.00	7	Carbidopa	50.00
200.00	8	Levodopa	200.00
80.00	9	Methocel E4M premium CR	80.00
61.00	10	Microcrystalline cellulose	61.00
2.00	11	Silicon dioxide colloidal	2.00
2.00	12	Magnesium stearate	2.00

Manufacturing Directions

1. This is a bilayer or two-compartment tablet consisting of a core layer of sustained-release carbidopa–levodopa overcoated with a layer of immediate-release carbidopa–levodopa.
2. Separately blend the core ingredients (items 7–10) (and the outer layer [items 1–4] ingredients), compress to produce core tablets, and then overcoat with the compressed outer-layer blend using a suitable coating press.

CARBINOXAMINE MALEATE, PHENYLPROPANOLAMINE, AND ACETAMINOPHEN SUSTAINED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Carbinoxamine maleate	5.00
75.00	2	Phenylpropanolamine hydrochloride	75.00
50.00	3	Acetaminophen	50.00
143.35	4	Sucrose and maize starch microgranules	143.35
6.34	5	Polyvinylpyrrolidone (PVP)	6.34
0.01	6	Dye	0.01
0.075	7	Dye	0.075
0.025	8	Dye	0.025
23.99	9	Talc	23.99

Manufacturing Directions

Note: This product requires separate preparation of microgranules for each active ingredient. This preparation requires a coating pan equipped with air suction and hot air heating system, mixer, automatic airless pump with a spray gun, vibrating sieve, and capsule-filling machine with triple-feed microgranular system.

1. Place the neutral microgranules in the coating pan; prepare a 20% solution of PVP.
2. Maintain the temperature of microgranules at 20 ± 2°C.
3. Using the pump, apply the solution of PVP, and then project the active ingredient onto the microgranules with a plastic scoop until they are dry.
4. Repeat these operations until all the active ingredients have been incorporated.
5. Sieve the microgranules with a 1.11 mm sieve.
6. Dry the microgranules at 30 ± 5°C for 3 hours.
7. Prepare a 40% solution of shellac in alcohol and the required quantity of talc.
8. Apply the shellac solution, maintaining a microgranule temperature of 20 ± 2°C, and add talc simultaneously.
9. Sieve the microgranules through a 1.18 mm sieve.
10. Dry the microgranules at 18°C to 23°C for 8 hours. Store until used.
11. Test for dissolution and rework if necessary.

CARBONYL IRON, COPPER SULFATE, AND MANGANESE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
24.00	1	Carbonyl iron (BASF)	24.00
0.16	2	Copper sulfate	0.16
3.50	3	Manganese sulfate	3.50
100.00	4	Ludipress®	100.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, and mix.
2. Press into 131 mg tablets using medium-compression force and 8 mm biplanar punches.

CARISOPRODOL TABLETS SOMA

Soma tablets are available as 350 mg round, white tablets. Carisoprodol is present as a racemic mixture. Other ingredients include alginic acid, magnesium stearate, potassium sorbate, starch, and tribasic hydrogen phosphate.

CARVEDILOL TABLETS COREG

Coreg (carvedilol) is a white, oval, film-coated tablet containing 3.125, 6.25, 12.5, or 25 mg of carvedilol. The 6.25, 12.5, and 25 mg tablets are Tiltab® tablets. Inactive ingredients consist

of colloidal silicon dioxide, crospovidone, hydroxypropyl methylcellulose, lactose, magnesium stearate, polyethylene glycol, polysorbate 80, povidone, sucrose, and titanium dioxide.

CARVEDILOL TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Carvedilol	25.00
25.00	2	Saccharose	25.00
28.00	3	Lactose monohydrate	28.00
1.78	4	Polyvinylpyrrolidone 25 K	1.78
20.17	5	Polyvinylpyrrolidone cross-linked	20.17
10.00	6	Microcrystalline cellulose	10.00
5.32	7	Silicon dioxide colloidal	5.32
2.17	8	Magnesium stearate	2.17
—	9	Purified water	115.00

Manufacturing Directions

1. Place the following in a mixing vessel: item 3 sieved, item 2 (half), and item 4; add and mix item 9, and then mix by stirring for 30 minutes.
2. Add item 7 and item 1, and stir for another 30 minutes until a homogeneous suspension is obtained.
3. Pass the suspension in step 2 through a colloid mill, and keep circulating.
4. Add items 2 and 5 to a fluid-bed dryer, and then pour the suspension in step 3 to obtain dry granules.
5. Sieve the granules through a 1.2 mm mesh sieve.
6. Lubricate granules and compress.

CEFADROXIL DISPERSIBLE TABLETS (250 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Cefadroxil; use cefadroxin anhydrous	268.65
2.00	2	PVP potassium 30	2.00
—	3	Isopropyl alcohol	10.80
77.00	4	Lactose monohydrate	77.00
93.50	5	Starch (maize)	93.50
13.00	6	Aspartame	13.00
1.50	7	Aerosil® 200	1.50
0.45	8	Methylparaben	0.45
0.05	9	Propylparaben	0.05
4.00	10	Starch (maize)	4.00
5.00	11	Magnesium stearate	5.00
5.00	12	Talc	5.00
QS	13	Water, purified	QS

Manufacturing Directions

1. Mix items 2 and 3, and prepare a binding solution.
2. Sift item 1 through a 250 µm sieve.
3. Add step 1 into step 2, and prepare a wet mass.
4. Spread granules on trays, and dry in a dehumidified room.
5. Pass dried granules through a 595 µm sieve.
6. Prepare a paste of item 5 using purified water.
7. Sift items 4 and 6 into 9 through a 250 µm sieve. Mix for 15 minutes.
8. Add the paste from step 6, and mix until a wet mass is obtained without lumps.
9. Dry the granules obtained in step 8 in a fluid-bed dryer at 50°C for 2 hours.
10. Mix granules from steps 5 and 9, and load into a tumble mixer.
11. Sift items 10 to 12 through a 250 µm sieve, add to step 10, and blend for 2 minutes.
12. Compress into 630 mg tablets, using 11.3 mm punches.

CEFDINIR TABLETS (300 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
300.00	1	Cefdinir bulk powder	306.80
29.20	2	Microcrystalline cellulose (Avicel™ PH 101)	29.20
29.20	3	L-HPC (LH-21, Shin-Etsu Chemical)	29.20
3.70	4	Polyvinylpyrrolidone (Kollidon® 30)	3.70
0.90	5	Silicic acid light anhydrous (Aerosil® 200)	0.90
4.40	6	Magnesium stearate	4.40
15.00	7	Saccharin sodium	15.00
5.60	8	Strawberry flavor	5.60

Manufacturing Directions

1. Load items 1 to 4 after passing through a 250 µm mesh into a mixing vessel. Mix for 10 minutes.
2. Add items 5 to 8, one at a time, and blend for 1 minute each time.
3. Compress 395 to 400 mg.

CEFIXIME AND AMOXICILLIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Cefixime	100.00
250.00	2	Amoxicillin	250.00
90.00	3	Microcrystalline cellulose	90.00
8.00	4	Hydroxypropyl cellulose	8.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Thoroughly blend cefixime, amoxicillin, microcrystalline cellulose, and hydroxypropyl cellulose, and granulate the mixture.
2. Vacuum-dry the granules at 40°C and subject to grain size adjustment on a duplex sieve.
3. Add magnesium stearate to these granules, and compress the resulting mixture.
4. Coat the tablets with the coating solution (hydroxypropyl methylcellulose 10 mg in water) at a feed air temperature of 55°C and an exhaust gas temperature of 40°C.

CEFIXIME TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Cefixime bulk powder	448.90
38.90	2	Microcrystalline cellulose (Avicel™ PH 101)	38.90
38.90	3	L-HPC (LH-21, Shin-Etsu Chemical)	38.90
4.90	4	Polyvinylpyrrolidone (Kollidon® 30)	4.90
1.20	5	Silicic acid light anhydrous (Aerosil® 200)	1.20
5.90	6	Magnesium stearate	5.90
20.00	7	Saccharin sodium	20.00
7.50	8	Strawberry flavor	7.50

Manufacturing Directions

1. Load items 1 to 4 after passing through a 250 μm mesh into a mixing vessel. Mix for 10 minutes.
2. Add items 5 to 8, one at a time, and blend for 1 minute each time.
3. Compress 566 to 570 mg.

CEFPODOXIME TABLETS

Manufacturing Directions

1. The tablet formula consists of cefpodoxime proxetil (53.6%), HPMC 4000 cps (35%), Avicel™ PH 101 (10.4%), and magnesium stearate (1%).
2. Blend materials in a polybag, using the geometric dilution principle.
3. Compress the blend using 19.0 mm × 8.8 mm caplet-shaped concave punches with a target weight of 1.1 g/tablet.

CEFPROZIL TABLETS (250 MG) CEFZIL®

Cefzil® tablets contain cefprozil equivalent to 250 or 500 mg of anhydrous cefprozil. In addition, each tablet contains the following inactive ingredients: cellulose, hydroxypropyl methylcellulose, magnesium stearate, methyl cellulose, simethicone, sodium starch glycolate, polyethylene glycol, polysorbate 80, sorbic acid, and titanium dioxide. The 250 mg tablets also contain FD&C Yellow No. 6.

CEFPROZIL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Cefprozil	250.00
30.00	2	Starch (maize)	30.00
3.00	3	Magnesium stearate	3.00

Manufacturing Directions

1. Dry blend items 1 and 2 for 20 minutes.
2. Sieve item 3 through a 250 μm mesh, and blend with step 1. Blend for 2 minutes.
3. Compress.

CEPHALEXIN TABLETS KEFLEX

Each pulvule contains cephalexin monohydrate equivalent to 250 mg (720 μmol) or 500 mg (1439 μmol) of cephalexin. The pulvules also contain cellulose, FD&C Yellow No. 10, FD&C Blue No. 1, FD&C Yellow No. 6, gelatin, magnesium stearate, silicone, titanium dioxide, and other inactive ingredients. Each tablet manufactured by Biocraft contains cephalexin monohydrate equivalent to 250 mg (720 μmol) or 500 mg (1439 μmol) of cephalexin. Inactive ingredients include hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 90, sodium starch glycolate, and titanium dioxide.

CETIRIZINE AND PSEUDOEPHEDRINE DELAYED-RELEASE TABLETS (5 MG/120 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Cetirizine dihydrochloride, excess	6.25
120.00	2	Pseudoephedrine hydrochloride	120.00
25.00	3	Hydroxypropyl methylcellulose (Methocel DE5)	25.00
110.00	4	Hydroxypropyl methylcellulose (Methocel F4N)	110.00
10.00	5	Hydroxypropyl methylcellulose (Methocel K5M)	10.00
174.00	6	Microcrystalline cellulose	174.00
1.00	7	Dye yellow	1.00
2.50	8	Aerosil® 200	2.50
2.50	9	Magnesium stearate	2.50
5.00	10	Ethyl cellulose (7PPS)	5.00
0.001 mL	11	Propylene glycol	1.00 mL
0.06 mL	12	Dichloromethane	60.00
0.16 mL	13	Water, purified	160.00 mL

Manufacturing Directions

1. Place items 2 to 6 and 8 in a suitable mixer. Mix for 5 minutes.
2. Compress the mixture in step 1 at 445 mg per tablet.

CETIRIZINE CHEWABLE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Cetirizine hydrochloride	10.00
130.80	2	Mannitol DC grade	130.80
25.00	3	Lactose monohydrate	25.00
15.00	4	Microcrystalline cellulose	15.00
10.00	5	Betadex	10.00
2.00	6	Acesulfame potassium	2.00
0.70	7	Blue dye	0.70
1.50	8	Red dye (carmine)	1.50
2.00	9	Grape flavor	2.00
2.00	10	Colloidal silicon dioxide (Aerosil®-200)	2.00
1.00	11	Magnesium stearate	1.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 5, and 6 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 10% (=6.5 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity of step 4 into step 2.
6. Place 10% (=6.5 g) powder from step 1 in a stainless steel container.
7. Pass item 7 and item 8 through 0.5 mm sieve and add to step 6 and mix well.
8. Transfer half quantity of step 7 into step 2.
9. Pass item 3, item 4, and item 10 through 0.7 mm sieve and add to step 2.
10. Transfer balance quantity of step 4 into step 2.
11. Transfer balance quantity of step 7 into step 2.
12. Transfer balance quantity of step 1 into step 2.
13. Mix step 2 for 20 minutes using tumbler.
14. Pass item 11 through 0.250 mm sieve and add to step 13.
15. Mix step 14 for 2 minutes.
16. Compress into 200 mg tablets, using a suitable punch (8 mm, round).

CETIRIZINE HYDROCHLORIDE TABLETS (10 MG) ZYRTEC

Zyrtec tablets are formulated as white, film-coated, rounded-off rectangular-shaped tablets for oral administration and are available in 5 and 10 mg strengths. The inactive ingredients are as follows: lactose, magnesium stearate, povidone, titanium dioxide, hydroxypropyl methylcellulose, polyethylene glycol, and cornstarch.

CETIRIZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Cetirizine hydrochloride	10.20
39.00	2	Maize starch	39.00
70.55	3	Lactose monohydrate	70.55
2.60	4	PVP K-30	2.60
7.00	5	Maize starch, dried	7.00
0.65	6	Magnesium stearate	0.65
QS	7	Purified water	30.00

Manufacturing Directions

1. Prepare the binding solution by dissolving item 4 in item 7 at 25°C to 30°C until the solution becomes clear.

2. Sift item 1 through a 500 µm sieve in portions.
3. Add binding solution slowly, and granulate.
4. Add water if necessary. Dry granules at 55°C for 10 hours.
5. Pass granules through a 1.25 mm sieve in a V-shaped blender. Add items 5 and 6, and mix for 1 minute. Compress tablets of 130 mg with hardness of 5 to 8 kPa.
6. Coat using the HPMC. (See Appendix.)

CETIRIZINE HYDROCHLORIDE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Cetirizine hydrochloride	5.00
90.75	2	Mannitol DC grade	90.75
25.00	3	Lactose monohydrate	25.00
15.00	4	Microcrystalline cellulose	15.00
7.50	5	Betadex	7.50
1.50	6	Acesulfame potassium	1.50
0.50	7	Blue dye	0.50
1.00	8	Red dye (carmine)	1.00
1.50	9	Grape flavor	1.50
1.50	10	Colloidal silicon dioxide (Aerosil®-200)	1.50
0.75	11	Magnesium stearate	0.75

For other strengths, adjust quantity with item 2.

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 5, and 6 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=6.8 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity of step 4 into step 2.
6. Place 10% (=4.5 g) powder from step 1 in a stainless steel container.
7. Pass item 7 and item 8 through 0.5 mm sieve and add to step 6 and mix well.
8. Transfer half quantity of step 7 into step 2.
9. Pass items 3, 4, and 10 through 0.7 mm sieve and add to step 2.
10. Transfer balance quantity of step 4 into step 2.
11. Transfer balance quantity of step 7 into step 2.
12. Transfer balance quantity of step 1 into step 2.
13. Mix step 2 for 20 minutes using tumbler.
14. Pass item 11 through 0.250 mm sieve and add to step 13.
15. Mix step 14 for 2 minutes.
16. Compress into 150 mg tablets, using a suitable punch (6.0 mm × 7.0 mm, oval).

CETIRIZINE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Cetirizine hydrochloride	5.00
87.2	2	Lactose spray dried	87.2
5.00	3	Cornstarch	5.00
2.00	4	Povidone K30	2.00
0.80	5	Magnesium stearate	0.80
2.20	6	Hypromellose	2.20
0.50	7	Polyethylene glycol 4000	0.50
0.80	8	Titanium dioxide	0.80
—	9	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 3, and 4 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 10% (=4.4 g) lactose from step 1 to step 3 and mix well.
5. Transfer step 4 into step 2.
6. Transfer balance quantity of lactose from step 1 into step 2.
7. Mix step 2 for 15 minutes using tumbler.
8. Pass item 5 through 0.250 mm sieve and add to step 7.
9. Mix step 8 for 2 minutes.
10. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).
11. Place item 9 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
12. Add item 7 and item 8 to step 11 with stirring. Stir for 5 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
13. Load core tablets from step 10 in coating pan and apply coating dispersion from step 12 to get 2.5% to 3.0% weight gain.

CETIRIZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Cetirizine hydrochloride	15.00
3.00	2	Polyvinylpyrrolidone	3.00
1.50	3	Silicon dioxide	1.50
135.00	4	Lactose	135.00
1.50	5	Glyceryl behenate	1.50
	6	Water QS	

Manufacturing Directions

1. Place cetirizine and lactose in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend glyceryl behenate in a drum mixer.
4. Press the resulting mixture into tablets of 156.00 mg.
5. Coat these tablet cores with the following formulation: ethyl cellulose 10.00, hydroxypropyl cellulose 10.00, stearic acid 2.00, and alcohol 188.00 g.
6. Dissolve ethocel, povidone, and stearic acid in denatured alcohol (188 g).
7. Spray the coating solution onto the tablet cores in a coating pan.

CETYLPYRIDINIUM LOZENGES (2.5 MG)

Formulation: Cetylpyridinium chloride (Merck), 2.5 g; Ludipress® LCE, 370.0 g; polyethylene glycol 6000, powder, 20.0 g; menthol, crystalline, 6.0 g; aspartame, potassium (Searle), 1.5 g.

CHARCOAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Activated charcoal	250.00
150.00	2	Bolus alba (Merck)	150.00
28.00	3	Kollidon® 25	28.00
38.00	4	Acacia gum	38.00
QS	5	Water + isopropanol (10 + 3)	575.00 mL
15.00	6	Cremophor EL	15.00
QS	7	Isopropanol	300.00 mL

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with item 5, and pass through a 1 mm sieve.
2. Dry until a relative powder humidity of 90% is reached.
3. Add solution of items 6 and 7, and pass again through a 0.8 mm sieve.

CHLORCYCLIZINE HYDROCHLORIDE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Chlorcyclizine hydrochloride	50.00
109.75	2	Lactose monohydrate	109.75
4.28	3	Povidone (K 29–32)	4.28
11.30	4	Alcohol ethanol 190 proof	11.30
QS	5	Water, purified	QS
95.71	6	Starch (corn)	95.71
6.21	7	Talc	6.21
2.60	8	Magnesium stearate	2.60

Manufacturing Directions

1. Load chlorcyclizine hydrochloride, lactose, and povidone into a mass mixer. Mix well.
2. Add alcohol (diluted with an equal weight of purified water) and QS to mass.
3. Granulate through a 15.88 mm aperture or similar.
4. Dry at 41°C to less than 1% LOD (1 hour Brabender or equivalent at 105°C).
5. Sift and grind through a 1.19 mm aperture or similar screen.
6. Lubricate by adding cornstarch (#6), talc, and acid stearic (or magnesium stearate) sifted through a 600 µm aperture or similar.
7. Compress using 7.94 mm standard round convex punches with logo.
8. Coating is optional; use organic coatings, preferably.

CHLORDIAZEPOXIDE AND CLINIDIUM BROMIDE TABLETS (5 MG/2.5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.50	1	Clinidium bromide, 5% excess	2.625
5.00	2	Chlordiazepoxide, 5% excess	5.25
131.02	3	Lactose powder	131.02
8.50	4	Starch (maize)	8.50
2.30	5	Talc	2.30
0.30	6	Magnesium stearate	0.30
QS	7	Water, purified	QS

Manufacturing Directions

1. Prepare a paste with maize starch and water. Use this for separately granulating items 1 and 2. Use a 1:4 starch and water mixture, and heat to 50°C with continuous stirring.
2. Knead, granulate, dry, and sieve item 1 using step 1 paste. Mix a 1:5 ratio of items 1 to 3, and mix together for 5 minutes. Pass the mixture through an oscillating granulator using a 1 mm sieve. Add paste from step 1, and mix for 5 minutes. Add item 3 (part) and pass the wet mass through a 7 mm sieve. Dry at a humidity of 40% to 50%. Pass the dried granules through a 1.5 mm perforated sieve.
3. Knead, granulate, dry, and sieve item 2 using step 1 paste. Use a 1:3 ratio of item 2 to lactose, and mix for 5 minutes. Then, pass the mixture through a 1 mm oscillating granulator. Pass the wet mass through a 7 mm sieve, and dry at 60°C overnight in a relative humidity of granules that is 34% to 43%. Pass the dried granules through a 1.5 mm perforated sieve.
4. Mix the granules from steps 2 and 3, and tumble the mix for 1 hour at low rpm.
5. Premix items 5 and 6 for 5 minutes, and then blend this mixture with step 4. Tumble the mix for a half hour at low rpm.
6. Compress into 150 mg tablets, using 8 mm cylindrical biconvex punches at 4 to 5 tons of pressure.
7. Apply a sugar coating (see Appendix) to the final weight of 300 mg.

CHLORDIAZEPOXIDE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Chlordiazepoxide	10.00
61.70	2	Lactose	61.70
6.17	3	Starch (maize)	6.17
0.60	3	Talc	0.60
0.30	4	Magnesium stearate	0.30
QS	5	Water, purified	QS

Manufacturing Directions

1. Mix items 1 and 2 in a blender for 10 minutes at medium speed.
2. In a separate vessel, prepare a paste of item 3 with item 5, at 50°C, and maintain this temperature until fully gelatinized without lumps.
3. Transfer the hot paste to the blender in step 1, and mix for 30 minutes. Then, pass it through a granulator with a 10 mm perforated screen.
4. Dry the granules overnight at 45°C.
5. Sift the dry granules in an oscillating granulator with a 1 mm sieve.
6. Add item 4, and mix in a tumbler for 10 minutes.
7. Compress into 80 mg tablets, using 6×3 mm cylindrical biconvex punches.
8. Sugar coat the tablets. (See Appendix.)

CHLORHEXIDINE LOZENGES

Bill of Materials

Scale (mg/lozenge)	Item	Material Name	Quantity/1000 lozenges (g)
5.00	1	Chlorhexidine	5.00
150.00	2	Sorbitol (crystalline)	150.00
5.00	3	Kollidon® VA 64	5.00
5.00	4	Menthol (crystalline)	5.00
5.00	5	Eucalyptol (crystalline)	5.00
1.00	6	Aspartame, potassium	1.00
0.10	7	Saccharin sodium	0.10
2.00	8	Aerosil® 200	2.00
1.00	9	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 175 mg lozenges, using 8 mm biplanar punches.

CHLOROQUINE TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Chloroquine diphosphate	250.00
100.00	2	Dicalcium phosphate (Ditab)	100.00
10.00	3	Kollidon® 30	10.00
—	4	Isopropyl alcohol	83.00
10.00	5	Kollidon® CL	10.00
2.00	6	Aerosil® 200	2.00
3.00	7	Talc	3.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4. Then dry, pass through a 0.8 mm sieve, add the mixture of items 5 to 7, and press with low-compression force.
2. Compress into 361 mg tablets, using 8 mm biplanar punches.

CHLORPHENIRAMINE AND PSEUDOEPHEDRINE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
3.35	1	Chlorpheniramine maleate	3.35
100.00	2	Pseudoephedrine hydrochloride	100.00
396.65	3	Cab-o-Sil MS	396.65
200.00	4	Water	200.00

Manufacturing Directions

1. Mix chlorpheniramine maleate and pseudoephedrine hydrochloride in the water until thoroughly dissolved.
2. Pour Cab-o-Sil M5 (silicon dioxide) into a planetary mixer, to which add the dissolved drug solution and mix at slow speed.
3. Continue for 5 minutes, until the solution and Cab-o-Sil are completely mixed.
4. Dry the mixture in a forced hot air oven for 5 hours to an LOD of less than 2.0%.
5. Add magnesium stearate as a lubricant, and add tartaric acid as an acidulant.
6. Thoroughly mix the excipients, and compress.

CHLORPHENIRAMINE, PSEUDOEPHEDRINE, AND DEXTROMETHORPHAN CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
8.00	1	Chlorpheniramine maleate	8.00
120.00	2	Pseudoephedrine hydrochloride	120.00
60.00	3	Dextromethorphan hydrobromide	60.00
812.00	4	Cab-o-Sil M5	812.00
200.00	5	Water	200.00

Manufacturing Directions

1. Chlorpheniramine maleate dextromethorphan HBr and pseudoephedrine hydrochloride are mixed in the water until thoroughly dissolved.
2. Cab-o-Sil M5 (silicone dioxide) is poured into a planetary mixer, to which the dissolved drug solution is added and mixed at slow speed.
3. This is continued for 5 minutes, until the solution and Cab-o-Sil are completely mixed.
4. The entire composition is dried in a forced hot air oven for 7 hours at 50°C.
5. The composition is dried to an LOD of 1.25%.
6. The dried material is then screened through a No. 30 U.S. standard mesh screen.
7. The excipients are added as mentioned before, and the blend is compressed..

CHLORPHENIRAMINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
4.00	1	Chlorpheniramine maleate	4.00
75.00	2	Starch 1500	75.00
65.62	3	Microcrystalline cellulose (50 µm)	65.62
2.96	4	Stearic acid	2.96
1.11	5	Fumed silica	1.11
0.37	6	Magnesium stearate	0.37

Manufacturing Directions

1. Blend half of the Starch 1500 with the fumed silica and chlorpheniramine for 5 minutes.
2. Pass this mixture through a 40 mesh screen, and return to blender.
3. Add the remaining Starch 1500 to the material in step 1, and blend for 5 additional minutes.
4. Add the microcrystalline cellulose and stearic acid to the material from step 2, and blend for an additional 10 minutes.
5. Add the magnesium stearate to the material from step 3, and blend for an additional 5 minutes.

CHOLINE THEOPHYLLINATE TABLETS (100 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Choline theophylline	100.00
244.00	2	Ludipress®	244.00
6.00	3	Magnesium stearate	6.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve. Mix and press with very low-compression force.
2. Compress into 350 mg tablets, using 8 mm biplanar punches.

CHYMOTRYPSIN TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Chymotrypsin	27.50
71.50	2	Ludipress®	71.50
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm screen, and press with low-compression force.
2. Compress into 100 mg tablets, using 8 mm biplanar punches.

CILAZAPRIL TABLETS (2.5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.50	1	Cilazapril anhydrous	2.50
37.00	2	Lactose powder	37.00
2.87	3	Talc	2.87
57.43	4	Starch (maize)	57.43
7.65	5	Hydroxypropyl methylcellulose 2910/3C	7.65
1.91	6	Sodium stearyl fumarate	1.91
QS	7	Water, purified	QS

Manufacturing Directions

1. Disperse item 5 in 50 mL of item 7, and allow this to stand overnight.
2. In a tumble mixer, add item 1 and 10 g of item 2, and mix for 5 minutes.
3. Add the balance of item 2 and 20 g of item 4, and mix well.
4. Add the granulating solution from step 1, and knead. Then, pass through a 7 mm sieve in a granulator.
5. Spread on paper-lined trays, and dry at 45°C overnight.
6. Pass the dried granules through a 1.5 mm sieve at 20% to 25% RH.
7. In a tumble mixer, add the balance of item 4, and then add items 3 and 6. Mix for 6 minutes.
8. Compress into 200 mg tablets, using a suitable punch.
9. Coat using the Opadry coating. (See Appendix.)

CIMETIDINE CHEWABLE TABLETS

Manufacturing Directions

1. Cimetidine Premix Granules—Cimetidine, 200.0 mg; Eudragit E100, 20.0 mg; antacid (Al/Mg) granules (sorbitol: direct compression grade, 590.0 mg; lactose: direct compression grade spray dried, 325.0 mg; lactose crystalline, 325.0 mg; dried aluminum hydroxide gel, 250.0 mg; magnesium hydroxide, 200.0 mg; croscarmellose sodium type A, 30.0 mg; magnesium stearate, 15.0 mg). Total 1735.0 mg.
2. Tableting mix for compression—Cimetidine 220.0 mg; premix granules antacid (Al/Mg), 1735.0 mg; granules microcrystalline cellulose, 200.0 mg (Avicel™ PH102); aspartame, 10.0 mg; aniseed, 20.0 mg, butterscotch, 20.0 mg; magnesium stearate, 15.0 mg. Total 2220.0 mg.
3. Add a 40% (w/w) solution of the Eudragit E100 in methylene chloride with mixing to the cimetidine and blend until granules are formed.
4. Dry the resulting granules and then sieve through a 16 mesh screen.
5. Sieve aluminum hydroxide, magnesium hydroxide, and other ingredients for the antacid granules through a 12 mesh (1.4 mm) screen and mix together.
6. Compress the resulting mix on a rotary tablet press, and mill the resulting compacts using a 12 mesh screen.
7. Load cimetidine granules, antacid granules, and extragranular excipients into a cone blender and mix thoroughly.
8. Discharge the resulting mix from the blender and compress on a suitable rotary tablet press fitted with the appropriate punches.

CIMETIDINE TABLETS (200 MG)

Formulation: Cimetidine, 200 g; Ludipress®, 295 g; magnesium stearate, 5 g.

Manufacturing Directions

1. Pass the mixture through 0.8 mm screen.
2. Press with low-compression force at 510 mg at low humidity (30%).

CIMETIDINE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Cimetidine[a]	202.00
48.89	2	Microcrystalline cellulose (Avicel™ PH 102)	48.89
6.00	3	Povidone (PVP K-30)	6.00
0.40	4	Sodium lauryl sulfate	0.40
0.26	5	Dispersed blue E132	0.26
0.26	6	Ferric oxide (iron oxide yellow)	0.26
13.11	7	Starch (maize)[b]	14.41
9.44	8	Sodium starch glycolate (Primojel®)	9.44
1.40	9	Magnesium stearate	1.40
—	10	Purified water	77.78

Note: For higher strength (400 and 800 mg tablets), adjust formula and fill weights accordingly.

[a] Cimetidine 2.0 mg/tablet (1%) is added as an extra to compensate for the moisture.

[b] Maize starch 1.3 mg/tablet (10%) is added as an extra to compensate for the moisture.

Manufacturing Directions

1. Prepare a slurry of item 7 in 15.56 g of item 10 (30–40°C). Then, make a translucent paste by adding 44.44 g of item 10 (90–95°C). Cool to 45°C to 50°C.
2. Disperse items 5 and 6 in 4.44 g of item 10 (25–30°C) by homogenizing. Add the color dispersion to the starch paste at step 1, and mix well.
3. Dissolve item 3 in 13.33 g of item 10. Stir until the solution is clear. Add item 4 to the solution. Stir just to dissolve. Do not produce foam by stirring. Add this solution to the colored paste at step 2, and mix for 5 minutes.
4. Pass items 1 and 2 through a 1200 µm sieve using a sifter. Collect in a stainless steel drum. Load to a mixer. Mix at a high speed for 10 minutes.
5. Add colored starch paste from step 3 to the dry powder in the mixer. When the addition is over, mix at medium speed to get the satisfactory wet mass.
6. Add item 10 if required. Record extra quantity if used.
7. Pass the wet mass through a FitzMill using sieve 24250, knives forward, at medium speed.
8. Collect and spread the granules onto the trays, one-third the thickness of the tray, and dry the granules at 55°C for 16 hours. After 4 hours of drying, stir the granules in the trays, and change the positions of the trays for uniform drying. *Note:* Stirring is a very important step to avoid migration of color. Migration leads to mottling of the tablet.
9. Check the moisture of dried granules. The limit is not more than 1.5%. Dry further if required to get a moisture content of 1.5%.
10. Pass the granules through a 1.25 mm sieve using a granulator at medium speed. Do not fill the hopper completely. This increases excess fines.
11. Pass item 8 through a 500 µm sieve using a sifter. Collect in a polyethylene bag, and add to the blender. Mix for 5 minutes
12. Pass item 9 through a 250 µm sieve using a sifter. Collect in a polyethylene bag, and add 4.4 to 6.7 g powder from the bulk. Mix it, and then add it to the blender. Mix for 1 minute.
13. Check temperature and humidity before starting compression. The limits are as follows: temperature 25°C to 27°C; RH 45% to 55%.
14. Compress the granules using round concave punches. The weight of 10 tablets is 2.80 g ± 2%.
15. Coat tablets. (See the details in the Appendix.)

CIPROFLOXACIN TABLETS (500 MG) CIPRO

Cipro film-coated tablets are available in 100, 250, 500, and 750 mg (ciprofloxacin equivalent) strengths. The inactive ingredients are starch, microcrystalline cellulose, silicon dioxide, crospovidone, magnesium stearate, hydroxypropyl methylcellulose, titanium dioxide, polyethylene glycol, and water.

CIPROFLOXACIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Ciprofloxacin HCl Monohydrate	500
10.00	2	Crospovidone (Kollidon® CL)	10.00
60.00	3	Sodium starch glycolate (Primojel®)	60.00
9.50	4	Povidone (PVP K-30)	9.50
54.37	5	Microcrystalline cellulose (Avicel™ PH 101)	54.37
20.00	6	Crospovidone (Kollidon® CL)	20.00
20.00	7	Sodium starch glycolate (Primojel®)	20.00
6.00	8	Magnesium stearate	6.00
3.46	9	Colloidal silicon dioxide (Aerosil® 200)	3.46
—	10	Absolute alcohol (ethanol, dehydrated alcohol)	268.00

Manufacturing Directions

Note: It is important to note the following:

- Avoid overmixing lubricants, because this could reduce hardness.
- Process the products in an explosion-proof area. Relative humidity should not be more than 50%, and the temperature should be not more than 27°C.

1. Granulating solution: Dissolve item 4 in item 10 under slow stirring by stirrer.
2. Dry powder mixing: Sift items 1, 3, and 2 through a stainless steel sieve (900 µm) in sifter. Load into a mixer. Mix and chop for 3 minutes at low speed.
3. Kneading
   a. Knead the mixed powder with granulating solution for 2 minutes while mixing at low speed. Then, mix and chop at high speed for 2 minutes.
   b. If required, add more absolute alcohol, and mix and chop at low speed to get to the end point of granulation. Record the additional quantity of absolute alcohol. Unload the wet mass in a stainless steel tray for drying.
4. Drying
   a. Dry the wet mass in the oven. Start air circulation without the heater "on" for 2 hours, keeping the door open. Then, dry at 55°C for 5 hours.
   b. Check the LOD. The limit is 1.5% to 2.0%.
   c. If required, continue drying at 55°C for another half an hour to get the desired LOD.
5. Grinding: Pass the dried granules through a 1.25 mm sieve using a granulator at medium speed. Collect in stainless steel drums.
6. Lubrication
   a. Sift items 5, 7, 6, and 9 through a 500 µm sieve, and add it to the dry granules in the drum.
   b. Pass item 8 through a 250 µm sieve using a sifter. Add 40 to 60 g of granules from bulk. Mix in polyethylene bag for 1 minute. Add to a drum blender, and mix for 1 minute.
7. Compression: Compress the granules using a rotary tableting machine with 18 × 8 mm oblong concave punches. Compress into 770 mg tablets.
8. Coating: Coat using HPMC coating. (See Appendix.)

CIPROFLOXACIN TABLETS (750 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
750.00	1	Ciprofloxacin HCl Monohydrate	750.00
15.00	2	Crospovidone (Kollidon® CL)	15.00
70.00	3	Sodium starch glycolate (Primojel®)	70.00
11.00	4	Povidone (PVP K-30)	11.00
70.00	5	Microcrystalline cellulose (Avicel™ PH 101)	70.00
25.00	6	Crospovidone (Kollidon® CL)	25.00
30.00	7	Sodium starch glycolate (Primojel®)	30.00
7.50	8	Magnesium stearate	7.50
3.50	9	Colloidal silicon dioxide (Aerosil® 200)	3.50
—	10	Absolute alcohol (ethanol, dehydrated alcohol)	400.00

Manufacturing Directions

See the manufacturing directions for the 500 mg tablet.

CISAPRIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
52.92	1	Cisapride-(L)-tartrate	52.92
346.08	2	Lactose	346.08
66.000	3	Hydroxypropyl methylcellulose 2208	66.000
2.85	4	Magnesium stearate	2.85
5.70	5	Colloidal anhydrous silica	5.70
28.60	6	Talc	28.60

CISAPRIDE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Cisapride	5.20
80.90	2	Lactose monohydrate	80.90
10.80	3	Starch (maize)	10.80
3.00	4	Povidone (PVP K-30)	3.00
0.15	5	Polysorbate 20 (Tween 20)	0.15
19.40	6	Microcrystalline cellulose (Avicel™ PH 102)	19.40
0.60	7	Magnesium stearate	0.60
—	8	Purified water	18.00

Manufacturing Directions

Note: Avoid overmixing lubricants; otherwise, hardness can be reduced.

1. Preparation of binding solution
   a. Dissolve item 4 in 16.0 g of item 8 (30°C), while mixing at slow speed by stirrer.
   b. Add item 5 to 2.0 g of item 8 (60–70°C). Stir manually with a spatula to make a clear solution.
   c. Add the previous step into step 1. Mix manually.
2. Sieving and mixing: Sift items 1 to 3 through a 500 µm sifter. Load into a mixer and mix for 5 minutes at low speed.
3. Kneading
   a. Add the binding solution to the dry powders, while mixing at low speed for 2 minutes. After the binding solution is added, mix further for 1 minute, using the mixer and chopper at low speed. Scrape sides and blade. Check for satisfactory granules with few or no lumps.
   b. If required, add extrapurified water, and record.
   c. Unload the granules into a stainless steel tray for drying.
4. Drying
   a. Dry the granules in an oven at 55°C for 10 hours. After 4 hours of drying, scrape the semidried granules to break the lumps for uniform drying.
   b. Check the LOD. The limit is 0.7% to 1.0%.
   c. Transfer the dried granules into stainless steel drums.
5. Grinding
   a. Pass the dried granules through a 1 mm sieve at medium speed. Collect in stainless steel drums.
   b. Load granules into the drum blender.
6. Lubrication
   a. Sift item 6 through a 500 µm sieve using a sifter. Add to step 2, in a drum blender. Mix for 5 minutes.
   b. Sift item 7 through a 500 µm stainless steel sieve in sifter. Add 4 to 6 g granules in a polyethylene bag to sieve item. Mix manually for 1 minute. Add to drum blender, and blend for 1 minute.
   c. Unload in stainless steel drums.
7. Compression: Compress the granules using a rotary tableting machine with 7 mm round punches and a compression weight of 120 mg.

CISAPRIDE TARTRATE MINI TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
6	1	Cisapride tartrate	6
3.54	2	Explotab	3.54
25.36	3	Avicel™ PH 101	25.36
3.54	4	Aerosil® 200	3.54
3.54	5	Magnesium stearate	3.54

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
6	1	Cisapride tartrate	6
6.92	2	Methocel K100 M	6.92
3.45	3	Klucel LF	3.45
17.68	4	Avicel™ PH 101	17.68
3.45	5	Aerosil® 200	3.45
3.45	6	Magnesium stearate	3.45

Manufacturing Directions

1. The ingredients (1–5), with the exception of magnesium stearate, are blended for 45 minutes.
2. Magnesium stearate is then added and blending continued for 5 minutes.
3. The blend is then tableted in 3.8 mm round deep concave punches with fill weight of 35.48 mg in the first formula and 34.54 mg in the second formula.
4. Coat the tablets using the following formulation: Eudragit L 12.5, 49.87%; talc, 2.47%; diethyl phthalate, 1.27%; isopropyl alcohol, 43.33%; purified water, 3.07%. Coat to provide 12.5% weight gain.

CITALOPRAM HYDROBROMIDE TABLETS CELEXA

Celexa is a film-coated, oval-scored tablet containing citalopram HBr in strengths equivalent to a 20 or 40 mg citalopram base. The inactive ingredients are copolyvidone, cornstarch, croscarmellose sodium, glycerin, lactose, monohydrate, magnesium stearate, hydroxypropyl methylcellulose, microcrystalline cellulose, and polyethylene glycol; titanium dioxide and iron oxides are used as coloring agents in the pink 20 mg tablets.

CLARITHROMYCIN TABLETS (250 MG/500 MG) BIAXIN

Each yellow oval film-coated Biaxin tablet contains 250 or 500 mg of clarithromycin and the following inactive ingredients: cellulosic polymers, croscarmellose sodium, D&C

Yellow No. 10, FD&C Blue No. 1, magnesium stearate, povidone, propylene glycol, silicon dioxide, sorbic acid, sorbitan monooleate, stearic acid, talc, titanium dioxide, and vanillin. The 250 mg tablet also contains pregelatinized starch.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Clarithromycin[a]	256.00
80.90	2	Microcrystalline cellulose (Avicel™ PH 102)	80.90
8.00	3	Croscarmellose sodium (Ac-Di-Sol)	8.00
9.00	4	Povidone (PVP K-30)	9.00
1.10	5	Polysorbate 80 (Tween 80)	1.10
51.50	6	Microcrystalline cellulose (Avicel™ PH 102)	51.50
10.00	7	Croscarmellose sodium (Ac-Di-Sol)	10.00
22.00	8	Pregelatinized starch (Starch 1500)	22.00
2.25	9	Magnesium stearate	2.25
4.50	10	Talc (fine powder)	4.50
3.00	11	Stearic acid	3.00
1.75	12	Colloidal silicon dioxide (Aerosil® 200)	1.75
—	13	Alcohol (ethanol 95%)	88.00

[a] Clarithromycin 6.0 mg/tablet is added as an excess to compensate for the water content and assay of the material. The weight of clarithromycin is factored based on potency. The weight of microcrystalline cellulose (Avicel™ PH 101) is then adjusted to compensate for the factored potency of clarithromycin. Adjust the fill weight and formula for a 500 mg tablet.

Manufacturing Directions

Precautions: Avoid overmixing lubricants; otherwise, hardness can be reduced. Process the products in an explosion-proof area, with relative humidity of not more than 50% and a room temperature of not more than 27°C.

1. Screen, if necessary, through an approximately 710 µm screen, the following: clarithromycin, croscarmellose sodium, microcrystalline cellulose (v PH 101), and silicon dioxide. Blend together in suitable massing equipment.
2. Dissolve povidone in approximately 240 mL of ethanol—a complete solution must be achieved.
3. While mixing the blended powders from step 1, add the povidone solution from step 2.
4. Continue mixing to ensure an even distribution of the solution, and then add extra ethanol until a characteristic granule mass is obtained.
5. If necessary, pass the wet mass through a 3 to 4 mm screen. Dry at approximately 50°C to 55°C until the LOD is not more than 3%.
6. Sift dried granule over a 1.4 mm (approximately) screen. Pass the oversized granules through a 1.7 mm (approximately) screen, using a suitable mill. Alternate screening and milling systems may be used to yield suitably sized granules.
7. Load a portion of the granule from step 6 into a suitable blender. Add microcrystalline cellulose (Avicel™ PH 102) and croscarmellose sodium, blend, add talc, purify, and blend until uniform.
8. Mix together stearic acid and magnesium stearate with a small portion of granule. If necessary, pass through a 0.5 mm (approximately) screen.
9. Add the preceding steps, mix, and then add the balance of granule. Mix until uniform.
10. Compress tablets to the following parameters: tablet weight 8.5 g/10 tablets ± 3%.
11. Coat using an HPMC coating solution.

CLARITHROMYCIN DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Clarithromycin base	250.00
22.50	2	Crospovidone	22.50
62.50	3	Croscarmellose sodium	62.50
3.80	4	Polysorbate	3.80
566.20	5	Microcrystalline cellulose	566.20
40.00	6	Aspartame	40.00
20.00	7	Saccharin sodium	20.00
20.00	8	Mint flavor	20.00
5.00	9	Colloidal silica	5.00
10.00	10	Magnesium stearate	10.00

CLARITHROMYCIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Clarithromycin	500.00
200.00	2	Methocel K100 LV Premium CR Grade	200.00
260.00	3	Lactose monohydrate	260.00
30.00	4	Talc	30.00
6.25	5	Magnesium stearate	6.25

Manufacturing Directions

1. Load methocel (K 100 LV) into a mixer and dry blend with clarithromycin.
2. Granulate the mixture using water until proper granulation is obtained. Dry the granulation, sift, and grind to appropriate size.

3. Screen talc and magnesium stearate and blend with dry granulation. Load the granulation into hopper and compress into tablets. Coat the tablets with an aqueous coating.

CLARITHROMYCIN CONTROLLED-RELEASE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
1000.00	1	Clarithromycin	1000.00
25.00	2	Methocel K15 MCR	25.00
12.50	3	Methocel K4 MCR	12.50
12.50	4	Lactose	12.50
20.00	5	Sodium stearyl fumarate	20.00
12.506.25	6	Magnesium stearate	12.50
10.00	7	Talc	10.00
0.50	8	Colloidal silicon dioxide	0.50

Manufacturing Directions

1. Blend clarithromycin with the two polymers and lactose and wet granulate with water. Dry, size, and lubricate granules, and compress to tablets (1161.5 mg).
2. The tablets thus obtained can optionally be film coated.

CLENBUTEROL TABLETS (20 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
0.02	1	Clenbuterol hydrochloride	0.02
99.00	2	Ludipress®	99.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components in a Turbula mixer, and press to tablets with a compression force of 20 kN.
2. Compress into 100 mg tablets, using 8 mm punches.
3. If the content uniformity does not meet the requirements, prepare a premix of clenbuterol hydrochloride with a small part of the Ludipress® before mixing with the other components of the tableting mixture.

CLINDAMYCIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
20.00	1	Clindamycin, use clindamycin hydrochloride	22.70
265.00	2	Lactose dihydrate	265.00
33.33	4	Starch (maize)	33.30
2.00	5	Hydroxypropyl cellulose (Klucel EF)	2.00
30.00	6	Calcium lactate·5H_2O	30.00
41.00	7	Lactic acid	41.00
128.00	8	Microcrystalline cellulose (Avicel™ PH 102)	128.00
12.00	9	Kollidon® CL	12.00
7.00	10	Aerosil® 200	7.00

Manufacturing Directions

1. Clindamycin HCl, lactose, one-half of the cornstarch, HPC, calcium lactate, and lactic acid are granulated in a fluidized-bed granulator.
2. The resulting granules and the remainder of the cornstarch, Kollidon®, microcrystalline cellulose, magnesium stearate, and Aerosil® are passed through a forced sieve (1.25 mm) and homogenized in a container mixture.
3. The resulting mixture is tableted on a rotary tableting machine.

CLOBAZAM TABLETS (10 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Clobazam	10.00
135.00	2	Dicalcium phosphate	135.00
7.00	3	Kollidon® VA64	7.00
7.00	4	Kollidon® CL	7.00
1.50	5	Magnesium stearate	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force (15 kN).
2. Compress into 165 mg tablets, using 8 mm biplanar punches.

CLOMIFEN CITRATE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Clomifen citrate	50.00
100.00	2	Ludipress®	100.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, sieve, and press with low-compression force.
2. Compress into 154 mg tablets, using 8 mm biplanar punches.

CLOMIPRAMINE HYDROCHLORIDE TABLETS, BUCCAL (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Clomipramine hydrochloride	10.00
90.00	2	Gelatin	90.00
20.00	3	Glycerin, anhydrous	20.00
10.00	4	Lactose, anhydrous	10.00
20.00	5	Mannitol	20.00

Manufacturing Directions

1. Mix clomipramine hydrochloride (10 g) and 90 g of gelatin and pulverize in a mill.
2. After mixing, add 20 g of glycerin, 10 g of lactose, and 20 g of mannitol, and mix the components until uniform.
3. Compress 150 mg to provide a buccal dosage unit. Each buccal unit contains 10 mg of clomipramine hydrochloride.

CLOMIPRAMINE HYDROCHLORIDE TABLETS, EFFERVESCENT (300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Clomipramine hydrochloride	300.00
1985.00	2	Sodium bicarbonate	1985.00
1000	3	Citric acid	1000

Manufacturing Directions

1. Thoroughly mix the components (i.e., clomipramine hydrochloride, sodium bicarbonate, and citric acid, as set forth in the preceding table).
2. Produce an effervescent tablet by placing the mixture in a die, followed by with compression with an appropriate punch. Relatively little compression force should be used (e.g., about 3,000 to about 20,000 pounds of force).

CLONAZEPAM TABLETS (1 MG/2 MG)

Klonopin, a benzodiazepine, is available as scored tablets with a K-shaped perforation containing 0.5 mg and 1 or 2 mg of clonazepam, and unscored tablets with a K-shaped perforation containing 1 or 2 mg of clonazepam. Each tablet also contains lactose, magnesium stearate, microcrystalline cellulose, and cornstarch, with the following colorants: 0.5 mg of FD&C Yellow No. 6 Lake and 1 mg of FD&C Blue No. 1 Lake and of FD&C Blue No. 2 Lake.

CLONIDINE TABLETS (0.1 MG/0.2 MG/0.3 MG) PLAVIX

Plavix for oral administration is available as pink, round, biconvex, engraved film-coated tablets containing 97.875 mg of clopidogrel bisulfate, which is the molar equivalent of 75 mg of clopidogrel base. Each tablet contains anhydrous lactose, hydrogenated castor oil, microcrystalline cellulose, polyethylene glycol 6000, and pregelatinized starch as inactive ingredients. The pink film coating contains ferric oxide (red), hydroxypropyl methylcellulose 2910, polyethylene glycol 6000, and titanium dioxide. The tablets are polished with carnauba wax.

CODEINE, ACETAMINOPHEN, AND PENTOBARBITAL TABLETS (15 MG/300 MG/30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Codeine phosphate, 2.5% excess	15.375
300.00	2	Acetaminophen	300.00
30.00	3	Pentobarbital sodium; use pentobarbital	27.50
40.00	4	Calcium carbonate, precipitated	40.00
58.66	5	Lactose monohydrate	58.66
20.00	6	Povidone K 29–32	20.00
20.00	7	Starch (corn)	20.00
2.00	8	Polyethylene glycol, milled	2.00
0.066	9	Red dye	0.066
0.054	10	Yellow dye	0.054
0.018	11	Scarlet dye	0.018
25.79	14	Polacrilin potassium (Amberlite IRP-88)	25.79
10.40	15	Magnesium stearate	10.40

Manufacturing Directions

1. Mixing
   a. Add codeine phosphate to acetaminophen in the presence of an authorized person.
   b. Pass step a through a micropulverizer fitted with a 6.35 mm aperture or similar screen at high speed, with the hammers forward if the acetaminophen has a bulk density above 0.4 g/cc. After micropulverizing, the bulk density should be checked and should not exceed 0.4 g/cc. Add this to the mixer.
   c. Pass pentobarbital and calcium carbonate through an 840 µm aperture screen, and then add to the mixer.
   d. Add lactose, povidone, cornstarch, and polyethylene G 8000 NF (milled) to the mixer, and mix for 5 minutes.
   e. Dissolve the dyes in water, and add alcohol.
   f. Add the dye solution to the powders in the mixer, and mix until the color is evenly dispersed.
   g. Screen the wet granulation through a 9.52 mm aperture screen.
   h. Oven dry for 2 to 3 hours at 43°C, or use a fluid-bed dryer at room temperature for 12 minutes or until the LOD is 1% to 2% (1 hour at 105°C on an Ohaus, Brabender, or equivalent balance).
   i. Mill the dried granulation through a 1.2 mm aperture screen (FitzMill or similar, medium speed, knives forward), and then add to a suitable mixer (V or similar).
   j. Pass the Amberlite and magnesium stearate through a 595 µm aperture screen on a suitable shaker (Russel or similar), and add to the mixer (V or similar).
   k. Blend for 30 minutes.
   l. Discharge the blended material into polyethylene-lined containers. Seal and deliver this to the compression area.
2. Compression
   a. Compress on an 11.90 mm standard concave punch.
   b. The weight of 10 tablets is 5.2 g.

CONJUGATED ESTROGENS AND MEDROXYPROGESTERONE TABLETS, PREMPRO

Prempro 2.5 mg—Each peach tablet for oral administration contains 0.625 mg conjugated estrogens, 2.5 mg of medroxyprogesterone acetate, and the following inactive ingredients: calcium phosphate tribasic, calcium sulfate, carnauba wax, cellulose, glyceryl monooleate, lactose, magnesium stearate, methyl cellulose, pharmaceutical glaze, polyethylene glycol, sucrose, povidone, titanium dioxide, and red ferric oxide.

Prempro 5 mg—Each light-blue tablet for oral administration contains 0.625 mg of conjugated estrogens, 5 mg of medroxyprogesterone acetate, and the following inactive ingredients: calcium phosphate tribasic, calcium sulfate, carnauba wax, cellulose, glyceryl monooleate, lactose, magnesium stearate, methyl cellulose, pharmaceutical glaze, polyethylene glycol, sucrose, povidone, titanium dioxide, and FD&C Blue No. 2.

Premphase—Each maroon Premarin tablet for oral administration contains 0.625 mg of conjugated estrogens and the following inactive ingredients: calcium phosphate tribasic, calcium sulfate, carnauba wax, cellulose, glyceryl monooleate, lactose, magnesium stearate, methyl cellulose, pharmaceutical glaze, polyethylene glycol, stearic acid, sucrose, titanium dioxide, FD&C Blue No. 2, D&C Red No. 27, and FD&C Red No. 40. These tablets comply with USP Drug Release Test 1. Each light-blue tablet for oral administration contains 0.625 mg of conjugated estrogens and 5 mg of medroxyprogesterone acetate and the following inactive ingredients: calcium phosphate tribasic, calcium sulfate, carnauba wax, cellulose, glyceryl monooleate, lactose, magnesium stearate, methyl cellulose, pharmaceutical glaze, polyethylene glycol, sucrose, povidone, titanium dioxide, and FD&C Blue No. 2.

CONJUGATED ESTROGENS (0.3–2.50 MG) PREMARIN

Tablets are available in 0.3, 0.625, 0.9, 1.25, and 2.5 mg strengths of conjugated estrogens. Premarin tablets contain the following inactive ingredients: calcium phosphate tribasic, calcium sulfate anhydrous (white tablet), calcium sulfate, carnauba wax, cellulose, glyceryl monooleate, lactose, magnesium stearate, methyl cellulose, pharmaceutical glaze, polyethylene glycol, stearic acid, sucrose, talc, and titanium

dioxide. The 0.3 mg tablets also contain D&C Yellow No. 10, FD&C Blue No. 1, FD&C Blue No. 2, and FD&C Yellow No. 6. The 0.625 mg tablets also contain FD&C Blue No. 2, D&C Red No. 27, and FD&C Red No. 40. The 0.9 mg tablets also contain D&C Red No. 6 and D&C Red No. 7. The 1.25 mg tablets contain black iron oxide, D&C Yellow No. 10, and FD&C Yellow No. 6. The 2.5 mg tablets contain FD&C Blue No. 2 and D&C Red No. 7.

COUMADIN TABLETS

Coumadin tablets also contain (all strengths) lactose, starch, and magnesium stearate; the colors include: 1 mg tablet D&C Red No. 6; 2 mg tablet FD&C Blue No. 2 and FD&C Red No. 40; 2.5 mg tablet FD&C Blue No. 1 and D&C Yellow No. 10; 4 mg tablet FD&C Blue No. 1 Lake; 5 mg tablet FD&C Yellow No. 6; 7.5 mg tablet D&C Yellow No. 10 and FD&C Yellow No. 6; and 10 mg tablet is dye free.

CROSPOVIDONE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1000.00	1	Crospovidone (micronized)	1000.00
150.00	2	Citric acid	150.00
25.00	3	Aerosil® 200	25.00
100.00	4	Sucrose (crystalline)	100.00
1.00	5	Saccharin sodium	1.00
QS	6	Water	QS
5.00	7	Magnesium stearate	5.00
125.00	8	Sodium bicarbonate	125.00
65.00	9	Flavor mixture	65.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with item 6, dry, and pass through a sieve.
2. Mix the dry granules with items 7 to 9, and press with medium-compression force.
3. The dosage may be increased to 2000 mg crospovidone by increasing the tablet weight to 3200 mg.
4. Compress 1590 mg tablets, using 20 mm-diameter biplanar punches.

CYCLOBENZAPRINE HYDROCHLORIDE TABLETS (10 MG)

Cyclobenzaprine HCl is supplied as 10 mg tablets for oral administration. The inactive ingredients are hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxide, lactose, magnesium stearate, starch, and titanium dioxide.

CYCLOBENZAPRINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Cyclobenzaprine	10.00
74.00	2	Lactose anhydrous	74.00
35.00	3	Starch (maize)	35.00
1.00	4	Magnesium stearate	1.00
25.00	5	Starch (maize)	25.00
—	6	Water, purified	30.00 mL

Manufacturing Directions

1. Place the active ingredient (cyclobenzaprine) and lactose in a suitable mixer.
2. Blend until a uniform mix is obtained.
3. Add item 5 to item 6 to make a paste.
4. Add step 3 into step 2 to form a suitable mass.
5. Add item 3 to step 4, and mix until granules are formed.
6. Screen granules through a suitable milling machine, using a 1/4 in. stainless steel screen.
7. Dry the milled granules in a suitable drying oven until the desired moisture of less than 2% is obtained.
8. Mill the dried granules through a suitable milling machine using a 1/4 in. mesh stainless steel screen, and transfer to a blender.
9. Add the magnesium stearate to the blender after passing through a 250 μm sieve. Then, blend for 3 minutes.
10. Compress the tablets.
11. Coat the tablets using an aqueous or nonaqueous coating. (See Appendix.) For example, 2.5 mg of hydroxypropyl methylcellulose can be dissolved in 25 mg of deionized water. An aqueous (10 mg) suspension of 1.88 mg of talc, 0.5 mg of titanium dioxide, 0.1 mg of yellow iron oxide, and 0.02 mg of red iron oxide is stirred into this solution. The coating suspension is sprayed on the tablets. The coated tablets are dried overnight at 45°C.

CYPROHEPTADINE TABLETS (4 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Cyproheptadine	4.00
194.00	2	Ludipress®	194.00
2.00	3	Magnesium stearate	12.00

Manufacturing Directions

1. Pass all ingredients through a 0.8 mm sieve.
2. Mix and press with very low-compression force (4 kN).
3. Compress into 202 mg tablets, using 8 mm biplanar punches. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

DAPSONE TABLETS (50 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
50.00	1	Dapsone	50.00
80.00	2	Starch (maize)	80.00
50.00	3	Dicalcium phosphate	50.00
20.00	4	Lactose monohydrate	20.00
8.00	5	Starch (maize)	8.00
0.12	6	Methylparaben	0.12
0.02	7	Propylparaben	0.03
1.50	8	Talc	1.50
1.00	9	Magnesium stearate	1.00
—	10	Water, purified	QS

Manufacturing Directions

1. Place items 1 to 4 in a suitable vessel after passing them through a 40 mesh screen. Mix at medium speed for 15 minutes.
2. In a separate vessel, take a sufficient quantity of item 10, and heat it to 80°C; add items 5 and 6, and dissolve. Allow the mixture to cool to 50°C, and then add item 7. Stir and mix this to obtain a smooth paste.
3. Add the wet mass in step 2 to step 1, and mix well. Pass the wet mass through an 8 mm screen, and collect on paper-lined trays.
4. Dry the wet mass at 50°C overnight to an LOD of not more than 2%.
5. Pass dried granules through an 18 mm sieve, and collect them in a tumble mixer.
6. Pass item 8 through a 500 µm and item 9 through a 250 µm sieve screen, and add to step 5. Blend for 1 minute.
7. Compress into 200 mg tablets, using 8 mm round punches.

DELAVIRDINE MESYLATE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
200.00	1	Delavirdine mesylate	200.00
198.76	2	Microcrystalline cellulose	198.76
71.29	3	Coarse powder lactose monohydrate spray	71.29
75.00	4	Hydroxypropyl methylcellulose 2910 3 cps	75.00
110.00	5	Croscarmellose sodium Type A	110.00
1.50	6	Colloidal silicon dioxide	1.50
5.00	7	Magnesium stearate	5.00

Manufacturing Directions

1. Manufacture the tablets by intensely mixing the delavirdine mesylate and the microcrystalline cellulose in a high-shear mixer.
2. Then, add and mix the hydroxypropyl methylcellulose, croscarmellose, lactose, and screened colloidal silicon dioxide in a high-shear mixer. Finally, add screened magnesium stearate and lubricate in a high-shear mixer. Compress the resulting mixture, film coat, and polish to give tablets that have about 200 mg of delavirdine mesylate/tablet.

DESLORATADINE TABLETS (5 MG), CLARINEX®

Clarinex® (desloratadine) tablets are light blue, round, film-coated tablets containing 5 mg of desloratadine, an antihistamine, to be administered orally. The tablet also contains the following excipients: dibasic calcium phosphate dihydrate USP, microcrystalline cellulose NF, cornstarch NF, talc USP, carnauba wax NF, white wax NF, coating material consisting of lactose monohydrate, hydroxypropyl methylcellulose, titanium dioxide, polyethylene glycol, and FD&C Blue No. 2 Aluminum Lake.

DESOGESTREL AND ETHINYL ESTRADIOL TABLETS (0.15 MG/0.03 MG), ORTHO-CEPT

Ortho-Cept 21 and Ortho-Cept 28 tablets provide an oral contraceptive regimen of 21 orange, round tablets, each containing 0.15 mg of desogestrel (13-ethyl-11-methylene-18 ,19-dinor-17α-pregn-4-en-20-yn-17-ol) and 0.03 mg of ethinyl estradiol (19-nor-17α-pregna-1,3,5(10)-trien-20-yne-3,17, diol). Inactive ingredients include vitamin E, cornstarch, povidone, stearic acid, colloidal silicon dioxide, lactose, hydroxypropyl methylcellulose, polyethylene glycol, titanium dioxide, talc, and ferric oxide. Ortho-Cept 28 also contains seven green tablets containing the following inactive ingredients: lactose,

pregelatinized starch, magnesium stearate, FD&C Blue No. 1 Aluminum Lake, ferric oxide, hydroxypropyl methylcellulose, polyethylene glycol, titanium dioxide, and talc.

DIAZEPAM TABLET (10 MG)

Formulation: Diazepam, 10 g; Ludipress®, 100 to 480 g; magnesium stearate, 0.5 to 2.0 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compaction force 11 to 490 mg based on label required.

DIAZEPAM TABLETS (2 MG/5 MG/10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Diazepam	10.00
70.00	2	Potato starch	70.00
150.00	3	Lactose	150.00
1.50	4	Potato starch, cold swelling	1.50
0.076	5	Polysorbate 80	0.076
48.00	6	Microcrystalline cellulose	48.00
0.75	7	Magnesium stearate	0.75
QS	8	Talc, QS	300.00

Manufacturing Directions

1. Granulation
   a. Weigh and mix for 10 minutes potato starch, lactose, potato starch (cold swelling), and diazepam in a suitable mixer.
   b. Pass the mixture through a FitzMill at high speed, impact forward.
   c. Separately dissolve polysorbate 80 in purified water.
   d. Wet the mixture from step 1b with the solution from step 1c, adding more water if necessary.
   e. Pass the wet mass through a FitzMill sieve #24192, and dry in a drying oven at 35°C for 20 hours.
   f. Pass the dried granulation through a FitzMill.
   g. Separately pass through a FitzMill sieve (0.3 mm screen) the following: microcrystalline cellulose, magnesium stearate, and talc.
   h. Add the granules from step 1f, and mix for 15 minutes.
2. Compression: Compress using round, flat punches with beveled edges and a break line on one side. Theoretical weight of 300 mg (290–310 mg); thickness 3.2 mm (range: 3.1–3.3 mm); diameter 9.5 mm (range 9.3–9.7 mm). For 2 mg and 5 mg tablets, adjust fill weight accordingly; for larger tablet size, adjust proportionally with lactose and starch.

DICLOFENAC SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Diclofenac sodium	25.00
85.00	2	Lactose, monohydrate	85.00
10.00	3	Sodium starch glycolate (pH 5.5–7.5)	10.00
3.00	4	Povidone (K 29–32)	3.00
3.00	5	Starch (corn)	3.00
58.00 mL	6	Alcohol isopropyl, anhydrous	58.00 mL
5.00	7	Sodium starch glycolate (pH 5.5–7.5)	5.00
1.50	8	Magnesium stearate	1.50

Manufacturing Directions

1. Granulation
   a. Dry mix together diclofenac sodium, lactose, sodium starch glycolate, and starch in a suitable planetary mixer for 10 to 15 minutes.
   b. Dissolve povidone in 44 mL of alcohol and ensure complete solution.
   c. While mixing, add povidone solution to step 1a, and add the remaining alcohol to obtain suitable mass. Add an extra quantity of alcohol, if required.
   d. Pass the wet mass through a 4 mesh (4.8 mm aperture) screen, and spread on paper-lined oven trays.
   e. Dry the granules at 40°C to an LOD of not more than 2% (3 hours at 60°C under vacuum).
   f. Request samples.
      Note: The balance of manufacturing in the "Granulation" process should be done at not more than 45% relative humidity and at a temperature not exceeding 26.5°C.
   g. Mill the dried granule through a FitzMill fitted with a 1.19 mm aperture screen at slow speed and with knives forward.
   h. Store the material in clean, polyethylene-lined containers that are sealed.
2. Lubrication
   a. Load one-half of the screened granule from step 1 h into a suitable blender. Add sodium starch glycolate and magnesium stearate to the blender,

and then add the balance of screened granule from step 1 h. Blend for 15 to 20 minutes.
   b. Store in clean, tared polyethylene-lined containers, and seal and weigh for yield.
3. Compression
   a. Compress on a suitable tablet machine equipped with a dedusting unit, using 1/4 in. diameter concave punches with both sides plain.
   b. The theoretical weight of 10 tablets is 1.325 g (range 1.295–1.355 g), with a thickness of 3.7 to 4.1 mm.
4. Coating: Use a subcoat, an enteric color coat, and a finishing coat. (See Appendix.)

DICLOFENAC SODIUM TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Diclofenac sodium	50.00
85.00	2	Lactose, monohydrate	85.00
15.00	3	Sodium starch glycolate (pH 5.5–7.5)	15.00
5.00	4	Povidone (K 29–32)	5.00
4.00	5	Starch (corn)	4.00
0.073 mL	6	Alcohol isopropyl, anhydrous refined	73.00 mL
7.00	7	Sodium starch glycolate (pH 5.5–7.5)	7.00
2.00	8	Magnesium stearate impalpable powder	2.00

Manufacturing Directions

1. Follow the manufacturing directions in the previous formulation. The theoretical weight of 10 tablets is 1.68 g (range: 1.64–1.72), with a thickness of 4.60 to 5.0 mm. Apply an enteric coat. (See Appendix.)

DICLOFENAC SODIUM TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Diclofenac sodium	100.00
15.00	2	Eudragit® RSPN, 5% (methyl methacrylate copolymer)	15.00
6.00	3	Dibutyl phthalate (2%)	6.00
176.00	4	Dicalcium phosphate dihydrate	176.00
3.00	5	Magnesium stearate	3.00
—	6	Isopropyl alcohol	QS

Manufacturing Directions

1. Place items 1, 2, and 4 in a planetary blender, and mix for 10 minutes.
2. In a separate container, add items 3 and 6 until homogeneous. Add to step 1 slowly to form loose aggregates of blend.
3. Pass the aggregates through an 8 mesh sieve onto paper-lined trays.
4. Dry the granules in a room with low humidity.
5. Pass the dried granules through a 20 mesh screen into a blending vessel.
6. Add item 5 after passing through a 250 μm sieve to step 5, and blend for 2 minutes.
7. Compress into 300 mg tablets, using a suitable punch.
8. Coat using an enteric coating. (See Appendix.)

DICLOFENAC SODIUM DISPERSIBLE TABLETS (50 MG)

Formulation: Diclofenac Na, 50.0 mg; Avicel™ PH 102, 143.8 mg; Kollidon® CL, 50.0 mg; Aerosil® 200, 5.0 mg; magnesium stearate, 1.0 mg.

Manufacturing Directions

Mix the ingredients together, pass through a 0.8 mm sieve, and compress into tablets with a force of about 10 kN at 248 mg.

DICLOFENAC SODIUM TABLETS (25 MG) VOLTAREN, CATAFLAM®

Diclofenac potassium is available as Cataflam® immediate-release tablets of 50 mg for oral administration. Cataflam® inactive ingredients include calcium phosphate, colloidal silicon dioxide, iron oxides, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, sodium starch glycolate, starch, sucrose, talc, and titanium dioxide.

Diclofenac sodium is available as Voltaren delayed-release (enteric-coated) tablets of 25, 50, and 75 mg for oral administration, as well as Voltaren-XR extended-release tablets of 100 mg. Voltaren inactive ingredients are hydroxypropyl methylcellulose, iron oxide, lactose, magnesium stearate, methacrylic acid copolymer, microcrystalline cellulose, polyethylene glycol, povidone, propylene glycol, sodium hydroxide, sodium starch glycolate, talc, titanium dioxide, D&C Yellow No. 10 Aluminum Lake (25 mg tablet only), and FD&C Blue No. 1 Aluminum Lake (50 mg tablet only). Voltaren-XR inactive ingredients are cetyl alcohol, hydroxypropyl methylcellulose, iron oxide, magnesium stearate, polyethylene glycol, polysorbate, povidone, silicon dioxide, sucrose, talc, and titanium dioxide.

DICLOFENAC SUSTAINED-RELEASE TABLETS (100 MG)

Formulation: Diclofenac sodium (Ivotec), 100.0 g; Kollidon® SR, 100.0 g; silicon dioxide, colloidal, 3.4 g; magnesium stearate, 3.4 g.

Manufacturing Directions

1. Pass all ingredients through a 0.8 mm sieve, blend for 10 minutes in a Turbula mixer, and then compress with medium-compression force at 206.40 mg.

DICLOFENAC TABLETS (50 MG)

Formulation: Diclofenac sodium, 50.0 g; Ludipress®, 150.0 g; magnesium stearate, 1.5 g; polyethylene glycol 6000, powder, 15.0 g; Kollidon® CL, 10.0 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force at 226 mg.

DIDANOSINE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Didanosine	50.00
17.00	2	Microcrystalline cellulose	17.00
2.10	3	Sodium starch glycolate	2.10
0.60	3	Magnesium stearate (for compaction)	0.60
0.40	4	Magnesium stearate (for tableting)	0.30

Manufacturing Directions

1. Sift items 1 to 4 through a 250 μm mesh, mix well, and dry compress.
2. Pass granules through a large mesh and blend with item 4. Finally, compress into 70 mg tablets, using 8 mm punches.
3. Coat using Eudragit L-30D-55 coating solution. (See Appendix.)

DIETHYLCARBAMAZINE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Diethylcarbamazine citrate	102.00
100.00	2	Dicalcium phosphate	100.00
3.50	3	Gelatin	3.50
130.00	4	Lactose monohydrate	130.00
35.00	5	Starch (maize)	35.00
10.00	6	Talc	10.00
3.50	7	Magnesium stearate	3.50
—	8	Water, purified	QS

Manufacturing Directions

1. Sift items 1, 2, and 4 through a 500 μm sieve, and place them in a suitable blender. Blend for 5 minutes.
2. In a separate vessel, place items 3 and 5; add sufficient hot item 8 to dissolve and disperse into a smooth slurry.
3. Add step 2 into step 1, make a suitable wet mass, and pass through a 2.38 mm sieve onto paper-lined trays. Dry overnight at 60°C to an LOD of not more than 2.5%.
4. Pass the dried granules through a 16 mesh sieve into a blending vessel.
5. Sift items 6 and 7 through a 250 μm sieve, add to step 4, and blend for 1 minute.
6. Compress into 350 mg tablets, using 9.7 mm punches.

DIFENOXIN AND ATROPINE TABLETS (0.5 MG/0.025 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.50	1	Difenoxin hydrochloride	0.50
0.025	2	Atropine sulfate	0.025
88.00	3	Lactose monohydrate	88.00
23.00	4	Starch (corn)	23.00
2.50	5	Starch (corn)	2.50
5.00	6	Talc	5.00
1.00	7	Magnesium stearate	1.00
—	8	Water, purified	QS

Manufacturing Directions

1. Blending
   a. Prepare a blend of lactose, starch (item 4), and talc.
   b. Blend difenoxin hydrochloride and atropine sulfate with a small quantity of blend from step 1a.

c. Blend this premix with the remainder of step 1. Pass through a 40 mesh (420 μm aperture or similar) screen.
d. Slurry the starch (item 5) in 5 mL of cold purified water. Add the slurry to 20 mL of boiling purified water.
e. Mass blend with starch paste from step 1d, adding more hot purified water, if necessary.
f. Pass the mass through an 8 mesh (2.38 mm aperture or similar) screen.
g. Dry the granules at 35°C (95°F) until the LOD is not greater than 5%.
h. Screen the dried granules through a 20 mesh (840 μm aperture or similar) screen, and lubricate with magnesium stearate.

2. Compression: Compress on a rotary tablet machine using 6.35 mm circular punches.

DIGOXIN TABLETS (0.125 MG/0.25 MG), LANOXIN

Lanoxin is supplied as 125 μg (0.125 mg) or 250 μg (0.25 mg) tablets for oral administration. Each tablet contains the labeled amount of digoxin and the following inactive ingredients: corn and potato starches, lactose, and magnesium stearate. In addition, the dyes used in the 125 μg (0.125 mg) tablets are D&C Yellow No. 10 and FD&C Yellow No. 6.

DIGOXIN TABLETS

Manufacturing Directions

1. Add 12.5 g digoxin and 50.5 g polyvinylpyrrolidone (MGW: 25,000) in 1500 g of an isopropanol–water mixture (7+3) to the pot of a planetary agitator of 20 L volume.
2. Add 437 g of amorphous, porous silica in portions to this solution while stirring with a blade agitator.
3. After silica has combined with the liquid phase, and the batch has taken on a gel-type, completely lump-free structure, add 4500 g of lactose is added in portions, and vigorously mix the batch.
4. Spread the pasty mass evenly on drying trays and dry for 3 hours at 80°C. Thereafter, pass the dry material through a 0.75 mm screen, provide with an addition of 15 wt.% of pelletizing aids, and compact to tablets in the usual manner.

DIHYDROXYALUMINUM SODIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
31.00	1	Dihydroxyaluminum sodium carbonate (Giulini A 265)	31.00
61.50	2	Sugar	61.50
2.00	3	Magnesium stearate	2.00
15.00	4	Starch	15.00
QS	5	Flavor, sweetener	0.50

Manufacturing Directions

1. Blend to mix and compress into 110 mg tablets, using 6 mm punch.

DILTIAZEM HYDROCHLORIDE TABLETS (60 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Diltiazem hydrochloride	60.00
100.00	2	Lactose monohydrates	100.00
66.00	3	Oil castor hydrogenated (Cutina HR)	66.00
20.00	4	Polyethylene glycol 8000, milled	20.00
0.06 mL	5	Alcohol isopropyl anhydrous	60.00 mL
4.00	6	Magnesium stearate	4.00

Manufacturing Directions

1. Mill castor oil hydrogenated through a 120 mesh (125 μm aperture) screen at medium speed with knives forward.
2. Load milled castor oil hydrogenated from step 1, lactose (item 2), and diltiazem hydrochloride into a suitable planetary mixer, and dry blend for 10 to 15 minutes.
3. Dissolve the polyethylene glycol in the isopropyl alcohol (warm to 40–45°C, if necessary).
4. Gradually add the warm solution from step 3 to powder blend, and mix until a suitable mass is obtained.
5. Pass the mass through a 4 mesh (4.8 mm aperture) screen, and spread on paper-lined oven trays.
6. Dry the granules at 45°C to 50°C to an LOD of not more than 1% (at 60°C under vacuum for 3 hours). Allow to cool.

7. Mill the dried granule through a 16 mesh (1.19 mm aperture) screen, with knives forward at medium speed. As an alternative, pass the dried granule through a 1.19 mm aperture screen fitted to an oscillating granulator.
8. Load the screened granule into a suitable blender, add magnesium stearate, and blend for 5 to 10 minutes.
9. Compress on a suitable rotary machine, using 3/8 in. standard concave punches. The theoretical weight of 10 tablets is 250 mg/tablet, with hardness not less than 4 kPa.

DILTIAZEM TABLETS 60 MG CARDIZEM

Cardizem direct-compression tablets: Each tablet contains 30, 60, 90, or 120 mg of diltiazem HCl. It also contains D&C Yellow No. 10 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake (60 and 120 mg), or FD&C Blue No. 1 Aluminum Lake (30 and 90 mg), hydroxypropyl methylcellulose, lactose, magnesium stearate, methylparaben, microcrystalline cellulose, silicon dioxide, and other ingredients.

DILTIAZEM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Diltiazem	60.00
141.00	2	Ludipress®	141.00
5.00	3	Polyethylene glycol 6000 powder	5.00
1.00	4	Aerosil® 200	1.00
1.00	5	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force.
2. Compress into 215 mg tablets, using 8 mm biplanar punches.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Dimenhydrinate	50.00
245.00	2	Ludipress®	245.00
5.00	3	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components, sieve, and press with low-compression force.
2. Compress into 300 mg tablets, using 8 mm biplanar punches.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Dimenhydrinate	50.00
50.00	2	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
125.00	3	Lactose	125.00
2.29	4	Croscarmellose sodium (Ac-Di-Sol, SD-711)	2.29
1.00	5	Fumed silicon dioxide	1.00
0.50	6	Stearic acid	0.50
0.50	7	Magnesium stearate	0.50

Manufacturing Directions

1. Screen items 1, 5, and 6 separately through a 40 mesh sieve.
2. Blend items 1, 2, 4, and 5 in a V-blender for 3 minutes.
3. Add item 3 in the blender, and mix for 17 minutes.
4. Add item 6, and blend for 3 minutes.
5. Add item 7 to the blender, and mix for 5 minutes.
6. Compress using 3/8 in., flat, beveled-edge punches to a hardness of 6 kPa and average tablet weight of 228 mg.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Dimenhydrinate	100.00
40.00	2	Lactose monohydrate	40.00
40.00	3	Cornstarch	40.00
6.00	4	Kollidon® 90F	6.00
30.00	5	Isopropanol	30.00
14.00	6	Kollidon® CL	14.00
16.00	7	Talc	16.00
2.00	8	Aerosil® 200	2.00
2.00	9	Calcium arachinate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with item 5, dry, pass through a 0.8 mm sieve, mix with items 6 to 9, and press with low-compression force.
2. Compress into 210 mg tablets, using 9 mm biconvex punches.

DIMENHYDRINATE TABLETS (50 MG), DC

Formulation: Dimenhydrinate, 50 g; Aerosil® 200, 4.0 g; Ludipress®, 140 g; Kollidon® CL, 2.0 g; magnesium stearate, 1.5 g.

Manufacturing Directions

1. Mix dimenhydrinate with Aerosil® 200, add other components, and then sieve.
2. Press with low-compression force at 202 mg.

DIPHENHYDRAMINE AND PSEUDOEPHEDRINE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Diphenhydramine hydrochloride	25.00
60.00	2	Pseudoephedrine hydrochloride	60.00
415.00	3	Cab-o-Sil	415.00
200.00	4	Water	200.00

Manufacturing Directions

1. Mix diphenhydramine hydrochloride and pseudoephedrine hydrochloride in the water until thoroughly dissolved.
2. Pour Cab-o-Sil M5 (silicon dioxide) into a planetary mixer, to which add the dissolved drug solution and mix at slow speed.
3. Continue for 5 minutes, until the solution and Cab-o-Sil are completely mixed.
4. Dry the entire composition in a forced hot air oven for 7 hours at 50°C.
5. Dry the composition to an LOD of 1.0%.
6. Screen the dried material through a No. 30 U.S. Standard mesh screen and compressed to give average weight of 1.0 g containing 50 mg of diphenhydramine hydrochloride and 120 mg of pseudoephedrine hydrochloride.

DIPHENHYDRAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Diphenhydramine hydrochloride	25.00
150.00	2	Calcium phosphate (dibasic)	150.00
20.00	3	Starch (StaRX 1500)	20.00
QS	4	Polyvinylpyrrolidone (PVP)	QS
QS	5	Alcohol, USP	QS
75.00	6	Stearic acid (fine powder)	75.00
25.00	7	Cellulose (microcrystalline)	25.00
QS	8	Purified water, USP	QS

Manufacturing Directions

1. In a planetary mixer, load the diphenhydramine hydrochloride, calcium phosphate dibasic, and starch.
2. Mix for 5 to 10 minutes.
3. In a separate mixer, place polyvinylpyrrolidone, alcohol, and water in a: 1:50:40 ratio.
4. Moisten this mixture with solution from the previous step to granulate.
5. Record the volume used.
6. Pass the wet mass through a 14 mesh screen on dryer trays.
7. Dry the granulation at 120°F to 130°F, or use a fluid-bed dryer.
8. Pass the dried granules through a 20 mesh screen.
9. Transfer dried granules to twin-shell blender, and add stearic acid (previously passed through a 30 mesh screen) and microcrystalline cellulose.
10. Mix for 5 to 7 minutes.
11. Compress into 300 mg tablets, using a rotary press with 5/16 in. standard concave punches.

DIPHENOXYLATE HYDROCHLORIDE AND ATROPINE SULFATE TABLETS (2.5 MG/0.025 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
2.50	1	Diphenoxylate hydrochloride	2.50
0.025	2	Atropine sulfate	0.025
11.40	3	Starch (maize)	11.40
54.00	4	Lactose monohydrate	54.00
2.50	5	Starch (maize)	2.50
0.60	6	Magnesium stearate	0.60
QS	7	Water, purified, ca	11.00

Manufacturing Directions

1. Sieve item 5, and disperse into 2.50 g of cold item 7. Then, add the balance of item 7 at 70°C, and heat to 80°C until completely gelatinized. Prepare a smooth slurry without lumps.
2. Leave the starch paste to cool to 40°C to 50°C.
3. Sieve item 4 and item 3 through a 250 μm sieve. Load items 1 and 2 into the mixer, and mix the items for 5 minutes at medium speed.
4. Add a starch paste cooled to 40°C to 50°C, and mix for 3 minutes at slow speed until a satisfactory mass is obtained. Add extra item 7 if required.
5. Spread the wet granules onto trays, and dry at 55°C for 12 hours.
6. Pass the dried granules through a 1 mm sieve.
7. Sieve item 6 through a 250 μm sieve, add to granules, and mix for 1 minute.
8. Compress into 71 mg tablets, using 5.5 mm punches.

DIVALPROATE SODIUM TABLETS (125 MG), DEPAKOTE

Depakote tablets are supplied in three dosage strengths containing divalproex sodium equivalent to 125, 250, or 500 mg of valproic acid. The inactive ingredients are cellulosic polymers, diacetylated monoglycerides, povidone, pregelatinized starch (contains cornstarch), silica gel, talc, titanium dioxide, and vanillin. In addition, individual tablets contain the following: 125 mg tablets: FD&C Blue No. 1 and FD&C Red No. 40; 250 mg tablets: FD&C Yellow No. 6 and iron oxide; and 500 mg tablets: D&C Red No. 30, FD&C Blue No. 2, and iron oxide.

DIVALPROATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
6.25	1	Povidone K 29–32	6.25
125.00	2	Valproic acid; use divalproex sodium	134.55
25.00	3	Cornstarch	25.00
6.25	4	Povidone K 29–32	6.25
35.00	5	Silicon dioxide	35.00
QS	6	Alcohol SD 3A 200 proof, ca	38 mL
7.50	7	Silicon dioxide	7.50

Manufacturing Directions

Caution: Avoid inhaling or making skin contact with sodium hydrogen divalproate. Wear dust respirator and eye protection during the processing of granulating, lubricating, and compressing sections.

1. Granulation
   a. Dissolve povidone (item 1) in approximately 33 mL of alcohol.

      Caution: Sodium divalproate melts under excessive shear. Ensure adequate lubrication during the milling step.
   b. Cross-feed sodium hydrogen divalproate, pregelatinized starch, povidone (item 4), and approximately one-half of the silicon dioxide (item 5) through a comminuting mill, fitted with a 686 μm aperture screen at high speed, hammers forward.

      Note: To permit easy milling, it is advantageous to premix sodium hydrogen divalproate with one-third of silicon dioxide (item 5) for 5 minutes in a suitable mixer before passing through the comminuting mill.
   c. Load the milled materials from step 2 and the remaining silicon dioxide (item 5) into a suitable mixer. Blend for 5 to 10 minutes. Add povidone solution (step 1a) to the contents of the mixer to obtain a suitable mass. The materials do not wet easily, but they overmass rapidly. If necessary, add extra alcohol, up to 15 mL. Another method, if using high-shear mixers, is to load the milled materials from step 2 and the remaining silicon dioxide into the mixer bowl. Blend at fast mixer/fast chopper conditions for 2 minutes. Add the povidone solution (step 1) over a period of 20 to 30 seconds using fast mixer/fast chopper conditions. Discharge from the mixer at a motor current of 35 to 40 amps. If necessary, add extra alcohol, portion wise, up to 8 mL, allowing sufficient time between additions to ensure that the motor current does not exceed 40 amps.
   d. Pass the wet mass through an oscillating granulator fitted with a 4.0 mm aperture screen and spread on paper-lined oven trays. As an alternative, pass the wet mass through a 9.53 mm aperture screen fitted to a comminuting mill, at slow speed, with knives forward, and spread on paper-lined oven trays. Dry at 49°C to an LOD of not more than 2% (3 hours, 60°C, vacuum).

      Note: The balance of manufacturing in the "Granulation" process should be done at not more than 45% relative humidity and at temperatures of not more than 30°C.
   e. Pass the dried granule through a 1.18 mm or 1.40 mm aperture screen fitted to an oscillating granulator, or screen the dry granules on a 1.4 mm aperture screen fitted to a suitable sieve shaker. Pass coarse granule through either a 1.18 mm or a 1.40 mm aperture screen fitted to an oscillating granulator.
2. Lubrication

   Note: The balance of manufacturing in the "Lubrication" stage should be done at not more than 40% relative humidity and at not more than 30°C.

a. Load one-half of the screened granule from step 1d into a suitable blender. Add silicon dioxide (item 7) via a 1.7 mm aperture screen to the blender followed by the balance of the screened granule from step 1d.
b. Blend for 20 minutes, ensuring that no pockets or agglomerations of lubricant silicon dioxide remain.
c. Discharge into tared polythene-lined drums.

3. Compression: Compress into 215 mg tablets, using 6.24×11.90 mm punches. For higher-strength 250 and 500 mg tablets, use proportional amounts and larger-sized punches.

Note: The balance of manufacturing in the "Compression" stage must be done at not more than 40% relative humidity and at not more than 26.5°C.

a. Coating: Apply a PVP subcoat, an enteric opaque Methocel coating, and a finishing coat. (See Appendix for details.)

DIVALPROEX SODIUM TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Valproic acid; use divalproex sodium, milled	538.20
80.00	2	Hydroxypropyl methylcellulose (Methocel K 15 M), CR	80.00
180.00	3	Methyl cellulose (Methocel K100 L), CR	180.00
121.80	4	Lactose, anhydrous	121.80
50.00	5	Microcrystalline cellulose (Avicel™ PH 101)	50.00
30.00	6	Colloidal silicon dioxide	30.00

Note: Item 3 can be replaced by item 4. Note that this is a once-daily use formulation.

Manufacturing Directions

1. Pass item 1 through a 40 mesh sieve (0.42 mm nominal mesh opening) and place in a suitable mixing vessel.
2. Pass items 2 to 5 through a 250 µm mesh, add to step 1, and mix for 20 minutes.
3. Add item 6 to step 2, and blend for an additional 5 minutes.
4. Compress into 1000 mg tablets, using a suitable punch.

DOXAZOSIN MESYLATE TABLETS (1 MG/2 MG/4 MG/8 MG)

Doxazosin mesylate is available as colored tablets for oral use and contains 1 mg (white), 2 mg (yellow), 4 mg (orange), and 8 mg (green) of doxazosin as the free base. The inactive ingredients for all tablets are microcrystalline cellulose, lactose, sodium starch glycolate, magnesium stearate, and sodium lauryl sulfate. The 2 mg tablet contains FD&C Yellow No. 10 and FD&C Yellow No. 6; the 4 mg tablet contains FD&C Yellow No. 6; the 8 mg tablet contains FD&C Blue No. 10 and FD&C Yellow No. 10.

DOXYCYCLINE HYDROCHLORIDE TABLETS (100 MG)

Inert ingredients for the tablet formulation are ethyl cellulose, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, propylene glycol, sodium lauryl sulfate, talc, titanium dioxide, and FD&C Yellow No. 6 Lake. Inert ingredients for the coated pellets are lactose, NF; microcrystalline cellulose, NF; and povidone, USP. Each shell and band contains FD&C Blue No. 1; FD&C Yellow No. 6, D&C Yellow No. 10; gelatin, NF; silicon dioxide; sodium laurel sulfate, NF; and titanium dioxide, USP.

DOXYCYCLINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Doxycycline hydrochloride	100.00
40.00	2	Microcrystalline cellulose PH102	40.00
3.00	3	Aerosil® 200	3.00
13.00	4	Sodium starch glycolate	13.00
1.75	5	Magnesium stearate	1.75
2.00	6	Talc	2.00

Manufacturing Directions

1. Place items 1 to 6 in a suitable blender after passing them through a 60 mesh sieve.
2. Mix the items for 10 minutes.
3. Compress into 160 mg tablets, using 12×5 mm punches.
4. Coat using HPMC coating. (See Appendix.)

DOXYCYCLINE MONOHYDRATE TABLETS

Manufacturing Directions

1. Doxycycline monohydrate (105.8 g) and microcrystalline cellulose (45 g) are mixed for 15 minutes in a planetary mixer.

2. The mixture is then granulated with 60 mL of water. After 10 minutes of kneading, the obtained wet mass is passed through a 2 mm sieve and the wet granulation dried at about 40°C until its water content is below 2% by weight.
3. The granulate is then passed through a 0.71 mm sieve and is mixed for 20 minutes with low-substituted hydroxypropyl cellulose LHll (18 g), hydroxypropyl methylcellulose 5 cps viscosity (4 g), saccharin (10 g), colloidal silica (0.6 g), and enough lactose to bring the total weight of the mixture to 248 g. Then, magnesium stearate (2 g) is added, and the mixing is continued for an additional 2 minutes.
4. The resulting mixture is compressed into tablets, each of about 250 mg, about 9 mm diameter, and hardness of 70 to 100 N, or into tablets, each of about 125 mg, having a hardness of 60 to 90 N. The tablets disintegrate completely in water at room temperature within 30 to 45 seconds.

EFAVIRENZ TABLETS

Manufacturing Directions

1. Core tablet: Efavirenz, 950 g; microcrystalline cellulose NF, 380 g; hydroxypropyl cellulose LF NF, 60.8 g; croscarmellose sodium, 95 g; sodium lauryl sulfate, 19 g; lactose hydrous spray dried, 19.8% w/w; magnesium stearate, 1% w/w; water, 1.045 L.
2. Film coating material per tablet: 3.3% by wt of tablet hydroxypropyl cellulose LF NF 8.54 mg (2.5%), hydroxypropyl methylcellulose USP 6CPS 8.54 mg (2.5%), titanium dioxide USP 3.42 mg (1%), and water (94%).
3. Blend Efavirenz (950 g) with microcrystalline cellulose (380 g), sodium lauryl sulfate (19 g), hydroxypropyl cellulose (60.8 g), and croscarmellose sodium (95 g) in a Fielder 10 L high-shear granulator mixer for 4 minutes.
4. Add at least about 1.1 wt% water per weight of efavirenz (1.045 L) to wet granulate the blended mixture over about 6 minutes to about 8 minutes to agglomerate the mixture using an appropriate spray nozzle.
5. Dry the granulated mixture to a moisture content of about 2% to about 5% in a GlattWST-15 fluid-bed dryer.
6. Mill the dried mixture using a 40 G round screen in a Comil. Blend the milled mixture in a V-blender with lactose for 4 minutes (calculated amount is the amount needed to make the final composition contain 19.8% lactose by weight).
7. Lubricate the blended mixture with magnesium stearate (calculated amount is the amount needed to make the final composition contain 1% magnesium stearate by weight) in the V-blender for 3 minutes.
8. Compress the lubricated mixture.
9. Film coat the compressed tablets with an aqueous coating suspension that contains 2.5% hydroxypropyl cellulose (HPC); 2.5% hydroxypropyl methylcellulose (HPMC); and 1% titanium dioxide and 94% water by weight percent in a pan coater to a coat weight of about 3.3% per tablet. Note that the coat is the dried form of the suspension.

ELETRIPTAN-COATED FAST-CRUMBLING GRANULE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
98.50	1	Eletriptan (salt)	98.50
4.90	2	AGG sodium croscarmellose	4.90
20.40	3	Ethyl cellulose	20.40
4.00	4	Polyoxyethylene glycol 6000	4.00
3.70	5	AGM sodium croscarmellose precipitated	3.70
1.40	6	Precipitated silica	1.40
3.90	7	Aspartame	3.90
3.50	8	Ac-Di-Sol	3.50

Manufacturing Directions

1. First prepare a granulation solution by dissolving 48 g of ethyl cellulose in 273 g of ethyl alcohol.
2. Prepare a coating suspension by mixing 97 g of ethyl cellulose, 28.5 g of polyethylene glycol 6000, 26 g of sodium croscarmellose, 10 g of precipitated silica, and 27.5 g of aspartame in 1900 g of ethyl alcohol, until a homogeneous suspension is obtained.
3. Then fluidize the powder mixture consisting of 700 g of eletriptan and 35 g of Ac-Di-Sol.
4. Start the granulation process by spraying the granulation solution for about 15 to 20 minutes at a spraying rate of 25 g/min and a suspension atomization pressure of 0.8 bar.
5. Perform the actual coating by spraying the coating suspension for about 1.5 hours at a spraying rate of about 15 to 20 g/min and a suspension spraying pressure of 1.5 bar.
6. Formulate the coated granules thus obtained as fast-crumbling multiparticulate tablets, the composition of which is as follows:
   a. Coated granules: Eletriptan, 136.8 mg (salt) (equivalent to 80 g of base active principle); mannitol, 575.20 mg; sodium croscarmellose, 24 mg; aspartame, 30 mg; mint liquorice, 10 mg; magnesium stearate, 8 mg.

b. Manufacture the tablets by screening all the excipients, followed by homogenization of the granules coated with the mixture of excipients in a plowshare granulator. Distribute the granules obtained and shape on a rotary tableting machine. The hardness of the tablets obtained is about 30 N.

ENALAPRIL MALEATE TABLETS (2.5 MG/5 MG/10 MG/20 MG) VASOTEC

Enalapril maleate is supplied as 2.5, 5, 10, and 20 mg tablets for oral administration. In addition to the active ingredient enalapril maleate, each tablet contains the following inactive ingredients: lactose, magnesium stearate, starch, and other ingredients. The 2.5, 10, and 20 mg tablets also contain iron oxides.

ENALAPRIL MALEATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Enalapril maleate	20.00
10.00	2	Sodium carbonate powder	10.00
146.72	3	Lactose hydrous powder	146.72
22.00	4	Starch (corn)	22.00
1.10	5	Magnesium stearate	1.10
0.050	6	Iron oxide red	0.050
0.130	7	Iron oxide yellow	0.130

Manufacturing Directions

Note: Use goggles, and wear dust protection. Also, process under low-humidity conditions.

1. Granulation: Mix the ingredients with the excipients in a planetary mixer. Pass through a FitzMill equipped with a stainless steel screen, and remix in the planetary mixer. Wet the granulate with starch paste. Pass the wet mass through FitzMill. Dry the granules in hot air, and pass the dried granules through a FitzMill. Collect in polyethylene-lined containers.
2. Lubrication: Transfer the dried, milled granules into the planetary mixer, add magnesium stearate, and mix. Collect in polyethylene-lined drums.
3. Compression: Compress into 200 mg tablets, using round punches.

ENALAPRIL MALEATE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Enalapril maleate	20.00
5.00	2	Sodium carbonate powder	5.00
160.50	3	Lactose hydrous powder	160.50
22.00	4	Starch (corn)	22.00
1.10	5	Magnesium stearate	1.10
0.050	6	Iron oxide red	0.050

Manufacturing Directions

1. Follow the instructions listed for the 20 mg strength.

ENOXACIN TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Enoxacin; use enoxacin sesquihydrate	434.00
80.00	2	Calcium carboxymethyl cellulose	80.00
6.00	3	Hydroxypropyl methylcellulose	6.00
60.00	4	Cellulose microcrystalline (Avicel™ PH 101)	60.00
6.00	5	Silicon dioxide colloidal	6.00
14.00	6	Magnesium stearate	14.00
QS	7	Water, purified, ca	200 mL

Manufacturing Directions

1. Granulation
   a. If necessary, mill the enoxacin using a comminuting mill fitted with a 3 mm screen or sift through a 425 μm (40 mesh) screen.
   b. Load the enoxacin and calcium carboxymethyl cellulose into a suitable mixer, and blend for 10 minutes.
   c. Dissolve the hydroxypropyl cellulose in 200 mL of hot (80°C) water and allow to cool to below 40°C.
   d. Add the solution from step 3 to the powder blend from step 2. Mix to produce a satisfactory mass. If necessary, add more purified water.
   e. If necessary, pass the wet mass through a 4 mm screen, and load onto paper-lined trays.
   f. Dry at 55°C to give an LOD of 6.5% to 7.5% (140°C, 2 hours).

g. Pass the dried granulation through a 1.00 mm screen using a suitable granulator, adding Avicel™ , silicon dioxide colloidal, and magnesium stearate, simultaneously.
h. Blend for 5 minutes in a suitable mixer.

2. Compression: Compress using 16.00×8.00 mm ovaloid punches.
3. Coating: Coat using aqueous Methocel coating. (See Appendix.)

ENTACAPONE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
200.00	1	Entacapone	200.00
50.00	2	Microcrystalline cellulose	50.00
400.00	3	Mannitol	400.00
10.00	4	Magnesium stearate	10.00

EPLERENONE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
50.00	1	Eplerenone	50.00
71.40	2	Lactose monohydrate	71.40
26.14	3	Microcrystalline cellulose intragranular PH101	26.14
18.00	4	Microcrystalline cellulose extragranular	18.00
5.10	5	Hydroxypropyl methylcellulose 2910	5.10
8.50	6	Croscarmellose sodium (Ac-Di-Sol)	8.50
1.70	7	Sodium lauryl sulfate	1.70
1.70	8	Talc	1.70
0.85	9	Magnesium stearate	0.85

Manufacturing Directions

1. Mix and granulate by wet method and compress into 50 mg dose immediate-release tablet (tablet diameter of 9/32 in.) or 25 mg dose immediate-release tablet (tablet diameter of 7/32 in.) using appropriate fill weight.
2. Coat tablets using Opadry White YS-1–18027A at 3% or alternately, Opadry Yellow YS-1–12524-A at 4% gain.

ERGOTAMINE TARTRATE FAST-MELT TABLETS

1. Ergotamine tartrate, 10%; sodium bicarbonate, 27%; citric acid anhydrous, 22%; Avicel™ PH113, 15%; xylitol, 15%; L-HPC LH-11, 5%; Fujicalin SG, 4%; Crodesta F160, 2%.
2. Dry these ingredients to significantly reduce the moisture content of each material.
3. Blend for 10 minutes, and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix EGT-EGF (20–80 mesh), 55%; microcrystalline cellulose, 26%; mannitol, 10%; Ac-Di-Sol, 2.5%; L-HPC LH-11, 2.5%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; and fumed silicon dioxide, 0.1%.
5. Pass these granules through a 20 mesh screen, and then blend for 5 minutes prior to compression.
6. Compress ergotamine tartrate tablets to a hardness of approximately 1 to 5 kPa, and tablets should disintegrate in water in approximately 15 to 35 seconds.

ERYTHROMYCIN AND SULFAMETHOXAZOLE TABLETS

Manufacturing Directions

1. Load 500 g of sulfamethoxazole and 10 g of a starch derivative into a mass mixer. Add 10 grams of cornstarch along with sufficient water to make a starch paste. Use this starch paste to make a standard granulation tableting, which should be dried and sized.
2. Separately, load 275 g of erythromycin and 10 g of conventional cellulosic binder into a mass mixer. Add a solution of 10 g povidone in water, and granulate the mixture. Dry the granulation and size in similar fashion to the sulfamethoxazole granulation, to yield particles of 10 to 40 mesh. Recycle oversize and undersize particles.
3. Separately, disperse 80 g of a cellulose phthalate enteric coating polymer and 8 g of an alkyl citrate plasticizer in a sufficient quantity of acetone and ethanol to make a solution. Add 0.3 g of blue dye lake , and stir the dispersion to mix.
4. Coat the erythromycin granulation with this solution in a particle coater, and size the resulting coated particles.
5. Separately, load a portion of the sulfamethoxazole granulation into a blender. Add the dried erythromycin-coated particles sized to 10 to 40 mesh, as well as 200 g of microcrystalline cellulose, NF and 4 g of conventional lubricants and glidants. Add the remainder of the sulfamethoxazole granulation, and blend the mixture. Compress this blended material in a conventional tablet press at applied force of 1500 to 6000 lb/in^2 into tablets having a weight per 10 tablets of approximately 12 g.

ERYTHROMYCIN ETHYLSUCCINATE TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Erythromycin; use erythromycin ethylsuccinate, citrate, washed[a]	470.58
200.00	2	Sucrose	200.00
200.00	3	Sodium citrate	200.00
50.00	4	Starch (maize)	50.00
2.50	5	Dye (optional)	2.50
—	6	Water, purified, ca	90.00
40.00	7	Polacrilin potassium (Amberlite IRP-88)	40.00
6.00	8	Magnesium stearate	6.00

[a] Adjust for potency; taken as 850 μg/g for the amount given.

Manufacturing Directions

Caution: Protect face and hands; relative humidity in the working area should not exceed 50%.

1. Granulation
   a. Pass the following items through a 0.5 mm aperture stainless steel screen: erythromycin ethylsuccinate, sucrose, sodium citrate, starch (maize), and dye (if used). Transfer the screened items to a suitable planetary mixer, and mix for 10 minutes.
   b. While mixing, add purified water to the powders from step 1 until a suitable mass is formed. If necessary, add more purified water to complete the granulation.
   c. Pass the wet mass from step 1b through a suitable granulator fitted with a 2.0 mm aperture stainless steel screen. Collect the granules on paper-lined trays.
   d. Dry the granules in an oven at 50°C until the LOD content is in the range of 1% to 1.5%.
   e. Pass the dried granules through a suitable granulator fitted with a 1.0 mm aperture screen. Collect the granules, and store in securely closed, double polyethylene-lined drums.
2. Lubrication
   a. Place into a suitable blender the dried, screened granules from step 1e.
   b. Pass the Amberlite and magnesium stearate through a 0.5 mm aperture stainless steel screen. Add the screened powders to the blender.
   c. Blend for 10 minutes.
   d. Discharge the blended granules into double polyethylene-lined drums. Close securely, and store until ready for compression.
3. Compression: Compress using 9 × 19 mm ovaloid punches. Compress 967 mg. If using dye, compress 969 mg per tablet.
4. Coating: Apply Methocel, opaque Methocel, and Celar glass Methocel* coatings. (See Appendix.)

ERYTHROMYCIN PARTICLE-COATED TABLETS (150 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Cellulose microcrystalline (Avicel™ PH 101)	150.00
12.00	2	Sodium starch glycolate	12.00
12.00	3	Hydroxypropyl cellulose	12.00
150.00	4	Lactose monohydrate powder	150.00
QS	5	Alcohol SD 3A 200 proof, ca	200 mL
333.00	6	Erythromycin; use erythromycin particle coated[a]	530.25
1.25	7	Stearic acid	1.25
1.25	8	Wax hydrogenated vegetable (Sterotex K)	1.25
1.25	9	Magnesium stearate powder	1.25
1.25	10	Silicon dioxide	1.25

[a] Adjust weight of erythromycin-coated particles to allow for variable potency: (333 × 1000)/potency = G required for 1000 tablets. Adjust the weight of cellulose and microcrystalline NF (7) to compensate for variable potency of erythromycin. The amount required is 770.75; the factor weight of item 6 is G, required for 1000 tablets.

Manufacturing Directions

Caution: Protect face and hands from erythromycin, because some individuals may be sensitive, and reactions may occur. Take a shower after excessive exposure during manufacture.

1. Granulating
   a. Load cellulose microcrystalline (item 1), sodium starch glycolate, hydroxypropyl cellulose, and lactose into a suitable mixer. Mix for approximately 20 minutes.
   b. Granulate by adding approximately 200 mL of alcohol while mixing.
   c. Pass wet granulation through a 5/8 in. band in rotary granulator or a similar granulator.

d. Spread on paper-lined trays, and dry at 49°C until reaching an LOD of not more than 2% (60°C, 3 hours vacuum).
e. Pass dried granulation through 1.2 mm aperture screen. Mill oversize material through a 1.2 mm screen, knives forward, medium speed, using a FitzMill.
f. Fill into polyethylene-lined drums.

2. Lubricating
   a. Load ingredients from step 1f into the blender.
   b. Add erythromycin-coated particles.
   c. Mix and mill approximately 12.5 g of cellulose microcrystalline (item 7), stearic acid, hydrogenated vegetable oil wax, magnesium stearate, and colloidal silicon dioxide through 595 µm aperture screen, knives forward, at high speed, using a FitzMill, into a blender.
   d. Load the balance of the cellulose microcrystalline (item 7) into the blender, and blend for 10 minutes.
   e. Discharge into polyethylene-lined drums.
3. Compression
   a. Compress the product using ovaloid 8.6×18.9 mm punches.
   b. Do not grind tablets or rework culls. Use a compressing machine with a force feeder.
   c. The weight of 10 tablets is 11 g, the thickness is 7.7 to 8.6 mm, and the hardness is 18 to 25 kPa.
4. Coating: Use the HPMC clear coating solution. (See Appendix.)

ERYTHROMYCIN TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Erythromycin; use erythromycin stearate (600 µg/mg[a])	166.667
91.18	2	Sodium citrate dihydrate powder	91.180
3.287	3	Povidone K 29–32	3.287
11.51	4	Sodium carboxymethyl cellulose, high viscosity	11.518
—	5	Alcohol denatured 200 proof	50.800 mL
8.68	6	Polacrilin potassium (Amberlite IRP-88)	8.684

[a] Adjust for potency.

Manufacturing Directions

1. See following.

ERYTHROMYCIN TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Erythromycin, use erythromycin stearate (600 µg/mg[a])	166.66
100.00	2	Sodium citrate dihydrate powder	100.00
12.80	3	Povidone K 29–32	12.80
14.20	4	Sodium carboxymethyl cellulose, high viscosity	14.20
—	5	Alcohol denatured 200 proof	50.80 mL

[a] Adjust for potency.

Manufacturing Directions

1. Granulation
   a. Sift the sodium citrate through a 600 µm aperture or similar screen.
   b. Place erythromycin stearate, sodium citrate, povidone, starch, and sodium carboxymethyl cellulose in a mixer, and mix for 15 minutes.
   c. Gradually add sufficient alcohol, while mixing, to produce a suitable mass.
   d. Dry the granulation at 49°C to less than 1.5% LOD or 7% moisture by Karl Fischer.
   e. Sift the dried granulation through a 1.19 mm aperture screen, or similar, and mill the oversized material through a #2 (1.59 mm aperture, or similar) band on the Hammer mill (FitzMill), or similar, at medium speed, knives forward, for 0 to 30 minutes.
   f. Load the granulation into the blender, add Amberlite IRP-88, if used, and blend for 20 to 30 minutes.
   g. Unload the contents of the blender into polyethylene-lined drums, and deliver to the compressing area.
2. Compression: Compress using 9.5 mm standard concave punches. Fill to appropriate amount.

ERYTHROMYCIN TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Erythromycin, use erythromycin stearate (630 µg/mg[a])	794.00
146.00	2	Starch (corn)	146.00
16.00	3	Povidone K 29–32	16.00
104.00	4	Magnesium hydroxide	104.00
—	5	Alcohol SD 3A 200 proof	210–250 mL
26.00	6	Polacrilin potassium (Amberlite IRP-88)	26.00

Note: During the drying step of granulation, starch has a water loss equivalent to approximately 6.2% of its weight. This enables a theoretical reduction in tablet weight of 9 mg. This may, however, be offset by a loss of active ingredient during the manufacturing process.

[a] Do not use erythromycin stearate with a potency less than 610 µg/mg. Calculate the actual quantity of erythromycin stearate. Do not factor in any ingredient to compensate for erythromycin stearate potency change.

Manufacturing Directions

1. Granulation
   a. Load povidone, cornstarch, magnesium hydroxide, and approximately one-half of erythromycin stearate into a suitable blender, and blend for 10 minutes. Add the balance of the erythromycin stearate, and blend for 15 minutes.

      Note: Proceed to step 1d if only one wet granulation step is necessary.
   b. Empty the blender into tared, polyethylene-lined drums, and weigh for yield.
   c. Divide the blended powder into equal portions for massing. (The size of a massing "part" is predetermined from considering the capacity of the massing equipment.)
   d. Load preblended materials from step 1b into the mixer.
   e. Wet granulation, conventional method: Add 210 mL of alcohol slowly over a period of 10 minutes and mix for 5 minutes. If necessary, add additional alcohol (20–40 mL), and mix until a satisfactory mass is obtained. Do not overmix. Usually, 5 minutes of mixing after the final addition of alcohol is sufficient. Record the total amount of alcohol used. Proceed to dry as in step 1g.
   f. Wet granulation, high-speed mixer method:
      i. Load preblended materials from step 1c into the mixer. Or, if preblending is not required, load povidone, cornstarch, magnesium hydroxide, and erythromycin stearate into the high-speed mixer, and mix for 3 minutes with the agitator at slow speed and the granulator at fast speed.
      ii. Add 150 mL of alcohol while mixing with the agitator at a slow speed and the granulator at a fast speed over a period of 2 minutes. Continue to mix for another 4 minutes, adding additional alcohol, if necessary, to obtain a satisfactory granulation.
   g. Spread the wet mass onto paper-lined trays. Commence the drying setup immediately after this step has been completed. Do not air dry.
   h. Load trays of granulation into a suitable drying oven, and dry at 50°C to 2% to 3.5% LOD, 3 hours in vacuum oven at 60°C, under 5 mmHg vacuum. Under no circumstances must the Karl Fischer test method be used. Other LOD tests may be used for process control, provided equivalence can be demonstrated to the quoted vacuum oven method.
   i. Alternative fluid-bed drying method: load granulate into fluid-bed dryer and dry at 40°C to 45°C.

      Note: It is important not to dry the granulation below 2%.

      This loss is obtained after approximately 4 hours' drying for oven loads from 70 to 130 kg, depending upon the amount loaded onto trays and the number of trays.
   j. Repeat steps 1d through 1h if there is more than one part of blended powder from step 1b.
   k. Allow the dried granule to cool, and then screen through an 840 µm aperture screen using an oscillating granulator or through a 1.8 mm aperture screen using a comminuting mill with cutters forward at medium speed. Record the total weight of granulation.
   l. Request samples.
   m. Proceed to "Blending and Lubrication."
2. Lubrication
   a. If Amberlite is lumpy, screen through a 600 µm aperture screen before preblending.
   b. Preblend Amberlite with a small portion of the granule and the blend with approximately one-half of the bulk granule for 5 minutes.
   c. Add the balance of granule, and blend for a further 10 minutes.
   d. Empty the blender into tared, polyethylene-lined drums. Weigh.
3. Slugging (if required): Use a suitable compressing machine with either 19 or 12 mm flat punches.
   a. Compress the material into slugs having the following specifications: for 19 mm, weight is 1.7 to 1.75 g, and hardness is 16 to 17 kPa; for 12 mm, weight is 0.8 to 0.85 g, and hardness is 14 to 15 kPa.
   b. The slugs should show no signs of lamination, capping, or surface melting and should break with a distinct snap.
   c. Reduce slugs by passing slowly through a 0.107 in. (2.7 mm) perforated screen using cutters at medium speed.

d. After reduction, lubricate as in step 2.

4. Compression

Note: Precompression may be used to meet hardness specifications.

5. Coating: Aqueous Methocel. (See Appendix.)

ESTAZOLAM TABLETS (1 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.00	1	Estazolam	1.00
120.65	2	Lactose monohydrate	120.65
8.37	3	Starch (maize)	8.37
3.78	4	Starch (maize)	3.78
QS	5	Water, purified	19.00 mL
1.20	6	Stearic acid	1.20

Manufacturing Directions

Caution: Use a respirator and gloves throughout; shower after exposure.

1. Granulation
   a. Mix starch (item 3) together with approximately 10 mL water in a glass or stainless steel vessel; avoid formation of lumps.
   b. Boil the remaining 18 mL of water, and add it to the mix from step 1a, with continuous stirring until a gel is formed. Further heat may be necessary. A mix temperature of 95°C must be achieved before a gel is formed.
   c. Pass estazolam through a 0.7 mm aperture stainless steel screen.
   d. Pass through a 1.19 mm aperture stainless steel screen lactose, starch (item 3), and hydroxypropyl cellulose into a suitable planetary mixer. Add screened estazolam, and mix for 10 minutes.
   e. Add the starch gel from step 1b, and mix for 20 minutes or until a suitable mass is formed.
   f. Pass the wet mass through an oscillating granulator or similar, fitted with a 2.38 mm aperture stainless steel screen. Collect granules on paper-lined trays.
   g. Dry in an oven at 50°C until the LOD is less than 7%.
   h. Pass the dried granules through an oscillating granulator or a similar granulator, fitted with a 1.4 mm aperture stainless steel screen. Collect in a polyethylene-lined drum and close securely.
2. Lubrication
   a. Place the dried granules into a suitable planetary or ribbon filter.
   b. Pass starch (item 4) and magnesium stearate through a 0.25 mm stainless steel screen and mix. Add this blend to the granules, and mix for 5 minutes. Transfer to polyethylene-lined drums.
3. Compression: compress in a suitable rotary machine using a 7 mm diameter beveled edge, with weight of 10 tablets at 1.2 g (1.17–1.23 g) and thickness of 2.35 mm ± 0.12 mm.

ESTAZOLAM TABLETS (2 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Estazolam	2.00
79.30	2	Lactose	79.30
24.30	3	Starch (maize), dried	27.10
2.40	4	Hydroxypropyl cellulose	2.40
5.00	5	Starch (maize)	5.00
QS	6	Water, purified	28.00 mL
5.70	7	Starch (maize)	5.70
0.30	8	Magnesium stearate	0.30

Manufacturing Directions

1. See the manufacturing directions for 1 mg formulation of estazolam.

ESTRADIOL TABLETS (0.5 MG/1 MG/2 MG), ESTRACE

Estrace tablets for oral administration contain 0.5, 1, or 2 mg of micronized estradiol per tablet. Estrace 0.5 mg tablets contain the following inactive ingredients: acacia, dibasic calcium phosphate, lactose, magnesium stearate, colloidal silicon dioxide, starch (corn), and talc. Estrace 1 mg tablets contain the following inactive ingredients: acacia, D&C Red No. 27 Aluminum Lake, dibasic calcium phosphate, FD&C Blue No. 1 Aluminum Lake, lactose, magnesium stearate, colloidal silicon dioxide, starch (corn), and talc. Estrace 2 mg tablets contain the following inactive ingredients: acacia, dibasic calcium phosphate, FD&C Blue No. 1 Aluminum Lake, FD&C Yellow No. 5 (tartrazine) (Aluminum Lake), lactose, magnesium stearate, colloidal silicon dioxide, starch (corn), and talc.

ESTRADIOL VAGINAL TABLETS (25.8 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.8 µg	1	Estradiol hemihydrate equivalent to estradiol 25 µg	0.0258
101.974	2	Lactose spray dried	101.974
15.00	3	Maize starch	15.00
2.00	4	Hypromellose	2.00
1.00	5	Magnesium stearate	1.00
2.60	6	Hypromellose	2.60
0.50	7	Polyethylene glycol 4000	0.50
—	8	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 3, and 4 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 5% (=2.5 g) powder from step 1 to step 3, and mix well.
5. Add 10% (=5 g) powder from step 1 to step 4, and mix well.
6. Add 15% (=7.6 g) powder from step 1 to step 5, and mix well.
7. Transfer step 6 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 5 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 120 mg tablets, using a suitable punch (6 mm, round).
13. Place item 8 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
14. Add item 7 to step 13 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Check that coating dispersion is clear and lump free.
15. Load core tablets from step 12 in coating pan and apply coating dispersion from step 14 to get 1.5% to 1.8% weight gain.

ESTROPIPATE TABLETS (0.626 MG/1.25 MG/2.25 MG/5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.626	1	Estropipate, 25% excess	0.769
157.02	2	Lactose monohydrate	157.02
1.00	3	Yellow dye	1.00
0.007	4	Yellow dye	0.007
1.00	5	Dibasic potassium phosphate, anhydrous	1.00
1.20	6	TRIS (tromethamine)	1.20
7.00	7	Hydroxypropyl cellulose	7.00
10.00	8	Sodium starch glycolate	10.00
40.00	9	Cellulose microcrystalline	40.00
QS	10	Water, purified	QS
QS	11	Alcohol SD 3A 200 proof	QS
0.50	12	Colloidal silicon dioxide	0.50
1.25	13	Magnesium stearate	1.25
1.25	14	Wax, hydrogenated vegetable oil (Sterotex K)	1.5

Note: For 1.25, 2.25, and 5.0 mg tablets, adjust with item 2 and modify dyes.

Manufacturing Directions

1. Granulation
   a. Load lactose cellulose microcrystalline, hydroxypropyl cellulose, dyes, or dye into mixer, and blend powders. If necessary, screen or mill powders to break up agglomerates. A portion of the cellulose microcrystalline may be added at the lubrication step.
   b. Dissolve the dibasic potassium phosphate in purified water. Use this solution to granulate powders in step 1a.
   c. Size wet granulation, dry, and pass through screen and mill.
   d. Dissolve tromethamine and estropipate in water or alcohol.
   e. Load granulation from step 1c and sodium starch glycolate into mixer, and mass with step 1d. Size wet granulation, and dry. Pass the dried granulation through screen and mill.
2. Lubrication
   a. Load the portion of the dried granulation into the blender.
   b. Screen colloidal silicon dioxide, magnesium stearate, and hydrogenated vegetable oil wax, and load into blender.
   c. Load remainder of dried granulation into blender and blend.
3. Compression: compress using a rotary machine using oval tooling. The theoretical weight is 221 mg.

ETHAMBUTOL TABLETS (400 MG)

Formulation: ethambutol, 400 g; sorbitol, crystalline, 200 g; Kollidon® VA 64,20 g; Kollidon® CL, 10 g; magnesium stearate, 10 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium/high-compression force at 620 mg.

ETHAMBUTOL TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Ethambutol hydrochloride	400.000
5.60	2	Silicon dioxide colloidal	5.600
68.00	3	Starch (corn) NF[a]	76.800
33.50	4	Mannitol	33.600
22.40	5	Starch (corn)	22.400
11.20	6	Corn oil hydrogenated	11.200
8.00	7	Magnesium stearate	8.000
11.20	8	Talc powder	11.200
QS	9	Water, purified	80.000

[a] The quantity of starch (corn) is based on a moisture content of 13% w/w. If the moisture content varies outside this range of 12.5% to 13.5%, then the amount used should be factored accordingly.

Manufacturing Directions

1. Massing
   a. Mix starch (item 5) with approximately 27.3 mL of purified water (item 9) in a glass or stainless steel vessel, avoiding the formation of lumps.
   b. Boil the remaining 52.8 mL of purified water (item 9), and add the mix from step 1a with continuous stirring until a gel is formed. Further heat may be necessary.
      Note: A mix temperature greater than 95°C must be exceeded before a gel is formed.
   c. Mill the ethambutol through a 1.59 mm aperture screen at medium speed with knives forward, then load into a suitable mixer.
   d. Pass silicon dioxide, starch (corn) (item 3), and mannitol through a 1.00 mm aperture stainless steel screen and add to the mixer. Mix at 60 rpm for 10 minutes.
   e. Pass the mixed powders from step 1d through a 1 mm aperture stainless steel screen and return to the mixer.
   f. Add, in one load, the starch gel from step 1b at 70°C to 80°C, and mix for 5 minutes at 60 rpm.
   g. Stop the mixer and inspect the mass. Add the extra 6.88 mL of purified water (item 10) at 50°C to complete the granulation while mixing. Mix for a further 5 minutes at 60 rpm.
2. Drying/granulation: Proceed to step 2a or 2b.
   a. Oven drying
      i. Pass the wet mass through an A granulator fitted with a 4.76 mm aperture stainless steel screen. Collect the granules on paper-lined trays.
      ii. Dry the granules in a hot air oven at 50°C, turning over the granules every half hour. After 1 hour of drying, pass the granules through an A granulator fitted with a 2.38 mm aperture stainless steel screen. Collect the granules on paper-lined trays, and return to the hot air oven at 50°C.
   b. Fluid-bed drying
      i. Pass the wet mass through an A granulator fitted with a 4.76 mm aperture stainless steel screen into the fluid-bed dryer bowl.
      ii. Dry the granules in the fluid-bed dryer at 50°C for 30 minutes, turning over after 15 minutes. Then, pass the granules through a granulator fitted with a 2.38 mm aperture stainless steel screen, and return to the fluid-bed dryer bowl with the air inlet and outlet fully open. Proceed to step 3.
   c. Continue drying the granules while turning them over every 30 minutes until the LOD is between 1.5% and 2%.
   d. Pass the dried granules through an A granulator fitted with a 1 mm aperture stainless steel screen. Collect the granules in a polyethylene-lined drum, and close securely.
   e. Request samples.
3. Lubrication
   a. Place the dried granules from step 2d in a suitable blender.
   b. Add hydrogenated corn oil , magnesium stearate, and talc via a 0.6 mm aperture stainless steel screen, and mix for 25 minutes.
   c. Transfer to a polyethylene-lined drum, and close securely until ready for compression.
4. Compression: compress on a suitable tablet machine using ovaloid punches that are 15.5×7.7 mm or 14.6×7.8 mm, where the weight of 10 tablets is 5.6 g, hardness is more than 5 kPa, and the disintegration time is not more than 15 minutes. If using a coating, move to the next step.
5. Coating: Use an HPMC methylene chloride coating. (See Appendix.)

ETHAMBUTOL TABLETS (800 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
800.00	1	Ethambutol	800.00
200.00	2	Dicalcium phosphate (Di-Tab)	200.00
30.00	3	Kollidon® 30	30.00
—	4	Isopropyl alcohol	QS
50.00	5	Kollidon® CL	50.00
15.00	6	Magnesium stearate	15.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4. Dry, pass through a 0.8 mm sieve, add items 5 and 6, and press with high-compression force.
2. Compress into 1.112 g tablets, using 20 mm oblong punches.

ETOPHYLLINE AND THEOPHYLLINE TABLETS (100 MG/22 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Etophylline powder (Knoll)	100.00
22.00	2	Theophylline, anhydrous	23.00
53.00	3	Ludipress®	53.00
1.00	4	Magnesium stearate	1.00
2.00	5	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press into tablets with low-compression force.
2. Compress into 175 mg tablets, using 8 mm biplanar punches. To enhance the flowability of the tableting mixture, the amount of Aerosil® 200 can be increased.

ETOPHYLLINE AND THEOPHYLLINE TABLETS (100 MG/22 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Etophylline powder (Knoll)	100.00
22.00	2	Theophylline, anhydrous	23.00
50.00	3	Starch (maize)	50.00
3.00	4	Kollidon® VA 64	3.00
4.00	5	Kollidon® VA 64	4.00
—	6	Water, purified, ca	35.00
1.00	7	Magnesium stearate	1.00
5.00	8	Talc	5.00

Manufacturing Directions

1. Granulate a mixture of items 1 to 4 with solution of items 5 and 6. Pass through a 0.8 mm sieve, dry, mix with items 7 and 8, pass through a 0.5 mm sieve, and press with medium-compression force.
2. Compress into 183 mg tablets, using 8 mm biplanar punches.

EZETIMIBE AND SIMVASTATIN TABLETS (10 MG/40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Ezetimibe	10.00
40.00	2	Simvastatin	40.00
94.92	3	Lactose monohydrate	94.92
40.00	4	Microcrystalline cellulose (Avicel™ PH102)	40.00
2.00	5	Hydroxypropyl methylcellulose	2.00
0.04	6	Butylated hydroxyanisole	0.04
3.00	7	Citric acid monohydrate	3.00
0.04	8	Propyl gallate	0.04
8.00	9	Croscarmellose sodium	8.00
2.00	10	Magnesium stearate	2.00
—	11	Water, purified	20.00
—	12	Ethanol 95%	10.00
4.00	13	Hydroxypropyl methylcellulose	4.00
—	14	Water, purified	35.00

Manufacturing Directions

1. Dissolve item 7 in half of item 11 (10 g) in a stainless steel container.

2. Dissolve item 5 in the mixture of remaining half quantity of item 11 and half quantity of item 12 (5 g) and add to step 1 and mix well.
3. Dissolve items 6 and 8 one by one in the remaining half quantity of item 12 in another stainless steel container.
4. Mix step 3 with step 2.
5. Pass items 3, 1, and 2 through 0.5 mm sieve and mix well.
6. Place step 5 in a granulator.
7. Knead step 6 with solution of step 4 for 5 to 10 minutes until a loose, moist mass is obtained.
8. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
9. Spread step over paper-lined trays, and dry at 45°C to 50°C for 8 hours (the relative humidity over the granules should be 20–35%).
10. Pass the dried granules through a 1.25 mm sieve granulator.
11. Transfer the granules to a tumbler.
12. Pass 9 through 0.5 mm sieve and add to step 11 and mix for 15 minutes.
13. Pass item 10 through 0.250 mm sieve and add to step 12.
14. Mix step 13 for 2 minutes.
15. Compress into 200 mg tablets, using a suitable punch (8.5 mm, round).
16. Place item 14 in a stainless steel vessel. Add item 13 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
17. Load core tablets from step 15 in coating pan and apply coating dispersion from step 16 to get 1.5% to 1.8% weight gain.

EZETIMIBE AND SIMVASTATIN TABLETS (10 MG/80 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Ezetimibe	10.00
80.00	2	Simvastatin	80.00
127.38	3	Lactose monohydrate	127.38
60.00	4	Microcrystalline cellulose (Avicel™ PH102)	60.00
3.00	5	Hydroxypropyl methylcellulose	3.00
0.06	6	Butylated hydroxyanisole	0.06
4.50	7	Citric acid monohydrate	4.50
0.06	8	Propyl gallate	0.06
12.00	9	Croscarmellose sodium	12.00
3.00	10	Magnesium stearate	3.00
—	11	Water, purified	30.00
—	12	Ethanol 95%	15.00
6.00	13	Hydroxypropyl methylcellulose	6.00
—	14	Water, purified	50.00

Manufacturing Directions

1. Dissolve item 7 in half quantity of item 11 (15 g) in a stainless steel container.
2. Dissolve item 5 in the mixture of remaining half quantity of item 11 and half quantity of item 12 (7.5 g) and add to step 1 and mix well.
3. Dissolve items 6 and 8 one by one in the remaining half quantity of item 12 in another stainless steel container.
4. Mix step 3 with step 2.
5. Pass items 3, 1, and 2 through 0.5 mm sieve and mix well.
6. Place step 5 in a granulator.
7. Knead step 6 with solution of step 4 for 5 to 10 minutes until a loose, moist mass is obtained.
8. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
9. Spread step over paper-lined trays, and dry at 45°C to 50°C for 8 hours (the relative humidity over the granules should be 20–35%).
10. Pass the dried granules through a 1.25 mm sieve granulator.
11. Transfer the granules to a tumbler.
12. Pass item 9 through 0.5 mm sieve, add to step 11, and mix for 15 minutes.
13. Pass item 10 through 0.250 mm sieve and add to step 12.
14. Mix step 13 for 2 minutes.
15. Compress into 300 mg tablets, using a suitable punch (11.0 mm × 8.5 mm, modified oval).
16. Place item 14 in a stainless steel vessel. Add item 13 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
17. Load core tablets from step 15 in coating pan and apply coating dispersion from step 16 to get 1.5% to 1.8% weight gain.

EZETIMIBE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000Tablets (g)
10.00	1	Ezetimibe	10.00
62.70	2	Lactose spray dried	62.70
20.00	3	Microcrystalline cellulose (Avicel™ PH102)	20.00
3.00	4	Povidone K30	3.00
1.00	5	Sodium lauryl sulfate	1.00
2.50	6	Croscarmellose sodium	2.50
0.80	7	Magnesium stearate	0.80

Manufacturing Directions

1. Pass item 2 through 1 mm sieve and collect in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve, collect in a stainless steel container, and mix well for 5 minutes.
3. Transfer step 2 to step 1.
4. Pass item 6 and item 3 through 0.5 mm sieve and add to step 1.
5. Mix step 1 for 20 minutes using tumbler.
6. Pass item 7 through 0.250 mm sieve and add to step 5.
7. Mix step 6 for 2 minutes.
8. Compress into 100 mg tablets, using a suitable punch (5.0 mm × 5.5 mm, oval).

FAMCICLOVIR TABLETS (125 MG/250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
125.00	1	Famciclovir	125.00
165.00	2	Microcrystalline cellulose (Avicel™) QS	165.00
4.00	3	Sodium starch glycolate (Primojel®)	4.00
0.50	4	Magnesium stearate	0.50

Manufacturing Directions

1. Sift Famciclovir, Avicel™, and sodium starch glycolate through a 250 µm sieve into a mixer.
2. Mix for 5 minutes.
3. Sift magnesium stearate through a 250 µm sieve and add to step 1. Blend for 3 minutes.
4. Compress 295 mg in a suitable punch. For 250 mg strength, compress 590 mg.
5. Coat using a Hypromellose coating. (See Appendix.)

FAMOTIDINE TABLETS (20 MG), PEPCID

Each tablet for oral administration contains either 20 or 40 mg of famotidine. The inactive ingredients are hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxides, magnesium stearate, microcrystalline cellulose, starch, talc, and titanium dioxide. Each Pepcid RPD orally disintegrating tablet for oral administration contains either 20 mg or 40 mg of famotidine and the following inactive ingredients: aspartame, mint flavor, gelatin, mannitol, red ferric oxide, and xanthan gum.

FAMOTIDINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Famotidine	20.00
80.00	2	Microcrystalline cellulose (Avicel™ PH 102)	80.00
67.60	3	Pregelatinized starch (Starch 1500)	67.60
2.00	4	Povidone (PVP K-25)	2.00
—	5	Alcohol (ethanol 95%)	36.67
22.80	6	Microcrystalline cellulose (Avicel™ PH 102)	22.80
8.16	7	Pregelatinized starch (Starch 1500)	8.16
2.00	8	Glyceryl behenate	2.00
2.41	9	Talc (fine powder)	2.41

Manufacturing Directions

1. Preparation of binding solution: Dissolve item 4 in item 5 to make a clear solution by using a stirrer at medium speed in a stainless steel container.
2. Dry mixing: Load items 1 to 3 into a mixer. Mix for 5 minutes with a mixer and chopper at low speed.
3. Wet massing
   a. Add the binding solution at a rate of 8.3 g/min to the dry powder in the mixer, while mixing at low speed. Mix and chop for a further 2 to 3 minutes at low speed.
   b. Check for a satisfactory wet mass. Add additional ethanol 95% if required to get a satisfactory wet mass.
4. Drying
   a. Spread the granules onto stainless steel trays to a thickness of one-quarter of the tray thickness. Load the trays on the trolley.
   b. Load the trolleys to the oven. Keep the doors open. Start the air circulation, heaters off, for 2 hours.
   c. Start the heaters of the dryer. Close the doors. Set the temperature at 55°C for 6 hours.
   d. Check the moisture contents of the dried granules (limit: not more than 3.5%). Dry further, if required, to get a moisture content of 3.5%.
5. Grinding: Pass the dried granules through a sifter using a 1250 µm sieve. Pass the retained granules through a granulator equipped with a 1.0 mm sieve.
6. Lubrication
   a. Pass items 6 and 7 through a 500 µm sieve using a sifter. Collect in a stainless steel container.
   b. Load the sized granules from step 5a along with sieved powder from step 6a into the blender. Blend for 3 minutes.

c. Mix items 8 and 9 in a polythene bag for 1 minute. Pass this mixture through a 250 μm sieve into the sifter. Collect in a polythene bag. Add 3 to 5 g of granules from step 6b to it, and mix manually for 1 minute. Add this mixture to step 6b, and mix for 1 minute.
d. Unload in stainless steel drums.

7. Compression: Compress the granules using a rotary tableting machine. The dimension is 7.1 ± 0.1 mm concave plain. The weight of 10 tablets is 2.05 g ± 2%.
8. Tablet coating: Coat the tablet using an HPMC coating. (See Appendix.)

FAMOTIDINE TABLETS (40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Famotidine	40.00
70.50	2	Microcrystalline cellulose (Avicel™ PH 102)	70.50
67.60	3	Pregelatinized starch (Starch 1500)	67.60
0.09	4	Ferric oxide (iron oxide red)	0.09
2.50	5	Povidone (PVP K-25)	2.50
—	6	Alcohol (ethanol 95%)	36.67
11.16	7	Microcrystalline cellulose (Avicel™ PH 102)	11.16
8.66	8	Pregelatinized starch (Starch 1500)	8.66
2.00	9	Glyceryl behenate	2.00
2.41	10	Talc (fine powder)	2.41

Manufacturing Directions

1. See the manufacturing directions for the 20 mg formulation.

FENOPROFEN CALCIUM TABLETS

Manufacturing Directions

1. Mixture A: Load a Diosna mixer with 17.5 kg of fenoprofen calcium, 2.64 kg of lactose, 1.75 kg of starch powder, and 656 g of pregelatinized starch through a 10 mesh screen. Blend the mixture for 5 minutes using a low-speed mixer and low-speed chopper settings.
2. While continuing to mix as described in step 1, slowly add 4373 mL of a 15% wt/v aqueous povidone solution.
3. Agitate the mixture using a high-speed mixer and high-speed chopper settings for 3 minutes. During this time, add purified water to the mixture in a quantity sufficient to produce a satisfactory granulation.
4. Wet sieve the granulation through a 6 mesh screen onto paper-lined trays. Dry the granulation 110°F for 16 hours. Mill the dried granulation at 1400 rpm with a FitzMill into a clean, polyethylene-lined drum yielding 22.32 kg of mixture A. The mill should employ a 2AA plate with knives forward.
5. Mixture B: To a Diosna mixer add 26.25 kg of fenoprofen calcium, 3.965 kg of lactose, 2.625 kg of starch powder, and 984.5 g of pregelatinized starch. Blend the mixture for 5 minutes using a low-speed mixer and low-speed chopper settings. While continuing to mix as described in step 1, slowly add 6563 mL of a 15% wt/v aqueous povidone solution containing 495 g of Opaspray Butterscotch L-2701 (manufactured by Colorcon, Inc.). Agitate the mixture using a high-speed mixer and high-speed chopper settings for 3 minutes. During this time, add purified water in a quantity sufficient to produce a satisfactory granulation. Sieve the wet granulation using a 6 mesh screen onto paper-lined trays. Dry the granulation at 110°F for 16 hours.
6. Prepare a third mixture, mixture C, in the same manner as mixture B. After drying, combine this mixture with mixture B and mill at 1400 rpm with a FitzMill into a clean polyethylene-lined drum yielding 68.03 kg of mixture BC. The mill should employ a 2AA plate with knives forward.
7. Load a ribbon mixer with 11.6 kg of mixture A and 35.3 kg of mixture BC. To this mixture add 1.5 kg of cellulose with sodium carboxymethyl cellulose-591 (Avicel™ RC-591, FMC Corporation) and 120 g of sodium lauryl sulfate through a 30 mesh screen. Blend the mixture is blended for 10 minutes. To the mixture add 250 g of magnesium stearate and 500 g of stearic acid powder through a 30 mesh screen. Continue mixing for an additional 5 minutes, after which discharge the granulation into a clean polyethylene-lined drum, yielding 49.20 kg of material.
8. Compress this on a Manisty Express Tableting Machine using appropriate tooling.
9. Coat the resulting tablets in a 48 in. Accela Cota with an aqueous film coating mixture consisting of hydroxypropyl methylcellulose 7% w/w, polyethylene glycol 2% w/w, propylene glycol 3% w/w, and benzyl alcohol 1% w/w. Place the tablets on paper-lined trays to dry.
10. The tablets prepared by the preceding method should have the following per tablet unit formula: fenoprofen calcium, 700.0 mg; lactose, 105.7 mg; starch powder, 70.0 mg; pregelatinized starch, 26.25 mg; povidone, 26.25 mg; Opaspray Butterscotch, 9.9 mg; cellulose with sodium CMC-591, 30.0 mg; sodium lauryl sulfate, 2.4 mg; magnesium stearate, 5.0 mg; stearic acid powder, 10.0 mg; clear film coat (theory), 19.32 mg.

FERROUS FUMARATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ferrous fumarate	200
295.00	2	Ludipress®	295
5.00	3	Magnesium stearate	5

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Press with low-compression force.
3. Compress into 509 mg tablets, using 12 mm biplanar punches.

FERROUS SULFATE, MANGANESE SULFATE, AND COPPER SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
65.00	1	Anhydrous ferrous sulfate	65.00
3.50	2	Manganese sulfate	3.50
0.16	3	Copper sulfate	0.16
70.00	4	Ludipress®	70.00
10.00	5	Kollidon® 30	10.00
2.00	6	Magnesium stearate	2.00
3.00	7	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high-compression force.
2. Compress into 149 mg tablets, using 8 mm biplanar punches.

FERROUS SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Anhydrous ferrous sulfate	203.00
185.00	2	Ludipress®	185.00
15.00	3	Kollidon® VA 64	15.00
4.00	4	Magnesium stearate	4.00
4.00	5	Talc	4.00
3.00	6	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with medium-compression force.
2. Compress into 413 mg tablets, using 8 mm biplanar punches.

FEXOFENADINE AND PSEUDOEPHEDRINE TABLETS (10 MG/240 MG), ALLEGRA

Allegra-D® (fexofenadine HCl and pseudoephedrine HCl) extended-release tablets for oral administration contain 60 mg of fexofenadine HCl for immediate release and 120 mg of pseudoephedrine HCl for extended release. Tablets also contain the following excipients: microcrystalline cellulose, pregelatinized starch, croscarmellose sodium, magnesium stearate, carnauba wax, stearic acid, silicon dioxide, hydroxypropyl methylcellulose, and polyethylene glycol.

FEXOFENADINE AND PSEUDOEPHEDRINE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
240.00	1	Pseudoephedrine sulfate	240.00
15.00	2	Microcrystalline cellulose (Avicel™ PH 101)	15.00
200.00	3	Xanthan gum Keltrol TF	200.00
80.00	4	Sodium alginate Keltone HVCR	80.00
53.00	5	Calcium carbonate	53.00
6.00	6	Magnesium stearate	6.00
6.00	7	Aerosil® 200	6.00
10.00	8	Fexofenadine	10.00
95.00	9	Lactose monohydrate	95.00
66.50	10	Microcrystalline cellulose (Avicel™ PH 101)	66.50
1.00	11	Yellow FD&C No. 10	1.00
20.00	12	Starch (maize)	20.00
6.00	13	Starch (maize)	6.00
1.50	14	Magnesium stearate	1.50
—	15	Water, purified	60.00

Manufacturing Directions

1. Place pseudoephedrine sulfate, microcrystalline cellulose, xanthan gum, sodium alginate, calcium carbonate, and one-half of the lubricants in a suitable mixer, after sieving through a 44 mesh sieve.
2. Pass the blend through a roll compactor.
3. Sieve the compact through a 22 mesh sieve to obtain granules.

4. Mix the granules with the remaining lubricants (items 6 and 7), and compress into tablets (600 mg) to form the first tablet layer.
5. Place items 8 to 12 after passing through a 100 mesh sieve in a suitable mixer. Blend for 10 minutes.
6. Place item 13 in a separate vessel, and make a paste (10%) using item 14.
7. Add step 6 into step 5, and granulate.
8. Dry the granules, and blend the sifted item 14.
9. Compress into 200 mg tablets (the second layer).
10. Use appropriate tableting equipment for bilayer tableting or core tableting.

FEXOFENADINE TABLETS (30 MG/60 MG/180 MG) ALLEGRA

Each tablet contains 30, 60, or 180 mg of fexofenadine hydrochloride (depending on the dosage strength) and the following excipients: croscarmellose sodium, magnesium stearate, microcrystalline cellulose, and pregelatinized starch. The aqueous tablet film coating is made from hydroxypropyl methylcellulose, iron oxide blends, polyethylene glycol, povidone, silicone dioxide, and titanium dioxide.

FINASTERIDE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Finasteride	5.00
56.70	2	Lactose monohydrate	56.70
5.00	3	Starch 1500 (pregelatinized starch)	5.00
20.00	4	Avicel™ PH 102 (microcrystalline cellulose)	20.00
27.00	5	Maize starch	27.00
5.50	6	Primojel® (sodium starch glycolate)	5.50
0.60	7	Magnesium stearate	0.60
3.50	8	Hypromellose (hydroxypropyl methylcellulose)	3.50
0.60	9	Talc, fine powder, extra pure	0.60
0.60	10	Titanium dioxide	0.60
—	11	Purified water	QS
0.20	12	Disperse blue E132	0.20
0.10	13	Triacetin	0.10
—	14	Ethanol 95%	QS
—	15	Purified water	QS

Manufacturing Directions

1. Make a slurry of starch paste in purified water.
2. Mix finasteride, maize starch, and Primojel®.
3. Add lactose monohydrate with step 2, and pass through a 0.5 mm sieve.
4. Knead the mixed powder from steps 2 and 3 with starch paste to make a suitable wet mass. Pass the wet mass through an 8 mesh sieve onto drying trays.
5. Dry the granules for approximately 3.5 hours at 55°C to get the desired LOD of 2.5%.
6. Grind the dried granules from step 5, and blend with magnesium stearate, previously sieved (250 mm) in a drum blender. Blend for 2 minutes.
7. Lubricate the granules.
8. Compress into 120 mg tablets, using a suitable punch.
9. Disperse hypromellose and triacetin in purified water and ethanol. Keep it overnight. Disperse talc, titanium dioxide, and colorant, and homogenize.
10. Coat the core tablets with the coating dispersion in step 9. (See Appendix.)

FLUCONAZOLE TABLETS (50 MG/100 MG/200 MG), DIFLUCAN

Diflucan tablets: These tablets contain 50, 100, or 200 mg of fluconazole and the following inactive ingredients: microcrystalline cellulose, dibasic calcium phosphate anhydrous, povidone, croscarmellose sodium, FD&C Red No. 40 Aluminum Lake dye, and magnesium stearate.

FLUOXETINE TABLETS (20 MG)

Formulation: Fluoxetine HCl (BASF), 22.4 g; Ludipress®, 176.0 g; magnesium stearate, 1.6 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with low-compression force at 205 mg.

FLUOXETINE HYDROCHLORIDE TABLETS (10 MG/20 MG/40 MG), PROZAC®

Each Prozac® pulvule contains fluoxetine hydrochloride equivalent to 10 mg (32.3 μmol), 20 mg (64.7 μmol), or 40 mg (129.3 mmol) of fluoxetine. The pulvules also contain starch, gelatin, silicone, titanium dioxide, iron dioxide, and other inactive ingredients. The 10 and 20 mg pulvules also contain FD&C Blue No. 1, and the 40 mg pulvule also contains FD&C Blue No. 1 and FD&C Yellow No. 6.

Each Prozac® tablet contains fluoxetine HCl equivalent to 10 mg (32.3 mmol) of fluoxetine. The tablets also contain microcrystalline cellulose, magnesium stearate, crospovidone, hydroxypropyl methylcellulose, titanium dioxide,

polyethylene glycol, and yellow iron oxide. In addition to the preceding ingredients, the 10 mg tablet contains FD&C Blue No. 1 Aluminum Lake and polysorbate 80.

FLUOXETINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Fluoxetine; use fluoxetine hydrochloride	11.45
20.00	2	Microcrystalline cellulose	20.00
64.05	3	Lactose	64.05
4.00	4	Sodium starch glycolate	4.00
0.50	5	Magnesium stearate	0.50

Manufacturing Directions

1. Place items 1 to 4 in a suitable blender, after passing through a 250 mm sieve.
2. Mix for 20 minutes.
3. Add item 5 after passing through a 250 µm mesh, and blend for 1 minute.
4. Compress.
5. Coat using HPMC coating, adding 6% to 10% tablet weight.
6. For a controlled-release formulation, use 5% to 12% of tablet core weight) %w/w of Eudragit RS 100 and 86.0; dibutyl phthalate 10.0; talc 4.0; FD&C Yellow No. 6 0.01; and triacetin 10.

FLUOXETINE HYDROCHLORIDE TABLETS (12.5 MG/25.0 MG), CONTROLLED-RELEASE BILAYER

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Fluoxetine, use fluoxetine hydrochloride	28.59
15.00	2	Methocel K4M	15.00
62.00	3	Lactose monohydrate	62.00
3.00	4	Polyvinyl pyrrolidone	3.00
1.00	5	Magnesium stearate	1.00
1.00	6	Syloid 244	1.00
15.04	7	Compritol 888	15.04
29.32	8	Lactose monohydrate	29.32
4.00	9	Polyvinyl pyrrolidone	4.00
1.52	10	Magnesium stearate	1.52
—	11	Water, purified	QS
29.32	12	Methocel E5	29.32
0.08	13	Iron oxide	0.08

Manufacturing Directions

1. Make two layers (items 1–6 and items 7–10, using item 11 as necessary for wet granulation).
2. Compress tablets on a Manesty triple-layer press.
3. Coat using items 12 and 13 on a Manesty triple-layer press.
4. Adjust item 3 for 12.5 mg strength.

FLUOXETINE HYDROCHLORIDE FAST-MELT TABLETS

Manufacturing Directions

1. Mix fluoxetine hydrochloride, 18%; sodium bicarbonate, 26%; citric acid anhydrous, 26%; microcrystalline cellulose, 4%; anhydrous lactose, 13%; xylitol, 10%; and Crodesta F160, 3%.
2. Dry the ingredients at an elevated temperature to significantly reduce the moisture content of each material.
3. Blend for 5 to 10 minutes and extrude in a hot melt extruder at approximately 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix FLX-EFG (20–80 mesh), 50%; anhydrous lactose, 31%; microcrystalline cellulose, 10%; L-HPC LH-11, 5%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; fumed silicon dioxide, 0.1%.
5. Screen the granules and blend for 5 minutes prior to compression.
6. Fluoxetine HCl tablets are then compressed to a hardness of approximately 1 to 5 kPa (depending upon the dose of the active), and tablets disintegrate in water in approximately 15 to 40 seconds.

FLUVOXAMINE MALEATE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Fluvoxamine maleate	50.00
96.00	2	Mannitol	96.00
39.00	3	Maize starch	39.00
12.00	4	Pregelatinized starch (Starch 1500)	12.00
0.60	5	Colloidal silicon dioxide (Aerosil® 200)	0.60
1.50	6	Sodium stearyl fumarate	1.50
QS	7	Purified water	QS

Manufacturing Directions

1. Make a slurry of starch paste in purified water.
2. Sift mannitol, fluvoxamine maleate, and the remaining part of maize starch through a 0.5 mm stainless steel sieve.
3. Knead the powder mix from step 2 with starch paste to get the desired wet mass. Then pass the mass through an 8 mesh screen to drying trays.
4. Dry at 50°C for 24 hours to reach an LOD of not more than 2%.
5. Pass the dried granules through a 16 mesh screen into a blending vessel.
6. Pass Starch 1500, Aerosil® 200, and sodium stearyl fumarate through a 0.25 mm sieve into step 5. Blend for 2 minutes.
7. Compress into 200 mg tablets, using 12 mm punches.
8. Apply Eudragit L 100–55 coating. (See Appendix.)

FOLIC ACID TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
5.00	1	Folic acid[a]	5.24
12.00	2	Maize starch (dried)[b]	12.00
5.26	3	Cellulose (microcrystalline) (Avicel™ PH102)	5.26
20.00	4	Cellulose (microcrystalline) (Avicel™ PH102)	20.00
1.50	5	Colloidal silicon dioxide (Aerosil® 200)	1.50
66.00	6	Lactose (spray-dried)[c]	66.00
2.50	7	Talc (fine powder)	2.50
2.50	8	Stearic acid (fine powder)	2.50

[a] Extra folic acid is added (0.08 mg/tablet) to compensate water (water NMT8.0%).

[b] LOD: NMT 4.5% when dried at 120°C for 4 hours.

[c] Meets the USP NF, except particle size distribution, as follows: min. 98%, 250 µm; 30% to 60%, 100 µm; max. 15%, 45 µm.

Manufacturing Directions

1. Folic acid must be protected from exposure to direct light.
2. Sift items 1 to 3 through a FitzMill (impact forward, high speed), and collect in a stainless steel drum.
3. Load the material into a blender, and mix for 3 minutes.
4. Sift items 4 to 8 through a 500 µm sieve using a sifter, and collect in a stainless steel drum.
5. Load this sieved material into a blender.
6. Mix for 5 minutes.
7. Unload the lubricated powder into a stainless steel drum. Check for small lumps or globules in the powder mix.
8. If required, pass the entire mass through a 500 µm sieve using a sifter, and mix for 1 minute in a blender.
9. Compress into 1.15 g tablets (hardness, 3–7 kPa), using 7 mm round flat punches.
10. For 1 mg tablets, compensate with lactose and compress as in step 9.

FOLIC ACID TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
5.00	1	Folic acid	5.00
195.00	2	Ludipress®	195.00
1.50	3	Magnesium stearate	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press into tablets using medium-compression force.
2. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.
3. Compress into 213 mg tablets, using 8 mm biplanar punches.

FOSINOPRIL TABLETS (20 MG), MONOPRIL

Monopril is available for oral administration as 10, 20, and 40 mg tablets. Inactive ingredients include lactose, microcrystalline cellulose, crospovidone, povidone, and sodium stearyl fumarate.

FOSINOPRIL TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
20.00	1	Fosinopril sodium	20.00
134.50	2	Lactose monohydrate	134.50
40.00	3	Microcrystalline cellulose (Avicel™ PH 102)	40.00
7.00	4	Crospovidone	7.00
4.50	5	Povidone	4.50
4.00	6	Sodium stearyl fumarate	4.00
—	7	Alcohol	QS

Note: For 10 and 40 mg strength, adjust with item 2.

Manufacturing Directions

1. Place items 1 and 2 in a suitable mixer, after sifting, and mix for 20 minutes.
2. In a separate vessel, place item 5 with a suitable quantity of item 7, and make a binder solution.
3. Add step 2 into step 1 to make a wet mass.
4. Dry the mass at 45°C to 70°C in a tray oven or a fluid-bed dryer, until the LOD is less than 3%.
5. Pass the dried granules through a hammer mill fitted with 0.03 to 0.07 in. screen.
6. Transfer screened granules into a suitable blender, add items 3 and 4, and blend for 1 to 3 minutes.
7. Compress into 200 mg tablets.

FUCIDIN TABLETS (125 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
125.00	1	Fucidin	125.00
63.00	2	Dicalcium phosphate (Di-Tab)	63.00
2.50	3	Kollidon® 90C	2.50
—	4	Isopropyl alcohol	30 mL
6.20	5	Kollidon® CL	6.20
1.30	6	Aerosil® 200	1.30
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4. Dry and then pass the mixture through a 0.8 mm sieve.
2. Add the mixture of items 5 and 6, and press with low-compression force.
3. Compress into 200 mg tablets, using 9 mm punches. To accelerate the disintegration, the amount of Kollidon® 90F should be reduced, and Kollidon® CL should be applied in intra- and extragranular forms.

FURAZOLIDONE TABLETS (100 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Furazolidone	104.00
40.00	2	Lactose monohydrate	40.00
40.00	3	Dicalcium phosphate	30.00
2.00	4	Gelatin	2.00
2.00	5	Talc	2.00
2.00	6	Magnesium stearate	2.00
20.00	7	Starch (maize)	20.00
QS	9	Water, purified	QS

Manufacturing Directions

1. Sift items 1 to 3 through a 250 mm sieve, and load into a suitable mixing vessel. Mix the items for 5 minutes.
2. Separately, load a sufficient quantity of item 9. Add item 4, and dissolve it at 50°C. Add item 7, and mix until a smooth slurry is formed.
3. Add step 2 into step 1, and mix to form a wet mass suitable for granulation. Pass the mass through the sieve onto paper-lined trays, and dry at 60°C overnight to reach an LOD of not more than 2%.
4. Pass the dried granules through 1.19 mm mesh into a suitable blending vessel.
5. Sift items 5 and 6 through a 500 mm sieve, and blend for 2 minutes.
6. Compress into 200 mg tablets, using 8.3 mm punches.

FUROSEMIDE TABLETS (40 MG), LASIX

Lasix is a diuretic that is an anthranilic acid derivative. Lasix for oral administration contains furosemide as the active ingredient. It also contains the following inactive ingredients: lactose, magnesium stearate, starch, and talc.

FUROSEMIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
40.00	1	Furosemide	40.00
158.00	2	Ludipress®	158.00
2.00	3	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through 0.8 mm sieve, and press with low-compression force.
2. Compress into 205 mg tablets, using 8 mm biplanar punches.

FUROSEMIDE TABLETS (40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Furosemide	40.00
83.10	2	Starch (maize)	83.10
30.00	3	Lactose monohydrate	30.00
1.00	4	Colloidal silicon dioxide (Aerosil® 200)	1.00
14.00	5	Starch (maize)	14.00
2.00	6	Talc (fine powder)	2.00
20.00	7	Starch 1500 (pregelatinized starch)	20.00
1.60	8	Stearic acid	1.60
8.00	9	Starch (maize, dried)	8.00
0.30	10	Magnesium stearate	0.30
—	11	Purified water	70.00

Manufacturing Directions

Note: Avoid overmixing lubricants, otherwise hardness can be reduced.

1. Preparing starch paste: Make a smooth slurry of item 5 in 14 g of item 11 (25–30°C). Transfer the slurry into 56 g of item 11 (80–90°C) preheated in a steam jacket vessel under continuous stirring to get a translucent paste. Cool to 45°C to 50°C.
2. Sieving and dry mixing: Sift items 1, 3, 2, and 4 through a stainless steel 630 mm sieve in sifter. Load into mixer. Mix for 5 minutes at low speed.
3. Kneading: Knead the powder mix in the mixer with starch paste at low mixer speed for 3 minutes. Scrape sides and blades. Mix and chop at low speed for 3 minutes. Check the end point of granulation. If required, add more purified water to separate the granules, freeing big lumps.
4. Drying
   a. Unload the wet mass in stainless steel trays for drying. Dry the wet mass in an oven at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break lumps for uniform drying.
   b. Check the LOD. The LOD limit is 2% to 2.5%.
   c. If required, dry further at 55°C to meet the LOD limit.
   d. Transfer the dried granules to stainless steel drums.
5. Grinding and lubricating
   a. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed. Collect in stainless steel drums. Load the granules into the blender.
   b. Sift items 7 and 9 through a 500 µm sieve, using a sifter, and add it into the blender. Mix for 2 minutes.
   c. Sift items 6, 8, and 10 through a 500 µm sieve. Add 2 to 4 g of granules from bulk (step 5a).
   d. Mix in a polythene bag for 1 minute, and add to blender. Blend the mixture for 1 minute.
   e. Unload in stainless steel drums.
6. Compression: Check temperature and humidity before starting compression. As a limit, the temperature should not exceed 27°C, and the recommended relative humidity is 55% to 60%. Compress the granules using a rotary tableting machine. The diameter should be 8.0 mm round punches.

FUROSEMIDE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Furosemide	200.00
388.00	2	Ludipress®	388.00
6.00	3	Magnesium stearate	6.00
6.00	4	Aerosil® 200	6.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 618 mg tablets, using 12 mm biplanar punches.

GABAPENTIN TABLETS (600 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Gabapentin (10–125 mm)	600.00
24.00	2	Hydroxypropyl cellulose 75–150 cps (Klucel LF)	24.00
39.00	3	Crospovidone sodium (polyplasdone XL)	39.00
12.00	4	Calcium stearate	12.00
—	5	Alcohol	QS

Note: Compress 675 mg; for 800 mg, compress 900 mg.

Manufacturing Directions

1. Prepare a 7.5% solution of item 2 in item 5 by slowly adding item 2 to item 5 and mixing for 60 minutes at room temperature, until a clear homogeneous solution is obtained

2. Place item 1 in a fluid-bed dryer, and apply the solution in step 1 to granulate.
3. Set the process air volume to 100 cfm, and fluidize gabapentin. When the product temperature reaches about 25°C to 28°C, apply the binder solution. Introduce this solution through a pneumatically atomized nozzle positioned in the expansion chamber of the fluid-bed processor. The fluidized gabapentin particles are thus coated with the binder solution. While spraying, increase the process air volume until the product temperature is stabilized between 12°C and 25°C. Once all the binder solution is applied, set the process air volume to 150 cfm and the temperature to about 35°C to dry the coated particles. Drying is complete when the LOD, determined by a computerized moisture analyzer balance, is not more than 0.75%.
4. Pass the spray-coated particles through a comminuting mill.
5. Place the sized particles in a V-blender with items 3 and 4. Blend these materials for 5 minutes.
6. Compress at a pressure of 12 to 14 kN. The hardness range of the 600 mg tablets is 13.3 to 14.9 kPa, with an average hardness of 14.2 kPa.
7. Optionally, coat the tablets with an aqueous dispersion such as an Opadry. (See Appendix.)

GALANTHAMINE HYDROBROMIDE TABLETS (1 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
1.00	1	Galanthamine hydrobromide	1.00
32.00	2	Calcium phosphate	32.00
5.00	3	Lactose	5.00
15.00	4	Microcrystalline cellulose	15.00
0.70	5	Talc	0.70
0.70	6	Magnesium stearate	0.70

Note: For 5 mg strength, fill a proportionate amount or adjust with item 2.

Manufacturing Directions

1. Pass items 1 to 4 through a 250 µm sieve, and place in a blending vessel. Mix the materials for 10 minutes.
2. Pass items 5 and 6 through a 250 µm sieve, and add to step 1. Blend this mixture for 1 minute.
3. Compress.

GARLIC EXTRACT + THYME EXTRACT TABLET CORES WITH VITAMIN C (300 MG + 25 MG + 100 MG)

Formulation: Garlic extract, granulated (Aflopa), 300 g; thyme extract, powder (Aflopa), 25 g; ascorbic acid, crystalline (BASF), 100 g; Kollidon® CL, 14 g; Ludipress®, 268 g; magnesium stearate, 7 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with medium-compression force at 714 mg.

GARLIC TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
95.00	1	Calcium phosphate, dibasic	95.00
94.00	2	Lactose monohydrate	94.00
9.00	3	Kollidon® 30	9.00
25.00	4	Water	25.00
100.00	5	Dried garlic powder	100.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, pass through a 0.8 mm sieve, add items 5 and 6, and press with low-compression force.
2. Compress into 312 mg tablets, using 9 mm biconvex punches.

GEMFIBROZIL TABLETS (600 MG)

Gemfibrozil is available in tablet form for oral administration. Each tablet contains 600 mg of gemfibrozil. Each tablet also contains calcium stearate; candelilla wax FCC; microcrystalline cellulose; hydroxypropyl cellulose; hydroxypropyl methylcellulose, USP; methylparaben, NF; Opaspray white; polyethylene glycol; polysorbate 80; propylparaben; colloidal silicon dioxide; and pregelatinized starch.

GEMFIBROZIL TABLETS

Bill of Materials

Scale (mg/tablet)	item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Gemfibrozil	600.00
120.00	2	Microcrystalline cellulose (Avicel™ PH 101)	120.00
40.00	3	Gelatin	40.00
2.00	4	Diotilan	2.00
16.00	5	Calcium stearate	16.00
54.00	6	Sodium carboxymethyl starch	54.00
24.00	7	Talc	24.00
8.00	8	Silicon dioxide colloidal	8.00
9.50	9	Hydroxypropyl methylcellulose	9.50
4.00	10	Polyethylene glycol 4000	4.00
0.50	11	Simethicone	0.50
2.00	12	Titanium dioxide	2.00
—	13	Water, purified	QS
—	14	Alcohol	QS

Manufacturing Directions

1. Place the gemfibrozil and microcrystalline cellulose in a suitable whirlpool mixer and homogenize.
2. Prepare an aqueous solution of item 3 and add to step 1.
3. Prepare an ethanolic solution of item 4, add to step 1, and granulate.
4. Dry the granules. Screen the granules through a 0.8 mm sieve screen, return to the mixer, and homogenize with the components of the external layer (calcium stearate, sodium carboxymethyl starch, talc, and colloidal silicic acid).
5. Compress the homogenized mixture into oval biconvex tablets weighing 864 mg.
6. Coat the tablets to a final weight of 880 mg, using items 9 to 12. (See Appendix for details.)

GINKGO EXTRACT TABLETS (40 MG)

Formulation: Ginkgo biloba extract, dry powder, 240 g; (Biogen) Aerosil® 200, 1 g; Kollidon® CL, 4 g; Ludipress®, 203 g; magnesium stearate, 2 g.

Manufacturing Directions

1. Mix the ginkgo extract with Aerosil® 200, add the other components, pass through a 0.8 mm sieve, and press to tablets with low-compression force at 254 mg.

GLIBENCLAMIDE TABLETS (2.5 MG)

Bill of Materials

Scale (mg/tablet)	item	Material Name	Quantity/1000 Tablets (g)
2.50	1	Glibenclamide, micro (4.8% excess)	2.62
80.88	2	Lactose monohydrate	80.88
50.00	3	Starch (maize)	50.00
1.00	4	Colloidal silicon dioxide (Aerosil® 200)	1.00
11.00	5	Starch (maize)	11.00
10.00	6	Starch (maize, dried)	10.00
3.00	7	Talc (fine powder)	3.00
0.50	8	Magnesium stearate	0.50
1.00	9	Colloidal silicon dioxide (Aerosil® 200)	1.00
—	10	Purified water	55.00

Manufacturing Directions

Note: Glibenclamide is an oral hypoglycemic agent. During the processing of the batch, the person involved may take a glass full of 5% glucose solution, if required.

1. Preparing the binder
   a. Make a slurry of item 5 in 15 g of item 10 (40–45°C) in a stainless steel container. Check that it is free of lumps.
   b. Place this slurry into 40 g of item 10 heated to 95°C into the vessel. Stir until there is complete gelatinization.
   c. Cool to 50°C.
2. Dry mixing: Load items 1 to 4 into the mixer (Diosna P 250). Mix and chop for 5 minutes at high speed.
3. Kneading
   a. Add starch paste to the mixer. Mix for 2 minutes, with the mixer at low speed and the chopper at high speed.
   b. Scrape the sides and blades. Mix and chop at low speed for 2 minutes. If required, add item 10.
   c. If required for breaking bigger lumps, pass the wet mass through a FitzMill, using sieve #24205 at medium speed, with knives forward.
4. Drying
   a. Spread the wet granules onto the trays. Load the trolleys onto the dryer. Dry the granules at 55°C for 10 hours or up to the moisture content limit. Scoop the granules after 4 hours of drying. Then rotate the trays—put the upper trays down and the down trays up—for uniform drying.
   b. Check the moisture content. Limit: not more than 2.5%.

5. Grinding: Pass the dried granules through a 1 mm sieve. Collect in a stainless steel drum and load in a blender.
6. Lubricating: Mix items 6, 7, and 9 in a polythene bag. Pass through a 250 µm sieve, using a sifter. Collect in a polythene bag. Add to the granules in the blender (step 5). Mix this mixture for 5 minutes.
7. Pass item 8 through a 250 µm sieve. Collect in a polythene bag. Mix 2 g of granules with this, and add it to the blender in step 5a. Mix for 1 minute. Unload lubricated granules in a stainless steel drum.
8. Compressing: Compress the granules using a rotary tableting machine. Toolings should be of length 10 mm × 5 mm. The weight of 10 tablets should be 1.6 g ± 3%.

GLIBENCLAMIDE TABLETS (5 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
5.00	1	Glibenclamide, micro	5.00
78.50	2	Lactose monohydrate	78.50
50.00	3	Starch (maize)	50.00
1.00	4	Colloidal silicon dioxide (Aerosil® 200)	1.00
10.00	5	Starch (maize)	10.00
11.00	6	Starch (maize, dried)[a]	11.00
3.00	7	Talc (fine powder)	3.00
0.50	8	Magnesium stearate	0.50
1.00	9	Colloidal silicon dioxide (Aerosil® 200)	1.00
—	10	Purified water	55.00

[a] LOD: Not more than 4.5% when dried at 120°C for 4 hours.

Manufacturing Directions

1. Follow the manufacturing directions provided in the previous formulation.

GLICLAZIDE TABLETS (80 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
80.00	1	Gliclazide[a]	80.00
30.00	2	Starch (maize)	30.00
40.00	3	Lactose monohydrate	40.00
23.00	4	Dicalcium phosphate	23.00
4.00	5	Starch (maize)	40.00
1.80	6	Gelatin	1.80
0.06	7	Propylparaben	0.06
0.06	8	Methylparaben	0.06
1.00	9	Talc	1.00
1.00	10	Magnesium stearate	1.00
1.00	11	Sodium croscarmellose	1.00
1.00	12	Aerosil® 200	1.00
1.00	13	Sodium starch glycolate	1.00
—	14	Water, purified, ca	50 mL

[a] Untapped bulk density of 0.69 to 0.70.

Manufacturing Directions

1. Screen items 1 to 4 through a 250 µm sieve.
2. Place items 1 to 4 in a suitable vessel, and mix for 30 minutes.
3. In a separate vessel, heat item 14 to boiling, and add to it items 7 and 8 at 90°C to dissolve. Add item 6, and stir and mix to dissolve completely. Then allow the mixture to cool to room temperature.
4. Add item 5 to step 3, and stir and mix to obtain a lump-free slurry. Stop heating, and mix for another 5 minutes.
5. Add the slurry in step 4 to step 2. Stir at a high speed for 30 minutes to obtain a uniform wet mass.
6. Pass the wet mass through an 8 mm size sieve, and dry the mass in a fluid-bed dryer for 50 minutes at 50°C.
7. Pass the dried granules through a 20 mesh (grind larger size) screen, and transfer to a tumbler.
8. Sift items 11 to 13 through a 500 µm sieve, and sift item 10 through a 250 µm sieve. Then add these items to step 7, and blend for 10 minutes.
9. Compress into 180 mg tablets, using 3 mm punches.

GLIMEPIRIDE TABLETS (1 MG/2 MG), AMARYL®

Amaryl® tablets contain the active ingredient glimepiride and the following inactive ingredients: lactose (hydrous), sodium starch glycolate, povidone, microcrystalline cellulose, and magnesium stearate. In addition, Amaryl® 1 mg tablets contain ferric oxide red. Amaryl® 2 mg tablets contain ferric oxide yellow and FD&C Blue No. 2 Aluminum Lake. Amaryl® 4 mg tablets contain FD&C Blue No. 2 Aluminum Lake.

GLIMEPIRIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Glimepiride	2.00
109.90	2	Lactose monohydrate	109.90
35.00	3	Avicel™ PH 102 (microcrystalline cellulose PH 102)	35.00
8.00	4	Primojel® (sodium starch glycolate)	8.00
0.75	5	Iron oxide yellow	0.75
0.85	6	Dispersed FD&C Blue No. 2	0.85
3.00	7	Polyvinyl pyrrolidone K-30 (PVP K-30)	3.00
0.50	8	Magnesium stearate	0.50
QS	9	Purified water	QS

Manufacturing Directions

1. Dissolve color in water and homogenize it. Then make a binding solution with PVP K-30.
2. Mix glimepiride with Primojel®, iron oxide yellow, and dispersed blue E 132 (FD&C Blue No. 2), and pass through a 0.710 mm sieve.
3. Mix Avicel™ PH 102 with powder from step 2, and pass through a 0.710 mm sieve.
4. Mix lactose monohydrate with powder from step 3, and pass through a 0.710 mm sieve.
5. Knead the powder with binding solution to get the desired granules.
6. Dry the granules at 60°C for 12 hours to obtain an LOD of not more than 3%.
7. Pass the dried granules in a Frewitt granulator using a 1.25 mm sieve.
8. Compress into 160 mg tablets, using 12 mm punches. For 1 mg and 3 mg strengths, compress the same weight and adjust with lactose.

GLIPIZIDE TABLETS (5 MG), GLUCOTROL

Immediate-release tablets—Each immediate-release tablet for oral administration contains glipizide, 5 or 10 mg, and the following inactive ingredients: cornstarch, anhydrous lactose, microcrystalline cellulose, colloidal silicon dioxide, and stearic acid.

Extended-release tablets—Inert ingredients in the formulations are as follows: polyethylene oxide, hydroxypropyl methylcellulose, magnesium stearate, sodium chloride, red ferric oxide, cellulose acetate, polyethylene glycol, and Opadry white and black ink. Glucotrol XL extended-release tablets are similar in appearance to conventional tablets. Each tablet, however, consists of an osmotically active drug core surrounded by a semipermeable membrane.

The core is divided into two layers: an "active" layer containing the drug and a "push" layer containing pharmacologically inert (but osmotically active) components. The membrane surrounding the tablet is permeable to water but not to drug or osmotic excipients. As water from the gastrointestinal (GI) tract enters the tablet, pressure increases in the osmotic layer and "pushes" against the drug layer, resulting in the release of drug through a small, laser-drilled orifice in the membrane on the drug side of the tablet. The Glucotrol XL extended-release tablet is designed to provide a controlled rate of delivery of glipizide into the GI lumen, which is independent of pH or GI motility. The function of the Glucotrol XL extended-release tablet depends upon the existence of an osmotic gradient between the contents of the bilayer core and fluid in the GI tract. Drug delivery is essentially constant as long as the osmotic gradient remains constant and then gradually falls to zero. The biologically inert components of the tablet remain intact during drug GI transit and are eliminated in the feces as an insoluble shell.

GLIPIZIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Glipizide, 20% excess	6.00
43.00	2	Starch (maize)	43.00
50.00	3	Lactose monohydrate	50.00
28.00	4	Dicalcium phosphate	28.00
2.00	5	Gelatin	2.00
0.075	6	Propylparaben	0.075
0.075	7	Methylparaben	0.075
2.00	8	Magnesium stearate	2.00
2.00	9	Sodium starch glycolate	2.00
—	10	Water, purified, ca	50 mL

Manufacturing Directions

1. Pass items 1 to 4 through a 250 μm sieve, and place in a suitable blender. Mix these items for 30 minutes.
2. In a separate vessel, place item 10 and bring to boil by heating. Add items 6 and 7, and stir to dissolve at 90°C. Allow to cool to 50°C.
3. Add items 4 and 5 to step 2. Stir and mix vigorously at 50°C to obtain a smooth paste without lumps. Allow the mixture to cool to room temperature.
4. Transfer step 3 to step 1, and mix to obtain a wet mass.
5. Transfer the wet mass onto trays, and dry in an oven at 60°C overnight to an LOD of not more than 2.5%.
6. Pass dried granules through a 20 mesh screen, and collect in a tumble blender.

7. Pass item 9 through a 500 µm sieve and item 8 through a 250 µm sieve. Add to step 8. Blend for 2 minutes.
8. Compress into 120 mg tablets, using 6 mm punches.

GLIPIZIDE TABLETS CR (5 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
20.00	1	Xanthan gum	20.00
30.00	2	Locust bean gum	30.00
108.00	3	Dextrose	108.00
8.30	4	Surelease®	8.30
—	5	Water, purified	—
5.00	6	Glipizide	5.00
3.30	7	Sodium stearyl fumarate	3.30
43.70	8	Dextrose powder, anhydrous	43.70

Manufacturing Directions

1. Place items 1 to 3 in a mixer, and mix at high speed for 3 minutes using a chopper blade.
2. In a separate vessel, add and mix item 4 with item 5, and spray the mixture gradually into step 1 while mixing at high speed to provide even distribution and to produce a suitable wet mass.
3. Dry the wet mass in a fluid-bed dryer to an LOD of less than 10% (preferably less than 5%).
4. Pass the dried granules through a 20 mesh screen, and transfer them to a mixing vessel (V-blender). Blend for 10 minutes.
5. Add items 6 and 8 to step 4 after passing through a 250 µm sieve. Blend the mixture for 15 minutes.
6. Add item 7, and blend for 3 minutes.
7. Compress into 220 mg tablets, using a suitable punch at 5 kPa hardness.

GLYBURIDE AND METFORMIN TABLETS (250 MG/500 MG; 1.25 MG/2.50 MG), GLUCOVANCE

The glyburide used in Glucovance has a particle size distribution of 25%, with an undersize value not more than 6 µm, a 50% undersize value not more than 7 to 10 µm, and a 75% undersize value not more than 21 µm. Glucovance is available for oral administration in tablets containing 1.25 mg glyburide with 250 mg metformin hydrochloride, 2.5 mg glyburide with 500 mg metformin hydrochloride, and 5 mg glyburide with 500 mg metformin hydrochloride. In addition, each tablet contains the following inactive ingredients: microcrystalline cellulose, povidone, croscarmellose sodium, and magnesium stearate. The tablets are film coated, which provides color differentiation.

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Metformin hydrochloride	250.00
1.25	2	Glyburide	1.25
7.00	3	Croscarmellose sodium	7.00
10.00	4	Povidone	10.00
28.25	5	Microcrystalline cellulose (Avicel™ PH 101)	28.25
2.25	6	Magnesium stearate	2.25
—	7	Water, purified	QS

Note: For 2.5/500 strength, increase the fill volume to double.

Manufacturing Directions

1. Place croscarmellose sodium and glyburide in a suitable blender, and blend for 10 minutes.
2. In a separate vessel, mix metformin hydrochloride and magnesium stearate (99.5%:0.5% w/w) using high shear force.
3. In a separate container, add item 4 and an appropriate quantity of item 7 (1:10 ratio) to make paste.
4. Add the paste in step 3 to steps 1 and 2 combined and mixed prior to the addition of the paste.
5. Granulate using a high-shear mixer. Dry the granules in a fluid-bed dryer at approximately 60°C to achieve a moisture content of not more than 2%.
6. Size the dried granules with a screening mill, and mix with the microcrystalline cellulose using a tumble mixer.
7. Incorporate magnesium stearate as a lubricant, using a tumble mixer (step 6) to produce the final compression blend.
8. Compress 300 mg for 250/1.25 and 600 mg for 500/2.5 tablets.
9. Coat the tablets using an HPMC-based film-coating system, until the required amount of film coat is applied. The typical level of a film coat applied to the tablets is 2% w/w. (See Appendix for details.)

GLYBURIDE TABLETS (5 MG), MICRONASE

Micronase® tablets (standard glyburide)—mmase tablets contain glyburide, which is an oral blood-glucose-lowering drug of the sulfonylurea class. Glyburide is a white, crystalline compound, formulated as mmase tablets of 1.25, 2.5, and 5 mg strengths for oral administration. The inactive ingredients of the compound are colloidal silicon dioxide, dibasic calcium phosphate, magnesium stearate, microcrystalline cellulose, sodium alginate, and talc. In addition, the 2.5 mg tablet contains aluminum oxide and FD&C Red No. 40. The 5 mg tablet contains aluminum oxide and FD&C Blue No. 1.

Glynase® PresTab® tablets (micronized glyburide)—Glynase® PresTab® tablets contain micronized (smaller particle size) glyburide, which is an oral blood-glucose-lowering drug of the sulfonylurea class. Glyburide is a white, crystalline compound, formulated as Glynase® PresTab® tablets of 1.5, 3, and 6 mg strengths for oral administration. The inactive ingredients of the compound are colloidal silicon dioxide, cornstarch, lactose, and magnesium stearate. In addition, the 3 mg strength contains FD&C Blue No. 1 Aluminum Lake, and the 6 mg tablet contains D&C Yellow No. 10 Aluminum Lake.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Glyburide, micronized (ca 5 m^2/g) with excess	5.25
140.00	2	Lactose spray dried (foremost spray-dried lactose #315 or #316)	140.00
28.60	3	Starch (maize)	28.60
0.75	4	Magnesium stearate	0.75

Manufacturing Directions

1. Place items 1 to 3 in a suitable mixing vessel. Mix for 20 minutes, until a homogeneous mixture is reached.
2. Sift item 4 through a 250 μm mesh and add to step 1. Blend slowly for 2 minutes.
3. Compress into ca 175 mg tablets, using a suitable punch.

GRISEOFULVIN TABLETS (125 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
125.00	1	Griseofulvin, micronized	125.00
250.00	2	Ludipress®	250.00
10.00	3	Polyethylene glycol 6000 powder	10.00
19.00	4	Aerosil® 200	19.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, and mix.
2. Press with low-compression force, applying a vibrating hopper.
3. Compress into 367 mg tablets, using 12 mm biplanar punches.
4. The flowability of the tableting mixture can be increased by adding higher amounts of Ludipress® and Aerosil® 200.

GRISEOFULVIN TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Griseofulvin	500.00
100.00	2	Kollidon® VA 64	100.00
—	3	Dimethylformamide	7500.00
75.00	4	Kollidon® CL	75.00
75.00	5	Lactose monohydrate	75.00
5.00	6	Magnesium stearate	5.00
5.00	7	Aerosil® 200	5.00

Manufacturing Directions

1. Dissolve the mixture of items 1 and 2 in item 3.
2. Evaporate to dryness.
3. Pass the obtained coprecipitate through a 0.5 mm sieve.
4. Mix with items 4 to 7 and press with low-compression force.
5. Compress into 751 mg tablets, using 12 mm biplanar punches.

GUAIFENESIN TABLETS

Manufacturing Directions

1. Inner tablet: Guaifenesin, 175.0 mg; microcrystalline cellulose, 35.1 mg; crospovidone, 35.0 mg; polyvinylpyrrolidone, 7.3 mg; talc, 2.3 mg; zinc stearate, 2.3 mg. Total 257.0 mg.
2. Outer tablet: Guaifenesin, 425.0 mg; hydroxypropyl methylcellulose K4M, 139.9 mg; stearic acid, 30.0 mg; zinc stearate, 5.4 mg. Total 600.3 mg.
3. Make the inner tablet by oscillating guaifenesin and half of the polyvinylpyrrolidone through a 30 mesh screen.
4. Transfer the blend to a pharmaceutical-grade blender and mix until it is of uniform consistency.
5. Granulate the mixture with polyvinylpyrrolidone that has been previously dissolved in a sufficient amount of purified water to make a solution of about 8% to about 12% of polyvinylpyrrolidone.
6. Discharge this mixture and dry in a forced air oven at 40°C until the water content is less than 1%.
7. Oscillate the dried granulation through a 12 mesh screen and return to the blender.
8. Add the remaining polyvinylpyrrolidone, microcrystalline cellulose, and talc to this dried granulation and mix until it is of uniform consistency.
9. Finally, add zinc stearate, and mix the mixture until it is of uniform consistency.
10. Compress this mixture into inner tablets using a standard tableting press.

11. Make the outer tablet by first passing guaifenesin through an oscillator equipped with a 30 mesh screen.
12. After this step, transfer guaifenesin to a blender and add hydroxypropyl methylcellulose K4M and stearic acid to it. Mix until uniform.
13. Add zinc stearate, and blend the mixture until uniform.
14. Compress the mixture of ingredients that comprise the outer tablet around the already formed inner tablet on a standard compression coating tablet press.

GUAIFENESIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
69.77	1	Guaifenesin USP	69.77
16.00	2	Starch 1500	16.00
9.48	3	Microcrystalline cellulose NF	9.48
4.00	4	Starch 1500	4.00
0.50	5	Stearic acid NF	0.50
0.25	6	Magnesium stearate	0.25
100.00	7	Total	100.00

Manufacturing Directions

1. Granulation: preblend items 1 and 2 for 2 minutes prior to granulating with water to appropriate moisture.
2. Wet mass for 3 minutes.
3. Size the granulation.
4. Pass lubricant through a 60 mesh screen prior to blending.
5. Pass colloidal silicon dioxide through a 30 mesh screen along with the microcrystalline cellulose.
6. Blend all the ingredients except the lubricant for 10 minutes.

HEPARIN TABLETS[A]

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.08	1	Heparin (low molecular weight)	0.08
0.40	2	Water	0.40
0.92	3	Monoglyceride	0.92
1.24	4	CPL-Galactolipid	1.24
1.40	5	Palm kernel stearin	1.40

[a] Other proportions may include heparin 0.18, 0.21, and proportionally increased excipients. Lipid materials trade name and source: Galactolipids from oats (CPL-Galactolipid; Lipid Technologies Provider AB, Karlshamn, Sweden); medium chain monoglyceride (Akoline MCM; Karlshamns AB, Karlshamn, Sweden); palm kernel stearin (fraction of palm kernel oil; Karlshamns AB, Karlshamn Sweden); heparin (low molecular weight; Calbiochem, p. no. 375097); Palm kernel stearin (Akofine NF; Karlshamns AB, Karlshamn, Sweden).

Manufacturing Directions

1. Blend the ingredients and melt the mixture by heating to a temperature of 60°C and stirring at this temperature for 5 hours, by when all heparin will have dissolved.
2. Cast aliquots (0.24 g) of the melted phase in a mold covered with hydrogenated triglyceride (Akofine NF) powder. Cool the mold in a freezer and recover the tablets.

HERBAL HEMORRHOID TABLETS

Manufacturing Directions

1. Initially, wash genera Glycyrrhizae Radix, Rhei Rhizoma, Ephedrae Herba, Moutan Radicis Cortex, Menthae Herba, Pinelliae Rhizoma, Pasoniae Radix, Aconiti Tuber, Corni Fructus, Gypsum, Ginseng Radix, and Pelladendri Radix, respectively, with water to remove sand, clay, dust, and the like.
2. Clean and dry these natural substances to a moisture content of approximately 5%.
3. Cut 168 g of Glycyrrhizae Radix, 104 g of Rhei Rhizoma, 104 g of Ephedrae Herba, 168 g of Moutan Radicis Cortex, 104 g of Menthae Herba, 168 g of Pinelliae Rhizoma, 56 g of Pasoniae Radix, 56 g of Acontii Tuber, 56 g of Corni Fructus, 168 g of Ginseng Radix, and 104 g of Pelladendri Radix into a particle size of about 1 cm and mix together.
4. To this mixture add 104 g of Testudinis Carapax, 56 g of Natrii Sulfas, 168 g of Gypsum, 56 g of Cinnabaris, and 256 g of Talcum.
5. Thereafter, place this mixture in an extractor that has an aromatic vapor collector.
6. Add 12 L of water to approximately 2 kg of the mixture in the extractor.
7. Heat the mixture in the extractor to about 80°C for 1 hour and then extract.
8. Filter the aqueous mixture first in a centrifugal separator and then filter again in a microfilter.
9. Condense the aromatic vapor distilled from the aqueous mixture and add as an aromatic liquid to the filtrate.
10. Evaporate the filtrate through an automatic vacuum evaporator to a moisture content of about 30% to produce an extract that is useful as an antihemorrhoidal composition in extract form.
11. At this time, dry the concentrated liquid through a dry sprayer to produce a granulated formulation, a tablet formulation, a pill formulation, an ointment formulation, or the like, for use as an antihemorrhoid medicine.

HORSETAIL EXTRACT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
450.00	1	Horsetail extract (powder)	450.00
14.00	2	Kollidon® VA 64	14.00
5.00	3	Lutrol F 68	5.00
QS	4	Isopropanol	~120.00
14.00 g	5	Kollidon® CL	14.00
QS	6	Magnesium stearate	QS

Manufacturing Directions

1. Granulate the extract (item 1) with solution of items 2 to 4, then dry, pass through a 0.8 mm sieve, mix with items 5 and 6, and press with high-compression force.
2. Compress into 489 mg tablets, using 12 mm biplanar punches.

HYDROCHLOROTHIAZIDE AND POTASSIUM CHLORIDE (50 MG/300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Hydrochlorothiazide	50.00
300.00	2	Potassium chloride	300.00
15.00	3	Kollidon® CL	15.00
2.00	4	Aerosil® 200	2.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix the components, and press.
2. Compress into 369 mg tablets, using 9 mm punches.

HYDROCHLOROTHIAZIDE FAST-MELT TABLETS

Manufacturing Directions

1. Mix hydrochlorothiazide, 20%; sodium bicarbonate, 25%; citric acid anhydrous, 25%; Avicel™ PH113, 18%; xylitol, 10%; and Crodesta F160, 2%.
2. Dry at elevated temperatures to significantly reduce the moisture content of each material.
3. Blend for 10 minutes and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix HYD-EFG (30–60 mesh), 50%; microcrystalline cellulose, 31%; anhydrous lactose, 10%; Ac-Di-Sol, 2.5%; L-HPC LH-11, 2.5%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; and Cab-O-Sil M5P, 0.1%.
5. Screen the granules and blend with the ingredients for 5 minutes prior to compression.
6. Compress the hydrochlorothiazide tablets to a hardness of approximately 1 to 3 kPa, and tablets should disintegrate in water in approximately 15 to 35 seconds.

HYDROCHLOROTHIAZIDE TABLETS (50 MG)

Hydrochlorothiazide is supplied as 25, 50, and 100 mg tablets for oral use. Each tablet contains the following inactive ingredients: calcium phosphate, FD&C Yellow No. 6, gelatin, lactose, magnesium stearate, starch, and talc.

HYDROCHLOROTHIAZIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Hydrochlorothiazide	50.00
280.00	2	Ludipress®	280.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Compress with a low-compression force. Compress into 328 mg tablets, using 8 mm punches.

HYDROCHLOROTHIAZIDE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Hydrochlorothiazide	50.00
422.00	2	Lactose monohydrate	422.00
8.00	3	Kollidon® 90F	8.00
—	4	2-Propanol	38 mL
15.00	5	Kollidon® CL	15.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with item 2, pass through a 0.8 mm sieve, add items 5 and 6, and press with low-compression force.
2. Compress into 495 mg tablets, using 12 mm biplanar punches.

HYDROCHLOROTHIAZIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Hydrochlorothiazide	50.00
64.76	2	Dicalcium phosphate	64.76
64.76	3	Lactose	64.76
20.00	4	Starch 1500	20.00
0.50	5	Magnesium stearate	0.50

Manufacturing Directions

1. Blend all the materials (except magnesium stearate) for 15 minutes.
2. Add magnesium stearate and blend for 5 additional minutes.
3. Compress 200 mg tablets; for 25.00 mg strength, compress 100 mg.

HYDROCODONE AND ACETAMINOPHEN TABLETS (5.0 MG/500 MG; 7.50 MG/750 MG)

Each tablet contains hydrocodone bitartrate (5 mg) and acetaminophen (500 mg). Other ingredients include colloidal silicon dioxide, cornstarch, croscarmellose sodium, dibasic calcium phosphate, magnesium stearate, microcrystalline cellulose, povidone, and stearic acid. Each extra-strength tablet contains hydrocodone bitartrate (7.5 mg) and acetaminophen (750 mg). Other ingredients include colloidal silicon dioxide, cornstarch, croscarmellose sodium, magnesium stearate, povidone, and stearic acid.

HYDROCODONE AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
750.00	1	Acetaminophen powder	750.00
7.50	2	Hydrocodone bitartrate	7.50
12.00	3	Colloidal silicon dioxide	12.00
154.40	4	Microcrystalline cellulose	154.40
64.00	5	Croscarmellose sodium	64.00
26.00	6	Hydroxypropyl methylcellulose	26.00
124.80	7	Starch (maize)	124.80
4.00	8	Magnesium stearate	4.00
—	9	Water, purified	QS

Note: For 500 mg item 1 and 5.0 mg item 2 formulation, adjust fill volume.

Manufacturing Directions

1. Pass hydrocodone bitartrate through a 20 mesh screen. Pass acetaminophen and colloidal silicon dioxide (50%) through a Frewitt SG Turbo Sieve equipped with a 1.0 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum at speed setting 5 (approximately 1030 rpm).
2. Pass microcrystalline cellulose (50%), croscarmellose sodium (50%), cornstarch (66%), and hydroxypropyl methylcellulose through the Turbo Sieve at the same settings as in step 1. Load the screened powders into a Lodige MGT-600 mixer, and mix for 5 minutes with the plow speed at approximately 103 rpm and no choppers.
3. Add water to the mixer over a 10 minute period, using a stainless steel transfer container with a valve, while mixing with the plows at about 103 rpm and the choppers at slow speed.
4. Mix the wet mass for another 15 minutes, until a wattmeter reading of 15 to 16 mkW is reached.
5. Dry the material. Preheat a Glatt fluid-bed dryer by running it for 2.5 minutes at 60°C inlet air temperature at 3500 m^3/h. Set the exhaust blower bypass speed at about 40%, the filter shaking interval for about 2 minutes, and the filter shaking duration for 5 seconds. Transfer the material in the dryer for drying. Decrease the inlet air to 2500 m^3/h and the inlet air temperature to 55°C after 30 minutes. Dry the material until an LOD of less than 0.5% is reached.
6. Pass the dried granulation through a FitzMill using a 20 mesh screen with knives forward, at medium speed.
7. Pass the remaining microcrystalline cellulose and the colloidal silicon dioxide through a Frewitt SG Turbo Sieve equipped with a 1 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum. The speed setting is at approximately 1030 rpm.
8. Add magnesium stearate, and mix for 3 minutes.
9. Compress using a 13/32 in. round tooling.

HYDROCODONE AND IBUPROFEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Ibuprofen	400.00
15.00	2	Hydrocodone bitartrate	15.00
12.00	3	Colloidal silicon dioxide	12.00
154.40	4	Microcrystalline cellulose	154.40
64.00	5	Croscarmellose sodium	64.00
26.00	6	Hydroxypropyl methylcellulose	26.00
124.80	7	Starch (maize)	124.80
4.00	8	Magnesium stearate	4.00
—	9	Water, purified	QS

Manufacturing Directions

1. Pass hydrocodone bitartrate through a 20 mesh screen. Pass ibuprofen and colloidal silicon dioxide (50%) through a Frewitt SG Turbo Sieve equipped with a 1.0 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum at speed setting 5 (approximately 1030 rpm).
2. Pass microcrystalline cellulose (50%), croscarmellose sodium (50%), cornstarch (66%), and hydroxypropyl methylcellulose through the Turbo Sieve at the same settings as in step 1. Load screened powders into a Lodige MGT-600 mixer, and mix for 5 minutes with the plow speed at approximately 103 rpm and no choppers.
3. Add water to the mixer over a 10 min period, using a stainless steel transfer container with a valve while mixing with the plows at about 103 rpm and the choppers at slow speed.
4. Mix the wet mass for another 15 minutes until a wattmeter reading of 15 to 16 MkW is reached.
5. Dry the material using a preheated Glatt fluid-bed dryer; preheat by running the dryer for 2.5 minutes at 60°C inlet air temperature at 3500 m^3/h. Set the exhaust blower bypass speed at about 40%, the filter shaking interval for about 2 minutes, and the filter shaking duration for 5 seconds. Transfer the material in the dryer for drying. Decrease the inlet air to 2500 m^3/h and the inlet air temperature to 55°C after 30 minutes. Dry the material until an LOD of less than 0.5% is reached.
6. Pass the dried granulation through a FitzMill using a 20 mesh screen, with knives forward, at medium speed.
7. Pass the remaining microcrystalline cellulose and the colloidal silicon dioxide through a Frewitt SG Turbo Sieve equipped with a 1 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum. The speed setting is at approximately 1030 rpm.
8. Add magnesium stearate, and mix for 3 minutes.
9. Compress using a 13/32 in. round tooling.

HYDROMORPHONE HYDROCHLORIDE FAST-MELT TABLETS

Manufacturing Directions

1. Mix hydromorphine hydrochloride 15%, sodium bicarbonate 28%, citric acid anhydrous 24%, microcrystalline cellulose 10%, anhydrous lactose 11%, xylitol 10%, and sucrose stearate 2%.
2. Mix these ingredients and dry at elevated temperatures to significantly reduce the moisture content of the material.
3. Blend for 10 minutes, and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix HDM-EGF (30–60 mesh), 50%; microcrystalline cellulose, 18%; anhydrous lactose, 18%; crospovidone, 5%; L-HPC LH-11, 5%; aspartame, 3.25%; natural orange powder, 0.15%; magnesium stearate, 0.45%; fumed silicon dioxide, 0.15%.
5. Screen the granules and blend for 5 minutes prior to compression.
6. Hydromorphone tablets are compressed to a hardness of approximately 1 to 5 kPa (depending upon the dose of the active), and tablets disintegrate in water in approximately 15 to 35 seconds.

HYDROXYZINE TABLETS

Inert ingredients for the tablets are acacia, carnauba wax, dibasic calcium phosphate, gelatin, lactose, magnesium stearate, precipitated calcium carbonate, shellac, sucrose, talc, and white wax. The 10 mg tablets also contain sodium hydroxide, starch, titanium dioxide, and FD&C Yellow No. 6 Lake. The 25 mg tablets also contain starch and velo dark green. The 50 mg tablets also contain starch and velo yellow. The 100 mg tablets also contain alginic acid, FD&C Blue No. 1, polyethylene glycol, and FD&C Red No. 3.

HYOSCINE BUTYLBROMIDE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.000	1	Hyoscine butylbromide	10.000
16.500	2	Lactose monohydrate	16.500
28.000	3	Lactose monohydrate, dense	28.000
17.930	4	Starch (maize)	17.93
2.240	5	Povidone (PVP K-30)	2.240
—	6	Purified water	5.080
0.400	7	Magnesium stearate	0.400
2.740	8	Pregelatinized starch (Starch 1500)	2.740

Manufacturing Directions

Caution: Hyoscine butylbromide is a potent smooth muscle relaxant. Inhalation can produce toxic effects. Strictly adhere to the usage of mask, gloves, and goggles.

1. Preparation of binding solution: Dissolve item 5 in item 6 by stirring to make a clear solution. Use the stirrer at medium speed in a stainless steel container.
2. Dry mixing: Check to see if hyoscine butyl bromide is in fine powder form. If not, pass through a 630 μm sieve using a sifter. Load items 1, 2, 4, and 3 into

the mixer, and mix for 5 minutes with the mixer and chopper at low speed.

3. Wet massing
   a. Add the binding solution to the dry powder in the mixer while mixing at low speed. When the addition is over, mix and chop for a further 2 minutes at high speed.
   b. Scrape the lid and blade, and check for a satisfactory wet mass. Add more item 6 if required to get a satisfactory wet mass.
4. Drying
   a. Spread the granules onto stainless steel trays to a thickness of one-third of the tray thickness, and load the trays on the trolley.
   b. Load the trolleys into the oven. Dry at 60°C for 16 hours. Turn the granules after 3 to 4 hours so as to ensure uniform drying of the granules.
   c. Check the moisture content of the dried granules, keeping in mind the limit of 1.0% to 1.5%.
5. Grinding: Pass the dried granules through a granulator equipped with a 1.0 mm sieve.
6. Lubricating
   a. Mix items 7 and 8 in a polythene bag, and pass through a 250 µm sieve using a sifter. Collect the material in a stainless steel container.
   b. Load the sized granules from step 5 along with sieved powder from step 6a into the drum mixer. Mix these items for 3 minutes.
   c. Unload into stainless steel drums.
7. Compression: Compress the granules using a rotary tableting machine (with dies and punches: 6 mm, concave, plain punches with fill weights of 780 mg).
8. Coating: Sugar coat the tablets. (See Appendix.)

IBUPROFEN AND DOMPERIDONE MALEATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
7.50	2	Domperidone maleate	7.50
750.00	3	Sucrose	750.00
50.00	4	Sorbitol	50.00
1.12	5	Silica fumed	1.12
6.75	6	Stearic acid	6.75

Manufacturing Directions

1. Combine items 1 to 6 to form a homogeneous blend.
2. Compress by direct compression to form a chewable tablet containing 200 mg of ibuprofen and 7.5 mg of domperidone maleate.
3. Compression weight approximately 1015 mg per tablet.

IBUPROFEN AND DOMPERIDONE MALEATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
5.00	2	Domperidone maleate	5.00
20.00	3	Microcrystalline cellulose	20.00
30.00	4	Croscarmellose sodium	30.00
2.00	5	Magnesium stearate	2.00
2.00	6	Hydrogenated cottonseed oil	2.00
60.00	7	Tricalcium phosphate	60.00
10.00	8	Hydroxypropyl cellulose	10.00
10.00	9	Hydroxypropyl methylcellulose	10.00
112.00	10	Sorbitol	112.00

Manufacturing Directions

1. Sieve ibuprofen, domperidone maleate, tricalcium phosphate, hydroxypropyl cellulose, croscarmellose sodium, and microcrystalline cellulose and blend to form a homogeneous mixture.
2. Granulate the mixture to a suitable end point with water and dry.
3. Blend the dried granules with magnesium stearate.
4. Compress the lubricated granules to form tablet cores, each containing 200 mg of ibuprofen and 5 mg of domperidone or each containing 400 mg of ibuprofen and 10 mg of domperidone.
5. Coat the tablet cores with a conventional film coating.

IBUPROFEN AND DOMPERIDONE SUSTAINED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Ibuprofen	400.00
20.00	2	Domperidone maleate	20.00
100.00	3	Xanthan gum	100.00
12.00	4	Hydroxypropyl methylcellulose	12.00
6.00	5	Stearic acid	6.00
2.00	6	Colloidal silicon dioxide	2.00

Manufacturing Directions

1. Granulate the hydroxypropyl methylcellulose and ibuprofen with approximately 20% of the total content of xanthan gum using water as the granulating agent.

2. Combined the ibuprofen granule with the remainder of the xanthan gum and the other ingredients and compress into tablets containing 400 mg of ibuprofen and 20 mg of domperidone.

IBUPROFEN AND HYDROCODONE BITARTRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
7.52	2	Hydrocodone Bitartrate	7.52
6.00	3	Colloidal silicon dioxide	6.00
77.20	4	Microcrystalline cellulose	77.20
32.00	5	Sodium croscarmellose	32.00
13.00	6	Hydroxypropyl methylcellulose	13.00
62.40	7	Cornstarch	62.40
2.00	8	Magnesium stearate	2.00

Manufacturing Directions

1. Pass hydrocodone bitartrate through a 20 mesh handscreen.
2. Pass ibuprofen (50%) and colloidal silicon dioxide (0.75%) through a Frewitt SG Turbo Sieve equipped with a 1.0 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-line collecting drum at speed setting 5 (approximately 1030 rpm).
3. Pass microcrystalline cellulose (9.5%), croscarmellose sodium (4.0%), cornstarch (10.6%), and hydroxypropyl methylcellulose (3.3%) through the Turbo Sieve at the same settings.
4. Introduce the screened powders into a Lodige MGT-600 mixer and mix for 5 minutes with plow speed at approximately 103 rpm and no choppers.
5. Add water to the mixer over a 10 minute period using a stainless steel transfer container with a valve while mixing with plows at about 103 rpm and choppers at slow speed.
6. Mix the wet material for another 15 minutes until a Wattmeter of 15 to 16 kW is reached.
7. To dry the material, preheat a Glatt fluid-bed dryer by running it for 2.5 minutes at 60°C, with inlet air temperature at 3500 m^3/h. Set the exhaust blower bypass speed at about 40%, the filter shaking interval for about 2 minutes, and the filter shaking duration for 5 seconds. Place the material in the dryer for drying. Decrease the inlet air to 2500 m^3/h and the inlet air temperature to 55°C after 30 minutes. Dry the material until an LOD of less than 0.5% is reached.
8. Pass the dried granulation through a FitzMill using a 20 mesh screen 1536–0200 with knives forward at medium speed.
9. Pass the remaining microcrystalline cellulose and the colloidal silicon dioxide alternately through a Frewitt SG Turbo Sieve equipped with a 10 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum. Set the speed at approximately 1030 rpm.
10. Introduce the milled granulation, the remaining croscarmellose, the screened colloidal silicon dioxide, the microcrystalline cellulose, and the cornstarch into a Littleford FKM-3000 mixer through a chute and mix for 3 minutes at fast speed.
11. Pass magnesium stearate through a Frewitt Turbo Sieve equipped with a 1.0 mm round-hold screen, an angle bar, a cloth skirt, and a polyethylene line collecting drum. Set the speed at about 1030 rpm.
12. Add magnesium stearate to the mixture and mix for 3 minutes at fast speed. Discharge the final blend through a cloth sleeve into tared totes with inserts with minimum jogging.
13. Compress the composition into tablets by using a Kilian TX-32 tablet press and 13/32 in. round tooling and film coat.

IBUPROFEN CHEWABLE TABLETS

Manufacturing Directions

1. Dissolve PVAP and PVP-K90, equivalent to a 2:1 weight ratio, in minimum volumes of an aqueous ammonium hydroxide solution (28% v/v) and water, respectively, and then mix.
2. Into the resulting mixture, dissolve ibuprofen, equal to the amount of PVAP used, and then add 0.1 N HCl solution dropwise until the pH of the solution is 1.0.
3. Filter the white solid precipitate, wash with water, and then vacuum dry.
4. Use the entrapped granules containing 39.06% ibuprofen in the preparation of tablets.
5. Accurately weigh appropriate amounts of the granules and the cherry vehicle, corresponding to 200 mg of ibuprofen per 668 mg of tablet, and then mix, and compress tablets.

IBUPROFEN-COATED FAST-CRUMBLING GRANULE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
16.00	2	Sodium croscarmellose (AGG)	16.00
27.50	3	Aspartame	27.50
12.20	4	Precipitated silica	12.20
35.00	5	Ethyl cellulose	35.00
8.00	6	Hypromellose	8.00
1.33	7	Sodium (AGM) croscarmellose	1.33
	8	Pharmacoat 606	

Manufacturing Directions

1. Mix ethyl cellulose, 80% precipitated silica, and 30% aspartame in ethyl alcohol, until a homogeneous suspension is obtained.
2. Then, fluidize powder mixture consisting of ibuprofen, item 7, 70% aspartame, and 20% precipitated silica.
3. Start granulation by spraying the mixture for about 15 to 20 minutes at a spraying rate of 25 g/min and a suspension atomization pressure of 0.8 bar.
4. Perform the actual coating by spraying the remainder of the mixture over about 1.5 hours at a spraying rate of 15 to 20 g/min and a suspension atomization pressure of 1.5 bar.
5. Spray 15% of the mixture during the granulation step, and spray the remainder to 100% during the coating step.
6. Formulate the granules obtained as fast-crumbling multiparticulate tablets, with the following composition: coated granules, 300 mg; mannitol, 344 mg; sodium croscarmellose, 21 mg; precipitated silica, 7 mg; aspartame, 20 mg; mint flavoring, 4 mg; magnesium stearate, 4 mg.

IBUPROFEN FAST-DISSOLVE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
121.90	1	Ibuprofen-coated granules	121.90
11.00	2	Citric acid	11.00
3.90	3	Magnasweet 135	3.90
6.50	4	Aspartame	6.50
7.80	5	Cherry flavor	7.80
39.00	6	Croscarmellose sodium	39.00
1.95	7	Silicon dioxide	1.95
3.25	8	Magnesium stearate	3.25
457.90	9	Fast-dissolving granulation (see manufacturing directions)	457.90

Manufacturing Directions

1. Make a fast-dissolving granulation by combining 400 g of melted PEG 900 with fructose powder (100 g) in a planetary mixer (low-shear mixer) and mixing until granules are formed.
2. Allow the granulations to cool, and then screen.
3. Screen ingredients, and then mix in a V-blender.
4. Compress tablets (653.7 mg) at 600 lb (about 2.7 kN).
5. The tablets should have hardness of 0.2 to 0.5 kPa and disintegrate in less than 15 seconds.

IBUPROFEN SUSTAINED-RELEASE BILAYER TABLET

Manufacturing Directions

1. Immediate-release layer composition
   a. Part I: Ibuprofen USP 160.0 mg; microcrystalline cellulose NF, 32.0 mg; (Avicel™ PH 101) starch NF, 32.0 mg; pregelatinized starch NF, 16.0 mg; (Starch 1500) sodium starch glycolate NF, 6.4 mg.
   b. Part II: Hydroxypropyl methylcellulose, 1.6 mg (2910 USP, Methocel E-5) Purified Water USP, QS.
   c. Part III: Sodium starch glycolate NF, 1.6 mg (Explotab); colloidal silicon dioxide NF, 0.8 mg. Total 250.4 mg.
   d. Weigh the components of Part I and preblend them in a high-shear mixer (Fielder: impeller speed of approximately 118 rpm for 3 minutes).
   e. Prepare the granulating agent (Part II) by dissolving hydroxypropyl methylcellulose 2910 USP into purified water USP (a ratio of 3.2 g of hydroxypropyl methylcellulose to 200 g water).
   f. Deliver the granulating agent to the powders of Part I, in the high-shear mixer.
   g. Granulate the mixture for 20 minutes (Fielder: impeller speed of approximately 118 rpm).
   h. Remove the completed wet granulation from the high-shear mixer and load into the product bowl of a fluid-bed apparatus (e.g., Aeromatic or Glatt).
   i. With an inlet air temperature of approximately 60°C, dry the granulation to a moisture level of 0.5% to 1.1% as determined by loss on drying (e.g. Computrac). The wet granulation can also be dried on trays in drying ovens.
   j. Sieve the dried granulation (e.g. Glatt Quick Sieve: Stator No. 3, Screen No. 1.5 mm, 1000 rpm). Other machines such as a Fitzpatrick Comminution Mill can also be used.
   k. Blend the sieved and dried granulation with the powders of Part III using a suitable mixer such as a twin-shell, ribbon, or planetary mixer.
2. Sustained-release layer
   a. Povidone USP, 14.7 mg (Plasdone K 29/32); alcohol USP 1:1 mixture with QS purified water USP

b. Part III: Pregelatinized starch NF, 8.0 mg (Starch 1500 LM); microcrystalline cellulose NF, 7.3 mg (Avicel™ PH 101); magnesium stearate NF, 5.0 mg; colloidal silicon dioxide, NF 5.0 mg (Cab-O-Sil). Total = 523.3 mg; total tablet weight = 773.7 mg.
c. Weigh the components of Part I and preblend them in a high-shear mixer (Fielder: impeller speed of approximately 250 rpm for 1 minute).
d. Prepare the granulating agent (Part II) by dissolving the povidone USP in a 1:1 mixture of alcohol USP and purified water USP (a ratio of 12.25 g of povidone to 100 g of alcohol/water).
e. Spray the granulating agent at a rate of 600 mL/min onto Part I in the high-shear mixer.
f. Granulate the mixture for 1 minute after the addition of Part II (Fielder: impeller speed of approximately 250 rpm).
g. Remove the completed wet granulation from the high-shear mixer and load it into the product bowl of a fluid-bed apparatus (e.g., Aeromatic or Glatt).
h. With an inlet air temperature of approximately 60°C, dry the granulation to a moisture level of 0.3% to 0.8% as determined by loss on drying (e.g., Computrac).
i. The wet granulation can also be dried on trays in drying ovens.
j. Sieve the dried granulation (Fitzpatrick Comminution Mill, Model D6: medium speed, knives forward, 0.093 screen). Other machines such as Glatt Quick Sieve can also be used.
k. Blend the sieved and dried granulation with the powders of Part III by using a suitable mixer such as a twin-shell, ribbon, or planetary mixer.

3. Compression of tablets or caplets
a. Load the granulation of the immediate-release layer into one hopper and the granulation of the sustained-release layer into the second hopper of a bilayer tableting machine (e.g., Stokes Versapress).
b. Compress tablets using $0.749 \times 0.281 \times 0.060$ extra deep concave capsule-shaped tooling. (Tablet tooling of other shapes, such as oval or round, can also be used.)
c. The sustained-release layer has a target weight of 523.3 mg, and the immediate-release layer has a target weight of 250.4 mg. Ideal tablet hardness immediately after compression is 11 to 12 kPa.

IBUPROFEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
88.00	2	Maize starch	88.00
30.00	3	Maize starch	30.00
12.80	4	Maize starch (dried)[a]	12.80
1.60	5	Stearic acid (fine powder)	1.60
—	6	Purified water	144.00

[a] Loss on drying: NMT 4.5% when dried at 120°C for 4 hours.

Manufacturing Directions

1. Pass item 3 through a 250 µm sieve using a sifter.
2. Prepare a slurry of item 3 with 10.67 g of cold item 6 (25–30°C) in a stainless steel container.
3. Pour the slurry into a vessel containing 37.33 g of hot item 6 (70–90°C).
4. Heat to 80°C to 90°C and mix until mixture swells and becomes translucent.
5. Cool to 50°C.
6. Check weight (theoretical weight, 58.00 g). If required, adjust with hot purified water. Record the quantity of extra water added.
7. Pass items 1 and 2 through sifter using 250 µm sieve.
8. Load it into a mixer (if required, grind item 1 through a 1 mm sieve).
9. Mix the powder for 15 minutes at high speed.
10. Add binding solution to the dry powder in the mixer and mix for 15 minutes at high speed. Check for satisfactory wet mass.
11. Pass the wet mass through a FitzMill using sieve 24207, knives forward, and medium speed.
12. Collect and spread the granules onto the trays, one-third the thickness of the tray.
13. Load the trolleys into the oven and dry the granules at 55°C for 36 hours.
14. After 12 hours of drying, stir the granules in the trays and change the position of the trays for uniform drying.
15. Check the moisture of the dried granules. The limit NMT is 2.5%. Dry further if required to obtain moisture content of 2.5%.
16. Check the weight of dried granules (theoretical weight = 318.00 g).
17. Pass the dried granules through a 1.5 mm sieve using a granulator. Collect in a stainless steel drum and add it to the blender.
18. Pass items 4 and 5 through a 250 µm sieve using a sifter.
19. Add the sieved material to the granules in a blender and mix for 5 minutes.

20. Compress into 330 mg tablets, using 10 mm convex punches at 4 to 9 kPa.
21. Coat the tablets using one of the polyvinylpyrrolidone (PVP) coating solutions provided in the Appendix or use the following sugar-coating formulation:

Bill of Materials: Sugar Coating

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
7.06	1	Sandrac varnish (WMR)	7.06
3.33	2	Povidone (PVP K-25)	3.33
1.86	3	Povidone (PVP K-25)	1.86
175.85	4	Sucrose	175.85
0.16	5	Titanium dioxide	0.16
1.20	6	Polishing emulsion[a]	1.20
1.33	7	Talc (fine powder)	1.33
—	8	Purified water	87.10

[a] See appendix for polishing emulsion formulation.

22. Load the tablets into the pan.
23. Start the tablets rolling with the exhaust on and air supply off.
24. Pour the item 1 solution onto the rolling tablets and allow the tablets to roll, using hand agitation if required, permitting the solution to spread well over the tablet bed.
25. Permit the tablets to roll until tack develops, at which point item 7 should be quickly sprinkled over the tablets.
26. Allow to roll freely for 2 minutes at 45°C.
27. Do not roll too long, as the seal may be worn from the tablet edges.
28. After 2 minutes of rolling, jog the tablets every 1 minute over a period of 15 minutes with exhaust and drying air on at 45°C.
29. Continue jogging for a further 15 minutes. Jog every 3 minutes with exhaust and drying air temperature on at 45°C.
30. Dissolve 2.40 g of item 2 in 28.80 g of item 8.
31. Apply a half quantity of it to the tablets over 5 minutes; allow to dry, and apply the remainder over a 15 minute period.
32. Heat 11.52 g of item 8 to boiling, dissolve 26.88 g of item 4, and cool down to 25°C.
33. Check weight (theoretical weight, 38.40 g). If less, adjust weight to 38.40 g with purified water.
34. Apply sugar coat over a 30 minute period.
35. Dry the tablets in the coating pan at 30°C, jogging every 1 hour for 6 hours.
36. Heat 72.0 g of item 8 in mixer to boiling.
37. Dissolve 168.0 g of item 4 and then cool to 25°C.
38. Filter the syrup through a 180 μm stainless steel sieve.
39. Dissolve item 3 in 3.68 g of item 8.
40. Dissolve 4.53 g of item 4 in item 6.
41. Disperse item 5 in about 10.67 g of sugar syrup from the previous step and homogenize.
42. Mix these steps with sugar syrup. Check for evenness of the dispersion.
43. Apply sugar coating.

Bill of Materials: Polishing Coat

Scale (mg/ tablet)	Item	Material Name	Quantity/ kg (g)
28.75	1	Bee's wax, bleached (white bee's wax)	28.75
70.00	2	Polyethylene glycol (PEG-6000)	70.00
57.50	3	Carnauba wax	57.50
125.00	4	Talc (fine powder)	125.00
718.75	5	Ethanol, 95%	718.75

44. Melt items 1 to 3 in a steam-heated vessel by gentle heating to 70°C or in a stainless steel container on a hotplate heater.
45. Add item 4 to the vessel or stainless steel container and stir manually.
46. Add item 5 to the vessel or stainless steel container and stir manually.
47. Pass the mixture through a homogenizer.
48. Store the polishing emulsion in a closed container at room temperature.
49. Apply gloss solution.
50. Add step 46 item without air to the tablet bed carefully to get a uniform distribution while rolling.
51. After 5 minutes of distribution, turn on the cold air, and roll further until a shine appears.
52. Once the desired polish appears, stop rolling the pan.
53. Dry the tablets in the pan at 30°C for 30 minutes. Final tablet weight should be 480 mg.

IBUPROFEN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
115.00	1	Lactose	115.00
11.30	2	Povidone	11.30
QS	3	Water, purified	QS
23.00	4	Starch (maize)	23.00
40.00	5	Starch pregelatinized	40.00
11.00	6	French chalk	11.00
1.10	7	Magnesium stearate	1.10
6.80	8	Explotab	6.80
400.00	9	Ibuprofen	400.00

Manufacturing Directions

1. Granulation
   a. Load the following into a planetary mixer: ibuprofen, starch pregelatinized, and polyvinylpyrrolidone. Mix all for 15 minutes.

b. Pass the powder through a 40 mesh screen.
c. Add a sufficient quantity of purified water to form a desirable mass.
d. Pass the mass through a 40 mesh screen on a dryer tray.
e. Dry the granules in a fluid-bed dryer or use a fan-forced oven at 50°C to 60°C for 24 hours to dry granules to an LOD of not more than 1%.
f. Pass the granules through a 40 mesh sieve.

2. Blending
   a. Place the granules in a planetary mixer. Add maize starch, French chalk (item 6), magnesium stearate, and Explotab, and mix for 20 minutes.
3. Compressing: Compress using a rotary press in round punches. The average weight is 610 mg (± 5%).
4. Coating: Apply a sugar coating. (See Appendix.)

IBUPROFEN TABLETS (400 MG), MOTRIN

Ibuprofen, a nonsteroidal anti-inflammatory agent, is available in 400, 600, and 800 mg tablets for oral administration. The inactive ingredients are carnauba wax, colloidal silicon dioxide, croscarmellose sodium, hydroxypropyl methylcellulose, lactose, magnesium stearate, microcrystalline cellulose, propylene glycol, and titanium dioxide.

IBUPROFEN TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Ibuprofen	400.00
43.70	2	Starch (maize)	43.70
18.00	3	Povidone (PVP K-30)	18.00
105.00	4	Starch (maize)	108.13
40.00	5	Starch (maize, dried)	40.00
4.00	6	Colloidal silicon dioxide (Aerosil® 200)	4.00
3.45	7	Colloidal silicon dioxide (Aerosil® 200)	3.45
1.50	8	Stearic acid	1.50
4.50	9	Magnesium stearate	4.50
—	10	Purified water	163.97

Manufacturing Directions

1. Preparing the paste
   a. Pass item 2 through a sifter using a 630 µm sieve. Prepare a slurry of item 2 with 51.78 g of item 10 (30°C). Pour the slurry into a vessel containing 112.19 g of item 10 (70°C). Heat to 80°C to 90°C, and mix until the material swells and becomes translucent.
   b. Cool to 50°C. Check the weight. The theoretical weight is 212.43 g.
   c. If required, adjust with item 10 (70°C). Record the quantity of extra water added.
2. Mixing: Load items 1, 4, and 3 to the mixer. Mix for 5 minutes at high speed.
3. Wet massing:
   a. Add two-thirds of the starch paste quantity (preparing the paste, step 1b) to the dry powder in the mixer (Diosna). Mix for 4 minutes at low speed. Scrape the sides and blades.
   b. Add the remaining quantity, and mix for 3 minutes at low speed. Scrape the sides and blades.
   c. Mix and chop for a further 2 minutes. Check for a satisfactory wet mass. If required, add additional purified water to obtain a satisfactory wet mass.
4. Drying
   a. Dry the granules in a fluid-bed dryer at 55°C for 3 hours. Keep just enough air pressure in order to bounce the granules. After 1 hour of drying, scrape the semidried granules to break the lumps for uniform drying. Unload in a stainless steel drum. Keep overnight for curing.
   b. Check the moisture content of the dried granules. The limit is not more than 2.5%.
5. Grinding: Pass the granules through a 1.25 mm sieve using a granulator. Collect the granules in a stainless steel drum, and add to the blender.
6. Lubricating
   a. Mix items 6 and 8 in a stainless steel drum, and pass through a 500 µm sieve using a sifter. Collect in a stainless steel drum, and add to the blender.
   b. Pass items 5 and 9 through a 250 µm sieve in a sifter. Collect the sieved items in a stainless steel drum, and add to the blender. Mix the materials for 2 minutes.
   c. Unload the result in stainless steel drums.
7. Compressing
   a. Compress the tablets after slugging.
   b. Check the temperature and humidity before starting slugging and compression.
   c. The recommended relative humidity is 45% to 55% at temperatures 25°C to 27°C.
8. Slugging: Slug the granules using a rotary tableting machine with 16 mm punches.
9. Grinding: Grind the slugs through a 6.0 mm sieve followed by a 1.25 mm sieve. Keep 5.40 g of the granules aside. Load the rest of the ground granules in a blender.
10. Sift 5.4 g of the ground granules from step 9 through a 630 µm sieve using a sifter. Add the retained granules to the blender.
11. Add item 7 into the sieved granules from step 10. Mix in a polythene bag. Sift through a 630 µm sieve using a sifter. Add to the blender, and mix for 2 minutes.

12. Compress the granules using a rotary tableting machine (12.7 mm concave punches; compress 620 mg).
13. Tablet coating: Coat using Opadry® and HPMC coatings. (See Appendix.)

IBUPROFEN TABLETS (400 MG)

Formulations: Ibuprofen (Francis), 400 g; Aerosil® 200, 4 g; Ludipress®, 342 g; Kollidon® CL, 8 g; magnesium stearate, 8 g.

Manufacturing Directions

1. Pass ibuprofen and magnesium stearate through a 200 µm sieve.
2. Mix with the other components and press with medium-compression force at 752 mg.

IBUPROFEN TABLETS (600 MG)

Formulations: Ibuprofen 50 (BASF), 600 g; Aerosil® 200, 9 g; Avicel™ PH 200, 108 g; Kollidon® VA 64, 50 g; Kollidon® CL, 27 g; Macrogol 6000 powder, 6 g.

Manufacturing Directions

1. Mix ibuprofen with Aerosil® 200, and add the other components.
2. Press with low-compression force at 793 mg.

IBUPROFEN TABLETS (600 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
600.00	1	Ibuprofen	600.00
129.80	2	Starch (maize)	144.22
1.15	3	Colloidal silicon dioxide (Aerosil® 200)	1.15
70.00	4	Starch (maize)	70.00
5.00	5	Colloidal silicon dioxide (Aerosil® 200)	5.00
8.07	6	Stearic acid	8.07
41.15	7	Pregelatinized starch (Starch 1500)	41.15
10.00	8	Magnesium stearate	10.00
—	9	Purified water	469.00

Manufacturing Directions

1. See the manufacturing directions for 400 mg strength tablet.

IMIPRAMINE TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Imipramine hydrochloride	26.00
1.40	2	Polyvinylpyrrolidone	1.40
1.40	3	Magnesium stearate	1.40
1.40	4	Talc	1.40
50.00	5	Lactose monohydrate	50.00
50.00	6	Dicalcium phosphate	50.00
14.00	7	Starch (maize)	14.00
—	8	Isopropyl alcohol, ca	20 mL

Manufacturing Directions

2. Sift through a 250 µm sieve, and place items 1 and 5 to 7 in a suitable mixing vessel. Mix the items for 10 minutes.
3. In a separate vessel, place item 2 and a suitable quantity of item 8 to dissolve it.
4. Add step 2 into step 1, and make a suitable wet mass; pass through a 2.38 mm sieve, and dry in a dehumidified room overnight.
5. Pass the dried granules through an 18 mesh screen into a blending vessel.
6. Sift items 3 and 4 through a 250 µm sieve, and add to step 4. Blend for 1 minute.
7. Compress into 140 mg tablets, using 7.2 mm punches.

INDOMETHACIN SUSTAINED-RELEASE TABLETS (75 MG)

Formulation: Indomethacin (Synopharm), 75 g; Kollidon® SR, 125 g; Ludipress® LCE, 100 g; silicon dioxide, colloidal, 1.5 g; magnesium stearate, 1.5 g.

Manufacturing Directions

1. Pass all ingredients through a 0.8 mm sieve, blend for 10 minutes in a mixer, and then compress with medium-compression force at 303 mg.

INDOMETHACIN TABLETS (50 MG), DC

Formulation: Indomethacin, 50 g; Ludipress®, 227 g; Kollidon® CL, 20 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force at 303 mg.

INDOMETHACIN TABLETS (100 MG)

Formulation: Indomethacin, 100 g; Ludipress®, 397 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Press with low-compression force at 500 mg.
3. If the flowability of indomethacin is not good, it should be mixed with a low percentage of Aerosil® 200.

INOSINE TABLETS

Bill of Materials

Scale (g/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Inosin (Riboxin, Russia)	200.00
51.00	2	Lactose monohydrate	51.00
6.00	3	Kollidon® 90F	6.00
QS	4	Isopropanol	60.00 mL
10.00	5	Kollidon® CL	10.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with the solvent mixture of items 4.
2. Dry and pass through a 0.8 mm sieve, add items 5 and 6, and press with low-compression force.
3. Compress into 270 mg tablets, using 9 mm biconvex punches.

IRBESARTAN TABLETS (75 MG/150 MG/300 MG), AVAPRO

Avapro is available for oral administration in unscored tablets containing 75, 150, or 300 mg of irbesartan. Inactive ingredients include lactose, microcrystalline cellulose, pregelatinized starch, croscarmellose sodium, poloxamer 188, silicon dioxide, and magnesium stearate.

IRBESARTAN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Irbesartan[a]	75.00
15.38	2	Lactose monohydrate	15.38
22.50	3	Microcrystalline cellulose (Avicel™ PH 101)	22.50
22.50	4	Pregelatinized starch	22.50
7.50	5	Croscarmellose sodium	7.50
4.50	6	Poloxamer 188 (Pluronic F 68)	4.50
1.12	7	Silicon dioxide colloidal	1.12
1.50	8	Magnesium stearate	1.50
—	9	Water, purified[b]	QS

[a] Use different fill weights for 150 mg and 300 mg strength tablets.

[b] The tablets are prepared by a wet granulation process wherein the total amount of water employed (by weight) is up to 50% of the total solids weight.

Manufacturing Directions

1. Place irbesartan, lactose, pregelatinized starch, and a portion (one-half) of croscarmellose sodium in a mixer. Mix the materials for 20 minutes.
2. Pass the powder blend in step 1 through sizing equipment (cone mill or oscillator), and mix in a mixer.
3. Dissolve poloxamer 188 in purified water (25% of the weight of total solids), and use it to wet granulate (with the further addition of water in an amount up to 25% of the weight of total solids, as needed) the mixed powder in step 2.
4. Dry the granules (tray or fluid-bed dryer) until the LOD is 2% or less.
5. Pass the dried granules through a screen, or mill them to obtain the proper size (1–3 mm).
6. Mix the sized granules with silicon dioxide, microcrystalline cellulose, and the remaining croscarmellose sodium in a mixer.
7. Add magnesium stearate and mix for 1 minute.
8. Compress 150 mg for 75 mg strength, 300 mg for 150 mg strength, and 600 mg for 300 mg strength.

IRON (POLYMER-COATED PARTICLE) TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Elemental iron; use ferrous sulfate polymer-coated particles (233 mg iron per g ferrous sulfate)	450.60
200.00	2	Cellulose microcrystalline	200.00
254.40	3	Lactose monohydrate	254.40
36.00	4	Sodium starch glycolate	36.00
9.00	5	Magnesium stearate	9.00

Note: Factor in potency of ferrous sulfate polymer-coated particles.
Adjust with item 3. Item 1 is prepared by first granulating ferrous sulfate using alcohol and water, drying, and sieving particles over 1200 µm in size. Regranulate smaller particles. Apply enteric (HPMC) coating to the granules in a fluid-bed dryer.

Manufacturing Directions

1. Load a suitable mixer/blender with microcrystalline cellulose, and disperse the ferrous sulfate polymer-coated powder.
2. To this mix, add about half the lactose (item 3) and blend for 5 minutes.
3. Pass the sodium starch glycolate through a 500 µm sieve, followed by about half of the remaining lactose.
4. Add to the mix.
5. Blend for a further 5 minutes.
6. Pass the magnesium stearate (item 5) through a 500 µm sieve, followed by the remaining lactose.
7. Add to the previous mix.
8. Blend for a further 5 minutes.
9. Compress into 950 mg tablets at 8 to 14 kpi, using 8 × 16 mm punches; do not rework tablets.
10. Coat the tablets using a HPMC coating solution. (See Appendix.)

ISONIAZID TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Isoniazid	105.00
2.00	2	Starch (maize)	2.00
1.25	3	Gelatin	1.25
1.25	4	Magnesium stearate	1.25
1.25	5	Talc	1.25
—	6	Water, purified	QS

Manufacturing Directions

1. Sift item 1 through a 250 µm sieve into a blending vessel.
2. In a separate vessel, place item 3 and a suitable quantity of item 6, heat to 50°C, and dissolve item 3. Then, add item 2 into step 1, and form a smooth slurry.
3. Add step 2 to a mixing vessel and form a suitable wet mass.
4. Pass the wet mass through a 2.38 mm sieve onto paper-lined trays, and dry at 60°C for 8 hours to an LOD of not more than 2.5%. Transfer the wet mass to a suitable blending vessel.
5. Sift items 4 and 5 through a 500 µm sieve, and add to step 4. Blend these materials for 1 minute.
6. Compress into 125 mg tablets, using 7.3 mm punches.

ISOSORBIDE DINITRATE TABLETS (5 MG) ISMO AND INDUR

Each Ismo tablet contains 20 mg of isosorbide mononitrate. The inactive ingredients in each tablet are D&C Yellow No. 10 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, hydroxypropyl methylcellulose, lactose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 20, povidone, silicon dioxide, sodium starch glycolate, titanium dioxide, and hydroxypropyl cellulose.

Imdur tablets contain 30, 60, or 120 mg of isosorbide mononitrate in an extended-release formulation. The inactive ingredients are aluminum silicate, colloidal silicon dioxide, hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxide, magnesium stearate, paraffin wax, polyethylene glycol, titanium dioxide, and trace amounts of ethanol.

ISOSORBIDE DINITRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Isosorbide dinitrate (40% in Lactose)	13.15
25.00	2	Microcrystalline cellulose (Avicel™ PH 102)	25.00
58.60	3	Lactose (spray dried)	58.60
0.75	4	Magnesium stearate	0.75
2.50	5	Starch (maize, dried)	2.50

Manufacturing Directions

Note: Protect the product from heat and moisture. Heat and moisture affect the potency of isosorbide.

1. Dry mixing and sieving
   a. Mix items 1 to 3 in a suitable stainless steel drum. Pass these materials through a 630 µm sieve using a sifter. Collect in a stainless steel drum.
   b. Load the powders into the drum blender.

2. Mixing
   a. Mix items 4 and 5 in a bag. Pass the material through 250 μm sieve. Collect in a bag.
   b. Take about 1.25 g powder from step 1b and add to step 2a. Mix manually, and transfer to step 1b.
3. Mix for 5 minutes using a drum blender.
4. Check and record the weight of the granules. The theoretical weight of the granules is 100.0 g.
5. Compression: Compress granules into 100 mg tablets using a rotary tableting machine with 6 mm punches.

ISOSORBIDE DINITRATE TABLETS (5 MG)

Formulation: Isosorbide dinitrate + lactose (4 + 6), 12.5 g; lactose monohydrate, 152.1 g; Kollidon® 30, 5.4 g; Kollidon® CL, 9.0 g; magnesium stearate, 1.0 g.

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Press with low-compression force at 184 mg.

ISOSORBIDE DINITRATE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Isosorbide dinitrate (40% in lactose)	26.30
50.00	2	Microcrystalline cellulose (Avicel™ PH 102)	50.00
117.20	3	Lactose (spray dried)	117.20
1.50	4	Magnesium stearate	1.50
5.00	5	Starch (maize, dried)	5.00

Manufacturing Directions

1. See the manufacturing directions for the 5 mg formulation.

ISOVALERAMIDE SUSTAINED-RELEASE TABLETS

Manufacturing Directions

1. Preparation of the tablet core
   a. Disperse active drug (e.g., Isovaleramide; NPS 1776; Oread, Lawrence, KS; cGMP grade) by passage through a 30 mesh screen.
   b. Mix drug, xanthan gum (e.g., XANTURAL; Monsanto, St. Louis, MO; NF grade), and lactose (e.g. monohydrate form, spray dried; Oread, Palo Alto, CA; NF grade) into a 1 L glass jar and blend in a mixer for 4 minutes at 96 rpm.
   c. Add magnesium stearate (e.g. Oread, Palo Alto, CA; NF grade) and blend the mixture for 1 minute.
   d. Compress the final blend into caplets by using 0.32 in. × 0.75 in. × 0.060 in. tooling to a target weight of 800 mg, target hardness of 8 kPa, and target thickness of 0.25 in.
2. Coating of the tablet cores
   a. Prepare hydroxypropyl methylcellulose (HPMC; e.g., Dow Chemical Co., Midland, MI; NF grade) solution by adding HPMC slowly to purified water heated to approximately 80°C. Allow the solution to cool to room temperature by placing the vessel in a cold water bath. Add additional water to prepare the final requisite amount of HPMC solution.
   b. Prepare Aquacoat® ECD/dibutyl sebacate mixture by adding dibutyl sebacate (DBS: e.g., Morflex Inc., Greenboro, NC; NF grade) to Aquacoat® ECD (e.g., FMC Pharmaceutical Division, Philadelphia, PA) while mixing. Continue mixing for a minimum of 30 minutes.
   c. Slowly add the HPMC solution to the Aquacoat® ECD/DBS mixture.
   d. Load the core tablets into a coating apparatus (Vector LCDS 3 coater) fitted with a 1.3 L coating pan and warm until an outlet temperature of 40°C is reached.
   e. Spray coat the tablets until the planned theoretical weight gain (based on core tablet weight) is achieved; however, after curing, the actual coating solids applied are less than the theoretical value (e.g., 8% or 15% theoretical can be 5% and 12% coat, respectively, after curing). Thus, extra spray may need to be added to account for the loss upon curing. Conditions for coating are as follows: inlet temperature, 70°C; outlet temperature, 40°C to 43°C; spray rate, 45 g/min; pan speed, 14 rpm; fluidizing air, 30 to 40 scfm; atomization air pressure, 26 psi.
   f. Stop spraying when the requisite amount of coating suspension is applied. Dry the tablets for approximately 5 minutes in the coating pan. Adjust the inlet temperature during drying to keep the outlet temperature below 45°C.
   g. Cure te tablets in an oven at 60°C for 18 hours.

KAOLIN-PECTIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
QS	1	Distilled purified water	300 mL
50.00	2	Cornstarch	50.00
50.00	3	Povidone (K-29–32)	50.00
QS	4	Distilled purified water	0.50 L
630.00	5	Hydrated aluminum-magnesium silicate	630.00
100.00	6	Kaolin (powder)	100.00
50.00	7	Pectin	50.00
80.00	8	Cornstarch	80.00
80.00	9	Sodium lauryl sulfate	80.00
10.00	10	Magnesium stearate	10.00

Manufacturing Directions

1. Heat purified water (item 1) to 75°C to 80°C, and add cornstarch (item 2) with continuous stirring until a translucent paste is formed; use this paste within 1 hour.
2. Dissolve povidone in purified water (item 4) in a separate container. Ensure that dissolution is complete.
3. Load the following into a suitable planetary mixer: hydrated aluminum-magnesium silicate, kaolin, and pectin.
4. Mix for 5 minutes.
5. Add freshly prepared starch paste from the first step and the povidone solution to the powder blend from the third step; mix until a mass of suitable consistency is obtained.
6. Add extra purified water, if needed.
7. Spread the wet mass on paper-lined trays and dry in the oven at 50°C for 2 hours.
8. Pass the semidried mass through a 4.8 mm (4 mesh) screen by hand or by using a suitable granulator, and load the granule mass onto paper-lined trays.
9. Dry in the oven at 50°C until the moisture content is between 10.0% and 15.0%.
10. Pass the dried granules through a 1.0 mm (18 mesh) screen on a comminuting mill at medium speed, knives forward, into clean, tared, polyethylene-lined drums; seal and weigh.
11. Transfer the dried granules to a suitable blender.
12. Screen the following items through a 595 μm (30 mesh) screen, and add to the blender: cornstarch (item 8), sodium lauryl sulfate, and magnesium stearate.
13. Blend for 5 to 10 minutes.
14. Compress on a suitable compression machine using 1/2 in. round standard concave punches, upper punch with logo and lower punch with a bisect line.
15. Compress into 977 mg tablets at 10 to 18 kpi.
16. Coat using an aqueous Methocel coating and polish as desired.

KETOTIFEN TABLETS (1 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.00	1	Ketotifen; use ketotifen fumarate DC	1.38
1.90	2	Magnesium stearate	1.90
32.50	3	Maize starch	32.50
154.20	4	Calcium hydrogen phosphate anhydrous	154.20
QS	5	Water purified	QS

Manufacturing Directions

1. Granulation
   a. Make a 10% paste with maize starch using a sufficient quantity of purified water and one-half the quantity of maize starch.
   b. Add calcium hydrogen phosphate anhydrous with one-half the quantity of the starch paste.
   c. Add one-half the quantity of maize starch with ketotifen; mix in a planetary mixer.
   d. Add mixture from step 1b to 1c, and mix for 5 minutes. Add the balance of the maize starch powder, and mix for another 10 minutes.
   e. Pass the wet mass through a 20 mesh screen over lined trays and dry at 95°C until an LOD of not more than 3% is achieved.
2. Lubrication: Mix dry granules with magnesium stearate for 3 minutes.
3. Compression: Compress using round, flat, beveled-edge, scored punch with the logo on one side; diameter is 7 mm; weight is 190 mg.

KHELLIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Khellin	25
124.0	2	Ludipress®	124
1.00	3	Magnesium stearate	1

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press.
2. Compress into 150 mg tablets, using 8 mm biplanar punches.

LABETALOL TABLETS (50 MG)

Formulation: Labetalol, fine powder (Joy Sun), 50.0 g; Ludipress®, 98.4 g; Aerosil® 200, 0.8 g; magnesium stearate, 0.8 g.

Manufacturing Directions

1. Mix all components, and sieve through a 0.8 mm screen.
2. Press with low-compression force at 150 mg.

LAMOTRIGINE TABLETS (100 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Lamotrigine, 3% excess	103.00
48.00	2	Avicel™ PH 102	48.00
111.00	3	Lactose monohydrate	111.00
7.00	4	Primojel®	7.00
7.00	5	PVP K30	7.00
1.00	6	Iron oxide yellow	1.00
12.00	7	Avicel™ PH 102	12.00
8.00	8	Primojel®	8.00
1.50	9	Magnesium stearate	1.50
1.50	10	Iron oxide yellow	1.50
—	11	Water purified, ca	75 mL

Manufacturing Directions

1. Load items 1 to 4 after sifting through a 500 μm sieve into a suitable mixer.
2. In a separate vessel, place items 5, 6, and 11; dissolve and homogenize for 5 minutes at medium speed.
3. Add step 2 to step 1, and knead for 1 to 2 minutes; mix until a suitable mass is obtained.
4. Dry granules on trays at 55°C for 12 hours to an LOD of 0.8%.
5. Grind the dried granules through a 1.25 mm sieve.
6. Transfer step 5 to a blender, and add items 7 to 9 after passing them through a 500 μm sieve. Blend for 2 minutes.
7. Compress into 300 mg tablets, using 9.5 mm round punches.

LANSOPRAZOLE TABLETS (10 MG OR 20 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Lansoprazole	10.00
200.00	2	Calcium glycerophosphate	200.00
400.00	3	Sodium bicarbonate	400.00
12.00	4	Croscarmellose sodium	12.00
3.00	5	Pregelatinized starch	3.00

Lansaprazole Enteric-Coated Tablets

1. Core material: nonpareil cores, 400 g; lansoprazole, 400 g; hydroxypropyl methylcellulose, 80 g; sodium lauryl sulfate, 3 g; water purified, 1360 g.
2. Separating layer core material (step 1), 100 g; hydroxypropyl methylcellulose, 9 g; polyethylene glycol 6000, 1 g; talc, 18 g; ethanol 95%, 250 g; water purified, 250 g.
3. Enteric coating layer subcoated pellets (step 2), 100 g; hydroxypropyl methylcellulose phthalate, 40 g; acetyltributyl citrate, 8 g; cetanol, 2 g; ethanol 95%, 162 g; acetone, 378 g. Perform suspension layering in a Wurster equipped fluid-bed apparatus.
4. Spray lansoprazole onto inert nonpareil cores from a water suspension containing lansoprazole, the dissolved binder, and the wetting agent.
5. Coating layer the prepared core material with a separating layer in the same equipment by spraying a suspension of talc in an HPMC/PEG solution. Add PEG to act as a plasticizer for the HPMC.
6. Apply the enteric coating layer in the same equipment by spraying the enteric coating polymer solution (including additives according to above composition from step 2) onto the pellets (layered with a separating layer). Mix the obtained enteric coating layered pellets with prepared granules and other components as described in step 1.

LANSOPRAZOLE TABLETS (10 MG OR 20 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Lansoprazole	10.00
175.00	2	Calcium glycerophosphate	175.00
175.00	3	Calcium lactate	175.00
250.00	4	Sodium bicarbonate	250.00
20.00	5	Polyethylene glycol 6000	20.00
12.00	6	Croscarmellose sodium	12.00
3.00	7	Peppermint flavor	3.00
1.00	8	Magnesium silicate	1.00
1.00	9	Magnesium stearate	1.00

LANSOPRAZOLE TABLETS CHEWABLE (10 MG/20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Lansoprazole	10.00
175.00	2	Calcium lactate	175.00
175.00	3	Calcium glycerophosphate	175.00
250.00	4	Sodium bicarbonate	250.00
0.50	5	Aspartame calcium	0.50
12.00	6	Silicon dioxide colloidal	12.00
15.00	7	Starch (maize)	15.00
12.00	8	Croscarmellose sodium	12.00
10.00	9	Dextrose, anhydrous	10.00
3.00	10	Peppermint flavor	3.00
3.00	11	Maltodextrin	3.00
3.00	12	Mannitol	3.00
3.00	13	Pregelatinized starch	3.00

Manufacturing Directions

1. Pass all ingredients through a 250 µm mesh, and blend in a suitable blender.
2. Compress into 672 mg tablets, using 15 mm biplanar punches. For 20 mg tablets, increase the quantity of item 1, and compress an additional 10 mg.

LANSOPRAZOLE TABLETS, RAPID DISSOLUTION (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Lansoprazole	20.00
175.00	2	Calcium lactate	175.00
175.00	3	Calcium glycerophosphate	175.00
500.00	4	Sodium bicarbonate	500.00
50.00	5	Calcium hydroxide	50.00
12.00	6	Croscarmellose sodium	12.00

LEVAMISOLE HYDROCHLORIDE TABLETS (40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Levamisole hydrochloride, with excess	47.40
10.00	2	Starch (maize)	10.00
20.00	3	Lactose monohydrate	20.00
10.00	4	Sodium starch glycolate	10.00
30.60	5	Starch (maize)	30.60
1.00	6	Magnesium stearate	1.00
5.00	7	Talc	5.00
1.00	8	Aerosil® 200	1.00
—	9	Water, purified, ca	50 mL

Manufacturing Directions

1. Sift items 1 to 4 through a 250 µm sieve, and place in a suitable mixer. Mix the items for 15 minutes.
2. In a separate vessel, place item 5, mix with hot item 9, and form a smooth slurry.
3. Add step 2 into step 1, and mix the items to achieve a lump-free mass.
4. Pass the wet mass through an 8 mesh sieve onto paper-lined trays.
5. Dry the granules at 50°C overnight to reach an LOD of no more than 2%. Transfer to a blender.
6. Pass items 6 to 8 through a 250 µm sieve, add to step 5, and blend for 2 minutes.
7. Compress into 125 mg tablets, using 7 mm punches.
8. Coat tablets with an HPMC methylene chloride coating. (See Appendix.)

LEVAMISOLE TABLETS (150 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Levamisole hydrochloride	150.00
300.00	2	Ludipress®	300.00
4.00	3	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, and pass the mixture through a 0.8 mm sieve.
2. Press with low-compression force.
3. Compress into 458 mg tablets, using 12 mm biplanar punches.

LEVOFLOXACIN TABLETS (250 MG) LEVAQUIN

Levaquin tablets are available as film-coated tablets and contain the following active ingredients: 250 mg (as expressed in the anhydrous form): hydroxypropyl methylcellulose, crospovidone, microcrystalline cellulose, magnesium stearate, polyethylene glycol, titanium dioxide, polysorbate 80, and synthetic red iron oxide; 500 mg (as expressed in the anhydrous form): hydroxypropyl methylcellulose, crospovidone, microcrystalline cellulose, magnesium stearate, polyethylene glycol, titanium dioxide, polysorbate 80, and synthetic red and yellow iron oxides.

LEVOTHYROXINE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.05	1	Levothyroxine sodium	0.05
10.00	2	Citric acid anhydrous	10.00
1.00	3	Magnesium citrate	1.00
89.00	4	Ludipress®	89.00

Manufacturing Directions

1. Prepare a premix of items 1 and 2. Add items 3 and 4, and pass the mixture through a 0.8 mm sieve.
2. Mix and press with low-compression force.
3. Compress into 101 mg tablets, using 6 mm biplanar punches. Item 2 may be omitted and compensated with item 4. If the content uniformity of formulation No. 1 does not meet the requirements, add a small part of the Ludipress® and item 3 mixture, and the mixture of items 1 and 2. The function of citric acid in formulation No. 2 is to stabilize the active ingredient.

LEVOTHYROXINE TABLETS (50 µG) SYNTHROID

The inactive ingredients in synthroid tablets are acacia, confectioner's sugar (contains cornstarch), lactose, magnesium stearate, povidone, and talc. The following are the color additives by tablet strength: 25 µg: FD&C Yellow No. 6; 50 µg: none; 75 µg: FD&C Red No. 40 and FD&C Blue No. 2; 88 µg: FD&C Blue No. 1, FD&C Yellow No. 6, and D&C Yellow No. 10; 100 µg: D&C Yellow No. 10 and FD&C Yellow No. 6; 112 µg: D&C Red No. 27 and 30; 125 µg: FD&C Yellow No. 6, FD&C Red No. 40, and FD&C Blue No. 1; 150 µg: FD&C Blue No. 2; 175 µg: FD&C Blue No. 1 and D&C Red No. 27 and 30; 200 µg: FD&C Red No. 40; 300 µg: D&C Yellow No. 10, FD&C Yellow No. 6, and FD&C Blue No. 1.

LEVOTHYROXINE TABLETS (0.025 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.025	1	Levothyroxine	0.025
11.42	2	Prosolv SMCC 50	11.42
104.29	3	Prosolv SMCC 90	104.29
6.14	4	Sodium starch glycolate	6.14
0.86	5	Magnesium stearate	0.86
0.28	6	FD&C Yellow No. 6	0.28

Manufacturing Directions

1. Add items 1 and 2 in a suitable blender. Blend the items for 10 minutes, and pass through a 60 mesh screen.
2. In a separate container, take 50% of item 3 and item 6, and blend for 10 minutes.
3. Add the balance of item 3 to step 1, and blend for 1 minute.
4. Add step 3 into step 1, and mix.
5. Add items 4 and 5, one at a time, and blend.
6. Compress into 123 mg tablets.

LEVOTHYROXINE SODIUM FAST-MELT TABLETS

Manufacturing Directions

1. Mix levothyroxine sodium, 30%; sodium bicarbonate, 24%; citric acid, anhydrous, 24%; anhydrous lactose, 10%; xylitol, 10%; and sucrose stearate, 2%.
2. Dry the ingredients at elevated temperatures to significantly reduce the moisture content of each material.
3. Blend for 10 minutes, and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix LS-EGF (20–80 mesh), 55%; microcrystalline cellulose, 26%; mannitol, 10%; crospovidone, 5%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; and fumed silicon dioxide, 0.1%.
5. Blend for approximately 5 minutes prior to compression.
6. Levothyroxine sodium tablets are then compressed to a hardness of approximately 1 to 5 kPa (depending upon the dose of the drug), and tablets disintegrate in water in approximately 15 to 35 seconds.

LINEZOLID TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Linezolid	400.00
40.00	2	Starch (maize)	40.00
78.40	3	Microcrystalline cellulose PH 101	78.40
8.00	4	Hydroxypropyl cellulose	8.00
28.00	5	Sodium starch glycolate	28.00
5.60	6	Magnesium stearate	5.60

Manufacturing Directions

1. Mix all ingredients, and compress into 560 mg tablets, using 12 mm biplanar punches.

LISINOPRIL AND HYDROCHLOROTHIAZIDE TABLETS (10/12.50)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Lisinopril	10.00
12.50	2	Hydrochlorothiazide	12.50
68.20	3	Dibasic calcium phosphate anhydrous, DC grade	68.20
30.00	4	Mannitol	30.00
6.50	5	Starch 1500	6.50
0.50	6	Yellow ferric oxide	0.50
1.00	7	Red ferric oxide	1.00
1.30	8	Magnesium stearate	1.30

Manufacturing Directions

1. Pass item 3 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 2, 5, 6, and 7 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=5.20 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 4 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 8 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 130 mg tablets, using a suitable punch (5.0 mm × 6.0 mm, oval).

LISINOPRIL AND HYDROCHLOROTHIAZIDE TABLETS (20/12.5)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Lisinopril	20.00
12.50	2	Hydrochlorothiazide	12.50
73.50	3	Dibasic calcium phosphate anhydrous, DC grade	73.50
35.00	4	Mannitol	35.00
7.50	5	Starch 1500	7.50
1.50	6	Magnesium stearate	1.50

Manufacturing Directions

1. Pass item 3 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 2, and 5 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=5.5 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 4 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 150 mg tablets, using a suitable punch (6.5 mm, round).

LISINOPRIL AND HYDROCHLOROTHIAZIDE TABLETS (20/25)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Lisinopril	20.00
25.00	2	Hydrochlorothiazide	25.00
110.50	3	Dibasic calcium phosphate anhydrous, DC grade	110.50
30.00	4	Mannitol	30.00
10.00	5	Starch 1500	10.00
1.50	6	Yellow ferric oxide	1.50
1.00	7	Red ferric oxide	1.00
2.00	8	Magnesium stearate	2.00

Manufacturing Directions

1. Pass item 3 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 2, 5, 6, and 7 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 10% (=5.50 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 4 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 8 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 200 mg tablets, using a suitable punch (6.5 mm × 7.5 mm, oval).

LISINOPRIL TABLETS (10 MG), ZESTRIL

Zestril is supplied as 2.5, 5, 10, 20, and 40 mg tablets for oral administration. The inactive ingredients are as follows: 2.5 mg tablets: calcium phosphate, magnesium stearate, mannitol, and starch; 5, 10, and 20 mg tablets: calcium phosphate, magnesium stearate, mannitol, red ferric oxide, and starch; 40 mg tablets: calcium phosphate, magnesium stearate, mannitol, starch, and yellow ferric oxide.

LISINOPRIL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Lisinopril	10.00
139.00	2	Ludipress®	139.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve.
2. Mix intensively, and press with low-compaction force (10 kN).

LISINOPRIL TABLETS (2.5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.50	1	Lisinopril	2.50
66.50	2	Dibasic calcium phosphate anhydrous, DC grade	66.50
25.00	3	Mannitol	25.00
5.00	4	Starch 1500	5.00
1.00	5	Magnesium stearate	1.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass item 1 and item 4 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=4.6 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 5 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 100 mg tablets, using a suitable punch (5.0 mm × 5.5 mm, oval).

LISINOPRIL TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Lisinopril	5.00
61.50	2	Dibasic calcium phosphate anhydrous, DC grade	61.50
27.00	3	Mannitol	27.00
5.00	4	Starch 1500	5.00
0.50	5	Red ferric oxide	0.50
1.00	6	Magnesium stearate	1.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, and 5 through 0.5 mm sieve and collect in a stainless steel container.

4. Add 20% (=6.2 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 100 mg tablets, using a suitable punch (5.0 mm, round).
13. Compress into 152 mg tablets, using 8 mm biplanar punches for 7.5 mg strength tablet

LISINOPRIL TABLETS (10 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Lisinopril	10.00
81.20	2	Dibasic calcium phosphate anhydrous, DC grade	81.20
30.00	3	Mannitol	30.00
6.50	4	Starch 1500	6.50
1.00	5	Red ferric oxide	1.00
1.30	6	Magnesium stearate	1.30

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass item 1, item 4 and item 5 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=6.0 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress to 130 mg tablets, using a suitable punch (5.0 mm × 6.0 mm, oval).

LISINOPRIL TABLETS (15 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
15.00	1	Lisinopril	15.00
89.50	2	Dibasic calcium phosphate anhydrous, DC grade	89.50
35.00	3	Mannitol	35.00
7.50	4	Starch 1500	7.50
1.50	5	Red ferric oxide	1.50
1.50	6	Magnesium stearate	1.50

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, and 5 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 15% (=6.7 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 150 mg tablets, using a suitable punch (7 mm, round).

LISINOPRIL TABLETS (20 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
20.00	1	Lisinopril	20.00
121.00	2	Dibasic calcium phosphate anhydrous, DC grade	121.00
45.00	3	Mannitol	45.00
10.00	4	Starch 1500	10.00
2.00	5	Red ferric oxide	2.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.

3. Pass items 1, 4, and 5 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 10% (=6.0 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 200 mg tablets, using a suitable punch (7.5 mm × 8.0 mm, oval).

LISINOPRIL TABLETS (40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Lisinopril	20.00
121.00	2	Dibasic calcium phosphate anhydrous, DC grade	121.00
45.00	3	Mannitol	45.00
10.00	4	Starch 1500	10.00
2.00	5	Red ferric oxide	2.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, and 5 through 0.5 mm sieve and collect in a stainless steel container.
4. Add 10% (=7.1 g) powder from step 1 to step 3 and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass item 3 through 0.7 mm sieve and place in tumbler from step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 250 mg tablets, using a suitable punch (8.0 mm, round).

LITHIUM CARBONATE TABLETS

Manufacturing Directions

1. Load sodium chloride (8000 g), milled through a Whistler Mill using a small slotted screen, and 60,000 g of lithium carbonate into a 5 ft^3 ribbon blender, and blend for 5 minutes.
2. Discharge the powder mixture from the blender, and pass through a FitzMill at a high speed (hammers). Return the powder to the blender and wet granulate (16,000 g of water) with povidone.
3. Add the binder solution in water while the mixer is running. Pass the resultant wet mass through the FitzMill (1/2 in., perforated band, hammers forward) at high speed. Tray and dry the resultant mass overnight (16 hours at 55°C).
4. Size the dried mixture through the FitzMill (2A with knives at medium speed). Return the resultant blend to the ribbon blender.
5. Pass sorbitol powder through a 40 mesh screen along with Stearowet C (a combination of calcium stearate and sodium lauryl sulfate). Add 2000 g of the Stearowet C and 8000 g of the sorbitol powder to the blender along with 200 g of sodium starch glycolate, and mix the blend for 5 minutes.
6. Compress the resultant mixture into 200,000 tablets using a 3/8 in. standard concave tooling, uppers plain, lowers plain.
7. Each tablet should weigh 406 mg and have the following composition: lithium carbonate, 300 mg; sodium chloride, 49 mg; polyvinylpyrrolidone, 15 mg; Stearowet C, 10 mg; sorbitol, 40 mg; and sodium starch glycolate, 1 mg. The compressed tablets should have a hardness of 8 to 10 kPa, a friability of NMT 0.4%, and a thickness of 0.175 in.
8. The tablets can be optionally coated using conventional procedures. Place the tablets in Accela Cota and spray 10,000 mL of a conventional clear film seal solution thereon. Subsequently, spray 30,000 mL of a colored film seal (e.g., 1300 g of Opaspray® K-1–1243 in 30,000 mL of a clear film seal solution). Follow by spraying 10,000 mL of half-strength film and color solution (e.g., 215 g of the same ingredient in 10,000 mL of half-strength film seal solution). Finish the spraying with 5000 mL of half-strength film seal solution. Dry the coated tablets in a pan for 1 hour using 800 to 1000 cfm of air at 30°C to 35°C. Tray and dry at 20°C to 23°C overnight. After submission of, e.g., 150 tablets to quality control for approval, polish the tablets in a pan with 2 g of carnauba wax.

LOMEFLOXACIN HYDROCHLORIDE TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Lomefloxacin; use lomefloxacin hydrochloride	442.00
123.00	2	Microcrystalline cellulose	123.00
13.50	3	Croscarmellose sodium Type A	13.50
1.80	4	Hydroxypropyl cellulose	1.80
3.50	5	Silicon dioxide, colloidal	3.50
2.70	6	Polyoxyl 40 stearate	2.70
81.00	7	Starch (maize)	81.00
7.50	8	Magnesium stearate	7.50
—	9	Water, purified, ca	65 mL
QS	10	Ethanol, ca	90 mL

Manufacturing Directions

1. If necessary, mill all items to remove any lumps.
2. Mix in a suitable mixer (double-cone or Y). Before this, sieve items 1 to 3 and item 7 through a 60 mesh screen (0.25 mm). Then, mix at medium speed for 15 minutes.
3. In a suitable container, mix disperse items 4 and 6 and add items 9 and 10. Mix until dissolved. Allow to stand overnight.
4. Add the binder solution from step 3 to the mix obtained in step 2, and pass the wet mass through a 20 mesh sieve to obtain granules.
5. Dry the granules at 55°C for 15 hours to get a moisture content of not more than 2.5% (determined at 80°C for 4 hours).
6. Blend the granules with item 5 for over 5 minutes; then, add item 8, and mix again for 3 minutes.
7. Compress tablets with a target weight of 675 mg.
8. Coat, using an HPMC coating. (See Appendix.)

LOPERAMIDE HYDROCHLORIDE FAST-MELT TABLETS

Manufacturing Directions

1. Prepare granules by using loperamide hydrochloride, 5%; sodium bicarbonate, 27%; citric acid anhydrous, 27%; tartaric acid, 3%; microcrystalline cellulose, 15%; anhydrous lactose, 8%; xylitol, 12%; and Crodesta F160, 3%.
2. The ingredients are dried at elevated temperature in the presence of a desiccant to significantly reduce the moisture content of each material.
3. The ingredients are then blended for 10 minutes and extruded in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) to form granules containing the effervescent ingredients.
4. Granules are passed through a screen and then blended with the following ingredients: LH-EFG (30–80 mesh) 50%, microcrystalline cellulose 31%, mannitol 8%, Ac-Di-Sol 5%, L-HPC LH-11 2%, aspartame 3%, redberry flavor 0.4%, magnesium stearate 0.5%, and Cab-O-Sil M5P 0.1%, which are mixed for 5 minutes prior to compression.
5. Loperamide FICI tablets are then compressed to a hardness of approximately 1 to 3 kPa, and tablets disintegrate in purified water in approximately 15 to 35 seconds.

LOPERAMIDE HYDROCHLORIDE TABLETS (2 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Loperamide hydrochloride	2.00
68.00	2	Starch (maize)	68.00
46.00	3	Lactose monohydrate	46.00
3.00	4	Starch (maize)	3.00
56.00	5	Dicalcium phosphate	56.00
2.00	6	Talc	2.00
2.00	7	Magnesium stearate	2.00
—	8	Water, purified, ca	60 mL

Manufacturing Directions

1. Sift items 2, 3, and 5 through a 250 μm sieve, and sift item 1 through a 40 mesh screen. Place them in a suitable mixing vessel by a geometric dilution process for item 1, and then mix for 30 minutes (this step is critical to content uniformity).
2. Place item 3 in a suitable vessel, and add item 8. Heat it, and mix to prepare a smooth slurry.
3. Add step 2 to step 1 slowly, and mix to obtain a lump-free mass.
4. Pass the wet mass through a 6 mesh screen onto paper-lined trays.
5. Dry the granules in a fluid-bed dryer at 50°C for 1 hour to LOD of not more than 2.5%. Transfer to a blender.
6. Pass item 6 through a 500 μm sieve and item 7 through a 250 μm sieve, and add to step 6; blend for 2 minutes.
7. Compress into 170 mg tablets, using 8 mm punches.

LORATADINE AND PSEUDOEPHEDRINE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Loratadine	25.00
180.00	2	Pseudoephedrine sulfate	180.00
5.00	3	Polyvinylpyrrolidone	5.00
75.00	4	Low-substituted hydroxypropyl cellulose	75.00
75.00	5	Crospovidone	75.00
1.50	6	Colloidal silicon dioxide	1.50
250.00	7	Crystalline sugar seeds	250.00
120.00	8	Purified water	120.00

Manufacturing Directions

1. Prepare a binder solution by dissolving 5.0 g of polyvinylpyrrolidone in 120 g of water.
2. Mix 25 g of loratadine, 180 g of pseudoephedrine sulfate, 25 g of microcrystalline cellulose, 75 g of low-substituted hydroxypropyl cellulose, 75 g of crospovidone, and 1.5 g of colloidal silicon dioxide and screen through a 20 mesh sieve to give a mixed powder.
3. Spray the binder solution of step 1 onto 250 g of crystalline sugar seeds in a centrifugal granulator, and dust the mixed powder onto the crystalline sugar seeds in the centrifugal granulator to afford pellets using a rotation panel rate of 140 to 200 rpm, spraying rate of the binder solution of 2 to 20 mL/min, air spraying pressure of 1 to 2 kg/cm^2, air spraying volume of 5 to 300 L/min, and powder (step 2) spraying rate of 5 to 30 g/min.

LORATADINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Loratadine	10.00
69.93	2	Pregelatinized starch	69.93
69.63	3	Microcrystalline cellulose	69.63
0.37	4	Colloidal silicon dioxide	0.37
0.25	5	Magnesium stearate	0.25

Manufacturing Directions

1. Use a multistep blending process in order to ensure proper distribution of the active ingredient. Initially, combine half of the Starch 1500® with the drug and colloidal silicon dioxide.
2. Blend this mixture in a twin-shell V-blender for 5 minutes.
3. Discharge the mixture and pass through a 40 mesh screen by hand. This step not only breaks up the silicon dioxide but also helps to distribute the active.
4. Return the screened mixture to the blender, and add the remainder of the Starch 1500® and blend for an additional 5 minutes.
5. Add microcrystalline cellulose and blend for 10 minutes.
6. Last, add magnesium stearate and blend for 5 minutes.
7. Pass magnesium stearate through a 60 mesh screen prior to weighing.
8. Compress tablets at 100 mg or proportionally for different strengths.

LORATADINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Loratadine	10.00
67.30	2	Lactose monohydrate	67.30
22.00	3	Maize starch	22.00
10.00	4	Maize starch	10.00
5.00	5	Maize starch, dried	5.00
0.70	6	Magnesium stearate	0.70
QS	7	Purified water	QS

Manufacturing Directions

1. Sift items 1 to 3 through a 630 μm stainless steel sieve, load in mixer, and mix for 5 minutes.
2. In a separate container, prepare binder solution by mixing item 4 using purified water at 30°C to 40°C; heat translucent slurry to 90°C to 95°C, and cool to 45°C to 50°C.
3. Mix the binder solution with the first step, and granulate; dry on trays at 55°C for 8 hours; dry to LOD of 2% to 3% (2 hours after beginning drying, crush mixture for uniform drying).
4. Heat for additional 1 hour at 55°C if LOD is not within limits.
5. Add magnesium stearate, tumble mix, and compress using 7.00 mm round punches to tablet weight of 1.15 g (within 3%) to achieve thickness of 2.3 ± 0.3 mm and hardness of 4to7 kPa.

LORATADINE AND CHLORPHENIRAMINE SUSTAINED-RELEASE TABLET

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Loratadine	5.00
141.50	2	Lactose monohydrate	141.50
55.00	3	Microcrystalline cellulose	55.00
22.00	4	Starch	22.00
1.50	5	Magnesium stearate	1.50
18.00	6	Eudragit® S100	18.00
9.00	7	Triethyl citrate	9.00
4.50	8	Talc	4.50
0.315	9	Ammonium hydroxide 1 N solution	0.315
QS	10	Water	QS
14.00	11	Eudragit® EPO	14.00
8.00	12	Citric acid	8.00
QS	13	Water	QS
4.00	14	Chlorpheniramine maleate	4.00
45.00	15	Lactose fine powder	45.00
15.00	16	Sucrose fine powder	15.00
2.00	17	Flavor (optional)	2.00
0.10	18	Polyvinylpyrrolidone	0.10
QS	19	Ethanol 95%	QS
QS	20	Water	QS

Manufacturing Directions

1. Prepare a granulation containing loratadine, lactose, microcrystalline cellulose, and starch.
2. Blend with magnesium stearate for 5 minutes.
3. Compress about 225 mg.
4. Compress this granulation into CAT unit using tooling and tableting apparatuses.
5. Prepare the coating solution by mixing water, Eudragit® S100, ammonium hydroxide solution, triethyl citrate, and talc to form a uniform dispersion.
6. Coat loratadine from step 3 with Eudragit® S coating solution using a coating pan or a fluid-bed coater until a desired coat weight is achieved (256.80 mg).
7. Prepare a coating solution containing Eudragit® E and citric acid in water.
8. Coat tablets from step 6 to 278.80 mg.
9. Prepare the solvent mixture containing polyvinylpyrrolidone, ethyl alcohol, and water.
10. Blend chlorpheniramine maleate, lactose, sucrose, and flavoring agent. Screen to break lumps.
11. Mix until a moistened powder blend is achieved.
12. Double compress loratadine tablet with chlorpheniramine triturate.
13. The product contains 4 mg of chlorpheniramine maleate in the molded triturate tablet for intraoral release and 5 mg of loratadine in the delayed release form as incorporated in the matrix. Enteric-coated loratadine starts to release 4 to 8 hours after administration of the dosage form.

LORATADINE AND PSEUDOEPHEDRINE SULFATE TABLETS (10 MG/240 MG) CLARITIN-D®

Claritin-D® 12 hour extended-release tablets—These tablets contain 5 mg of loratadine in the tablet coating for immediate release and 120 mg of pseudoephedrine sulfate, which is equally distributed between the tablet coating for immediate release and the barrier-coated extended-release core. The inactive ingredients are acacia, butylparaben, calcium sulfate, carnauba wax, cornstarch, lactose, magnesium stearate, microcrystalline cellulose, neutral soap, oleic acid, povidone, rosin, sugar, talc, titanium dioxide, white wax, and zein.

Claritin-D® 24 hour extended-release tablets—These tablets contain 10 mg of loratadine in the tablet film coating for immediate release and 240 mg pseudoephedrine sulfate in the tablet core, which is released slowly, allowing once-daily administration. The inactive ingredients for oval, biconvex Claritin-D® 24 hour extended-release tablets are calcium phosphate, carnauba wax, ethyl cellulose, hydroxypropyl methylcellulose, magnesium stearate, polyethylene glycol, povidone, silicon dioxide, sugar, titanium dioxide, and white wax.

LORATADINE AND PSEUDOEPHEDRINE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
240.00	1	Pseudoephedrine sulfate	240.00
15.00	2	Microcrystalline cellulose (Avicel™ PH 101)	15.00
200.00	3	Xanthan gum Keltrol® TF	200.00
80.00	4	Sodium alginate keltone HVCR	80.00
53.00	5	Calcium carbonate	53.00
6.00	6	Magnesium stearate	6.00
6.00	7	Aerosil® 200	6.00
10.00	8	Loratadine	10.00
95.00	9	Lactose monohydrate	95.00
66.50	10	Microcrystalline cellulose (Avicel™ PH 101)	66.50
1.00	11	FD&C Yellow No. 10	1.00
20.00	12	Starch (maize)	20.00
6.00	13	Starch (maize)	6.00
1.50	14	Magnesium stearate	1.50
—	15	Water, purified	60.00

Manufacturing Directions

1. Place pseudoephedrine sulfate, microcrystalline cellulose, xanthan gum, sodium alginate, calcium carbonate, and one-half of the lubricants in a suitable mixer after sieving through a 44 mesh sieve.
2. Pass the blend through a roll-compactor.
3. Sieve the compact through a 22 mesh sieve to obtain granules.
4. Mix the granules with the remaining lubricants (items 6 and 7), and compress into tablets (600 mg) to form the first tablet layer.
5. After passing through a 100 mesh sieve, place items 8 to 12 in a suitable mixer. Blend these items for 10 minutes.
6. Place item 13 in a separate vessel, and make a paste (10%) using item 14.
7. Add step 6 into step 5, and granulate.
8. Dry the granules, and blend or sift item 14.
9. Compress into 200 mg tablets (the second layer).
10. Use appropriate tableting equipment for bilayer tableting or core tableting.

LORATADINE FASTAB

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Loratadine (micronized)	10.00
180.60	2	Pharmaburst	180.60
2.70	3	Acesulfame K	2.70
2.00	4	Magnesium stearate	2.00
2.00	5	Talc (fine powder)	2.00
2.70	6	Dry anise flavor	2.70

Manufacturing Directions

1. Sift and mix items 1, 2, 3, and 6.
2. Lubricate with magnesium stearate and fine talc powder.
3. Compress into 200 mg tablets, using 6 mm punches.

LORATADINE TABLETS (10 MG), CLARITIN®

Claritin® tablets contain 10 mg of micronized loratadine, an antihistamine, to be administered orally. They also contain the following inactive ingredients: cornstarch, lactose, and magnesium stearate.

Claritin® Reditabs (rapidly disintegrating tablets) contain 10 mg of micronized loratadine, an antihistamine, to be administered orally. They disintegrate in the mouth within seconds after placement on the tongue, allowing the contents to be subsequently swallowed with or without water. Claritin® Reditabs also contain the following inactive ingredients: citric acid, gelatin, mannitol, and mint flavor.

LORATADINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Loratadine	10.00
67.30	2	Lactose monohydrate	67.30
22.00	3	Starch (maize)	22.00
10.00	4	Starch (maize)	10.00
5.00	5	Starch (maize, dried)	5.00
0.70	6	Magnesium stearate	0.70
—	7	Purified water	40.00

Manufacturing Directions

Note: Avoid overmixing the lubricants; otherwise, hardness is reduced.

1. Sieving and dry mixing: Sift items 1 to 3 through a stainless steel 630 μm sieve in a sifter. Load into mixer. Mix for 5 minutes at low speed.
2. Preparing the binder: Prepare a slurry of item 4 in 10 g of item 7 (30–40°C). Then, make a translucent paste in a Guisti steam jacked vessel, using 30 g of item 7 (90–95°C). Cool to 45°C to 50°C. Check the unity of the paste. The theoretical weight is 50 g.
3. Kneading
   a. Knead the powder with starch paste, while mixing at low speed over a period of 2 minutes.
   b. Scrape sides and backs. Mix and chop at speed 1 for 2 minutes. Check the end point of granulation. If required, add additional purified water to get the end point. (The end point of the granulation is the point when the wet mass consists of few or no lumps of the granules.)
   c. Unload the wet granules into a stainless steel tray for drying.
4. Drying and LOD
   a. Dry the wet granules in an oven at 55°C for 8 hours. After 2 hours of drying, scrape the semidried granules to break any lumps (for uniform drying).
   b. Check the LOD, with a limit of 2% to 3%.
   c. If required, dry further at 55°C for 1 hour. Check the LOD.
   d. Transfer the dried granules into stainless steel drums.
5. Grinding and lubricating
   a. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed. Collect in stainless steel drums. Load the granules into a drum blender.
   b. Sift items 5 and 6 through a 500 μm sieve using a sifter, and add it into a drum blender. Mix for 2 minutes.
   c. Unload into stainless steel drums.

6. Compressing: Compress the granules using a rotary tableting machine with 7 mm flat, bevel-edge punches to 115 mg per tablet.

LORAZEPAM TABLETS (0.50 MG/1 MG/2 MG), ATIVAN

Each Ativan tablet, to be taken orally, contains 0.5, 1, or 2 mg of lorazepam. The inactive ingredients present are lactose and other ingredients.

LORAZEPAM TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
0.50	1	Lorazepam	0.50
50.00	2	Lactose	50.00
20.00	3	Starch (maize)	20.00
2.00	4	Methyl cellulose	2.00
25.00	5	Microcrystalline cellulose (Avicel™ PH 101)	25.00
1.00	6	Magnesium stearate	1.00

Manufacturing Directions

1. Mix lorazepam, lactose, starch, and one-half of the microcrystalline cellulose in a suitable mixer.
2. Granulate with a solution of methyl cellulose in water.
3. Dry the granules. Mix the remaining microcrystalline cellulose and magnesium stearate. Compress. Adjust the 1 and 2 mg strengths with lactose.

LOSARTAN AND HYDROCHLOROTHIAZIDE TABLETS (50 MG/12.5 MG)

Hyzaar is available for oral administration, containing 50 mg of losartan potassium, 12.5 mg of hydrochlorothiazide, and the following inactive ingredients: microcrystalline cellulose, lactose hydrous, pregelatinized starch, magnesium stearate, hydroxypropyl cellulose, hydroxypropyl methylcellulose, titanium dioxide, and D&C Yellow No. 10 Aluminum Lake. Hyzaar contains 4.24 mg (0.108 mEq) of potassium.

LOSARTAN POTASSIUM TABLETS (50 MG), COZAAR

Cozaar is available for oral administration, containing either 25 or 50 mg of losartan potassium and the following inactive ingredients: microcrystalline cellulose, lactose hydrous, pregelatinized starch, magnesium stearate, hydroxypropyl cellulose, hydroxypropyl methylcellulose, titanium dioxide, D&C Yellow No. 10 , and FD&C Blue No. 2 . Cozaar 25 and 50 mg tablets contain potassium in the following amounts: 2.12 mg (0.054 mEq) and 4.24 mg (0.108 mEq), respectively.

LOSARTAN POTASSIUM TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
50.00	1	Losartan potassium	50.00
46.00	2	Microcrystalline cellulose	46.00
75.50	3	Lactose, spray dried	75.50
7.50	4	Starch 1500	7.50
1.00	5	Magnesium stearate	1.00
3.00	6	Hypromellose	3.00
0.75	7	Talc, fine powder	0.75
0.75	8	Titanium dioxide	0.75
0.50	9	Polyethylene glycol	0.50
—	10	Ethanol	QS
—	11	Purified water	QS

Manufacturing Directions

1. Sift losartan potassium, lactose spray dried, and microcrystalline cellulose through a stainless steel 500 μm sieve.
2. Load sifted powder into a blender, and blend well.
3. Sift magnesium stearate and Starch 1500 through a stainless steel 250 μm sieve.
4. Load step 3 into the blender (step 2), and blend well.
5. Compress into 185 mg tablets, using 12 mm punches.
6. Coat the tablet using Eudragit® L-100 coating. (See Appendix.)

LYCOPENE TABLET CORES (6 MG)

Formulation: LycoVit 10% dry powder, 60 g; Ludipress®, 330 g; Kollidon® CL, 6 g; magnesium stearate, 4 g.

Manufacturing Directions

1. Mix LycoVit dry powder with the other components.
2. Sieve through a 0.8 mm screen and press with medium- to high-compression force at 400 mg.

MAGALDRATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Magaldrate, USP	500.00
400.00	2	Lactose monohydrate	400.00
50.00	3	Orange flavor (FDO)	50.00
20.00	4	Kollidon® 90F	20.00
6.00	5	Banana flavor (FDO)	6.00
6.00	6	Cocoa flavor (FDO)	6.00
1.00	7	Saccharin sodium	1.00
180.00	8	Water	180.00
5.00	9	Aerosil® 200	5.00
3.00	10	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 to 8, pass through a 0.8 mm sieve, dry, mix with items 9 and 10, and press with low-compression force.
2. Compress into 1 g tablets, using 16 mm biplanar punches.

MAGALDRATE CHEWABLE TABLETS (500 MG)

Formulation: I—Magaldrate USP, 500 g; lactose monohydrate, 400 g; orange flavor (FDO), 50 g. II—Kollidon 90F, 20 g; banana flavor (FDO), 6 g; cocoa flavor (FDO), 6 g; saccharin sodium, 1 g; water, 180 g. III—Aerosil® 200, 5 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Wet granulation: Granulate mixture I with solution II, pass through a 0.8 mm sieve, dry, mix with III, and press with low-compression force at 1000 mg.

MAGALDRATE CHEWABLE TABLETS (1000 MG)

Formulation: Magaldrate (Reheis), 1000 g; Ludipress® LCE, 930 g; Lutrol E4000F, 60 g; aspartame, potassium (Searle), 10 g; peppermint flavor, QS.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force at 2 g.

MAGALDRATE-DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
700.00	1	Magaldrate	700.00
435.00	2	Lactose monohydrate	435.00
10.00	3	Kollidon® 90F	10.00
50.00	4	Kollidon® CL	50.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force (4–6 kN).
2. Compress into 1.2 g tablets, using 16 mm biplanar punches.

MAGALDRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Magaldrate (powder, 100 mesh)	400.00
325.00	2	Sucrose	325.00
60.00	3	Cellulose (microcrystalline) (Avicel™ PH101)	60.00
30.00	4	Cornstarch	30.00
8.84	5	Guar gum	8.84
0.50	6	Saccharin sodium	0.50
—	7	Purified water	100.00 mL
—	8	Alcohol SD 3A (200 proof)	100.00 mL
QS	9	Flavor	0.60 mL
QS	10	Flavor	1.00 mL
0.06	11	Ethyl vanillin	0.06
8.00	12	Talc	8.00
16.00	13	Magnesium stearate	16.0

Manufacturing Directions

1. Pass granulated sugar (take about 10% excess) through a 500 µm stainless steel screen on comminuting mill (impact forward, high speed).
2. Screen the milled sugar through 250 µm aperture on sieve shaker.
3. Weigh the required quantity, and load into a suitable mixer.
4. Discard remaining sugar.

5. Screen magaldrate powder (take about 5% excess) through 150 µm stainless steel screen on sieve shaker.
6. Weigh the required quantity and add to the blend.
7. Mix well.
8. Screen, if necessary, microcrystalline cellulose, cornstarch, and guar gum through 500 µm aperture on sieve shaker.
9. Add to the first step and mix well.
10. Dissolve saccharin sodium in water.
11. To this add alcohol and mix well.
12. Add this hydroalcoholic solution to magaldrate blend and knead well.
13. Add more water, if necessary, and QS to mass.
14. Pass wet mass through 2.8 mm aperture on sieve shaker or oscillating granulator, and spread uniformly on stainless steel trays.
15. Tray-dry granules at 70°C to 75°C.
16. After 3 to 4 hours of drying, screen semidried granules through 1.4 mm aperture on sieve shaker, and reload for further drying.
17. (This step helps in drying granules faster and more uniformly.) Dry to LOD of 1% to 1.5%.
18. Screen dried granules through 1.0 mm aperture on sieve shaker, and store in drums doubly lined with polyethylene bags.
19. Load half of the granulation into a suitable blender.
20. From the balance of the granules, take out the fines (about 40 g of fines for a batch of 1000 tablets) through 250 µm aperture on sieve shaker.
21. Retain coarse particles for later use.
22. Mix together the flavors in a suitable vessel.
23. Add and dissolve the ethyl vanillin.
24. Check that the solution is clear before proceeding.
25. Load a suitable mixer with the fines from step 20.
26. While mixing, disperse the flavor solution.
27. Add magnesium stearate and talc and mix thoroughly.
28. Pass the blend through a 250 µm aperture on sieve shaker.
29. Add the dispersed flavor blend to the granules.
30. Add remaining granules, and blend for 8 to 10 minutes.
31. Discharge blended granules into suitable air-tight containers doubly lined with polyethylene bags.
32. Compress on a suitable machine fitted with 14.4 mm-diameter round punches with beveled edges.
33. Weight: 8.5 g/10 tablets; thickness: ~3.6 to 3.8 mm; hardness:8 to 10 kPa.

MAGALDRATE WITH SIMETHICONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
525.00	1	Sucrose, NF	525.00
15.00	2	Lactose monohydrate, NF	15.00
60.00	3	Simethicone, USP	60.00
60.00	4	Cellulose microcrystalline (Avicel™ PH101), NF	60.00
12.00	5	Silicon dioxide colloidal (International)	12.00
400.00	6	Magaldrate, USP	400.00
40.00	7	Acacia (special grade), NF	40.00
0.05	8	Dye	0.05
—	9	Distilled purified water, USP	100.00 mL
—	10	Alcohol SD 3A (200 proof)	100.00 mL
1.50	11	Flavor	1.50
0.15	12	Ethyl vanillin, NF	0.15
5.00	13	Silicon dioxide (colloidal)	5.00
30.00	14	Starch monohydrate	30.00
10.00	15	Lactose monohydrate	10.00
80.00	16	Talc powder, USP	80.00
5.30	17	Magnesium stearate	5.30

Manufacturing Directions

1. Pass the granulated sucrose (with about 10% excess) through a 500 µm aperture stainless steel screen on comminuting mill (impact forward, high speed).
2. Screen the milled sugar through a 250 µm screen on sieve shaker.
3. Weigh the required quantity, and load into a suitable mixer (planetary mixer or dough mixer). Discard the remainder.
4. Screen lactose (item 2) through a 250 µm aperture screen on sieve shaker and add to powdered sugar from preceding step. Mix well.
5. While mixing vigorously, add and disperse simethicone (add slowly in a fine stream of flow to avoid lump formation). Mix well.
6. Rough blend colloidal silicon dioxide (item 5) and microcrystalline cellulose, and add to the simethicone dispersed mass from previous step.
7. Mix initially at low speed for 4 to 5 minutes, and thereafter, mix vigorously for 5 to 10 minutes.
8. Either screen simethicone dispersed mass through a 1.0 mm aperture on sieve shaker or pass through a comminuting mill using a 1.4 mm aperture screen (impact forward, medium speed).
9. Load into a mass mixer, and continue mixing.
10. Screen magaldrate powder (with about 7% excess) through a 150 µm aperture screen on sieve shaker and weigh the required quantity.

11. To this quantity, add acacia, and rough blend.
12. Add this blend in the dough mixer, dispersing in small quantities, and mix well for 30 to 40 minutes, until simethicone is well absorbed in the dry blend. Discard remaining magaldrate powder.
13. Dissolve dye in water, then add alcohol, and mix well.
14. Wet down mass with colored hydroalcoholic solution, and knead well.
15. Add more hydroalcoholic solution, if necessary (1:1 water-to-alcohol ratio), to mass.
16. Screen wet mass through a 2.8 mm aperture screen on sieve shaker or oscillating granulator, and spread uniformly on trays.
17. Tray-dry granules at 71°C to 74°C until LOD is within 1% to 1.5% (test at 105°C for 1 hour).
18. After about 3 to 4 hours of drying, screen semidried granules through a 1.4 mm aperture on sieve shaker, and reload for further drying.
19. (*Note:* This step helps in drying granules faster and more uniformly and avoids color mottling on final product.) Screen dried granules through a 1.0 mm aperture screen on sieve shaker, and store in drums lined with double polyethylene bags. Alternative drying can be done in a fluid-bed dryer.
20. Pass dried granules through a 1.00 mm aperture screen on sieve shaker.
21. Pass coarse granules through a comminuting mill using a 1.4 mm aperture screen (knives forward, slow speed) and then through 1.0 mm aperture on sieve shaker.
22. Store granules in drums lined with double polyethylene bags.
23. Load half of the base granulation into a suitable blender.
24. From the balance of the granules take out fines (about 50 g of fines for a batch of 1000 tablets) through a 250 µm aperture on sieve shaker, and hold in a suitable vessel.
25. Add and dissolve ethyl vanillin in liquid flavor.
26. Check for clarity, and only then disperse over dried starch.
27. Rough blend colloidal silicon dioxide (item 13) with lactose monohydrate (item 15), talc, and magnesium stearate, and add to the flavored starch.
28. To this mixture, add fines from step 24, and mix well by hand or in a suitable mixer.
29. Screen through a 250 µm aperture on sieve shaker.
30. Add this flavored, dispersed blend to the base granulation (first step) in a blender.
31. Add the remaining bulk granules from the second step to the base granulation and blend well for 8 to 10 minutes. (*Caution:* Do not mix for too long, as the granules may crumble to a finer size, which may adversely affect hardness during compression.) Discharge blended granules into suitable airtight containers lined with double polyethylene bags until ready for compressing.
32. Compress on a suitable machine fitted with 14.4 mm diameter round punches with beveled edges. Compress into 1244 mg tablets.

MAGNESIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
260.00	1	Magnesium carbonate, USP	260.00
238.00	2	Ludipress®	238.00
4.00	3	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 500 mg tablets, using 12 mm biplanar punches.

MEBENDAZOLE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Mebendazole	100.00
196.00	2	Ludipress®	196.00
4.00	3	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 294 mg tablets, using 12 mm biplanar punches.

MECLIZINE HYDROCHLORIDE TABLETS (25 MG)

Meclizine hydrochloride tablets are multiple-layered tablets (MLT) available in 12.5, 25, and 50 mg strengths for oral administration. Each tablet contains the following inactive ingredients: colloidal silicon dioxide, lactose, magnesium stearate, microcrystalline cellulose, sodium starch glycolate, starch, stearic acid, and other ingredients. In addition, the 12.5 mg tablet contains FD&C Blue No. 1; the 25 mg tablet contains D&C Yellow No. 10 and FD&C Yellow No. 5; and the 50 mg tablet contains D&C Yellow No. 10, FD&C Blue No. 1, and FD&C Yellow No. 5.

MEDROXYPROGESTERONE ACETATE TABLETS (2.5 MG/5 MG/10 MG), PROVERA

Each Provera tablet for oral administration contains 2.5, 5, or 10 mg of medroxyprogesterone acetate. The inactive ingredients are calcium stearate, cornstarch, lactose, mineral oil, sorbic acid, sucrose, and talc. The 2.5 mg tablet contains FD&C Yellow No. 6.

MEFENAMIC ACID AND DICYCLOMINE HYDROCHLORIDE TABLETS (250 MG/10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Mefenamic acid	250.00
10.00	2	Dicyclomine hydrochloride	10.00
30.00	3	Lactose monohydrate	30.00
16.00	4	Starch (maize)	16.00
4.80	5	Gelatin	4.80
3.20	6	Polyvinylpyrrolidone potassium 30	3.20
6.00	7	Talc	6.00
6.00	8	Magnesium stearate	6.00
6.00	9	Sodium starch glycolate	6.00
4.00	10	Aerosil® 200	4.00
0.80	11	Methylparaben	0.80
0.08	12	Propylparaben	0.08
—	13	Water, purified, ca	75 mL

Manufacturing Directions

1. Place items 1 to 3 in a suitable mixer after passing them through a 250 µm sieve. Mix the items for 10 minutes.
2. In a separate vessel, bring to boil item 13, and add items 11 and 12 at 90°C to dissolve. Add items 4 to 6 to the hot solution, and stir to disperse into a smooth slurry. Cool to 50°C.
3. Add step 2 into step 1, and mix thoroughly to obtain a lump-free wet mass. Pass the wet mass through a 2.38 mm sieve onto paper-lined trays. Dry the granules at 50°C overnight until an LOD of not more than 2% is reached.
4. Pass the dried granules through a 1.19 mm mesh screen into a suitable tumbler.
5. Sift items 9 and 10 through a 500 µm sieve and item 8 through a 250 µm sieve into step 4, and blend for 3 minutes.
6. Compress into 335 mg tablets, using 9.5 mm punches.

MEFENAMIC ACID TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Mefenamic acid	250.00
40.00	2	Starch (maize)	40.00
5.00	3	Kollidon® 90F	50.00
—	4	Isopropyl alcohol	QS
12.00	5	Kollidon® CL	12.00
85.00	6	Microcrystalline cellulose (Avicel™ PH 101)	85.00
5.00	7	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate a mixture of items 1 and 2 with the solution of items 3 and 4, sieve, dry, and add a mixture of items 5 to 7.
2. Compress with medium-compression force. Compress into 404 mg tablets, using 12 mm punches.

MEFLOQUINE HYDROCHLORIDE TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00; 275.00	1	Mefloquine; use mefloquine hydrochloride	250.00; 275.00
50.00	2	Lactose monohydrate	50.00
65.00	3	Maize (starch)	65.00
3.00	4	Polyoxyl 40 stearate	3.00
10.00	5	Polyvinylpyrrolidone (PVP K-30)	10.00
65.00	6	Microcrystalline cellulose (Avicel™ PH 102)	65.00
25.00	7	Crospovidone (Kollidon® CL)	25.00
2.00	8	Magnesium stearate	2.00
5.00	9	Talc, fine powder	5.00
QS	10	Purified water	QS

Manufacturing Directions

1. Sift mefloquine hydrochloride, lactose monohydrate, and maize starch through a 0.500 mm stainless steel sieve.
2. Dissolve polyoxyl 40 stearate and PVP K-30 in purified water (70–80°C) by slow stirring, until it becomes clear. Cool the solution to 25°C to 30°C. This is the granulating solution.

3. Knead the powder mix with granulating solution to get the desired wet mass.
4. Pass the wet mass through an 8 mesh screen onto drying trays.
5. Dry the granules to a targeted LOD of 2%.
6. Pass the dried granules through a 16 mesh screen.
7. Sift Avicel™ PH 102 and Kollidon® CL through a 0.500 mm stainless steel sieve.
8. Load the ground granules from step 5 and the powder mix from step 6 into a suitable blender. Blend for 2 minutes to get a homogeneous mixture.
9. Sift magnesium stearate and talc fine powder through a stainless steel 500 µm sieve. Add the powder mix in step 7. Blend these items for 1 minute.
10. Compress into 500 mg tablets, using 15 mm suitable punches.
11. Coat using a hypromellose coating. (See Appendix.)

MEPROBAMATE AND PHENOBARBITAL TABLETS (400 MG/30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Meprobamate	400.00
30.00	2	Phenobarbital	30.00
76.00	3	Microcrystalline cellulose (Avicel™ PH 101)	76.00
13.00	4	Kollidon® VA 64	13.00
21.00	5	Kollidon® CL	21.00
8.00	6	Talc	8.00
1.00	7	Aerosil® 200	1.00
1.00	8	Calcium arachinate	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force.
2. Compress into 551 mg tablets, using 12 mm biplanar punches.

MEPROBAMATE AND PHENOBARBITAL TABLETS (400 MG/30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Meprobamate	400.00
30.00	2	Phenobarbital	30.00
13.00	3	Kollidon® VA 64	13.00
—	4	Isopropyl alcohol	QS
21.00	5	Kollidon® CL	21.00
50.00	6	Starch (maize)	50.00
8.00	7	Talc	8.00
1.00	8	Aerosil® 200	1.00
1.00	9	Calcium arachinate	1.00

Manufacturing Directions

1. Granulate a mixture of items 1 and 2 with a solution of items 3 and 4. Dry, pass through a 0.8 mm sieve, mix with items 5 to 9, and press with low-compression force.
2. Compress into 559 mg tablets, using 12 mm biplanar punches.

MEPROBAMATE TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Meprobamate	400.00
80.00	2	Microcrystalline cellulose (Avicel™ PH 101)	80.00
30.00	3	Starch (maize)	30.00
20.00	4	Kollidon® VA 64	20.00
20.00	5	Kollidon® CL	20.00
7.00	6	Talc	7.00
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force (20 kN).
2. Compress into 560 mg tablets, using 12 mm biplanar punches.

MEPROBAMATE TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Meprobamate	400.00
100.00	2	Starch (maize)	100.00
15.00	3	Kollidon® 25 or Kollidon® VA 64	15.00
4.50	4	Lutrol E 400[a]	4.50
—	5	Isopropyl alcohol	QS
2.00	6	Talc	2.00
0.20	7	Aerosil® 200	0.20
0.30	8	Calcium arachinate	0.30

[a] Use only if selecting Kollidon® 25 as item 3.

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 to 5. Pass through a 0.8 mm sieve, add items 6 to 8, and press.
2. Compress into 520 mg tablets (515 mg if deleting item 4), using 12 mm biplanar punches.

METAMIZOL TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metamizol sodium (dipyrone)	500.00
100.00	2	Ludipress®	100.00
10.00	3	Kollidon® CL	10.00
10.00	4	Magnesium stearate	10.00

Manufacturing Directions

1. Mix all components, pass through a 0.5 mm sieve, and press with low-compression force.
2. Compress into 625 mg tablets, using 12 mm biplanar punches.

METAMIZOL TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metamizol sodium (dipyrone)	500.00
100.00	2	Microcrystalline cellulose (Avicel™ PH 101)	100.00
15.00	3	Kollidon® 30	15.00
25.00	4	Kollidon® CL	25.00
1.00	5	Aerosil® 200	1.00
8.00	6	Talc	8.00
1.00	7	Calcium arachinate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.5 mm sieve, and press with low-compression force.
2. Compress into 654 mg tablets, using 12 mm biplanar punches.

METFORMIN HYDROCHLORIDE BIPHASIC TABLETS

Manufacturing Directions

1. Dissolve/disperse 25 g of ethyl cellulose N10 NF in 100 mL of 95% ethanol.
2. Gradually add this dispersion to 500 g of metformin hydrochloride in a planetary mixer to produce a uniform damp granulation.
3. Dry the granulation at 55°C for 1 hour and pass through a 0.8 mm aperture screen to break down agglomerates.
4. Blend the metformin–ethyl cellulose granules (541 g) with 351.5 g of hydroxypropyl methylcellulose 2208 USP (100,000 cps grade), 10 g of hydroxypropyl methylcellulose 2910 USP (5 cps grade), and 100.5 g of microcrystalline cellulose in a planetary mixer for 10 minutes.
5. Finally, lubricate this mix with 1% w/w magnesium stearate and compress into capsule-shaped tablets, each containing 500 mg of metformin hydrochloride.

METFORMIN HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin hydrochloride	500.00
100.00	2	Dicalcium phosphate	100.00
15.00	3	Kollidon® 90F	15.00
8.00	4	Kollidon® 90F	8.00
—	5	Isopropyl alcohol	90.00
5.00	6	Kollidon® CL	5.00
15.00	7	Polyethylene glycol 6000 powder	15.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 3 with the solution of items 4 and 5. Mix these granules with items 6 and 7, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 650 mg tablets, using 12 mm biplanar punches. If hardness is the problem, reduce the amount of Kollidon® 90F.

METFORMIN HYDROCHLORIDE TABLETS, EXTENDED RELEASE (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin hydrochloride	500.00
240.00	2	Lactose anhydrous	240.00
250.00	3	Hydroxypropyl cellulose	250.00
5.00	4	Colloidal silicon dioxide	5.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Pass items 1 to 4 through a 250 µm mesh, and place in a suitable blender. Mix these materials for 15 minutes.
2. Add item 5, and mix for 3 to 7 minutes.
3. Compress 1000 mg to a hardness of 16 to 20 kPa in a suitable 15 mm punch. Adjust the weight and punch size for lower or higher strength.

METFORMIN TABLETS (500 MG)

Metformin HCl tablets contain 500 and 850 mg of metformin HCl. In addition, each tablet contains the following inactive ingredients: povidone, magnesium stearate, and hydroxypropyl methylcellulose (hypromellose) coating.

METFORMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin hydrochloride	500.00
190.00	2	Lactose anhydrous	190.00
300.00	3	Polyethylene oxide	300.00
5.00	4	Colloidal silicon dioxide	5.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Compress 1000 mg; adjust the weight for higher or lower strength.

METFORMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin hydrochloride	500.00
160.00	2	Lactose anhydrous	160.00
330.00	3	Hydroxypropyl cellulose	330.00
5.00	4	Colloidal silicon dioxide	5.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Compress 1000 mg; adjust the weight for lower or higher strength.

METFORMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin hydrochloride	500.00
45.90	2	Dibasic calcium phosphate	45.90
329.60	3	Hydroxypropyl cellulose	329.60
92.70	4	Ethyl cellulose	92.70
51.50	5	Povidone	51.50
5.15	6	Colloidal silicon dioxide	5.15
5.15	7	Magnesium stearate	5.15

Manufacturing Directions

1. Compress 1030 mg; adjust the weight for higher or lower strength.

METFORMIN TABLETS, EXTENDED RELEASE (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metformin	500.00
240.00	2	Lactose monohydrate	240.00
250.00	3	Hydroxypropyl cellulose	250.00
5.00	4	Silicon dioxide colloidal	5.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Place items 1 to 3 in a suitable blending vessel, after passing through a 250 µm sieve.
2. Sift items 4 and 5 through a 250 µm sieve, and add to step 1.
3. Blend for 3 to 5 minutes.
4. Compress into 1000 mg tablets at 18 to 20 kp.

METHENAMINE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Methenamine powder	500.00
0.50	2	Gelatin powder	0.50
4.50	3	Magnesium stearate	4.50

Manufacturing Directions

1. Accurately weigh methenamine, gelatin, and magnesium stearate.
2. Mix methenamine and gelatin in a suitable blender for 15 minutes. Add magnesium stearate, and mix for additional 5 minutes.
3. Compress into 505 mg tablets, using 3/8 in. round punch at 5 kg of pressure.

METHYCLOTHIAZIDE AND DESERPIDINE TABLETS (5 MG/0.25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Methyclothiazide	5.00
0.25	2	Deserpidine	0.25
7.80	3	Starch (corn)	7.80
166.80	4	Lactose monohydrate	166.80
6.80	5	Starch (corn)	6.80
QS	6	Water, purified, ca	30 mL
6.80	7	Talc	6.80
1.50	8	Magnesium stearate	1.50

Manufacturing Directions

Caution: This is an expensive preparation—keep losses to a minimum. Deserpidine is poisonous—handle carefully. Maintain a low relative humidity during processing and storing.

1. Granulation
   a. Load methyclothiazide, deserpidine, and starch (item 3) together with an equal quantity of lactose into a mixer, and blend for 30 minutes. Cover the mixing bowl during this operation.
   b. Pass blended materials from step 1 through a 250 µm sieve aperture screen at high speed (hammers forward using an Apex mill or similar mill).
   c. Load the milled ingredients from step 2 into the mixer, add the balance of the lactose, and dry blend for 30 minutes.
   d. Mix starch (item 5) with 30 mL of cold purified water, and heat to make a paste.
   e. Add the hot starch paste to the blended powders in the mixer, and mass for 1 to 3 minutes. *Note:* Overmixing and overwetting will prolong tablet disintegration time.
   f. Pass the wet mass through a 4.76 mm aperture screen, and spread onto trays.
   g. Load trays of wet granulation into the oven, and dry for 4 hours at 49°C. *Note:* It is essential to use a full oven load of trays.
   h. Remove the dried granulation from the oven, and pass through an 840 µm aperture screen, or pass mill-dried granulation through a 600 µm aperture screen using a FitzMill, impact forward, high speed into polyethylene-lined drums. Tie liners tightly. *Note:* The FitzMill method may improve dissolution.
2. Lubrication
   a. Load approximately 20% of granulation into blender.

b. Mix talc and magnesium stearate, while milling through a 600 µm aperture screen, impact forward, high speed on a FitzMill or similar mill, and load into the blender.
c. Load the remaining granulation into blender, and *blend only for 14 minutes. Note:* If lumps are present after several minutes of blending, it may be necessary to put the entire granulation through a 1.19 mm aperture, and then continue blending to the required time. Also, note that overblending results in increased tablet disintegration time.
d. Discharge into polyethylene-lined drums. Seal containers well.

3. Compression: Compress using standard 7 mm concave square punches.

METHYCLOTHIAZIDE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.20	1	Starch (corn)	5.20
QS	2	Dyes	QS
5.00	3	Methyclothiazide	5.00
9.40	4	Starch (corn)	9.40
166.40	6	Lactose monohydrate	166.40
QS	7	Water, purified, ca	25 mL
6.80	8	Talc	6.80
2.00	9	Magnesium stearate	2.00

Manufacturing Directions

1. Granulation and lubrication
   a. Make starch paste, using cornstarch (item 1) and purified water.
   b. Mix dyes with item 3, cornstarch (item 4), and an equal amount of lactose, and mill through a comminuting mill using a 177 µm aperture screen, impact forward, high speed. Load into the mixer. Add the balance of lactose to the mixer (mill through a 420 µm aperture screen, impact forward, high speed, if lumpy), and dry mix for 10 minutes.
   c. Add hot starch paste from step 1 to the mixer. Mix until granular but not longer than 5 minutes. If necessary, 1.8 mL of purified water may be added to wet the mass during mixing. *Note:* Overmixing and overwetting will prolong the tablet disintegration time.
   d. Granulate the wet mass through a comminuting mill, using a 15.88 mm aperture band, and spread on trays.
   e. Dry at 60°C until the LOD is 1%, or less, when tested for 60 minutes in a Brabender (or equivalent) set at 105°C.
   f. Sift the dried granulation through a 1.19 mm aperture screen, and mill the coarse material through a comminuting mill fitted with a 1.59 mm aperture band, knives forward, at medium speed.
   g. Load one-half of the granulation into the blender. Mix talc and magnesium stearate, while milling through a 600 µm aperture screen, impact forward, high speed, and load into the blender. Load the remaining half of the granulation into the blender, and *blend only for 4 minutes.*
   h. Discharge a portion of the granulation from the blender, and check for white lumps. If present, discharge the entire granulation from the blender through a 1.19 mm aperture screen to break lumps, and then return to the blender. Load the remaining granulation into the blender, and *blend only for 10 minutes. Note:* Overblending results in increased tablet disintegration time.
   i. Discharge the blender into tared, polyethylene-lined drums. Seal, weigh, and deliver the drums to the storage area.
2. Compress using concave 7.1 mm punches; weight is 195 mg (to be determined based on amount of dyes used).

METHYL CYSTEINE TABLETS (100 MG)

Formulation: Methyl cysteine hydrochloride, 100 g; Ludipress®, 200 g; magnesium stearate, 3 mg; menthol, 4 mg.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force at 307 mg.

METHYLERGOTAMINE MALATE TABLETS (0.5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.50	1	Methylergotamine malate, 10% excess	0.55
0.15	2	Maleic acid	0.15
5.25	3	Starch (maize)	5.25
47.08	4	Lactose monohydrate	47.08
1.00	5	Starch (maize)	1.00
0.50	6	Stearic acid	0.50
2.30	7	Talc	2.30
2.30	8	Magnesium stearate	2.30
	9	Water, purified, ca	60 mL

Manufacturing Directions

1. Sift items 2, 4, and 5 through a 250 μm sieve in a suitable mixing vessel. Mix the items for 5 minutes.
2. In a separate vessel, place item 5, and add a sufficient amount of hot item 9 to make a paste.
3. Add step 2 into step 1, and make a suitable wet mass. Pass the wet mass through a 2.38 mm sieve onto drying trays.
4. Dry the granules at 50°C overnight to an LOD of not more than 3%.
5. Pass the granules through a 20 mesh sieve into a blending vessel.
6. Pass item 1 through a 250 μm sieve, and using a geometric dilution with granules in step 5, add and mix item 1 into step 5.
7. Pass items 6 and 7 through a 500 μm sieve and item 8 through a 250 μm sieve, and add all three items to step 6. Blend for 2 minutes. (Do not overblend.)
8. Compress into 58 mg tablets, using 3 mm punches.
9. Provide a sugar coating to a final weight of 100 mg per tablet and a diameter of 5 mm. (See Appendix for sugar coating formulations.)

METHYLPHENIDATE HYDROCHLORIDE TABLETS EXTENDED RELEASE (18 MG/36 MG), CONCERTA

Concerta also contains the following inert ingredients: butylated hydroxytoluene, carnauba wax, cellulose acetate, hydroxypropyl methylcellulose, lactose, phosphoric acid, poloxamer, polyethylene glycol, polyethylene oxides, povidone, propylene glycol, sodium chloride, stearic acid, succinic acid, synthetic iron oxides, titanium dioxide, and triacetin. Concerta uses osmotic pressure to deliver methylphenidate HCl at a controlled rate. The system, which resembles a conventional tablet in appearance, comprises an osmotically active trilayer core surrounded by a semipermeable membrane with an immediate-release drug overcoat. The trilayer core is composed of two drug layers containing the drug and excipients and a push layer containing osmotically active components. There is a precision laser-drilled orifice on the drug-layer end of the tablet. In an aqueous environment, such as the gastrointestinal tract, the drug overcoat dissolves within 1 hour, providing an initial dose of methylphenidate. Water permeates through the membrane into the tablet core. As the osmotically active polymer excipients expand, methylphenidate is released through the orifice. The membrane controls the rate at which water enters the tablet core, which in turn, controls drug delivery. The biologically inert components of the tablet remain intact during gastrointestinal transit and are eliminated in the stool as a tablet shell, along with insoluble core components.

METHYLPREDNISOLONE TABLETS (2 MG/4 MG/8 MG/16 MG/24 MG/32 MG), MEDROL

Each Medrol tablet for oral administration contains 2, 4, 8, 16, 24, or 32 mg of methylprednisolone. The inactive ingredients found in Medrol are as follows. 2 mg: calcium stearate, cornstarch, erythrosine sodium, lactose, mineral oil, sorbic acid, and sucrose; 4 and 16 mg: calcium stearate, cornstarch, lactose, mineral oil, sorbic acid, and sucrose; 8 and 32 mg: calcium stearate, cornstarch, FD&C Yellow No. 6, lactose, mineral oil, sorbic acid, and sucrose; 24 mg: calcium stearate, cornstarch, FD&C Yellow No. 5, lactose, mineral oil, sorbic acid, and sucrose.

METOCLOPRAMIDE TABLETS (10 MG), REGLAN

Reglan tablets (metoclopramide tablets, USP), 10 mg, are white, scored, capsule-shaped tablets engraved with "Reglan" on one side and "AHR 10" on the opposite side. Each tablet contains 10 mg of metoclopramide base (as the monohydrochloride monohydrate). The inactive ingredients are magnesium stearate, mannitol, microcrystalline cellulose, and stearic acid.

Reglan tablets, 5 mg, are green, elliptical-shaped tablets engraved with "Reglan 5" on one side and "AHR" on the opposite side. Each tablet contains 5 mg of metoclopramide base (as the monohydrochloride monohydrate). The inactive ingredients are cornstarch, D&C Yellow No. 10 lake, FD&C Blue No. 1 Aluminum Lake, lactose, microcrystalline cellulose, silicon dioxide, and stearic acid.

METOCLOPRAMIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Anhydrous metoclopramide hydrochloride; use metoclopramide hydrochloride	10.54
7.00	2	Maize starch (dried)	7.00
1.00	3	Silicon dioxide (colloidal)	1.00
0.76	4	Magnesium stearate	0.76
5.00	5	Starch (pregelatinized)	5.00
101.24	6	Lactose	101.24
QS	7	Purified water	~15.00 mL

Manufacturing Directions

1. Dried maize starch must be used for lubrication.
2. Dry the starch at 80°C for 36 hours prior to its use in manufacturing.
3. Check LOD of starch; the LOD must be less than 2.0%.

4. Pass the lactose, pregelatinized starch, and metoclopramide hydrochloride through a 1.25 mm aperture screen, and transfer it to a suitable mass mixer; mix for 5 minutes.
5. Add the water slowly to the mixer, and mix for 30 minutes or until a suitable consistency is obtained. Add extra water, if required.
6. Pass the mass through a 4.80 mm aperture screen or an oscillating granulator (or by hand), and dry in a tray dryer or fluid-bed dryer at 50°C until the moisture content is below 5.5%.
7. Pass the granules through a 875 µm aperture screen on an oscillating granulator (or comminuting mill at medium speed, knives forward) into tared, polyethylene-lined drums; seal and weigh.
8. Carry out remaining steps at a relative humidity below 50% and temperature below 26°C.
9. Transfer the dried granulation to a suitable blender.
10. Screen the starch (item 2), magnesium stearate, and silicon dioxide through a 250 µm aperture screen on a sieve shaker, and add to the blender.
11. Blend for 10 minutes.
12. Discharge the granules into polyethylene-lined drums; seal and weigh for yield.
13. Compress into 1.255 g per 10 tablets, using 6.35 or 7.14 mm standard concave punches.

METOCLOPRAMIDE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Metoclopramide hydrochloride	10.00
89.50	2	Ludipress®	89.50
0.50	3	Magnesium stearate	0.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 100 mg tablets, using 6 mm biplanar punches.

METOCLOPRAMIDE TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Metoclopramide hydrochloride anhydrous; use metoclopramide hydrochloride	20.54
7.00	2	Starch (maize), dried	7.00
1.00	3	Silicon dioxide colloidal	1.00
0.76	4	Magnesium stearate	0.76
5.00	5	Starch pregelatinized	5.00
101.24	6	Lactose	101.24
—	7	Water purified (deionized)	15.00 mL

Manufacturing Directions

1. Granulation

1. *Note:* Dried cornstarch must be used for lubrication. Dry the starch at 80°C for 36 hours before its use in manufacturing. Check the LOD of the starch. The LOD must be less than 2% (1 hour on Brabender at 105°C or equivalent).
   a. Pass the lactose, starch pregelatinized, and metoclopramide hydrochloride through a 1.25 mm aperture screen, transfer to a suitable mass mixer, and mix for 5 minutes.
   b. Add the water slowly to the mixer, and mix for 30 minutes or until a suitable consistency is obtained. Add extra water if required.
   c. Pass the mass through a 4.8 mm aperture screen or an oscillating granulator (or by hand), and dry in a tray dryer or fluid-bed dryer at 50°C until the moisture content is below 5.5%.
   d. Arrange for samples.
   e. Pass the granule through an 875 µm aperture screen on an oscillating granulator (or comminuting mill at medium speed, knives forward) into tared polyethylene-lined drums. Then, seal the drums and weigh.

2. Lubrication

   Note: Carry out at a relative humidity below 50% and temperature below 26°C.
   a. Transfer the dried granulation to a suitable blender.
   b. Screen the starch (item 2), magnesium stearate, and silicon dioxide through a 250 µm sieve aperture screen on a sieve shaker, and add to the blender. Blend for 10 minutes.
   c. Discharge the granules into polyethylene-lined drums, seal, and weigh for yield.

3. Compressing

   Note: Carry out at a relative humidity below 50% and at temperature below 26°C.

a. Compress using 7.14 mm round, standard concave punches or 6.35 mm round, standard concave punches.
b. Compress to the following specifications: weight of 10 tablets = 1.255 g ± 3%.

METOPROLOL SUCCINATE TABLETS (95 MG), TOPROL

Toprol-XL is formulated to provide a controlled and predictable release of metoprolol for once-daily administration. The tablets comprise a multiple-unit system containing metoprolol succinate in a multitude of controlled-release pellets. Each pellet acts as a separate drug delivery unit and is designed to deliver metoprolol continuously over the dosage interval. The tablets contain 47.5, 95, and 190 mg of metoprolol succinate equivalent to 50, 100, and 200 mg of metoprolol tartrate, USP, respectively. The inactive ingredients are silicon dioxide, cellulose compounds, sodium stearyl fumarate, polyethylene glycol, titanium dioxide, and paraffin.

METOPROLOL SUCCINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
95.00	1	Metoprolol succinate	95.00
25.00	2	Polyoxol 40 hydrogenated	25.00
230.00	3	Hydroxypropyl methylcellulose	230.00
94.00	4	Aluminum silicate	94.00
—	5	Alcohol	QS

Manufacturing Directions

1. Mix metroprolol with polyoxyl 40 hydrogenated castor oil, and then carefully mix it with the carrier materials (HPMC and aluminum silicate).
2. Granulate the mixture with ethanol, and dry the granules.
3. Add lubricant, and compress.

METOPROLOL TARTRATE TABLETS

Metoprolol tartrate is a selective β_1-adrenoreceptor blocking agent, available as 50 and 100 mg tablets for oral administration and in 5 mL ampules for intravenous administration. Each ampule contains a sterile solution of metoprolol tartrate (5 mg) and sodium chloride (45 mg). Metoprolol tartrate is (±)-1-(isopropylamino)-3-(p-(2-(methoxyethyl)phenoxy)-2-propanol (2:1) *dextro*-tartrate salt.

Metoprolol tartrate is a white, practically odorless, crystalline powder with a molecular weight of 684.82. It is very soluble in water; freely soluble in methylene chloride, in chloroform, and in alcohol; slightly soluble in acetone; and insoluble in ether.

The Lopressor tablets contain the following inactive ingredients: cellulose compounds, colloidal silicon dioxide, D&C Red No. 30 Aluminum Lake (50 mg tablets), FD&C Blue No. 2 Aluminum Lake (100 mg tablets), lactose, magnesium stearate, polyethylene glycol, propylene glycol, povidone, sodium starch glycolate, talc, and titanium dioxide.

METRONIDAZOLE TABLET CORES (400 MG)

Formulation: Metronidazole, 400 g; Avicel™ PH 102, 150 g; Kollidon® VA 64, 25 g; Kollidon® CL, 15 g; Aerosil® 200, 5 g; polyethylene glycol 6000, powder, 50 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force (25–30 kN) at 645 mg.

METRONIDAZOLE TABLETS (200 MG)

Formulation: Metronidazole, 200 g; Avicel™ PH 101, 200 g; Kollidon®, 6 g; Kollidon® CL, 10 g; Aerosil® 200, 5 g; magnesium stearate, 5 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force (25–30 kN) at 426 mg.

METRONIDAZOLE EFFERVESCENT VAGINAL TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metronidazole	500.00
600.00	2	Sodium bicarbonate	600.00
30.00	3	Kollidon® 30	30.00
10.00	4	Kollidon® 30	10.00
—	5	Isopropyl alcohol	150 mL
500.00	6	Tartaric acid	500.00
50.00	7	Polyethylene glycol 6000 powder	50.00

Manufacturing Directions

1. Granulate items 1 and 2 with the solution of items 3 and 4. Pass through a 0.8 mm sieve, mix with items 6 and 7, and press.
2. Compress into 1700 mg tablets, using 16 mm biplanar punches.

METRONIDAZOLE, FURAZOLIDONE, AND LOPERAMIDE TABLETS (200 MG/25 MG/2 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Metronidazole	200.00
25.00	2	Furazolidone	25.00
2.00	3	Loperamide	2.00
200.00	4	Starch (maize)	200.00
175.00	5	Dicalcium phosphate	175.00
5.00	6	Gelatin	5.00
110.00	7	Starch (maize)	110.00
1.16	8	Yellow dye	1.16
4.00	9	Magnesium stearate	4.00
2.00	10	Talc	2.00
—	11	Water, purified, ca	500 mL

Manufacturing Directions

1. Sift items 1, 2, 4, and 5 through a 40 mesh sieve into a mixing vessel.
2. Mix for 10 minutes, and use this mix to dilute item 1 into the same vessel.
3. In a separate vessel, heat item 11 to 90°C, and add items 6 to 8. Stir to make a smooth slurry containing 30% starch.
4. Add the slurry in step 3 into step 2, and mix until a suitable mass for granulation is obtained.
5. Pass the wet mass through a 2.38 mm sieve onto paper-lined trays.
6. Dry the granules at 50°C overnight to meet an LOD of not more than 2.5%.
7. Pass the dried granules through a 1.19 mm mesh into a blending vessel.
8. Pass item 9 though a 250 µm sieve and item 10 through a 500 µm sieve into step 6. Blend for 2 minutes.
9. Compress into 680 mg tablets, using 13 mm punches.

METRONIDAZOLE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Metronidazole	200.00
200.00	2	Avicel™ PH 101	200.00
6.00	3	Kollidon® 30	6.00
10.00	4	Kollidon® CL	10.00
5.00	5	Aerosil® 200	5.00
5.00	6	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force (25–30 kN).
2. Compress into 426 mg tablets, using 12 mm biplanar punches.

METRONIDAZOLE TABLETS (200 MG/400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Metronidazole	400.00
150.00	2	Lactose monohydrate	150.00
37.50	3	Starch (corn)	37.50
30.00	4	Povidone K 29–32	30.00
37.50	5	Starch (corn)	37.50
QS	6	Water, purified	121.00 mL
13.00	7	Starch (corn)	13.00
1.25	8	Magnesium stearate	1.25

Note: For 200 mg strength, scale down the BOM proportionally and compress using a 9.5 mm round, standard concave punch. The thickness should be 4.3 to 4.9 mm (range: not more than ± 5%); hardness: National Testing Laboratory (NTL) 7 to 17 kPa; disintegration time: not more than 15 minutes in water.

Manufacturing Directions

1. Granulation
   a. Make a starch paste using starch (corn) (item 3) and purified water (distilled) (item 6) in a stainless steel container.
   b. Pass the following items through a 595 µm aperture screen, and transfer to a suitable mixer: metronidazole, lactose, and starch (corn) (item 5).
   c. Add the povidone to the mixer, and mix for 5 minutes.
   d. Add the starch paste from step 1 to the mixer, and mix until a suitable-consistency mass is obtained. Add extra water if required.
   e. Pass the wet mass through a 2.36 mm screen on a suitable granulator.
   f. Spread the granules on paper-lined trays, and dry in an oven at 50°C until the moisture content is not more than 5.5%.
   g. Request samples for moisture content.
   h. Pass the dried granules through a 1.59 mm aperture screen on a suitable comminuting mill, at medium speed, with knives forward, into tared, polyethylene-lined drums. Then, seal the drums and weigh.
2. Lubrication
   a. Transfer the dried granulation to a suitable blender.

b. Screen the following items through a 595 μm aperture screen, and add the following to the blender: starch (corn) (item 7) and magnesium stearate. Blend for 5 minutes.
c. Discharge the granule into polyethylene-lined drums, seal, and weigh for yield.

3. Compression: Compress using 12.7 mm round, standard concave punches.
4. Coating: Coat using a Methocel coating. (See Appendix.)

METRONIDAZOLE TABLETS (400 MG)

Metronidazole is an oral synthetic antiprotozoal and antibacterial agent, 1-(β-hydroxyethyl)-2-methyl-5-nitroimidazole. Metronidazole tablets contain 250 mg or 500 mg of metronidazole. Inactive ingredients include cellulose, FD&C Blue No. 2 lake, hydroxypropyl cellulose, hydroxypropyl methylcellulose, polyethylene glycol, stearic acid, and titanium dioxide.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Metronidazole	400.00
150.00	2	Avicel™ PH 102	150.00
25.00	3	Kollidon® VA 64	25.00
15.00	4	Kollidon® CL	15.00
5.00	5	Aerosil® 200	5.00
50.00	6	Polyethylene glycol 6000, powder	50.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force (25–30 kN).
2. Compress into 645 mg tablets, using 12 mm biconvex punches.

METRONIDAZOLE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Metronidazole	500.00
220.00	2	Sorbitol, crystalline	220.00
10.00	3	Kollidon® 90F	10.00
—	4	Ethanol 96%, ca	75.00
20.00	5	Kollidon® CL	20.00
4.00	6	Talc	4.00
0.50	7	Aerosil® 200	0.50
0.50	8	Calcium arachinate	0.50

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with the solution of items 3 and 4. Pass the mixture through a 0.8 mm sieve, dry it, mix it with items 5 to 7, and press it with medium-compression force.
2. Compress into 755 mg tablets, using 16 mm biplanar punches.

MIDODRINE HYDROCHLORIDE CONTROLLED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Midodrine hydrochloride	15.00
18.80	2	Microcrystalline cellulose PH101	18.80
65.20	3	Lactose monohydrate	65.20
1.00	4	Sodium carboxymethyl cellulose	1.00
28.00	5	Water	28.00

Manufacturing Directions

1. The following preparation provides a zero-order release profile.
2. Intensely mix items 1 to 4 in mixer.
3. Apply item 5 to step 2, and continue mixing until properly wet.
4. Extrude the mass in step 3 through a screen with apertures between 0.4 and 1.0 mm to give spheronized pellets with smooth surface.
5. Apply inner coat using a fluid bed to increase the weight of pellets by 8.5% w/w using hydroxypropyl methylcellulose (13.5 g), magnesium stearate (2.9 g), talc (25.2 g), Eudragit® NE 30 D (895.1 g), and purified water (1135.4 g).
6. Apply outer coat in a fluid bed to increase the weight by another 1% w/w using hydroxypropyl methylcellulose (20.0 g), talc (20.0 g), and purified water (460.0) g.
7. The release profile can be changed by mixing fractions of pellets with different amounts of inner coating applied, or the release profile can be changed by coating with other acrylic resins such as Eudragit® RL 30 D, Eudragit® RS 30 D, or combinations thereof, or using other types of film-forming agents such as ethyl cellulose or silicone polymers. Furthermore, the release profile can be changed by applying a fraction of noncoated pellets or by applying an enteric coating to a fraction of pellets.

MIDODRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Midodrine hydrochloride	50.00
2.00	2	Klucel MF	2.00
93.00	3	Methocel E50	93.00
1.50	4	Midodrine hydrochloride	1.50
6.6	5	Klucel MF	6.6
156.90	6	Methocel E50	156.90
2.80	7	Midodrine hydrochloride	2.80
247.20	8	Methocel E50	247.20
1.20	9	Midodrine hydrochloride	1.20
9.70	10	Methocel E50	9.70
8.50	11	Talc	8.50

Manufacturing Directions

1. Compress ingredients 1 to 3, 4 to 6, and 7 to 8 as the core, the first, and the second layer, respectively. Using the core composition, compress a core weighing 100 mg using a punch 6 mm in diameter. Compression coat the core using 165 mg of the first compression layer composition and a punch of 9 mm in diameter. Again compression coat the compression-coated core using 250 mg of the second compression layer composition and a punch of 11 mm in diameter.
2. Apply ingredients 9 to 11 by spray coating.

MIDODRINE HYDROCHLORIDE TRIPLE-LAYER TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Midodrine hydrochloride	5.00
2.00	2	Klucel MF	2.00
93.00	3	Methocel E50	93.00
1.50	4	Midodrine hydrochloride	1.50
6.60	5	Klucel MF	6.60
156.90	6	Methocel E50	156.90
2.80	7	Midodrine hydrochloride	2.80

1.20	9	Midodrine hydrochloride	1.20
9.70	10	Methocel E5	9.70
8.50	11	Talc	8.50

Manufacturing Directions

1. Items 1 to 3 are compressed to form a core using 6 mm diameter punch.
2. Coat the core using items 4 to 6 using 9 mm diameter punch.
3. Coat the tablet (step 2) with items 7 to 8 using 11 mm diameter punch.
4. Spray coat step 3 with items 9 to 11.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.66	1	Midodrine hydrochloride	1.66
48.34	2	Hydroxypropyl methylcellulose E50	48.34

3.58	13	Hydroxypropyl methylcellulose E5	3.58
2.51	14	Talc	2.51
0.71	15	Propylene glycol	0.71

Manufacturing Directions

1. Compress core using 6 mm punch using items 1 to 3.
2. Compress core in step 1 with items 4 to 6 in 9 mm diameter punch.
3. Compress tablet in step 2 using items 7 and 8 using 11 mm diameter punch.
4. Apply coating by spray method using items 9 to 12.
5. Apply coating by spray method using items 12 to 15.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)

0.40	13	Paraffin solid	0.40
0.20	14	Acetyltributyl citrate	0.20
2.80	15	Ethyl cellulose	2.80
0.04	16	Aerosil® 200	0.04
0.50	17	Paraffin solid	0.50
0.20	18	Acetyltributyl citrate	0.20
3.30	19	Ethyl cellulose	3.30
0.05	20	Aerosil® 200	0.05

Manufacturing Directions

1. Coat item 1 with items 2 to 6.
2. Coat step 1 with items 7 to 11.
3. Coat step 2 with items 12 to 16.
4. Final outer coat: use items 17 to 20.

MONTELUKAST SODIUM TABLETS, SINGULAIR

Each 10 mg film-coated Singulair tablet contains 10.4 mg of montelukast sodium. Each tablet also contains cornstarch, hydroxypropyl cellulose, magnesium stearate, colloidal silicon dioxide, lactose, and other inactive ingredients. A Singulair tablet is equivalent to 10 mg of free acid and the following inactive ingredients: microcrystalline cellulose, lactose monohydrate, croscarmellose sodium, hydroxypropyl cellulose, and magnesium stearate. The film coating consists of hydroxypropyl methylcellulose, hydroxypropyl cellulose, titanium dioxide, red iron oxide, yellow iron oxide, and carnauba wax.

Each 5 mg chewable Singulair tablet contains 5.2 mg of montelukast sodium, which is the molar equivalent to 5 mg of free acid, and the following inactive ingredients: mannitol, microcrystalline cellulose, hydroxypropyl cellulose, red ferric oxide, croscarmellose sodium, cherry flavor, aspartame, and magnesium stearate.

MORPHINE SULFATE AND GRANISETRON HYDROCHLORIDE SUSTAINED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Morphine sulfate	30.00
130.00	2	Hydroxypropyl methylcellulose	130.00
70.00	3	Lactose monohydrate	70.00
10.00	4	Polyvinylpyrrolidone	10.00
2.00	5	Silicon dioxide	2.00
1.12	6	Granisetron hydrochloride	1.12
60.00	7	Lactose fine powder	60.00
5.00	8	Sucrose fine powder	5.00
1.00	9	Flavor	1.00
0.06	10	Polyvinylpyrrolidone	0.06
QS	12	Ethyl alcohol 95%	QS
,	13	Water	QS

Manufacturing Directions

1. Prepare a granulation blend containing morphine sulfate, hydroxypropyl methylcellulose, lactose, and polyvinylpyrrolidone. Add silicon dioxide and stearic acid to the granulation and blend for additional 5 to 10 minutes.
2. Compress the morphine sulfate sustained-release granulation using appropriate tooling and tableting machine to fill weight of 244 mg.
3. Prepare the solvent mixture containing polyvinylpyrrolidone in water or a mixture of water and ethanol.
4. Blend granisetron hydrochloride, lactose, sucrose, and the flavoring agent. Screen to break lumps.
5. Add the mixture of step 3 to that of step 4, while mixing until a moistened powder blend is achieved.
6. Compress about 67.80 mg of moistened blend.

MORPHINE SULFATE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
24.00	1	Morphine sulfate	24.00
27.00	2	Sodium bicarbonate	27.00
27.00	3	Citric acid anhydrous	27.00
10.00	4	Microcrystalline cellulose	10.00
10.00	5	Xylitol	10.00
2.00	6	Sucrose stearate	2.00

Manufacturing Directions

1. Dry morphine sulfate at 100°C for 2 to 4 hours to reduce the moisture content of the material. Dry other ingredients at 40°C to 60°C to significantly reduce the moisture content of the material.
2. Blend items 1 to 6 for 10 minutes and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent couple.
3. Screen the granules and blend with the ingredients: MS-EGF (30–60 mesh), 50%; microcrystalline cellulose, 31%; mannitol, 10%; Ac-Di-Sol, 5%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; Cab-O-Sil M5P, 0.1%, for 5 minutes prior to compression.
4. Compress morphine sulfate tablets to a hardness of approximately 1 to 5 kPa, and tablets should disintegrate in water in approximately 15 to 35 seconds.

MULTIVITAMIN AND BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
7.00	2	Beta-carotene; use beta-carotene dry powder (10%, Pharma)	70.00
2.20	3	Thiamine mononitrate	2.20
2.20	4	Riboflavin	2.20
6.50	5	Nicotinamide	6.50
11.50	6	Calcium D-pantothenate	11.50
2.20	7	Pyridoxine hydrochloride	2.20
0.06	8	Cyanocobalamin; use cyanocobalamin dry powder (0.1%)	60.00
85.00	9	Ascorbic acid (powder)	85.00
32.00	10	Vitamin E acetate (dry powder; SD 50)	32.00
210.00	11	Ludipress®	210.00
7.00	12	Kollidon® VA6 4	7.00
3.00	13	Magnesium stearate	3.00
7.00	14	Orange flavor	7.00
2.50	15	Saccharin sodium	2.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 448 mg tablets, using 12 mm planar punches.

MULTIVITAMIN AND CARBONYL IRON TABLETS

Bill of Materials

Scale (per tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
5000 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	10.00
2.20 mg	2	Thiamine mononitrate, BASF	2.20
2.20 mg	3	Riboflavin	2.20
16.50 mg	4	Nicotinamide	16.50
11.50 mg	5	Calcium D-pantothenate	11.50
2.20 mg	6	Pyridoxine hydrochloride	2.20
6.00 mg	7	Cyanocobalamin (dry powder; 0.1%)	6.00
85.00 mg	8	Ascorbic acid (powder)	85.00
31.00 mg	9	Vitamin E acetate (dry powder; SD 50)	31.00
311.00 mg	10	Ludipress®	311.00
10.00 mg	11	Carbonyl iron (powder OF)	10.00
3.00 mg	12	Magnesium stearate	3.00
7.20 mg	13	Orange flavor	7.20
2.50 mg	14	Saccharin sodium	2.50

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, mix, and press with high-compression force (20 kN).
2. Compress into 500 mg tablets, using 12 mm biplanar punches.

MULTIVITAMIN AND FLUORIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
1.20	1	Riboflavin; use coated riboflavin (25% excess)	5.28
0.30	2	Folic acid (powder)	0.31
1.00	3	Fluoride; use sodium fluoride (powder)	2.21
19.50	4	Starch (Bright Yellow 2 LA)	19.50
1.05	5	Pyridoxine; use pyridoxine hydrochloride (6% excess)	4.02
1.05	6	Thiamine HCl; use coated thiamine mononitrate (5% excess)	3.21
13.50	7	Niacin; use nicotinamide	40.20
4.50 µg	8	Vitamin B12; use cyanocobalamin oral powder in starch (10% excess)	5.17
20.00	9	Ascorbic acid; use surface-coated ascorbic acid and sodium salt	21.00
40.00	10	Sodium ascorbate; use surface-coated sodium ascorbate (5% excess)	47.25
7.49	11	Anhydrous citric acid	7.49
15 IU	12	Vitamin E; use vitamin E (D,L-α-tocopherol) (5% excess)	31.50
400 IU (10 µg)	13	Vitamin D; use vitamin D3 beadlets (25% excess)	0.65
9.36	14	Flavor	9.36
2500 IU or 0.75 mg	15	Vitamin A; use vitamin A palmitate beadlets (500 mU/g), USP (60% excess)	8.25
500.60	16	Sugar (compressible)	500.60

Manufacturing Directions

Manufacture this product at less than 40% relative humidity and a temperature below 26.7°C.

1. If lumpy, hand screen riboflavin through an 8 mesh screen, and then mix with folic acid, sodium fluoride powder, and approximately 3.5 g of Bright Yellow starch in a suitable blender until the yellow color of premix is uniform.
2. Cross-feed the premixed items, pyridoxine hydrochloride, thiamine mononitrate, nicotinamide, cyanocobalamin oral powder in starch, ascorbic acid, citric acid, and vitamin E through an 846 µm screen on a comminuting mill (knives forward, medium speed).

3. Transfer the powders to a suitable blender.
4. Clear mill with a part of the compressible sugar, and transfer to the blender.
5. Load vitamin D3 beadlets, sodium ascorbate, flavor, and vitamin A palmitate into the blender.
6. Blend for 10 minutes.
7. Discharge the contents of the blender into polyethylene-lined drums.
8. Pass the remaining compressible sugar through an 846 µm screen on a comminuting mill (knives forward, medium speed).
9. Transfer to the blender.
10. Screen the material from previous step, magnesium stearate, and the remaining Bright Yellow starch through an 846 µm screen, and transfer to the blender. (*Note:* Mill material not passing through the screen through an 846 µm screen on a comminuting mill at medium speed with knives forward.) Blend for 20 minutes.
11. Discharge blender into polyethylene-lined drums, and weigh for yield.
12. Use precompression, if available, to obtain a tablet with adequate friability.
13. Coat as needed. (See Appendix.)

MULTIVITAMIN AND MINERAL TABLETS

Bill of Materials

Scale (per tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
4000 IU/400 IU	1	Vitamin A/vitamin D crystalets (500,000 A/50,000 D per g) (25% excess)	10.00
40.00 mg	2	Vitamin A acetate (powder; 500 MA) (20% excess)	50.00
10.00 mg	3	Thiamine hydrochloride (10% excess)	11.00
5.00 mg	4	Riboflavin	5.00
100.00 mg	5	Nicotinamide niacinamide (white powder)	100.00
200.00 mg	6	Ascorbic acid (white powder) (10% excess)	220.00
20.00 mg	7	Calcium pantothenate (dextro) (30% excess)	26.00
5.00 mg	8	Pyridoxine hydrochloride	5.00
7.33 mg	9	Povidone (K-29–32)[a]	7.33
29.16 mg	10	Anhydrous refined alcohol isopropyl	29.16
24.20 mg	11	Talc powder	24.20
6.07 mg	12	Magnesium stearate (impalpable powder)	6.07
4.75 mg	13	Stearic acid (fine powder)	4.75
10.0 mg	14	Iron; use iron sulfate (dried)	31.26
1.00 mg	15	Copper[a]	1.00
0.15 mg	16	Iodine[a]	0.15
1.00 mg	17	Manganese[a]	1.00
5.00 mg	18	Magnesium[a]	5.00
1.50 mg	19	Zinc[a]	1.50
0.10 mg	20	Cobalt; use cobalt sulfate	0.47
5.00 mg	21	Potassium; use potassium sulfate	11.14
0.20 mg	22	Molybdenum; use sodium molybdate (dihydrate)	0.50
6.00 µg	23	Vitamin B12; use cyanocobalamin (1000 µg/g oral powder in gelatin; 5% excess)	6.30

[a] Provided as mineral mix (includes 3% excess).

Bill of Materials: Mineral Mix

Scale (mg/ Tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
13.85	1	Copper sulfate with excess	14.28
0.01175	2	Calcium iodate monohydrate	0.01212
0.1228	3	Manganese sulfate monohydrate	0.1267
0.1480	4	Zinc sulfate (pure dry powder)	0.1526

Manufacturing Directions

1. Mineral mix processing: Grind copper sulfate, calcium iodate, manganese sulfate, and zinc sulfate through FitzMill screen 0 band (high speed, impact forward). *Note:* Vitamin A is susceptible to destruction by oxidation and also excessive exposure to actinic light and moisture. Compression of this tablet should be done with relative humidity less than 40%. Protect granulation with CO_2 if material is not to be compressed soon after granulation.
2. Hand screen vitamin A and D crystallets and vitamin A acetate through 1.2 mm aperture screen.
3. Load into mass mixer (screen using 1.2 mm aperture screen, if necessary) thiamine HCl, riboflavin, nicotinamide, ascorbic acid, calcium pantothenate, pyridoxine HCl, and the vitamin A and D mix.
4. Blend for 10 minutes.
5. Dissolve povidone in alcohol (~26 mL).
6. Add povidone solution to blended materials, and mix for 5 minutes.
7. Scrape mixer, and then add alcohol to mass.
8. Pass wet mass through a 15.88 mm aperture (or similar), band-fitted to rotary granulator. (*Note:* Wet mass can set hard; therefore, granules should be spread quickly onto trays.) Dry the granulation at 49°C until LOD is less than 1.0%.
9. Pass the dried granulation through a 1.2 mm aperture screen fitted to an oscillating granulator.
10. Mill the talc (item 11), magnesium stearate, stearic acid, iron sulfate, mineral mix, cobalt sulfate, potassium sulfate, and sodium molybdate through a 595 µm aperture screen at high speed, impact forward.
11. Load half of the granulation into a suitable blender; add mineral mix and cyanocobalamin oral powder.
12. Add balance of granulation and blend for 30 minutes.
13. Compress and coat using a sealing subcoating of polyvinylpyrrolidone (PVP) (see Appendix), followed by HPMC coating solution and clear Methocel gloss.

MULTIVITAMIN AND MINERAL TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Beta-carotene (dry powder; 10%)	150.00
2.50	2	Thiamine mononitrate	2.50
2.90	3	Riboflavin	2.90
2.00	4	Pyridoxine hydrochloride	2.00
22.00	5	Nicotinamide	22.00
12.00	6	Calcium D-pantothenate	12.00
110.00	7	Ascorbic acid for direct compression	110.00
550.00	8	Calcium phosphate (dibasic)	550.00
82.00	9	Ferrous fumarate	82.00
166.00	10	Magnesium oxide	166.00
2.50	11	Cupric sulfate	2.50
13.80	12	Manganese sulfate	13.80
57.20	13	Potassium chloride	57.20
37.00	14	Zinc sulfate	37.00
57.00	15	Avicel™ PH102	57.00
50.00	16	Kollidon® CL	50.00
5.70	17	Stearic acid	5.70
5.00	18	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force.
2. Compress into 1300 mg tablets, using 16 mm biplanar punches.

MULTIVITAMIN + CALCIUM + IRON TABLETS (1 RDA OF VITAMINS)

Formulation: Vitamin A acetate dry powder, 5.0 g, 500,000 IU/g (BASF); Vitamin D dry powder, 2.0 g, 100,000 IU/g; thiamine mononitrate, 1.2 g; riboflavin, 1.8 g; nicotinamide, 12.0 g; vitamin E acetate dry powder SD 50 4.0 g; ascorbic acid, powder, 50.0 g; ferrous fumarate, 60.0 g; dibasic calcium phosphate, 200.0 g; granulated with 5% Kollidon® 30; calcium carbonate, 125.0 g; Avicel™ PH 101, 45.0 g; Aerosil® 200, 1.5 g.

Manufacturing Directions

Mix all components, pass through a sieve, and press to tablets at 500 mg.

MULTIVITAMIN, CALCIUM, AND IRON TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Vitamin A acetate (dry powder)	5.00
2.00	2	Vitamin D (dry powder; 500,000 IU/g)	2.00
1.20	3	Thiamine mononitrate (100,000 IU/g)	1.20
1.80	4	Riboflavin, BASF	1.80
12.00	5	Nicotinamide	12.00
4.00	6	Vitamin E acetate (dry powder; SD 50)	4.00
50.00	7	Ascorbic acid (powder), BASF	50.00
60.00	8	Ferrous fumarate	60.00
200.00	9	Dibasic calcium phosphate granulated with 5% Kollidon® 30	200.00
125.00	10	Calcium carbonate	125.00
45.00	11	Avicel™ PH101	45.00
1.50	12	Aerosil® 200	1.50

Manufacturing Directions

1. Mix all components, pass through a sieve, and press to tablets.
2. Compress into 500 mg tablets, using 11 mm biplanar punches.

MULTIVITAMIN + CARBONYL IRON TABLETS (1–2 RDA OF VITAMINS)

Formulation: Vitamin A acetate dry powder 500,000 IU/g, 10.0 g; thiamine mononitrate, 2.2 g; riboflavin, 2.2 g; nicotinamide, 16.5 g; calcium D-pantothenate, 11.5 g; pyridoxine hydrochloride, 2.2 g; cyanocobalamin, dry powder 0.1%, 6.0 g; ascorbic acid, powder, 85.0 g; vitamin E acetate dry powder SD 50, 31.0 g; Ludipress®, 311.0 g; carbonyl iron powder, 10.0 g; magnesium stearate, 3.0 g; orange flavor, 7.2 g; saccharin sodium, 2.5 g.

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, mix, and press with high-compression force (20 kN) at 500 mg.

MULTIVITAMIN CHEWABLE TABLETS FOR CHILDREN

Formulation: Vitamin A acetate dry powder, 7.0 g, 500,000 IU/g; thiamine mononitrate, 1.2 g; riboflavin, 1.2 g; nicotinamide, 20.0 g; pyridoxine hydrochloride, 1.8 g; cyanocobalamin 0.1%, dry powder, 6.5 g; ascorbic acid, powder, 60.0 g; vitamin D3 acetate dry powder, 100,000 IU/g, 5.0 g; vitamin E acetate, 31.0 g; dry powder SD 50 4.0 g; sorbitol, crystalline, 200.0 g; sucrose, crystalline, 200.0 g; Kollidon® VA 64, 20.0 g; Aerosil® 200, 1.0 g; orange flavor, dry powder, 30.0 g; raspberry flavor, dry powder, 6.0 g; passion fruit flavor, dry powder, 3.0 g; cyclamate sodium, 2.0 g.

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and press with medium- to high-compression force (20 kN) at 575 mg.

MULTIVITAMIN CHEWABLE TABLETS FOR CHILDREN

Bill of Materials

Scale (per tablet)	Item	Material Name	Quantity/1000 Tablets (g)
3500 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	7.00
1.20 mg	2	Thiamine mononitrate	1.20
1.20 mg	3	Riboflavin	1.20
20.00 mg	4	Nicotinamide	20.00
1.80 mg	5	Pyridoxine hydrochloride	1.80
6.50 mg	6	Cyanocobalamin (dry powder; 0.1%), BASF	6.50
60.00 mg	7	Ascorbic acid (powder)	60.00
5.00 mg	8	Vitamin D3 acetate (dry powder; 100,000 IU/g)	5.00
31.00 mg	9	Vitamin E acetate (dry powder, SD 50)	31.00
200.00 mg	10	Sorbitol (crystalline)	200.00
200.00 mg	11	Sucrose (crystalline)	200.00
20.00 mg	12	Kollidon® VA 64	20.00
1.00 mg	13	Aerosil® 200	1.00
30.00 mg	14	Orange flavor (dry powder)	30.00
6.00 g	15	Raspberry flavor (dry powder)	6.00
3.00 mg	16	Passion fruit flavor (dry powder)	3.00
2.00 mg	17	Cyclamate sodium	2.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and press with medium- to high-compression force (20 kN).
2. Compress into 575 mg tablets, using 12 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
13.00	1	Thiamine mononitrate	13.00
4.00	2	Riboflavin	4.00
11.00	3	Pyridoxine hydrochloride	11.00
66.00	4	Nicotinamide	66.00
17.00	5	Calcium D-pantothenate	17.00
360.00	6	Tartaric acid (powder)	360.00
550.00	7	Sodium bicarbonate	550.00
300.00	8	Sucrose (crystalline)	300.00
300.00	9	Sucrose (powder)	300.00
35.00	10	Kollidon® 30	35.00
5.00	11	Kollidon® 30	5.00
QS	12	Isopropanol	~80.00
6.00	13	Riboflavin	6.00
550.00	14	Ascorbic acid (powder)	550.00
20.00	15	Cyanocobalamin (dry powder, 0.1%)	20.00
12.00	16	Vitamin A palmitate (250,000 IU/g dry powder CWD)	12.00
60.00	17	Vitamin E acetate (dry powder; 50%)	60.00
80.00	18	PEG-6000 (powder)	80.00
100.00	19	Kollidon® CL	100.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 10 with solution of items 11 and 12; dry at 60°C with vacuum.
2. Mix with items 13 to 19, and press with high-compression force at maximum 30% of relative atmospheric humidity.
3. Compress into 2.5 g tablets, using 20 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.50	1	Thiamine mononitrate	5.50
5.50	2	Riboflavin	5.50
6.50	3	Pyridoxine hydrochloride	6.50
60.00	4	Nicotinamide	60.00
30.00	5	Calcium D-pantothenate	30.00
200.00	6	Ascorbic acid (powder)	200.00
0.20	7	Cyanocobalamin (dry powder, 0.1%)	20.00
30.00	8	Vitamin A acetate (dry powder; 325,000 IU/g CWD)	30.00
55.00	9	Vitamin E acetate (dry powder; 50%)	110.00
500.00	10	Citric acid (powder)	500.00
400.00	11	Tartaric acid (powder)	400.00
500.00	12	Sodium bicarbonate	500.00
600.00	13	Ludipress®	600.00
70.00	14	PEG-6000 (powder)	70.00
0.50	15	Saccharin sodium	0.50
40.00	16	Cyclamate sodium	40.00
200.00	17	Sucrose, crystalline	200.00
200.00	18	Fructose	200.00
100.00	19	Flavors (Firmenich)	100.00

Manufacturing Directions

1. Mix all components, and sieve through a 0.8 mm screen.
2. Press with high-compression force at maximum 30% relative atmospheric humidity.
3. Compress into 3 g tablets, using 20 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS I, DC (1–2 RDA OF VITAMINS)

Formulation: Lucarotene dry powder 10%, 23.0 g, CWD G/Y; dry vitamin E acetate 50% DC, 40.0 g; thiamine mononitrate, 2.0 g; riboflavin C, 2.0 g; nicotinamide, 22.0 g; calcium D-pantothenate, 11.0 g; pyridoxine hydrochloride, 2.0 g; cyanocobalamin 0.1% dry powder, 6.0 g; ascorbic acid, powder, 85.0 g; Ludipress® LCE, 477.0 g; sodium bicarbonate, 600.0 g; tartaric acid, 400.0 g; polyethylene glycol 6000, powder, 90.0 g; orange flavor (Dragoco), 60.0 g; aspartame (Searle), 30.0 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with high-compression force at a maximum of 30% of relative atmospheric humidity at 1850 mg.

MULTIVITAMIN EFFERVESCENT TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Thiamine mononitrate	2.00
2.00	2	Riboflavin	2.00
2.00	3	Pyridoxine hydrochloride	2.00
22.00	4	Nicotinamide	22.00
11.00	5	Calcium D-pantothenate	11.00
400.00	6	Tartaric acid (powder)	400.00
300.00	7	Lactose monohydrate	300.00
100.00	8	Cornstarch	100.00
3.00	9	Cornstarch	3.00
50.00	10	Water	50.00
23.00	11	Beta-carotene (dry powder; 10% CWD; food grade)	23.00
6.00	12	Cyanocobalamin (powder; 0.1%)	6.00
85.00	13	Ascorbic acid (powder)	85.00
40.00	14	Vitamin E acetate (dry powder; 50%)	40.00
600.00	15	Sodium bicarbonate	600.00
80.00	16	Flavors	80.00
QS	17	Saccharin sodium	QS

Manufacturing Directions

1. Granulate mixture of items 1 to 6 with solution of items 9 and 10 prepared at 70°C.
2. Dry and sieve; add items 11 to 17, pass through a 0.4 mm sieve, and press with high-compression force at maximum 30% of relative atmospheric humidity.
3. Compress into 1.63 g tablets, using 16 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS, DC (3–4 RDA OF VITAMINS)

Formulations: Thiamine mononitrate, 5.5 g; riboflavin, 5.5 g; pyridoxine hydrochloride, 6.5 g; nicotinamide, 60.0 g; calcium D-pantothenate, 30.0 g; ascorbic acid, powder, 200.0 g; cyanocobalamin 0.1% dry powder, 20.0 g; vitamin A palmitate dry powder 325,000 IU/g CWD, 30.0 g; vitamin E acetate dry powder 50%, 110.0 g; tartaric acid, powder, 400.0 g; sodium bicarbonate, 500.0 g; Ludipress®, 600.0 g; polyethylene glycol 6000, powder, 70.0 g; saccharin sodium, 0.5 g; cyclamate sodium, 40.0 g; sucrose, crystalline, 200.0 g; fructose, 200.0 g; flavors (Firmenich), 100.0 g.

Manufacturing Directions

1. Mix all components, sieve through a 0.8 mm screen, and press with high-compression force at maximum 30% relative atmospheric humidity.

MULTIVITAMIN + MINERALS TABLETS WITH BETA-CAROTENE (1 RDA OF VITAMINS)

Formulation: Beta-carotene dry powder, Betavit 20%, 16.5 g; thiamine mononitrate, 1.7 g; riboflavin, 1.9 g; nicotinamide (Degussa), 22.0 g; calcium D-pantothenate, 12.0 g; pyridoxine hydrochloride, 2.2 g; ascorbic acid, cryst., 72.0 g; vitamin E acetate dry powder 50%, 66.0 g; ferrous fumarate, 54.7 g; magnesium oxide, high density type, 165.8 g; copper II oxide, powder, 2.5 g; manganese sulfate, 6.9 g; zinc oxide, 18.7 g; potassium chloride (Baker), 76.3 g; dicalcium phosphate, DI-TAB, 91,550.0 g; Avicel™ PH 102, 60.0 g; croscarmellose, 32.0 g; Syloid® 244 FP (Grace), 6.0 g; stearic acid, 6.0 g; magnesium stearate, 6.0 g.

Manufacturing Directions

1. Pass all ingredients through a 0.8 mm sieve, blended in a mixer, and then compress with medium- to high-compression force at 1193 mg.

MULTIVITAMIN TABLET CORES WITH BETA-CAROTENE (1–2 RDA OF VITAMINS)

Formulation: Vitamin A acetate dry powder, 1.27%, 500,000 IU/g; beta-carotene dry powder BetaVit 10%, 11.50%; thiamine mononitrate, 1.24%; riboflavin, 0.96%; nicotinamide, 11.50%; calcium D-pantothenate, 1.91%; pyridoxine hydrochloride, 1.15%; cyanocobalamin gelatin coated 1%, 2.86%; D-biotin, 1% trituration, 1.91%; folic acid, 0.09%; ascorbic acid, 38.20%; vitamin D3 dry powder 100,000 IU/g, 0.76%; vitamin E acetate dry powder 50 DC, 28.40%; phytomenadione dry powder 5% (GFP 0.19%), 270.2 g; Ludipress®, 69.1 g; magnesium stearate, 3.3 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force at 459 mg.

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Thiamine mononitrate (powder), USP (5% excess; 5–10%)	10.50
5.00	2	Riboflavin, USP	5.00
100.00	3	Nicotinamide niacinamide (white powder), USP	100.00
200.00	4	Ascorbic acid; use sodium ascorbate (microcrystalline) (2% excess)	229.47
20.00	5	Calcium pantothenate; use calcium pantothenate racemic (20% excess)	2..00
5.00	6	Pyridoxine hydrochloride, USP	5.00
6.10	7	Povidone (PVP K-25), USP	6.10
—	8	Alcohol dehydrated (200 proof), USP	25.00 mL
21.90	9	PEG-8000, NF	21.90
25,000 IU	10	Vitamin A (275,000 IU[a]) (20% excess)	7.50 mg
400 IU	11	Vitamin D as D2 powder (850 mD[a])	1.77
6.00	12	Vitamin B12 oral powder in gelatin (5% excess)	6.30
16.00	13	PEG-8000 (milled), NF	16.00
5.30	14	Magnesium stearate	5.30
23.20	15	Talc	23.20

[a] Adjust quantities according to regulatory allowance for OTC label.

Manufacturing Directions

Vitamin A is susceptible to destruction by oxidation and also excessive exposure to actinic light and moisture. Oxidation and destruction are catalyzed by traces of copper and other heavy metals. Dry granulation and compression of this tablet should be done where relative humidity is less than 40%. Protect with CO_2 at blending and storage stages.

1. Load the following into a suitable mixer (screen if necessary): thiamine mononitrate, riboflavin, nicotinamide, sodium ascorbate, calcium pantothenate, and pyridoxine HCl.
2. Dissolve PVP (item 7) in approximately 16 mL alcohol.
3. Add PVP solution to the powders from first step, and QS with alcohol to mass.
4. Granulate the mass through a 4 mesh (4.76 mm aperture, or similar) screen.
5. Dry at 50°C until the LOD is below 1.0%.
6. Grind to 16 mesh (1.2 mm, or similar).
7. Melt the PEG-8000 (item 9, and incorporate vitamins A and D with thorough agitation.
8. Mix until mass cools and becomes granular.
9. Screen through a 16 mesh (1.2 mm aperture, or similar) screen, and grind coarse material through a FitzMill, or similar, No. 2 band (1.59 mm aperture, or similar) at slow speed or a 16 mesh (1.2 mm aperture, or similar).
10. Reserve for lubrication.
11. Mix milled PEG-8000 (item 13) with talc and magnesium stearate, and pass through a FitzMill, using a 60 mesh (250 µm aperture, or similar) screen (impact forward, high speed).
12. If a FitzMill is unavailable, pass the mixture through a 30 mesh (595 µm aperture, or similar) screen.
13. Load base granulation into a mixer along with vitamin B12, the mixture from step 12, and the PEG-coated vitamin A and D mixture from the first step. Blend thoroughly.
14. Store dry mixed granulation with CO_2 protection.
15. Compress.
16. Apply a PVP subcoat, a CAP-carbowax or other aqueous coating, and finish with a polish coat. (See Appendix.)

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Riboflavin	10.00
100.00	2	Niacinamide (white powder)	100.00
5.00	3	Pyridoxine hydrochloride (15% excess)	5.75
15.00	4	Thiamine mononitrate (powder) (5% excess)	15.75
500.00	5	Ascorbic acid, EP	500.00
100.00	6	Lactose	100.00
40.00	7	Povidone (K-29–32)	40.00
100.00	8	Cellulose microcrystalline (Avicel™ PH101)	100.00
—	9	Alcohol SD 3A (200 proof)	QS
20.00	10	Calcium pantothenate; use racemic calcium pantothenate, USP (80 mesh; 15% excess)	23.00
11.50	12	Magnesium oxide (light powder calcined)	11.50
500.00	13	Ascorbic acid	500.00
3.83	14	Povidone (K-29–32)	3.83
—	15	Alcohol SD 3A (200 proof)	QS
4.00 µg	16	Vitamin B12; use vitamin B12 oral powder in gelatin (15% excess)	4.60
28.00	17	Acid stearic	28.00
9.60	18	Magnesium stearate	9.60

Manufacturing Directions

1. Dry blend riboflavin, niacinamide, pyridoxine hydrochloride, thiamine mononitrate, ascorbic acid (item 5), and lactose for 10 minutes.
2. Dissolve povidone (item 7) in 75 mL of alcohol (item 9).
3. While mixing in mass mixer, add povidone solution to mass, and continue mixing for 10 minutes, or until a satisfactory granule mass is obtained.
4. Additional alcohol may be added, if required.
5. Granulate the mass through a 15.9 mm screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on an oscillating granulator.
6. Dry the granules between 41°C and 49°C in a hot air oven (for approximately 8 hours) or fluid-bed dryer until moisture content is below 1.5%.
7. Dry screen the granule through a 1 mm screen on an oscillating granulator.
8. Dry blend the calcium pantothenate and magnesium oxide in a suitable mixer for 10 minutes.
9. Dissolve povidone (item 14) in 20 mL alcohol (item 15).
10. While mixing, add povidone solution, and mix to produce a suitable mass.
11. Additional alcohol may be added, if required.
12. Granulate the mass through a 15.9 mm aperture screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on a oscillating granulator.
13. Dry the granule at 45°C in a hot air oven until moisture content is below 1.5%.
14. Dry screen granule through a 1.0 mm screen on an oscillating granulator.
15. Mix the two granules made separately in a suitable mixer.
16. Add vitamin B12 powder, and blend for 10 minutes. If necessary, screen the stearic acid and magnesium stearate through a 250 µm screen.
17. Add the remainder of the granule together with magnesium stearate and stearic acid to the mixer and blend for 10 minutes.
18. Compress and coat. (See Appendix.)

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Riboflavin	10.00
100.00	2	Niacinamide (white powder)	100.00
5.00	3	Pyridoxine hydrochloride (15% excess)	5.75
15.00	4	Thiamine mononitrate (powder) (5% excess)	15.75
40.00	7	Povidone (K-29–32)	40.00
25.00	8	Povidone (K-29–32)	25.00
—	9	Alcohol SD3A (200 proof)	QS
13.50	10	Stearic acid (fine powder)	13.50
2.70	11	Magnesium stearate	2.70

Manufacturing Directions

1. Mill niacinamide, riboflavin, pyridoxine hydrochloride, and thiamine mononitrate through a 500 µm screen on a comminuting mill (impact forward, slow speed).
2. Load screened material from previous step into a mass mixer, add povidone (item 7) and dry blend for 5 to 15 minutes.
3. While mixing in the mass mixer, add alcohol (item 9) to mass, and continue mixing for 10 minutes or until a satisfactory granule mass is obtained.
4. If necessary, granulate the mass through a 15.9 mm screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on an oscillating granulator.
5. Dry the granule between 41°C and 49°C in a hot air oven (for approximately 8 hours) or fluid-bed dryer until moisture content is below 1.5%.
6. Dry screen the granules through a 1.0 mm screen on an oscillating granulator.
7. Load ascorbic acid and povidone (item 8) into the mixer and dry blend for 10 minutes.
8. While mixing, add 15 mL of alcohol (item 9), and mix until a satisfactory mass is formed, adding more alcohol if necessary. If necessary, screen through a 4.00 mm screen and load onto trays.
9. Dry at 49°C for 8 hours.
10. Dry screen the granules through a 1.0 mm aperture screen on an oscillating granulator.
11. Screen magnesium stearate and stearic acid through a 500 µm aperture screen.
12. Mix the two granules, add the screened lubricants, and blend for 20 minutes.
13. Coat with a protective subcoat, a color coat, and a polish coat (see Appendix).

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Vitamin A acetate (dry powder; 500,000 IU/g)	10.00
2.20	2	Thiamine mononitrate	2.20
2.20	3	Riboflavin	2.20
16.50	4	Nicotinamide	16.50
11.50	5	Calcium D-pantothenate	11.50
2.20	6	Pyridoxine hydrochloride	2.20
6.00	7	Cyanocobalamin (dry powder, 0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
321.00	10	Ludipress®[a]	321.00
21.00	11	Kollidon® VA 64	21.00
3.00	12	Magnesium stearate	3.00
7.20	13	Orange flavor	7.20
2.50	14	Saccharin sodium	2.50

[a] Can be replaced with 300 g of microcrystalline cellulose (Vitacel-μ).

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium-compression force (15 kN).
2. Compress into 500 mg tablets, using 12 mm biplanar punches.

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Thiamine hydrochloride, with excess	2.20
2.20	2	Riboflavin	2.20
11.00	3	Calcium D-pantothenate	11.00
2.20	4	Pyridoxine hydrochloride	2.20

7.00	14	Orange flavor	7.00
2.00	15	Saccharin sodium	2.00
3.00	16	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 and 9.
2. Pass through a 0.8 mm sieve, mix with items 8 to 16, and press with medium-compression force.
3. Compress into 560 mg tablets, using 12 mm biplanar punches.

MULTIVITAMIN TABLETS FOR DOGS

Formulation: Vitamin A + D3 dry powder, 4.0 g, 500,000 + 50,000 IU/g; thiamine mononitrate, 0.5 g; riboflavin, 0.7 g; nicotinamide, 5.0 g; calcium D-pantothenate, 1.0 g; pyridoxine hydrochloride, 0.5 g; cyanocobalamin gelatin-coated 1%, 0.5 g; folic acid, 0.05 g; choline bitartrate, 20.0 g; vitamin E acetate dry powder SD 50, 20.0 g; Ludipress®, 196.0 g; magnesium stearate, 2.0 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force at 250 mg.

MULTIVITAMIN TABLETS FOR DOGS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2000 IU Vitamin A, 200 IU Vitamin D	1	Vitamin A + vitamin D3 (dry powder; 500,000 + 50,000 IU/g)	4.00
0.50	2	Thiamine mononitrate	0.50
0.70	3	Riboflavin	0.70
5.00	4	Nicotinamide	5.00
1.00	5	Calcium D-pantothenate	1.00
0.50	6	Pyridoxine hydrochloride	0.50
0.50	7	Cyanocobalamin (gelatin-coated, 1%)	0.50

196.00	11	Ludipress®	196.00
2.00	12	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low-compression force.
2. Compress into 250 mg tablets, using 8 mm biplanar punches.

MULTIVITAMIN TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.00	1	Beta-carotene; use beta-carotene dry powder (Betavit, 10%)	10.00
2.00	2	Thiamine mononitrate	2.00
2.00	3	Riboflavin	2.00
16.00	4	Nicotinamide	16.00
11.00	5	Calcium D-pantothenate	11.00
2.00	6	Pyridoxine hydrochloride	2.00
0.06	7	Cyanocobalamin; use cyanocobalamin dry powder (0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
321.00	10	Ludipress®	321.00
7.00	11	Kollidon® VA 64	7.00
3.00	12	Magnesium stearate	3.00
7.00	13	Orange flavor	7.00
2.00	14	Saccharin sodium	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 508 mg tablets, using 12 mm planar punches.

MULTIVITAMIN TABLETS WITH COPPER AND ZINC

Formulation: Vitamin mixture (thiamine mononitrate), 3.9%; riboflavin, 0.4%; nicotinamide, 10.1%; calcium D-pantothenate, 2.9%; pyridoxine hydrochloride, 1.2%; cyanocobalamin gelatin coated 0.1%, 2.6%; folic acid, 0.1%; ascorbic acid fine powder, 63.4%; vitamin E acetate dry powder 500 SD, 9.1%; copper oxide, 0.3%; zinc sulfate 6.0%, 1000 g; Aerosil, 200.5 g; Ludipress®, 150 g; Avicel™ PH102, 120 g; Kollidon® VA64, 25 g; magnesium stearate, 10 g; talc, 10 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force at 1350 mg.

MULTIVITAMIN TABLETS, DC (1–2 RDA OF VITAMINS)

Formulation: Vitamin A acetate dry powder, 10.0 g, 500,000 IU/g; thiamine mononitrate, 2.2 g; riboflavin, 2.2 g; nicotinamide, 16.5 g; calcium D-pantothenate, 11.5 g; pyridoxine hydrochloride, 2.2 g; cyanocobalamin 0.1% dry powder, 6.0 g; ascorbic acid, powder, 85.0 g; vitamin E acetate dry powder SD 50, 31.0 g; Ludipress®, 321.0 g; magnesium stearate, 3.0 g; orange flavor, 7.2 g; saccharin sodium, 2.5 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium-compression force (15 kN).

MULTIVITAMIN WITH BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.85 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	5.47
5.00	2	Beta-carotene; use beta-carotene dry powder (Betavit, 10%)	50.00
15.34	3	Thiamine mononitrate	15.34
4.13	4	Riboflavin	4.13
50.00	5	Nicotinamide	50.00
8.23	6	Calcium D-pantothenate	8.23
5.00	7	Pyridoxine hydrochloride	5.00
0.04	8	Cyanocobalamin; use gelatin-coated cyanocobalamin (1%)	4.00
0.04	9	D-biotin; use 1% trituration	4.00
0.38	10	Folic acid	0.38
165	11	Ascorbic acid	165
327	12	Vitamin D3 (dry powder; 100,000 IU/g)	327
122.00	13	Vitamin E acetate (dry powder; SD 50)	122.00
0.41	14	Phytomenadione; use phytomenadione dry powder (5% GFP)	0.82

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 432 mg tablets, using 12 mm biplanar punches.

MULTIVITAMIN WITH ZINC TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Niacin; use niacinamide (white powder)	99.20
750.00	2	Ascorbic acid; use microcrystalline sodium ascorbate[a]	843.68
20.00	3	Vitamin B6; use pyridoxine hydrochloride	34.03
QS	4	Povidone	40.00
15.00	5	Thiamine hydrochloride; use thiamine mononitrate (powder)	17.47
15.00	6	Riboflavin with excess	16.50
20.00	7	Pantothenic acid; use calcium pantothenate	32.60
0.49	8	Folic acid (powder) with excess	0.52
12.00 µg	9	Vitamin B12; use cyanocobalamin oral powder in gelatin 1:1000	15.00
60.00	10	Vitamin E (D,L-α-tocopherol acetate)	60.00
—	11	Alcohol SD 3A (200 proof)	138 mL
22.50	12	Elemental zinc (pure zinc sulfate powder)	55.61
4.00	13	Povidone	4.00
—	14	Alcohol SD 3A (200 proof)	4 mL
—	15	Alcohol SD 3A (200 proof)	9 mL
10.80	16	Magnesium stearate	10.80
40.00	17	Cellulose microcrystalline	40.00
3.20	18	Silicon dioxide colloidal	3.20
6.00	19	Colloidal silicon dioxide	6.00

[a] May use ascorbic acid (750.00 g) instead.

The quantity of povidone is reduced to 6.34 g, and the amount of alcohol SD used is adjusted.

Manufacturing Directions

1. Mill niacinamide, sodium ascorbate, pyridoxine, povidone (item 4), and thiamine through a comminuting mill with hammers (impact forward) at high speed and fitted with a 0 band (686 µm aperture, or similar) screen.
2. Load millings into mass mixer.
3. Screen riboflavin, calcium pantothenate, folic acid, vitamin B12, and vitamin E through 840 µm screen.
4. Load into mass mixer, and dry mix for 5 to 10 minutes.
5. Add 89 mL alcohol to powder while mixing.
6. Add additional alcohol, if required (approximately 49 mL), to achieve satisfactory granulation.

7. Pass wet mass through 5/8 in. band (15.88 mm aperture, or similar) screen and spread out on paper-lined trays.
8. Dry granulation at 49°C, and dry until LOD is not more than 1.5%.
9. Sift dry granule through 1.19 mm screen, and coarse grind granule through a No. 2 band (1.59 mm aperture, or similar) screen fitted on a comminuting mill (knives forward, medium speed) to polyethylene-lined drums.
10. Mill zinc sulfate and povidone through a comminuting mill fitted with a 0 band (686 µm aperture, or similar) screen at high speed with impact (hammers) forward.
11. Load millings into mass mixer for 5 to 10 minutes.
12. Add 3.3 mL alcohol (item 14) to powders from first step while mixing.
13. If necessary, use additional alcohol (up to 0.83 mL) to achieve satisfactory granulation.
14. Granulate wet mass through 5/8 in. band (15.88 mm aperture, or similar) screen, and spread out on paper-lined trays.
15. Dry granule at 49°C, and dry until LOD is not more than 1.5%.
16. Sift dry granule through 1.19 mm screen, and coarse grind granule through a No. 2 band (1.59 mm aperture, or similar) screen fitted on a comminuting mill (knives forward, medium speed) and transfer to polyethylene-lined drums.
17. Load approximately 1/10th of vitamin granulation into blender.
18. Premix magnesium stearate, microcrystalline cellulose, and silicon dioxide in a bowl, and sift through 840 µm screen into blender.
19. Load another 1/10th of vitamin granulation into blender, and blend for 5 minutes.
20. Discharge a portion of granulation from the blender, and check for white lumps.
21. If lumps are present, discharge entire granulation through a 1.68 mm aperture screen to break lumps, and then return it to blender.
22. Load zinc granulation into the blender.
23. Load remaining vitamin granulation into blender, and blend for 15 minutes.
24. Discharge blender into polyethylene-lined drums, tie liners, close and seal drums, and deliver to storage area.
25. Compress and coat (see Appendix).

NALIDIXIC ACID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Nalidixic acid	500.00
20.00	2	Lactose monohydrate	20.00
25.00	3	Starch (maize)	25.00
30.00	4	Starch (maize)	30.00
0.10	5	Propylparaben	0.10
0.40	6	Methylparaben	0.40
0.80	7	Sodium starch glycolate	0.80
2.50	8	Magnesium stearate	2.50
1.00	9	Talc	1.00
0.20	10	Aerosil® 200	0.20
2.00	11	Starch (maize), dried	2.00
—	12	Water, purified, ca	400 mL

Manufacturing Directions

1. Sift items 1 and 2 through a 40 mesh sieve into a suitable blending vessel.
2. Sift item 3 through an 80 mesh sieve, add to step 1, and mix for 10 minutes.
3. In a separate vessel, sift item 4 through an 80 mesh, add items 5 and 6, and mix for 5 minutes. Add item 12 at 80°C to prepare a 30% starch paste that is smooth and lump-free.
4. Add step 3 into step 2, and make a wet mass suitable for granulation.
5. Pass the wet mass through a 10 mm sieve in a mill, and dry in a fluid-bed dryer at 50°C for 1 hour to an LOD of not more than 3%. Transfer to a blending vessel.
6. Sift items 7 to 11 through a 250 µm sieve screen, and add to step 5. Blend for 1 minute only.
7. Compress into 575 mg tablets, using 13 mm punches.

NALIDIXIC ACID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Nalidixic acid	500.00
15.00	2	Kollidon® 30	15.00
—	3	Water, purified	125.00
25.00	4	Kollidon® CL	25.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate item 1 with the solution of item 2 in item 3. Dry, and pass through a 0.8 mm sieve. Add the

mixture of items 4 and 5, mix for 10 minutes, pass again through a 0.8 mm sieve, and press with low-compression force (10 kN).
2. Compress into 545 mg tablets, using 12 mm biplanar punches.

NAPROXEN TABLETS (250 MG)

Naproxen tablets for oral administration each contain 250, 375, or 500 mg of naproxen. Naproxen is a member of the arylacetic acid group of nonsteroidal anti-inflammatory drugs.

NAPROXEN TABLETS

Bill of Materials

Scale (mg/tablet)	item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Naproxen	250.00
6.00	2	Kollidon® 90F	6.00
4.00	3	Kollidon® 90F	4.00
4.00	4	Cremophor RH40	4.00
—	5	Water	41.00
150.00	6	Tablettose	150.00
1.00	7	Stearic acid	1.00
10.00	8	Ac-Di-Sol	10.00
1.00	9	Magnesium stearate	1.00
10.00	10	Polyethylene glycol 6000 powder	10.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 to 5, dry, pass through a 0.8 mm sieve, add items 6 to 9, and press with low-compression force.
2. Compress into 441 mg tablets, using 12 mm biplanar punches.

NAPROXEN TABLETS (250 MG/500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Naproxen	250.00
78.40	2	Lactose monohydrate	78.40
7.00	3	Starch (corn)	7.00
4.00	4	Sodium starch glycolate	4.00
0.60	5	Yellow dye	0.60
5.00	6	Povidone K 29–32	5.00
5.00	7	Polysorbate 80	5.00
QS	8	Isopropyl alcohol, ca	200.00 mL
3.70	9	Talc	3.70
3.30	10	Magnesium stearate	3.30

Note: For 500 mg strength, use the same formula with higher fill weight.

Manufacturing Directions

1. Granulation
   a. Pass naproxen and lactose through a 16 mesh (1.2 mm aperture) screen into a planetary mixer (or something similar). Mix these items for 10 minutes.
   b. To a suitable blender, add starch (corn), sodium starch glycolate, and yellow dye. Blend these items for 10 minutes.
   c. Incorporate the blended powders from step 1b into the blend in step 1a. Mix for 10 minutes.
   d. Dissolve povidone and polysorbate 80 in alcohol isopropyl. The solution must be complete.
   e. While mixing the blended powders from step 1c, add the solution from step 1d. When all the solution is added, continue mixing for 2 minutes, until a characteristic mass is obtained. Add more isopropyl alcohol, if required. Record the additional amount of isopropyl alcohol.
   f. Pass the wet mass through an 8 mesh (2.38 mm aperture) screen by hand. Load the granular mass onto paper-lined trays, and oven dry at 49°C until the LOD is between 1.5% and 2.5%.
   g. Pass the dried granules through a FitzMill fitted with a 2A band (knives forward, medium speed) into tared, polyethylene-lined drums.
2. Lubrication
   a. Transfer the dried granules from step 1 g to a suitable blender.
   b. Screen talc and magnesium stearate through a 30 mesh (595 μm aperture) screen, and add this to the blender. Blend this mixture for 10 minutes.
   c. Discharge the granules into clean, tared, polyethylene-lined drums. Then seal the drums, and weigh for yield.
3. Compression: Compress on a suitable compression machine using 9.5 mm round, standard concave punches—tablet weight: 352 mg.

NAPROXEN TABLETS (450 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
450.00	1	Naproxen, with excess	457.50
10.00	2	Kollidon® CL	10.00
25.00	3	Kollidon® 30	25.00
—	4	Water, purified	90.00
2.50	5	Magnesium stearate	2.50

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4, pass through a 0.8 mm sieve, add item 5, and press to tablets with low-compression force.
2. Compress into 496 mg tablets, using 12 mm biplanar punches.

NELFINAVIR MESYLATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
730.62	1	Nelfinavir mesylate	730.62
240.00	2	Crospovidone	240.00
217.37	3	Calcium silicate	217.37
QS	4	Purified water	QS
12.00	5	Magnesium stearate	12.00

Manufacturing Directions

1. Use wet granulation to prepare the compression mix, dry (to remove water), mix with item 5, and then compress.

NEOMYCIN TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Neomycin sulfate	250.00
334.00	2	Ludipress®	334.00
6.00	3	Magnesium stearate	6.00
10.00	4	Aerosil® 200	10.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with low-compression force.
2. Compress into 600 mg tablets, using 12 mm biplanar punches.

NIACIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1000.00	1	Niacin	1000.00
40.00	2	Polyvinylpyrrolidone	40.00
10.00	3	Silicon dioxide	10.00
15.00	4	Sodium stearyl fumarate	15.00
400.00	5	Water	400.00

Manufacturing Directions

1. Place niacin and lactose in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend sodium stearyl fumarate in a drum mixer.
4. Press the resulting mixture into tablets (1065.00 mg).
5. Coat these tablet cores with the following formulation: ethyl cellulose (Ethocel), 10.10 mg; polyvinyl-pyrrolidone (povidone), 5.50 mg; stearic acid, 2.40 mg.
6. First dissolve Ethocel, povidone, and stearic acid in denatured alcohol (180 g).
7. Spray the coating solution onto the tablet cores in a coating pan.

NICARDIPINE HYDROCHLORIDE SUSTAINED-RELEASE TABLETS

Manufacturing Directions

1. First, dissolve 1200 g nicardipine hydrochloride and 1200 g hydroxypropyl methylcellulose in a mixture of 4800 g methanol and 4800 g dichloromethane.
2. Introduce 300 g of silicon dioxide (mean particle diameter of approximately 48 μm, particle diameter of 75 μm or smaller) to a fluidized-bed granulator and coated with this solution by the side spraying method (spraying liquid volume 18 g/min, spraying air pressure 3 kg/cm^2, product temperature 30°C, inlet temperature 70°C) to obtain nicardipine hydrochloride particles.
3. Separately, dissolve 54 g of ethyl cellulose and 6 g of hydroxypropyl methylcellulose in a mixture of 57 g of purified water and 1083 g of methanol.
4. Introduce nicardipine hydrochloride particles (300 g) to a fluidized-bed granulator and coat with this solution by side spraying (spraying liquid volume of 8 g/min, spraying air pressure of 2.5 kg/cm^2, product temperature of 39°C, inlet temperature of 70°C) to obtain sustained-release fine particles.
5. Granulate 60 g of these sustained-release fine particles, 254.4 g mannitol, 63.6 g lactose that has been pulverized with a pin mill pulverizing device, and 12 g erythritol (spraying liquid volume 15 g/min, spraying air pressure of 0.5 kg/cm^2, product temperature of 39°C, inlet temperature of 50°C, spraying cycle of 5 seconds spraying–15 seconds drying) with an aqueous 5% w/w solution containing 8 g copolyvidone (Kollidon® VA64) in a fluidized-bed granulator to obtain the composition of the present invention. The ratio of ungranulated fine particles will be 7.9%.
6. After further mixing 2 g of magnesium stearate with the composition that is obtained, make 400 mg tablets containing 20 mg of nicardipine hydrochloride per tablet under an initial hardness of 0.6 kPa using a rotary tableting machine.
7. Next, heat these tablets for 10 minutes at 130°C using a program oven.

8. Then, cool at room temperature for 30 minutes. The tablets that are obtained should show a hardness of 3.7 kPa ($n=5$), friability of 0.1% or less (100 rounds), and disintegration time in the buccal cavity of 20 seconds.

NICOTINAMIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
300.00	1	Nicotinamide (Degussa)	320.00
160.00	2	Avicel™ PH101	160.00
16.00	3	Kollidon® VA 64	16.00
3.00	4	Magnesium stearate	3.00
3.00	5	Aerosil® 200	3.00

Manufacturing Directions

1. With medium-compression force, compress into 506 mg tablets, using 12 mm biplanar punches.

NICOTINIC ACID (NIACIN) TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
200.00	1	Nicotinic acid	200.00
200.00	2	Ludipress®	200.00
5.00	3	Kollidon® CL	5.00
1.50	4	Magnesium stearate	1.50
3.00	5	Aerosil® 200	3.00
10.00	6	PEG-6000	10.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve.
2. Mix and press with very low-compression force.
3. Compress into 410 mg tablets, using 12 mm biplanar punches.

NICOTINIC ACID (=NIACIN) TABLETS (200 MG)

Formulation: Nicotinic acid (Lonza), 200.0 g; Ludipress®, 200.0 g; Kollidon® CL, 5.0 g; magnesium stearate, 1.5 g; Aerosil® 200, 3.0 g; polyethylene glycol 6000, powder, 10.0 g.

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with very low-compression force at 419 mg.

NICOTINIC ACID TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
375.00	1	Nicotinic acid	375.00
188.70	2	Hydroxypropyl methylcellulose E10 M premium	188.70
12.90	3	Povidone K90	12.90
5.80	4	Stearic acid (Hystrene 5016)	5.80

Manufacturing Directions

1. Mix one-half of the quantity of item 1 and items 2 and 3, and dry mix the powder bed in a granulator, with choppers on, for approximately 1 minute.
2. At the completion of the 1 minute premix cycle, spray an approximate quantity about three times the quantity of item 3 slowly for a period of 5 minutes.
3. Discharge the granulated unit into double polyethylene-lined containers and then manually load into a Glatt bowl while passing through a 4 mesh screen; load the Glatt bowl into a Glatt fluid-bed dryer with an inlet air temperature setting of about 70 ± 5°C.
4. Dry the unit until a moisture level of approximately 1.0% is obtained ..
5. Discharge the dried granulation into appropriately labeled, double polyethylene-lined drums and reconcile.
6. Pass the dried and reconciled granulation through a Kemutec BetaGrind mill equipped with a 1.5 mm screen and running at approximately 1500 rpm.
7. Collect the milled granulation into appropriately labeled, double polyethylene-lined drums and reconcile.
8. Sample the milled granulation and test by quality control and release prior to further processing.
9. Load the released granulation units into a Patterson-Kelley 20 ft^3 V-blender, after which blend together for about 10 ± 1 minutes and then discharge to appropriately labeled, double polyethylene-lined containers.
10. Add item 4, blend, and compress at 582.40 mg in caplet-shaped punches; compress 727.50 mg for 500 mg strength and 990.50 mg for 750 mg strength.

NIFEDIPINE COPRECIPITATE TABLET

1. Dissolve 1.0 kg of nifedipine and 1.0 kg of polyvinylpyrrolidone in 18 L of methylene chloride at room temperature.

2. Treat the obtained solution in a spray-dryer plant at a temperature equal to 90°C with double fluid nozzle with external mixing.
3. A solid coprecipitate having a ratio by weight between nifedipine and polyvinylpyrrolidone equal to 1:1 and a granulometry lower than 100 µm will be obtained.
4. Prepare a tablet composition using the coprecipitate of nifedipine and polyvinylpyrrolidone 1:1, having a granulometry lower than 100 µm.
5. First prepare a granulate by introducing in a fluid-bed dryer hydroxypropyl methylcellulose, carboxypolymethylene, and talc, in addition to the coprecipitate of nifedipine and polyvinylpyrrolidone. Use purified water in order to obtain the granules, which, mixed with magnesium stearate and colloidal silica, allow some tablets to be obtained, which should be subsequently coated with an opaque, protective film.
6. In the final composition, the proportion of all ingredients will be as follows (by weight%): nifedipine 15.96%; polyvinylpyrrolidone 15.96%; talc 30.31%; hydroxypropyl methylcellulose 31.91%; carboxypolymethylene 1.60%; magnesium stearate 1.06%; colloidal silica 1.60%.
7. Substances of the coating: (by weight%): talc 0.49%; magnesium stearate 0.24%; titanium dioxide 0.37%; iron oxide 0.04%; acrylic acid copolymer 0.37%; polyethylene glycol 4000 0.08%.
8. The tablets should have an average weight equal to 188 mg.

NIFEDIPINE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Nifedipine	5.00
60.00	2	Starch (maize)	60.00
40.00	3	Lactose monohydrate	40.00
40.00	4	Dicalcium phosphate	40.00
4.00	5	Polyvinylpyrrolidone K30	4.00
0.04	6	Isopropyl alcohol	40 mL
2.00	7	Magnesium stearate	2.00
1.00	8	Talc	1.00

Manufacturing Directions

1. Sift item 1 through a 40 mesh screen into a suitable mixing vessel. Sift items 2 to 4 through a 250 µm sieve into the same vessel, portion by portion, mixing with item 1 to achieve geometric dilution. Dry the mix for 15 minutes.
2. In a separate vessel, prepare the binding solution by dissolving item 5 and item 6.
3. Add the binding solution from step 2 into step 1 slowly, and mix until a suitable mass is obtained.
4. Pass the wet mass through a 6 mesh sieve onto trays, and dry it overnight in a dehumidified room.
5. Pass dried granules through an 18 mesh sieve. Load into a blending vessel.
6. Sift items 7 and 8 through a 250 µm sieve, and add to step 5. Blend for 1 minute.
7. Compress into 150 mg tablets, using 7 mm punches.
8. Coat with an HPMC organic coating. (See Appendix.)

NIFEDIPINE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Nifedipine	10.00
40.00	2	Kollidon® 25	40.00
—	3	Methylene chloride	180.00
105.00	4	Microcrystalline cellulose (Avicel™ PH 102)	105.00
20.00	5	Starch (maize)	20.00
25.00	6	Kollidon® CL	25.00
0.40	7	Magnesium stearate	0.40

Manufacturing Directions

1. Dissolve a mixture of items 1 and 2 in item 3. Granulate the mixture of items 4 to 6 with the solution prepared previously, then sieve, dry the obtained coprecipitate, add item 7, and press with low- to medium-compression force.
2. Compress into 223 mg tablets, using 8 mm punches.

NIMESULIDE DISPERSIBLE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Nimesulide	100.00
120.00	2	Lactose monohydrate	120.00
100.00	3	Starch (maize)	100.00
0.40	4	Sodium metabisulfite	0.40
0.40	5	Propylparaben	0.40
30.00	6	Starch (maize)	30.00
5.00	7	Talc	5.00
1.50	8	Magnesium stearate	1.50
2.50	9	Flavor	2.50
11.20	10	Sodium starch glycolate	11.20
—	11	Water, purified	QS

Manufacturing Directions

1. Sift items 1 to 3 through a 40 mesh sieve into a suitable mixer, and mix for 15 minutes.
2. In a separate vessel, prepare the binding paste by taking an appropriate quantity of item 11, heating it to 90°C, adding item 5, and dissolving. Add item 4 and dissolve. Finally, add item 6, and make a smooth slurry (30% starch).
3. Add step 2 into step 1, and form a lump-free mass.
4. Pass the wet mass through an 8 mm sieve, and load onto trays. Dry the mass at 50°C, overnight, to less than 2% moisture.
5. Pass the dried granules through an 18 mesh sieve into a blending vessel.
6. Sift items 7 to 10 through a 250 µm sieve into step 4, and blend for 1 minute.
7. Compress into 358 mm tablets, using 40 mm punches.

NITRENDIPINE TABLETS (25 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Nitrendipine with excesss	26.00
53.00	2	Ludipress®	53.00
1.50	3	Kollidon® CL	1.50
0.50	4	Magnesium stearate	0.50

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with low-compression force.
2. Compress into 82 mg tablets, using 6 mm biplanar punches.

NITROFURANTOIN TABLETS

Formulations: Nitrofurantoin sodium hydrate, 238 mg (equivalent to 200 mg nitrofurantoin); microcrystalline cellulose, 175 mg; sodium starch glycolate, 25 mg; cornstarch, 25 mg; talc, 20 mg; magnesium stearate, 1 mg.

Manufacturing Directions

1. Mix and screen the ingredients and compress 488 mg convex core tablets by direct compression using a suitable tablet press which will yield tablets approximately 11 mm in diameter and 5.4 mm in height.
2. Coating solution: Eudragit® S 12.5% isopropanol suspension, 45.7; polyethylene glycol 6000 33% aqueous solution, 3.5; talc, 2.5; isopropanol/acetone 1:1, 48.3.
3. Use solution from step 2 to enteric coat by spraying the Eudragit® S suspension onto their surfaces as tablets rotate in a conventional coating pan. Coating thickness required to produce an even, uninterrupted surface distribution varies between 4.0 and 7.2 mg/cm^2 . Coat thickness may vary beyond this range depending upon production scale and process equipment. Air suspension coating techniques are also applicable.

NITROFURANTOIN TABLETS (100 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Nitrofurantoin	100.00
20.00	2	Starch (maize)	20.00
38.00	3	Lactose monohydrate	38.00
10.00	4	Kollidon® 30	10.00
—	5	Water, purified	QS
5.00	6	Kollidon® CL	5.00
8.00	7	Starch (maize)	8.00
4.00	8	Talc	4.00
1.00	9	Magnesium stearate	1.00

Manufacturing Directions

1. Granulate a mixture of items 1 to 3 with a solution of items 4 and 5, dry, sieve, mix with items 6 to 9, and press.

NITROFURANTOIN TABLETS (100 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Nitrofurantoin	100.00
200.00	2	Ludipress®	200.00
2.00	3	Magnesium stearate	2.00
3.00	4	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 307 mg tablets, using 12 mm punches, or compress into 180 mg tablets, using 8 mm punches.

NITROGLYCERIN AND ISOSORBIDE MONONITRATE SUSTAINED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Isosorbide mononitrate	30.00
100.00	2	Hydroxypropyl methylcellulose	100.00
40.00	3	Lactose monohydrate	40.00
40.00	4	Ethyl cellulose	40.00

1.00	7	Magnesium stearate	1.00
8.00	8	Eudragit® L100–55	8.00
1.80	9	Triethyl citrate	1.80
4.50	10	Talc	4.50
1.47	11	Polyethylene glycol 6000	1.47
0.29	12	Sodium hydroxide	0.29
QS	13	Water	QS
14.00	14	Eudragit® EPO	14.00
8.00	15	Citric acid	8.00
QS	16	Water	QS
0.30	17	Nitroglycerin	0.30
65.00	18	Lactose fine powder	65.00
5.00	19	Sucrose fine powder	5.00
2.00	20	Flavor optional	2.00
0.10	21	Polyvinylpyrrolidone	0.10
QS	22	Ethyl alcohol 95%	QS

Manufacturing Directions

1. Blend isosorbide mononitrate, hydroxypropyl methylcellulose, ethyl cellulose, and lactose to form a uniform blend.
2. Prepare polyvinylpyrrolidone in water or a mixture of water and ethanol solution.
3. Granulate step 1 with solution from step 2.
4. Dry the granulation, and screen or mill to desired particle size.
5. Add silicon dioxide, stearic acid, and magnesium stearate, and blend for additional 5 to 10 minutes.
6. Compress tablets at 233 mg.
7. Prepare the coating solution by mixing water, Eudragit® L100–55, sodium hydroxide, PEG 6000, triethyl citrate, and talc to form a uniform dispersion.
8. Coat isosorbide mononitrate tablets with Eudragit® L coating solution using a coating pan or a fluid-bed coater until a desired coat weight is achieved (259.50 g).
9. Prepare a coating solution containing Eudragit® E and citric acid in water.
10. Coat isosorbide mononitrate enteric-coated tablets with this coating solution in a coating pan or a fluid-bed coater until a desired coating weight is obtained (291 mg).
11. Prepare the solvent mixture containing polyvinylpyrrolidone, ethyl alcohol, and water.
12. Blend nitroglycerin, lactose, sucrose, and the flavoring agent. Screen to break lumps.
13. Add the mixture of step 11 to step 12 until a moistened powder blend is achieved.
14. Compress isosorbide mononitrate tablet (281.06 mg) with moistened nitroglycerin triturate (72.4 mg) in a tableting machine for the total weight of 353.46 mg. The product contains 0.3 mg of nitroglycerin in the molded triturate tablet for intraoral release and 30 mg of isosorbide mononitrate as a sustained-release form, which releases isosorbide for a duration of 8 to 12 hours.

NITROGLYCERIN RETARD TABLETS

Manufacturing Directions

Formulation: Cetyl alcohol, 15.0% w/w; hydroxyethyl cellulose, 5.0% w/w; lactose, 45.5% w/w; talc, 15.0% w/w; nitroglycerin 1:10, 16.0% w/w; talc and magnesium stearate QS, 100.0% w/w.

1. Melt cetyl alcohol in a water-jacketed tank fitted with a stirrer; add the lactose and blend. Granulate the free-flowing mass through a No. 16 stainless steel screen.
2. Hydrate hydroxyethyl cellulose with three volumes of water for each part by weight of hydroxyethyl cellulose, and stir until a granular paste will be obtained.
3. Add the granules from step 1 to the paste obtained from step 2. Continue the blend, and add the talc and nitroglycerin powder. Blend until a uniform granular mass is obtained.
4. Dry the granules at 45°C for 30 minutes and after drying, granulate through a 16 mesh screen.
5. Add the tablet lubricants (magnesium stearate and talc) in suitable quantity and compress the mixture into tablets.

Compression data: Tablet weight is 400 mg; punch size: 3/8 in.; flat beveled edge.

NITROGLYCERIN TABLETS (0.3 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.30	1	Nitroglycerin, use 1.95% mixture (diluted nitroglycerin	15.38
0.61	2	Glyceryl monostearate	0.61
16.37	3	Lactose monohydrate	16.37
0.065	4	Silicon dioxide colloidal	0.065
2.10	5	Pregelatinized starch	2.10
0.10	6	Calcium stearate	0.105

Adjust quantity based on assay with item 3. Do not add any excess.

Manufacturing Directions

1. Mill glyceryl monostearate (Myvaplex 600P) and lactose monohydrate in a suitable mixing vessel equipped with an intensifier bar.
2. Separately mill silicon dioxide and lactose monohydrate together.
3. Add diluted nitroglycerin USP to step 1. Blend for 10 minutes, with the intensifier bar set to "on."
4. Add step 2 into step 3, and mix for 3 minutes.
5. Add item 5 after passing through a 250 µm sieve to step 4, and mix for another 5 minutes, with the intensifier bar set to "on."
6. Add calcium stearate to the blend in step 5, and blend for 5 minutes.
7. Compress a suitable quantity into tablets.

NORAMIDOPYRINE METHANESULFONATE AND DICYCLOMINE HYDROCHLORIDE TABLETS (500 MG/10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Noramidopyrine methanesulfonate	500.00
10.00	2	Dicyclomine hydrochloride	10.00
4.00	3	Lactose monohydrate	4.00
12.50	4	Starch (maize)	12.50
1.50	5	Gelatin	1.50
1.50	6	Magnesium stearate	1.50
1.50	7	Talc	1.50
1.50	8	Carboxymethyl cellulose	1.50
1.50	9	Aerosil® 200	1.50
1.50	10	Sodium metabisulfite	1.50
0.22	11	Methylparaben	0.22
0.02	12	Propylparaben	0.02
—	13	Isopropyl alcohol	QS
—	14	Water, purified	QS

Manufacturing Directions

1. Place items 1 and 3 in a suitable mixing vessel, and 7 g of item 4, and mix for 5 minutes.
2. In a separate vessel, take a sufficient quantity of item 14, bring it to a boil, and dissolve in it items 11 and 12. Allow the mixture to cool to 50°C, add items 5 and 10, and dissolve. Add the balance of item 4, and mix well to prepare a smooth paste.
3. Add step 2 into step 1, and form a smooth wet mass. Pass the mass through a 2.38 mm sieve screen over paper-lined trays, and dry at 60°C, overnight, to an LOD of not more than 3%.
4. Pass the dried granules through a 16 mesh screen into a blending vessel.
5. Granulate item 2 with a sufficient quantity of item 13 (optionally containing a dye).
6. Dry the granules in step 4 in a dehumidified room.
7. Add step 6 into step 5, and mix for 5 minutes.
8. Sift items 6 to 9 through a 500 mm screen, and blend for 2 minutes.
9. Compress 625 mg in a suitable punch.

NOREPHEDRINE AND TERFENIDINE TABLETS

Formulation: L(–)-norephedrine hydrochloride, 37.5 mg; terfenadine, 30.0 mg; lactose, 65.0 mg; hydroxypropyl methylcellulose, 15.0 mg; croscarmellose sodium, 5.0 mg; talc, 10.0 mg; hydrogenated castor oil, 8.0 mg. Total 70.5 mg.

Manufacturing Directions

1. Make the tablet is made by wet granulating L(–)-norephedrine hydrochloride, terfenadine, and lactose with a solution of hydroxypropyl methylcellulose. Dry and size the granulation, and sequentially dry blend the remaining ingredients and then compress into tablets.

NORETHINDRONE AND ETHINYL ESTRADIOL TABLETS (0.75 MG/0.035 MG; 0.50 MG/0.035 MG; 1.0 MG/0.035 MG)

Each of the following products is a combination oral contraceptive containing the progestational compound norethindrone and the estrogenic compound ethinyl estradiol:

- Ortho-Novum 7/7/7—Each white tablet contains 0.5 mg of norethindrone and 0.035 mg of ethinyl estradiol. The inactive ingredients are lactose, magnesium stearate, and pregelatinized starch. Each light peach tablet contains 0.75 mg of norethindrone and 0.035 mg of ethinyl estradiol. The inactive ingredients are FD&C Yellow No. 6, lactose, magnesium stearate, and pregelatinized starch. Each peach tablet contains 1 mg of norethindrone and 0.035 of ethinyl estradiol. The inactive ingredients are FD&C Yellow No. 6, lactose, magnesium stearate, and pregelatinized

starch. Each green tablet in the Ortho-Novum 7/7/7 28 package contains only inert ingredients, as follows: D&C Yellow No. 10 Aluminum Lake, FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, microcrystalline cellulose, and pregelatinized starch.

- Ortho-Novum 10/11—Each white tablet contains 0.5 mg of norethindrone and 0.035 mg of ethinyl estradiol. The inactive ingredients are lactose, magnesium stearate, and pregelatinized starch. Each peach tablet contains 1 mg of norethindrone and 0.035 of ethinyl estradiol. The inactive ingredients are FD&C Yellow No. 6, lactose, magnesium stearate, and pregelatinized starch. Each green tablet in the Ortho-Novum 10/11 28 package contains only inert ingredients, as listed under the green tablets in the Ortho-Novum 7/7/7 28 package.
- Ortho-Novum 1/35—Each peach tablet contains 1 mg of norethindrone and 0.035 mg of ethinyl estradiol. The inactive ingredients are FD&C Yellow No. 6, lactose, magnesium stearate, and pregelatinized starch. Each green tablet in the Ortho-Novum 1/35 28 package contains only inert ingredients, as listed under green tablets in the Ortho-Novum 7/7/7 28 package.
- Modicon—Each white tablet contains 0.5 mg of norethindrone and 0.035 mg of ethinyl estradiol. The inactive ingredients are lactose, magnesium stearate, and pregelatinized starch. Each green tablet in the Modicon 28 package contains only inert ingredients, as listed under the green tablets in the Ortho-Novum 7/7/7 28 package.

NORFLOXACIN TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Norfloxacin	400.00
90.00	2	Microcrystalline cellulose (Avicel™ PH 112)	90.00
26.00	3	Croscarmellose sodium (Ac-Di-Sol)	26.00
4.00	4	Magnesium stearate	4.00
—	5	Absolute alcohol (ethanol, dehydrated alcohol)	60.00

Manufacturing Directions

Note: Avoid overmixing lubricants, or hardness may be reduced.

1. Sieving and kneading
   a. Sift item 1 through a 900 μm sieve. Load it into the mixer.
   b. Add item 5 to step 1a, while mixing at low speed. Scrape sides and blades. Mix and chop at low speed for 2 minutes. Check the end point of granulation. If required, add additional absolute alcohol to get the end point. (The end point of the granulation is the point where there are few or no lumps in the granulation.)
2. Drying: Dry the wet granules in an oven at 55°C for 6 hours. After 2 hours of drying, scrape the semidried granules to break the lumps for uniform drying.
3. Check the LOD. The limit is 0.7% to 1%. If required, dry further at 55°C for 1 hour. Check the LOD.
4. Transfer the dried granules to stainless steel drums.
5. Grinding: Grind the dried granules through a 1.25 mm sieve, using a granulator at medium speed. Collect the granules in stainless steel drums. Load the granules into the blender.
6. Lubrication
   a. Sift items 2 and 3 through a 500 μm sieve, and add it to the blender. Mix the blend for 2 minutes.
   b. Sift item 4 through a 250 μm sieve. Add 5 to 100 g granules from bulk (see the previous step). Mix in a polythene bag for 1 minute. Then, add to the blender. Blend for 1 minute.
   c. Unload in stainless steel drums.
7. Compression
   a. Check the temperature and humidity before starting compression. The limits are that the temperature cannot exceed 25°C, and the relative humidity should be between 45% and 50%.
   b. Compress the granules using a rotary tableting machine (diameter: 16.2×8.3 mm, compression weight: 520 mg).
8. Tablet coating: Coat with an HPMC solution. (See Appendix.)

NORFLOXACIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Norfloxacin	400.00
48.56	2	Microcrystalline cellulose	48.56
47.12	3	Starch 1500	47.12
5.15	4	Stearic acid	5.15
2.58	5	Fumed silica	2.58
10.30	6	Croscarmellose sodium	10.30
1.29	7	Magnesium stearate	1.29

Manufacturing Directions

1. Pass Starch 1500 and fumed silica together through a 40 mesh screen.
2. Add norfloxacin, microcrystalline cellulose, stearic acid, and croscarmellose sodium to the material from step 1 and blend for 15 minutes in a twin-shell blender.
3. Add the magnesium stearate to the material from step 2 and blend for an additional 5 minutes.
4. Compress into 515 mg tablets.

NORGESTIMATE AND ETHINYL ESTRADIOL TABLETS (0.18 MG/0.035 MG; 0.215 MG/0.035; 0.25 MG/0.035 MG)

Each of the following products is a combination oral contraceptive containing the progestational compound norgestimate and the estrogenic compound ethinyl estradiol.

1. Ortho Tri-Cyclen® 21 Tablets and Ortho Tri-Cyclen® 28 Tablets
   a. Each white tablet contains 0.180 mg of the progestational compound, norgestimate and 0.035 mg of the estrogenic compound, ethinyl estradiol. Inactive ingredients include lactose, magnesium stearate, and pregelatinized starch.
   b. Each light blue tablet contains 0.215 mg of the progestational compound, norgestimate and 0.035 mg of the estrogenic compound, ethinyl estradiol. Inactive ingredients include FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, and pregelatinized starch.
   c. Each blue tablet contains 0.250 mg of the progestational compound, norgestimate and 0.035 mg of the estrogenic compound, ethinyl estradiol.Inactive ingredients include FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, and pregelatinized starch.
   d. Each green tablet in the Ortho Tri-Cyclen 28 package contains only inert ingredients, as follows: D&C Yellow No. 10 Aluminum Lake, FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, microcrystalline cellulose, and pregelatinized starch.
2. Ortho-Cyclen 21 Tablets and Ortho-Cyclen 28 Tablets
   a. Each blue tablet contains 0.25 mg of the progestational compound, norgestimate and 0.035 mg of the estrogenic compound, ethinyl estradiol. Inactive ingredients include FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, and pregelatinized starch.
   b. Each green tablet in the Ortho-Cyclen 28 package contains only inert ingredients, as follows: D&C Yellow No. 10 Aluminum Lake, FD&C Blue No. 2 Aluminum Lake, lactose, magnesium stearate, microcrystalline cellulose, and pregelatinized starch.

NYSTATIN TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Nystatin	55.00
110.00	2	Ludipress®	110.00
1.00	3	Aerosil® 200	1.00
1.30	4	Magnesium stearate	1.30

Manufacturing Directions

1. Mix the components, and pass through a 0.8 mm sieve.
2. Press with very low-compression force.
3. Compress into 175 mg tablets, using 8 mm punches. For 100 mg strength, compress into 350 mg tablets using 10 mm punches.

NYSTATIN TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Nystatin	200.00
51.00	2	Lactose monohydrate	51.00
—	3	Isopropyl alcohol	40 mL
10.00	4	Kollidon® CL	10.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate a mixture of items 1 and 2 with a solution of items 3 and 4. Dry, pass through a 0.8 mm sieve, add item 5, and press with medium-compression force.
2. Compress into 270 mg tablets, using 9 mm punches.

OLANZAPINE ORALLY DISINTEGRATING TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Olanzapine	5.00
92.97	2	Mannitol DC grade	92.97
0.50	3	Gelatin	0.50
0.50	4	Aspartame	0.50
0.02	5	Sodium methylparaben	0.02
0.01	6	Sodium propylparaben	0.01
1.00	7	Colloidal silicon dioxide (Aerosil® 200)	1.00

For all other strengths, adjust the total weight with item 2.

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1 and items 3 to 6 through 0.5 mm sieve and collect in a container.
4. Add 15% (=6.9 g) mannitol from step 1 to step 3, and mix well.
5. Transfer step 4 into step 2.
6. Transfer balance quantity of step 1 into step 2.
7. Mix step 2 for 20 minutes using tumbler.
8. Pass item 7 through 0.500 mm sieve and add to step 7.
9. Mix step 8 for 2 minutes.
10. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).

OLANZAPINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Olanzapine	10.00
200.00	2	Pregelatinized starch	200.00
25.00	3	Microcrystalline cellulose (Avicel™ PH 101)	25.00
15.00	4	Povidone	15.00
10.00	5	Croscarmellose	10.00
3.75	6	Magnesium stearate	3.75
2.50	7	FD&C Yellow No. 2 lake	2.50
—	8	Water, purified, ca	5 mL

Manufacturing Directions

1. Place items 1 to 3, 5, and 7 in a suitable blender, and mix them.
2. In a separate vessel, prepare a binding solution using items 4 and 8.
3. Add to step 1, and granulate. Dry granules in trays at 40°C under vacuum.
4. Pass the dried granules through a 60 mesh screen.
5. Add and blend item 6, and compress.

OLANZAPINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
2.50	1	Olanzapine	2.50
49.20	2	Lactose spray dried	49.20
35.00	3	Microcrystalline cellulose (Avicel™ PH102)	35.00
2.00	4	Crospovidone	2.00
0.50	5	Hydroxypropyl cellulose	0.50
0.80	6	Magnesium stearate	0.80
2.00	7	Hypromellose	2.00
0.45	8	Polyethylene glycol 4000	0.45
0.60	9	Titanium dioxide	0.60
0.20	10	FD&C Blue No. 2 Aluminum Lake	0.20
—	11	Water, purified	30.00

Note: For all other strengths, adjust the total quantity with item 2.

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and place in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve and collect in a stainless steel container.
3. Add 5.0% (=2.5 g) lactose from step 1 to step 2, and mix well.
4. Add 10.0% (=4.9 g) lactose from step 1 to step 3, and mix well.
5. Transfer step 4 into step 1.
6. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
7. Mix step 1 for 20 minutes using tumbler.
8. Pass item 6 through 0.250 mm sieve, and add to step 7.
9. Mix step 8 for 2 minutes.
10. Compress into 90 mg tablets, using a suitable punch (5.5 mm, round, imprinted 2.5).
11. Place item 11 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolved. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
12. Add items 8 to 10 one by one to step 11 with stirring. Stir for 5 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
13. Load core tablets from step 10 in coating pan, and apply coating dispersion from step 12 to get 2.5% to 3.0% weight gain.

OLANZAPINE TABLETS ZYPREXA®

Each Zyprexa® tablet contains olanzapine equivalent to 2.5 mg (8 µmol), 5 mg (16 µmol), 7.5 mg (24 µmol), or 10 mg (32 µmol). The inactive ingredients are carnauba wax, color mixture white, crospovidone, FD&C Blue No. 2 Aluminum Lake, hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose, magnesium stearate, microcrystalline cellulose, and other inactive ingredients.

OMEPRAZOLE AND IBUPROFEN TABLETS (10 MG/400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Omeprazole; use magnesium omeprazole	12.00
12.00	2	Nonpareil cores	12.00
1.80	3	Hydroxypropyl methylcellulose	1.80
—	4	Water, purified	35.40
23.50	5	Hydroxypropyl cellulose	2.35
4.03	6	Talc	4.03
—	7	Water, purified	48.00
38.70	8	Methacrylic acid copolymer (30% suspension)	38.70
3.48	9	Triethyl citrate	3.48
0.58	10	Mono- and diglycerides	0.58
0.06	11	Polysorbate 80	0.06
—	12	Purified water	22.68
400.00	13	Ibuprofen	400.00
273.60	14	Microcrystalline cellulose	273.60
100.40	15	Polyvinylpyrrolidone cross-linked	100.40
33.30	16	Polyvinylpyrrolidone K-25	33.30
26.70	17	Sodium lauryl sulfate	26.70
—	18	Water, purified	297.00
4.0	19	Sodium stearyl fumarate	4.00

Manufacturing Directions

Note: The formulation and manufacturing directions given here can be used to formulate combinations of omeprazole with other NSAIDs, such as naproxen (250 mg) or piroxicam (20 mg). Omeprazole can be replaced with pantoprazole or lansoprazole.

1. Prepare a solution of items 1 and 3 in item 4, and spray onto item 2 to prepare nonpareil cores in a fluid-bed dryer.
2. Prepare a solution of items 5 to 7 and 8 to 12 separately. Alternate application of these solutions on step 1 to provide enteric properties to the cores.
3. Pass the enteric-coated cores through a sieve.
4. Prepare a granulating solution using items 16 to 18.
5. Dry blend items 13, 15 (one-tenth), and 16, and add step 4 to this step to granulate. Add more of item 18 to the mass. Pass granules through an 8 mesh screen, and dry at 60°C for 6 hours. Pass dried granules through a 0.8 mm sieve.
6. Add step 3 and the balance of item 15, and blend for 10 minutes.
7. Compress into 886 mg tablets, using 15 mm punches. There is a disintegration time of less than 1 minute in simulated gastric juice (USP without enzymes).

OMEPRAZOLE EFFERVESCENT TABLETS

Manufacturing Directions

1. Core material: magnesium omeprazole, 12.00 kg; nonpareil cores, 12.00 kg; hydroxypropyl methylcellulose, 1.8 kg; water purified, 35.4 kg. Perform suspension layering in a fluid-bed apparatus. Spray magnesium omeprazole onto inert sugar seeds (nonpareil cores) from a water suspension containing the dissolved binder.
2. Separating layer core material (step 1), 23.50 kg; hydroxypropyl cellulose, 2.35 kg; talc, 4.03 kg; magnesium stearate, 0.34 kg; water purified, 48.00 kg. Coating layer the prepared core material with a separating layer in a fluid-bed apparatus with a hydroxypropyl cellulose solution containing talc and magnesium stearate.
3. Enteric coating layer pellets with the layer (step 2), 29.00 kg; methacrylic acid copolymer (30% suspension), 38.70 kg; triethyl citrate, 3.48 kg; mono- and diglycerides (NF), 0.58 kg; polysorbate 80, 0.06 kg; water purified, 22.68 kg. Spray the enteric coating layer consisting of methacrylic acid copolymer, mono- and diglycerides, triethyl citrate, and polysorbate onto the pellets (layered with a separating layer) in a fluid-bed apparatus. In the same type of apparatus, coat the enteric coating layered pellets with hydroxypropyl methylcellulose/magnesium stearate suspension.
4. Overcoating layer enteric-coated pellets (step 3), 44.7 kg; hydroxypropyl methylcellulose, 0.58 kg; magnesium stearate, 0.02 kg; water purified, 11.6 kg. Classify the pellets covered by an overcoating layer by sieving.
5. Mix the obtained enteric coating layered pellets with prepared granules and other components as described in the following and thereafter, compress to effervescent tablets.
6. Granulation (1000 tablets): citric acid anhydrous, 605 g; mannitol dried, 200 g; riboflavin, 0.1 g; polyvinylpyrrolidone K-25 (PVP K-25), 6.0 g; EtOH 99% (w/v), 90 g.

7. Dissolve PVP K-25 in ethanol to give the granulating solution. In this solution, disperse riboflavin. Mix citric acid and mannitol, add the liquid, and further mix the mass. Then, put the mass on a tray and dry in a drying oven for approximately 2 hours at 55°C. Mill the granulate to pass 1.0 mm sieve.
8. Prepare a premix consisting of the following by dry mixing in a mixer: Sodium carbonate anhydrous, 36 g; sodium dodecyl sulfate, 1 g; sodium stearyl fumarate, 14 g; essence orange, 2.0 g; saccharin sodium, 2.0 g; polyvinyl pyrrolidone cross-linked, 70 g; enteric-coated pellets from step 4, 95.7 g.
9. Final mixing: Granulate from step 7, 811.1 g; premix from step 8, 220.7 g; sodium bicarbonate, 453 g. The final mixing time should be 4 minutes.
10. Compress tablets on a tableting machine equipped with punches giving 20 mm diameter flat tablets with beveled edges. Tablet weight is 1485 mg.

OMEPRAZOLE FAST-DISINTEGRATING TABLETS

Manufacturing Directions

1. Add croscarmellose sodium 300 g to the vortex of a rapidly stirred beaker containing 3.0 kg of deionized water.
2. Mix the slurry of step 1 for 10 minutes.
3. Place omeprazole 90 g (powdered) in the bowl of a Hobart mixer. After mixing, slowly add the slurry of croscarmellose sodium to the omeprazole in the mixer bowl, forming a granulation. Place in trays and dry at 70°C for 3 hours.
4. Place the dry granulation in a blender, and add 1500 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of a calcium, sodium alginate complex) and 1500 g of Avicel™ PH-302 (microcrystalline cellulose).
5. After the mixture of step 4 is thoroughly blended, add 35 g of magnesium stearate and mix for 5 minutes.
6. Compress the resulting mixture of step 5 into tablets on a standard tablet press with an average weight of about 0.75 g and containing about 20 mg omeprazole.

OMEPRAZOLE FAST-DISSOLVING TABLETS

Manufacturing Directions

1. Add croscarmellose sodium (300 g) to the vortex of a rapidly stirred beaker containing 3.0 kg of deionized water.
2. Mix te slurry from step 1 for 10 minutes.
3. Place 90 g of omeprazole (powdered) in the bowl of a Hobart mixer. After mixing, slowly add the slurry of croscarmellose sodium to the omeprazole in the mixer bowl, forming a granulation. Place in trays and dry at 70°C for 3 hours.
4. Place the dry granulation in a blender, and to it add 1500 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of a calcium, sodium alginate complex) and 1500 g of Avicel™ PH-302 (microcrystalline cellulose).
5. After this mixture is thoroughly blended, add 35 g of magnesium stearate and mix for 5 minutes.
6. Compress the resulting mixture is compressed into tablets on a standard tablet press with average weight of about 1.5 g that contain about 20 mg omeprazole. These tablets should have low friability and rapid disintegration time. This formulation may be dissolved in an aqueous solution containing a buffering agent for immediate oral administration. Alternatively, the suspension tablet may be swallowed whole with a solution of buffering agent. In both cases, the preferred solution is sodium bicarbonate 8.4%. As a further alternative, sodium bicarbonate powder (about 975 mg per 20 mg dose of omeprazole or an equipotent amount of other proton pump inhibitor [PPI]) is compounded directly into the tablet. Such tablets are then dissolved in water or sodium bicarbonate 8.4%, or swallowed whole with an aqueous diluent.

OMEPRAZOLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Omeprazole	20.00
200.00	2	Poloxamer (Pluronic PE 6800)	200.00
7.00	3	Colloidal silicon dioxide	7.00
10.00	4	Magnesium carbonate	10.00
12.00	5	Sodium starch glycolate	12.00
100.00	6	Titanium dioxide	100.00
226.00	7	Ludipress®	226.00
25.00	8	Sodium stearyl fumarate	25.00
Enteric coating layer			
75.00	9	Polyvinyl acetate phthalate	75.00
0.25 mg	10	Antifoam emulsion	0.25 mg
12.00	11	Sodium hydroxide	12.00

Manufacturing Directions

1. Melt the poloxamer at a temperature of 80°C.
2. Add omeprazole, 2 mg of colloidal silicon dioxide, 8 mg of magnesium carbonate, titanium dioxide, and 6 mg of sodium starch glycolate and mix thoroughly. Continue mixing until the melt solidifies.
3. Granulate the melt and add the rest of the ingredients to the granulate. Compress the granulate into tablets containing 20 mg omeprazole.
4. Transfer these tablets, which form the substrate of the composition, into a conventional coating pan and

coat with the enteric coating layer, prepared in the following manner.

a. First, dissolve the antifoam emulsion in water to form an aqueous solution. Stir polyvinyl acetate phthalate into this solution for a final concentration of about 10% weight per volume before adding sodium hydroxide.
b. Add sodium hydroxide (1 M solution) to adjust the pH value of the solution to about 8, thereby obtaining a basic solution of the enteric coating material.
c. Spray this solution onto the tablets with an incoming air temperature of 40°C. The omeprazole cores can be alternately coated using hydroxypropyl methylcellulose acetate succinate (HPMCAS) as the enteric coating layer.

OMEPRAZOLE TABLETS (10 MG/20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Omeprazole	10.00
200.00	2	Calcium glycerophosphate	200.00
400.00	3	Sodium bicarbonate	400.00
12.00	4	Croscarmellose sodium	12.00
3.00	5	Pregelatinized starch	3.00

OMEPRAZOLE TABLETS (10 MG/20 MG)

3.00	11	Maltodextrin	3.00
3.00	12	Mannitol	3.00
3.00	13	Pregelatinized starch	3.00

Manufacturing Directions

1. Pass all ingredients through a 250 μm mesh, and blend in a suitable blender.
2. Compress into 672 mg tablets, using 15 mm biplanar punches. For 20 mg tablets, increase the quantity of item 1, and compress an additional 10 mg.

OMEGA FATTY ACIDS TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
140.00 g	1	Omega fatty acids dry N-3	140.00
140.00 g	2	Avicel™ PH101	140.00
8.40 g	3	Kollidon® VA 64	8.40
2.00 g	4	Magnesium stearate	2.00

OMEPRAZOLE TABLETS, RAPID DISSOLUTION (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Omeprazole	10.00
175.00	2	Calcium lactate	175.00
175.00	3	Calcium glycerophosphate	175.00
500.00	4	Sodium bicarbonate	500.00
50.00	5	Calcium hydroxide	50.00
12.00	6	Croscarmellose sodium	12.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 289 mg tablets, using 9 mm biconvex punches.
3. The dry powder omega fatty acids dry N-3 contains 25% fish oil; this fish oil consists of about 30% eicosapentaenoic acid + docosahexaenoic acid.
4. These tablet cores could be coated with an enteric coating of Kollicoat MAE 30 D. (See Appendix for more choices.)

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Melt together orlistat (60 g) and myristic acid (30 g) at 50°C.
2. Add mannitol (400 g) and lactose (400 g), and cool the mixture to room temperature under continuous stirring.
3. Add and homogeneously distribute talcum (10 g).
4. Press the powder into tablets of 960 mg weight (=orlistat content of 120 mg).

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Melt together orlistat (120 g) and myristic acid (30 g) at 50°C.
2. Add sucrose palmitate (PEG40 stearate, 12 g) and lactose (15 g), and cool the mixture to room temperature under continuous stirring.
3. Press the powder into tablets of 960 mg weight (=orlistat content of 120 mg).

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Mix together orlistat (120 g), sodium laurate (30 g), mannitol (80 g), and HPMC 3 cps (60 g) with stepwise addition of a (50:50% m/m) ethanol/water mixture (0.2 mL/g).
2. Dry the formed granules in vacuum at 30°C to constant weight and press into tablets (each containing 120 mg orlistat).

OXPRENOLOL RETARD TABLETS

Manufacturing Directions

1. Homogeneoulsy mix 15.6 kg of 3-(4-chloro-3-sulfamoylphenyl)-3-hydroxyisoindolin-1-one (chlorthalidone), 3.0 kg of microcrystalline cellulose, 6.456 kg of dicalcium phosphate, 0.9 kg of cornstarch, 0.024 kg of iron yellow, and 0.120 kg of magnesium stearate.
2. Carry out the pressing of the two active substance mixtures to form capsule-shaped tablets. The tablets should have a length of 18.0 mm, a width of 5.5 mm, a depth of approximately 5.6 mm, and a radius of curvature of 3.5 mm; the depth of the dividing notches provided on both sides is 1.47 mm in each case.

OXPRENOLOL RETARD TABLETS

Manufacturing Directions

1. Granulate a mixture of 9.6 kg of the ground hydrochloride of 1-(2-allyloxyphenoxy)-3-isopropylaminopropan-2-ol (ox-prenolol) and 6.98 kg of ground lactose together with 16.0 kg of a 30% aqueous dispersion of the 70:30 copolymer of ethyl acrylate and methyl methacrylate in the fluidized bed; the spraying-in speed should be 0.7 L/min, and the temperature of the supply air 38°C. Dry the mixture in the same apparatus for 25 minutes at a supply air temperature of 40°C. With the simultaneous addition of 0.12 kg of colloidal silicon dioxide, 0.3 kg of calcium stearate, and 4.0 kg of stearic acid, force the granulate through a sieve of 1 mm mesh width and then mix in a planetary mixer for 15 minutes.
2. Carry out pressing of the granulate to form capsule-shaped biconvex tablets each weighing 410 mg on a tablet press having guided dies (the two opposing dies being provided with wedges for forming the dividing notches) having the following dimensions: length = 16.5 mm, width = 6.0 mm, and radius of curvature = 3.6 mm. The tapering dividing notches provided on both sides should each be 1.47 mm in depth; the depth of the compact approximately 5.4 mm.
3. Carry out coating in a coating vessel of 55 cm diameter which is equipped with baffle plates. Continuously spray 5 kg of compacts using a binary nozzle with a coating solution or suspension of the following composition. Dissolve 0.1 kg of hydroxypropyl methylcellulose (viscosity 5 cps) in 1.2 kg of demineralized water.
4. To this add, while stirring, 0.005 kg of polysorbate 80, 0.05 kg of talc, and 0.1 kg of a 20% homogeneous suspension of titanium dioxide in a solution of 0.007 kg of hydroxypropyl methylcellulose (5 cps) in 90% ethanol. The supply air temperature should be 60°C; maintain the temperature of the compacts in the vessel at approximately 35°C. The amount of film coating to be sprayed on is 19 mg (dry weight) per compact.

OXPRENOLOL RETARD TABLETS

Manufacturing Directions

1. Homogeneously mix 15.6 kg of 3-(4-chloro-3-sulfamoylphenyl)-3-hydroxyisoindolin-1-one (chlorthalidone), 3.0 kg of microcrystalline cellulose, 6.456

kg of dicalcium phosphate, 0.9 kg of cornstarch, 0.024 kg of iron yellow, and 0.120 kg of magnesium stearate.
2. Carry out the pressing of the two active substance mixtures to form capsule-shaped tabletsThe tablets should have a length of 18.0 mm, a width of 5.5 mm, a depth of approximately 5.6 mm, and a radius of curvature of 3.5 mm; the depth of the dividing notches provided on both sides should be 1.47 mm in each case.

OXYBUTYNIN CHLORIDE TABLETS (5 MG/10 MG) DITROPAN

Each Ditropan XL extended-release tablet contains 5 or 10 mg of oxybutynin chloride USP, formulated as a once-a-day controlled-release tablet for oral administration. Ditropan XL also contains the following inert ingredients: cellulose acetate, hydroxypropyl methylcellulose, lactose, magnesium stearate, polyethylene glycol, polyethylene oxide, synthetic iron oxides, titanium dioxide, polysorbate 80, sodium chloride, and butylated hydroxytoluene.

Ditropan XL uses osmotic pressure to deliver oxybutynin chloride at a controlled rate over approximately 24 hours. The system, which resembles a conventional tablet in appearance, comprises an osmotically active bilayer core surrounded by a semipermeable membrane. The bilayer core is composed of a drug layer, containing the drug and excipients, and a push layer, containing osmotically active components. There is a precision laser-drilled orifice in the semipermeable membrane on the drug-layer side of the tablet. In an aqueous environment, such as the gastrointestinal tract, water permeates through the membrane into the tablet core, causing the drug to go into suspension and the push layer to expand. This expansion pushes the suspended drug out through the orifice. The semipermeable membrane controls the rate at which water permeates into the tablet core, which in turn, controls the rate of drug delivery. The controlled rate of drug delivery into the gastrointestinal lumen is thus independent of pH or gastrointestinal motility. The function of Ditropan XL depends on the existence of an osmotic gradient between the contents of the bilayer core and the fluid in the gastrointestinal tract. Because the osmotic gradient remains constant, drug delivery remains essentially constant. The biologically inert components of the tablet remain intact during gastrointestinal transit and are eliminated in the feces as an insoluble shell.

OXYBUTYNIN HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Oxybutynin hydrochloride	15.00
15.00	2	Polyvinylpyrrolidone	15.00
3.00	3	Silicon dioxide	3.00
100.00	4	Lactose	100.00
30.00	5	Fumaric acid	30.00
1.50	6	Sodium stearyl fumarate	1.50

Manufacturing Directions

1. Place oxybutynin hydrochloride, fumaric acid, and lactose in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend sodium stearyl fumarate in a drum mixer.
4. Press the resulting mixture into tablets (7 mm diameter and 7 mm curvature) with average hardness being between 60 and 120 N and a total weight of 164.50 mg.
5. Coat these tablet cores with the following formulation: ethyl cellulose (Ethocel), 10.10 mg; polyvinylpyrrolidone (povidone), 5.50 mg; stearic acid, 2.40 mg; for total weight of 182.50 mg.
6. First dissolve Ethocel, povidone, and stearic acid in denatured alcohol (180 g). Spray the coating solution onto the tablet cores in a coating pan.

OXYBUTYNIN HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Oxybutynin hydrochloride	10.00
15.00	2	Polyvinylpyrrolidone	15.00
3.00	3	Silicon dioxide colloidal	3.00
100.00	4	Lactose	100.00
30.00	5	Fumaric acid	30.00
1.50	6	Sodium stearyl fumarate	1.50
—	7	Water, purified	85.00

Manufacturing Directions

1. Place oxybutynin hydrochloride, fumaric acid, and lactose in fluidized-bed equipment.
2. Prepare in a separate container an aqueous PVP solution (in 85 g of water).

3. Spray the solution in step 2 into step 1 to form granules at a typical setting using a fluid-bed dryer: Airflow = 100 to 110 m^3/h; liquid flow (g/min) = 6 to 7 g/min; inlet temperature = 65°C; and spraying pressure = 2.8 bar.
4. Pass dried granules through a sieve (1 mm mesh). Sodium stearyl fumarate is weighed, added, and blended in a drum mixer.
5. Compress using 7 mm punches at 164 mg.
6. Coat the tablets using the following formula per tablet: ethyl cellulose (Ethocel), 10.10 mg; polyvinylpyrrolidone (povidone), 5.50; stearic acid, 2.40; and the total weight (dry weight of coated tablet) is 182.50.

OXYCODONE HYDROCHLORIDE AND ACETAMINOPHEN TABLETS (5 MG/325 MG), PERCOCET

Each tablet of Percocet contains acetaminophen, 325 mg, and oxycodone HCl, 5 mg (5 mg oxycodone HCl is equivalent to 4.4815 mg oxycodone). The inactive ingredients are microcrystalline cellulose, povidone, pregelatinized starch, stearic acid, and other ingredients.

OXYCODONE AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
325.00	1	Acetaminophen powder	325.00
4.48	2	Oxycodone; use oxycodone hydrochloride	5.00
6.00	3	Colloidal silicon dioxide	6.00
77.00	4	Microcrystalline cellulose	77.00
32.00	5	Croscarmellose sodium	32.00
13.00	6	Hydroxypropyl methylcellulose	13.00
62.00	7	Starch (maize)	62.00
2.00	8	Magnesium stearate	2.00
—	9	Water, purified	QS

Manufacturing Directions

1. Pass hydrocodone bitartrate through a 20 mesh screen, and pass acetaminophen and colloidal silicon dioxide (50%) through a Frewitt SG Turbo Sieve equipped with a 1.0 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-line collecting drum at speed setting 5 (approximately 1030 rpm).
2. Pass microcrystalline cellulose (50%), croscarmellose sodium (50%), cornstarch (66%), and hydroxypropyl methylcellulose through the Turbosieve at the same settings as in step 2. Load screened powders into a Lodige MGT-600 mixer, and mix for 5 minutes with the plow speed at approximately 103 rpm and no choppers.
3. Add water to the mixer over a 10 minute period, using a stainless steel transfer container with a valve, while mixing with the plows at about 103 rpm and the choppers at slow speed.
4. Mix the wet mass for another 15 minutes until a Wattmeter reading of 15 to 16 mkW is reached.
5. Dry the material. Preheat a Glatt fluid-bed dryer by running it for 2.5 minutes at 60°C inlet air temperature at 3500 m^3/h. Set the exhaust blower bypass speed at about 40%, the filter shaking interval for about 2 minutes, and the filter shake duration at 5 seconds. Transfer the material in the dryer for drying. Decrease the inlet air to 2500 m^3/h and the inlet air temperature to 55°C after 30 minutes. Dry the material until an LOD of less than 0.5% is reached.
6. Pass the dried granulation through a FitzMill using a 20 mesh wire screen, with knives forward, at medium speed.
7. Pass the remaining microcrystalline cellulose and the colloidal silicon dioxide through a sieve equipped with a 1 mm round-hole screen, an angle bar, a cloth skirt, and a polyethylene-lined collecting drum.
8. Add magnesium stearate, and mix for 3 minutes.
9. Compress using a 13/32 round tooling.

OXYCODONE HYDROCHLORIDE TABLETS (5 MG)

Each tablet contains oxycodone hydrochloride, 5 mg. The tablets also contain microcrystalline cellulose and stearic acid. The oral solution contains alcohol, FD&C Red No. 40, flavoring, glycol, sorbitol, water, and other ingredients.

OXYTETRACYCLINE TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Oxytetracycline hydrochloride	250.00
230.00	2	Ludipress®	230.00
6.00	3	Magnesium stearate	6.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with very low-compression force.
2. Compress into 495 mg tablets, using 12 mm biplanar punches.

PANCREATIN AND CHOLIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
130.00	1	Pancreatin	130.00
2.00	2	Cholic acid	2.00
127.00	3	Avicel™ PH101	127.00
56.00	4	Lactose monohydrate	56.00
2.00	5	Magnesium stearate	2.00
3.00	6	Aerosil® 200	3.00

Manufacturing Directions

1. Mix the components, and press with high-compression force.
2. Compress into 324 mg tablets, using 9 mm biconvex punches.
3. Coat by enteric coating. (See Appendix.)

PANCREATIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Pancreatin	30.00
308.00	2	Ludipress®	308.00
10.00	3	Kollidon® CL	10.00
2.00	4	Magnesium stearate	2.00

Manufacturing Directions

1. Mix the components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 355 mg tablets, using 8 mm biconvex punches.
3. Coat by enteric coating. (See Appendix.)

PANCREATIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Pancreatin	300.00
290.00	2	Ludipress®	290.00
25.00	3	Kollidon® CL	25.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Mix the components, pass through a 0.8 mm sieve, and press to tablets with low-compression force.
2. Compress into 615 mg tablets, using 11 mm biconvex punches.
3. Coat by enteric coating. (See Appendix.)

PANTOPRAZOLE TABLETS, PROTONIX

Protonix is supplied as a delayed-release tablet for oral administration, available in two strengths. Each delayed-release tablet contains 45.1 or 22.6 mg of pantoprazole sodium sesquihydrate (equivalent to 40 or 20 mg of pantoprazole, respectively), with the following inactive ingredients: calcium stearate, crospovidone, hydroxypropyl methylcellulose, iron oxide, mannitol, methacrylic acid copolymer, polysorbate 80, povidone, propylene glycol, sodium carbonate, sodium lauryl sulfate, titanium dioxide, and triethyl citrate.

PANTOPRAZOLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Pantoprazole	10.00
200.00	2	Calcium glycerophosphate	200.00
400.00	3	Sodium bicarbonate	400.00
12.00	4	Croscarmellose sodium	12.00
3.00	5	Pregelatinized starch	3.00

PANTOPRAZOLE TABLETS (10 MG/20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Pantoprazole	10.00
175.00	2	Calcium glycerophosphate	175.00
175.00	3	Calcium lactate	175.00
250.00	4	Sodium bicarbonate	250.00
20.00	5	Polyethylene glycol 6000	20.00

5.8	5	Gelatin (40% solution)	5.8
17.4	6	Starch-coated dicalcium phosphate	17.4
1.60	7	Monodiglyceride mixture	1.60
0.60	8	Lecithin	0.60
0.10	9	Aspartame	0.10
0.10	10	Vanillin	0.10
0.20	11	Glycerin	0.20
0.20	12	Sodium bicarbonate	0.20
0.38	13	Mint flavor	0.38

Manufacturing Directions

1. Boil lycasin, water, fat, mono- and diglyceride mixture, glycerin, and lecithin to 131°C.
2. Add glycerin and cool the mixture to 60°C.
3. Add sodium bicarbonate, papain, dicalcium phosphate, and the remaining ingredients.
4. Thereafter, cool the mixture to room temperature and grind into powder and compress into a 205 mg tablet using a tablet press.

PAPAVERINE HYDROCHLORIDE RETARD TABLETS

Formulation: Cetyl alcohol, 10 g; hydroxyethyl cellulose, 5 g; papaverine hydrochloride, 75 g; talc, 10 g.

Manufacturing Directions

1. Melt cetyl alcohol in a jacketed vessel and incorporate papaverine hydrochloride, blend well, and granulate through a 16 mesh sieve. Dry at room temperature.
2. Hydrate the hydroxyethyl cellulose with 15 g of water.
3. Blend the granules obtained as a result of step 1 with the hydrated cellulose component of step 2 and mix well.
4. Granulate the whole through a 16 mesh sieve and dry.
5. Compress into tablets of suitable size and shape.

PARA AMINO SALICYLIC ACID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Calcium para amino salicylic acid	500.00
280.00	2	Ludipress®	280.00
35.00	3	Kollidon® 35	35.00
—	4	Isopropyl alcohol	QS
5.00	5	Magnesium stearate	5.00
5.00	6	Talc	5.00

Manufacturing Directions

1. Granulate items 1 and 2 with a solution of items 3 and 4. Dry the granules, and lubricate with items 5 and 6.
2. Compress into 825 mg tablets, using 16 mm biplanar punches.

PAROXETINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Paroxetine; use paroxetine hydrochloride hemihydrate	22.67
83.34	2	Dicalcium phosphate (Ditab)	83.84
50.67	3	Microcrystalline cellulose (Avicel™ PH 102)	50.67
8.34	4	Sodium starch glycolate (Explotab)	8.34
1.67	5	Magnesium stearate	1.67

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Paroxetine; use paroxetine hydrochloride hemihydrate	34.00
125.00	2	Dicalcium phosphate (Ditab)	125.00
76.00	3	Microcrystalline cellulose (Avicel™ PH 102)	76.00
12.50	4	Sodium starch glycolate (Explotab)	12.50
2.50	5	Magnesium stearate	2.50

Manufacturing Directions

1. Pass item 2 through a screen, and weigh it into a planetary mixer.
2. Add 30 mesh screened paroxetine to the bowl.
3. Add 20 mesh screened Avicel™ and Explotab, and mix all the powders for 10 minutes.
4. Add magnesium stearate, and mix for 5 minutes.
5. Compress into pentagonal tablets using 9.5 mm punches for 30 mg tablets and 8.25 mg for 20 mg tablets. Compress 250 and 166.7 mg, respectively.

PAROXETINE HYDROCHLORIDE TABLETS (10 MG/20 MG/30 MG/40 MG), PAXIL®

1. Immediate-release tablets—Each film-coated Paxil® tablet contains paroxetine HCl equivalent to paroxetine as follows. 10 mg: yellow; 20 mg: pink (scored); 30 mg: blue; and 40 mg: green. Inactive ingredients consist of dibasic calcium phosphate dihydrate, hydroxypropyl methylcellulose, magnesium stearate, polyethylene glycols, polysorbate 80, sodium starch glycolate, titanium dioxide, and one or more of the following: D&C Red No. 30, D&C Yellow No. 10, FD&C Blue No. 2, and FD&C Yellow No. 6.
2. Controlled-release tablets—Each enteric, film-coated, bilayer, controlled-release Paxil® tablet contains paroxetine HCl equivalent to paroxetine as follows: 12.5 mg and 25 mg. One layer of the tablet consists of a degradable barrier layer, and the other contains the active material in a hydrophilic matrix. The barrier layer is pale yellow and pink for the 12.5 and 25 mg strength tablets, respectively; the active layer is white. Inactive ingredients consist of hydroxypropyl methylcellulose, polyvinylpyrrolidone, lactose monohydrate, magnesium stearate, colloidal silicon dioxide, glyceryl behenate, methacrylic acid copolymer type C, sodium lauryl sulfate, polysorbate 80, talc, triethyl citrate, and one or more of the following colorants: yellow ferric oxide and red ferric oxide.

PAROXETINE HYDROCHLORIDE HEMIHYDRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Paroxetine hydrochloride hemihydrate	22.76
160.24	2	Dibasic calcium phosphate hemihydrate	160.24
8.00	3	Povidone anhydrous PVP K30	8.00
6.00	4	Sodium starch glycolate	6.00
3.00	5	Magnesium stearate	3.00
QS	6	Water	QS

Manufacturing Directions

1. Premix paroxetine hydrochloride hemihydrate, dibasic calcium phosphate anhydrous, sodium starch glycolate, and povidone and granulate with water.
2. Mix the granulate, after drying and milling through a 0.6 mm sieve, with dibasic calcium phosphate anhydrous and sodium starch glycolate in a dry state for 20 minutes. Then, add magnesium stearate, followed by mixing for a further 5 minutes.
3. Press tablets (approximately 206 mg) from the resulting mixture and coat with a coating suspension of Opadry® containing the composition (%w/w) titanium dioxide, 31.250; hydroxypropyl methylcellulose, 29.875 (Methocel E3 Premium); hydroxypropyl methylcellulose, 29.875 (Methocel E5 Premium); polyethylene glycol 400, 8.000; polysorbate 80 (Tween), 1.000).

PAROXETINE HYDROCHLORIDE HEMIHYDRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
22.76	1	Paroxetine hydrochloride hemihydrate	22.76
160.24	2	Dibasic calcium phosphate anhydrous	160.24
8.00	3	Anhydrous povidone (PVP K-30)	8.00
6.00	4	Sodium starch glycolate	6.00
3.00	5	Magnesium stearate	3.00
QS	6	Purified water QS	QS

Manufacturing Directions

1. Premix paroxetine hydrochloride hemihydrate, dibasic calcium phosphate anhydrous, sodium starch glycolate, and povidone and granulate with water.
2. Mix the granulate, after drying and milling through a 0.6 mm sieve, with dibasic calcium phosphate anhydrous and sodium starch glycolate in a dry state for 20 minutes. Then, add magnesium stearate, followed by mixing for a further 5 minutes.
3. Press tablets from the resulting mixture and coat with a coating suspension of Opadry® coating suspension (Opadry 6.0). Composition: (%w/w) titanium dioxide, 31.250%; hydroxypropyl methylcellulose, 29.875% (Methocel E3 Premium); hydroxypropyl methylcellulose, 29.875% (Methocel E5 Premium); polyethylene glycol 400, 8.000%; polysorbate 80 (Tween), 1.000%.
4. Tablet weight should give about 20 mg strength (approximately 206 mg).

PENICILLIN CHEWABLE TABLETS (125 MG)

Each tablet contains Penicillin V potassium equivalent to 250 mg (400,000 units) or 500 mg (800,000 units) Penicillin V. The tablets also contain lactose, magnesium stearate, povidone, starch, stearic acid, and other inactive ingredients.

PENICILLIN CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
277.16	1	Mannitol	277.16
53.00	2	Sugar	53.00
21.20	3	Sodium cyclamate	21.20
2.30	4	Saccharin sodium	2.30
125.00	5	Penicillin; use benzathine Penicillin V, 3% excess	172.83
—	6	Water, purified, ca	96.00 mL
5.50	7	Raspberry flavor	5.50
4.40	8	Polacrilin potassium (Amberlite IRP-88)	4.40
11.60	9	Talc	11.60
35.00	10	Magnesium stearate	35.00

Note: Adjust the weight of penicillin for potency, and alter the weight of mannitol to compensate. The weight of sodium citrate is 450 minus the weight of penicillin.

Manufacturing Directions

Note: Allergic reactions sometimes occur with penicillin. Avoid contact as much as possible, and use equipment dedicated to penicillin or cephalosporin products. The LOD limits are low, so use an air-conditioned area.

1. Granulation
   a. Mill mannitol, sugar, sodium cyclamate, and sodium saccharin through a 2.38 mm aperture screen using a suitable comminuting mill, with knives forward, at medium speed.
   b. Add the milled materials from step 1 to the mixer, and then add the penicillin. Mix for 10 minutes. Add the water slowly, cleaning the sides of the mixer as necessary. Mix for 10 minutes after the water is added. The final mass should have a sandy appearance.
   c. Transfer the wet granulation to the bowl of a fluid-bed dryer through a 6.7 mm aperture screen. Dry at 30°C for 20 minutes. Stir, then pass the granulation by hand through a 5.5 mm aperture screen. After that, transfer the granulation to the bowl of the fluid-bed dryer.
   d. Continue drying at 60°C, turning over after each 30 minutes, until the LOD is no more than 0.8% (drying time is approximately 60 minutes).

e. Screen the dried granules through an 840 µm aperture screen on a suitable sieve shaker, and pass the coarse material through a 1.6 mm aperture screen on a comminuting mill, at low speed, with knives forward.
f. Screen the flavor, polacrilin potassium, magnesium stearate, and talc through a 595 µm screen on a sieve shaker. Load the screened powders into a suitable blender.
g. Load the screened and milled granules from step 5 into the blender, and blend for 30 minutes.
h. Discharge the granulation into tared polyethylene-lined drums, and seal the bags. Weigh them for yield.
i. Compress on 9.53 mm square punches. Note the weight according to the adjustments made (hardness: 10–12 kPa diagonally, 15–21 kPa flat).

PEPTIDE SUBLINGUAL TABLETS

Formulation: The individual component peptides each have a molecular weight of less than 20,000 Daltons. Thymosin fraction, 5%; water, 5.0%; sucrose/lactose, 69.5%; propylene glycol, 0.5%; silicon dioxide, 15.0%; methyl nicotinate, 0.5%.

Manufacturing Directions

1. Form the wetted mixture into tablets of a desired weight, and then dry the tablets at 30°C for 36 hours.

PERFLOXACIN TABLETS (400 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Perfloxacin; use perfloxacin mesylate	592.00
63.00	2	Lactose monohydrate	63.00
42.00	3	Dicalcium phosphate	42.00
52.00	4	Starch (maize)	52.00
22.00	5	Starch (maize)	22.00
1.00	6	Gelatin	1.00
15.60	7	Sodium starch glycolate	15.60
10.00	8	Talc	10.00
5.00	9	Magnesium stearate	5.00
3.00	10	Sodium starch glycolate	3.00
10.00	11	Starch (maize)	10.00
—	12	Water, purified	QS

Manufacturing Directions

1. Sift items 1 to 4 through a 250 µm sieve, and load into a suitable vessel; mix it for 10 minutes.
2. In a separate vessel, place items 5 to 7, and add hot item 12 to make a 30% starch paste.
3. Add the paste in step 2 to step 1, and form a wet mass suitable for granulating.
4. Pass the wet mass through an 8 mesh sieve, and spread it on paper-lined trays.
5. Dry the granules at 50°C overnight until an LOD of not more than 3% is reached.
6. Pass the dried granules through a 1.19 mm sieve screen into a blending vessel.
7. Sift items 8 to 11 through a 250 µm sieve, and add to step 6. Blend for 2 minutes.
8. Compress into 815 mg tablets, using an 18.8 × 8.8 mm punch.
9. Coat the material with an HPMC methylene chloride coating. (See Appendix.)

PHENDIMETRAZINE TABLETS (35 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
35.00	1	Phendimetrazine	35.00
281.00	2	Ludipress®	281.00
281.00	3	Starch (maize)	281.00
3.00	4	Magnesium stearate	3.00
3.00	5	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 604 mg tablets, using 12 mm biplanar punches. The amount of Ludipress® and cornstarch may be reduced to obtain better disintegration times.

PHENINDIONE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Phenindione	50.00
165.00	2	Ludipress®	165.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 230 mg tablets, using 8 mm biplanar punches.

PHENOXYMETHYL PENICILLIN POTASSIUM TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
58.10	1	Sodium citrate powder	68.10
250.00	2	Penicillin V acid; use phenoxymethyl potassium[a]	277.20
29.50	3	Povidone K 29–32	29.50
—	4	Alcohol SD 3A 200 proof, ca	100 mL
16.00	5	Starch (maize)	16.00
16.00	6	Talc	16.00
6.10	7	Magnesium stearate	6.10

[a] Adjust the quantity based on the factored potency and adjusted by sodium citrate. Starch must be dried. The amount of sodium citrate is 345.30 – weight of item 2.

Manufacturing Directions

Note: Allergic reactions sometimes occur with penicillin. Avoid contact as much as possible, and use equipment dedicated to penicillin or cephalosporin products. The LOD limits are low, so use an air-conditioned area.

1. Granulation

   Note: Dried cornstarch must be used for lubrication. Dry the starch at 80°C for 36 hours prior to its use in manufacturing. Check the LOD of starch. The LOD must be less than 2%.

   a. Mill separately the sodium citrate through a 595 µm aperture screen using a suitable comminuting mill, at medium speed, with impact forward, and the penicillin through a 595 µm aperture screen with knives forward, at high speed. In a suitable mixer, mix them for 5 minutes.
   b. Dissolve povidone in 100 mL of alcohol in a dry stainless steel bucket.
   c. Add PVP–alcohol slowly to the mixer, and mix for 30 minutes or until balls form in the sandy mixture. Add and record extra alcohol if required.
   d. Pass the mass through a 9.52 mm aperture screen, place into a fluid-bed dryer bowl, and dry at 50°C for 1 hour. Turn over as necessary. The LOD should not be more than 0.7%.
   e. Mill the granules through a 1.59 mm aperture screen using a suitable comminuting mill, with knives forward, at medium speed. Put the granules into tared polyethylene-lined drums, then seal, and weigh.
2. Lubrication
   a. Transfer the dried granulation to a suitable blender.
   b. Screen the dried starch and talcum through a 595 µm aperture screen on a sieve shaker, and add to the blender. Blend this mixture for 30 minutes.
   c. Screen the magnesium stearate through a 595 µm aperture screen on a sieve shaker, and add it to the blender. Blend this for 30 minutes.
   d. Discharge the granules into polyethylene-lined drums. Then, seal and weigh for yield.
3. Compression
   a. Compress using 10.32 mm round, standard concave punches.
   b. Compress to calculated weight after adjustments, with a variation not more than 3%; thickness between 4.4 and 4.6 mm (range not more than ±5%); hardness between 10 and 14 kPa; and disintegration time no more than 15 minutes in water.
4. Coating: Coat by a Methocel subcoat, color coat, and polishing coat. (See Appendix.)

PHENOLPHTHALEIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Phenolphthalein	200.00
150.00	2	Dibasic calcium phosphate	150.00
11.00	3	Kollidon® 30	11.00
—	4	Isopropanol or ethanol (96%)	QS
19.00	5	Kollidon® CL	19.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, mix with items 5 and 6, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 385 mg tablets, using 9 mm biconvex punches.

PHENOLPHTHALEIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
90.00	1	Yellow phenolphthalein	90.00
64.80	2	Microcrystalline cellulose	64.80
187.20	3	Dicalcium phosphate	187.20
3.60	4	Croscarmellose sodium	3.60
3.60	5	Fumed silica	3.60
7.20	6	Stearic acid	7.20
3.60	7	Magnesium stearate	3.60

Manufacturing Directions

1. Screen items 6 and 7 through a 40 mesh sieve.
2. Blend items 1 and 5 in a V-blender for 3 minutes.
3. Add items 2 and 4 to the blender, and mix for 5 minutes.
4. Add item 3 to the blender, and mix for 12 minutes.
5. Add item 6, and blend for 3 minutes.
6. Add item 7, and mix for another 5 minutes.
7. Compress using 3/8 in., flat, bevel-edged punches to hardness of 10 kPa; average tablet weight is 360 mg.

PHENYLPROPANOLAMINE AND BROMPHENIRAMINE FAST-DISSOLVING TABLET

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
6.25	1	Phenylpropanolamine hydrochloride	6.25
1.00	2	Brompheniramine maleate	1.00
6.00	3	Citric acid	6.00
1.80	4	Magnasweet® 135	1.80
4.50	5	Aspartame	4.50
3.60	6	Cherry flavor	3.60
21.00	7	Croscarmellose sodium	21.00
3.00	8	Lecithin	3.00
30.00	9	Cornstarch	30.00
3.00	10	Silicon dioxide	3.00
2.10	11	Magnesium stearate	2.10
219.25	12	Fast-dissolving granulation (see following)	219.25

Manufacturing Directions

1. Make a fast-dissolving granulation by combining 400 g of melted PEG 900 with fructose powder (100 g) in a planetary mixer (low-shear mixer) and mixing until the granules form.
2. Allow the granulations to cool and then screen.
3. Mix all ingredients in a V-blender.
4. Compress tablets (301.5 mg) at approximately 3 kN.
5. Tablet hardness should be 0.2 to 0.5 kPa and disintegration time 10 seconds.

PHENYLPROPANOLAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
60.00	1	Phenylpropanolamine hydrochloride, USP	60.00
180.00	2	Calcium sulfate dihydrate	180.00
—	3	Starch paste10%	QS
12.00	4	Starch 1500 (StarX)	12.00
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Add starch in 1:10 ratio to cold water, and heat to boil with constant stirring until a thick, translucent white paste is formed.
2. Keep it for use in following granulation.
3. Mix the phenylpropanolamine hydrochloride with the calcium sulfate in a Sigma blade mixer for 15 minutes.
4. Add starch paste in sufficient quantity to form a suitable wet mass of desirable consistency.
5. Allow to mix for 30 minutes.
6. Pass the wet mass through a 14 mesh screen and distribute on drying trays.
7. Dry in a forced-air oven at 49°C to 54°C or in a fluid-bed dryer.
8. Pass the dried granules through an 18 mesh screen.
9. Transfer granules to a twin-shell blender, add items 4 and 5, and blend for 6 to 8 minutes.
10. Compress the granulation in a rotary press using 3/8 in. standard punches. Tablet weight is 260 mg.

PHENYLBUTAZONE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Phenylbutazone	100.00
3.33	2	Lactose monohydrate	3.33
3.33	3	Mannitol	3.33
162.00	4	Starch (maize)	162.00
10.00	5	Starch (maize)	10.00
0.66	6	Polyvinylpyrrolidone potassium 30	0.66
0.28	7	Propylparaben	0.28
0.28	8	Methylparaben	0.28
5.00	9	Talc	5.00
3.00	10	Magnesium stearate	3.00
7.00	11	Sodium starch glycolate	7.00
—	12	Water, purified	QS

Manufacturing Directions

1. Sift items 1 to 4 through a 40 mesh screen into a suitable mixing vessel. Mix for 10 minutes.
2. In a separate vessel, heat item 12 to boiling, and add and dissolve items 7 and 8. Allow this blend to cool to 60°C, then add item 6, and dissolve. Finally, add item 5, and stir well to make a smooth paste of 30% starch.
3. Add the starch paste from step 2 into step 1, and mix to form a suitable wet mass.
4. Pass the wet mass in step 3 through an 18 mesh screen onto trays. Then, dry at 60°C overnight to an LOD of not more than 2.8%. Transfer to a blending vessel.
5. Sift items 9 to 11 through a 250 µm sieve. Add to step 4, and blend for 1 minute.
6. Compress into 280 mg tablets, using a 5 mm punch.
7. Coat the tablets with a sealing coat and a color coat (HPMC). (See Appendix.)

PHENYLPROPANOLAMINE HYDROCHLORIDE TABLETS (60 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Phenylpropanolamine hydrochloride	60.00
180.00	2	Calcium sulfate dihydrate	180.00
QS	3	Starch paste (10%)	QS
12.00	4	Starch 1500 (StaRx)	12.00
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Starch paste: Add starch with a 1:10 ratio to cold water. Heat to a boil, with constant stirring, until a thick, translucent white paste is formed. Keep it for use in step 2.
2. Granulation
   a. Mix the phenylpropanolamine hydrochloride with the calcium sulfate in a sigma blade mixer for 15 minutes.
   b. Add starch paste from step 1 in sufficient quantity to form a suitable wet mass of desirable consistency.
   c. Allow to mix for 30 minutes.
   d. Pass the wet mass through a 14 mesh screen and distribute on drying trays.
   e. Dry in a forced-air oven at 120°F to 130°F or in a fluid-bed dryer.
   f. Pass the dried granules through an 18 mesh screen.
3. Lubrication
   a. Transfer granules to a twin-shell blender, add Starch 1500 and magnesium stearate, and blend for 6 to 8 minutes.
4. Compression: Compress the granulation in a rotary press using 9.5 mm standard punches. The tablet weight should be 260 mg.

PHENYTOIN SODIUM TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Phenytoin sodium	100.00
235.00	2	Ludipress®	235.00
10.00	3	Magnesium stearate	10.00
8.00	4	Kollidon® CL	8.00
5.00	5	Aerosil® 200	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 346 mg tablets, using 12 mm biplanar punches.

PHENYTOIN SODIUM TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Phenytoin sodium	100.00
50.00	2	Dicalcium phosphate	50.00
45.00	3	Sucrose crystalline	45.00
10.00	4	Kollidon® 25	10.00
—	5	Isopropyl alcohol + ethanol (1:1)	30.00
5.00	6	Kollidon® CL	5.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 3 with a solution of items 4 and 5; dry. Pass through a 0.8 mm sieve, mix with items 6 and 7, and press with high-compression force.
2. Compress into 209 mg tablets, using 8 mm biplanar punches.

PHENYTOIN TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Phenytoin base	100.00
235.00	2	Ludipress®	235.00
2.00	3	Magnesium stearate	2.00
2.00	4	Stearic acid	2.00
8.00	5	Kollidon® CL	8.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 351 mg tablets, using 12 mm biplanar punches.

PIOGLITAZONE HYDROCHLORIDE TABLETS (15 MG/30 MG/45 MG), ACTOS

Actos is available as a tablet for oral administration containing 15, 30, or 45 mg of pioglitazone (as the base) formulated with the following excipients: lactose monohydrate NF, hydroxypropyl cellulose NF, carboxymethyl cellulose calcium NF, and magnesium stearate NF.

PIPEMIDIC ACID TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Pipemidic acid; use pipemidic acid trihydrate	236.00
16.00	2	Calcium carboxymethyl cellulose	16.00
4.00	3	Hydroxypropyl cellulose	4.00
8.00	4	Cellulose microcrystalline	8.00
2.40	5	Silicon dioxide colloidal	2.40
5.60	6	Magnesium stearate	5.60
QS	7	Water, purified, ca	80.00 mL

Manufacturing Directions

Caution: Wear a mask and gloves during all operations.

1. Granulation
   a. Pass pipemidic acid (item 1) and calcium carboxymethyl cellulose (item 2) through a 24 mesh (0.6 mm) screen attached to an oscillating granulator. Load into a planetary mixer, and blend for 10 minutes.
   b. Dissolve the hydroxypropyl cellulose (item 3) in 80 mL of water, using continuous mechanical stirring.
   c. Add the binder solution to the mixed powder from step 1, and blend for 10 minutes to form a suitable mass. More water should be added, if necessary, to complete granulation and densification.
   d. The granules should then be screened through an 8 mesh (2 mm) screen.
   e. Spread the moist granules on trays, and dry at 50°C (122°F) for 16 hours or until moisture level is within the range of 11% to 16%.
2. Lubrication
   a. Using an oscillating granulator, pass the dried granules through a 12 mesh (1.4 mm) screen.
   b. Pass the cellulose microcrystalline (item 4), silicon dioxide colloidal (item 5), and magnesium stearate (item 6) through a 12 mesh (1.4 mm) screen.
   c. Load the items from step 2b into a planetary blender. Add half of the dried granule from step 2a, and blend for 5 minutes. Then, add the remainder of the dried granule, and blend for an additional 15 minutes at a nominal speed of 30 rpm.
   d. Load the lubricated granule into tared, polyethylene-lined drums, and weigh for yield.

3. Compression: Compress on a suitable machine using ovaloid tooling, 12.5 mm × 6.5 mm; the compression weight is 280 mg. For 400 mg strength, 9.1 × 15.5 mm punches and 560 mg weight.
4. Coating: Coat using a Methocel/Ethocel coating. (See Appendix.)

PIPOBROMAN TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Pipobroman	25.00
100.00	2	Lactose monohydrate powder	100.00
5.00	3	Povidone K 29–32	5.00
QS	4	Water, purified, ca	12 mL
2.00	5	Starch (corn)	2.00
1.10	6	Magnesium stearate	1.10

Manufacturing Directions

1. Granulation
   a. Pass pipobroman, lactose, and povidone through an 840 µm aperture screen using a FitzMill or something similar, with impact forward and high speed.
   b. Load milled granulation into a mixer. Mix for approximately 5 minutes, and then add 12 mL of purified water to the mass. Pass granulation through a FitzMill or a similar method using a no. 5 (12.7 mm) band, with knives forward and at slow speed.
   c. Pass granulation thinly on paper-lined trays, set the oven at 50°C, and dry overnight, or until the LOD is less than 2% (1 hour Brabender at 105°C).
   d. Sift dried granulation through an 840 µm aperture screen and FitzMill the coarse granules through a 1 mm aperture screen, with knives forward, at a slow speed.
2. Lubrication
   a. Load one-half of the base granulation into a Glen mixer or a similar mixing method.
   b. Mix cornstarch and magnesium stearate. Screen this mixture through a 595 µm aperture screen into a mixer.
   c. Load the remaining granulation into the mixer. Blend for approximately 5 minutes.
   d. Discharge into polyethylene-lined drums. The theoretical lubricated weight is 133.1 g.
3. Compression: Compress using 9/32 in. standard concave punches, with a compression weight of 133 mg.

PIROXICAM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.40	1	Piroxicam	150.40
6.70	2	Sodium dodecyl sulfate	6.70
18.00	3	Sodium starch glycolate	18.00
44.90	4	Hydroxypropyl methylcellulose	44.90
228.00	5	Cellulose lactose	228.00

Manufacturing Directions

1. Compress tablet.
2. Coat with copolymer of methacrylic acid triethyl citrate (150 mg) and simethicone 30% emulsion (15 mg).

PIROXICAM WATER-DISPERSIBLE TABLETS (20 MG)

Formulation: Piroxicam, 20 g; cornstarch, 150 g; Ludipress®, 50 g; Kollidon® CL, 8 g; polyethylene glycol 6000 powder, 10 g; Aerosil® 200, 1 to 2 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low- to medium-compression force at 238 mg.

PLACEBO TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
299.70	1	Ludipress®	299.70
0.30	2	Magnesium stearate	0.30

Manufacturing Directions

1. Mix the components, sieve, and press.
2. For this formulation, compress 300 mg.
3. The compression force determines hardness and friability.
4. At 7 kN, the hardness is 45 N; at 22 kN, the hardness is 160 N.
5. The disintegration time increases from 1 to 4 minutes.

PLACEBO TABLETS

Formulation: Ludipress®, 99.9%; magnesium stearate, 0.1%.

Manufacturing Directions

1. Mix the components, sieve, and press.
2. Tablet weight is 300 mg.

POTASSIUM BICARBONATE-COATED TABLET

Manufacturing Directions

1. Preparation of potassium bicarbonate crystals: US Patent 5445805 describes how to prepare crystals of size within the range of 800 to 900 μm, a Brunauer, Emmett, and Teller (BET) surface area of 0.004 to 0.01 m^2/g, and particle distributions such that over 90% by weight of the crystals are within the range of 700 to 1000 μm. (At least 90% of the crystals are retained on a 25 mesh screen [707 μm] and fewer than 10% are retained on an 18 mesh screen [1000 μm]).
2. Preparation and application of controlled-release coating lacquers—Coating lacquer composition: HR, 23.45 g; Ethocel, 163.45 g; acetyl tributyl citrate, 8.75 g; isopropyl alcohol, 3304.35 g. Total = 3500.00 g.
3. Coating conditions: process air flow = 100 to 171 m^3/h; spray period = 135 minutes; spray temperature = 60.1°C to 68.1°C; spray pressure = 2.0 bar; liquid flow rate = 26 to 28 g/min; product temperature = 46°C to 52°C. Coated crystals: theoretical yield = 3191.1 g; actual yield around 98% giving w/w dry matter of 6.37% (coated/uncoated crystals).
4. Dissolve hydrogenated castor oil (Cutina HR), ethyl cellulose (Ethocel Standard 100 premium), and acetyl tributyl citrate in isopropyl alcohol to provide the controlled-release coating lacquers.
5. Dissolve Cutina HR, Ethocel, and acetyl tributyl citrate in the isopropyl alcohol solvent by heating in a mixer equipped with a heating jacket set at 60°C to 70°C with vigorous agitation. Continue the agitation for about 1 hour. When dissolved, the mixture is clear to translucent.
6. Maintain the coating lacquer composition at temperatures of 60°C to 70°C.
7. Coat the lacquers on the potassium bicarbonate particles by concurrent flow through a fluidized bed in which the moisture content is controlled. Spray the coating lacquer from a spray nozzle positioned at the bottom of a Glatt fluidized-bed apparatus equipped with a Wurster tube.
8. Fluidize the potassium bicarbonate crystals, and spray the warm coating lacquer on the crystals in multiple coating cycles.
9. Adjust the process air flow rate as necessary to provide adequate movement of the crystals through the fluidized bed as they are coated. During the coating process, flash evaporate the isopropyl alcohol solvent from the crystals as they cycle through the fluidized bed.
10. After the application of the coating lacquer to the crystals is completed, remove any trace residual solvent remaining on the coated crystals by cycling in the fluidized bed without lacquer spray for 10 minutes.
11. Following the residual solvent removal, cool the coated crystals in the bed.
12. The amount of coating lacquer applied on the crystals is calculated as the % w/w of the dry matter of the respective coatings, relative to the uncoated potassium bicarbonate crystals.
13. Compression: potassium bicarbonate coated crystals 85.00%, Cutina HR 1.50%, Avicel™ PH 7.68%, cornstarch 5.12%, Syloid 0.40%, Lubritab 0.30%. Compress tablets of 1500 mg of potassium bicarbonate.

POTASSIUM CHLORIDE RETARD TABLET

Formulation: Cetyl alcohol, 14.00 g; potassium chloride, 82.00 g; hydroxyethyl cellulose, 4.50 g; talc, 1.50 g.

Manufacturing Directions

1. To 10 g of water at 50°C, contained in a suitable vessel, fitted with a stirrer, add the hydroxyethyl cellulose. Blend until a uniformly hydrated granular mass is formed.
2. Add to the hydrated cellulose granules, with constant stirring, the potassium chloride. Continue mixing until a free-flowing uniform granule blend is obtained.
3. Dry the cellulose–potassium chloride granules for 30 minutes at 50°C. Granulate the dried granules through a No. 16 stainless steel standard mesh screen.
4. Melt the cetyl alcohol in a water-jacketed tank fitted with an efficient stirrer. Hold the melt at 50°C to 60°C and incorporate the granules from step 3. Continue stirring until a free-flowing granular mass is obtained. Allow the mass to cool, and granulate through a No. 16 standard mesh stainless steel screen.
5. Lubricate the granules with talc, and compress into cores. Core compression data: Core weight, 750.0 mg; punch size, 7/16 in. deep concave.
6. The cores are then pan-coated using normal coating techniques.

POTASSIUM CHLORIDE TABLETS (30 MG), KLOR

Potassium chloride extended-release capsules, USP, are a solid oral dosage form of potassium chloride containing 10 mEq (750 mg) of potassium chloride (equivalent to 10 mEq [390 mg] of potassium and 10 mEq [360 mg] of chloride) in a microencapsulated capsule. This formulation is intended to release potassium so that the likelihood of a high localized

concentration of potassium chloride within the gastrointestinal tract is reduced. The inactive ingredients are calcium stearate, gelatin, pharmaceutical glaze, povidone, sugar spheres, and talc.

Klor-Con extended-release tablets, USP, are a solid oral dosage form of potassium chloride. Each contains 600 or 750 mg of potassium chloride equivalent to 8 or 10 mEq of potassium in a wax matrix tablet.

POTASSIUM CHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Potassium chloride	30.00
150.00	2	Gelatin powder	150.00
2.00	3	Croscarmellose sodium	2.00
5.00	4	Talc	5.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Accurately weigh potassium chloride, gelatin, croscarmellose sodium, talc, and magnesium stearate.
2. Add potassium chloride, gelatin, and croscarmellose sodium, one item at a time, in a suitable blender, and mix for 15 minutes. Add talc and magnesium stearate, and mix for an additional 5 minutes.
3. Compress into 200 mg tablets, using 6 mm punches.

POVIDONE-IODINE EFFERVESCENT VAGINAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
350.00	1	Polyvinylpyrrolidone (PVP)-iodine 30/06, with excess	360.00
1450.00	2	Ludipress®	1450.00
360.00	3	Tartaric acid	360.00
265.00	4	Sodium bicarbonate	265.00
19.00	5	Talc	19.00
2.00	6	Calcium arachinate	2.00
2.00	7	Aerosil® 200	2.00

Manufacturing Directions

1. Dry the mixture of items 2 to 4 for 4 hours at 60°C, mix with item 1 and items 5 to 7, and press to tablets.
2. Compress into 2.5 g tablet, using 20 mm biplanar punches.
3. The tablet is dissolved in water to obtain a vaginal douche solution.

POVIDONE-IODINE LOZENGES

Bill of Materials

Scale (mg/lozenge)	Item	Material Name	Quantity/1000 Lozenges (g)
5.00	1	Polyvinylpyrrolidone (PVP)-iodine 30/06	5.00
150.00	2	Sorbitol (crystallized)	150.00
4.00–5.00	3	Menthol (crystalline)	4.00–5.00
4.00–5.00	4	Eucalyptol (crystalline)	4.00–5.00
1.00	5	Aspartame, potassium	1.00
0.10	6	Saccharin sodium	0.10
1.00	7	Aerosil® 200	1.00
1.00	8	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 176 mg tablets, using 8 mm biplanar punches.

PRAVASTATIN SODIUM TABLETS (10–40 MG), PRAVACHOL

Pravachol is available for oral administration as 10, 20, and 40 mg tablets. Inactive ingredients include croscarmellose sodium, lactose, magnesium oxide, magnesium stearate, microcrystalline cellulose, and povidone. The 10 mg tablet also contains red ferric oxide; the 20 mg tablet also contains yellow ferric oxide; and the 40 mg tablet also contains green lake blend (mixture of D&C Yellow No. 10 Aluminum Lake and FD&C Blue No. 1 Aluminum Lake).

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Pravastatin sodium	10.00
12.00	2	Crospovidone	12.00
77.00	3	Lactose, spray dried	77.00
1.00	4	Magnesium stearate	1.00

Manufacturing Directions

1. Place pravastatin sodium and crospovidone in a blender after passing through a 250 μm sieve.
2. Add item 3, and mix for 20 minutes at moderate speed.
3. Add item 4, and blend for 5 minutes at low speed.

4. Compress in a suitable punch, 100 mg for 10 mg strength and proportionally for strengths up to 40 mg.

PRAVASTATIN TABLETS

Formulation: Pravastatin, 6.7%; lactose, 67%; microcrystalline cellulose, 20%; croscarmellose sodium, 2%; magnesium stearate, 1%; magnesium oxide, 3.3%.

Manufacturing Directions

1. Pravastatin, magnesium oxide, and a fraction (30%) of lactose are mixed together for 2 to 10 minutes employing a suitable mixer. The resulting mixture is passed through a 12 to 40 mesh size screen.
2. Microcrystalline cellulose, croscarmellose sodium, and the remaining lactose are added, and the mixture is mixed for 2 to 10 minutes. Thereafter, magnesium stearate is added, and mixing is continued for 1 to 3 minutes.
3. The resulting homogeneous mixture is then compressed into tablets each containing 5, 10, 20, or 40 mg of pravastatin. A dispersion of the tablets in water had a pH of about 10.

PRAZOSIN TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Prazosin hydrochloride, anhydrous[a]	5.00
94.00	2	Ludipress®	94.00
1.00	3	Magnesium stearate	1.00

[a] If using polyhydrate, increase the amount to 6.00, and adjust with item 2.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force.
2. Compress into 109 mg tablets, using 8 mm biplanar punches.

PREDNISOLONE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Prednisolone	5.00
60.00	2	Lactose monohydrate	60.00
32.50	3	Starch (maize)	32.50
6.00	4	Starch (maize)	6.00
4.00	5	Starch (maize, dried)[a]	4.00
2.00	6	Talc (fine powder)	2.00
0.50	7	Magnesium stearate	0.50
—	8	Purified water	18.00

[a] LOD: not more than 4.5% when dried at 120°C for 4 hours.

Manufacturing Directions

Precautions: The binding solution contains maize starch, and therefore, it is possible to have microbiological growth. Thus, prepare the solution directly before the granulation process. Prednisolone is a potent corticosteroid, and therefore, use a mask, gloves, and goggles during the whole process.

1. Preparation of binding solution
   a. Prepare a homogeneous slurry of item 4 using 8 g of item 8 (25–30°C). Check that it is free of lumps.
   b. Place this slurry into 10 g of item 8 heated to 90°C in the vessel (Giusti). Stir until there is complete gelatinization.
   c. Check the weight. The theoretical weight is 24 g.
   d. Leave the starch paste to cool to 40°C to 50°C.

   Note: Compensate any loss of weight due to vaporization by adding item 8.
2. Dry mixing: Pass items 1 to 3 through a 630 µm sieve using a sifter. Load this powder to the mixer, and mix for 15 minutes at high speed.
3. Wet massing: Add starch paste cooled to 40°C to 50°C from step 1d. Mix for 10 minutes at high speed. Add purified water if required.
4. Pass the wet granules through sieve 24205 using the FitzMill.
5. Drying: Spread the wet granules onto the trays. Load the trolleys to the dryer. Dry the granules at 60°C for 14 hours.
6. Grinding: Pass the dried granules through a 1 mm sieve using a granulator.
7. Lubrication
   a. Pass items 5 and 6 through a 250 µm sieve using a sifter. Collect the material in a stainless steel drum.
   b. Load the sieved material from step 6 into the blender.

c. Load the sieved lubricant powders from step 7a into the blender.
d. Blend the powders for 5 minutes.

8. Blending
   a. Pass item 7 through a 250 µm sieve using a sifter. Load the sieved powder into the blender. Mix the powder for 1 minute.
   b. Unload the lubricated granules in stainless steel drums.
9. Check and record the weight of the granules.
10. Compression: Compress 110 mg of the granules using a rotary tableting machine in 7.1 mm punches.

PREDNISOLONE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Prednisolone; use as prednisolone micronized with excess	10.50
49.50	2	Microcrystalline cellulose (Avicel™ PH 102)	49.50
7.50	3	Sodium starch glycolate (Primojel®)	7.50
105.00	4	Lactose (spray dried)	105.00
25.00	5	Starch (maize), dried	25.00
1.00	6	Colloidal silicon dioxide (Aerosil® 200)	1.00
1.50	7	Magnesium stearate	1.50

Manufacturing Directions

1. See the manufacturing directions for the 5 mg strength tablet.

PREDNISOLONE TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Prednisolone micronized with excess	21.00
60.00	2	Microcrystalline cellulose (Avicel™ PH 102)	60.00
9.00	3	Sodium starch glycolate (Primojel®)	9.00
127.00	4	Lactose (spray dried)	127.00
30.00	5	Starch (maize, dried)	30.00
1.00	6	Colloidal silicon dioxide (Aerosil® 200)	1.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. See the manufacturing directions for the 5 mg strength tablet.

PREDNISOLONE TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Prednisolone	20.00
155.00	2	Lactose monohydrate	155.00
10.00	3	Kollidon® VA 64	10.00
8.00	4	Kollidon® CL	8.00
5.00	5	Magnesium stearate	5.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress into 212 mg tablets, using 8 mm biplanar punches.

PREDNISONE TABLETS (10 MG)

Deltasone tablets contain prednisone, which is a glucocorticoid. Glucocorticoids are adrenocortical steroids, both naturally occurring and synthetic, that are readily absorbed from the gastrointestinal tract. Prednisone is a white to practically white, odorless, crystalline powder. It is very slightly soluble in water and slightly soluble in alcohol, in chloroform, in dioxane, and in methanol. The chemical name for prednisone is 17α,21-dihydroxypregna-1,4-diene-3,11,20-trione. Its molecular weight is 358.43.

Deltasone tablets are available in five strengths: 2.5, 5, 10, 20, and 50 mg. The inactive ingredients are as follows. 2.5 mg: calcium stearate, cornstarch, erythrosine sodium, lactose, mineral oil, sorbic acid, and sucrose; 5 mg: calcium stearate, cornstarch, lactose, mineral oil, sorbic acid, and sucrose; 10 mg: calcium stearate, cornstarch, lactose, sorbic acid, and sucrose; 20 mg: calcium stearate, cornstarch, FD&C Yellow No. 6, lactose, sorbic acid, and sucrose; 50 mg: cornstarch, lactose, magnesium stearate, sorbic acid, sucrose, and talc.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Prednisone	10.00
208.00	2	Ludipress®	208.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force.
2. Compress into 223 mg tablets, using 8 mm biplanar punches.

PREGABALIN-COATED GRANULE FAST-CRUMBLING TABLET

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Pregabalin	150.00
6.43	2	Copovidone potassium	6.43
7.50	3	Acesulfame	7.50
4.28	4	Precipitated silicate	4.28
39.64	5	Ethyl cellulose AGM	39.64
6.43	6	Crospovidone	6.43

Manufacturing Directions

1. Mix ethyl cellulose, 80% precipitated silica, and 50% acesulfame in ethyl alcohol, until a homogeneous suspension is obtained.
2. Fluidize a powder mixture consisting of pregabalin, item 6, 70% acesulfame and 20% precipitated silica.
3. Start the granulation by spraying the mixture for about 15 to 20 minutes at a spraying rate of 25 g/min and a suspension atomization pressure of 0.8 bar.
4. Perform the actual coating by spraying the remainder of the mixture over about 1 hour 30 minutes at a spraying rate of 15 to 20 g/min and a suspension atomization pressure of 1.5 bar.
5. Spray 15% of the mixture during the granulation step, the remainder to 100% being sprayed during the coating step.
6. Formulate the granules obtained as fast-crumbling multiparticulate tablets, the composition of which is as follows: Coated granules (150 mg), mannitol (474 mg), crospovidone (80 mg), aspartame (14 mg), flavoring (8 mg), and magnesium stearate (8 mg).

PROBENECID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Probenecid	500.00
130.00	2	Starch (maize)	130.00
10.00	3	Kollidon® 30	10.00
—	4	Alcohol	70.00 mL
25.00	5	Kollidon® CL	25.00
3.00	6	Aerosil® 200	3.00
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate a mixture of items 1 and 2 with a solution of items 3 and 4. Pass this mixture through a 0.8 mm sieve. Add items 5 to 7, and press with low-compression force.
2. Compress into 674 mg tablets, using 12 mm biplanar punches.

PROMETHAZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Promethazine HCl with excess	10.50
41.95	2	Lactose monohydrate	41.95
20.00	3	Maize starch	20.00
0.05	4	Sodium metabisulfite (sodium disulfite)	0.05
2.00	5	Povidone (PVP K-30)	2.00
5.00	6	Maize starch (dried)	5.00
0.50	7	Magnesium stearate	0.50
—	8	Alcohol (ethanol, 95%)	6.07
—	9	Purified water	8.67

Manufacturing Directions

Note: Avoid overmixing of lubricants; otherwise, hardness will be reduced.

1. Mix items 9 and 8 in a stainless steel container.
2. Dissolve items 4 and 5 by slow stirring with stirrer until mixture becomes clear.
3. Sift items 1 to 3 through a stainless steel 500 μm sieve in sifter.
4. Load into mixer, and mix for 5 minutes at low speed.
5. Add binding solution at a rate of 5 to 7 g/min to the dry powders, while mixing at low speed.
6. After addition is complete, scrape sides and blades.
7. Mix further for 2 minutes using a mixer and chopper at low speed.
8. Scrape sides and blades.
9. Check for the end point of granulation, which is the point where the granulation consists of few or no lumps.
10. If required, add purified water.
11. Dry the wet granules with the air circulation heater off to expel alcohol for 2 hours.
12. Then, dry at 55°C for 14 hours.
13. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
14. Check the LOD (limit: 1.0–1.5%).
15. If required, dry further at 55°C for 2 hours.
16. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed.

17. Collect in stainless steel drums.
18. Load granules into the blender.
19. Sift item 6 material through a 500 µm sieve using a sifter, and add it into blender.
20. Mix for 3 minutes.
21. Sift item 7 through a 500 µm sieve, and add 1 to 2 g of granules from step 20
22. Mix in polyethylene bag for 1 minute.
23. Add to blender.
24. Mix for 30 seconds.
25. Compress 0.80 g.
26. Coat using one of the HPMC coatings given in the Appendix.

PROMETHAZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
25.00	1	Promethazine HCl with excess	26.00
103.75	2	Lactose monohydrate	103.75
50.00	3	Maize starch with excess	52.50
1.50	4	Sodium metabisulfite (sodium disulfite)	1.50
5.00	5	Povidone (PVP K-30)	5.00
12.50	6	Maize starch (dried)	12.50
1.25	7	Magnesium stearate	1.25
—	8	Alcohol (ethanol, 95%)	15.00
—	9	Purified water	21.67

Manufacturing Directions

Note: Avoid overmixing of lubricants; otherwise, hardness will be reduced.

1. Mix items 9 and 8 in a stainless steel container.
2. Dissolve items 4 and 5 by slow stirring with stirrer until mixture becomes clear.
3. Sift items 1 to 3 through a stainless steel 500 µm sieve in sifter.
4. Load into mixer, and mix for 5 minutes at low speed.
5. Add binding solution at a rate of 5 to 7 g/min to the dry powders, while mixing at low speed.
6. After addition is complete, scrape sides and blades.
7. Mix further for 2 minutes using a mixer and chopper at low speed.
8. Scrape sides and blades.
9. Check for the end point of granulation, which is the point where the granulation consists of few or no lumps.
10. If required, add purified water.
11. Dry the wet granules with the air circulation heater off to expel alcohol for 2 hours.
12. Then, dry at 55°C for 14 hours.
13. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
14. Check the LOD (limit: 1.0–1.5%).
15. If required, dry further at 55°C for 2 hours.
16. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed.
17. Collect in stainless steel drums.
18. Load granules into the blender.
19. Sift item 6 material through a 500 µm sieve using a sifter, and add it into blender.
20. Mix for 3 minutes.
21. Sift item 7 through a 500 µm sieve, and add 1 to 2 g of granules from step 20
22. Mix in polyethylene bag for 1 minute.
23. Add to blender.
24. Mix for 30 seconds.
25. Compress 0.80 g.
26. Coat using one of the HPMC coatings in the Appendix.

PROMETHAZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Promethazine HCl[a]	10.50
41.95	2	Lactose monohydrate	41.95
20.00	3	Starch (maize)	20.00
0.05	4	Sodium metabisulfite (sodium disulfite)	0.05
2.00	5	Povidone (PVP K-30)	2.00
5.00	6	Starch (maize), dried[b]	5.00
0.50	7	Magnesium stearate	0.50
—	8	Alcohol (ethanol 95%)	6.07
—	9	Purified water	8.67

[a] 0.5 mg promethazine HCl/tablet added extra, considering the assay and LOD of the material (assay 97–101.5%, calculated on the dried basis LOD NMT 0.5%).

[b] LOD: NMT 4.5% when dried at 120°C for 4 hours.

Manufacturing Directions

1. Avoid overmixing lubricants, or hardness may be reduced.
2. Mix items 9 and 8 in a stainless steel container.
3. Dissolve items 4 and 5 by slow stirring with a stirrer until the mixture becomes clear.
4. Sift items 1 to 3 through a stainless steel 500 µm sieve in a sifter. Load into a mixer, and mix for 5 minutes at low speed.
5. Add a binding solution 5 to 7 g/min to the dry powders while mixing at low speed. After addition is over, scrape sides and blades. Mix an additional 2

minutes using a mixer and chopper at low speed. Scrape sides and blades.
6. Check for the end point of granulation. The end point is the point of granulation that consists of few or no lumps. If required, add purified water.
7. Dry the wet granules with the air circulation heater off to expel alcohol for 2 hours. Then, dry at 55°C for 14 hours. After 4 hours of drying, scrape the semidried granules to break the lumps for uniform drying.
8. Check the LOD. The limit is 1% to 1.5%. If required, dry further at 55°C for 2 hours.
9. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed. Collect the granules in stainless steel drums.
10. Load the granules into the blender. Sift the item 6 material through a 500 µm sieve using a sifter, and add it into the blender. Mix the blend for 3 minutes.
11. Sift item 7 through a 500 µm sieve. Add 1 to 2 g granules from step 10. Mix in a polythene bag for 1 minute. Add to the blender. Mix for 30 seconds.
12. Compress 0.80 g. Coat using one of the HPMC coatings. (See Appendix.)

PROMETHAZINE HYDROCHLORIDE TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Promethazine HCl with excess	26.00
103.75	2	Lactose monohydrate	103.75
50.00	3	Starch (maize)	52.50
1.50	4	Sodium metabisulfite (sodium disulfite)	1.50
5.00	5	Povidone (PVP K-30)	5.00
12.50	6	Starch (maize), dried	12.50
1.25	7	Magnesium stearate	1.25
—	8	Alcohol (ethanol 95%)	15.00
—	9	Purified water	21.67

PROMETHAZINE HYDROCHLORIDE TABLETS (10 MG), PHENERGAN

Each tablet of Phenergan contains 12.5, 25, or 50 mg of promethazine hydrochloride. The inactive ingredients present are lactose, magnesium stearate, and methyl cellulose. Each dosage strength also contains the following: 12.5 mg—FD&C Yellow No. 6 and saccharin sodium; 25 mg—saccharin sodium; and 50 mg—FD&C Red No. 40.

PROPRANOLOL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
120.00	1	Propranolol hydrochloride	120.00
4.00	2	Polyvinylpyrrolidone	4.00
2.00	3	Silicon dioxide	2.00
80.00	4	Lactose	80.00
2.00	5	Sodium stearyl fumarate	2.00
QS	6	Water QS	QS

Manufacturing Directions

1. Place propranolol hydrochloride and lactose are placed in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend sodium stearyl fumarate in a drum mixer.
4. Press the resulting mixture into tablets of 208.00 mg.
5. Coat these tablet cores with the following formulation: ethyl cellulose (Ethocel) 10.10 mg, polyvinylpyrrolidone (povidone) 5.50 mg, stearic acid 2.40 mg.
6. First dissolve Ethocel, povidone, and stearic acid in denatured alcohol (180 g). Spray the coating solution onto the tablet cores in a coating pan.

PROPRANOLOL HYDROCHLORIDE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Propranolol hydrochloride	10.00
490.00	2	Ludipress®	490.00
2.50	3	Magnesium stearate	2.50

Note: For 50 mg and 100 mg strengths, adjust with item 2.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force.
2. Compress 514 mg for 10 mg strength, 496 mg for 50 mg strength, and 505 mg for 100 mg strength, using 12 mm biplanar punches.

PROPRANOLOL HYDROCHLORIDE TABLETS (10 MG)

Propranolol HCl is available as 10, 20, 40, 60, and 80 mg tablets. The inactive ingredients contained in propranolol HCl tablets are lactose, magnesium stearate, microcrystalline cellulose, and stearic acid. In addition, propranolol HCl 10 mg and 80 mg tablets contain FD&C Yellow No. 6 and D&C Yellow No. 10; propranolol HCl 20 mg tablets contain FD&C Blue No. 1; propranolol HCl 40 mg tablets contain FD&C Blue No. 1, FD&C Yellow No. 6, and D&C Yellow No. 10; and propranolol HCl 60 mg tablets contain D&C Red No. 30.

PROPRANOLOL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (kg)
10.00	1	Propranolol hydrochloride	10.00
2.00	2	Maize starch	2.00
4.00	3	Lactose	4.00
0.20	4	Soluble starch	0.20
15.00	5	Purified water	15.00
3.00	6	Primojel®	3.00
9.00	7	Microcrystalline cellulose	9.00
0.50	8	Magnesium stearate	0.50

Manufacturing Directions

1. Pass items 1 to 3 through a FitzMill sieve 24228 at medium speed, and mix for 15 minutes.
2. Bring to boil 1.25 kg of purified water (item 5), and dissolve in it item 4. Add the remaining water and allow boiling for a few minutes, allowing the mixture to cool to room temperature.
3. Make a uniform mass of step 2 with step 1 solution, and pass it through a FitzMill sieve 24183, adding water if necessary.
4. Dry granules at 35°C for 14 hours. Pass the granules through a FitzMill sieve 24228 at low speed.
5. Pass items 6 to 8 through a FitzMill sieve 24228 and at medium speed.
6. Compress.
7. Coat in a pan at 25°C to 30°C under a flow of warm air using the Opaspray® coating. (See Appendix.) After coating, polish the film-coated tablet.

PROPRANOLOL HCL SUSTAINED-RELEASE PELLETS RELEASING TABLETS (MUPS-FORMULATION)

Formulation (for 500 g of tablets): Propranolol HCl/Kollicoat® SR 30D pellets, 250.0 g; microcrystalline cellulose Vivapur® 200, 250.0 g; magnesium stearate, 2.5 g.

Manufacturing Directions

1. Mix the ingredients together, pass through a 0.8 mm sieve, and compress into tablets with a force of about 15 kN at 400 mg.

PROPRANOLOL TABLETS (40 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Propranolol	40.00
108.00	2	Ludipress®	108.00
0.30	3	Magnesium stearate	0.30
0.40	4	Stearic acid	0.40

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high-compression force.
2. Compress into 150 mg tablets, using 8 mm biconvex punches.

PROTON PUMP INHIBITOR DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Lansoprazole or another equipotent PPI	10.00
175.00	2	Calcium acetate	175.00
175.00	3	Calcium glycerophosphate	175.00
250.00	4	Sodium bicarbonate	250.00
20.00	5	Polyethylene glycol	20.00
12.00	6	Croscarmellose sodium	12.00
3.00	7	Peppermint	3.00
1.00	8	Magnesium silicate	1.00
1.00	9	Magnesium stearate	1.00

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Lansoprazole or another equipotent PPI	10.00
175.00	2	Calcium lactate	175.00
175.00	3	Calcium glycerophosphate	175.00
250.00	4	Sodium bicarbonate	250.00
20.00	5	Polyethylene glycol	20.00
12.00	6	Croscarmellose sodium	12.00
3.00	7	Peppermint	3.00
1.00	8	Magnesium stearate	1.00
1.00	9	Magnesium silicate	1.00

PROTON PUMP INHIBITOR TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00 (or equipotent)	1	Proton pump inhibitor	10.00 (or equipotent)
175.00	2	Calcium lactate	175.00
250.00	3	Sodium bicarbonate	250.00
175.00	4	Calcium glycerophosphate	175.00
0.50	5	Phenylalanine (aspartame calcium)	0.50
12.00	6	Colloidal silicon dioxide	12.00
15.00	7	Cornstarch	15.00
12.00	8	Croscarmellose sodium	12.00
10.00	9	Dextrose	10.00
3.00	10	Peppermint	3.00
3.00	11	Maltodextrin	3.00
3.00	12	Mannitol	3.00
3.00	13	Pregelatinized starch	3.00

Manufacturing Directions

1. Compress.
2. May be used for 20 mg or equivalent quantity of the active without any change in other ingredients.

PSEUDOEPHEDRINE HYDROCHLORIDE FAST-DISINTEGRATING TABLETS

1. To the vortex of a rapidly stirred vessel containing 345 g of deionized water, add 30 g of croscarmellose sodium.
2. Mix this slurry for 10 minutes.
3. Concurrently, place 300 g of pseudoephedrine hydrochloride and 300 g of microcrystalline cellulose (Avicel™ PH-101) in the bowl of a mixer.
4. Stir this mixture for 10 minutes.
5. At the conclusion of the mixing time, slowly add the slurry to the contents of the mixing bowl, forming a granulation. Place in trays and dry in a 65°C oven for 3 hours.
6. Pass the dried granulation through a 16 mesh screen (1190 μm).
7. Place the dried granulation in a twin-shell blender, and add 300 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of a calcium, sodium alginate complex) and 300 g of microcrystalline cellulose (Avicel™ PH-102).
8. Thoroughly blend for 10 minutes, after which add 10.05 g of magnesium stearate and mix for an additional 5 minutes.
9. Prior to being added to the blender, pass the magnesium stearate through a 30 mesh screen.
10. Compress the resulting blend into tablets using 6.35 mm (0.25 in.) round standard concave tooling to give average weight of 0.1299 g and an average thickness of 4.864 mm (0.1915 in.).
11. The hardness of these tablets should average 1.38 kPa.
12. Friability will be measured at 0.077% after 4 minutes.
13. The average disintegration time should be 15 seconds in 10 mL of deionized water, forming a suspension with minimal shaking.

PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Pseudoephedrine HCl[a]	63.00
120.20	2	Lactose monohydrate	120.20
25.00	3	Maize starch	25.00
1.00	4	Povidone (PVP K-30)	1.00
4.00	5	Povidone (PVP K-30)	4.00
1.80	6	Magnesium stearate	1.80
—	7	Alcohol (ethanol, 95%)	29.00

[a] Pseudoephedrine HCl 3.0 mg/tab can be added in excess to compensate for moisture and handling loss.

Manufacturing Directions

Note: Avoid overmixing of lubricants; otherwise, hardness is reduced.

1. Dissolve item 5 in item 7 while mixing at slow speed using a stirrer.
2. Sift items 1 to 4 through a 500 μm sieve.
3. Load into mixer, and mix for 5 minutes at low speed.
4. Add binding solution to the dry powders while mixing at low speed for 2 minutes.
5. After addition is complete, mix further for 1 minute using mixer and chopper at low speed.
6. Scrape sides and blade.
7. Check for the end point of granulation, which is when the granulation consists of wet granules with few or no lumps.
8. If required, add ethanol 95% to achieve desired granules.
9. Record extra quantity of ethanol 95% used.
10. Dry the wet mass at 55°C for 7 hours.
11. After 4 hours of drying, scrape the semidried granules to break the lumps to promote uniform drying.
12. Check the moisture content (limit: 1.5–2.5%).
13. Sift the dried granules through a 1.25 mm sieve using a granulator at medium speed.
14. Collect in stainless steel drums.

15. Load granules into the drum blender.
16. Sift item 6 through a stainless steel 250 μm sieve in sifter.
17. Add 8 to 12 g granules in mixer to sieved item 6.
18. Mix manually for 1 minute.
19. Add to drum blender, and blend for 1 minute.
20. Compress into 215 mg tablets, using 8 mm round punches.

PSEUDOEPHEDRINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	(+) Pseudoephedrine hydrochloride	60.00
95.00	2	Dicalcium phosphate (Di-Tab)	95.00
5.00	3	Kollidon® 30	5.00
—	4	Water	QS
20.00	5	PEG-6000 (powder)	20.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate dicalcium phosphate with solution of items 3 and 4, dry, pass through a 0.8 mm sieve, and mix with item 1.
2. Add items 5 and 6, and press with low-compression force.
3. Compress into 192 mg tablets, using 8 mm biplanar punches.

PSYLLIUM AND DOCUSATE SODIUM TABLETS

Formulation: Psyllium, 71.0%; ethyl cellulose, 4.8%; isopropyl alcohol QS; microcrystalline cellulose, 16.7%; PVP crosslinked, 1.9%; carnauba wax, 2.3%; docusate sodium, 3.3%.

Manufacturing Directions

1. Soak ethyl cellulose in isopropyl alcohol overnight.
2. Granulate psyllium with isopropyl/ethyl cellulose mixture in mixer.
3. Dry at 49°C for 3 hours.
4. Mill through 12 mesh screen.
5. Mix in a mixer the following: psyllium, microcrystalline cellulose, and carnauba wax.
6. Compress the tablet per granulation specifications using a tableting press.
7. Coat the core tablets.

Methyl cellulose, polycarbophil, calcium polycarbophil, bran, malt soup extract, karaya, guar gum, or mixtures of these can be substituted for the psyllium. The amounts of psyllium and/or dioctyl sulfosuccinate can be varied. Dioctyl calcium sulfosuccinate or dioctyl potassium sulfosuccinate can be substituted for the dioctyl sodium sulfosuccinate, or two or three of these can be combined.

PSYLLIUM HUSK TABLETS

Manufacturing Directions

1. Stir raw, unmilled psyllium seed husk (2 g) with 0.2 N sodium hydroxide (400 mL) containing sodium borohydride (400 mg) in a nitrogen atmosphere at ambient temperature for 90 minutes.
2. The pH of the solution should be from 10 to 11.
3. Pass the solution through a pasteurizer at a temperature of 100°C for a period of 50 seconds.
4. Once pasteurized, centrifuge the mixture for 20 minutes at $23{,}500 \times g$.
5. Decant the supernatant from an insoluble fraction that settles out in the centrifuge bottle.
6. Mix the insoluble fraction with fresh sodium hydroxide/sodium borohydride solution (100 mL) and recentrifuge for 15 minutes to increase yield of the soluble fraction.
7. Adjust the pH of the supernatant to 5.5 by the addition of acetic acid at ambient temperature with stirring, forming a gel.
8. Desiccate the gel with isopropanol added with high-shear mixing.
9. Decant the isopropanol solution from the gel.
10. The solids content of the gel should be 30%.
11. Pass the gel material through an extruder and extrude into individual particles with an average particle size of 500 μm.
12. Introduce the extruded particles into a fluidized-bed dryer fitted with a cyclonic airflow screen, such as a Conidur screen.
13. Maintain the air temperature at 80°C.
14. Keep the gel temperature below 70°C throughout the drying process.
15. Dry the particles to a powder, with 90% of the water being removed.
16. The yield of the gel-forming polysaccharide should be 85%.
17. Manufacture chewable tablets, total weight 2.5 g, by dry blending step 8 with sorbitol for 10 minutes, each component having an average particle size of about 500 μm.
18. Add the premix, if desired, and blend the mixture for an additional 10 minutes.
19. Add magnesium stearate, and blend the composition for another 5 minutes.
20. Directly compress the mixture into tablets using pressures between 2000 and 4000 psi.
21. The final compositions should comprise the following components by weight: gel-forming polysaccharide,

50.0%; sorbitol Neosorb P20, 48.16%; magnesium stearate, 0.5%; flavorant, 0.4%; colorant, 0.14%; citric acid, 0.8%.

22. Optionally, the coating can be applied directly to a chewable tablet containing the gel-forming polysaccharide.
23. Additionally, it may be desired to include a flavorant within the coating composition: ethanol, 94%; polyethylene glycol, 5%; flavorant, 1%.

PYRAZINAMIDE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Pyrazinamide	500.00
134.50	2	Ludipress®	134.50
12.00	3	Kollidon® CL	12.00
3.50	4	Aerosil® 200	3.50

Manufacturing Directions

1. Mix all components, sieve through a 0.8 mm screen, and press with medium-compression force.
2. Compress into 652 mg tablets, using 12 mm biplanar punches.

PYRAZINAMIDE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Pyrazinamide	500.00
50.00	2	Starch (maize)	50.00
20.00	3	Kollidon® 30	20.00
—	4	Alcohol, ca	200 mL
5.00	5	Kollidon® CL	5.00
6.00	6	Magnesium stearate	6.00

Manufacturing Directions

1. Granulate mixture items 1 and 2 with a solution of items 3 and 4. Pass through a 0.8 mm sieve, mix with items 5 and 6, and press with low-compression force.
2. Compress into 605 mg tablets, using 12 mm biplanar punches.
3. The quantity of items 5 can be increased to 10 mg if there is a problem in compressing tablets.

PYRAZINAMIDE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Pyrazinamide	500.00
125.00	2	Mannitol	125.00
—	3	Water, purified	50.00 mL
25.00	4	Starch (maize)	25.00
QS	5	Water, purified	150 mL
10.00	6	Talc	10.00
6.00	7	Magnesium stearate	6.00

Manufacturing Directions

Note: Carry out all operations subsequent to drying at a relative humidity below 50% and temperature below 26°C.

1. Granulation
   a. Pass the pyrazinamide and mannitol through a 1.2 mm aperture stainless steel screen on a sieve shaker, transfer them to a suitable mass mixer, and mix for 5 minutes.
   b. Add the starch to the water (item 3) and mix until a smooth slurry, free from lumps, is formed.
   c. Heat the water (item 5) to boiling. Reduce the heat, then, while mixing, add the slurry from step 1b. Continue mixing well, until a smooth translucent paste is formed. Allow this paste to cool to 50°C before using it in step 1d.
   d. Add one-half of the starch paste from step 1c to the blended powders in the mixer, and mix for 1 minute. Stop mixing, and scrape the blades and sides of the mixer. Add the second half of the starch paste and mix for another 1 minute. Stop mixing, scrape the blades and sides of the mixer, and examine the mass.
   e. If necessary, add more water at 50°C in small quantities, mixing for 1 minute after each addition, until a good, wet, holding mass is formed. Record extra water used. *Note:* Do not overwet or overmix the mass.
   f. Pass the wet mass through a 4.76 mm aperture stainless steel screen by hand, spread on paper-lined trays, and dry in a hot air oven at 50°C, turning the granules every 20 minutes, to an LOD of 1% to 1.5% (3 hours at 60°C under maximum vacuum).
2. Lubrication
   a. Pass the granules through a 1.2 mm aperture stainless steel screen on a sieve shaker, and transfer the fines to a blender.
   b. Pass the coarse granules through an 840 μm aperture stainless steel screen on an oscillating

granulator, and then transfer the granules to the blender.
   c. Screen the talc and sodium starch glycolate through a 595 μm aperture stainless steel screen on a sieve shaker, and add the mixture to the blender. Blend it for 15 minutes.
   d. Screen the magnesium stearate through a 595 μm aperture stainless steel screen on a sieve shaker, and add to the blender. Blend for 2 minutes only.
   e. Discharge into polyethylene-lined drums, and then seal and weigh.
3. Compression: Compress using 12.5 mm round, concave bisected punches; disintegration time is not more than 15 minutes in water.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Pyridoxine hydrochloride	40.00
150.00	2	Lactose monohydrate	150.00
150.00	3	Avicel™ PH101	150.00
15.00	4	Kollidon® VA 64	15.00
10.00	5	Kollidon® CL	10.00
1.00	6	Magnesium stearate	1.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high-compression force.
2. Compress into 361 mg tablets, using 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40.00	1	Pyridoxine hydrochloride	40.00
300.00	2	Cornstarch	300.00
15.00	3	Kollidon® 30	15.00
80.00	4	Water + isopropanol	80.00
1.00	5	Magnesium stearate	1.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, dry, pass through a 0.8 mm sieve, mix with items 5 and 6, and press with high-compression force.
2. Compress into 354 mg tablets, using 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Pyridoxine hydrochloride	100.00
200.00	2	Tablettose®	200.00
10.00	3	Kollidon® VA 64	10.00
3.00	4	Kollidon® CL	3.00
1.00	5	Magnesium stearate	1.00
1.00	6	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 363 mg tablets, using 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Pyridoxine hydrochloride	100.00
150.00	2	Lactose monohydrate	150.00
83.00	3	Avicel™ PH101	83.00
10.00	4	Kollidon® VA 64	10.00
3.00	5	Kollidon® CL	3.00
1.00	6	Magnesium stearate	1.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 360 mg tablets, using 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Pyridoxine hydrochloride	250.00
100.00	2	Avicel™ PH101	100.00
12.00	3	Kollidon® VA 64	12.00
5.00	4	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 361 mg tablets, using 12 mm biplanar punches.

PYRIDOSTIGMINE BROMIDE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Pyridostigmine bromide	10.00
96.00	2	Starch (maize)	96.00
8.50	3	Silicic acid (Aerosil® 200)	8.50
1.50	4	Prejel PA5	1.50
30.00	5	Lactose powder anhydrous	30.00
3.70	6	Talc	3.70
0.23	7	Magnesium stearate	0.23
QS	8	Water, purified, ca	39.70 mL

Manufacturing Directions

1. Mix 5% of item 2 and equal amounts of item 8 in a suitable vessel, at boiling. Mix, and allow the paste to cool to 40°C.
2. Mix item 1 into the paste in step 1, in portions, and then add items 4 and 3, avoiding large lumps; mix to homogeneous mix.
3. Add to item 5 (passed through a sieve) the balance of item 8 (at 40°C), and item 2, and mix to obtain a good mass; add more item 8 if necessary.
4. Pass through a 10 mm screen in a granulator.
5. Dry the granules at 50°C until the relative humidity over the granules is 30% to 40%.
6. Crush granules in an oscillating granulator with 1 mm perforation plate.
7. Blend the granules with items 6 and 7, and pass through a 1 mm sieve.
8. Blend for 10 minutes.
9. Compress to 150 mg weight.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Pyridoxine hydrochloride	300.00
100.00	2	Lactose monohydrate D 20	100.00
20.00	3	Kollidon® 30	20.00
QS	4	Isopropanol + water (1+1)	60.00
10.00	5	Kollidon® CL	10.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 to 6, dry, and sieve through a 0.8 mm screen.
2. Press with medium-compression force.
3. Compress into 440 mg tablets, using 12 mm biplanar punches.

PYRILAMINE TANNATE AND PHENYLEPHRINE TANNATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Pyrilamine tannate	60.00
25.00	2	Phenylephrine tannate	28.75[a]
94.00	3	Starch	94.00
150.00	4	Methyl cellulose USP 1500 cps	150.00
32.00	5	Polygalactouronic acid	32.00
97.00	6	Calcium phosphate dihydrate	97.00
2.60	7	Magnesium stearate	2.60

[a] Manufacturing excess.

QUETIAPINE FUMARATE TABLETS (25 MG/100 MG/200 MG), SEROQUEL

Seroquel is supplied for oral administration as 25 mg (peach), 100 mg (yellow), and 200 mg (white) tablets. The inactive ingredients are povidone, dibasic dicalcium phosphate dihydrate, microcrystalline cellulose, sodium starch glycolate, lactose monohydrate, magnesium stearate, hydroxypropyl methylcellulose, polyethylene glycol, and titanium dioxide. The 25 mg tablets contain red ferric oxide and yellow ferric oxide, and the 100 mg tablets contain only yellow ferric oxide.

QUINAPRIL HYDROCHLORIDE TABLETS (5 MG/10 MG/20 MG/40 MG), ACCUPRIL

Accupril tablets contain 5, 10, 20, or 40 mg of quinapril for oral administration. Each tablet also contains candelilla wax, crospovidone, gelatin, lactose, magnesium carbonate, magnesium stearate, synthetic red iron oxide, and titanium dioxide.

QUINAPRIL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Quinapril; use quinapril hydrochloride	22.00
108.00	2	Lactose monohydrate	108.00
55.00	3	Magnesium carbonate	55.00
10.50	4	Crospovidone	10.50
4.00	5	Povidone K-30	4.00
0.50	6	Magnesium stearate	0.50
QS	7	Purified water	QS

Manufacturing Directions

1. Sift quinapril hydrochloride, lactose monohydrate, magnesium carbonate, and crospovidone through a 0.9 mm sieve.
2. Load sifted powder from step 1 to a mixer granulator and mix for 5 minutes.
3. Dissolve povidone K-30 in purified water under slow stirring until the solution becomes clear.
4. Add the binding solution from step 3 to step 2, and mix for a few minutes until the proper granules are formed.
5. Unload the granules, and dry at 55°C in an oven to get the desired LOD of 2.5%.
6. Grind the dried granules to get granules of the desired particle size of 16 mesh.
7. Add crospovidone and magnesium stearate to ground granules in a blender, and blend for 3 minutes.
8. Compress 200 mg of the lubricated granules into tablets (12 mm).
9. Use appropriate coating materials (HPMC). (See Appendix.)

QUININE SULFATE TABLETS (300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Quinine sulfate	300.00
20.00	2	Starch (maize)	20.00
25.00	3	Lactose monohydrate	25.00
5.00	4	Sodium starch glycolate	5.00
0.80	5	Methylparaben	0.80
0.10	6	Propylparaben	0.10
2.00	7	Gelatin	2.00
20.00	8	Starch (maize)	20.00
3.00	9	Talc	3.00
1.50	10	Aerosil® 200	1.50
2.00	11	Magnesium stearate	2.00
—	12	Water, purified	QS

Manufacturing Directions

1. Sift items 1 to 4 through a 250 µm sieve into a suitable mixing vessel.
2. In a separate vessel, take the appropriate quantity of item 12, and heat it to a boil. Add and dissolve items 5 and 6. Cool to 50°C, and add items 7 and 8. Then, mix to form a 30% starch paste.
3. Add the paste from step 2 into step 1, and mix the paste to form a suitable mass for granulation.
4. Pass the wet mass through a 2.38 mm sieve onto paper-lined trays; dry at 60°C overnight.
5. Pass the dried granules through an 18 mesh into a blending vessel. Sift items 9 to 11 through a 250 µm sieve, and add to step 5, and blend for 2 minutes. Compress into 375 mg tablets, using 9.5 mm punches.
6. Coat the tablets using HPMC and methylene chloride. (See Appendix.)

QUINOLONE ANTIBIOTIC TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Quinolone antibiotic[a]	100.00
23.50	2	Microcrystalline cellulose	23.50
15.00	3	Starch (maize)	15.00
6.50	4	L-Hydroxypropyl cellulose	6.50
3.50	5	Magnesium stearate	3.50
1.50	6	Colloidal anhydrous silica (Aerosil® 200)	1.50

[a] Applicable to most quinolone antibiotics.

Manufacturing Directions

1. The manufacturing process described is for the 100 mg tablet. Adjust the weights of all components based on the quantity used. When calculating, factor in for salt form, moisture, and activity.
2. Sift items 1 to 4.
3. Mix these (use two-thirds of item 4) at this stage in a blender. Add screened item 6, and mix at a slow speed.
4. Run the mixture through a compacting mill, and collect graded granules in a blender.
5. Add screened item 6 and the balance of item 4, and blend. Add the screened magnesium stearate in the rotating-shell blender. Mix at 6 rpm for 5 minutes. The final mixture is obtained.
6. Compress into 8 mm tablets or 10 mm tablets (for 200 mg tablets).
7. Coat using an HPMC coating. (See Appendix.)

RABEPRAZOLE SODIUM TABLETS (20 MG) ACIPHEX™

The active ingredient in Aciphex™ delayed-release tablets is rabeprazole sodium. Aciphex is available for oral administration as delayed-release, enteric-coated tablets containing 20 mg of rabeprazole sodium. The inactive ingredients are mannitol, hydroxypropyl cellulose, magnesium oxide, low-substituted hydroxypropyl cellulose, magnesium stearate, ethyl cellulose, hydroxypropyl methylcellulose phthalate, diacetylated monoglycerides, talc, titanium dioxide, carnauba wax, and ferric oxide (yellow) as a coloring agent.

RABEPRAZOLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Rabeprazole	20.00
50.00	2	Precipitated calcium carbonate	50.00
40.00	3	Starch (maize)	40.00
73.40	4	Lactose monohydrate	73.40
6.00	5	Hydroxypropyl cellulose	6.00
2.00	6	Magnesium stearate	2.00
—	7	Water, purified	QS

Manufacturing Directions

1. Mix R(+) rabeprazole, precipitated calcium carbonate, cornstarch, lactose, and hydroxypropyl cellulose together.
2. Add water, and knead the mixture. Then dry in vacuum at 40°C for 16 hours.
3. Pass the granules through a 16 mesh sieve to give granules.
4. Add item 6, and blend.
5. Compress.

RALOXIFENE TABLETS (60 MG), EVISTA

Evista is supplied in a tablet dosage form for oral administration. Each Evista tablet contains 60 mg of raloxifene HCl, which is the molar equivalent of 55.71 mg of free base. Inactive ingredients include anhydrous lactose, carnauba wax, crospovidone, FD&C Blue No. 2 Aluminum Lake, hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, modified pharmaceutical glaze, polyethylene glycol, polysorbate 80, povidone, propylene glycol, and titanium dioxide.

RALOXIFENE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Raloxifene HCl	60.00
156.00	2	Lactose anhydrous	156.00
7.20	3	Polyvinylpyrrolidone	7.20
7.20	4	Polysorbate 80	7.20
7.20	5	Cross-linked polyvinylpyrrolidone	7.20
2.40	6	Magnesium stearate	2.40

Manufacturing Directions

1. Granulate the mixture of raloxifene HCl, lactose anhydrous, and cross-linked polyvinylpyrrolidone with an aqueous solution of polyvinylpyrrolidone and polysorbate 80.
2. Dry the granules, and reduce to a suitable size.
3. Mix and blend magnesium stearate.
4. Compress into 240 mg tablets.

RANITIDINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Ranitidine; use ranitidine HCl	88.88
65.00	2	Microcrystalline cellulose, NF	65.00
1.12	3	Magnesium stearate, NF	1.12

Manufacturing Directions

1. Pass ranitidine and microcrystalline cellulose through a 595 µm screen, and transfer to a suitable mixer.
2. Mix for 10 minutes.
3. Screen magnesium stearate through a 400 µm screen, and add to the blender.
4. Blend for 2 minutes.
5. Compress using slightly convex round punches at hardness 8 ppi and disintegration time of not more than 15 minutes in water.
6. Coat using a Methocel-Ethocel coating solution (see Appendix).

RANITIDINE HYDROCHLORIDE TABLETS (150 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Ranitidine; use ranitidine hydrochloride	167.68
129.75	2	Microcrystalline cellulose	129.75
9.00	3	Hydroxypropyl methylcellulose 2910	9.00

Manufacturing Directions

1. Granulation: Pass ranitidine and microcrystalline cellulose through a 595 µm aperture screen, transfer to a suitable mixer, and mix for 10 minutes.
2. Lubrication
   a. Screen magnesium stearate through a 400 µm aperture screen and add to the blender. Blend for 2 minutes.
   b. Discharge the granule into polyethylene-lined drums. Seal the drums, and weigh for yield.
3. Compression: Compress using slightly convex round punches. The weight of 10 tablets should be about 2.07 g, with not more than 3% variation. Disintegration time is not more than 15 minutes in water.
4. Coating: Use opaque Methocel/Ethocel coating. (See Appendix.)

RANITIDINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Ranitidine	150.00
147.00	2	Ludipress®	147.00
3.00	3	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm screen, and press with low-compression force.
2. Compress into 305 mg tablets, using 8 mm biconvex punches.
3. If the flowability of the tableting mixture is not sufficient, add about 1% Aerosil® 200. For 300 mg strength, use proportion weight, and increase fill weight; the use of 1% Aerosil® 200 is required.

RANITIDINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
167.39	1	Ranitidine HCl USP (Orchev Pharma)	167.39
78.28	2	Microcrystalline cellulose NF (Avicel™ PH-102, FMC)	78.28
62.00	3	Pregelatinized starch NF (Starch 1500®, Colorcon)	62.00
1.55	4	Fumed silica NF (Aerosil® 200, Degussa AG)	1.55
0.78	5	Magnesium stearate NF (Peter Greven)	0.78

Manufacturing Directions

1. Blend all materials, with the exception of magnesium stearate, for 10 minutes in a blender.
2. Add magnesium stearate and blend for an additional 2 minutes.
3. Compress tablets at 310 mg.

RANITIDINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Ranitidine; use Ranitidine HCl[a]	85.00
95.00	2	Microcrystalline cellulose (Avicel™ PH102)	95.00
7.00	3	Croscarmellose sodium (Ac-Di-Sol)	7.00
6.60	4	Microcrystalline cellulose (Avicel™ PH102)	6.60
1.40	5	Magnesium stearate	1.40

[a] Ranitidine HCl (1.5%) is added to compensate LOD and process loss.

Manufacturing Directions

1. Process the product in an area where the relative humidity is 40% to 45%, and temperature does not exceed 25°C.
2. Store the bulk tablets in polyethylene-lined stainless steel containers at a controlled relative humidity of 45% to 50% and temperature not exceeding 25°C.
3. Pass items 2, 3, and 1 through a sifter using a 900 µm sieve.
4. Load into a blender, and mix for 3 minutes.

5. Manually mix items 4 and 5 in a polyethylene bag for 1 minute.
6. Pass through a sifter using a 500 μm sieve.
7. Collect in a polyethylene bag.
8. Add to blender, and blend for 1 minute.
9. Check temperature and humidity before start of slugging (at a temperature not exceeding 25°C and a relative humidity of 40% to 45%).
10. Slug 240.0 g of mixed powder in a rotary tableting machine.
11. Grind the slugs in a granulator using a 3.0 mm sieve followed by a 1.00 mm sieve.
12. Compress 195 mg using oblong biconvex punches.
13. Check temperature and humidity before start of compression (limit: temperature not exceeding 25°C and relative humidity of 40% to 45%).
14. Coat using a hydroalcoholic HPMC coating.

RANITIDINE TABLETS (75 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Ranitidine; use ranitidine HCl[a]	85.00
95.00	2	Microcrystalline cellulose (Avicel™ PH 102)	95.00
7.00	3	Croscarmellose sodium (Ac-Di-Sol)	7.00
6.60	4	Microcrystalline cellulose (Avicel™ PH 102)	6.60
1.40	5	Magnesium stearate	1.40

[a] Ranitidine HCl 1.5% is added as an extra to compensate LOD and process loss.

Manufacturing Directions

1. Process the product in an area where the RH is between 40% and 45%, and the temperature does not exceed 25°C. Store the bulk tablets in polythene-lined stainless steel containers at a controlled RH 45% to 50% and a temperature not exceeding 25°C.
2. Pass items 2, 3, and 1 through a sifter using a 900 μm sieve.
3. Load into blender, and mix for 3 minutes. Mix items 4 and 5 in a polythene bag manually for 1 minute. Pass through a sifter using a 500 μm sieve.
4. Collect in a polythene bag. Add to the blender, and blend for 1 minute.
5. Check temperature and humidity before it starts to get sluggish. (Temperature not exceeding 25°C, RH 40–45%.)
6. Slug 240.0 g of mixed powder in a rotary tableting machine. Grind the slugs in the granulator, using a 3 mm sieve followed by a 1 mm sieve.
7. Compress into 195 mg tablets, using oblong biconvex punches. Check the temperature and humidity before starting the compression. The limitation is that the temperature should not exceed 25°C, and the RH should be 40% to 45%.
8. Coat using a hydroalcoholic HPMC coating.

RANITIDINE TABLETS (300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Ranitidine; use as ranitidine HCl[a]	340.00
110.00	2	Microcrystalline cellulose (Avicel™ PH 102)	110.00
10.00	3	Croscarmellose sodium (Ac-Di-Sol)	10.00
16.00	4	Microcrystalline cellulose (Avicel™ PH 102)	16.00
4.00	5	Magnesium stearate	4.00

[a] Anhydrous; adjust for moisture.

Manufacturing Directions

Precautions: Process the product in an area where the relative humidity is between 40% and 45%, and the temperature should not exceed 25°C. Store the bulk tablets in polythene-lined stainless steel containers at a controlled relative humidity of 45% to 50% and at temperatures not exceeding 25°C.

1. Dry powder sieving and mixing: Pass items 2, 3, and 1 through a sifter, using a 900 μm sieve. Load into the blender, and mix for 3 minutes.
2. Lubrication
   a. Mix manually items 4 and 5 in a polythene bag for 1 minute. Pass through a sifter using a 500 μm sieve. Collect in a polythene bag. Add to the blender (step 1), and blend for 1 minute.
   b. Unload in stainless steel drums. Check and record the weight of powder mix.
3. Slugging
   a. Check the temperature and humidity before the start of slugging. Limits: temperature not exceeding 25°C; relative humidity of 40% to 45%.
   b. Slug 240.0 g of the mixed powder in a rotary tableting machine using the following parameters. Keep the rest of the quantity in a stainless steel drum.

4. Grinding: Grind the slugs in a granulator using a 3 mm sieve followed by a 1 mm sieve.
5. Mixing: Ground granules, 240 g, from step 2, and 240 g of the lubricated granules from step 3a. Load into blender and mix for 1 to 2 minutes.
6. Compression: Check the temperature and humidity before starting compression. Limits: temperature not exceeding 25°C; relative humidity of 40% to 45%. Compress the granules using a rotary tableting machine. Compress into 480 mg tablets, using 015.5 mm×7 mm punches.

RANITIDINE TABLETS (150 MG), ZANTAC

Each Zantac 150 tablet for oral administration contains 168 mg of ranitidine HCl equivalent to 150 mg of ranitidine. Each tablet also contains the inactive ingredients FD&C Yellow No. 6 Aluminum Lake, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, titanium dioxide, triacetin, and yellow iron oxide.

Each Zantac 300 tablet for oral administration contains 336 mg of ranitidine HCl equivalent to 300 mg of ranitidine. Each tablet also contains the inactive ingredients croscarmellose sodium, D&C Yellow No. 10 Aluminum Lake, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, titanium dioxide, and triacetin.

Zantac 150 EFFERdose tablets and Zantac 150 EFFERdose granules for oral administration are effervescent formulations of ranitidine that must be dissolved in water before use. Each individual tablet or the contents of a packet contains 168 mg of ranitidine HCl equivalent to 150 mg of ranitidine and the following inactive ingredients: aspartame, monosodium citrate anhydrous, povidone, and sodium bicarbonate. Each tablet also contains sodium benzoate. The total sodium content of each tablet is 183.12 mg (7.96 mEq) per 150 mg of ranitidine, and the total sodium content of each packet of granules is 173.54 mg (7.55 mEq) per 150 mg of ranitidine.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
3.00	1	Riboflavin	3.00
195.00	2	Ludipress®	195.00
2.00	3	Magnesium stearate	2.00
1.00	4	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with very low-compression force (4 kN).
2. Compress into 202 mg tablets, using 8 mm biplanar punches.
3. This is a very low active ingredient formulation (3 mg).
4. If content uniformity is a problem, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Riboflavin	10.00
75.00	2	Lactose monohydrate	75.00
20.00	3	Cornstarch	20.00
15.00	4	Avicel™ PH101	15.00
5.00	5	Kollidon® 30	5.00
25.00	6	Water	25.00
0.80	7	Aerosil® 200	0.80
2.50	8	Talc	2.50
1.70	9	Hydrogenated castor oil	1.70

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of items 5 and 6, dry, pass through a 0.8 mm sieve, mix with items 7 to 9, and press with low compressive force.
2. Compress into 134 mg tablets, using 8 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
75.00	1	Riboflavin	75.00
375.00	2	Sorbitol (crystalline)	375.00
23.00	3	Kollidon® VA 64	23.00
4.00	4	Magnesium stearate	4.00
12.00	5	Aerosil® 200	12.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress into 493 mg tablets, using 12 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Riboflavin	100.00
250.00	2	Sorbitol (crystalline)	250.00
19.00	3	Kollidon® VA 64	19.00
5.00	4	Magnesium stearate	5.00
10.00	5	Aerosil® 200	10.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 384 mg tablets, using 12 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Riboflavin, with excess	156.00
150.00	2	Ludipress®	150.00
4.00	3	Magnesium stearate	4.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 308 mg tablets, using 8 mm biplanar punches.

RIFAMPICIN, ISONIAZID, ETHAMBUTOL, AND PYRIDOXINE TABLETS (300 MG/200 MG/25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
—	1	Alcohol SD 3A, 200 proof	150.00 mL
3.00	2	Alcohol cetostearyl	3.00
300.00	3	Rifampicin powder	300.00
12.00	4	Hydroxypropyl methylcellulose 2910, 50 cps	2.00
—	5	Alcohol SD 3A, 200 proof	QS
200.00	6	Isoniazid isonicotinoyl hydrazine, 10% excess	220.00
25.00	7	Pyridoxine hydrochloride	25.00
400.00	8	Ethambutol hydrochloride	400.00
20.00	9	Povidone K 29–32	20.00
—	10	Water, purified	50.00 mL
—	11	Water, purified	QS
20.00	12	Talc	20.00
40.00	13	Sodium starch glycolate	40.00
10.00	14	Magnesium stearate	10.00

Manufacturing Directions

Note: Rifampicin and ethambutol hydrochloride are expensive raw materials; therefore, handle with care. The product should be manufactured in a separate, closed area, and all manufacturing equipment should be covered to minimize dust contamination.

1. Granulation I
   a. Pour the alcohol (item 1) into a container, and while stirring, gradually add the alcohol cetostearyl. Continue mixing until it all dissolves.
   b. Place the rifampicin into the mixer (preferably a planetary mixer), followed by the hydroxypropyl methylcellulose. Mix together for 5 minutes.
   c. While mixing the blended powders from step 1b, pour in the alcoholic solution from this step. (Do not add too slowly, or excessive evaporation will occur.) When all the solution is added, continue mixing for 1 minute.
   d. Stop the mixer, scrape the blades, walls, and bottom of the mixer, and then restart the mixer.
   e. While mixing, add extra alcohol (item 5) in portions, mixing for 30 seconds after each addition. Continue adding alcohol and mixing until the mass changes to a uniform dark reddish-brown color that exhibits good adhesion when squeezed and contains no dry powder. Stop mixing.
   f. Quickly scrape the blades, walls, and bottom of the mixer. Then, pass the mass through a 4.76 mm aperture screen, spread on lined trays, and

dry in a hot air oven at 50°C to an LOD (60°C for 3 hours under vacuum) of not more than 2.5%.
   g. Sift the dried granules through a 1.2 mm screen on a sieve shaker.
   h. Pass the coarse granules from step 1 g through a 1.7 mm screen.
   i. Transfer the siftings from step 1 g and the granules from step 1 h to a suitable blender.
2. Granulation II
   a. Pass successively, through a 1.2 mm aperture screen on a sieve shaker, the isoniazid followed by the pyridoxine hydrochloride. Load the screened powders into a suitable mixer, and mix for 5 minutes.
   b. Pass the ethambutol hydrochloride through a 1.2 mm aperture screen, and transfer to the mixer. Blend all the powders together for 5 minutes.
   c. Add the water (item 10) to a stainless steel container, and add, while mixing, the povidone. Continue mixing until it all dissolves.
   d. While mixing the powders from step 2b, add the aqueous solution from step 2c in a slow stream. When all the solution is added, continue mixing for 1 minute.
   e. Stop the mixer, and scrape the blades, wall, and bottom of the mixer. Start mixing again.
   f. Gradually add extra water until granulation is achieved with the formation of balls.
   g. Pass the mass through a 4.76 mm aperture screen, and spread on lined trays. Dry in a hot air oven at 50°C for 4 hours, pass the granules through a 2.38 mm aperture screen, return to the oven, and continue drying to an LOD of less than 1% (60°C for 3 hours under vacuum).
   h. Sieve the dried granules through an 840 μm aperture screen on a suitable sieve shaker.
   i. Pass the coarse granules from step 2h through an 840 μm aperture screen.
   j. Transfer the fines from step 2h and the granules from step 2i to the blender (see step 1i).
3. Lubrication
   a. Pass the talc and sodium starch glycolate through a 595 μm aperture screen on a sieve shaker, and then transfer to the blender with Granulations I and II.
   b. Blend all the items together for 15 minutes, and then, stop the blender.
   c. Pass the magnesium stearate through a 595 μm aperture screen on a sieve shaker, and then, transfer to the blender.
   d. Blend the batch for 3 to 4 minutes, and then, stop the blender.
   e. Discharge the contents of the blender into polyethylene-lined drums, and weigh.
4. Compression: Compress into 1.05 g tablets, using ovaloid punches (18.6×8.7 mm), with a disintegration time of not more than 20 minutes in water and a thickness of 8.4 to 8.8 mm.
5. Coating: Apply an organic Methocel coating. (See Appendix.)

RIFAMPICIN TABLETS (300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
—	1	Alcohol SD 3A, 200 proof	150.00 mL
3.00	2	Alcohol cetostearyl	3.00
300.00	3	Rifampicin powder	300.00
12.00	4	Hydroxypropyl methylcellulose 2910 50 cps	12.00
—	5	Alcohol SD 3A, 200 proof	QS
8.00	6	Talc	8.00
16.00	7	Sodium starch glycolate powder	16.00
7.50	8	Magnesium stearate	7.50

Manufacturing Directions

Caution: (1) Rifampicin is an expensive raw material; handle with care. (2) The product should be manufactured in a separate closed area, and all manufacturing equipment should be covered so as to minimize dust contamination. (3) After use, wash the manufacturing area and equipment thoroughly with water and detergent. Personnel should take a cleansing shower after exposure during manufacturing.

1. Granulation
   a. Do not overfill the mixer, because this retards penetration of the alcohol to the bottom of the bowl, leading to excessive evaporation and inadequate massing.
   b. Pour the alcohol (item 1) into a container, and while stirring gradually, add the alcohol cetostearyl. Continue mixing until all has dissolved.
   c. Place the rifampicin into the mixer (preferably a planetary mixer), followed by the hydroxypropyl methylcellulose. Mix together for 5 minutes.
   d. While mixing the blended powders from step 1b, pour in the alcoholic solution from step 1a. (Do not add too slowly, or excessive evaporation will occur.) When all the solution is added, continue mixing for 1 minute.
   e. Stop the mixer; scrape the blades, walls, and bottom of the mixer well, and then restart the mixer.
   f. While mixing, add extra alcohol (item 5) in portions, mixing for 30 seconds after each addition. Continue adding alcohol and mixing until the mass changes to a uniform dark reddish-brown color that exhibits good adhesion when squeezed and contains no dry powder. Stop mixing.
   g. Quickly scrape the blades, walls, and bottom of the mixer, and then pass the mass through a 4.76 mm aperture screen; spread on lined trays, and

then dry in a hot air oven at 50°C to an LOD not more than 2.5% (60°C for 3 hours under vacuum). Request samples.

h. Sift the dried granules through a 1.2 mm screen on a sieve shaker.
i. Pass the coarse granules from step g through a 1.7 mm screen on a granulator or something similar.
j. Transfer the siftings from steps g and h through a 1.7 mm screen on a granulator.

2. Lubrication: Pass the talc and sodium starch glycolate through a 595 μm aperture screen on a sieve shaker, and then transfer to the blender.
3. Blend all the items together for 15 minutes, and then, stop the blender.
   a. Pass the magnesium stearate through a 595 μm aperture screen on a sieve shaker, and then, transfer to the blender.
   b. Blend the batch for 3 to 4 minutes, and then, stop the blender.
   c. Discharge the contents of the blender into polyethylene-lined drums, and weigh. Record the batch weight.
4. Compression: Compress the tablets on a suitable rotary tableting machine, using round punches of 10.32 mm. The tablet weight for 10 tablets is as follows: (3.465 × 100)/(100% LOD). Hardness is 6 to 8 kPa; disintegration time should be more than 15 minutes in water; and thickness should be 5.15 to 5.25 mm.
   a. For other strengths of rifampicin, 450 and 600 mg, scale up the formula. For 450 mg tablets, use ovaloid punches of 15.2 × 7.77 mm. The tablet weight for 10 tablets is (5.145 × 100)/(100% LOD); hardness is 9 to 15 kPa; the disintegration time is not more than 15 minutes in water; and the thickness is 6.55 to 6.65 mm. The coating solution will be 200 mL—optionally add coating solution gloss Methocel, 90.00 mL. (See Appendix.)
   b. For 600 mg tablets, use ovaloid punches of 18.6 × 7.8 mm. The tablet weight for 10 tablets is (6.930 × 100)/(100% LOD); hardness is 9 to 15 kPa; the disintegration time is not more than 15 minutes in water; and the thickness is 6.35 to 6.45 mm. Use a coating solution of 250 mL. Optionally add coating solution gloss Methocel, 90.00 mL. (See Appendix.)

RIFAMPICIN TABLETS (450 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
450.00	1	Rifampicin	450.00
58.00	2	Starch, maize	58.00
9.00	3	Kollidon® 90F	9.00
—	4	Isopropyl alcohol or alcohol, ca	50 mL
15.00	5	Kollidon® CL	15.00
10.00	6	Stearic acid	10.00
2.00	7	Magnesium stearate	2.00
2.00	8	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4. Dry, sieve, and mix with items 5 to 8, and press with low-compression force to tablets.
2. Compress into 550 mg tablets, using 12 mm biplanar punches.

RISEDRONATE SODIUM TABLETS (5 MG/30 MG), ACTONEL

The inactive ingredients are crospovidone, ferric oxide yellow (5 mg tablets only), hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, silicon dioxide, and titanium dioxide.

RISEDRONATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
30.00	1	Risedronate sodium[a]	30.00
156.00	2	Lactose anhydrous	156.00
60.50	3	Microcrystalline cellulose	60.50
7.40	4	Crospovidone	7.40
1.10	5	Magnesium stearate	1.10

[a] This quantity of risedronate sodium is determined by assay and then adjusted to provide the designed dosage level of risedronate sodium on an anhydrous basis.

Manufacturing Directions

1. Place the risedronate active ingredient with the microcrystalline cellulose in a twin-shell blender. Blend for 20 minutes.

2. Pass the blend through an oscillator equipped with a 60 mesh screen.
3. Return the milled blend to the shell blender, along with the lactose and crospovidone, and mix until uniform.
4. Add the magnesium stearate, and mix until adequate lubrication is achieved.
5. Compress 250 mg.
6. Coat. (See Appendix.)

RISPERIDONE TABLETS (4 MG), RISPERDAL

Risperdal tablets are available in 0.25 mg (dark yellow), 0.5 mg (red-brown), 1 mg (white), 2 mg (orange), 3 mg (yellow), and 4 mg (green) strengths. The inactive ingredients are colloidal silicon dioxide, hydroxypropyl methylcellulose, lactose, magnesium stearate, microcrystalline cellulose, propylene glycol, sodium lauryl sulfate, and starch (corn). Tablets of 0.25, 0.5, 2, 3, and 4 mg also contain talc and titanium dioxide. The 0.25 mg tablets contain yellow iron oxide; the 0.5 mg tablets contain red iron oxide; the 2 mg tablets contain FD&C Yellow No. 6 Aluminum Lake; the 3 mg and 4 mg tablets contain D&C Yellow No. 10; and the 4 mg tablets contain FD&C Blue No. 2 Aluminum Lake.

RISPERIDONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Risperidone	4.00
140.00	2	Lactose monohydrate	140.00
105.00	3	Microcrystalline cellulose (Avicel™ PH 102)	105.00
81.00	4	Maize starch	81.00
18.00	5	Maize starch, dried	18.00
1.00	6	Colloidal silicone dioxide (Aerosil® 200)	1.00
1.00	7	Magnesium stearate	1.00
QS	8	Purified water	QS

Manufacturing Directions

1. Sift risperidone, lactose monohydrate, Avicel™ PH 102, and a part of the maize starch through a stainless steel 500 μm sieve.
2. Load the sifted powder into a mixer, and mix for 5 minutes.
3. Make a paste with the remaining part of the maize starch in purified water (80–90°C).
4. Knead the powder mix with the starch paste to get the desired granules.
5. Dry the granules in an air-circulating oven to a targeted LOD of not more than 2.5%.
6. Pass the dried granules through a 250 μm sieve into a blending vessel.
7. Lubricate with Aerosil® 200, maize starch dried, and magnesium stearate previously sieved through a stainless steel 250 μm sieve. Blend for 1 minute.
8. Compress into tablets to get the labeled amount of risperidone per tablet using specified tools.
9. Coat the tablets using a hypromellose coating. (See Appendix.)

ROFECOXIB TABLETS (12.5 MG/25 MG/50 MG), VIOXX

Each tablet of Vioxx for oral administration contains 12.5, 25, or 50 mg of rofecoxib and the following inactive ingredients: croscarmellose sodium, hydroxypropyl cellulose, lactose, magnesium stearate, microcrystalline cellulose, and yellow ferric oxide.

ROSIGLITAZONE MALEATE TABLETS (2 MG/4 MG/8 MG), AVANDIA

Each pentagonal film-coated Tiltab® tablet contains rosiglitazone maleate equivalent to rosiglitazone 2 mg, 4 mg, or 8 mg for oral administration. Inactive ingredients are hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol 3000, sodium starch glycolate, titanium dioxide, triacetin, and one or more of the following: synthetic red and yellow iron oxides and talc.

ROXITHROMYCIN DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
150.00	1	Roxithromycin base	150.00
22.50	2	Crospovidone	22.50
62.50	3	Croscarmellose sodium	62.50
3.80	4	Polysorbate	3.80
666.20	5	Microcrystalline cellulose	666.20
40.00	6	Aspartame	40.00
20.00	7	Saccharin sodium	20.00
20.00	8	Mint flavor	20.00
5.00	9	Colloidal silica	5.00
10.00	10	Magnesium stearate	10.00

ROXITHROMYCIN DISPERSIBLE TABLETS (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Roxithromycin	200.00
30.00	2	Ethyl cellulose	30.00
12.80	3	Sodium croscarmellose	12.80
0.27	4	Isopropyl alcohol	270.00 mL
130.00	5	Dicalcium phosphate	130.00
4.40	6	Sodium lauryl sulfate	4.40
320.00	7	Starch (maize)	320.00
4.00	8	Magnesium stearate	4.00
4.00	9	Talc	4.00
28.00	10	Sodium starch glycolate	28.00
8.00	11	Aerosil® 200	8.00
24.00	12	Aspartame	24.00
24.00	13	Flavor	24.00
—	14	Water, purified	QS

Manufacturing Directions

1. Sift items 1, 3, and 5 through a 250 µm sieve into a suitable mixing vessel.
2. In a separate vessel, add and mix items 2 and 4.
3. Add the binding solution in step 2 to step 1, and mix until a suitable mass is formed.
4. Pass the wet mass through a 2.38 mm sieve, and dry the granules in a dehumidified room.
5. Pass the dried granules through a 595 µm sieve into a blending vessel.
6. Pass items 6 and 7 through a 250 µm sieve into a blender, and mix for 15 minutes.
7. Prepare the paste with a portion of item 7 in hot water, and add to step 6. Mix until a proper mass is formed.
8. Dry the granules at 50°C overnight, and pass the dried granules through a 595 µm sieve.
9. Lubricate the two granules mixed together with items 8 to 13.
10. Compress into 150 mg tablets, using 8 mm punches.
11. Coat using HPMC coating. (See Appendix.)

SACCHARIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Saccharin sodium	15.00
10.00	2	Tartaric acid	10.00
14.00	3	Sodium bicarbonate	14.00
2.00	4	Kollidon® VA 64	2.00
2.00	5	PEG-6000 (powder)	2.00

Manufacturing Directions

1. Dry saccharin sodium and tartaric acid for 1 hour at 100°C.
2. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
3. Compress into 42 mg tablets, using 5 mm biplanar punches.

SACCHARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
37.50	1	Sodium cyclamate	37.50
17.00	2	Mannitol	17.00
6.35	3	Soda ash (light-milled powder, 58% Na_2O)	6.35
3.75	4	Saccharin sodium (dehydrated powder)	3.75
1.40	5	Povidone (PVP K-29–32)	1.40
8.00	6	Purified water	8.00
11.00	7	Tartaric acid	11.00
0.80	8	Soda ash (light-milled powder, 58% Na_2O)	0.80
1.00	9	Anhydrous sodium citrate	1.00
1.00	10	Sodium benzoate	1.00
0.20	11	PEG-8000	0.20

Manufacturing Directions

1. This product is hygroscopic and should be processed in a low-humidity area not exceeding 50% relative humidity at 24°C.
2. Maintain at 35% to 40% relative humidity at 24°C if possible.
3. If necessary, pass sodium cyclamate and mannitol (if used) through a FitzMill or similar type using a 420 µm or similar screen, and then, load into a suitable mixer.
4. To this mixture, add soda ash (item 3) and blend for 30 minutes or until uniform.
5. Dissolve povidone in 4 mL of warm purified water.
6. Dissolve saccharin sodium in 3 mL of warm purified water.
7. Add solutions from previous steps together plus sufficient purified water.
8. Mass with blended powders.
9. Blend for 1 hour or until uniform.
10. Pass the wet mass through a 4.76 mm or similar screen in an oscillating granulator, and spread onto trays.
11. Oven dry at 50°C to 55°C for 16 to 24 hours using a full oven load of trays (LOD NMT 0.9%).
12. Pass dried granulation through a 1.19 mm or similar screen in an oscillating granulator or through a

1.68 mm or similar screen using a comminuting mill (knives forward, slow speed).
13. Lubricants must meet LOD/moisture content before proceeding.
14. If lubricants fail, dry them at 80°C for 8 hours.
15. Use 60°C for tartaric acid.
16. Mill lubricants (except tartaric acid and granulated lactose, if used) through a 600 µm or similar screen in a comminuting mill (hammers forward, medium speed).
17. Load dried granulation, coated tartaric acid, lactose (if used), and milled lubricants into a suitable mixer and blend for 30 to 40 minutes.
18. Compress into 80 mg tablets, using 7/32 in. punches.

SACCHARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Saccharin sodium	15.00
31.00	2	Ludipress®	31.00
2.00	3	Kollidon® CL	2.00
0.30	4	Magnesium stearate	0.30
2.00	5	PEG-6000 (powder)	2.00
2.00	6	Lutrol F 68	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 51 mg tablets (or 50 mg if items 5 and 6 are omitted), using 5 mm punches.

SALBUTAMOL TABLETS (2 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Salbutamol; use as salbutamol sulfate	2.40
80.00	2	Lactose monohydrate	80.00
33.60	3	Starch (maize)	33.60
3.30	4	Starch (maize)	3.30
0.10	5	FD&C Yellow No. 6	0.10
0.60	6	Magnesium stearate	0.60
—	7	Purified water	28.00

Manufacturing Directions

Note: The binding solution is susceptible to microbial growth, so prepare the solution directly before use.

1. Sift item 4 through a 250 µm sieve using a sifter.
2. Manually make a homogeneous slurry of item 4 in 4 g of cold item 7 (25–30°C) in a stainless steel container. Check that it is free of lumps.
3. Add item 5 and the slurry of the starch paste (from step 2) into 24 g of item 7, heated to 85°C, into a Giusti vessel. Stir until there is complete gelatinization. Cool to 50°C.
4. Sift items 1, 3, and 2 through a 630 µm sieve using a sifter. Collect in a stainless steel container.
5. Load sieved powders in the mixer. Mix for 15 minutes at high speed.
6. Add starch paste from step 4 to the mixer. Mix this for 10 minutes.
7. Pass the wet mass through a FitzMill using sieve no. 24205 at medium speed, knives forward.
8. Spread the wet granules onto the trays. Load the trolleys into the oven. Dry the granules at 55°C for 10 hours. Scoop the granules after 4 hours of drying, and then, put the upper trays to the down position and the down trays to the upper position for uniform drying. Check the moisture content—as a limit, there should not be more than 2.5%.
9. Grind the dried granules through a 1 mm sieve using a granulator. Collect in a stainless steel drum, and load to the blender. Sift item 6 through a 250 µm sieve using a sifter. Collect in a polythene bag. Mix 2 g of granules with this, and add to the blender. Mix this for 1 minute.
10. Compress the granules. The weight of 10 tablets is 1.20 g ± 3%; hardness is not less than 2 kPa.

SALBUTAMOL TABLETS (4 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Salbutamol; use as salbutamol sulfate	4.80
80.00	2	Lactose monohydrate	80.00
31.28	3	Starch (maize)	31.28
3.30	4	Starch (maize)	3.30
0.02	5	Red FD&C No. 3	0.02
0.60	6	Magnesium stearate	0.60
—	7	Purified water	28.00

Manufacturing Directions

See the manufacturing directions for the 2.0 mg strength.

SCOPOLAMINE TABLETS

Manufacturing Directions

1. To 0.2 g of scopolamine hydrobromide, add 29.4 g of calcium hydrogenphosphate (anhydrous) in small portions and mix well in a mortar to form a triturate.
2. Mix the triturate (29.6 g) well with fumaric acid (60 g) and calcium stearate (0.4 g) in a polyethylene bag to form a mixed powder A.
3. Mix 25 g of fumaric acid, 9.8 g of potassium hydrogenphosphate (anhydrous), and 0.2 g of calcium stearate in a polyethylene bag to make a mixed powder B.
4. To 0.1 g of scopolamine hydrobromide, add 10 g of crystalline cellulose in small portions and mix well in a mortar to make a triturate.
5. Mix this triturate (10.1 g) well with 24.7 g of lactose and 0.2 g of calcium stearate in a polyethylene bag to make a mixed powder C.
6. Perform multilayer tableting on a single-punch machine equipped with a die (8 mm) and flat-faced punches: first, place 90 mg of the mixed powder A in the die and precompress lightly; place 35 mg of the mixed powder B on the first fill and lightly precompress; thereafter, place 35 mg of the mixed powder C on the second fill and compress with a total pressure of about 1.2 tons.

SELEGILINE TABLETS (5 MG)

Formulation: Selegiline HCI (BASF), 5 g; Ludipress®, 94 g; Magnesium stearate, 1 g.

Manufacturing Directions

1. Mix all components intensively, pass through a 0.8 mm sieve, and press with low-compression force at 99 mg.

SELEGILINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Selegiline	5.00
94.00	2	Ludipress®	94.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components intensively, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 99 mg tablets, using 6 mm biplanar punches.

SERRATIOPEPTIDASE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Serratiopeptidase	10.00
228.00	2	Ludipress®	228.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press with low-compaction force (6 kN).
2. Compress into 238 mg tablets, using 8 mm biplanar punches.

SERRATIOPEPTIDASE TABLETS (10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Serratiopeptidase, 40% excess	14.00
70.00	2	Lactose monohydrate	70.00
50.00	3	Microcrystalline cellulose potassium	50.00
80.00	4	Starch (maize)	80.00
—	5	Isopropyl alcohol	100 mL
2.50	6	Magnesium stearate	2.50
5.00	7	Talc	5.00

Manufacturing Directions

1. Place items 2 to 4 in a suitable vessel. Mix these items for 5 minutes.
2. Add item 5, and granulate the mass. Pass it through a 2.38 mm sieve onto paper-lined trays.
3. Dry the granules in a dehumidified area overnight.
4. Pass the granules through an 18 mesh screen into a blending vessel.
5. Add item 1 to step 4, and mix well.
6. Sift items 6 and 7 through a 250 µm sieve, and add to step 5.
7. Compress into 225 mg tablets, using 7 mm punches.
8. Coat with HPMC organic coating. (See Appendix.)

SERRATIOPEPTIDASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Serratiopeptidase	10.00
228.00	2	Ludipress®	228.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press with low compressive force (6 kN).
2. Compress into 238 mg tablets, using 8 mm biplanar punches.

SERTRALINE HYDROCHLORIDE TABLETS (25 MG/50 MG/100 MG), ZOLOFT

Zoloft is supplied for oral administration as scored tablets containing sertraline hydrochloride equivalent to 25, 50, and 100 mg and the following inactive ingredients: dibasic calcium phosphate dihydrate, D&C Yellow No. 10 Aluminum Lake (in the 25 mg tablet), FD&C Blue No. 1 Aluminum Lake (in the 25 mg tablet), FD&C Red No. 40 Aluminum Lake (in the 25 mg tablet), FD&C Blue No. 2 Aluminum Lake (in the 50 mg tablet), hydroxypropyl cellulose, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium starch glycolate, synthetic yellow iron oxide (in the 100 mg tablet), and titanium dioxide.

SERTRALINE L-LACTATE OSMOTIC TABLET

Manufacturing Directions

1. Blend tablet cores comprising sertraline L-lactate (13.8 wt%), L-aspartic acid (11 wt%), calcium acetate (5 wt%), microcrystalline cellulose (29.5 wt%), and fructose (38.2 wt%), then run through a roller compactor and mill.
2. Blend this milled material with 2.5 wt% magnesium stearate to form the final blended material that is used to make tablets having a total weight of 470 mg on a conventional tablet press.
3. Semipermeable asymmetric membrane coatings should comprise 10 wt% cellulose acetate 398–10, 2.5 wt% polyethylene glycol 3350, 15 wt% water, and 72.5 wt% acetone.
4. Spray coat the coating solution onto the tablets at a rate of 20 g/min until a 10 wt% coating level on the tablets has been achieved.

SERTRALINE HYDROCHLORIDE TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
27.98	1	Sertraline hydrochloride equivalent to sertraline 25.00 mg	27.98
52.52	2	Dibasic calcium phosphate dihydrate, DC grade	52.52
15.00	3	Microcrystalline cellulose (Avicel™ PH102)	15.00
3.00	4	Sodium starch glycolate	3.00
0.50	5	Hydroxypropyl cellulose	0.50
1.00	6	Magnesium stearate	1.00
2.00	7	Hypromellose	2.00
0.40	8	Polyethylene glycol 4000	0.40
0.20	9	Polysorbate 80	0.20
0.60	10	Titanium dioxide	0.60
0.20	11	D&C Yellow No. 10 Aluminum Lake	0.20
0.30	12	FD&C Blue No. 1 Aluminum Lake	0.30
—	13	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and place in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve, and add to step 1.
3. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
4. Mix step 1 for 20 minutes using tumbler.
5. Pass item 6 through 0.250 mm sieve and add to step 4.
6. Mix step 5 for 2 minutes.
7. Compress into 100 mg tablets, using a suitable punch (5.0 mm, round).
8. Place item 13 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
9. Add items 8 to 12 to step 8 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
10. Load core tablets from step 7 in coating pan, and apply coating dispersion from step 9 to get 2.5% to 3.0% weight gain.

SERTRALINE HYDROCHLORIDE TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
55.96	1	Sertraline hydrochloride equivalent to sertraline 50.00 mg	55.96
105.04	2	Dibasic calcium phosphate dihydrate, DC grade	105.04
30.00	3	Microcrystalline cellulose (Avicel™ PH102)	30.00
6.00	4	Sodium starch glycolate	6.00
1.00	5	Hydroxypropyl cellulose	1.00
2.00	6	Magnesium stearate	2.00
4.00	7	Hypromellose	4.00
0.80	8	Polyethylene glycol 4000	0.80
0.30	9	Polysorbate 80	0.30
1.20	10	Titanium dioxide	1.20
0.40	11	FD&C Red No. 40 Aluminum Lake	0.40
0.60	12	FD&C Blue No. 2 Aluminum Lake	0.60
—	13	Water, purified	60.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and place in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve and add to step 1.
3. Pass item 3 through 0.7 mm sieve and place in tumbler from step 1.
4. Mix step 1 for 20 minutes using tumbler.
5. Pass item 6 through 0.250 mm sieve and add to step 4.
6. Mix step 5 for 2 minutes.
7. Compress into 200 mg tablets, using a suitable punch (6.5 mm × 10 mm, oblong).
8. Place item 13 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
9. Add items 8 to 12 to step 8 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
10. Load core tablets from step 7 in coating pan, and apply coating dispersion from step 9 to get 2.5% to 3.0% weight gain.

SERTRALINE HYDROCHLORIDE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
111.92	1	Sertraline hydrochloride equivalent to sertraline 100.00 mg	111.92
110.08	2	Dibasic calcium phosphate dihydrate, DC grade	110.08
60.00	3	Microcrystalline cellulose (Avicel™ PH102)	60.00
12.00	4	Sodium starch glycolate	12.00
2.00	5	Hydroxypropyl cellulose	2.00
4.00	6	Magnesium stearate	4.00
6.00	7	Hypromellose	6.00
1.20	8	Polyethylene glycol 4000	1.20
0.40	9	Polysorbate 80	0.40
1.80	10	Titanium dioxide	1.80
0.20	11	Yellow iron oxide	0.20
—	12	Water, purified	90.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve and place in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve and add to step 1.
3. Pass item 3 through 0.7 mm sieve and place in tumbler from step 1.
4. Mix step 1 for 20 minutes using tumbler.
5. Pass item 6 through 0.250 mm sieve and add to step 4.
6. Mix step 5 for 2 minutes.
7. Compress into 300 mg tablets, using a suitable punch (10 mm, round).
8. Place item 12 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hypromellose.
9. Add items 8 to item 11 to step 8 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
10. Load core tablets from step 7 in coating pan and apply coating dispersion from step 9 to get 2.5% to 3.0% weight gain.

SILDENAFIL TABLETS (25 MG/50 MG/100 MG), VIAGRA

Viagra is formulated as blue, film-coated, rounded-diamond-shaped tablets equivalent to 25, 50, and 100 mg of sildenafil for oral administration. In addition to the active ingredient, sildenafil citrate, each tablet contains the following inactive

ingredients: microcrystalline cellulose, anhydrous dibasic calcium phosphate, croscarmellose sodium, magnesium stearate, hydroxypropyl methylcellulose, titanium dioxide, lactose, triacetin, and FD&C Blue No. 2 Aluminum Lake.

SILDENAFIL CITRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Sildenafil; use sildenafil citrate	70.50
100.00	2	Avicel™ PH 102	100.00
131.00	3	Dibasic calcium phosphate anhydrous	131.00
9.00	4	Ac-Di-Sol	9.00
1.00	5	Aerosil 200	1.00
1.50	6	Magnesium stearate	3.50

Manufacturing Directions

1. Place items 1 and 2 in a suitable blender or plastic bag after sifting through a 500 µm sieve. Mix them for 5 minutes.
2. Add item 3 to step 1 after sifting through a 500 µm sieve. Mix for 5 minutes.
3. Add items 4 to 6 after sifting them through a 500 µm sieve (item 6 through a 250 µm sieve). Blend this for 1 minute.
4. Compress into 315 mg tablets, using diamond-shaped 13.2 × 8.2 mm punches.
5. Coat using an HPMC coating. (See Appendix). Use dispersed blue E, 1321.4 mg/tablet, to match the color of Viagra. Following is a proposed formulation of coating solution:

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Hypromellose	4.00
0.80	2	Triacetin	0.80
1.22	3	Talc	1.22
2.60	4	Titanium dioxide	2.60
0.46	5	Lactose monohydrate	0.46
1.41	6	Dispersed blue E112	1.41
0.40	7	Opadry® OY-LS 29019 clear	0.40
QS	8	Water, purified	QS

SILIMARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
35.50	1	Silimarin	35.50
410.50	2	Ludipress®	410.50
4.50	3	Magnesium stearate	4.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force (about 10 kN).
2. Compress into 458 mg tablets, using 12 mm biplanar punches.

SILIMARIN TABLETS (35 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
35.00	1	Silimarin	35.50
410.50	2	Ludipress®	410.50
4.50	3	Magnesium stearate	4.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force (about 10 kN).
2. Compress into 458 mg tablets, using 12 mm biplanar punches.

SIMETHICONE AND MAGNESIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
16.00	1	Dextrose Monohydrate, USP 25.0 kg	16.00
0.16	2	D&C Yellow No. 10 D&C Lake 250 g	0.16
0.06	3	FD&C Blue No. 1 Lake 90.0 g	0.06
80.00	4	Simethicone Pwd GS (30%) 417 kg	266.40
64.00	5	Magnesium carbonate 100 kg	64.00,
128.00	6	Microcrystalline cellulose 200 kg	128.00
175.68	7	Dextrates 275 kg	175.68
5.00	8	Stearic acid 8.00 kg	5.00

Manufacturing Directions

1. Process simethicone mix by preblending magnesium carbonate and simethicone powder GS 30% in a V-blender.
2. Dry granulate this preblended mix and place in a V-shell blender.
3. Add dextrates and microcrystalline cellulose to the preblended mix in the V-shell blender, and blend the preblended mix, dextrates, and microcrystalline cellulose for approximately 10 minutes.
4. Combine FD&C Blue No. 1 Lake, D&C Yellow No. 10 Lake, and dextrose in a drum roller, dry granulate, and then place in the V-shell blender with the preblended mix, dextrates, and microcrystalline cellulose.
5. Dry granulate an additional amount of dextrose in the same granulator that the colorants are granulated in, for the purpose of rinsing the granulator after the dry granulation of the colorants.
6. Also add this amount of dextrose to the V-shell blender.
7. Pass an amount of stearic acid through a 30 mesh screen and add to the V-shell blender.
8. Blend the preblended mix, dextrates, microcrystalline cellulose, colorants, dextrose, and stearic acid in the V-shell blender for 3 minutes.
9. Measure a sample of the V-shell blender mix to test blend uniformity.
10. Upon meeting satisfactory blend uniformity requirements, transfer the simethicone layer mix to tote bins and then compress into 650 mg tablets.

SIMETHICONE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
70.00	1	Simethicone dry powder 25%	280.00
158.00	2	Sucrose, powder	158.00
7.00	3	Kollidon® 90F	7.00
3.50	4	Kollidon® 90F	3.50
QS	5	Isopropanol	QS
2.80	6	Aerosil® 200	2.80

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 and 5, dry, pass through a 0.8 mm sieve, add item 6, mix thoroughly, and press with high compressive force.
2. Compress into 442 mg tablets, using 12 mm biplanar punches.

SIMETHICONE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
80.00	1	Simethicone (Wacker silicon oil, S184)	80.00
400.00	2	Sorbitol (crystalline)	400.00
20.00	3	Aerosil® 200	20.00
390.00	4	Ludipress®	390.00
2.00	5	Menthol (powder)	2.00
8.00	6	Magnesium stearate	8.00

Manufacturing Directions

1. Mix items 2 and 3 with item 1, pass through a 0.8 mm sieve, add mixture of items 4 to 6, mix thoroughly, pass again through a 0.8 mm sieve, and press with high compressive force.
2. Compress into 870 mg tablets, using 16 mm biplanar punches.

SIMETHICONE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
70.00	1	Simethicone	70.00
71.40	2	Microcrystalline cellulose	71.40
71.40	3	Magnesium hydroxide	71.40
265.00	4	Mannitol	265.00
100.00	5	Lactose	100.00
395.10	6	Granular sugar	395.10
0.70	7	Menthol	0.70
10.00	8	Fumed silica	10.00
5.00	9	Fumed silica	5.00
10.00	10	Magnesium stearate	10.00

Manufacturing Directions

1. Blend item 2 and item 3 in a V-blender for 10 minutes.
2. Transfer to planetary mixer.
3. Slowly add weighted amount of item 1 to the mix, and mix slowly using a “B” flat beater blade; after thorough mixing, pass through a 20 mesh screen.
4. Add the balance of the ingredients, mix, and compress.

SIMVASTATIN FAST-MELT TABLET

Manufacturing Directions

1. Mix simvastatin 15%, sodium bicarbonate 25%, citric acid anhydrous 25%, xylitol 12%, microcrystalline cellulose 15%, anhydrous lactose 6%, and Crodesta F160 2%.
2. Dry these ingredients at elevated temperature in the presence of a desiccant to significantly reduce the moisture content of each material.
3. Blend for 10 minutes, and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix SV-EGF (30–80 mesh), 45%; Avicel™ PH113, 31%; Mannogen 3215, 15%; L-HPC LH-11, 5%; aspartame, 3%; redberry flavor, 0.25%; natural orange powder, 0.15%; magnesium stearate, 0.5%; and fumed silicon dioxide, 0.1%.
5. Blend for 5 minutes prior to compression.
6. Compress simvastatin tablets to a hardness of approximately 1 to 5 kPa (depending upon the dose of the drug), and tablets should disintegrate in water in approximately 15 to 35 seconds.

SIMVASTATIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Simvastatin with excess	10.10
55.23	2	Lactose monohydrate	55.23
15.00	3	Pregelatinized starch (Starch 1500)	15.00
0.02	4	Butylated hydroxyanisole	0.02
2.50	5	Ascorbic acid	2.50
1.25	6	Citric acid	1.25
15.00	7	Microcrystalline cellulose (Avicel™ PH 102)	15.00
0.60	8	Magnesium stearate	0.60
0.30	9	Colloidal silicon dioxide (Aerosil® 200)	0.30
—	10	Purified water	12.00
—	11	Absolute alcohol (ethanol, dehydrated alcohol)	5.00

Manufacturing Directions

Note: Avoid overmixing lubricants, or hardness may be reduced.

1. Preparation of granulating solution
   a. Make a clear solution of item 4 in item 11 by slow stirring.
   b. Dissolve items 5 and 6 in item 10 under slow stirring by a stirrer.
2. Dry powder mixing: Sift items 1, 2, and 3 through a stainless steel 500 µm sieve in a sifter. Load into the mixer, and mix for 3 minutes at low speed.
3. Kneading
   a. Add a binding solution, 25 to 31 g/min, to the dry powders while mixing at low speed. After the addition is over, scrape the sides and blades. Mix further for 2 minutes using a mixer and chopper at low speed. Scrape sides and blades. Check for the end point of granulation. (End point of the granulation is the point when the wet mass consists of few or no lumps of granule.)
   b. If required, add purified water. Record the extra quantity of purified water added. Unload the wet granules onto stainless steel trays for drying.
4. Drying
   a. Dry the wet granules in an oven at 55°C for 6 hours. After 3 hours of drying, scrape the semidried granules to break the lumps for uniform drying.
   b. Check the LOD, with a limit of 1.0% to 1.5%.
   c. If required, dry further at 55°C for 1 hour. Check the LOD. Transfer the dried granules in a stainless steel drum.
5. Grinding: Grind the dried granules through a 1.25 mm sieve. Collect in a polyethylene bag.
6. Lubrication
   a. Sift items 7 and 9 through a 500 µm sieve, and add this to the double polyethylene bag used in step 5a. Mix manually for 1 minute.
   b. Sift item 8 through a 500 µm sieve. Add 6 to 12 g granules from bulk (step 5). Mix in a polythene bag for 1 minute. Add this mixture to the polyethylene bag in step 5. Mix manually for 30 seconds. Add the two loads in the polyethylene bag, and mix manually for 15 seconds.
   c. Unload into stainless steel drums.
7. Compression: Compress the granules using a rotary tableting machine. The dimension should be 8.5 mm × 5 mm oval punches; 100 mg per tablet should be compressed.
8. Coating: Coat the tablets using an HPMC coating. (See Appendix.)

SIMVASTATIN TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Simvastatin	20.200
110.460	2	Lactose monohydrate	110.460
30.000	3	Pregelatinized starch (Starch 1500)	30.000
0.040	4	Butylated hydroxyanisole	0.040
5.000	5	Ascorbic acid	5.000
2.500	6	Citric acid	2.500
30.000	7	Microcrystalline cellulose (Avicel™ PH 102)	30.000
1.200	8	Magnesium stearate	1.200
0.600	9	Colloidal silicon dioxide (Aerosil® 200)	0.600
—	10	Purified water	24.000
—	11	Absolute alcohol (ethanol, dehydrated alcohol)	10.000

SIMVASTATIN TABLETS (10 MG), ZOCOR®

Zocor® tablets for oral administration contain 5, 10, 20, 40, or 80 mg of simvastatin and the following inactive ingredients: cellulose, hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxides, lactose, magnesium stearate, starch, talc, titanium dioxide, and other ingredients. Butylated hydroxyanisole is added as a preservative.

SODIUM FLUORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.50	1	Sodium fluoride with excess	0.55
56.25	2	Sorbitol, crystalline	56.25
56.25	3	Dicalcium phosphate	56.25
2.20	4	Kollidon® VA 64	2.20
0.50	5	Magnesium stearate	0.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compressive force.
2. Compress into 116 mg tablets, using 6 mm biplanar punches.
3. If the content uniformity is not sufficient, a premix of sodium fluoride and sorbitol or dicalcium phosphate should be prepared separately before mixing with the rest of the excipients.

SODIUM FLUORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.30	1	Sodium fluoride	1.30
76.70	2	Ludipress®	76.70
0.40	3	Magnesium stearate	0.40

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 78 mg tablets, using 5 mm biplanar punches.
3. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

SOTALOL HYDROCHLORIDE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Sotalol hydrochloride	500.00
100.00	2	Microcrystalline cellulose or lactose anhydrous	100.00
80.00	3	Starch, maize	80.00
30.00	4	Sodium starch glycolate	30.00
4.00	5	Magnesium stearate	4.00
4.00	6	Silicon dioxide colloidal	4.00
QS	7	Dyes	QS
—	8	Water, purified	QS

Manufacturing Directions

1. Place items 1 to 3 in a granulating bowl, and mix for 20 minutes. (*Note:* For item 2, a choice of using cellulose or lactose, or a combination thereof, is available.)
2. Add a sufficient quantity of item 8 to form a wet mass.
3. Pass the wet mass in step 2 through an 8 mesh onto paper-lined trays. Dry at 60°C for 12 hours to achieve an LOD of less than 5%.
4. Pass the dried granules through a 16 or 20 mesh screen, and transfer to a blending vessel.
5. Add items 4 to 7, and blend for 5 minutes.
6. Compress an appropriate amount in a suitable punch.

SPIRAMYCIN DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
750.00	1	Spiramycin base	750.00
45.00	2	Crospovidone	45.00
85.00	3	Croscarmellose sodium	85.00
7.50	4	Polysorbate	7.50
762.50	5	Microcrystalline cellulose	762.50
160.00	6	Aspartame	160.00
80.00	7	Saccharin sodium	80.00
80.00	8	Mint flavor	80.00
10.00	9	Colloidal silica	10.00
20.00	10	Magnesium stearate	20.00

SPIRONOLACTONE TABLETS (25 MG/50 MG/100 MG), ALDACTONE

Aldactone oral tablets contain 25, 50, or 100 mg of spironolactone. Inactive ingredients include calcium sulfate, cornstarch, flavor, hydroxypropyl methylcellulose, iron oxide, magnesium stearate, polyethylene glycol, povidone, and titanium dioxide.

SPIRONOLACTONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Spironolactone	25.00
175.00	2	Ludipress®	175.00
1.50	3	Magnesium stearate	1.50

Manufacturing Directions

1. Mix all components.
2. Pass the mixture through a sieve, and press with medium-compression force.
3. Compress into 197 mg tablets, using 8 mm biplanar punches.

SPIRULINA EXTRACT CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Spirulina extract (powder)	250.00
245.00	2	Ludipress®	245.00
25.00	3	PEG-6000 (powder)	25.00
5.00	4	Aerosil® 200	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compressive force.
2. Compress into 495 mg tablets, using 12 mm biplanar punches.

SUCRALFATE AND SODIUM ALGINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Sucralfate	500.00
20.00	2	Sodium alginate	20.00
70.00	3	Cornstarch	70.00
20.00	4	Kollidon® 30	20.00
—	5	Ethanol (95%)	80.00 mL
30.00	6	Kollidon® CL	30.00
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 and 5, pass through a sieve, mix the dry granules with items 6 and 7, and press with low compressive force.
2. Compress into 660 mg tablets, using 12 mm biplanar punches.

SULFADIMIDINE TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Sulfadimidine	500.00
100.00	2	Lactose monohydrate	100.00
15.00	3	Kollidon® 30	15.00
—	4	Water, purified, ca	200.00
25.00	5	Kollidon® CL	25.00
2.40	6	Talc	2.40
0.30	7	Aerosil® 200	0.30
0.30	8	Calcium arachinate	0.30

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with the solution of items 3 and 4. Dry, pass through a 0.8 mm sieve, mix with items 5 to 8, and press.
2. Compress into 610 mg tablets, using 12 mm biplanar punches.

SULFAMETHOXAZOLE AND TRIMETHOPRIM TABLETS (400 MG/80 MG; 800 MG/160 MG; 100 MG/20 MG)

Each double strength (DS) tablet contains 160 mg of trimethoprim and 800 mg of sulfamethoxazole plus magnesium stearate, pregelatinized starch, and sodium starch glycolate. Each tablet contains 80 mg of trimethoprim and 400 mg of sulfamethoxazole, plus magnesium stearate, pregelatinized starch, sodium starch glycolate, FD&C Blue No. 1 lake, FD&C Yellow No. 6 lake, and D&C Yellow No. 10 lake. Each teaspoonful (5 mL) of the pediatric suspension or suspension contains 40 mg of trimethoprim and 200 mg of sulfamethoxazole in a vehicle containing 0.3% alcohol, edetate disodium, glycerin, microcrystalline cellulose, parabens (methyl and propyl), polysorbate 80, saccharin sodium, simethicone, sorbitol, sucrose, FD&C Yellow No. 6, FD&C Red No. 40, flavors, and water.

SULFAMETHOXAZOLE AND TRIMETHOPRIM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
800.00	1	Sulfamethoxazole	800.00
160.00	2	Trimethoprim	160.00
70.00	3	Starch (corn)	70.00
5.00	4	Alginic acid	5.00
—	5	Water, purified, ca	320.00 mL
5.00	6	Magnesium stearate	5.00

Manufacturing Directions

1. Granulation
   a. Pass the following ingredients through a 595 µm aperture screen: sulfamethoxazole, trimethoprim, and starch (corn), and load into a suitable blender. Blend for approximately 20 minutes.
   b. Add and dissolve alginic acid (60°C) and purified water. Cool the solution to 35°C.
   c. Add the solution from step 1b to blended powders, and blend until a suitable granulating mass is obtained. Add more purified water if needed.
   d. Pass the granulating mass through a 2.38 mm aperture screen.
   e. Oven dry the wet granules at 45°C for 16 hours until the LOD is not more than 0.9% (105°C for 1 hour).
2. Lubrication
   a. Pass the dried granulate through a 1.2 mm aperture screen on an oscillating granulator, and load into a suitable blender.
   b. Add magnesium stearate, and mix well for approximately 10 minutes.
3. Compression
   a. Compress using a 19 mm caplet punch. The weight of 10 tablets is 10.4 g; the thickness is 7.4 to 8.2 mm; and the hardness is 14 to 22 kPa units.
   b. For 400/80 tablets, use an 11.5 mm diameter flat, beveled edge punch. The weight of 10 tablets is 5.20 g; the thickness is 4.2 to 4.6 mm; and the hardness is 13 to 24 kPa.
   c. For 100/20 tablets, use 7.5 mm diameter beveled edge punch. The weight of 10 tablets is 1.2 g; the thickness is 2.4 to 2.7 mm; and the hardness is 6 to 12 kPa.

SULFAMETHOXAZOLE AND TRIMETHOPRIM TABLETS (400 MG/80 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
400.00	1	Sulfamethoxazole	400.00
80.00	2	Trimethoprim	80.00
15.00	3	Kollidon® 30	15.00
—	4	Isopropyl alcohol	QS
24.00	5	Kollidon® CL	24.00
2.00	6	Talc	2.00
8.00	7	Magnesium stearate	8.00

Manufacturing Directions

1. Granulate a mixture of items 1 and 2 with a solution of items 3 and 4. Pass this through a 0.8 mm sieve, dry, add items 5 to 7, and press with low-compression force.
2. Compress into 546 mg tablets, using 12 mm biplanar punches.

SULFAMETHOXAZOLE AND TRIMETHOPRIM TABLETS (800 MG/160 MG; 400 MG/80 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1,000 Tablets (kg)
800.00	1	Sulfamethoxazole	800.00
160.00	2	Trimethoprim	160.00
20.00	3	Povidone K30	20.00
24.20	4	Primojel® (sodium carboxymethyl starch)	24.20
5.00	5	Magnesium stearate	5.00
0.20	6	Dioctyl sodium sulfosuccinate	0.20

Manufacturing Directions

1. First, prepare the PVP solution sufficient for this batch divided into four lots.
2. In a suitable stainless steel container, take 30 kg of deionized water, heat it to 70°C, and add to it while stirring item 4 gradually.
3. After complete dissolution, continue to stir, and add 140 kg of deionized water, item 3. Stir until completely dissolved.
4. Let stand overnight.
5. In a separate container, take one-fourth of items 1 and 2, and mix. Then add, in small portions, the PVP solution made in step 1, 45.1 kg each, until a moist mass with granular lumps is obtained. Pass the granules through a centrifugal granulator using a 10 mm sieve.
6. Spread the granules on trays, and dry at 60°C for 28 hours. The relative humidity should be 15% to 20%.
7. Pass the granules through an oscillating granulator with 2 mm perforations at a rate of 2 to 2.5 kg/min.
8. Place the granules in a V-type blender from each of the four lots, mix for 5 minutes, and transfer to a drum. Then, add item 5 and the balance of Primojel® (12.1 kg). Mix in a tumble mixer for 10 minutes.
9. Place the mixture in a V-blender, and mix for 1 hour. The relative humidity should be 20% to 25%.
10. Compress at 4 to 5 ton pressure. The weight of one tablet is 1.010 mg. This is the formula for a double-strength tablet. Adjust quantities and fill weight for 400/80 strength.

SULFAMETHOXAZOLE AND TRIMETHOPRIM TABLETS, DISPERSIBLE (800 MG/160 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
800.00	1	Sulfamethoxazole powder	800.00
160.00	2	Trimethoprim micronized	160.00
80.00	3	Starch (maize)	90.00
3.00	4	Sodium lauryl sulfate	3.00
15.00	5	Gelatin	15.00
25.00	6	Starch (maize)	25.00
8.00	7	Magnesium stearate	8.00
9.00	8	Guar gum	9.00
—	9	Purified water	300.00

Manufacturing Directions

Note: The binding solution is liable to microbiological growth, so prepare the solution fresh, before the granulation process.

1. Preparation of starch paste: Manually make a slurry of item 6 in 40 g of item 9 (40°C). Then, add 110 g of item 9 into the vessel, and heat to 80°C. Add the slurry of item 6 to it, and mix until it swells and is translucent.
2. Add item 5 slowly to 150 g of item 9 (70°C) using a stirrer. Avoid lumps and excessive foam formation. Add the gelatin solution to the starch paste in step 1, and mix for 10 minutes.
3. Dry powder mixing: Load items 1, 2, 3, and 4 in the mixer. Mix and chop at high speed for 6 minutes.
4. Wet massing: Add starch paste from step 2 to the dry powders in the mixer, while mixing and chopping at low speed. When the addition is over, mix further for 5 minutes or until a satisfactory mass is obtained. *Note:* Avoid lumps or a ball formation that is too big.
5. Drying
   a. Dry the granules in a fluid-bed dryer at 55°C for 1 hour.
   b. Check the moisture content. The limit is 1% to 1.5%. *Note:* Moisture control is a very important step. It affects the microbial quality of this product.
6. Grinding: Grind the dried granules through a 1.5 mm sieve first, and then through a 1.25 mm sieve fitted on a dry granulator. Collect the granules in a stainless steel drum. Load the granules to the blender.
7. Lubrication
   a. Mix items 7 and 8 in a polythene bag. Pass the mix through a 250 µm sieve using a sifter. Collect in a polythene bag. Add 10 g granules from step 6. Mix for 1 to 2 minutes, add to the blender, and mix for 2 minutes.
   b. Unload into stainless steel drums.
8. Compression: Compress the granules using a rotary tableting machine with 19 × 8.8 mm oblong punches. Each tablet will be 1100 mg.

SULFATHIAZOLE TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Sulfathiazole	250.00
237.00	2	Lactose monohydrate or dicalcium phosphate	237.00
12.00	3	Kollidon® 30	12.00
—	4	Water, purified	QS
12.00	5	Kollidon® CL	12.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate a mixture of items 1 to 3 with item 4, pass through a 0.8 mm sieve, dry, add items 5 and 6, and press with low-compression force.
2. Compress into 504 mg tablets (512 mg if using dicalcium phosphate), using 12 mm biplanar punches.

SUMATRIPTAN SUCCINATE FAST-MELT TABLETS

Manufacturing Directions

1. Mix sumatriptan succinate 15%, sodium bicarbonate 27%, citric acid anhydrous 26%, microcrystalline cellulose 11%, anhydrous lactose 9%, xylitol 10%, and sucrose stearate 2%.
2. These ingredients are dried at elevated temperatures to significantly reduce the moisture content of the materials.
3. Blend for approximately 10 minutes, and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) and to form granules containing the effervescent ingredients.
4. Mix SS-EGF (30–60 mesh) 50%, microcrystalline cellulose 31%, mannitol 10%, L-HPC LH-11 5%, aspartame 3%, redberry flavor 0.3%, natural orange powder 0.1%, magnesium stearate 0.5%, and fumed silicon dioxide 0.1%.
5. Screen and blend for 5 minutes prior to compression.
6. Sumatriptan succinate tablets are then compressed to a hardness of approximately 1 to 5 kPa (depending upon the dose of the active), and tablets disintegrate in water in approximately 15 to 35 seconds.

SUMATRIPTAN SUCCINATE TABLETS (25 MG/50 MG), IMITREX

Each Imitrex tablet for oral administration contains 35 or 70 mg of sumatriptan succinate equivalent to 25 or 50 mg of sumatriptan, respectively. Each tablet also contains the inactive ingredients croscarmellose sodium, lactose, magnesium stearate, microcrystalline cellulose, and titanium dioxide dye.

SUMATRIPTAN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
140.00	1	Sumatriptan[a]	140.00
154.00	2	Lactose monohydrate	154.00
17.00	3	Microcrystalline cellulose	17.00
3.30	4	Sodium croscarmellose	3.30
1.70	5	Magnesium stearate	1.70
—	6	Water, purified, ca	12.50 mL

[a] For 25 mg strength, use 35 mg of sumatriptan succinate.

Manufacturing Directions

1. Sift items 1 and 2 through a 0.6 mm mesh sieve screen into a fluid-bed granulator.
2. Granulate by spraying item 6 with an inlet temperature of 75°C; allow granules to dry.
3. Pass granules through a granulator fitted with a 0.8 mm mesh screen.
4. Transfer granules to a blender, add item 5, and mix for 5 minutes.
5. Compress about 320 mg in a suitable punch.

TAMOXIFEN TABLETS (10 MG/20 MG), NOLVADEX

Nolvadex tablets are available as follows. 10 mg tablets: each 10 mg tablet contains 15.2 mg of tamoxifen citrate, which is equivalent to 10 mg of tamoxifen; 20 mg tablets*:* each 20 mg tablet contains 30.4 mg of tamoxifen citrate, which is equivalent to 20 mg of tamoxifen. The inactive ingredients are carboxymethyl cellulose calcium, magnesium stearate, mannitol, and starch.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Tamoxifen; use tamoxifen citrate	15.30
114.50	2	Lactose monohydrate	114.50
38.00	3	Starch (maize)	38.00
3.50	4	PVP K30	3.50
0.75	5	Magnesium stearate	0.75
3.00	6	Ac-Di-Sol	3.00
—	7	Water, purified, ca	30 mL

Manufacturing Directions

1. After sifting items 1 to 3 through a 500 μm sieve, place in a suitable mixer. Mix this for 5 minutes at low speed.
2. In a separate vessel, add and dissolve item 4 in item 7 at a slow speed.
3. Add step 2 into step 1, and knead and mix for 5 minutes, and then again, long enough to achieve a suitable wet mass.
4. Dry the wet mass on trays at 55°C for 5 hours to an LOD of not more than 1 to 1.5%. If required, dry for another hour.
5. Pass the dried granules through a 1.25 mm sieve, and transfer to a blender.
6. Add items 5 and 6 (sifted through a 500 μm sieve) to step 5, and blend for 1 minute.
7. Compress into 175 mg tablets, using 8 mm round, plain concave punches. For 20 mg tablets, use appropriate fill weight in 10 mm punches.

TAMSULOSIN HYDROCHLORIDE BUCCAL TABLETS

Directions

1. Dissolve 80 g of tamsulosin hydrochloride and 80 g of hydroxypropyl methylcellulose (TC5E) in a mixture of 304 g purified water and 2736 g methanol.
2. Introduce 4000 g of Celphere 102 (mean particle diameter of approximately 127; particle diameter of approximately 50 to approximately 150 μm) to a fluidized-bed granulator and coat with this solution by the side spraying method (spraying liquid volume 100 g/min, spraying air pressure 4 kg/cm^2, product temperature 40°C, inlet temperature 80°C) to obtain tamsulosin hydrochloride particles.
3. Separately, dissolve 533 g of ethyl cellulose and 187 g of hydroxypropyl methylcellulose (TC5E) in a mixture of 698 g purified water and 22,582 g methanol.
4. Introduce tamsulosin hydrochloride (4000 g) particles to a fluidized-bed granulator and coat with this solution by side spraying (spraying liquid volume of 40 g/min, spraying air pressure of 4 kg/cm^2, product temperature of 50°C, inlet temperature of 60°C) to obtain sustained-release fine particles.
5. Introduce these sustained-release fine particles (4000 g) to a fluidized-bed granulator and coat with a mixture of 2000 g of Aquacoat, 4000 g of Eudragit® L30D55, 667 g of Eudragit® NE30D, and 6667 g of purified water (spraying liquid volume of 40 g/min, spraying air pressure of 4 kg/cm^2, product temperature of 40°C, inlet temperature of 60°C) to obtain enteric sustained-release fine particles.
6. Then, granulate 368 g of these enteric sustained-release fine particles, 2560 g mannitol, and 640 g lactose (spraying liquid volume 200 g/min, spraying air pressure of 1.5 kg/cm^2, product temperature of 29°C, inlet temperature of 80°C, spraying cycle of 10 seconds spraying to 30 seconds drying) with an aqueous 40% w/w solution containing 400 g maltose in a fluidized-bed granulator to obtain the final composition.
7. After further mixing 32 g calcium stearate with the composition that is obtained, make 200 mg tablets containing 0.2 mg tamsulosin hydrochloride per tablet under a tableting pressure of 100 kg/punch and an initial hardness of 1.0 kPa using a rotary tableting machine.
8. Next, subject these tablets for 18 hours to heating and humidifying at 25°C/75% RH using a thermostatic chamber at constant humidity.
9. Then, dry for 3 hours at 30°C and 40% RH. The tablets that are obtained should show a hardness of 5.9 kPa (n=5), friability of 0.8% (100 rounds), and disintegration time in the buccal cavity of 20 seconds.

TANNIN–CROSPOVIDONE COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
55.00	1	Tannic acid	55.00
230.00	2	Water	230.00
230.00	3	Kollidon® CL	230.00
33.00	4	Avicel™ PH101	33.00
2.60	5	Talc	2.60
0.30	6	Aerosil® 200	0.30
0.30	7	Calcium arachinate	0.30

Manufacturing Directions

1. Prepare solution of items 1 and 2, suspend item 3, and filter the formed insoluble tannin–crospovidone complex.
2. Wash with water until the water is clear, pass the solids through a 0.8 mm sieve, and dry.
3. Add items 4 to 7, and press with low compressive force.
4. Compress into 323 mg tablets, using 12 mm biplanar punches.

TEGASEROD MALEATE TABLETS 2 MG

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.77	1	Tegaserod maleate equivalent to Tegaserod 2 mg	2.77
87.73	2	Lactose spray dried	87.73
3.00	3	Crospovidone	3.00
5.00	4	Poloxamer	5.00
0.50	5	Hypromellose	0.50
1.00	6	Glyceryl behenate	1.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass item 1, item 4, and item 5 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 5% (=2.2 g) powder from step 1 to step 3, and mix well.
5. Add 15% (=6.6 g) powder from step 1 to step 4, and mix well.
6. Transfer step 5 into step 2.
7. Pass item 3 through 0.5 mm sieve, and add to step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 6 through 0.250 mm sieve, and place in tumbler from step 9.

11. Mix step 10 for 2 minutes.
12. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).

TEGASEROD MALEATE TABLETS 6 MG

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
8.31	1	Tegaserod maleate equivalent to Tegaserod 2 mg	8.31
127.44	2	Lactose spray dried	127.44
4.50	3	Crospovidone	4.50
7.50	4	Poloxamer 188	7.50
0.75	5	Hypromellose	0.75
1.50	6	Glyceryl behenate	1.50

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, and 5 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 10% (=6.3 g) powder from step 1 to step 3, and mix well.
5. Transfer step 4 into step 2.
6. Pass item 3 through 0.5 mm sieve, and add to step 2.
7. Transfer balance quantity of step 1 into step 2.
8. Mix step 2 for 20 minutes using tumbler.
9. Pass item 6 through 0.250 mm sieve, and add to step 8.
10. Mix step 9 for 2 minutes.
11. Compress into 150 mg tablets, using a suitable punch (5.5 mm × 7.0 mm, modified oval).

TEMAFLOXACIN HYDROCHLORIDE TABLETS (200 MG/300 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Temafloxacin hydrochloride, excess 10%	220.00
112.50	2	Lactose monohydrate	112.50
40.00	3	Sodium starch glycolate	40.00
12.50	4	Hydroxypropyl cellulose	12.50
100.00	5	Cellulose microcrystalline	100.00
5.00	6	Magnesium stearate	5.00
10.00	7	Talc	10.00
QS	8	Water, purified, ca	186.00 mL

Manufacturing Directions

1. Granulation
   a. Dissolve hydroxypropyl cellulose in two-thirds volume of purified water (item 8).
   b. Pass lactose, temafloxacin hydrochloride, and the sodium starch glycolate through an approximately 765 µm aperture screen, if necessary, load into a mixer, and mix. Add hydroxypropyl cellulose solution from step 1a, mix, and granulate. Add more water, if needed, until a granule mass is formed.
   c. Pass the wet mass through an approximately 4.8 mm aperture screen, and dry in a dryer at 45°C to 52°C to an LOD of not more than 1.5%. Pass the dried granules through an approximately 1.18 mm screen. If necessary, screen the microcrystalline cellulose (and crospovidone for 400 and 600 mg tablets) through an approximately 500 µm aperture screen. Add to the dried granules, and blend for 10 minutes.
   d. Pass magnesium stearate and talc through a 500 µm aperture screen. Add to the bulk from step 1c, and blend for 5 to 10 minutes.
   e. Compress as follows: 200 mg, 7.32 × 15.19 mm; 500 mg and 300 mg, 8.5 × 17.5 mm.
   f. Coat the compressed tablets by spraying with a color coat and then apply gloss. (See Appendix.)

TENOXICAM TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
20.00	1	Tenoxicam	20.00
90.00	2	Lactose monohydrate	90.00
84.00	3	Maize starch	84.00
4.00	4	Talc	4.00
2.00	5	Magnesium stearate	2.00
—	6	Water, purified, ca	50.00 mL

Manufacturing Directions

1. Place item 6 and item 3 (20%) in a mixer heated to 40°C, and mix for 10 minutes. Heat at 70°C to 80°C until a homogeneous paste is formed. Cool to 50°C.
2. In a separate vessel, place item 2, the balance of item 3, and item 1. Mix well.
3. Add the paste from step 1 into step 2, and mix for 15 minutes until a loose, moist mass is obtained.
4. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.

5. Spread over paper-lined trays, and dry at 45°C overnight (the relative humidity over the granules should be 20–35%).
6. Pass the dried granules through a 1.5 mm sieve granulator.
7. Transfer the granules to a tumbler, add item 4 and then item 5, and mix for 20 minutes.
8. Compress into 200 mg tablets, using a suitable punch (11.5 × 6.0 mm).

TERAZOSIN HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.00	1	Terazosin hydrochloride	1.10
98.00	2	Ludipress®	98.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press with low-compression force (10 kN).
2. Compress 98.1 mg for 1 mg and 97.6 mg for 5 mg strength, using 6 mm biplanar punches.
3. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.
4. For 5 mg strength, adjust with item 2.

TERAZOSIN TABLETS (1 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
128.56	1	Lactose	128.56
1.000	2	Terazosin; use terazosin monohydrate	1.187
7.500	3	Starch (maize)	7.500
6.000	4	Starch (maize)	6.000
—	5	Water, purified, ca	25 mL
6.000	6	Talc	6.000
1.123	7	Magnesium stearate	1.120

Manufacturing Directions

1. Granulation
   a. Mix the terazosin and a portion of lactose. Mill the mixture through a 425 µm (or similar) aperture screen using a comminuting mill, with impact forward, at high speed.
   b. If necessary, mill the remainder of lactose.
   c. Add the powders (step 1a and 1b) and starch (item 3) to the mixer. and blend for 20 minutes.
   d. Disperse starch (item 4) in purified water, and heat to make a paste.
   e. Add starch paste to powder blend, and blend for 5 to 7 minutes, adding extra purified water. Record any additional volume.
   f. If necessary, pass the granule through a 4.76 mm aperture on an oscillating granulator or a 12.7 mm aperture screen on a comminuting mill, with knives forward, at slow speed.
   g. Dry at 49°C to an LOD of not more than 2% (105°C for 1 hour).
   h. Pass granules through a 1.18 mm aperture screen on an oscillating granulator.
   i. Add one-half of the granules to a suitable blender.
   j. Blend the magnesium stearate and talc with a portion of the granules. Pass through a 1.18 mm aperture screen, and add to the bulk.
   k. Add the remainder of granule, and blend for 10 minutes. 2. Compression: Use 7.14 mm or other similar-size punches. For 2 mg, 5 mg, and 10 mg strengths, adjust with item 1 and any dye added to differentiate tablets.

TERBINAFINE TABLETS (250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
250.00	1	Terbinafine (used as terbinafine hydrochloride)	250.00
10.00	2	Hypromellose (hydroxypropyl methylcellulose)	10.00
105.00	3	Avicel™ PH 102 (microcrystalline cellulose)	105.00
2.50	4	Ac-Di-Sol (croscarmellose sodium)	2.50
1.50	5	Magnesium stearate	1.50
QS	6	Purified water	QS

Manufacturing Directions

1. Sift terbinafine hydrochloride and Avicel™ through a 250 µm sieve.
2. Dissolve hydroxypropyl methylcellulose in purified water to make a granulating solution.

3. Knead the powder mix in step 1 with the granulation solution to get the desired wet mass. Pass the mass through an 8 mesh sieve onto drying trays.
4. Dry granules at 60°C for 12 hours to an LOD of not more than 2%.
5. Pass the granules through a 16 mesh screen into the blending vessel.
6. Pass croscarmellose sodium and magnesium stearate through a 250 µm sieve, and add to step 5. Blend for 3 minutes.
7. Compress into 400 mg tablets, using a suitable punch.

TERFENADINE CHEWABLE TABLETS

Manufacturing Directions

1. Terfenadine, 10.00% (micronized or powdered); PVP K-90, 3.00%; block copolymer poloxomer 188, 1.00%; maltodextrin QD M500 fine, 10.00%; sorbitol INSTANT, 30.00%; aspartame, 0.50%; mannitol or xylitol, 44.50%; magnesium stearate, 0.50%; spray-dried flavor, 0.50%.
2. Premix terfenadine, block copolymer, aspartame, spray-dried flavor, and PVP in a cube blender for a time period of 10 minutes.
3. Add the sorbitol INSTANT, and mix the resulting admixture for another 10 minute time period.
4. Add the maltodextrin and mannitol or xylitol, and mix the resulting composition for a further 10 minutes. Then add the magnesium stearate lubricant and mix into the composition for a further 3 minutes.
5. Make the lubricated admixture into tablets by compression to a hardness of 9 to 12 kPa (12–18 Strong Cobb units) using 3/8 in. standard concave punches or an appropriate punch/die set.

TERFENADINE TABLETS (60 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Terfenadine	60.00
235.00	2	Ludipress®	235.00
6.00	3	Kollidon® CL	6.00
1.00	4	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with very low-compressive force.
2. Compress into 301 mg tablets, using 8 mm biplanar punches.

TESTOSTERONE AND NORETHINDRONE BUCCAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Testosterone	50.00
35.00	2	Norethindrone	35.00
14.80	3	Polyethylene oxide	14.80
0.20	4	Magnesium stearate	0.20

Manufacturing Directions

1. Thoroughly mix all components (i.e., testosterone, norethindrone, polyethylene oxide, and magnesium stearate, as set forth in BOM) prior to tablet formation using aqueous fluid-bed granulation to provide a homogeneous mixture of active agents and excipients.
2. Make the individual dosage units by applying approximately 10 to 15 mg of the mixture into the punch die of a tablet press and compressing the mixed components using a pressure in the range of approximately 500 to 2000 psi. Prepare tablets with a diameter of approximately 4 mm and a height of 1 mm. Remove the tablet from the punch die, and the weight and dimensions of the tablet are measured.

TESTOSTERONE, ESTRADIOL, AND PROGESTERONE BUCCAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.50	1	Testosterone	1.50
0.30	2	Estradiol	0.30
4.70	3	Progesterone	4.70
2.48	4	Polyethylene oxide (Polyox WSR-303)	2.48
1.00	5	Carbopol	1.00
0.02	6	Magnesium stearate	0.02

Manufacturing Directions

1. Thoroughly mix all components (i.e., testosterone, estradiol, polyethylene oxide, carbomer, and magnesium stearate) prior to tablet formation using aqueous fluid-bed granulation to provide a homogeneous mixture of active agents and excipients.
2. Make the individual dosage units by applying 10 mg of the mixture into the punch die of the tablet press and compressing the mixed components using a

pressure in the range of approximately 500 to 2000 psi. Prepare tablets with a diameter of approximately 4 mm and a height of 1 mm.

TETRACYCLINE TABLETS (125 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
125.00	1	Tetracycline hydrochloride	125.00
100.00	2	Ludipress®	100.00
42.00	3	Microcrystalline cellulose (Avicel™ PH 101)	42.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with very low-compression force.
2. Compress into 278 mg tablets, using 8 mm biplanar punches.

TETRACYCLINE TABLETS (250 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Tetracycline hydrochloride	250.00
175.00	2	Lactose monohydrate	175.00
15.00	3	Kollidon® 30	15.00
25.00	4	Kollidon® CL	25.00
28.00	5	Talc	28.00
3.50	6	Aerosil® 200	3.50
3.50	7	Calcium arachinate	3.50

Manufacturing Directions

1. Pass items 1 to 4 through a 0.5 mm sieve, add the mixture of items 6 and 7, and press with low-compression force.
2. Compress into 505 mg tablets, using 12 mm biplanar punches.

TETRAZEPAM TABLETS (PAGE50 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
50.00	1	Tetrazepam	50.00
113.00	2	Microcrystalline cellulose (Avicel™ PH 101)	113.00
30.00	3	Starch 1500 (Colorcon)	30.00
5.00	4	Kollidon® VA 64	5.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass the components through a 0.5 mm sieve, and press with low-compression force.
2. Compress into 208 mg tablets, using 8 mm biplanar punches.

THEOPHYLLINE AND EPHEDRINE TABLETS (130 MG/15 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
130.00	1	Theophylline (0.1–0.4 mm)	130.00
15.00	2	Ephedrine hydrochloride	15.00
150.00	3	Ludipress®	150.00
2.00	4	Aerosil® 200	2.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with very low-compression force.
2. Compress into 302 mg tablets, using 8 mm biplanar punches.

THEOPHYLLINE SUSTAINED-RELEASE TABLETS (500 MG) DC

Formulation: Theophylline, granular type (BASF), 500 g; Kollidon® SR, 125 g; Ludipress® LCE, 225 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Mix all components, pass through a sieve of 0.8 mm, and press with medium-compression force at 853 mg.

THEOPHYLLINE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Theophylline (0.1–0.4 mm)	100.00
147.00	2	Ludipress®	147.00
3.00	3	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force.
2. Compress into 247 mg tablets, using 8 mm biplanar punches.

THEOPHYLLINE TABLETS

Manufacturing Directions

1. Theophylline, 200 mg; crystalline PVA homopolymer, 200 mg; magnesium stearate, 5 mg. Total = 405 mg.
2. Mix in a geometric dilution.

Compress on 2.7×10^6 kg/m^2 pressure with 3/8 in. (9.53 mm) diameter standard concave tooling to form tablets with average hardness of 12 SCU.

THEOPHYLLINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Theophylline	100.00
70.62	2	Starch 1500	70.62
72.50	3	Microcrystalline cellulose (50 Mm)	72.50
5.00	4	Stearic acid	5.00
1.25	5	Fumed silica	1.25
0.63	6	Magnesium stearate	0.63

Manufacturing Directions

1. Blend all ingredients except magnesium stearate for 10 minutes in a twin-shell blender.
2. Add magnesium stearate and blend for an additional 5 minutes.
3. Compress tablets at 250 mg.

THEOPHYLLINE TABLETS (100 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Theophylline	100.00
137.10	2	Lactose anhydrous	137.10
60.00	3	Carbopol® 971P	60.00
1.50	4	Cab-o-Sil®	1.50
1.50	5	Magnesium stearate	1.50

Manufacturing Directions

1. Pass all items through a 250 µm mesh, and place items 1 to 3 in a suitable blender. (Item 3 can be used granulated in a fluid-bed.)
2. Add items 4 and 5, and blend for 3 minutes.
3. Compress into 300 mg tablets, using a suitable punch.

THEOPHYLLINE TABLETS CR (200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Theophylline powder	200.00
2.00	2	Sodium lauryl sulfate	2.00
2.00	3	Calcium stearate	2.00
35.00	4	Ethyl cellulose	35.00
3.60	5	Cetanol	3.60
1.60	6	Sodium lauryl sulfate	1.60
148.00	7	Triethyl citrate	148.00
—	8	Water, purified	QS

Manufacturing Directions

1. Place items 1 to 3 in a suitable mixer, and mix for 10 minutes.
2. Granulate step 1 by passing the items through a compactor or dry granulator.
3. Pass the compact material from step 2 through 16 to 32 mesh screens.
4. In a separate vessel, add items 4 to 7, and make a solution with item 8 to 200 g.
5. Transfer step 3 into a fluid-bed granulator, and apply the solution in step 4 to coat the granules.
6. Compress.

THEOPHYLLINE TABLETS (100 MG)

Formulation: Theophylline granules 0.1/0.4 mm (BASF), 100 g; Ludipress®, 147 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force at 247 mg.

THIAMINE AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Thiamine hydrochloride	500.00
100.00	2	Caffeine	100.00
30.00	3	Cornstarch	30.00
20.00	4	Kollidon® VA 64	20.00
15.00	5	Kollidon® VA 64	15.00
QS	6	Ethanol (96%)	QS
35.00	7	PEG-6000 (powder)	35.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of item 5 and 6, dry, sieve, mix with item 7, and press with low compressive force.
2. Compress into 698 mg tablets, using 16 mm biplanar punches.

THIAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Thiamine HCl with excess	110.00
43.50	2	Lactose monohydrate	43.50
4.00	3	Crospovidone (Kollidon® CL)	4.00
5.50	4	Povidone (PVP K-90)	5.50
5.50	5	Crospovidone (Kollidon® CL)	5.50
32.00	6	Microcrystalline cellulose (Avicel™ PH112)	32.00
5.60	7	Talc (fine powder)	5.60
3.70	8	Glyceryl behenate (glyceryl monostearate)	3.70
0.20	9	Magnesium stearate	0.20
—	10	Alcohol (ethanol, 95%)	50.67

Manufacturing Directions

1. Sift items 1, 2, and 3 through a stainless steel 630 µm sieve.
2. Load into mixer.
3. Mix for 5 minutes at high speed.
4. Dissolve item 4 in item 10 under slow stirring by stirrer.
5. Add the binding solution while mixing at high speed over a period of 2 minutes. Scrape sides and blades.
6. Mix and chop at high speed for 2 minutes.
7. Check the end point of granulation.
8. If required, add additional item 10 to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Dry wet granules in oven at 55°C for 8 hours.
9. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
10. Check the LOD (limit: 1.0–1.5%).
11. If required, dry at 55°C for an additional hour.
12. Check the LOD again.
13. Grind the dried granules through a 1.25 mm sieve with the granulator set at medium speed.
14. Collect in stainless steel drums.
15. Load the granules into blender.
16. Sift items 5 and 6 through a 500 µm sieve, and add to blender.
17. Mix for 2 minutes (do not overmix).
18. Sift items 8 and 9 through a 500 µm sieve.
19. Add 1.33 to 2.67 g of granules.
20. Mix in a polyethylene bag for 1 minute.
21. Add to blender.
22. Blend for 1 minute.
23. Check temperature and humidity before start of compression (limit: temperature should not exceed 25°C; relative humidity, 45–50%).
24. Compress using 8 mm, round, beveled, concave punches.

THIAMINE HYDROCHLORIDE TABLETS, SUGAR-COATED

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Thiamine hydrochloride monohydrate (with excess)	110.00
110.00	2	Lactose	110.00
5.00	3	Luviskol® K-98	5.00
1.00	4	Magnesium stearate	1.00
40.00	5	Ethyl alcohol (denatured)	40.00
251.44	6	Sugar (crystalline)	251.44
1.40	7	Sugar powder	1.40
14.50	8	Maize starch	14.50
14.81	9	Talcum	14.81
21.00	10	Copolymer lacquer	21.00
0.40	11	Paraffin (solid)	0.40
0.16	12	Gum acacia	0.16
0.228	13	Ethyl alcohol (denatured)	0.228
0.01	14	Paraffin (liquid)	0.01
QS	15	Purified water	QS

Manufacturing Directions

1. In a suitable stainless steel vessel, add denatured ethyl alcohol and Luviskol®; mix until homogeneous mixture is obtained. Set aside.
2. Pass lactose through a 2 mesh sieve, add thiamine, and mix for 10 minutes in an appropriate mixer.
3. Slowly add to this mixture the solution made earlier, and stir until slightly lumpy mass is obtained.
4. If required, add ethyl alcohol to the mixture.
5. Pass the wet mass through an oscillating granulator with a 7.00 mm perforated sieve.
6. Spread the granules over paper-lined trays, and dry at 40°C for 5 hours in a drying oven.
7. The relative humidity of the granules should be 15% to 25%.
8. Pass magnesium stearate and talcum through a 1 mm hand sieve.
9. Compress on a rotary tablet machine at about 4 to 5 tons of pressure; the weight of each tablet should be about 230 mg.
10. In a suitable container, add purified water and acacia gum; pass the resulting solution through a 0.8 mm sieve.
11. Load the compressed tablets into a coating pan, and apply the copolymer lacquer in ten portions; after the last application, apply neutral spray (crystalline sugar in demineralized water).
12. Dry the insulated tablets in a drying oven overnight at 45°C (minimum 14 hours); the tablet weight should be around 236 mg each.
13. Into an electric, jacketed kettle, put demineralized water, crystalline sugar, maize starch, and talcum; mix by stirring until homogeneous.
14. Pass through a sieve of mesh size 0.8 mm (pH, 6.0–8.0; density, 1.335–1.356).
15. Coat the tablets to 400 mg weight using the coating solution and a sugar-coating pan; set pans at slow speed, open air inlets, and set air inflow at 80°C and maximum contact temperature at 42°C.
16. Roll tablets to reach this temperature.
17. Turn pan to fast speed, close the inlet air flap, and make first application of syrup.
18. When all tablets are wet, and distribution of syrup is uniform, open the air inlet flap and allow 80°C air to blow (tablet temperature falls 1–2°C for a short time and then slowly rises to 42°C).
19. The next application of the syrup cycle begins.
20. Coat the tablets with color solution as described in steps 15–18 to 495 mg weight.
21. Set the air inflow temperature at 25°C, and reduce the size of application with the falling temperature, whereby tablets are evenly and lightly moistened after each application; the temperature drops from 42°C to 32°C.
22. Turn the coating pans slowly during the drying phase; for the last three applications, keep the pan lids closed, as well as the air intake and outflow during this phase.
23. Drying only with outlet air may be extended for the last three applications up to 10 to 15 minutes.
24. Immediately after the last application of syrup has dried slightly, begin the polishing step.
25. The polishing paste is prepared in a suitable boiling vessel by adding stock gum solution, crystalline sugar, and demineralized water.
26. Boil until temperature reaches 106°C with stirring.
27. In a steam kettle, melt solid and liquid paraffin, and pour melted paraffins into the mixture of gum; make up the weight with demineralized water.
28. Polishing paste ready for use contains 0.75 kg of paste and 0.113 kg of ethyl alcohol.
29. Tablet temperature is 28°C to 32°C.
30. Shut off the inlet flaps and outlet flaps, set the pans at the fast speed, and add polishing paste (about 0.3% of tablet weight).
31. Close the pans with inner lids and allow them to rotate at fast speed for 90 seconds for even distribution.
32. Remove the inner lid of the pan, and set it on slow speed.
33. Open the outlet air for 3 minutes, and blow the inlet air at 40°C for 6 to 8 minutes until a good sheen appears.
34. Set the pans on automatic system for overnight, with intermission time of 5 minutes off and 10 seconds on.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
110.00	1	Thiamine mononitrate	110.00
210.00	2	Pyridoxine hydrochloride	210.00
76.82	3	Lactose monohydrate	76.82
10.00	4	Crospovidone (Kollidon® CL)	10.00
18.50	5	Povidone (PVP K-90)	18.50
0.30	6	Cyanocobalamin	0.30
85.00	7	Microcrystalline cellulose (Avicel™ PH102)	85.00
14.00	8	Crospovidone (Kollidon® CL)	14.00
10.00	9	Glyceryl behenate (glyceryl monostearate)	10.00
0.49	10	Magnesium stearate	0.49
15.00	11	Talc (fine powder)	15.00
—	12	Alcohol (ethanol, 95%)	88.90

Manufacturing Directions

1. Dissolve item 5 in item 12 by using a stirrer to make a clear solution.
2. Dissolve item 6 carefully in the solution.
3. Sift items 1 to 4 through a 630 µm sieve.
4. Load the material into a mixer.
5. Mix and chop at high speed for 5 minutes.
6. Add binding solution from previous step to the dry powder in the mixer while mixing and chopping at high speed for 2 minutes.
7. Check for satisfactory wet mass.
8. Add additional item 12, if required, to obtain a satisfactory wet mass.
9. Do not allow big lumps.
10. Record the additional quantity of ethanol 95%.
11. Spread the granules onto stainless steel trays to a thickness of 1/4th of the tray thickness, and load the trays onto a trolley.
12. Load the trolley into an oven.
13. Keep the door open, switch on the oven with air circulation, heater turned off for 2 hours.
14. Dry the granules at 55°C for 12 hours.
15. Check the LOD of dried granules (limit: NMT 0.7%).
16. Grind the dried granules through a 1.25 mm sieve using a granulator.
17. Collect in a stainless steel drum.
18. Load into the blender.
19. Sift items 7, 8, and 9 through a 500 µm sieve.
20. Collect in stainless steel container.
21. Load the sieved powder into the blender.
22. Blend for 3 minutes.
23. Sift items 11 and 10 through a 500 µm sieve.
24. Collect in a polyethylene bag.
25. Add 4.44 to 6.67 g of granules from earlier step, and mix manually for 1 minute.
26. Add this mixture to the blender, and mix for 1 minute.
27. Compress the granules using a rotary tableting machine.
28. Compress into 550 mg tablets, using round, biconvex punches at 9 to 16 kp.
29. Coat tablets using an HPMC coating (see Appendix).

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Thiamine mononitrate (powder) with excess	115.00
50.00	2	Pyridoxine hydrochloride	50.00
9.75	3	Anhydrous citric acid (powder)	9.75
20.10	4	Monohydrate lactose (powder, regular)	20.10
1.67	5	Saccharin sodium	1.67
0.24	6	Dye	0.24
0.009	7	Dye	0.009
0.02	8	Dye	0.02
2.00	9	Cornstarch	2.00
QS	10	Purified water	18.00 mL
50.00 µg	11	Vitamin B12; use vitamin B12 oral powder cobalamin concentrate	62.50
12.50	13	Monohydrate lactose (powder, regular)	12.50
1.50	14	Oil orange terpeneless	1.50
3.50	15	Magnesium stearate	3.50
1.50	16	Talc (powder)	1.50
17.70	17	Corn starch, Light Coral Red 6 LA	17.70

Manufacturing Directions

1. Pass thiamine mononitrate, pyridoxine HCl, citric acid, lactose (item 4), and saccharin sodium through a 30 mesh (595 µm or similar) screen.
2. Load into mixer, and dry mix.
3. Dissolve the dyes in purified water.
4. Add the starch (item 9) to this dye solution with stirring.
5. Heat and continue stirring until a thick paste is formed.
6. Cool to room temperature before using.
7. (*Note:* Use 7.5 g of colored starch paste for the vitamin B1 and B6 blend and 12.5 g of colored starch paste for the vitamin B12 blend.) Add 7.5 g of colored starch paste to powder blend, and mix until mass is formed.
8. Pass through a 6 mesh (3.36 mm or similar) screen, and air dry for 3 to 4 hours.
9. Screen vitamin B12 oral powder and lactose (item 12) through a 30 mesh (595 µm or similar) screen.
10. Load into mixer, and dry mix.
11. Add 12.5 g colored starch paste to powder blend, and mix until mass is formed.
12. Pass through a 6 mesh (3.36 mm or similar) screen, and air dry for 3 to 4 hours.

13. Dry granulations from the two steps separately at 49°C overnight or until LOD is less than 1%.
14. Mill the two dried granulations through a 16 mesh (1.2 mm or similar) screen (knives forward, medium speed), and combine.
15. Sift a small quantity of granulation from the previous steps over a 30 mesh (595 µm or similar) screen, and add the orange oil to the fines.
16. Add magnesium stearate, talc powder, and Light Coral Red starch to mixture, and pass through a 30 mesh (595 µm or similar) screen.
17. Load base granulation and lubricants into a blender, and blend thoroughly.
18. Compress using 11/32 in. concave punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Thiamine hydrochloride	100.00
10.00	2	Pyridoxine hydrochloride	10.00
0.10	3	Cyanocobalamin (gelatin coated, 1%)	10.00
277.00	4	Ludipress®	277.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress into 394 mg tablets, using 12 mm biplanar punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Thiamine mononitrate	100.00
200.00	2	Pyridoxine hydrochloride	200.00
0.10	3	Cyanocobalamin (gelatin coated, 1%)	10.00
250.00	4	Ludipress®	250.00
45.00	5	PEG-6000 (powder)	45.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 609 mg tablets, using 12 mm biplanar punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.00	1	Thiamine mononitrate	250.00
250.00	2	Pyridoxine hydrochloride	250.00
75.00	3	Lactose monohydrate	75.00
25.00	4	Kollidon® 30	25.00
QS	5	Isopropanol	QS
1.00	6	Cyanocobalamin (gelatin coated, 1%)	100.00
25.00	7	Kollidon® CL	25.00
2.00	8	Magnesium stearate	2.00
2.00	9	Talc	5.00

Manufacturing Directions

1. Granulate mixture items 1 to 3 with solution of items 4 and 5, dry, pass through a 0.8 mm sieve, mix with items 6 to 9, and press with low compressive force, applying a vibrating hopper.
2. Compress into 730 mg tablets, using 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
50.00	1	Thiamine hydrochloride or thiamine mononitrate	50.00
293.00	2	Ludipress®	293.00
5.00	3	Magnesium stearate	5.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with medium compressive force.
2. Compress 357 mg, if hydrochloride salt is used, or 347 mg, if mononitrate salt is used, with 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Thiamine hydrochloride or thiamine mononitrate	50.00
150.00	2	Lactose monohydrate	150.00
150.00	3	Avicel™ PH101	150.00
15.00	4	Kollidon® CL	15.00
2.00	5	Aerosil® 200	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high compressive force.
2. Compress 344 mg, if hydrochloride salt is used, or 373 mg, if mononitrate salt is used, with 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Thiamine hydrochloride or thiamine mononitrate	110.00 (or 100.00)
190.00	2	Ludipress®	190.00
100.00	3	Lactose monohydrate	100.00
100.00	4	Avicel™ PH 101	100.00
9.00	5	Kollidon® CL	9.00
3.00	6	Aerosil® 200	3.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with medium compressive force.
2. Compress 302 mg, if hydrochloride salt is used, or 320 mg, if mononitrate salt is used, with 8 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Thiamine hydrochloride	100.00
200.00	2	Lactose monohydrate	200.00
10.00	3	Kollidon® 30	10.00
60.00	4	Isopropanol	60.00
10.00	5	Kollidon® CL	10.00
2.00	6	Magnesium stearate	2.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, dry, and sieve through a 0.8 mm screen, mix with items 5 to 7, and press to tablets.
2. Compress into 330 mg tablets, using 8 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Thiamine mononitrate	300.00
100.00	2	Dicalcium phosphate (Di-Tab)	100.00
15.00	3	Kollidon® 30	15.00
QS	4	Isopropanol	~50.00
10.00	5	Kollidon® CL	10.00
4.00	6	Magnesium stearate	4.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 2 and 3, dry, and sieve through a 0.8 mm screen.
2. Mix with items 5 and 6, and compress into 430 mg tablets, using 12 mm biplanar punches.

TIBOLONE TABLETS (0.3 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
0.30	1	Tibolone (Org GD 14)	0.30
1.95	2	Hydroxypropyl cellulose	1.95
32.50	3	Starch (maize)	32.50
0.32	4	Magnesium stearate	0.32
29.93	5	Lactose anhydrous	29.33
—	6	Water, purified	QS

Manufacturing Directions

1. Place items 3 and 5 in a suitable blender, and mix for 1 minute after passing them through a 250 µm sieve.
2. In a separate vessel, place items 1 and 2; add a sufficient amount of item 6 to make a uniform solution.
3. Add step 2 into step 1 gradually, and granulate for 2 minutes.
4. Pass the wet mass through an 8 mesh screen, and dry at 40°C for 4 hours.
5. Screen the granules through a 710 µm sieve into a blender.
6. Add item 4, and blend for 1 minute.
7. Compress into 65 mg tablets, using a suitable punch.

TICLOPIDINE HYDROCHLORIDE TABLETS (250 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
250.0	1	Ticlopidine HCl	250.0
72.0	2	Starch, maize	72.0
68.8	3	Microcrystalline cellulose (Avicel™)	68.8
6.0	4	Polyvinylpyrrolidone (PVP K30)	6.0
1.2	5	Colloidal silicon dioxide (Aerosil® 200)	1.2
2.0	6	Magnesium stearate	2.0
—	7	Water, purified	QS

Manufacturing Directions

1. Blend ticlopidine HCl, maize starch, Avicel™, and PVP K-30 after passing through a 350 µm sieve.
2. Place item 3 in a separate vessel, and prepare a paste using item 7.
3. Add step 2 into step 1. Knead to make a suitable wet mass.
4. Pass the wet mass through an 8 mesh screen onto drying trays. Dry at 60°C for 12 hours. The LOD should not be more than 2.5%.
5. Pass the dried granules through a 16 mesh screen into a blending vessel.
6. Blend with Avicel™, Aerosil®, and magnesium stearate previously sieved through a 500 µm sieve.
7. Compress into 400 mg tablets, using 15 mm punches.
8. Coat the tablets with Hypromellose solution. (See Appendix.)

TINIDAZOLE CONTROLLED-RELEASE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
1000.00	1	Tinidazole	1000.00
17.50	2	Methocel K15 MCR	17.50
10.00	3	Methocel K4 MCR	10.00
50.00	4	Lactose	50.00
25.00	5	Polyvinylpyrrolidone K30	25.00
10.00	6	Talc	10.00
5.00	7	Colloidal silicon dioxide	5.00
31.50	8	Sodium stearyl fumarate	31.50
1.00	9	Magnesium stearate	1.00

Manufacturing Directions

1. Blend the drug with the two polymers and lactose and granulate with a solution of polyvinylpyrrolidone in water.
2. Dry, size, and lubricate the granules, and compress to tablets at 1148 mg.

TOLTERODINE TABLETS (1 MG/2 MG), DETROL®

Detrol® tablets contain tolterodine tartrate. Detrol® tablets for oral administration contain 1 or 2 mg of tolterodine tartrate. The inactive ingredients are colloidal anhydrous silica, calcium hydrogen phosphate dihydrate, cellulose microcrystalline, hydroxypropyl methylcellulose, magnesium stearate, sodium starch glycolate (pH 3.0–5.0), stearic acid, and titanium dioxide.

TOPIRAMATE TABLETS (100 MG/200 MG), TOPAMAX

Topamax (topiramate) tablets contain the following inactive ingredients: lactose monohydrate, pregelatinized starch, microcrystalline cellulose, sodium starch glycolate, magnesium stearate, purified water, carnauba wax, hydroxypropyl methylcellulose, titanium dioxide, polyethylene glycol, synthetic iron oxide (100 and 200 mg tablets), and polysorbate 80.

TOSUFLOXACIN TOSYLATE TABLETS (75 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Tosufloxacin tosylate monohydrate	75.00
37.40	2	L-Aspartic acid	37.50
21.45	3	Cellulose, crystalline	21.45
34.50	4	Starch (maize)	34.50
7.50	5	Silicon dioxide, hydrated	7.50
2.25	6	Hydroxypropyl cellulose	2.25
1.80	7	Magnesium stearate	1.80

Manufacturing Directions

1. Pass items 1 and 2 through a 790 µm sieve into a suitable blender.
2. Blend for 2 minutes.
3. Add items 3 to 6, passing each item through a 500 µm sieve.
4. Blend for 5 minutes.
5. Pass item 7 through a 100 mesh screen into step 4.
6. Blend for 1 minute.
7. Compress into 180 mg tablets, using 8 mm punches.

TRAMADOL SUSTAINED-RELEASE TABLETS (100 MG)

Formulation: Tramadol HCl (Chemagis), 100.0 g; Kollidon® SR, 150.0 g; silicon dioxide, colloidal, 2.5 g; magnesium stearate, 1.5 g.

Manufacturing Directions

All ingredients are passed through a 0.8 mm sieve, blended for 10 minutes in a mixer, and then compressed with medium-compression force at 254 mg.

TRAMADOL HYDROCHLORIDE MATRIX TABLETS

Manufacturing Directions

1. Tramadol hydrochloride (100 mg), hydroxypropyl methylcellulose type 2208, 100,000 mPas (85 mg), calcium hydrogen phosphate (62 mg), colloidal silicon dioxide (5 mg), and magnesium stearate (3 mg).
2. Sieve all components through a 0.63 mm sieve, mixing in a cube blender for 10 minutes and pressing into tablets having a diameter of 9 mm, a radius of curvature of 8.5 mm, and a mean weight of 255 mg.

TRAZODONE HYDROCHLORIDE TABLETS (100 MG)

Trazodone HCl is supplied for oral administration in 50 mg, 100 mg, 150 mg, and 300 mg tablets. Trazodone HCl tablets, 50 mg, contain the following inactive ingredients: dibasic calcium phosphate, castor oil, microcrystalline cellulose, ethyl cellulose, FD&C Yellow No. 6 Aluminum Lake, lactose, magnesium stearate, povidone, sodium starch glycolate, and starch (corn).

Trazodone HCl tablets, 100 mg, contain the following inactive ingredients: dibasic calcium phosphate, castor oil, microcrystalline cellulose, ethyl cellulose, lactose, magnesium stearate, povidone, sodium starch glycolate, and starch (corn).

Trazodone HCl tablets, 150 mg, contain the following inactive ingredients: microcrystalline cellulose, FD&C Yellow No. 6 Aluminum Lake, magnesium stearate, pregelatinized starch, and stearic acid.

Trazodone HCl tablets, 300 mg, contain the following inactive ingredients: microcrystalline cellulose, yellow ferric oxide, magnesium stearate, sodium starch glycolate, pregelatinized starch, and stearic acid.

TRIAMCINOLONE TABLETS (4 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.00	1	Triamcinolone	4.00
191.00	2	Ludipress®	191.00
2.00	3	Kollidon® CL	2.00
2.00	4	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with low-compression force.
2. Compress into 206 mg tablets, using 8 mm biplanar punches.
3. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

TRIAMETRENE AND HYDROCHLOROTHIAZIDE TABLETS

Manufacturing Directions

1. First mixture—triamterene, 75 mg; Avicel™, PH-102, 125 mg; Rexcel, 38 mg; Ac-Di-Sol, 10 mg; magnesium stearate/sodium lauryl sulfate (94/6), 6 mg; sodium lauryl sulfate, 4 mg; Cab-O-Sil, M-5, 2 mg.

2. Second mixture—hydrochlorothiazide, 50 mg; Avicel™, PH-102, 80 mg; Ac-Di-Sol, 5 mg; magnesium stearate/sodium lauryl sulfate (94/6), 1 mg; Cab-O-Sil, M-5, 1 mg; D&C Yellow No. 10 lake, 1 mg.
3. After the separate granules are prepared, add 250 g of magnesium stearate/sodium lauryl sulfate (94/6) and thoroughly blend the final mixture and then form into tablets (or capsules) by customary methods.

TRIFLUOPERAZINE TABLETS (5 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Trifluoperazine hydrochloride	5.00
194.00	2	Ludipress®	194.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with very low-compression force.
2. Compress into 204 mg tablets, using 8 mm biplanar punches.
3. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

TRIMEBUTINE AND RANITIDINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Trimebutine	200.00
150.00	2	Ranitidine hydrochloride	150.00
122.00	3	Microcrystalline cellulose PH102	122.00
20.00	4	Lactose monohydrate	20.00
1.65	5	Magnesium stearate	1.65

Manufacturing Directions

1. In a suitable vessel, mill the trimebutine, ranitidine HCl, microcrystalline cellulose, and lactose monohydrate to a suitable size and mix until homogeneous.
2. Add the magnesium stearate, and mix the mixture until homogeneous.
3. Discharge the mixture and compress using conventional tablet tooling to a suitable hardness (e.g., 10–12 kPa) to target a net tablet weight of 500 mg.

TRIPROLIDINE AND PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.60	1	Triprolidine HCl (4% excess)	2.70
60.00	2	Pseudoephedrine HCl (5% excess)	63.00
122.40	3	Lactose monohydrate	122.40
25.50	4	Maize starch with excess	28.00
1.00	5	Povidone (PVP K-30)	1.00
4.00	6	Povidone (PVP K-30)	4.00
—	7	Alcohol (ethanol, 95%)	28.00
1.50	8	Magnesium stearate	1.50

Manufacturing Directions

1. Dissolve item 6 in item 7 using a stirrer.
2. Avoid loss of ethanol by evaporation.
3. Pass items 1 to 5 through a 630 µm sieve using sifter.
4. Collect in a stainless steel drum.
5. Load the sieved powders into a mixer.
6. Mix and chop for 5 minutes at low speed.
7. Add PVP solution to the mixer at medium rate while mixing.
8. Start the chopper at low speed when half of the solution is added.
9. Mix and chop at low speed until the satisfactory mass is obtained.
10. Spread the wet granules onto the trays.
11. Keep the trolleys in the open air for about 1 hour.
12. Load the trolleys into the oven, and start the air circulation at room temperature for 2 hours.
13. Dry the granules at 55°C with air circulation for 5 hours.
14. Scoop the granules after 2 hours of drying; move the upper trays down and the lower trays up for uniform drying.
15. Check the moisture content (limit: NMT 1.5%).
16. Pass the dried granules through a 1 mm sieve using a granulator.
17. Collect in a stainless steel drum, and load into the blender.
18. Pass item 8 through a 250 µm sieve using a sifter.
19. Collect in a polyethylene bag.
20. Mix 2 g of granules with this mixture, and add to the blender.
21. Mix for 1 minute.

22. Unload the lubricated granules in a stainless steel drum.
23. Compress into 220 mg tablets, using 8.5 mm, round, concave punches.

TULOBUTEROL HYDROCHLORIDE TABLETS (1 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.00	1	Tulobuterol hydrochloride	1.00
44.96	2	Lactose monohydrate	44.96
40.00	3	Blue dye	40.00
28.00	4	Starch (maize)	28.00
2.00	5	Acacia	2.00
3.00	6	Calcium carboxymethyl cellulose	3.00
—	7	Water, purified, ca	20 mL
1.00	8	Magnesium stearate	1.00

Manufacturing Directions

Caution: Tulobuterol is a low-dose bronchodilator. Operators should wear a mask and gloves during all stages of manufacture.

1. Blending
   a. Cross feed tulobuterol, blue dye, and lactose through a comminuting mill fitted with a 790 µm screen, with high-speed knives.
   b. Blend the maize starch, acacia, and calcium carboxymethyl cellulose. Put the tulobuterol blend in a suitable mixer/blender for 20 minutes, and disintegrate.
2. Granulation: Load the blended ingredients from steps a or b into a suitable planetary mixer. While mixing, add water in a slow steady stream. Continue massing for 5 minutes after all the water is added. Proceed to the drying step.
3. Drying
   a. Pass the wet mass through a 4 mm aperture screen onto paper-lined trays. Dry at 50°C to 55°C. The final LOD should be between 1.5% and 5% (105°C for 1 hour).
   b. Pass the dried granule through an oscillating granulator fitted with a 720 µm aperture screen.
4. Lubrication: Load the dried granules into a suitable blender. Pass the magnesium stearate and an equal portion of dried granule through a 600 µm aperture screen. Add to a blender, and blend for 5 minutes.
5. Compression
   a. Compress using a rotary machine fitted with 7/32 in. flat bevel-edged punches. The weight should be 80 mg ± 3%.
   b. For a 2 mg dose, adjust with lactose.

VALACYCLOVIR HYDROCHLORIDE TABLETS (500 MG/1 G), VALTREX

Each caplet contains valacyclovir hydrochloride equivalent to 500 mg or 1 g of valacyclovir and the inactive ingredients carnauba wax, colloidal silicon dioxide, crospovidone, FD&C Blue No. 2 lake, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, povidone, and titanium dioxide. The blue, film-coated caplets are printed with edible white ink.

VALDECOXIB TABLETS (10 MG/20 MG), BEXTRA

Bextra tablets for oral administration contain 10 or 20 mg of valdecoxib. Inactive ingredients include lactose monohydrate, microcrystalline cellulose, pregelatinized starch, croscarmellose sodium, magnesium stearate, hydroxypropyl methylcellulose, polyethylene glycol, polysorbate 80, and titanium dioxide.

VALERIANA AND PASSIFLORA EXTRACT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
44.00	1	Valeriana extract, powder	44.00
33.00	2	Passiflora extract, powder (with excess)	36.00
120.00	3	Avicel™ PH101	120.00
11.00	4	Kollidon® CL	11.00
3.60	5	Aerosil® 200	3.60
7.30	6	Magnesium stearate	7.30

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress into 231 mg tablets, using 9 mm biconvex punches.

VALPROATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
576.00	1	Sodium valproate	576.00
20.00	2	Cab-o-Sil	20.00
266.00	3	A-tab	266.00
154.00	4	Carbomer 971P	154.00
10.00	5	Magnesium stearate	10.00

Manufacturing Directions

1. Admix sodium valproate, Carbopol 971 carbomer, and nonhygroscopic additives and blend in V-blender for about 5 minutes.
2. Comminute the blend from step 1 through a 0.250 in. screen.
3. Pass the mixture from step 2 through a 20 mesh vibrating sieve.
4. Blend the sifted material from step 3 in a V-blender for an additional 15 minutes.
5. Pass magnesium stearate through a 50 mesh sieve.
6. Add the sieved magnesium stearate from step 5 to the resulting granulate from step 4 and blend for 5 minutes.
7. Compress the blend from step 6 into caplets.

VALPROATE SODIUM TABLETS (500 MG), DEPAKOTE

Depakote tablets are supplied in three dosage strengths containing divalproex sodium equivalent to 125, 250, or 500 mg of valproic acid. The inactive ingredients are cellulosic polymers, diacetylated monoglycerides, povidone, pregelatinized starch (contains cornstarch), silica gel, talc, titanium dioxide, and vanillin. In addition, individual tablets contain the following. 125 mg tablets: FD&C Blue No. 1 and FD&C Red No. 40; 250 mg tablets: FD&C Yellow No. 6 and iron oxide; 500 mg tablets: D&C Red No. 30, FD&C Blue No. 2, and iron oxide.

VALPROATE SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Valproate sodium	500.00
80.00	2	Starch (maize)	80.00
20.00	3	Kollidon® 30	20.00
—	4	Isopropyl alcohol, ca	60 mL
5.00	5	Kollidon® CL	5.00
5.00	6	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate the mixture of items 1 and 2 with a solution of items 3 and 4. Pass through a sieve, mix the dry granules with items 5 and 6, and press with low-compression force.
2. Compress into 607 mg tablets, using 12 mm biplanar punches. *Note:* The powder mixture easily develops electric charge.

VALSARTAN AND HYDROCHLOROTHIAZIDE TABLETS (80 MG/12.5 MG; 160 MG/25 MG), DIOVAN HCT

Diovan HCT tablets are formulated for oral administration to contain valsartan and hydrochlorothiazide, USP 80/12.5 mg, 160/12.5 mg, and 160/25 mg. The inactive ingredients of the tablets are colloidal silicon dioxide, crospovidone, hydroxypropyl methylcellulose, iron oxides, magnesium stearate, microcrystalline cellulose, polyethylene glycol, talc, and titanium dioxide.

VALSARTAN AND HYDROCHLOROTHIAZIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
80.00	1	Valsartan	80.00
12.50	2	Hydrochlorothiazide	12.50
1.50	3	Colloidal silica anhydrous (Aerosil® 200)	1.50
31.50	4	Microcrystalline cellulose (Avicel™ PH 102)	31.50
20.00	5	Polyvinylpyrrolidone crospovidone	20.00
4.50	6	Magnesium stearate	4.50

Manufacturing Directions

1. Blend all components (use only 50% of magnesium stearate) in a container mixer.
2. Sieve the blended material, and mix again.
3. Compact using a roller compactor such as Bepex Pharmapaktor L 200/50 P, Hosokawa Micron Group by applying a compaction force of 25 to 65 kN and a roller speed of 1.3 to 7.5 rpm.
4. Sieve the compacted material and the remaining portion of the magnesium stearate, and blend again for 2 minutes.
5. Compress into 150 mg tablets.

VENLAFAXINE HYDROCHLORIDE TABLETS (25 MG/37.5 MG/50 MG), EFFEXOR®

Compressed tablets of Effexor® contain venlafaxine hydrochloride equivalent to 25, 37.5, 50, 75, or 100 mg of venlafaxine. Inactive ingredients consist of cellulose, iron oxides, lactose, magnesium stearate, and sodium starch glycolate.

Effexor® XR is formulated as an extended-release capsule for once-a-day oral administration. Drug release is controlled by diffusion through the coating membrane on the spheroids and is not pH dependent. Capsules contain venlafaxine hydrochloride equivalent to 37.5, 75, or 150 mg of venlafaxine.

Inactive ingredients consist of cellulose, ethyl cellulose, gelatin, hydroxypropyl methylcellulose, iron oxide, and titanium dioxide.

VENLAFAXINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Venlafaxine	25.00
90.00	2	Microcrystalline cellulose	90.00
100.30	3	Pregelatinized starch	100.30
7.00	4	Croscarmellose	7.00
0.20	5	Magnesium stearate	0.20

Manufacturing Directions

1. Sieve the active ingredient through a suitable sieve, and blend with the excipients until a uniform blend is formed.
2. Screen the dry blend, and blend with the magnesium stearate.
3. Compress and adjust weight for different strengths.

VERAPAMIL SUSTAINED-RELEASE TABLETS (220 MG)

Formulation: Verapamil hydrochloride, 240.0 g; Ludipress® LCE, 230.0 g; Methocel K15M (Dow), 75.0 g; Talc, 75.0 g; magnesium stearate, 5.0 g; Aerosil® 200, 2.5 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low-compression force using a vibrating hopper at 628 mg.

VERAPAMIL TABLETS

Manufacturing Directions

1. Verapamil hydrochloride 240 mg, sodium alginate (300 cps) 135 mg, hydroxypropyl methylcellulose (Methocel E4M viscosity of 4000 cps) 45 mg, Avicel™ pH 101 33.2 mg, lactose 8.3 mg, hydroxypropylmethyl E5 9.0 mg, magnesium stearate 4.5 mg, purified water QS.
2. Dry blend verapamil hydrochloride, hydroxypropyl methylcellulose, sodium alginate, microcrystalline cellulose, and lactose for 5 minutes in a suitable blender. Wet mass the powders using binder in aqueous solution and pass the mix through a 10 mesh screen. Dry the granules, and add the magnesium stearate thereto.
3. Thoroughly mix the so-formed mixture and compress into tablets each weighing 475 mg.

VERAPAMIL TABLETS (120 MG), CALAN

Calan is available for oral administration in film-coated tablets containing 40, 80, or 120 mg of verapamil HCl. The inactive ingredients are microcrystalline cellulose, cornstarch, gelatin, hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxide colorant, lactose, magnesium stearate, polyethylene glycol, talc, and titanium dioxide. Sustained-release/extended-release tablets are designed for sustained release of the drug in the gastrointestinal tract. Sustained-release characteristics are not altered when the tablet is divided in half.

VERAPAMIL HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
120.00	1	Verapamil hydrochloride	120.00
270.00	2	Ludipress®	270.00
3.00	3	Magnesium stearate	3.00
3.00	4	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium-compression force.
2. Compress into 400 mg tablets, using 12 mm biplanar punches.

VESICARE TABLET 5 MG FILM-COATED TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Solifenacin succinate	5.00
74.30	2	Lactose spray dried	74.30
5.00	3	Cornstarch	5.00
5.00	4	Starch 1500	5.00
0.70	5	Magnesium stearate	0.70
2.00	6	Hydroxypropyl methylcellulose	2.00
0.40	7	Polyethylene glycol 8000	0.40
0.30	8	Talc	0.30
0.60	9	Titanium dioxide	0.60
0.20	10	Yellow ferric oxide	0.20
—	11	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 3, and item 4 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 5% (=1.9 g) powder from step 1 to step 3, and mix well.
5. Add 15% (=5.7 g) powder from step 1 to step 3, and mix well.
6. Transfer step 5 into step 2.
7. Transfer balance quantity of step 1 into step 2.
8. Mix step 2 for 20 minutes using tumbler.
9. Pass item 5 through 0.250 mm sieve, and add to step 8.
10. Mix step 9 for 2 minutes.
11. Compress into 90 mg tablets, using a suitable punch (5.5 mm, round).
12. Place item 11 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
13. Add items 7 to 10 one by one to step 12 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
14. Load core tablets from step 11 in coating pan and apply coating dispersion from step 13 to get 2.5% to 3.0% weight gain.

VESICARE TABLET (10 MG) FILM-COATED TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
10.00	1	Solifenacin succinate	10.00
122.20	2	Lactose spray dried	122.20
8.33	3	Cornstarch	8.33
8.33	4	Starch 1500	8.33
1.20	5	Magnesium stearate	1.20
3.00	6	Hydroxypropyl methylcellulose	3.00
0.75	7	Polyethylene glycol 8000	0.75
0.50	8	Talc	0.50
1.00	9	Titanium dioxide	1.00
0.30	10	Red ferric oxide	0.30
—	11	Water, purified	45.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 3, and 4 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 5% (=3 g) powder from step 1 to step 3, and mix well.
5. Add 15% (=9.1 g) powder from step 1 to step 3, and mix well.
6. Transfer step 5 into step 2.
7. Transfer balance quantity of step 1 into step 2.
8. Mix step 2 for 20 minutes using tumbler.
9. Pass item 5 through 0.250 mm sieve, and add to step 8.
10. Mix step 9 for 2 minutes.
11. Compress into 150 mg tablets, using a suitable punch (7.5 mm × 6.0 mm, oval).
12. Place item 11 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
13. Add items 7 to 10 one by one to step 13 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
14. Load core tablets from step 11 in coating pan and apply coating dispersion from step 13 to get 2.5% to 3.0% weight gain.

VIRACEPT 250 MG TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
292.00	1	Nelfinavir mesylate equivalent to nelfinavir 250 mg	292.00
158.00	2	Lactose monohydrate	158.00
25.00	3	Povidone	25.00
—	4	Water, purified	50.00
20.00	5	Crospovidone	20.00
5.00	6	Magnesium stearate	5.00
10.00	7	Hypromellose	10.00
2.00	8	Triacetin	2.00
0.30	9	FD&C Blue No. 2	0.30
—	10	Water, purified	100.00

Manufacturing Directions

1. Dissolve item 3 in item 4 in a stainless steel container.
2. Pass items 2 and 1 and 20% of item 5 (4 g) through 0.7 mm sieve and mix well.
3. Place step 2 in a granulator.
4. Knead step 3 with solution of step 1 for 5 to 10 minutes until a loose, moist mass is obtained.

5. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
6. Spread over paper-lined trays and dry at 50°C to 55°C for 8 hours (the relative humidity over the granules should be 20–35%).
7. Pass the dried granules through a 1.25 mm sieve granulator.
8. Transfer the granules to a tumbler.
9. Pass the remaining quantity of item 5 through 0.5 mm sieve, add to step 8, and mix for 15 minutes.
10. Pass item 6 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 500 mg tablets, using a suitable punch (14.5 mm, round).
13. Place item 10 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
14. Add item 8 and item 9 one by one to step 12 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
15. Load core tablets from step 12 in coating pan and apply coating dispersion from step 14 to get 1.5% to 2.0% weight gain.

VIRACEPT 625 MG TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
730.00	1	Nelfinavir mesylate equivalent to nelfinavir 650 mg	730.00
62.00	2	Lactose monohydrate	62.00
45.00	3	Povidone	45.00
—	4	Water, purified	100.00
45.00	5	Crospovidone	45.00
9.00	6	Colloidal silicon dioxide	9.00
9.00	7	Magnesium stearate	9.00
15.00	8	Hypromellose	15.00
3.00	9	Triacetin	3.00
0.50	10	FD&C Blue No. 2	0.50
—	11	Water, purified	150.00

Manufacturing Directions

1. Dissolve item 3 in item 4 in a stainless steel container.
2. Pass item 2, item 1, and 20% of item 5 (9 g) through 0.7 mm sieve and mix well.
3. Place step 2 in a granulator.
4. Knead step 3 with solution of step 1 for 5 to 10 minutes until a loose, moist mass is obtained.
5. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
6. Spread over paper-lined trays and dry at 50°C to 55°C for 8 hours (the relative humidity over the granules should be 20–35%).
7. Pass the dried granules through a 1.25 mm sieve granulator.
8. Transfer the granules to a tumbler.
9. Pass the remaining quantity of item 5 and the item 6 through 0.5 mm sieve, add to step 8, and mix for 15 minutes.
10. Pass item 7 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 900 mg tablets, using a suitable punch (16.5 mm, round).
13. Place item 11 in a stainless steel vessel. Add item 8 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
14. Add item 9 and item 10 one by one to step 13 with stirring. Stir for 10 minutes. Homogenize for 30 minutes.minutes. Pass the coating dispersion through 180 mm sieve (if required).
15. Load core tablets from step 12 in coating pan, and apply coating dispersion from step 14 to get 1.5% to 2.0% weight gain.

VITAMIN A AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
33,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	69.00
70.00	2	Vitamin E acetate (dry powder)	70.00
146.00	3	Mannitol (granulated) with 10% of Kollidon® 30	146.00
17.00	4	Kollidon® CL	17.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compressive force.
2. Compress into 300 mg tablets, using 12 mm biplanar punches.

VITAMIN A CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100,000 IU	1	Vitamin A acetate (dry powder, 325,000 IU/g)	350.00
350.00	2	Mannitol	350.00
25.00	3	Kollidon® VA 64	25.00
5.00	4	Magnesium stearate	5.00
3.00	5	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compressive force.
2. Compress into 750 mg tablets, using 12 mm biplanar punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
100.00	2	Avicel™ PH102	100.00
10.00	3	Kollidon® VA 64	10.00
5.00	4	Kollidon® CL	5.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress into 231 mg tablets, using 9 mm biconvex punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
189.00	2	Ludipress®	189.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 306 mg tablets, using 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50,000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	120.00
120.00	2	Ludipress®	120.00
10.00	3	Avicel™ PH101	10.00
1.00	4	Magnesium stearate	1.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 277 mg tablets, using 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50,000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
154.00	2	Avicel™ PH101	154.00
10.00	3	Kollidon® VA 64	10.00
4.00	4	Kollidon® CL	4.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress into 250 mg tablets, using 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	55.00
572.00	2	Dicalcium phosphate (granulated) (Di-Tab) with 3% of Kollidon® 30	572.00
28.00	3	Polyethylene glycol, powder	28.00
19.40	4	Kollidon® CL	19.40
5.60	5	Aerosil® 200	5.60

Manufacturing Directions

1. Granulate the dicalcium phosphate with Kollidon® 30, dissolved in isopropanol or water, and pass through a 0.5 to 12 mm screen sieve using a vibrating hopper.
2. Mix the obtained dried granules with the other components, sieve, and press with high compressive force.
3. Compress into 680 mg tablets, using biplanar punches.

VITAMIN A, VITAMIN B6, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
40,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	80.00
40.00	2	Pyridoxine hydrochloride	40.00
35.00	3	Vitamin E acetate (dry powder, SD 50)	75.00
395.00	4	Ludipress®	395.00
4.00	5	Magnesium stearate	4.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compressive force.
2. Compress into 583 mg tablets, using 12 mm biplanar punches.

VITAMIN A, VITAMIN C, AND VITAMIN D3 CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2000/200 IU	1	Vitamin A and vitamin D3 (dry powder, 500,000 and 50,000 IU/g, respectively)	4.00
30.00	2	Ascorbic acid (powder) with excess	33.00
300.00	3	Sucrose (crystalline)	300.00
300.00	4	Sorbitol (crystalline)	300.00
300.00	5	Mannitol	300.00
300.00	6	Ludipress®	300.00
5.00	7	Stearic acid	5.00
0.10	8	Saccharin sodium	0.10
30.00	9	Cyclamate sodium	30.00
30.00	10	Flavor mixture (Firmenich)	30.00
20.00	11	PEG-6000, powder	20.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compressive force.
2. Compress into 1290 mg tablets, using 16 mm biplanar punches.

VITAMIN A, VITAMIN C, AND VITAMIN E TABLETS (1200 IU/60 MG/30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets
1200 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	2.40
60.00	2	Ascorbic acid (powder)	60.00
30.00	3	Vitamin E acetate (dry powder, 50%)	60.00
105.00	4	Lactose monohydrate	105.00
30.00	5	Avicel™ PH101	30.00
20.00	6	Kollidon® 25	20.00
5.00	7	Talc	5.00
1.00	8	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 285 mg tablets, using 8 mm biplanar punches.

VITAMIN B-COMPLEX AND CARNITINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
95.00	1	Thiamine mononitrate	95.00
20.00	2	Riboflavin	20.00
100.00	3	Nicotinamide	100.00
50.00	4	Calcium D-pantothenate	50.00
2.00	5	Folic acid	2.00
0.20	6	Biotin	0.20
0.005	7	Cyanocobalamin (gelatin coated, 1%)	0.50
50.00	8	Carnitine hydrochloride	50.00
100.00	9	Inositol	100.00
2.00	10	Adenosine phosphate	2.00
15.70	11	Kollidon® 30	15.70
70.00	12	Isopropanol	70.00
26.00	13	Kollidon® CL	26.00
122.00	14	Lactose monohydrate	122.00
14.00	15	PEG-6000, powder	14.00

Manufacturing Directions

1. Granulate mixture of items 1 to 10 with solution of items 11 and 12.
2. Dry, pass through a 0.8 mm sieve, mix with items 13 and 15, and press with low compressive force.
3. Compress into 708 mg tablets, using 13 mm biplanar punches.

VITAMIN B-COMPLEX AND FOLIC ACID DRAGEES

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
4.35	1	Calcium D-pantothenate (granulate, 67%)	6.50
2.60	2	Thiamine mononitrate (10.4%)	25.00
20.00	3	Magnesium oxide (light)	20.00
45.75	4	D-mannitol (powder)	45.75
100.00	5	DL-methionine	100.00
2.30	6	Riboflavin	2.30
6.30	7	Nicotinamide	6.30
2.40	8	Pyridoxine HCl	2.40
4.00	9	Magnesium stearate	4.00
0.1150	10	D-biotin	0.1150
0.46	11	Folic acid	0.46
100.00	12	Choline tartrate	100.00
28.00	13	Silicic acid (precipitated)	28.00
0.87 µg	14	Vitamin B12 (as 0.1% water-soluble form)	0.871
3.15	15	Vitamin E (50%)	6.30
30.00	16	Sodium carboxymethyl starch	30.00
116.66	17	Isopropyl alcohol	116.66
22.00	18	Povidone (PVK K-90) (Luviskol®)	22.00

Manufacturing Directions

1. Incorporate in mixer PVP K-90 and isopropyl alcohol, and make a solution with continuous stirring.
2. Place in mixer choline tartrate, DL-methionine, D-mannitol powder, magnesium oxide (previously sieved), silicic acid, and sodium carboxymethyl starch, and mix for 15 minutes.
3. Add the solution of isopropyl alcohol and alcohol in first step for 10 minutes until moist mass is obtained.
4. Granulate the moist mass through a centrifugal granulator with a 10 mm screen.
5. Spread the granules on paper-lined trays, and dry overnight in a drying oven at 50°C.
6. Crush the granules through a 1.5 mm sieve.
7. Vitamin granulate: Tumble D-biotin, vitamin B12, folic acid, riboflavin, and pyridoxine hydrochloride in mixer for 5 minutes.
8. Combine in the mixer nicotinamide, vitamin E, thiamine mononitrate/gelatin/mannitol granulate, D-mannitol powder, and sodium carboxymethyl starch; then, add the vitamin mixture, and mix for 10 minutes.
9. Pass through a 1 mm sieve if lumpy.

10. In a mixer, make a separate solution of PVP K-90 and isopropyl alcohol.
11. Place in the mixer the solution of isopropyl alcohol and PVP; then, knead until an evenly moist homogeneous mass is obtained.
12. Add calcium D-pantothenate granules, and mix for 3 to 5 minutes.
13. Pass the granules through a centrifugal granulator with a 10 mm screen, and spread on paper-lined trays.
14. Keep overnight in a drying oven at 50°C; the relative humidity of the granules should be 10% to 20%.
15. Crush the dried granules through an oscillator with a 1.5 mm sieve.
16. Put the granulate mixture in the mixing drum—the choline tartrate and the two lots of vitamin granules.
17. Mix, and then add the magnesium stearate.
18. Check to be sure that the relative humidity of the mixture is 10% to 20%.
19. Compress, and apply a sealer coat (lacquer), sugar coat, and finishing coating.

VITAMIN B-COMPLEX AND VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
33.00	1	Thiamine mononitrate	33.00
4.00	2	Riboflavin	4.00
10.00	3	Pyridoxine hydrochloride	10.00
66.00	4	Nicotinamide	66.00
17.00	5	Calcium D-pantothenate	17.00
350.00	6	Tartaric acid (powder)	350.00
450.00	7	Sodium bicarbonate	450.00
750.00	8	Sucrose, crystalline	750.00
30.00	9	Kollidon® 30	30.00
QS	10	Isopropanol	QS
500.00	11	Ascorbic acid (crystalline)	500.00
3.00 g	12	Riboflavin	3.00
10.00	13	Cyanocobalamin (gelatin coated, 0.1%)	10.00
10.00	14	Orange flavor	10.00
2.00	15	Saccharin sodium	2.00
5.00	16	Cyclamate sodium	5.00
50.00	17	PEG-6000 (powder)	50.00

Manufacturing Directions

1. Granulate mixture of items 1 to 9 with solvent item 10, dry, pass through a 0.8 mm sieve, mix with items 13 to 17, and press with high compressive force at a maximum of relative atmospheric humidity of 30%.
2. Compress into 2315 mg tablets, using 20 mm biplanar punches.

VITAMIN B-COMPLEX AND VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Thiamine mononitrate	5.00
5.00	2	Riboflavin	5.00
5.00	3	Pyridoxine hydrochloride	5.00
0.50	4	Folic acid	0.50
30.00	5	Niacin	30.00
0.10	6	Biotin	0.10
10.00	7	Calcium D-pantothenate	10.00
150.00	8	Ascorbic acid (crystalline/powder)	150.00
172.40	9	Ludipress®	172.40
20.00	10	Kollidon® VA 64	20.00
2.00	11	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and then mix.
2. Use medium to low compressive force to compress 400 mg in 10 mm biplanar punches.

VITAMIN B-COMPLEX AND VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Thiamine hydrochloride	15.00
2.00	2	Riboflavin	2.00
5.00	3	Pyridoxine hydrochloride	5.00
25.00	4	Choline bitartrate	25.00
10.00	5	Nicotinamide	10.00
100.00	6	Ascorbic acid (crystalline/powder)	100.00
220.00	7	Ludipress®	220.00
8.00	8	Stearic acid	8.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and mix.
2. Use medium to low compressive force to compress 411 mg in 12 mm biplanar punches.
3. The thiamine mononitrate formulation is more stable compared with the thiamine hydrochloride formulation (previous).

VITAMIN B-COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Thiamine mononitrate or hydrochloride	25.00
25.00	2	Riboflavin	25.00
80.00	3	Nicotinamide	80.00
40.00	4	Calcium D-pantothenate	40.00
16.00	5	Pyridoxine hydrochloride	16.00
0.16	6	Cyanocobalamin (gelatin coated, 0.1%)	16.00
282.00	7	Avicel™ PH101	282.00
16.00	8	Kollidon® 30	16.00
3.00	9	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Compress using 12 mm biplanar punches with medium- to high-compression force.
3. The mononitrate formulation is preferred for stability reasons.

VITAMIN B-COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.30	1	Thiamine mononitrate	2.30
2.60	2	Riboflavin	2.60
2.30	3	Nicotinamide	2.30
2.20	4	Calcium D-pantothenate	2.20
2.70	5	Pyridoxine hydrochloride	2.70
0.024	6	Cyanocobalamin (gelatin coated, 0.1%)	2.40
280.00	7	Ludipress®	280.00
14.00	8	Flavor (Firmenich)	14.00
0.050	9	Saccharin sodium	0.05
4.00	10	Cyclamate sodium	4.00
5.00	11	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and 8 mm biplanar punches.
2. Compress into 314 mg tablets, using low-compression force.
3. According to the European Commission, this formulation is classified as dietary food.

VITAMIN B-COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Microcrystalline cellulose (Avicel™ PH102)	15.00
0.20	2	Colloidal silicon dioxide (Aerosil® 200)	0.20
3.00	3	Calcium pantothenate	3.00
9.33	4	Powdered cellulose	9.33
35.60	5	Lactose (spray-dried)	35.60
0.91	6	Magnesium stearate	0.91
20.00	7	Nicotinamide	20.00
2.10	8	Pyridoxine hydrochloride	2.10
2.00	9	Riboflavin base	2.00
0.80	10	Talc (fine powder)	0.80
2.10	11	Thiamine mononitrate	2.10

Manufacturing Directions

1. Riboflavin base is a fine powder that tends to form globules while mixing.
2. Disperse the base with Aerosil® and lactose carefully.
3. Mix items 9 and 2 and 6.67 g of item 5 in the drum of a drum mixer for 10 minutes.
4. Pass the mix two times through a 500 μm sieve using a sifter.
5. Pass items 11, 8, and 3 and 6.67 g of item 5 through a granulator fitted with a 1.0 mm sieve.
6. Pass items 7, 1, and 4 and 22.27 g of item 5 through a granulator fitted with a 1.0 mm sieve.
7. Pass items 10 and 6 through a sifter fitted with a 500 μm sieve.
8. Load sieved material from previous step to the blender.
9. Load sieved material to the blender.
10. Blend the powders for 15 minutes.
11. Load lubricant powders into the blender, and mix for an additional 5 minutes.
12. Compress into 91 mg tablets at low relative humidity (55–60%).
13. Coat tablets with a sealing coat, color coat, and polishing coat.

VITAMIN B-COMPLEX, CHOLINE, AND BILE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
60.00	1	Acid dehydrocholic (powder)	60.00
100.00	2	Choline dihydrogen citrate	100.00
20.00	3	Niacinamide (white powder)	20.00
100.00	4	Inositol	100.00
2.50	5	Riboflavin (2% excess)	2.55
0.50	6	Pyridoxine hydrochloride	0.50
30.00	7	Povidone (K value, 29–32)	30.00
100.00	8	Racemethionine (crystals)	100.00
60.00	9	Ox bile extract (powder, 30 mesh) (Bilein)	60.00
—	10	Alcohol dehydrated (200 proof)	26.00
3.0 µg	11	Cyanocobalamin (oral powder in gelatin, 1000 µg/g)	3.30
3.00	12	Thiamine hydrochloride (powder, regular)	3.60
8.40	13	Magnesium stearate (impalpable powder)	8.40
8.40	14	Stearic acid (fine powder)	8.40

Manufacturing Directions

1. Mill dehydrocholic acid, choline dihydrogen citrate, nicotinamide, inositol, and methionine through a 600 µm screen.
2. Place milled mixture from first step with riboflavin, pyridoxine hydrochloride, povidone, and ox bile extract in mass mixer.
3. Add alcohol QS (approximately 26 g or 32.7 mL) very slowly to the mass.
4. Mass for approximately 45 minutes in mixer.
5. Scrape all material from the mass mixer as much as possible.
6. Rinse mass mixer between runs.
7. Granulate through a comminuting or similar mill or a 4.76 mm screen.
8. Dry at 49°C to less than 1% LOD.
9. Sift through an 840 µm screen in a shaker, and grind coarsely through a comminuting mill (knives forward, medium speed).
10. Pass one-half of the base granulation through a 1.68 mm screen into a blender, if necessary.
11. Mix cyanocobalamin oral powder with an equal volume of base granulation, and load into a blender through a 1.68 mm screen.
12. Blend thiamine hydrochloride, magnesium stearate, and stearic acid.
13. Then, hand-screen mixture through a 600 µm screen.
14. Load into a blender through a 1.68 mm screen with the remainder of the base granulation, and blend for 20 minutes.
15. Compress and coat tablets using an appropriate formulation to render required color and sealing of tablet.

VITAMIN B-COMPLEX, VITAMIN A, VITAMIN C, AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
2.00	1	Thiamine mononitrate (20% excess)	2.40
1.00	2	Riboflavin (10% excess)	1.10
74.50	3	Lactose (spray-dried)	74.50
15.00	4	Nicotinamide	15.00
300 IU	5	Vitamin D3 (dry powder, 100,000 IU/g)	3.60
3000 IU	6	Vitamin A palmitate (250,000 IU/g)	18.00
36.00	7	Cellulose (microcrystalline) (Avicel™ PH102)	36.00
20.00	8	Ascorbic acid (90%) (33% excess)	26.60
1.00	9	Silicon dioxide (colloidal) (Aerosil® 200)	1.00
1.80	10	Magnesium stearate	1.80

Manufacturing Directions

1. Mix items 1 and 2 and 13.33 g of item 3 in a drum using a drum mixer for 10 minutes.
2. Pass the mix through a 250 µm sieve using a sifter.
3. Collect in a stainless steel drum, and load into the blender.
4. Pass items 4 to 7 and 61.17 g of item 3 through a granulator fitted with a 1.0 mm sieve.
5. Collect in a stainless steel drum, and load into the blender.
6. Pass item 8 through a FitzMill fitted with sieve number 24230.
7. Collect in a stainless steel drum, and load into the blender.
8. Mix for 10 minutes.
9. Pass item 9 through a 500 µm sieve using a sifter.
10. Collect in a polyethylene bag.
11. Pass item 10 through a 250 µm sieve using a sifter.
12. Collect in the same polyethylene bag.
13. Mix, and add 0.53 to 1.33 g powder from the preceding step.
14. Mix gently.
15. Add to the blender.

16. Mix for 3 minutes.
17. Unload lubricated granules in stainless steel drums.
18. Compress into 180 mg tablets, using 7 mm round concave punches.
19. Apply a sealing coat, a color coat, and a finishing coat (see Appendix).

VITAMIN B-COMPLEX, VITAMIN A, VITAMIN C, VITAMIN D, AND MINERAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
61.00	1	Ascorbic acid (coated), EC	61.00
5.50	2	Calcium pantothenate	5.50
8.00 µg	3	Cyanocobalamin	0.008
4.00	4	Copper sulfate, $5H_2O$	4.00
1.70	5	Magnesium oxide (heavy)	1.70
10.00	6	Nicotinamide	10.00
0.575	7	Pyridoxine hydrochloride	0.575
0.16	8	Potassium iodide	0.16
2.30	9	Riboflavin	2.30
3.25	10	Thiamine mononitrate	3.25
24.00	11	Vitamin A palmitate (250,000 IU/g)	24.00
4.80	12	Vitamin D3 powder (100,000 IU/g)	4.80
2.20	13	Zinc sulfate, $7H_2O$	2.20
19.265	14	Lactose monohydrate	19.265
25.00	15	Cellulose (microcrystalline) (Avicel™ PH102)	25.00
3.00	16	Povidone (PVP K-90)	3.00
6.50	17	Cellulose (microcrystalline) (Avicel™ PH102)	6.50
7.00	18	Crospovidone (Kollidon® CL)	7.00
1.00	19	Colloidal silicon dioxide (Aerosil® 200)	1.00
0.75	20	Magnesium stearate	0.75
3.00	21	Microcrystalline cellulose (powder)	3.00
—	22	Alcohol (absolute)	18.46

Manufacturing Directions

1. Dissolve item 16 in item 22 using a stirrer.
2. Dissolve item 3 while stirring to obtain a clear solution.
3. Press items 10, 9, 7, 6, 2, 14, and 15 through a 500 µm stainless steel sieve in a sifter.
4. Load into mixer, and mix for 5 minutes at high speed.
5. Knead the dry powder with binding solution while mixing at high speed for 3 minutes.
6. After the addition is complete, scrape the sides and blades.
7. Mix for an additional 2 minutes using a mixer and chopper at high speed. Check the end point of granulation. (The end point occurs when the granulation consists of few or no lumps.)
8. If required, add an additional quantity of item 22, and record this extra quantity of item 22.
9. Unload the wet granules in stainless steel trays for drying.
10. Transfer the trays to an oven.
11. Keep the door partially open.
12. Switch on the oven, with air circulation, heater switched off, for 2 hours to evaporate alcohol.
13. Close the door of the oven.
14. Dry the granules at 55°C for 12 hours.
15. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
16. Check the LOD (limit: 0.8–1.2%).
17. If required, dry further at 55°C for 2 hours.
18. Check the LOD.
19. Grind the dried granules through a 1.25 mm sieve using a granulator set at medium speed.
20. Load granules into the blender.
21. Mix items 4 and 13 and 3.08 g of item 17 in a polyethylene bag.
22. Mill through a FitzMill using sieve number 1530–0030 (knives forward, medium speed).
23. Collect in stainless steel drum.
24. Add to blender.
25. Sift items 11, 12, and 1 through a 630 µm sieve.
26. Add to blender.
27. Sift items 5, 8, 18, 19, and 21 and 3.42 g of item 17 through a 500 µm sieve.
28. Add to blender.
29. Mix for 5 minutes.
30. Sift item 20 through a 250 µm sieve.
31. Mix a portion of the powder mix (~3.85 g) with sieved item 20.
32. Add to the blender.
33. Mix for 1 minute.
34. Compress into 185 mg tablets, using 7 mm, round, concave punches.
35. Coat using a subcoat, a color coat, and a finishing coat (see Appendix).

VITAMIN B-COMPLEX, VITAMIN C, AND CALCIUM EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
7.00	1	Thiamine mononitrate	7.00
5.00	2	Riboflavin	5.00
25.00	3	Nicotinamide	25.00
20.00	4	Pyridoxine hydrochloride	20.00
12.00	5	Calcium D-pantothenate	12.00
75.00	6	Calcium carbonate	75.00
164.00	7	Calcium glycerophosphate	164.00
400.00	8	Sodium bicarbonate	400.00
300.00	9	Tartaric acid (powder)	300.00
400.00	10	Sucrose (crystalline)	400.00
350.00	11	Sucrose (powder)	350.00
50.00	12	Kollidon® 30	50.00
10.00	13	Kollidon® 30	10.00
QS	14	Isopropanol	QS
550.00	15	Ascorbic acid (powder)	550.00
2.00	16	Riboflavin	2.00
5.00	17	Cyanocobalamin (gelatin coated, 0.1%)	500.00
40.00	18	PEG-6000 (powder)	40.00
50.00	19	Kollidon® CL	50.00

Manufacturing Directions

1. Granulate mixture of items 1 to 12 with solution of item 19.
2. Granulate items 13 to 18 separately, dry at 60°C with vacuum, mix with item 1, and blend.
3. Compress into 2.5 g tablets, using 20 mm planar punches at medium- to high-compression force.

VITAMIN B-COMPLEX, VITAMIN C, AND FERROUS SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
300.00	1	Ferrous sulfate	300.00
15.00	2	Kollidon® 30	15.00
6.00	3	Kollidon® 30	6.00
QS	4	2-Propanol	QS
45.00	5	Thiamine mononitrate	45.00
10.00	6	Riboflavin	10.00
82.00	7	Pyridoxine hydrochloride	82.00
69.00	8	Nicotinamide	69.00
470.00	9	Ascorbic acid (powder)	470.00
690.00	10	Ludipress®	690.00
50.00	11	PEG-6000 (powder)	50.00
9.00	12	Aerosil® 200	9.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 2 with solution of items 5 to 12.
2. Pass through a 0.8 mm sieve.
3. Mix with items 3 and 4.
4. Compress with high compressive force, 25 to 30 kN. Compress into 1750 mg tablets, using 20 mm biplanar punches.

VITAMIN B-COMPLEX, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Niacinamide, (white powder), USP	100.00
750.00	2	Ascorbic acid; use sodium ascorbate (microcrystalline), USP	843.65
20.00	3	Calcium pantothenate, USP with excess	30.00
10.00	4	Riboflavin, USP	10.00
5.00	5	Pyridoxine hydrochloride, USP	5.25
40.00	6	Povidone, USP	40.00
68.00	7	Anhydrous isopropyl alcohol	68.00
15.00	8	Thiamine mononitrate (powder), USP	15.75
24.79	9	Vitamin E, USP, D,L-α-tocopheryl acid succinate	33.71
150.00 µg	10	Folic acid (powder), USP	0.18
5.00	11	Magnesium stearate	5.00
40.00	12	Cellulose (microcrystalline), NF	40.00
4.00 µg	13	Vitamin B12; use cyanocobalamin powder in gelatin (1000 µg/g)	4.20

Manufacturing Directions

1. Avoid unnecessary exposure to light and moisture.
2. Mill the nicotinamide and the sodium ascorbate through a 600 µm screen fitted to a FitzMill, or similar (impact forward, high speed).
3. Load into a suitable mass mixer.
4. Load calcium pantothenate, riboflavin, and pyridoxine hydrochloride into the mass mixer.
5. Dry blend for 5 minutes.
6. Dissolve povidone in alcohol (~84 mL) in a separate container.
7. While mixing the blended powders, add the povidone solution.
8. Continue to mix until a satisfactory granule mass is obtained.
9. If required, use additional alcohol.

10. Granulate through a FitzMill, or similar, using a 5/8 in. band (15.88 mm aperture or similar) or a 4.76 mm screen with knives forward at slow speed.
11. Dry the granulation at 49°C to less than 1.5% LOD.
12. Sift the dry granulation through a 1.19 mm screen.
13. Pass remaining coarse granules through a #2 band (1.59 mm aperture or similar) using a FitzMill, or similar (knives forward, medium speed).
14. Blend together the thiamine mononitrate, vitamin E, folic acid, magnesium stearate, and a portion of the microcrystalline cellulose.
15. Mill blended powders through a 600 µm screen (impact forward, high speed).
16. Care must be taken to prevent losses.
17. Load half of the base granulation, the balance of the microcrystalline cellulose, and the powder blend into a suitable blender.
18. Blend for 5 minutes.
19. Add balance of base granulation, and blend for 15 minutes.
20. Do not mill cyanocobalamin.
21. Blend together by hand the cyanocobalamin with a portion of the blended powders.
22. Return to the blender, and blend for 15 minutes.
23. Compress using ovaloid-shaped punches.
24. Seal tablets with a subcoat, and then apply color coat and finishing coating.

VITAMIN C AND CALCIUM CARBONATE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
300.00	1	Calcium; use calcium carbonate	315.00
450.00	2	Sodium bicarbonate/tartaric acid (powder)	450.00
600.00	3	Kollidon® 30	600.00
35.00	4	Kollidon® 30	35.00
200.00	5	Isopropanol	200.00
400.00	6	Sucrose (crystalline)	400.00
500.00	7	Ascorbic acid (crystalline, with excess)	550.00
120.00	8	Kollidon® CL	120.00
60.00	9	PEG-6000 (powder)	60.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with a solution of items 4 and 5, mix with item 6, and dry.
2. Add items 7 to 9, and press with high compressive force at a maximum atmospheric relative humidity of 30%.
3. Compress into 2500 mg tablets, using 20 mm biplanar punches.

VITAMIN C AND VITAMIN E LOZENGES

Bill of Materials

Scale (mg/ lozenge)	Item	Material Name	Quantity/ 1000 Lozenges (g)
100.00	1	Ascorbic acid (crystalline)	100.00
50.00	2	Vitamin E acetate (dry powder, SD 50)	100.00
400.00	3	Dextrose	400.00
4.00	4	Kollidon® 90F	4.00
25.00	5	Isopropanol	25.00
6.00	6	PEG-6000 (powder)	6.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with isopropanol, dry, pass through a 0.8 mm sieve, mix with item 6, and press with high-compression force.
2. Compress into 600 mg tablets, using 12 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
500.00	1	Ascorbic acid: 222.20 mg ascorbic acid and 312.50 mg sodium ascorbate microcrystalline	500.00
850.00	2	Sorbitol (granular)	850.00
100.00	3	Lactose (120 mesh)	100.00
3.30	4	FD&C Yellow Dye No. 5 lake	3.30
82.90	5	Cellulose (microcrystalline), NF (Avicel™ PH101)	82.90
11.60	6	Silica gel	11.60
8.29	7	Flavor	8.29
0.50	8	Flavor	0.50
8.29	9	Sodium cyclamate	8.29
33.20	10	Magnesium stearate	33.20

Manufacturing Directions

1. Pass ascorbic acid, sodium ascorbate, sorbitol, lactose, FD&C Yellow dye, microcrystalline cellulose, silica gel, flavors, and sodium cyclamate through a 420 µm screen.
2. Using a comminuting mill, pass the coarse granules through a 420 µm screen (knives forward, medium speed).

3. Transfer milled materials to a suitable blender, and blend for 5 minutes.
4. Screen the magnesium stearate by hand through an 840 μm screen, and transfer to blender.
5. Mix for 1 minute.
6. Compress using 18 mm standard concave punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/ kg (g)
422.00	1	Ascorbic acid (powder)	422.00
283.00	2	Microcrystalline cellulose	283.00
130.00	3	Sucrose (powder)	130.00
80.00	4	Sucrose (crystalline)	80.00
24.00	5	Kollidon® VA 64	24.00
24.00	6	Cyclamate sodium	24.00
20.00	7	PEG-6000 (powder)	20.00
12.00	8	Orange flavor and strawberry flavor	12.00
2.00	9	Aerosil® 200	2.00
1.00	10	Saccharin sodium	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press into tablets with medium- to high-compression force.
2. Compress 250 mg (for 100 mg strength), 1250 mg (for 500 mg strength), or 2500 mg (for 500 mg strength).

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
500.00	1	Ascorbic acid (crystalline)	500.00
1100.00	2	Sorbitol (crystalline)	1100.00
200.00	3	Sucrose (crystalline)	200.00
200.00	4	Sucrose (powder)	200.00
300.00	5	Dextrose	300.00
100.00	6	PEG-6000 (powder)	100.00
10.00	7	Magnesium stearate	10.00
10.00	8	Aerosil® 200	10.00
1.00	9	Saccharin sodium	1.00
10.00	10	Cyclamate sodium	10.00
30.00	11	Orange flavor	30.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium- to high-compression force.
2. Compress into 2080 mg tablets, using 20 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
100.00	1	Ascorbic acid (crystalline)	100.00
450.00	2	Sodium ascorbate (crystalline)	450.00
264.00	3	Sorbitol (crystalline)	264.00
200.00	4	Sucrose (crystalline)	200.00
200.00	5	Sucrose (powder)	200.00
300.00	6	Dextrose	300.00
60.00	7	PEG-6000 (powder)	60.00
3.00	8	Magnesium stearate	3.00
4.00	9	Aerosil® 200	4.00
1.00	10	Saccharin sodium	1.00
10.00	11	Cyclamate sodium	10.00
20.00	12	Orange flavor	20.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium- to high-compression force.
2. Compress into 1295 mg tablets, using 16 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
6.70	1	Anhydrous silica (colloidal) (Aerosil® 200)	6.70
40.00	2	Cellulose (microcrystalline) (Avicel™ PH101)	40.00
6.50	3	Aspartame	6.50
170.00	4	Ascorbic acid (coated), EC	170.00
10.50	5	Orange flavor (dry)	10.50
13.00	6	Carmellose sodium (sodium CMC 7 MFD)	13.00
2.80	7	Orange dye	2.80
470.00	8	Dextrates, NF	470.00
19.50	9	Magnesium stearate	19.50
13.00	10	Stearic acid (fine powder)	13.00
160.00	11	Sorbitol (powder)	160.00
388.00	12	Sodium ascorbate (granular)	388.00

Manufacturing Directions

1. Processing should be done in a controlled temperature and humidity area (limit: relative humidity, 40–50%; temperature, 20–25°C).
2. Mix items 2 and 7 in a polyethylene bag for 1 to 2 minutes.
3. Sift twice through a 250 µm sieve.
4. Collect in a polyethylene bag, and check the uniformity of dispersion.
5. If required, sift again.
6. Mix items 3, 5, and 6 in a polyethylene bag for 1 to 2 minutes.
7. Sift once through a 250 µm sieve.
8. Add to the first step, and mix for 1 to 2 minutes.
9. Sift items 8, 11, 4, and 12 once through a 1000 µm sieve, and collect in a stainless steel drum.
10. Add the sieved materials from the preceding steps to the stainless steel drum.
11. Mix in a drum blender for 2 to 3 minutes.
12. Mix items 10, 9, and 1 in a polyethylene bag for 1 to 2 minutes.
13. Sift twice through a 500 µm sieve.
14. Add 25.0 to 30.0 g of granules to the lubricant mixture.
15. Mix for 1 to 2 minutes.
16. Add this mixture to the granules.
17. Mix in a drum blender for 1 minute.
18. Check the moisture content (limit: moisture content NMT 3.5%).
19. Check temperature and humidity before beginning compression (limit: relative humidity, 40–50%; temperature, 20–25°C).
20. Compress into 1300 mg tablets, using 16 mm punches.
21. Fill appropriate amounts for lower strength (e.g., 100 mg tablets in 10 mm punches).

VITAMIN C CHEWABLE TABLETS WITH DEXTROSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Ascorbic acid (crystalline); use ascorbic acid (coated, 97.5%), EC	110.00
500.00	2	Dextrose	500.00
4.00	3	Kollidon® 90F	4.00
30.00–50.00	4	Water and/or isopropanol	30.00–50.00
6.00	5	PEG-6000 (powder)	6.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 4 and 5 (in a fluidized bed), sieve, add item 6, and press with high-compression force.
2. Compress into 620 mg tablets, using 12 mm biplanar punches.
3. If no fluidized bed is available, use of water as a granulation solvent should be avoided.
4. The use of coated ascorbic acid does not increase the stability.

VITAMIN C CHEWABLE TABLETS WITH FRUCTOSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
120.00	1	Ascorbic acid (powder)	120.00
500.00	2	Fructose	500.00
200.00	3	Ludipress®	200.00
100.00	4	Avicel™ PH101	100.00
15.00	5	Kollidon® VA 64	15.00
4.00	6	Aerosil® 200	4.00
35.00	7	PEG-6000 (powder)	35.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 970 mg tablets, using 12 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS WITH SUCROSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Ascorbic acid	500.00
850.00	2	Sucrose, crystalline	850.00
575.00	3	Avicel™ PH 101	575.00
60.00	4	Kollidon® VA 64	60.00
15.00	5	Magnesium stearate	15.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium-compression force.
2. Compress into 2000 mg tablets, using 20 mm biplanar punches.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1000.00	1	Vitamin C (as ascorbic acid)	1000.00
800.00	2	Tartaric acid (fine crystals)	800.00
1000.00	3	Sodium bicarbonate	1000.00
0.50	4	Riboflavin	0.50
20.00	5	Saccharin sodium	20.00
20.00	6	Sodium chloride (milled)	20.00
50.00	7	Lime flavor	50.00
1709.50	8	Sugar (fine crystals)	1709.50
QS	9	Alcohol	QS

Manufacturing Directions

1. All operations must be carried out at a relative humidity of less than 40% at 25°C.
2. Active substance granulate: If saccharin sodium is lumpy, sieve it by means of a centrifugal granulator (1 mm) or a 3 mm band sieve.
3. Suck into the mixer the entire amount of sugar, ascorbic acid, tartaric acid, and saccharin sodium (previously sieved, if required), together with first part sieved sodium bicarbonate (open filter, closed bypass; jacket temperature of 40°C); backflash filter twice, evacuate to ~800 mbar, and close filter.
4. Mix with mixer for approximately 10 minutes (jacket temperature 40°C) at a speed of 50 rpm.
5. Turn off the mixer, and evacuate to 10 mbar (open filter, closed bypass; jacket temperature of 40°C).
6. Separately dissolve or suspend riboflavin in alcohol.
7. Suck this granulating liquid into the evacuated vessel at a mixer speed of 30 rpm (closed filter, closed bypass; jacket temperature of 40°C).
8. With jacket heating turned off, granulate up to a product temperature of 60°C at a mixer speed of 110 rpm (time required is approximately 20–25 minutes).
9. At a jacket temperature of 56°C and a mixer rotation speed of approximately 15 rpm, dry for 2 to 5 minutes (closed filter, open bypass).
10. When dust develops in the course of further drying, close the bypass and open the filter.
11. At a mixer speed of 20 rpm and interval setting (2 minutes/15 seconds), continue the drying at a jacket temperature of approximately 58°C and vacuum of 10 mbar until a total drying time of 10 to 20 minutes is reached.
12. Sieve the active substance granulate by sucking it by means of vacuum at a jacket temperature of approximately 59°C and a mixer speed of 20 rpm through a Buehler universal mill (1.5 mm screen) directly into a suitable container.
13. Preferable relative humidity of the active substance is less than 10%.
14. Sieve milled sodium chloride and lime flavor through a round hand sieve (1 mm) with a diameter of approximately 38 cm; add to sieved sodium carbonate (second part) in a mixing drum, and mix (e.g., tumble mix, 19 rpm for 10 minutes).
15. Combine this dry mix (sucked by vacuum) with the active substance granulate.
16. Finally, add the remaining sieved and lump-free sodium bicarbonate (third part).
17. Mix the mixture that is ready for compression for 45 minutes.
18. The preferable relative humidity of the mixture is less than 20%.
19. In a suitable rotary tablet press, compress effervescent tablets with a weight of 4600 mg and a hardness of 8 kpi.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Ascorbic acid (powder) with excess	112.00
200.00	2	Sorbitol (instant)	200.00
1000.00	3	Anhydrous citric acid	1000.00
587.00	4	Sodium bicarbonate	587.00
65.00	5	PEG-6000 (powder)	65.00
10.00	6	Lemon flavor	10.00
25.00	7	Cyclamate sodium	25.00
1.00	8	Saccharin sodium	1.00

Manufacturing Directions

1. Dry the sodium bicarbonate for 1 hour at 100°C, mix with the other components, pass all through a 0.8 mm sieve, and press with high-compression force at a maximum atmospheric relative humidity of 30%.
2. Compress into 2050 mg tablets, using 20 mm biplanar punches.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1000.00	1	Ascorbic acid (crystalline)	1000.00
800.00	2	Sorbitol (crystalline)	800.00
150.00	3	Anhydrous citric acid	150.00
660.00	4	Sodium bicarbonate	660.00
80.00	5	PEG-6000 (powder)	80.00
QS	6	Lemon flavor	QS
QS	7	Cyclamate sodium	QS
QS	8	Saccharin sodium	QS

Manufacturing Directions

1. Dry the sodium bicarbonate for 1 hour at 100°C, mix with the other components, pass all through a 0.8 mm sieve, and press with high-compression force at a maximum atmospheric relative humidity of 30%.
2. Compress into 2690 mg tablets, using 20 mm biplanar punches.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
500.00	1	Sodium hydrogen carbonate	500.00
430.00	2	Tartaric acid	430.00
8.00	3	Kollidon® 25	8.00
0.20	4	2-Propanol	200.00 mg
550.00	5	Ascorbic acid (crystalline)	550.00
660.00	6	Sucrose	660.00
67.00	7	PEG-6000 (powder)	67.00
67.00	8	Dextrose (powder)	67.00
10.00	9	Orange flavor	10.00
1.00	10	Saccharin sodium	1.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 2 and 3, pass through a 0.5 mm sieve, and dry at 60°C.
2. Dry mixture of items 5 and 6 at 60°C.
3. Mix together with the previous granules and with items 7 to 10.
4. At a maximum atmospheric relative humidity of 30%, press to effervescent tablets.
5. Compress into 2300 mg tablets, using 20 mm biplanar punches.

VITAMIN C TABLETS

Manufacturing Directions

1. Produce a 5wt% vitamin C containing tablet in the following manner for a batch size of 100,000 tablets (100 kg).
2. Fine screen the following components (Frewitt screening machine) to a 1.0 mm mesh size and mixed for 10 minutes in a tumbling drum mixer in a V2A high-grade steel container (200 L): Ascorbic acid 5000 g; glucose $1H_2O$ 89,000 g ; cellulose powder (tableting aid K) 4000 g ; poly(1-vinyl-2-pyrrolidone 1000 g 25,000 (Kollidon® 25).
3. Thereafter, screen in by hand 1000 g of magnesium stearate by hand, mix for 2 minutes in the tumbling drum mixer, and compress.

VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Ascorbic acid (coated)	104.00
2.40	2	Anhydrous colloidal silica (Aerosil® 200)	2.40
60.00	3	Cellulose (microcrystalline) (Avicel™ PH102)	60.00
0.13	4	FD&C Yellow Dye No.10 lake	0.13
37.00	5	Lactose (spray-dried)	37.00
3.20	6	Glyceryl behenate (glyceryl monostearate)	3.20
2.40	7	Stearic acid (fine powder)	2.40
1.00	8	Magnesium stearate	1.00

Manufacturing Directions

1. Processing should be done under controlled temperature and humidity (limit: relative humidity, 40–50%; temperature, 20–25°C).
2. Mix items 5 and 4 in a polyethylene bag for 1 to 2 minutes.
3. Sift twice through a 630 µm sieve.
4. Collect in a polyethylene bag.
5. Check the uniformity of dispersion.
6. If required, sift again.
7. Sift item 3.
8. Sift mixture from first step and item 2 through a 630 µm sieve.
9. Load into a drum blender.
10. Sift item 4 through a 630 µm sieve.
11. Load into the mix in the drum blender.
12. Mix items 6, 7, and 8 in a polyethylene bag for 1 to 2 minutes.

13. Sift through a 250 µm sieve.
14. Collect in a polyethylene bag.
15. Add 13.33 to 20.00 g of granules to the lubricant mixture.
16. Mix for 1 to 2 minutes.
17. Add this to the mix in a stainless steel drum blender.
18. Mix in a drum blender for 2 minutes.
19. Check the temperature and humidity before beginning compression (limit: relative humidity, 40–45%; temperature, 20–25°C).
20. Compress into 210 mg tablets, using 8 mm round concave punches.

VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)

3.00	4	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high-compression force.
2. Compress into 413 mg tablets, using 12 mm biplanar punches.

VOLTAREN ENTERIC-COATED TABLETS (25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
25.00	1	Diclofenac sodium	25.00
44.20	2	Lactose spray dried	44.20
25.00	3	Microcrystalline cellulose (Avicel™ PH102)	25.00
2.00	4	Povidone K30	2.00
3.00	5	Sodium starch glycolate	3.00
0.80	6	Magnesium stearate	0.80
18.60	7	Eudragit® L30 D, 30% dispersion (methacrylic acid copolymer)	18.60
0.50	8	Triethyl citrate (Eudraflex)	0.50
1.00	9	Talc	1.00
—	10	Water, purified	15.00
2.00	11	Hydroxypropyl methylcellulose	2.00
0.40	12	Polyethylene glycol 6000	0.40
0.30	13	Talc	0.30
0.70	14	Titanium dioxide	0.70
0.25	15	D&C Yellow No. 10 Aluminum Lake	0.25
—	16	Water, purified	35.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and place in a tumbler.
2. Pass item 1, item 4, and item 5 through 0.5 mm sieve, and place in tumbler from step 1.
3. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
4. Mix step 1 for 20 minutes using tumbler.
5. Pass item 6 through 0.250 mm sieve, and add to step 4.
6. Mix step 5 for 2 minutes.
7. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).
8. Place item 10 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring.
9. Add item 8 and item 9 one by one to step 8 with stirring. Stir for 5 minutes.
10. Load core tablets from step 7 in coating pan and apply coating dispersion from step 9 to get 6.0% to 6.5% weight gain.
11. Place item 16 in a stainless steel vessel. Add item 11 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
12. Add item 12, item 13, item 14, and item 15 one by one to step 11 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Check that coating

dispersion is clear and lump free. Pass the coating dispersion through 180 mm sieve (if required).
13. Apply coating dispersion from step 12 to step 10.

VOLTAREN ENTERIC-COATED TABLETS (50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
50.00	1	Diclofenac sodium	50.00
68.25	2	Lactose spray dried	68.25
45.00	3	Microcrystalline cellulose (Avicel™ PH102)	45.00
5.00	4	Povidone K30	5.00
5.25	5	Sodium starch glycolate	5.25
1.50	6	Magnesium stearate	1.50
32.38	7	Eudragit® L30 D, 30% dispersion (methacrylic acid copolymer)	32.38
0.875	8	Triethyl citrate (Eudraflex)	0.875
2.00	9	Talc	2.00
—	10	Water, purified	25.00
3.50	11	Hydroxypropyl methylcellulose	3.50
0.70	12	Polyethylene glycol 6000	0.70
0.50	13	Talc	0.50
1.20	14	Titanium dioxide	1.20
0.20	15	FD&C Blue No. 1 Aluminum Lake	0.20
—	16	Water, purified	55.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and place in a tumbler.
2. Pass items 1, 4, and 5 through 0.5 mm sieve, and place in tumbler from step 1.
3. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
4. Mix step 1 for 20 minutes using tumbler.
5. Pass item 6 through 0.250 mm sieve, and add to step 4.
6. Mix step 5 for 2 minutes.
7. Compress into 175 mg tablets, using a suitable punch (8.0 mm, round).
8. Place item 10 in a stainless steel vessel. Add item 7 slowly to the vortex while stirring.
9. Add item 8 and item 9 one by one to step 8 with stirring. Stir for 5 minutes.
10. Load core tablets from step 7 in coating pan, and apply coating dispersion from step 9 to get 6.0% to 6.5% weight gain.
11. Place item 16 in a stainless steel vessel. Add item 11 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
12. Add item 12, item 13, item 14, and item 15 one by one to step 11 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Check that coating dispersion is clear and lump free. Pass the coating dispersion through 180 mm sieve (if required).
13. Apply coating dispersion from step 12 to step 10.

VOLTAREN ENTERIC-COATED TABLET (75 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
75.00	1	Diclofenac sodium	75.00
124.50	2	Lactose monohydrate	124.50
75.00	3	Microcrystalline cellulose (Avicel™ PH102)	75.00
12.00	4	Povidone K30	12.00
10.50	5	Sodium starch glycolate	10.50
3.00	6	Magnesium stearate	3.00
—	7	Ethanol 95%	45.00
55.50	8	Eudragit® L30 D, 30% dispersion (methacrylic acid copolymer)	55.50
1.50	9	Triethyl citrate (Eudraflex)	1.50
3.00	10	Talc	3.00
—	11	Water, purified	45.00
4.50	12	Hydroxypropyl methylcellulose	4.50
0.90	13	Polyethylene glycol 6000	0.90
0.90	14	Talc	0.90
2.00	15	Titanium dioxide	2.00
0.20	16	Red ferric oxide	0.20
—	17	Water, purified	60.00

Manufacturing Directions

1. Dissolve item 4 in item 7 in a stainless steel container.
2. Pass item 2, item 1, and half quantity of item 3 (37.5 g) through 0.5 mm sieve, and mix well.
3. Place step 2 in a granulator.
4. Knead step 3 with solution of step 1 for 5 to 10 minutes until a loose, moist mass is obtained.
5. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
6. Spread over paper-lined trays, and dry at 45°C to 50°C for 8 hours (the relative humidity over the granules should be 20–35%).
7. Pass the dried granules through a 1.25 mm sieve granulator.
8. Transfer the granules to a tumbler.
9. Pass item 5 and the remaining half quantity of item 9 through 0.5 mm sieve, add to step 8, and mix for 15 minutes.

10. Pass item 6 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 300 mg tablets, using a suitable punch (10.5 mm, round).
13. Place item 11 in a stainless steel vessel. Add item 8 slowly to the vortex while stirring.
14. Add item 9 and item 10 one by one to step 13 with stirring. Stir for 5 minutes.
15. Load core tablets from step 12 in coating pan, and apply coating dispersion from step 14 to get 6.0% to 6.5% weight gain.
16. Place item 17 in a stainless steel vessel. Add item 12 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
17. Add item 13, item 14, item 15, and item 16 one by one to step 11 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Check that coating dispersion is clear and lump free. Pass the coating dispersion through 180 mm sieve (if required).
18. Apply coating dispersion from step 17 to step 15.

VYTORIN TABLETS (10 MG/10 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Ezetimibe	10.00
10.00	2	Simvastatin	10.00
50.16	3	Lactose monohydrate	50.16
25.00	4	Microcrystalline cellulose (Avicel™ PH102)	25.00
0.02	5	Butylated hydroxyanisole	0.02
1.50	6	Citric acid monohydrate	1.50
0.02	7	Propyl gallate	0.02
2.50	8	Croscarmellose sodium	2.50
0.80	9	Magnesium stearate	0.80
—	10	Water, purified	10.00
—	11	Ethanol 95%	5.00
2.20	12	Hydroxypropyl methylcellulose	2.20
—	13	Water, purified	20.00

Manufacturing Directions

1. Dissolve item 6 in item 10 in a stainless steel container.
2. Dissolve item 5 and item 7 one by one in item 11 in another stainless steel container.
3. Mix step 2 with step 1.
4. Pass items 3, 1, and 2 through 0.5 mm sieve, and mix well.
5. Place step 4 in a granulator.
6. Knead step 5 with solution of step 3 for 5 to 10 minutes until a loose, moist mass is obtained.
7. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
8. Spread step over paper-lined trays, and dry at 45°C to 50°C for 8 hours (the relative humidity over the granules should be 20–35%).
9. Pass the dried granules through a 1.25 mm sieve granulator.
10. Transfer the granules to a tumbler.
11. Pass items 4 and 8 through 0.5 mm sieve, add to step 10, and mix for 15 minutes.
12. Pass item 9 through 0.250 mm sieve, and add to step 11.
13. Mix step 12 for 2 minutes.
14. Compress into 100 mg tablets, using a suitable punch (6.0 mm, round).
15. Place item 13 in a stainless steel vessel. Add item 12 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
16. Load core tablets from step 14 in coating pan and apply coating dispersion from step 15 to get 1.5% to 1.8% weight gain.

VYTORIN TABLETS (10 MG/20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Ezetimibe	10.00
20.00	2	Simvastatin	20.00
75.24	3	Lactose monohydrate	75.24
37.50	4	Microcrystalline cellulose (Avicel™ PH102)	37.50
0.03	5	Butylated hydroxyanisole	0.03
2.25	6	Citric acid monohydrate	2.25
0.03	7	Propyl gallate	0.03
3.75	8	Croscarmellose sodium	3.75
1.20	9	Magnesium stearate	1.20
—	10	Water, purified	15.00
—	11	Ethanol 95%	7.50
3.3	12	Hydroxypropyl methylcellulose	3.3
—	13	Water, purified	30.00

Manufacturing Directions

1. Dissolve item 6 in item 10 in a stainless steel container.
2. Dissolve item 5 and item 7 one by one in item 11 in another stainless steel container.
3. Mix step 2 with step 1.
4. Pass items 3, 1, and 2 through 0.5 mm sieve, and mix well.

5. Place step 4 in a granulator.
6. Knead step 5 with solution of step 3 for 5 to 10 minutes until a loose, moist mass is obtained.
7. Granulate the moist mass using a centrifugal granulator with a 7 mm sieve.
8. Spread over paper-lined trays, and dry at 45°C to 50°C for 8 hours (the relative humidity over the granules should be 20–35%).
9. Pass the dried granules through a 1.25 mm sieve granulator.
10. Transfer the granules to a tumbler.
11. Pass items 4 and 8 through 0.5 mm sieve, add to step 10, and mix for 15 minutes.
12. Pass item 9 through 0.250 mm sieve, and add to step 11.
13. Mix step 12 for 2 minutes.
14. Compress into 150 mg tablets, using a suitable punch (7.5 mm × 6.0 mm, oval).
15. Place item 13 in a stainless steel vessel. Add item 12 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
16. Load core tablets from step 14 in coating pan, and apply coating dispersion from step 15 to get 1.5% to 1.8% weight gain.

WARFARIN TABLETS (1, 2, 2.5, 3, 4, 5, 6, 7.5, AND 10 MG), COUMADIN WARFARIN SODIUM TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
11.470	1	Starch (maize)	11.470
0.215	2	Dye	0.215
0.119	3	Dye	0.119
3.020	4	Starch (maize)	3.020
—	5	Water, purified, ca	9.000
37.000	6	Cellulose microcrystalline	37.000
126.310	7	Lactose monohydrate	126.310
1.000	8	Warfarin sodium anhydrous[a]	1.000
0.930	9	Magnesium stearate	0.930
0.930	10	Amberlite (RP-88) ion exchange resin	0.930

[a] Factored quantity; adjust with lactose. Dyes are selected to color-code different strengths for safety.

Manufacturing Directions

Caution: Warfarin is poisonous. Wear a dust mask when handling. Send a 5 g sample to redetermine factor before granulating.

1. Granulation
   a. Roughly blend cornstarch (item 1) with dyes, and mill through an 80 mesh (117 µm aperture or similar) screen.
   b. Roughly blend 200 mg of colored starch mixture from step 1a with cornstarch (item 4).
   c. Make a starch paste using the colored starch mixture from step 1b and approximately 18 mL purified water. *Note:* Starch paste should be smooth and thin. A thick starch paste will cause dye spots.
   d. Roughly blend the remaining colored starch mixture from step 1a with the following items: cellulose microcrystalline, lactose, and warfarin sodium, and mill through a 30 mesh (600 µm aperture or similar) screen.
   e. Load the milled material into a Day mixer (or similar), and blend for 10 minutes. Mass with hot starch paste. The addition of starch paste should be finished in 2 minutes. Mass for another 15 minutes using additional purified water, if necessary. Record the amount of purified water added. (*Note:* Do not overwet or mass for too long.)
   f. Granulate through a 5/8 in. (15.88 mm aperture or similar) band.
   g. Dry overnight at 49°C to not more than a 1.5% LOD at 105°C.

      Note: Protect the granules from moisture from this step on. Make sure that the relative humidity is not greater than 40% at 24°C (54 grains).
   h. Sift and grind through a 30 mesh (600 µm aperture or similar) screen.
   i. Or, sift the dried granulation through a 20 mesh (840 µm aperture or similar) screen, and mill the coarse material through a 20 mesh (840 µm aperture or similar) screen using FitzMill (or similar), with knives forward, at medium speed.
2. Lubrication
   a. Load the granulation into the blender.
   b. Sift magnesium stearate and Amberlite through a 30 mesh (600 µm aperture, or similar) screen into a partial drum of granulation. Mix by hand, and load into a blender.
   c. Add the remaining granulation to a blender, and blend for 10 minutes.
   d. Discharge the blender into polyethylene-lined drums.
3. Compression: Compress using an 8 mm round flat, bevel-edged punch. The weight of 10 tablets is 1.85 g; thickness is 2.7 to 2.9 mm. Different dyes and different strengths of warfarin sodium can be adjusted with lactose.

YASMIN TABLET (3 MG/0.03 MG)—ACTIVE FILM-COATED TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
3.00	1	Drospirenone	3.00
0.03	2	Ethinyl estradiol	0.03
74.47	3	Lactose spray dried	74.47
5.00	4	Cornstarch	5.00
1.80	5	Povidone K25	1.80
5.00	6	Starch 1500	5.00
0.70	7	Magnesium stearate	0.70
2.00	8	Hydroxypropyl methylcellulose	2.00
0.40	9	Polyethylene glycol 6000	0.40
0.30	10	Talc	0.30
0.60	11	Titanium dioxide	0.60
0.20	12	Yellow ferric oxide	0.20
—	13	Water, purified	30.00

Manufacturing Directions

1. Pass item 3 through 0.7 mm sieve and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 2, 4, 5, and 6 through 0.5 mm sieve, collect in a stainless steel container, and mix well.
4. Add 5% (=1.9 g) powder from step 1 to step 3, and mix well.
5. Add 10% (=3.8 g) powder from step 1 to step 4, and mix well.
6. Add 15% (=5.7 g) powder from step 1 to step 5, and mix well.
7. Transfer step 6 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 7 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 90 mg tablets, using a suitable punch (5.5 mm, round).
13. Place item 13 in a stainless steel vessel. Add item 8 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
14. Add items 9 to 12 one by one to step 13 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
15. Load core tablets from step 12 in coating pan, and apply coating dispersion from step 14 to get 2.5% to 3.0% weight gain.

YASMIN TABLET—INERT FILM-COATED TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
92.20	1	Lactose spray dried	92.20
5.00	2	Cornstarch	5.00
2.00	3	Povidone K25	2.00
0.80	4	Magnesium stearate	0.80
2.00	5	Hydroxypropyl methylcellulose	2.00
0.30	6	Talc	0.30
0.60	7	Titanium dioxide	0.60
—	8	Water, purified	30.00

Manufacturing Directions

1. Pass items 1 to 3 through 0.7 mm sieve, and collect in a tumbler.
2. Mix step 1 for 5 minutes using tumbler.
3. Pass item 4 through 0.250 mm sieve, and add to step 2.
4. Mix step 3 for 1 minute.
5. Compress into 100 mg tablets, using a suitable punch (4.5 mm × 4.5 mm square).
6. Place item 8 in a stainless steel vessel. Add item 5 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
7. Add items 6 and 7 to step 6 with stirring. Stir for 10 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
8. Load core tablets from step 5 in coating pan, and apply coating dispersion from step 7 to get 2.0% to 2.5% weight gain.

ZOLMITRIPTAN ORALLY DISINTEGRATING TABLETS (2.5 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
2.50	1	Zolmitriptan	2.50
64.80	2	Mannitol DC grade	64.80
10.00	3	Microcrystalline cellulose	10.00
2.50	4	Crospovidone	2.50
1.00	5	Aspartame	1.00
8.00	6	Sodium bicarbonate	8.00
8.00	7	Citric acid anhydrous	8.00
2.00	8	Orange flavor	2.00
0.70	9	Colloidal silicon dioxide (Aerosil® 200)	0.70
0.50	10	Magnesium stearate	0.50

Manufacturing Directions

1. Pass items 2 and 7 through 1 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, 5, and 8 through 0.5 mm sieve, and collect in a stainless steel container.
4. Add 15% (=5.5 g) powder from step 1 to step 3, and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass items 3, 6, and 9 through 0.5 mm sieve, and add to step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 10 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).

ZOLMITRIPTAN ORALLY DISINTEGRATING TABLETS (5 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
5.00	1	Zolmitriptan	5.00
62.30	2	Mannitol DC grade	62.30
10.00	3	Microcrystalline cellulose	10.00
2.50	4	Crospovidone	2.50
1.00	5	Aspartame	1.00
8.00	6	Sodium bicarbonate	8.00
8.00	7	Citric acid anhydrous	8.00
2.00	8	Orange flavor	2.00
0.70	9	Colloidal silicon dioxide (Aerosil® 200)	0.70
0.50	10	Magnesium stearate	0.50

Manufacturing Directions

1. Pass items 2 and 7 through 1 mm sieve, and collect in a stainless steel container.
2. Place half quantity of step 1 in a tumbler.
3. Pass items 1, 4, 5, and 8 through 0.5 mm sieve, and collect in a stainless steel container.
4. Add 15% (=5.2 g) powder from step 1 to step 3, and mix well.
5. Transfer half quantity from step 4 into step 2.
6. Pass items 3, 6, and 9 through 0.5 mm sieve, and add to step 2.
7. Transfer the remaining half quantity of step 4 into step 2.
8. Transfer balance quantity of step 1 into step 2.
9. Mix step 2 for 20 minutes using tumbler.
10. Pass item 10 through 0.250 mm sieve, and add to step 9.
11. Mix step 10 for 2 minutes.
12. Compress into 100 mg tablets, using a suitable punch (5.0 mm × 5.5 mm, oval).

ZOLMITRIPTAN TABLETS (2.5 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Quantity/ 1000 Tablets (g)
2.50	1	Zolmitriptan	2.50
58.70	2	Lactose spray dried	58.70
35.00	3	Microcrystalline cellulose (Avicel™ PH102)	35.00
3.00	4	Sodium starch glycolate	3.00
0.80	5	Magnesium stearate	0.80
2.20	6	Hydroxypropyl methylcellulose	2.20
0.40	7	Polyethylene glycol 4000	0.40
0.70	8	Titanium dioxide	0.70
0.20	9	Yellow iron oxide	0.20
—	10	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and place in a tumbler.
2. Pass item 1 and item 4 through 0.5 mm sieve, and collect in a stainless steel container.
3. Add 5% (=3.0 g) lactose from step 1 to step 2, and mix well.
4. Add 10% (=5.8 g) lactose from step 1 to step 3, and mix well.
5. Transfer step 4 into step 1.
6. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
7. Mix step 1 for 20 minutes using tumbler.
8. Pass item 5 through 0.250 mm sieve, and add to step 7.
9. Mix step 8 for 2 minutes.
10. Compress into 100 mg tablets, using a suitable punch (5.5 mm, round).
11. Place item 10 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
12. Add items 7 to 9 one by one to step 10 with stirring. Stir for 5 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
13. Load core tablets from step 10 in coating pan, and apply coating dispersion from step 12 to get 2.5% to 3.0% weight gain.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
5.00	1	Zolmitriptan	5.00
56.20	2	Lactose spray dried	56.20
35.00	3	Microcrystalline cellulose (Avicel™ PH102)	35.00
3.00	4	Sodium starch glycolate	3.00
0.80	5	Magnesium stearate	0.80
2.20	6	Hydroxypropyl methylcellulose	2.20
0.40	7	Polyethylene glycol 4000	0.40
0.70	8	Titanium dioxide	0.70
0.20	9	Red iron oxide	0.20
—	10	Water, purified	30.00

Manufacturing Directions

1. Pass item 2 through 0.7 mm sieve, and place in a tumbler.
2. Pass items 1 and 4 through 0.5 mm sieve, and collect in a stainless steel container.
3. Add 10% (=5.6 g) lactose from step 1 to step 2, and mix well.
4. Transfer step 3 into step 1.
5. Pass item 3 through 0.7 mm sieve, and place in tumbler from step 1.
6. Mix step 1 for 20 minutes using tumbler.
7. Pass item 5 through 0.250 mm sieve, and add to step 6.
8. Mix step 7 for 2 minutes.
9. Compress into 100 mg tablets, using a suitable punch (5.0 mm × 5.5 mm, oval).
10. Place item 10 in a stainless steel vessel. Add item 6 slowly to the vortex while stirring. Stir till lumps dissolve. Homogenize for 5 minutes. Keep for 3 to 4 hours for saturation of hydroxypropyl methylcellulose.
11. Add item 7, item 8, and item 9 one by one to step 10 with stirring. Stir for 5 minutes. Homogenize for 5 minutes. Pass the coating dispersion through 180 mm sieve (if required).
12. Load core tablets from step 9 in coating pan and apply coating dispersion from step 11.

ZOLMITRIPTAN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
1.25	1	Zolmitriptan	1.25
0.12	2	Talc	0.12
0.15	3	Polyvinylpyrrolidone	0.15
QS	4	Water	QS
QS	5	Ethanol	QS
60.00	6	Sugar spheres	60.00
6.00	7	Eudragit® S	6.00
3.00	8	Triethyl citrate	3.00
1.50	9	Talc	1.50
0.105	10	Ammonium hydroxide 1 N solution	0.105
3.10	11	Hydroxypropyl methylcellulose	3.10
0.40	12	Polyethylene glycol	0.40
0.50	13	Flavor (optional)	0.50
0.50	14	Color (optional)	0.50
QS	15	Water	QS
QS	16	Ethanol	QS

Manufacturing Directions

1. Prepare a dispersion containing zolmitriptan and talc in polyvinylpyrrolidone solution prepared in water and/or ethanol or a mixture thereof.
2. Apply or spray solution (1) onto the sugar spheres using a coating pan or a fluid-bed coater until a desired amount of solution (1) is applied.
3. The coated spheres may be further seal-coated with a solution containing polyvinylpyrrolidone prepared in water and/or ethanol or a mixture thereof.
4. Prepare the coating solution by mixing water, Eudragit® S100, ammonium hydroxide solution, triethyl citrate, and talc to form a uniform dispersion.
5. Coat zolmitriptan beads (from step 3) with Eudragit® S coating solution using a coating pan or a fluid-bed coater until a desired coat weight is achieved.
6. Seal coat of the enteric-coated zolmitriptan beads: Prepare a coating solution of hydroxypropyl methylcellulose and polyethylene glycol in water or ethanol or combination thereof.
7. Coat zolmitriptan enteric-coated beads (step 5) with this coating solution in a coating pan or a fluid-bed coater until a desired coating weight is obtained for tablets containing 1.25 or 2.50 mg zolmitriptan.

ZOLPIDEM HEMITARTRATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Zolpidem hemitartrate	10.00
91.00	2	Lactose monohydrate	91.00
12.00	3	Microcrystalline cellulose	12.00
2.52	4	Hydroxypropyl methylcellulose	2.52
3.84	5	Sodium carboxymethyl cellulose	3.84
0.72	6	Magnesium stearate	0.72
—	7	Water, purified	QS

Manufacturing Directions

1. Mix items 1 to 4, and blend for 10 minutes.
2. Add item 7 to granulate, dry, and sieve granules.
3. Mix granules with items 5 and 6.
4. Compress into 120 mg tablets.

ZOLPIDEM TARTRATE TABLETS (5 MG/10 MG), AMBIEN®

Each Ambien® tablet includes the following inactive ingredients: hydroxypropyl methylcellulose, lactose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, sodium starch glycolate, and titanium dioxide. The 5 mg tablet also contains FD&C Red No. 40, iron oxide colorant, and polysorbate 80.

Tablet Coating Formulations

INTRODUCTION

Solid dosage forms are frequently coated for varied purposes, including the following:

- Mask taste and smell.
- Offer protection from the environment.
- Provide protection from gastric acid (enteric coating).
- Make dose easy to swallow.
- Provide identification.
- Add esthetic appeal.
- Hide surface defects.

Many types of coatings are available.

I. Sugar coating: Compressed tablets are coated with a colored or uncolored sugar layer that is water soluble and quickly dissolves after swallowing. The sugar coat protects the enclosed drug from the environment and provides a barrier to objectionable taste or odor. The sugar coat also enhances the appearance of the compressed tablet and permits the manufacturer's information to be imprinted. Sugar coating provides a combination of insulation, taste masking, smoothing the tablet core, coloring, and modified release. The disadvantages of sugar coating are the time and expertise required in the coating process and thus, increased size, weight, and shipping costs. The sugar-coating process involves five separate operations:

   a. Sealing/waterproofing: Prior to the application of any sugar/water syrup, the tablet cores must be sealed, thoroughly dried, and free of all residual solvents. The seal coat provides a moisture barrier and hardness to the surface of the tablet in order to minimize attritional effects. Core tablets having very rapid disintegration rates conceivably could start the disintegration process during the initial phase of sugar coating. The sealants are generally water-insoluble polymers/film formers applied from an organic solvent solution. The quantities of material applied as a sealing coat will depend primarily on the tablet porosity, since highly porous tablets will tend to soak up the first application of solution, thus preventing it from spreading uniformly across the surface of every tablet in the batch. Hence, one or more further applications of resin solution may be required to ensure that the tablet cores are sealed effectively. Common materials used as a sealant include shellac, zinc sulfate, cellulose acetate phthalate (CAP), polyvinylacetate phthalate, hydroxypropyl cellulose, hydroxypropyl methylcellulose, etc.
   b. Subcoating: Subcoating is the actual start of the sugar-coating process and provides the rapid buildup necessary to round up the tablet edge. It also acts as the foundation for the smoothing and color coats. Generally, two methods are used for subcoating. Dusting with powder and then drying follows the same process where the application of gum based solution and routine repeated application until the desired shape is achieved is practiced. In the other method, a suspension of dry powder in gum/sucrose solution is applied, followed by drying the tablets. Thus, subcoating is a sandwich of alternate layers of gum and powder. It is necessary to remove the bulk of the water after each application of coating syrup.
   c. Grossing/smoothing: The grossing/smoothing process is specifically for smoothing and filing the irregularity on the surface generated during subcoating. It also increases the tablet size to a predetermined dimension. If the subcoating is rough a with high number of irregularities, then the use of grossing syrup containing suspended solids will provide more rapid buildup and better filling qualities. Smoothing usually can be accomplished by the application of a simple syrup solution (approximately 60%–70% sugar solid). This syrup generally contains pigments, starch, gelatin, acacia, or opacifier if required. Small quantities of color suspension can be applied to impart a tint of the desired color when there are irregularities in coating.
   d. Color coating: This stage is often critical in the successful completion of a sugar-coating process and involves multiple applications of syrup solution (60%–70% sugar solid) containing the requisite coloring matter. Mainly soluble dyes were previously used in the sugar coating to achieve the desired color, since the soluble dye will migrate to the surface during drying. But nowadays, insoluble certified lakes have virtually replaced soluble dyes in pharmaceutical tablet coating. The most efficient process for color coating involves the use of a predispersed opacified lake suspension.
   e. Polishing: Sugar-coated tablets need to be polished to achieve a final elegance. Polishing is achieved by applying a mixture of waxes, such as beeswax, carnauba wax, candelilla wax, and hard paraffin wax, to tablets in the polishing pan.

II. Film coating: Film coating is the deposition of a thin film of polymer surrounding the tablet core. Conventional pan equipment may be used, but nowadays, more sophisticated equipment is employed to provide a high degree of automation and coating time. The polymer is solubilized into solvent. Other additives, such as plasticizers and pigments, are added. The resulting solution is sprayed onto a rotated tablet bed. The drying conditions cause removal of the solvent, giving a thin deposition of coating material around each tablet core. Usually, a spray process is employed in the preparation of film-coated tablets. The Accela Cota is the prototype of a perforated cylindrical drum, providing high drying air capacity. Fluidized-bed equipment has made a considerable impact; tablets move in a stream of air passing through the perforated bottom of a cylindrical column. With a smaller cylindrical insert, the stream of cores rises in the center of the device together with a spray mist applied in the middle of the bottom. For fluidized-bed coating, very hard tablets (hardness >20 N) have to be used. The fundamental requirements are independent of the actual type of equipment being used and include an adequate means of atomizing the spray liquid for application to the tablet core, adequate mixing and agitation of the tablet bed, and sufficient heat input in the form of drying air to provide the latent heat of evaporation of the solvent. This is particularly important with aqueous-based spraying, and good exhaust facilities are required to remove dust and solvent-laden air. The materials used in film coating include the following:
   a. Film formers
      i. Hydroxypropyl methylcellulose (HPMC): This is available in different viscosity grades. It is a polymer of choice for air suspension and pan spray-coating systems because of its solubility in gastric fluid and organic and aqueous solvent systems. The advantages are that it does not affect tablet disintegration and drug availability; it is cheap, flexible, and highly resistant to heat, light, and moisture; it has no taste or odor; and color and other additives can be easily incorporated. The disadvantage is that when it is used alone, the polymer has a tendency to bridge or fill the debossed tablet surfaces. So, a mixture of HPMC and other polymers/plasticizers is used.
      ii. Methylhydroxy ethylcellulose (MHEC): This is available in a wide variety of viscosity grades. It is not frequently used as HPMC because it is soluble in fewer organic solvents.
      iii. Ethylcellulose (EC): Depending on the degree of ethoxy substitution, different viscosity grades are available. It is completely insoluble in water and gastric fluids. Hence, it is used in combination with water-soluble additives such as HPMC and not alone. Unplasticized EC films are brittle and require film modifiers to obtain an acceptable film formulation. Aquacoat® is an aqueous polymeric dispersion utilizing EC. These pseudolatex systems contain high-solids, low-viscosity compositions that have coating properties quite different from those of regular EC solution.
      iv. Hydroxypropyl cellulose (HPC): This is soluble in water below 40°C (insoluble above 45°C), gastric fluid, and many polar organic solvents. HPC is extremely tacky as it dries from a solution system. It is used for the subcoat and not for color or glass coating. It gives a very flexible film.
      v. Povidone: The degree of polymerization decides the molecular weight of the material. It is available in four viscosity grades: K-15, K-30, K-60, and K-90. The average molecular weight of these grades is 10,000, 40,000, 160,000, and 360,000, respectively. K-30 is widely used as a tablet binder and in tablet coating. It has excellent solubility in a wide variety of organic solvents, water, and gastric and intestinal fluids. Povidone can be cross-linked with other materials to produce films with enteric properties. It is used to improve the dispersion of colorants in coating solution.
      vi. Sodium carboxymethylcellulose: This is available in medium-, high-, and extra-high-viscosity grades. It is easily dispersed in water to form colloidal solutions but is insoluble in most organic solvents and hence, not a material of choice for coating solutions based on organic solvents. Films prepared from it are brittle but adhere well to tablets. Partially dried films are tacky. So, coating compositions must be modified with additives.
      vii. Polyethylene glycols (PEGs): PEGs with low molecular weights (200–600) are liquid at room temperature and are used as plasticizers. High–molecular weight PEGs (900–8000 series) are white, waxy solids at room temperature. The combination of PEG waxes with CAP gives films that are soluble in gastric fluids.
      viii. Acrylate polymers: These are marketed under the name of Eudragit®. Eudragit® E is a cationic copolymer. Only Eudragit® E is freely soluble in gastric fluid up to pH 5 and expandable and permeable above pH 5. This material is available as an organic solution

(12.5% in isopropanol/acetone), a solid material, or a 30% aqueous dispersion. Eudragit® RL and RS are copolymers with low content of quaternary ammonium groups. These are available only as organic solutions and solid materials. They produce films for delayed action (pH dependent).

b. Solvents: Mostly, solvents are used either alone or in combination with water, ethanol, methanol, isopropanol, chloroform, acetone, methylene chloride, etc. Water is more often used, because there are no environmental or economic considerations. For drugs that readily hydrolyze in the presence of water, nonaqueous solvents are used.
c. Plasticizers: As solvent is removed, most polymeric materials tend to pack together in a three-dimensional honeycomb arrangement. Both internal and external plasticizing techniques are used to modify the quality of the film. A combination of plasticizers may be used to get the desired effect. The concentration of plasticizer is expressed in relation to the polymer being plasticized. Recommended levels of plasticizers range from 1% to 50% by weight of the film former. Commonly used plasticizers are castor oil, propylene glycol (PG), glycerin, lower–molecular weight (200–400 series) polyethylene glycol (PEG), surfactants, etc. For aqueous coating, PEG and PG are more often used, while castor oil and Spans are primarily used for organic solvent–based coating solutions. The external plasticizer should be soluble in the solvent system used for dissolving the film former and the plasticizer. The plasticizer and the film former must be at least partially soluble or miscible in each other.
d. Colorants: Colorants can be used in solution form or in suspension form. To achieve proper distribution of suspended colorants in the coating solution requires the use of powdered colorants (<10 microns). Most common colorants in use are certified FD&C or D&C colorants. These are synthetic dyes or lakes. Lakes are the choice for sugar or film coating, as they give reproducible results. The concentration of colorants in the coating solutions depends on the color shade desired, the type of dye, and the concentration of opaquant-extenders. If a very light shade is desired, a concentration of less than 0.01% may be adequate; on the other hand, if a dark color is desired, a concentration of more than 2.0% may be required. Inorganic materials (e.g., iron oxide) and natural coloring materials (e.g., anthocyanins, carotenoids, etc.) are also used to prepare coating solutions. Magenta red dye is nonabsorbable in biologic systems and resistant to degradation in the gastrointestinal tract. Opaspray® (an opaque color concentrate for film coating) and Opadry® (a complete film coating concentrate) are promoted as achieving lower lot-to-lot color variation.
e. Opaquant-extenders: These are very fine inorganic powders used to provide more pastel colors and increase film coverage. These inorganic materials provide a white coat or mask the color of the tablet core. Colorants are very expensive, and high concentrations are required. These inorganic materials are cheap. In the presence of these inorganic materials, the amount of colorants required decreases. The most commonly used materials are titanium dioxide, silicate (talc and aluminum silicates), carbonates (magnesium carbonates), oxides (magnesium oxide), and hydroxides (aluminum hydroxides).
f. Other components: Flavors, sweeteners, surfactants, antioxidants, antimicrobials, etc., may be incorporated into the coating solution.

III. Enteric coating: A one-layer system is applied as one homogeneous layer, which can be white-opaque or colored. The advantage is that only one application is needed. In a two-layer system, the enteric formulation is applied first, followed by colored film. Both layers can be made of enteric polymer; alternatively, only the basic layer contains enteric polymer, while the top layer is a fast-disintegrating, water-soluble polymer. Polymers used for enteric coating include the following:
    a. Cellulose acetate phthalate (CAP): This is widely used in industry. Aquateric® is a reconstituted colloidal dispersion of latex particles. It is composed of solid or semisolid polymer spheres of CAP ranging in size from 0.05 to 3 microns. Cellulose acetate trimellitate (CAT), developed as an ammoniated aqueous formulation, showed faster dissolution than a similar formulation of CAP. Its disadvantages include that it dissolves above pH 6 only, delays the absorption of drugs, is hygroscopic and permeable to moisture in comparison with other enteric polymers, and is susceptible to hydrolytic removal of phthalic and acetic acid, changing the film properties. CAP films are brittle and are usually used with other hydrophobic film-forming materials.
    b. Acrylate polymers: Eudragit® L & Eudragit® S are two forms of commercially available enteric acrylic resin. Both of them produce films resistant to gastric fluid. Eudragit® L and S are soluble in intestinal fluid at pH 6 and 7, respectively. Eudragit® L is available as an organic solution (in isopropanol), a solid, or an aqueous dispersion. Eudragit® S is available only as an organic solution (in isopropanol) and a solid.

c. Hydroxypropyl methylcellulose phthalate: HPMCP 50, 55, and 55-s (also called HP-50, HP-55, and HP-55-s) are widely used. HP-55 is recommended for general enteric preparation, while HP-50 and HP-55-s are for special cases. These polymers dissolve at pH 5 to 5.5.
d. Polyvinyl acetate phthalate: This is similar to HP-55 in stability and pH-dependent solubility.
e. Enteric coating can be combined with polysaccharides that are degraded by enzymes in the colon, such as cyclodextrin and galactomannan.

IV. Controlled-Release Coating: Polymers such as modified acrylates, water-insoluble cellulose (ethyl cellulose), etc., are used for controlled-release coating.

V. Compressed coating: This type of coating requires a specialized tablet machine. Compression coating is not widely used, but it has advantages in some cases in which the tablet core cannot tolerate organic solvent or water and yet needs to be coated for taste masking, or to provide delayed or enteric properties to the finished product, and also to avoid incompatibility by separating incompatible ingredients.

VI. Electrostatic coating: Electrostatic coating is an efficient method of applying coating to conductive substrates. A strong electrostatic charge is applied to the substrate. A coating material containing conductive ionic species of opposite charge is sprayed onto the charged substrate. The complete and uniform coating of corners, and the adaptability of this method to such relatively nonconductive substrates as pharmaceuticals, is limited.

VII. Dip coating: Coating is applied to the tablet cores by dipping them into the coating liquid. The wet tablets are dried in a conventional manner in a coating pan. Alternate dipping and drying steps may be repeated several times to obtain the desired coating. This process lacks the speed, versatility, and reliability of spray-coating techniques. Specialized equipment has been developed to dip coat tablets, but no commercial pharmaceutical application has been obtained.

VIII. Vacuum film coating: Vacuum film coating is a new coating procedure that employs a specially designed baffled pan. The pan is hot water jacketed, and it can be sealed to achieve a vacuum system. The tablets are placed in the sealed pan, and the air in the pan is displaced by nitrogen before the desired vacuum level is obtained. The coating solution is then applied with an airless spray system. The heated pan causes the evaporation, and the vapor is removed by the vacuum system. Because there is no high-velocity heated air, the energy requirement is low, and the coating efficiency is high. Organic solvent can be effectively used with this coating system with minimum environmental or safety concerns.

Formulations for tablet coating are often proprietary to various manufacturers, as these address several formulation needs, as described previously. The suppliers of coating ingredients are often very open to sharing the coating technology, and companies are highly encouraged to make use of them, more particularly where the coating materials have an open drug master file (DMF) available for regulatory filings. The companies producing the following ingredients are very good sources of information:

Eudragit® https://www.chempoint.com/products/basf/basf-acrylic-monomers/methyl-acrylate
Colorcon® https://www.colorcon.com/products-formulation/all-products/film-coatings
Methocel/ethocel https://www.dow.com/en-us/product-search

The advantage of using these prepackaged formulations is consistency in color matching as well as other considerations regarding ease of use. The most significant aspect remains the choice of colors, which often determines the method of manufacturing the coating solutions. With a limited choice of dyes and lakes available for selection, manufacturers often use a combination of several colors and dyes along with agents such as talc for opaqueness to obtain the desired color and protection.

There follows a current listing of approved colors in various regulatory regions.

Approved Drug Colorants for Internal Use in Japan-1[a]

Name	CAS Number	Color Index Number	Precedent Limit	Compendia
Black iron oxide	12227-89-3	77499	1.539 mg	JPE
Caramel			1500 mg	JPE
Carbon black	1333-86-4	77268:1	0.096 mg	JPE
Carmine	1390-65-4	75470	1.8 mg	JPE
β-Carotene	7235-40-7	40800	0.1%	JPE
Copper chlorophyll			1.8 mg	JPC
Glycyrrhiza extract			300 mg	JP
Gold leaf	7440-57-5		14 mg	JPE
Light anhydrous silicic acid	7631-86-9		2.6 g	JP
Medicinal carbon	16291-96-6		150 mg	JP
2-octyldodecyl myristate	22766-83-2		100 mg	JPE
Orange essence			15 mg	JPE
Powdered green tea			100 mg	JPE
Red ferric oxide	1309-37-1	77491	95.4 mg	JPE
Riboflavin	83-88-5		0.8 mg	JP
Riboflavin butyrate			0.4 mg	JP
Riboflavin sodium phosphate			2 mg	JP
Rose oil	8007-01-0		0.1 mg	NF
Rye green leaf extract			2 mg	JPE
Sodium copper chlorophyllin			75 mg	JPC
Sodium hydroxide	1310-73-2		224 mg	JP
Talc	14807-96-6		3384 mg	JP

Uranine Acid Form	D&C Yellow No. 7	45350:1	7/5/2321
Uranine Sodium Salt	D&C Yellow No. 8	45350	518-47-8
Zinc oxide	–	77947	–

Approved Drug Colorants Listed by the European Union[a]

Note: Aluminum lakes prepared from colors mentioned in this list are also permitted.

Color	E Number	Color Index Number	Alternate Names
Allura Red AC	E129	16035	FD&C Red No. 40
Aluminum	E173	77000	–
Amaranth	E123	16185	Delisted FD&C Red No. 2
Anthocyanins	E163	–	–
Beet Root Red	E162	–	Betanin
β-apo-8′-carotenal	E160e	40820	–
β-apo-8′-carotenoic acidethyl ester	E160f	40825	–
Brilliant Black BN	E151	28440	Black PN
Brilliant Blue FCF	E133	42090	FD&C Blue No. 1
Brown HT	E155	20285	–
Calcium carbonate	E170	77220	–
Canthaxanthin	E161g	40850	–
Caramel	E150a	–	–
Caramel, caustic sulfite	E150b	–	–
Caramel, ammonia	E150c	–	–
Caramel, sulfite ammonia	E150d	–	–
Carbon vegetable black	E153	77268:1	Carbo medicinalis vegetabilis
Carmine	E120	75470	Carmine 40, carminic acid
Carmoisine	E122	14720	Azorubine
Carotene		75130	α-, β-, and γ-carotene
I. Mixed carotenes	E160a(i)	75130	–
II. β-carotene	E160a(ii)	40800	–
Chlorophylls/Chlorophyllins		–	–
i. Chlorophylls	E140(i)	75810	–
ii. Chlorophyllins	E140(ii)	75815	–
Chlorophylls/chlorophyllins copper complexes		75815	–
i. Copper complexes of chlorophylls	E141(i)	–	–
ii. Copper complexes of chlorophyllins	E141(ii)	–	–

Green S	E142	44090	Acid Brilliant Green BS
Indigotine	E132	73015	FD&C Blue No. 2, Indigo carmine
Iron oxides and hydroxides	E172	77491	Iron oxide red
		77492	Iron oxide yellow
		77499	Iron oxide black
Lutein	E161b	–	–
Lycopene	E160d	–	–
Paprika Extract	E160c	–	Capsanthin, capsorubin
Patent Blue V	E131	42051	Acid Blue 3
Ponceau 4R	E124	16255	Cochineal Red A
Quinoline Yellow[a]	E104	47005	China Yellow
Riboflavin		–	–
i. Riboflavin	E101(i)	–	–
ii. Riboflavin-5′-phosphate	E101(ii)	–	–
Sunset Yellow FCF	E110	15985	FD&C Yellow No. 6, Orange Yellow S
Tartrazine	E102	19140	FD&C Yellow No. 5
Titanium dioxide	E171	77891	–
Turmeric	E100	75300	Curcumin

This list is derived from Annex 1 of Directive 94/36/EC, colors permitted for use in foodstuffs. European Medicines Agency (EMEA) Guideline EMEA/CHMP/QWP/396951/2006 states that colorants mentioned in this annex are permitted for use in medicinal products.

[a] This is not D&C Yellow No. 10. Although the C.I. numbers are the same, the dyes differ in composition. Quinoline Yellow is primarily the disulfonated quinoline dye, whereas D&C Yellow No. 10 is the monosulfonated color. Quinoline Yellow is not accepted for use in the United States; conversely, D&C Yellow No. 10 cannot be used in the EU.

Color Additives Exempt from Certification Permitted for Use in the United States[a]

[a] Based on 21 CFR 2007. Restrictions may exist limiting the use of some of these colors to specific applications (i.e., external drug use only, etc.). Additionally, there may be quantitative limits for the use of some colors. The specific 21 CFR reference for each color should be reviewed to determine potential restriction status.

Another choice confronting manufacturers is whether to use an aqueous coating or an organic coating system; both have their advantages and disadvantages. While organic coatings provide greater protection against moisture uptake during the coating process (important for moisture-sensitive ingredients) and are easier to apply because of the fast evaporation of solvents, problems encountered with these coatings include environmental control of organic solvents going into the atmosphere, the need to perform solvent residue tests, and the need to have explosion-proof facilities; thus, aqueous coating systems are often preferred.

CELLULOSE BASED

Cellulose acetate phthalate (CAP).

Caution: Check with regulatory authorities about the approval status of all dyes before using them.

HYDROXYPROPYL METHYLCELLULOSE (METHOCEL, HPMC) AQUEOUS COATINGS

Methocel-based coatings in an aqueous base are the most popular coating options; two methods of making solutions are possible.

If a lake is used, then alcohol is also included (see, for example, Holberry Red).

A. Brite Rose

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
6.00	1	Hydroxypropyl methylcellulose 2910 (15 cps)	60.00 g
2.00	2	PEG-400 (low color)	20.00 g
2.00	3	PEG-8000	20.00 g
0.25	4	FD&C Red No. 30 Lake	2.50 g
2.00	5	Titanium dioxide (special coating grade)	20.00 g
QS	6	Deionized purified water	QS to 1 L

Manufacturing Directions

1. Place 250 mL of water into a suitable container, and heat to 60°C to 70°C.
2. With gentle stirring, disperse the hydroxypropyl methylcellulose onto the hot water; when the cellulose has wetted, quickly add 250 mL of cold water.
3. Stir until the dispersion is homogeneous, although the solution of cellulose may not be complete.
4. Dissolve PEG-8000 in 50 mL of water, and then add to the preceding step.
5. Add PEG-400 to the preceding basic solution.
6. Load a suitable-size ball jar with the FD&C Red No. 30 and titanium dioxide.
7. Add sufficient water to cover the pigment and balls.
8. Mill overnight or for 12 hours.
9. Other pigment reduction methods may be used to yield a particle size not greater than 1.0 μm.
10. Add milled pigments to the base solution from the preceding step, and bring the volume up with cold water.
11. Use within 7 days.

G. Clear

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
6.00	1	Hydroxypropyl methylcellulose 2910 (15 cps)	60.00 g
0.10	2	Sorbic acid	1.00 g
2.00	3	Alcohol (200 proof), SD 3A	20.00 mL
2.00	4	PEG-400 (low color)[a]	20.00 g
2.00	5	PEG-8000 (optional)	20.00 g
QS	6	Deionized purified water	QS to 1 L

[a] Increase amount to 6.00 if item 5 is not used.

Manufacturing Directions

1. Place approximately 500 mL of water into a suitable vessel.
2. Heat water to 65°C to 70°C.
3. Add the PEG-8000 to the hot water and dissolve (if used).
4. While maintaining gentle agitation, sprinkle the hydroxypropyl methylcellulose onto the surface of the hot water solution.
5. Position stirring head to avoid excessive entrainment of air.
6. When the cellulose has been dispersed, add the PEG-400.
7. Continue to stir until dispersion is homogeneous, although solution of cellulose may not be complete.
8. Stop stirring, and allow solution to stand until entrained air is removed.
9. Dissolve sorbic acid in alcohol, and ensure that the solution is complete.
10. When the solution from the step above is clear, add 250 mL of cold water, mix well, and add sorbic acid solution.
11. Mix, then bring up to volume with cold water.
12. Store coating solution in well-filled, well-sealed containers.
13. Use within 3 months.

0.75	7	Opadry® OY-S-29019 (clear)	0.75
QS	8	Purified water	225.00

Manufacturing Directions

1. The formula for this coating solution is prepared to obtain a weight gain of 10 mg per caplet (around 600 mg in weight).
2. Disperse item 1 in 175 g of purified water (70°C–80°C) while stirring.
3. Hold overnight for complete dispersion.
4. Disperse items 2 and 3 in 25 g of purified water (25°C–30°C).
5. Hold overnight for complete hydration.
6. Add mixture from previous step.
7. Homogenize using a homogenizer (gap setting = 1.5 mm).
8. Homogenize items 4, 5, and 6 in 50 g of hypromellose dispersion from the preceding step twice, using a homogenizer (gap setting = 1.5 mm).
9. Pass the dispersion twice through a 90 µm sieve.
10. (*Note:* This is a critical step; follow instructions closely to prevent foreign particles and spots.) Preparation of polishing solution: Disperse item 7 in 25 g of purified water with slow stirring.
11. Make a vortex by slow stirring and add the powder in such a way as to avoid foam formation.

0.75	7	Opadry® OY-S (clear)	0.75
QS	8	Purified water	225.00

Manufacturing Directions

1. Disperse item 1 in 175 g of purified water (70°C–80°C) while stirring.
2. Keep overnight for complete dispersion.
3. Disperse items 2 and 3 in 25 g of purified water (25°C–30°C).
4. Keep overnight for complete hydration.
5. Add together and homogenize using homogenizer (gap setting = 1.5 mm).
6. Homogenize items 4, 5, and 6 in 50 g of hypromellose dispersion twice, using homogenizer (gap setting = 1.5 mm).
7. Pass the dispersion twice through a 90 µm sieve.
8. (*Note:* This is a critical step; follow instructions closely to prevent foreign particles and spots.) Disperse item 7 in 25 g of purified water while stirring slowly.
9. Make a vortex by slow stirring, and add the powder in such a way as to avoid foam formation.
10. Follow the parameters for coating in Accela Cota:

Caplet load	620 g
Pan speed	4 rpm
Drying air temperature	70°C–75°C
Exhaust temperature	50°C–55°C
Fluid pressure	15–20 psi
Valve on spray gun	One revolution open
Atomizing pressure	55 psi
Nozzle orifice	1 mm
Nozzle distance to bed	250–280 mm
Difference of air pressure	−1.0 to −1.5 cm
Spray rate	200–225 g/min
Coating time	3.0–3.5 hours

11. Stir the dispersion at slow speed (6–10 rpm) continuously.
12. Spray the polishing solution under the same conditions as before, adjusting the spray rate to 180 g/min.
13. Check the caplet surface every 5 minutes for sticking.
14. If sticking tends to appear, stop the coating immediately.
15. When the spraying is over, roll the tablets in a pan for 10 minutes with cold air blowing onto the caplets.
16. Unload the film-coated caplets into stainless steel containers lined with polyethylene bags.
17. Appearance is a light green, film-coated caplet that is smooth, with no sticking or chipping on the caplet surface.
18. Weight gain per caplet is NLT 10 mg/tablet.

HYDROXYPROPYL METHYLCELLULOSE OPAQUE ORGANIC COATING

A. Brite Green

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L (g)
1.00	1	Titanium dioxide	10.00
50.00 v/v	2	Alcohol (200 proof), SD 3A	~397.00
1.69	3	PEG-400 (low color), NF	16.90
0.02	4	FD&C Yellow No. 5	0.20
0.0068	5	FD&C Blue No. 1	0.068
4.00	6	Hydroxypropyl methylcellulose 2910 (15 cps)	40.00
QS	7	Methylene chloride	~625.00

Manufacturing Directions

1. Place titanium dioxide and QS with alcohol into a ball mill.
2. Mill the material for 16 hours.
3. Place 465 mL alcohol into a suitable mixing tank.
4. Start agitation.
5. Slowly add PEG-400 to mixing tank.
6. Mix for 5 minutes.
7. Add FD&C Yellow to the mixing tank with continued agitation.

8. Rinse bottle with alcohol tapped from mixing tank.
9. Return rinse to mixing tank.
10. Add FD&C Blue to the mixing tank, and rinse.
11. Mix for 2 hours.
12. Tap approximately 10 mL of solution from mixing tank after 0.5, 1, and 1.5 hours of mixing.
13. Put solution back into mixing tank. (*Note:* Tapping solution ensures that dye is not tapped into lower valve and/or pipeline.) Rinse the ball mill with two rinses of 11.6 mL alcohol.
14. Reseal the ball mill, and allow it to run for 2 to 5 minutes between rinses.
15. Empty content of the ball mill and rinses into mixing tank.
16. Slowly sprinkle hydroxypropyl methylcellulose into mixing tank with constant agitation.
17. Agitate for an additional 15 minutes. (*Note:* Prevent the development of lumps by slowly sprinkling hydroxypropyl methylcellulose into the alcohol.) After mixing for 10 minutes, tap approximately 10 mL from the mixing tank, and put back into tank to recirculate.
18. Add sufficient methylene chloride (~474 mL) to bring up to volume.
19. Continue agitation for 2 hours.
20. After 0.5, 1, and 1.5 hours, tap approximately 10 mL of solution from mixing tank and put back into mixing tank to recirculate.
21. (*Note:* No residue should be present in the solution when tapped at 1.5 hours; if some is present, then continue agitation and tap every 15 minutes until no residue is observed.) (*Caution:* Avoid contact with methylene chloride and vapors; they may have toxic effects when swallowed or inhaled.) (*Note:* Nitrogen pressure may be used to assist bottle filling.) Strain mixing tank contents through two-ply cheesecloth, or similar, into suitable approved containers (one-half the total number of bottles). (*Note:* Lumps may obstruct spray nozzle.)

4.50	5	Hydroxypropyl methylcellulose 2910 (15 cps)	45.00 g
QS	6	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Place titanium dioxide and sufficient methylene chloride into suitably sized ball jars to cover the balls.
2. Mill for not less than 16 hours.
3. While mixing alcohol, add and disperse hydroxypropyl methylcellulose, hydroxypropyl cellulose, and propylene glycol, followed by 250 mL of methylene chloride.
4. Continue mixing until the dissolution is complete.
5. While mixing the solution from the second step, empty into it the contents of the ball jar, rinse the balls and jar with methylene chloride, add the rinsing to the batch, and mix.
6. Bring the batch up to volume with methylene chloride, and mix well until homogeneous.
7. Strain the batch through muslin into suitable, approved bottles.
8. Seal and store.

HYDROXYPROPYL METHYLCELLULOSE/ ETHYLCELLULOSE COATING

Scale (%, w/v)	Item	Material Name	Quantity/L
1.16	1	Titanium dioxide	11.60 g
45.00	2	Alcohol (dehydrated; 200 proof)	~450.00 g
0.20	3	Vanillin (crystals), NF	2.00 g
0.50	4	Albumen powder (white hen egg)	5.00 g
2.00	3	PEG-400 (low color), NF	20.00 g
1.30	4	FD&C Red No. 3	13.00 g
0.05	5	FD&C Red No. 2 (Amaranth), USP	0.50 g
0.20	6	FD&C Yellow No. 6	2.00 g
2.95	5	Hydroxypropyl methylcellulose 2910, USP (15 cps)	29.50 g
QS	6	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Load vanillin, albumen, titanium dioxide, FD&C Red No. 3, FD&C Red No. 2, and FD&C Yellow No. 6 into a suitable-size ball jar.
2. Add sufficient methylene chloride to cover the pigments and balls.
3. Mill for 24 hours.
4. Measure 400 mL of alcohol into a suitable stainless steel container.

5. Sprinkle the hydroxypropyl methylcellulose/ethylcellulose onto the surface of the alcohol while stirring vigorously.
6. When the hydroxyethyl methylcellulose/ethylcellulose has been wetted, quickly add 300 mL methylene chloride while stirring vigorously.
7. Add the PEG-400 to the solution, and rinse the container with the remaining alcohol; add the rinsings to the bulk.
8. Empty the contents of the ball jar from the first step into the coating solution from the previous step, while stirring vigorously.
9. Rinse the ball jar with methylene chloride; add the rinsings to the bulk.
10. Bring up to volume with methylene chloride.

B. Subcoating Solution

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
45.00	1	Alcohol (190 proof), USP	450.00 mL
0.50	2	Hydroxypropyl cellulose, NF	5.00 g
4.50	3	Hydroxypropyl methylcellulose 2910, USP (15 cps)	45.00 g
QS	4	Methylene chloride	QS to 1 L

HYDROXY METHYLCELLULOSE/HYDROXY ETHYLCELLULOSE COATING

A. Blue

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
1.00	1	Hydroxy methylcellulose	10.00 g
1.00	2	Hydroxy ethylcellulose (15 cps)	10.00 g
0.312	3	Titanium dioxide	3.21 g
1.00	4	FD&C Blue No. 1 Lake (12%)	10.00 g
0.375	5	Castor oil (odorless)	3.75 g
0.375	6	Sorbitan monooleate	3.75 g
50.00	7	Alcohol (200 proof), SD 3A	500.00 mL
QS	8	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Premix hydroxypropyl methylcellulose and hydroxypropyl cellulose, and add to 440 mL alcohol with rapid agitation.
2. Mix for not less than 1 hour.
3. Place FD&C Blue dye and titanium dioxide into a ball mill.
4. Cover the balls and materials with 60 mL of alcohol, and mill for 16 hours.
5. Add contents to mixing tank, and add the castor oil and sorbitan monooleate.
6. Rinse the ball mill with methylene chloride, and add the rinsings to the mixing tank.
7. Bring up to a volume of 1 L with methylene chloride, and mix for at least 1 hour.

B. Clear (50:50)

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
1.00	1	Hydroxy methylcellulose	10.00 g
1.00	2	Hydroxy ethylcellulose, USP (15 cps)	10.00 g
0.375	3	Castor oil (odorless)	3.75 g
50.00	4	Alcohol (200 proof), SD 3A	500.00 mL
QS	5	Methylene chloride	QS to 1 L

HYDROXY METHYLCELLULOSE/HYDROXY ETHYLCELLULOSE COATING

A. Clear

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
1.00	1	Hydroxy methylcellulose	10.00 g
1.00	2	Hydroxy ethylcellulose, USP (15 cps)	10.00 g
0.375	3	Castor oil (odorless), USP	3.75
50.00	4	Alcohol (200 proof), SD 3A	500.00 mL
QS	5	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Place alcohol into mixing tank.
2. Turn on mixer to mixing speed; maintain mixing speed throughout preparation of coating solution.
3. Place hydroxy methylcellulose and hydroxy ethylcellulose into the mixing tank.
4. Let mix for 1 hour.

5. Add methylene chloride (~500 mL) to bring the final volume up to 1 L.
6. Mix for 1 hour.
7. Solution need not be agitated at all times.
8. Keep tank tightly closed at all times.
9. Rubber stoppers on bottles must be protected from methylene chloride with a polyethylene layer.

POLYVINYLPYRROLIDONE (PVP) COATINGS

A. Subcoating

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
20.00	1	Povidone USP K-29–32[a]	200.00 g
80.00	2	Alcohol (200 proof), SD 3A	800 mL

[a]May be substituted with Kollidon® VA 64 (polyvinylpyrrolidone/vinylacetate copolymer; 10%), and item 2 can be replaced with isopropyl alcohol.

Manufacturing Directions

1. Spray the solution onto the warm tablet cores (30°C–40°C) for a few minutes before continuing with the main aqueous coating procedure.
2. The amount of 0.4 mg/cm^2 tablet surface is sufficient for good subcoating protection.
3. No plasticizer is needed in this formulation due to the plasticity of Kollidon® VA 64.

B. Kollidon® VA 64 (Polyvinylpyrrolidone/Vinylacetate Copolymer, BASF)

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg
5.00	1	Kollidon® VA 64	50.00 g
4.00	2	Lutrol E 6000	40.00 g
0.50	3	Glycerin, USP	5.00 g
1.50	4	Iron oxide or lake	15.00 g
3.00	5	Titanium dioxide	30.00 g
5.00	6	Talc	50.00 g
QS	7	Purified water	QS to 1 L

Manufacturing Directions

Pass the suspension through a disk mill prior to use and spray under the following conditions.

Sugar-Coating Pan

Spray gun	Walther WAXV with 1 mm nozzle
Spraying time	3 seconds
Pause	0.5 seconds
Dry air	6 seconds
Pause	3 seconds

Accela Cota (Continuous Spraying)

Spray gun	Walther WAXV with 0.8 mm nozzle
Temperature at inlet	45°C
Temperature at outlet	38°C
Spraying pressure	2 bar
Spraying time	~50 minutes

If the film is too sticky, a certain part of the Kollidon® should be substituted by HPMC or sucrose.

Kollidon® VA 64 and Polyvinyl Alcohol

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg
5.0	1	Kollidon® VA 64	50.00 g
4.00	2	Lutrol E 6000	40.00 g
6.00	3	Polyvinyl alcohol	76.00 g
68.00	4	Purified water	680.00 g
0.50	5	Glycerin, USP	5.00 g
1.50	6	Iron oxide or lake	18.00 g
3.00	7	Titanium dioxide	37.00 g
5.00	8	Talc	50.00 g
QS	9	Purified water	168.00 g

Manufacturing Directions

1. Dissolve items 1 and 2 in item 4, add polyvinyl alcohol, and stir for 45 minutes, avoiding the formation of too many air bubbles.
2. Suspend the pigments and talc in 168 mL of water, and pass this mixture through a colloid mill.
3. To obtain the final coating suspension, mix this solution with the first solution.
4. Suggested conditions for coating using Accela Cota are as follows.

Tablet core loading	5.0 kg
Amount of coating suspension	1.26 kg
Inlet air temperature	59°C
Outlet air temperature	46°C
Nozzle	1.0 mm
Rotation speed of the pan	15 rpm
Spraying pressure	2.0 bar
Spraying rate	15 g/min
Spraying time (continuously)	83 minutes
Final drying	5 minutes
Quantity of film former applied	~3 mg/cm^2

D. Kollidon® 30 and Shellac

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg (g)
2.00	1	Kollidon® 25 or 30	20.00
17.70	2	Shellac	177.00
18.50	3	Titanium dioxide	185.00
6.50	4	Talc	65.00
1.50	5	Cetyl alcohol	15.00
3.00	6	Sorbitan trioleate	30.00
5.00	7	Color lake	50.00
QS	8	Isopropanol or alcohol	458.00

Manufacturing Directions

1. Dissolve shellac and sorbitan trioleate in the warm solvent, and then Kollidon® and cetyl alcohol.
2. Add titanium dioxide, talc, and lake, and then mix in the colloid mill.
3. Application of the coating suspension: About 50 g of suspension is applied to 1 kg of tablet cores in a conventional coating pan or in an Accela Cota pan (1–2 mg film formers/cm^2).

E. Kollidon® VA 64 and Hydroxypropyl Methylcellulose

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg
4.00	1	Kollidon® VA 64	53.00 g
1.00	2	Lutrol E 6000	12.00 g
6.00	3	Hydroxypropyl methylcellulose	79.00 g
1.50	4	Iron oxide or lake	18.00 g
3.00	5	Titanium dioxide	37.00 g
4.00	6	Talc	50.00 g
QS	7	Purified water	QS to 1 kg

Manufacturing Directions

1. Dissolve Lutrol and Kollidon® in a portion of the water, add hydroxypropyl methylcellulose, and stir for 45 minutes, avoiding the formation of too many air bubbles.
2. Suspend the pigments and talc in a portion of the water, and pass this mixture through a colloid mill.
3. Mix the two portions.
4. Conditions for coating using Accela Cota are as follows.

Tablet core loading	5.0 kg
Core size	9 mm biconvex
Amount of coating suspension applied	1.2 kg
Inlet air temperature	60°C
Outlet air temperature	40°C
Nozzle	1.0 mm
Rotation speed of the pan	12 rpm
Spraying pressure	2.0 bar
Spraying rate	50 g/min
Spraying time (continuously)	34 minutes
Final drying	2 minutes
Drying after spraying	5 minutes at 60°C
Quantity of film former applied	3.14 mg/cm^2

F. Povidone, Ethylcellulose, and Talc

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
7.50	1	Povidone (PVP K-29–32), USP	75.00 g
4.25	2	Ethylcellulose, NF	42.50 g
0.50	3	PEG-400, NF	5.00 g
5.00	4	Talc	50.00 g
45.00	5	Alcohol (200 proof), SD 3A	450.00 mL
QS	6	Methylene chloride, NF	QS to 1 L

Manufacturing Directions

1. Dissolve Povidone in alcohol, and then add PEG-400.
2. Add ethyl cellulose to this solution.
3. Mix until evenly dispersed, and then bring up to volume with methylene chloride with constant stirring.
4. Add talc to this solution, and stir to ensure distribution.
5. Solution should be freshly prepared and used within 10 days of manufacture.
6. Thoroughly disperse talc before use.
7. If batch is more than 200 L, do not add talc.
8. If coating solution is manufactured without talc, then solution should be used within 4 weeks.

CELLULOSE ACETATE PHTHALATE AND CARBOWAX COATINGS

A. Brite Green

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
6.00	1	Cellulose acetate phthalate (Carbowax™)	60.00 g
1.86	2	Propylene glycol	18.65 g
0.66	3	Sorbitan monooleate (Span 80)	6.00 g
0.12	4	Castor oil (odorless)	1.25 g
0.85	5	FD&C Blue No. 1	0.85 g
3.11	6	FD&C Yellow No. 5 Lake	31.10 g
5.33	7	Titanium dioxide	53.30 g
21.58	8	Methylene chloride	215.80 g
QS	9	Acetone	QS to 1 L

Manufacturing Directions

1. Place methylene chloride in a suitably sized mixing tank.
2. While stirring, add propylene glycol, Span 80, and castor oil.
3. To this mixture add half of cellulose acetate phthalate, and allow to soak overnight.
4. Load dyes and titanium dioxide into a suitable ball jar.
5. Add sufficient acetone to cover the raw materials and balls.
6. Ball mill overnight.
7. Melt balance of Carbowax™ with a portion of the acetone using gentle heat.
8. Add the melted Carbowax™ to the mixture from the second step.
9. Empty contents of ball jar mill into this mixture.
10. Rinse the ball jar with acetone, and add rinsings.
11. Add acetone to volume, and mix well.
12. If necessary, strain solution through gauge before storage or use.

B. Cherry Red

In the preceding formulation, use FD&C Red No. 3 (6.800 g), FD&C Red No. 2 (Amaranth, USP; 1.00 g), and FD&C Yellow (5.40 g).

C. Clear

Delete dyes.

D. Orange

Use FD&C Yellow No. 6 (4.00 g) and FD&C Yellow No. 5 (12.00 g).

SUGAR COATINGS

A. Basic

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg
4.00	1	Kollidon® VA 64	40.00 g
16.00	2	Sucrose	160.00 g
2.40	3	Titanium dioxide	24.00 g
1.20	4	Color lake	12.00 g
3.20	5	Lutrol E 4000	32.00 g
4.00	6	Talc	40.00 g
QS	7	Purified water	QS to 1 kg

Manufacturing Directions

1. Dissolve sucrose, Kollidon®, and Lutrol in the water, and suspend the other components.
2. Pass through a colloid mill.
3. Use the following conditions for use in Accela Cota.

Tablet core loading	5.00 kg
Amount of coating suspension	1.20 kg
Inlet air temperature	45°C
Outlet air temperature	35°C
Nozzle	0.80 mm
Rotation speed of the pan	15 rpm
Spraying pressure	2.0 bar
Spraying time (continuously)	50 minutes
Quantity of film former applied	4.00 mg/cm^2

B. Automatic

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity, g/kg
4.00	1	Kollidon® 30	40.00
38.00	2	Sucrose	380.00
4.50	3	Titanium dioxide	45.00
QS	4	Color lake	QS
4.50	5	Calcium carbonate	45.00
14.50	6	Talc	145.00
QS	7	Purified water	QS to 1 kg

Manufacturing Directions

1. Dissolve sucrose in hot water, and then mix with glycerol.
2. Dissolve Kollidon®, and suspend the other components.
3. Coating procedure: Coat 4 kg of tablet cores with a weight of 420 mg each by spraying with 2.5 kg of the suspension in a conventional coating pan under the following conditions:

Spray phase	5 seconds
Interval	10 minutes
Drying phase (warm air)	10 minutes
Total coating time	16 hours

C. Manual, White

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg (g)
0.33	1	Kollidon® 30	3.36
0.29	2	Carmellose sodium	2.92
0.21	3	Aerosil® 200	2.14
QS	4	Color lake (white)	QS
1.62	5	Talc	16.20
0.10	6	Polysorbate or Cremophor RH40	1.00
1.40	7	Titanium dioxide	14.00
62.70	8	Sucrose	627.00
33.40	9	Purified water	334.00

Manufacturing Directions

1. Dissolve Kollidon®, polysorbate or Cremophor, and sucrose in water, and suspend the other components in this solution.
2. Mix in a colloid mill.
3. Start with formulation without the color and then apply the color coat.
4. The polishing can be done by means of a solution of beeswax or PEG-6000.

ENTERIC COATINGS

A. Kollicoat® and Kollidon® Enteric Film Coating

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg
0.50	1	Titanium dioxide	5.00 g
2.00	2	Talc	20.00 g
0.50	3	Iron oxide	5.00 g
0.50	4	Kollidon® 25 or Kollidon® 30	5.00 g
50.00	5	Kollicoat® MAE 30 DP (methacrylic acid/ethyl acrylate copolymer, 1:1)	500.00 g
1.50	6	Triethyl citrate	15.00 g
QS	7	Purified water	QS to 1 kg

Manufacturing Directions/Conditions

Tablet core loading	5 kg
Core size	9 mm biconvex
Quantity of suspension applied	1890 g
Quantity of solids/cm^2	9 mg
Quantity of film-forming agent/cm^2	6 mg
Speed of the coating pan	12 rpm
Spray nozzle	0.8 mm
Spraying pressure	2.0 bar
Type of spraying	Continuous
Inlet air temperature	50°C
Outlet air temperature	~30°C
Spraying time	~60 minutes
Spraying rate	~30 g/min

EUDRAGIT® ENTERIC AQUEOUS

A. Brick Red

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg (g)
46.667	1	Distilled purified water	466.667
1.519	2	Talc (powder)	15.198
0.798	3	Titanium dioxide (special coating grade)	7.983
1.55	4	Iron oxide, red	15.50
0.426	5	Polysorbate 80	4.262
0.015	6	Dimethyl polysiloxane emulsion (30%)	0.155
47.60	7	Eudragit®; use Eudragit® L 30D-55	476.00
1.426	8	Triethyl citrate (Eudraflex®)	14.259

Manufacturing Directions

1. Weigh the quantity of water needed.
2. Put approximately 21.5% of the total quantity of water in a suitable mixing container.
3. Add talc powder, and stir vigorously until well suspended (approximately 20 minutes).
4. Add the following to this suspension, and mix thoroughly: titanium dioxide, iron oxide, Tween 80, and dimethyl polysiloxane emulsion (30%).
5. (*Note:* The pigments may require homogenizing with colloid, corundum disc mill, or ball mill.) Put the Eudragit® in a suitable mixing vessel, and add the following with continuous mixing: homogenized pigment mixture, Eudraflex® (i.e., triethyl citrate), and remaining quantity of water. *Note:* When PEG-8000 is used as a plasticizer, it should be incorporated as a 10% aqueous solution.

B. Yellow

Bill of Materials

Scale (%, w/w)	Item	Material Name	Quantity/kg (g)
46.66	1	Distilled purified water	466.66
1.25	2	Talc (powder)	12.57

[a] Dispersed orange: This material is the aluminum lake of Sunset Yellow FCF (E110).

HYDROXYPROPYL METHYLCELLULOSE PHTHALATE ENTERIC COATING

A. Clear Enteric

Bill of Materials

Scale (%)	Item	Material Name	Quantity/kg
20.00 (v/v)	1	Acetone	200.00 mL
10.00 (v/v)	2	Purified water	100.00 mL
4.00 (w/v)	3	Hydroxypropyl methylcellulose	40.00 g
0.30 (w/v)	4	Vanillin (crystals)	3.00 g
0.40 (w/v)	5	Acetylated monoglycerides	4.00 g
QS	6	Alcohol (200 proof), SD 3A	QS to 1 L

Manufacturing Directions

1. Place acetone, purified water, and 470 mL of alcohol into a suitable mixing tank.
2. Add hydroxypropyl methylcellulose phthalate, vanillin crystals (if used), and the distilled acetylated monoglycerides.
3. Mix until a clear solution is obtained.
4. Bring up to 1 L with alcohol, and record volume used.
5. Mix for 1 hour.

B. Orchid Pink Opaque

Bill of Materials

Scale (%)	Item	Material Name	Quantity/kg
20.00 (v/v)	1	Acetone	200.00 mL
10.00 (v/v)	2	Purified water	100.00 mL
8.00 (w/v)	3	Hydroxypropyl methylcellulose phthalate	80.00 g
0.80 (w/v)	4	Diacetylated monoglycerides	8.00 g
0.06 (w/v)	5	D&C Red No. 30 Lake	0.60 g
0.006 (w/v)	6	FD&C Blue No. 2 Aluminum Lake (14%)	0.06 g
0.70 (w/v)	7	Titanium dioxide	7.00 g
QS	8	Alcohol (200 proof), SD 3A	To 1L

C. Light Apricot Orange

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/kg
20.00 (v/v)	1	Acetone	200.00 mL
10.00 (v/v)	2	Purified water	100.00 mL
8.00	3	Hydroxypropyl methylcellulose phthalate	80.00 g
0.80	4	Diacetylated monoglycerides	8.00 g
0.10	5	FD&C Yellow No. 10 Aluminum Lake (14–17%)	1.00 g
0.06	6	FD&C Red No. 3 Aluminum Lake (14%)	0.60 g
0.70	7	Titanium dioxide	7.00 g
QS	8	Alcohol (200 proof), SD 3A	To 1 kg

Composition of Proprietary Products Approved in the United States

- ABILIFY® (aripiprazole) tablets are available in 5, 10, 15, 20, and 30 mg strengths. Inactive ingredients include cornstarch, hydroxypropyl cellulose, lactose monohydrate, magnesium stearate, and microcrystalline cellulose. Colorants include ferric oxide (yellow or red) and FD&C Blue No. 2 Aluminum Lake.
- ACCOLATE (Zafirlukast) is supplied as 10 and 20 mg tablets for oral administration. Inactive ingredients: film-coated tablets containing croscarmellose sodium, lactose, magnesium stearate, microcrystalline cellulose, povidone, hypromellose, and titanium dioxide.
- ACEON® (perindopril erbumine) tablets are available in 2, 4, and 8 mg strengths for oral administration. In addition to perindopril erbumine, each tablet contains the following inactive ingredients: colloidal silica (hydrophobic), lactose, magnesium stearate, and microcrystalline cellulose. The 4 and 8 mg tablets also contain iron oxide.
- ACIPHEX® delayed-release tablets contain rabeprazole sodium and are available for oral administration as delayed-release, enteric-coated tablets containing 20 mg of rabeprazole sodium. Inactive ingredients are carnauba wax, crospovidone, diacetylated monoglycerides, ethylcellulose, hydroxypropyl cellulose, hypromellose phthalate, magnesium stearate, mannitol, sodium hydroxide, sodium stearyl fumarate, talc, titanium dioxide, and yellow ferric oxide as a coloring agent.
- Actiq (oral transmucosal fentanyl citrate) is formulated as a white to off-white solid drug matrix on a handle that is radiopaque and is fracture resistant (acrylonitrile butadiene styrene [ABS] plastic) under normal conditions when used as directed. Actiq is designed to be dissolved slowly in the mouth in a manner to facilitate transmucosal absorption. The handle allows the Actiq unit to be removed from the mouth if signs of excessive opioid effects appear during administration. Active ingredient: fentanyl citrate, USP is a highly lipophilic compound (octanol–water partition coefficient at pH 7.4 is 816:1) that is freely soluble in organic solvents and sparingly soluble in water (1:40). The pK_as of the tertiary nitrogen are 7.3 and 8.4. Actiq is available in six strengths equivalent to 200, 400, 600, 800, 1200, or 1600 μg fentanyl base that are identified by the text on the solid drug matrix, the dosage unit handle tag, the blister package, and the shelf carton. Inactive ingredients: hydrated dextrates, citric acid, dibasic sodium phosphate, artificial berry flavor, magnesium stearate, modified food starch, and confectioner's sugar.
- ACTONEL (risedronate sodium tablets) tablets for oral administration contain the equivalent of 5, 30, or 35 mg of anhydrous risedronate sodium in the form of the hemipentahydrate with small amounts of monohydrate. Inactive ingredients: crospovidone, ferric oxide red (35 mg tablets only), ferric oxide yellow (5 and 35 mg tablets only), hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, silicon dioxide, and titanium dioxide.
- ACTONEL with CALCIUM is a co-package product containing ACTONEL (risedronate sodium tablets, 35 mg) for once-weekly dosing and calcium carbonate tablets, USP (1250 mg, equivalent to 500 mg of elemental calcium) for daily dosing for the remaining 6 days of the week. Each package contains a 28 day course of therapy. Each ACTONEL tablet in the ACTONEL with CALCIUM co-package contains the equivalent of 35 mg of anhydrous risedronate sodium in the form of the hemipentahydrate with small amounts of monohydrate. Inactive ingredients—ACTONEL: crospovidone, ferric oxide red, ferric oxide yellow, hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, silicon dioxide, and titanium dioxide. CALCIUM: pregelatinized starch, sodium starch glycolate, FD&C Blue No. 2, magnesium stearate, polyethylene glycol 3350, hypromellose, Opaspray Light Blue, and polysorbate 80.
- ACTOPLUS MET™ (pioglitazone hydrochloride and metformin hydrochloride) tablets contain two oral antihyperglycemic drugs. ACTOPLUS MET is available as a tablet for oral administration containing 15 mg of pioglitazone hydrochloride (as the base) with 500 mg of metformin hydrochloride (15 mg/500 mg) or 15 mg of pioglitazone hydrochloride (as the base) with 850 mg of metformin hydrochloride (15 mg/850 mg) formulated with the following excipients: povidone USP, microcrystalline cellulose NF, croscarmellose sodium NF, magnesium stearate NF, hypromellose 2910 USP, polyethylene glycol 8000 NF, titanium dioxide USP, and talc USP.
- ACTOS (pioglitazone hydrochloride) is available as a tablet for oral administration containing 15, 30, or 45 mg of pioglitazone (as the base) formulated with

the following excipients: lactose monohydrate NF, hydroxypropyl cellulose NF, carboxymethylcellulose calcium NF, and magnesium stearate NF.

- ADIPEX-P tablets contain the inactive ingredients cornstarch, lactose (anhydrous), magnesium stearate, microcrystalline cellulose, pregelatinized starch, sucrose, and FD&C Blue No. 1.
- ALDOCLOR (methyldopa-chlorothiazide) combines two antihypertensives (methyldopa and chlorothiazide) and is supplied as tablets for oral use, each containing 250 mg of methyldopa and 250 mg of chlorothiazide. Each tablet contains the following inactive ingredients: calcium disodium edetate, cellulose, citric acid, D&C Yellow No. 10 Aluminum Lake, ethylcellulose, FD&C Yellow No. 6 Aluminum Lake, gelatin, glycerin, guar gum, hydroxypropyl methylcellulose, magnesium stearate, starch, talc, titanium dioxide, and FD&C Blue No. 2 Aluminum Lake.
- ALDORIL Methyldopa is supplied as tablets in four strengths for oral use: ALDORIL 15 contains 250 mg of methyldopa and 15 mg of hydrochlorothiazide. ALDORIL 25 contains 250 mg of methyldopa and 25 mg of hydrochlorothiazide. ALDORIL D30 contains 500 mg of methyldopa and 30 mg of hydrochlorothiazide. ALDORIL D50 contains 500 mg of methyldopa and 50 mg of hydrochlorothiazide. Each tablet contains the following inactive ingredients: calcium disodium edetate, calcium phosphate, cellulose, citric acid, colloidal silicon dioxide, ethylcellulose, guar gum, hydroxypropyl methylcellulose, magnesium stearate, propylene glycol, talc, and titanium dioxide. ALDORIL 15 and ALDORIL D30 also contain iron oxide.
- ALKERAN (melphalan) is a film-coated tablet containing 2 mg of melphalan and the inactive ingredients colloidal silicon dioxide, crospovidone, hypromellose, macrogol/PEG 400, magnesium stearate, microcrystalline cellulose, and titanium dioxide.
- ALTOPREV™ lovastatin extended-release tablets are designed for once-a-day oral administration and deliver 10, 40, or 60 mg of lovastatin. In addition to the active ingredient lovastatin, each tablet contains the following inactive ingredients: acetyltributyl citrate, butylated hydroxyanisole, candelilla wax, cellulose acetate, confectioner's sugar (contains cornstarch), FD&C Yellow No. 6, glyceryl monostearate, hypromellose, hypromellose phthalate, lactose, methacrylic acid copolymer, type B, polyethylene glycols (PEG 400 and PEG 8000), polyethylene oxides, polysorbate 80, propylene glycol, silicon dioxide, sodium chloride, sodium lauryl sulfate, synthetic black iron oxide, red iron oxide, talc, titanium dioxide, and triacetin.
- ANADROL® (oxymetholone) tablets for oral administration contain 50 mg of the steroid oxymetholone. Inactive ingredients: lactose, magnesium stearate, povidone, and starch.
- Appearex® is a biotin preparation. Each Appearex® tablet contains as its active ingredient 2.5 mg of biotin, a dose clinically proven to improve nail strength and quality. Inactive ingredients include lactose monohydrate, cornstarch, povidone (K25), and magnesium stearate.
- APRAL® (acamprosate calcium) tablets contain acamprosate calcium 333 mg, equivalent to 300 mg of acamprosate. Inactive ingredients in Apral tablets include crospovidone, microcrystalline cellulose, magnesium silicate, sodium starch glycolate, colloidal anhydrous silica, magnesium stearate, talc, propylene glycol, and Eudragit® L30D or equivalent. Sulfites are used in the synthesis of the drug substance, and traces of residual sulfites may be present in the drug product.
- ARICEPT® (donepezil hydrochloride) is a film-coated tablet containing 5 or 10 mg of donepezil hydrochloride. Inactive ingredients are lactose monohydrate, cornstarch, microcrystalline cellulose, hydroxypropyl cellulose, and magnesium stearate. The film coating contains talc, polyethylene glycol, hypromellose, and titanium dioxide. Additionally, the 10 mg tablet contains yellow iron oxide (synthetic) as a coloring agent. ARICEPT ODT tablets are available for oral administration. Each ARICEPT® ODT tablet contains 5 or 10 mg of donepezil hydrochloride. Inactive ingredients are carrageenan, mannitol, colloidal silicon dioxide, and polyvinyl alcohol. Additionally, the 10 mg tablet contains ferric oxide (yellow) as a coloring agent.
- ARIMIDEX® (anastrozole) tablets for oral administration contain 1 mg of anastrozole, a nonsteroidal aromatase inhibitor. Each tablet contains as inactive ingredients: lactose, magnesium stearate, hydroxypropyl methylcellulose, polyethylene glycol, povidone, sodium starch glycolate, and titanium dioxide.
- AROMASIN® tablets for oral administration contain 25 mg of exemestane. Each AROMASIN tablet contains the following inactive ingredients: mannitol, crospovidone, polysorbate 80, hypromellose, colloidal silicon dioxide, microcrystalline cellulose, sodium starch glycolate, magnesium stearate, simethicone, polyethylene glycol 6000, sucrose, magnesium carbonate, titanium dioxide, methylparaben, and polyvinyl alcohol.
- ARTHROTEC (diclofenac sodium/misoprostol) oral tablets are white to off-white, round, biconvex, and approximately 11 mm in diameter. Each tablet consists of an enteric-coated core containing 50 mg (ARTHROTEC 50) or 75 mg (ARTHROTEC 75) diclofenac sodium surrounded by an outer mantle containing 200 μg misoprostol. Inactive ingredients in ARTHROTEC: colloidal silicon dioxide, crospovidone, hydrogenated castor oil, hypromellose,

lactose, magnesium stearate, methacrylic acid copolymer, microcrystalline cellulose, povidone (polyvidone) K-30, sodium hydroxide, starch (corn), talc, and triethyl citrate.

- Asacol delayed-release tablet for oral administration contains 400 mg of mesalamine, an anti-inflammatory drug. The Asacol delayed-release tablets are coated with acrylic based resin, Eudragit S (methacrylic acid copolymer B, NF), which dissolves at pH 7 or greater, releasing mesalamine in the terminal ileum and beyond for topical anti-inflammatory action in the colon. Inactive ingredients: each tablet contains colloidal silicon dioxide, dibutyl phthalate, edible black ink, iron oxide red, iron oxide yellow, lactose, magnesium stearate, methacrylic acid copolymer B (Eudragit S), polyethylene glycol, povidone, sodium starch glycolate, and talc.
- ATACAND (candesartan cilexetil) is available for oral use as tablets containing either 4, 8, 16, or 32 mg of candesartan cilexetil and the following inactive ingredients: hydroxypropyl cellulose, polyethylene glycol, lactose, cornstarch, carboxymethylcellulose calcium, and magnesium stearate. Ferric oxide (reddish brown) is added to the 8, 16, and 32 mg tablets as a colorant.
- ATACAND HCT (candesartan cilexetil-hydrochlorothiazide). ATACAND HCT 16-12.5 contains 16 mg of candesartan cilexetil and 12.5 mg of hydrochlorothiazide. ATACAND HCT 32-12.5 contains 32 mg of candesartan cilexetil and 12.5 mg of hydrochlorothiazide. The inactive ingredients of the tablets are calcium carboxymethylcellulose, hydroxypropyl cellulose, lactose monohydrate, magnesium stearate, cornstarch, polyethylene glycol 8000, and ferric oxide (yellow). Ferric oxide (reddish brown) is also added to the 16-12.5 mg tablet as colorant.
- Aygestin (norethindrone acetate tablets, USP). 5 mg oral tablets contain the following inactive ingredients: lactose, magnesium stearate, and microcrystalline cellulose.
- Beelith. Each tablet contains magnesium oxide 600 mg and pyridoxine hydrochloride (vitamin B6) 25 mg equivalent to vitamin B6 20 mg. Each tablet yields 362 mg of magnesium and supplies 90% of the Adult U.S. Recommended Daily Allowance (RDA) for magnesium and 1000% of the Adult RDA for vitamin B6. Inactive ingredients: FD&C Yellow No. 6, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, sodium starch glycolate, and titanium dioxide. May also contain D&C Yellow No. 10, FD&C Yellow No. 5 (Tartrazine), hydroxypropyl cellulose, polydextrose, stearic acid, and/or triacetin.
- Bethanechol chloride. Each tablet for oral administration contains 5, 10, 25, or 50 mg of bethanechol chloride, USP. Tablets also contain the following inactive ingredients: anhydrous lactose, colloidal silicon dioxide, magnesium stearate, microcrystalline cellulose, sodium starch glycolate, and (25 and 50 mg) D&C Yellow No. 10 and FD&C Yellow No. 6.
- BIAXIN Clarithromycin tablet (clarithromycin tablets, USP) contains 250 or 500 mg of clarithromycin and the following inactive ingredients: 250 mg tablets—hypromellose, hydroxypropyl cellulose, croscarmellose sodium, D&C Yellow No. 10, FD&C Blue No. 1, magnesium stearate, microcrystalline cellulose, povidone, pregelatinized starch, propylene glycol, silicon dioxide, sorbic acid, sorbitan monooleate, stearic acid, talc, titanium dioxide, and vanillin. 500 mg tablets—hypromellose, hydroxypropyl cellulose, colloidal silicon dioxide, croscarmellose sodium, D&C Yellow No. 10, magnesium stearate, microcrystalline cellulose, povidone, propylene glycol, sorbic acid, sorbitan monooleate, titanium dioxide, and vanillin. Each yellow oval film-coated BIAXIN XL tablet (clarithromycin extended-release tablets) contains 500 mg of clarithromycin and the following inactive ingredients: cellulosic polymers, D&C Yellow No. 10, lactose monohydrate, magnesium stearate, propylene glycol, sorbic acid, sorbitan monooleate, talc, titanium dioxide, and vanillin.
- BIAXIN® Filmtab® (clarithromycin tablets, USP) oval film-coated immediate-release tablets contain 500 mg of clarithromycin and the following inactive ingredients: hypromellose, hydroxypropyl cellulose, colloidal silicon dioxide, croscarmellose sodium, D&C Yellow No. 10, magnesium stearate, microcrystalline cellulose, povidone, propylene glycol, sorbic acid, sorbitan monooleate, titanium dioxide, and vanillin.
- BiDil is a fixed-dose combination of isosorbide dinitrate and hydralazine hydrochloride. Each BiDil tablet for oral administration contains 20 mg of isosorbide dinitrate and 37.5 mg of hydralazine hydrochloride. The inactive ingredients in BiDil tablets include anhydrous lactose, microcrystalline cellulose, sodium starch glycolate, colloidal silicon dioxide, magnesium stearate, hypromellose, FD&C Yellow No. 6 Aluminum Lake, polyethylene glycol, titanium dioxide, and polysorbate 80.
- BLOCADREN (timolol maleate) is supplied as tablets in three strengths containing 5, 10, or 20 mg timolol maleate for oral administration. Inactive ingredients are cellulose, FD&C Blue No. 2, magnesium stearate, and starch.
- Buphenyl® (sodium phenylbutyrate) tablets for oral administration contain sodium phenylbutyrate. Each tablet of Buphenyl® contains 500 mg of sodium phenylbutyrate and the inactive ingredients microcrystalline cellulose, magnesium stearate, and colloidal silicon dioxide.
- CADUET® contains amlodipine besylate. CADUET® tablets are formulated for oral administration in several combination strengths from 2.5/10 to 10/80

mg. Each tablet also contains calcium carbonate, croscarmellose sodium, microcrystalline cellulose, pregelatinized starch, polysorbate 80, hydroxypropyl cellulose, purified water, colloidal silicon dioxide (anhydrous), magnesium stearate, and Opadry® II White 85F28751 (polyvinyl alcohol, titanium dioxide, PEG 3000, and talc), or Opadry® II Blue 85F10919 (polyvinyl alcohol, titanium dioxide, PEG 3000, talc, and FD&C Blue No. 2). Combinations of atorvastatin with 2.5 and 5 mg amlodipine are film coated white, and combinations of atorvastatin with 10 mg amlodipine are film coated blue.

- Calcium polycarbophil 625 mg (equivalent to 500 mg polycarbophil). Inactive ingredients: calcium carbonate, caramel, crospovidone, hypromellose, light mineral oil, magnesium stearate, microcrystalline cellulose, povidone, silicon dioxide, and sodium lauryl sulfate.
- CANESTIN synthetic conjugated estrogens tablets contain a blend of nine synthetic estrogenic substances. The estrogenic substances are sodium estrone sulfate, sodium equilin sulfate, sodium 17(α)-dihydroequilenin sulfate, sodium 17(α)-estradiol sulfate, sodium 17(β)-dihydroequilenin sulfate, sodium 17(α)-dihydroequilenin sulfate, sodium 17(β)-dihydroequilenin sulfate, sodium equilenin sulfate, and sodium 17(β)-estradiol sulfate. Tablets for oral administration are available in 0.3, 0.45, 0.625, 0.9, and 1.25 mg strengths of synthetic conjugated estrogens. Tablets also contain the following inactive ingredients: ethylcellulose, hypromellose, lactose monohydrate, magnesium stearate, polyethylene glycol, polysorbate 80, pregelatinized starch, titanium dioxide, and triethyl citrate; 0.3 mg tablets also contain FD&C Blue No. 2 Aluminum Lake and D&C Yellow No. 10 Aluminum Lake; 0.45 mg tablets also contain FD&C Yellow No. 6/Sunset Yellow FCF Lake; 0.625 mg tablets also contain FD&C Red No. 40 Aluminum Lake; 0.9 mg tablets do not contain additional color additives; 1.25 mg tablets also contain FD&C Blue No. 2 Aluminum Lake.
- Captopril tablets for oral administration contain 12.5, 25, 50, or 100 mg of captopril and the following inactive ingredients: anhydrous lactose, colloidal silicon dioxide, crospovidone, microcrystalline cellulose, and stearic acid.
- CARDURA® XL (doxazosin mesylate extended-release tablets) contains doxazosin mesylate. CARDURA® XL is an extended-release tablet for oral use and is designed to deliver 4 or 8 mg of doxazosin as the free base. Each 4 and 8 mg tablet contains 5.1 and 10.2 mg doxazosin mesylate (includes a 5% overage) to provide 4 and 8 mg doxazosin as a free base, respectively. The inactive ingredients for CARDURA® XL: polyethylene oxide, sodium chloride, hypromellose, red ferric oxide, titanium dioxide, magnesium stearate, cellulose acetate, Macrogol®, pharmaceutical glaze, and black iron oxide. CARDURA® XL is similar in appearance to a conventional tablet. It consists, however, of an osmotically active drug core surrounded by a semipermeable membrane. The core itself is divided into two layers: an "active" layer containing the drug and a "push" layer containing pharmacologically inert (but osmotically active) components. The membrane surrounding the tablet is permeable to water but not to drug or osmotic excipients. As water from the gastrointestinal tract enters the tablet, pressure increases in the osmotic layer and "pushes" against the drug layer, resulting in the release of drug through a small, laser-drilled orifice in the membrane on the drug side of the tablet. CARDURA® XL utilizes GITS (Gastrointestinal Therapeutic System), which is designed to provide a controlled rate of delivery of doxazosin into the gastrointestinal lumen, which is independent of pH or gastrointestinal (GI) motility. The function of CARDURA® XL depends upon the existence of an osmotic gradient between the contents of the bilayer core and fluid in the GI tract. Drug delivery is essentially constant as long as the osmotic gradient remains constant and then gradually falls to zero. The biologically inert components of the tablet remain intact during GI transit and are eliminated in the feces as an insoluble shell.
- CASODEX® (bicalutamide) tablets for oral administration contain 50 mg of bicalutamide. The inactive ingredients of CASODEX® tablets are lactose, magnesium stearate, methylhydroxypropylcellulose, polyethylene glycol, polyvidone, sodium starch glycolate, and titanium dioxide.
- CEFTIN tablets are film coated and contain the equivalent of 250 or 500 mg of cefuroxime as cefuroxime axetil. CEFTIN tablets contain the inactive ingredients colloidal silicon dioxide, croscarmellose sodium, hydrogenated vegetable oil, hypromellose, methylparaben, microcrystalline cellulose, propylene glycol, propylparaben, sodium benzoate, sodium lauryl sulfate, and titanium dioxide.
- CELEBREX (celecoxib) oral capsules contain either 100, 200, or 400 mg of celecoxib. The inactive ingredients in CELEBREX capsules: croscarmellose sodium, edible inks, gelatin, lactose monohydrate, magnesium stearate, povidone, sodium lauryl sulfate, and titanium dioxide.
- Celexa® (citalopram HBr) 10 mg tablets are film coated and oval shaped, containing citalopram HBr in strengths equivalent to 10 mg citalopram base. Celexa® 20 mg and 40 mg tablets are film-coated, oval, scored tablets containing citalopram HBr in strengths equivalent to 20 or 40 mg of citalopram base. The tablets also contain the following inactive ingredients: copolyvidone, cornstarch, croscarmellose sodium, glycerin, lactose monohydrate, magnesium stearate, hypromellose, microcrystalline

cellulose, polyethylene glycol, and titanium dioxide. Iron oxides are used as coloring agents in the beige (10 mg) and pink (20 mg) tablets.

- CHANTIX™ tablets contain the active ingredient varenicline (as the tartrate salt). CHANTIX™ is supplied for oral administration in two strengths: a 0.5 mg capsular biconvex, white to off-white, film-coated tablet and a 1 mg capsular biconvex, light blue, film-coated tablet. Each 0.5 mg CHANTIX™ tablet contains 0.85 mg of varenicline tartrate equivalent to 0.5 mg of varenicline free base; each 1 mg CHANTIX™ tablet contains 1.71 mg of varenicline tartrate equivalent to 1 mg of varenicline free base. The following inactive ingredients are included in the tablets: microcrystalline cellulose, anhydrous dibasic calcium phosphate, croscarmellose sodium, colloidal silicon dioxide, magnesium stearate, Opadry® White (for 0.5 mg), Opadry® Blue (for 1 mg), and Opadry® Clear.
- Chlorpheniramine-Ibuprofen-Pseudoephedrine tablets. Active ingredients (in each caplet): chlorpheniramine maleate (2 mg), ibuprofen (200 mg), and pseudoephedrine HCl (30 mg). Aluminum LakeAluminum LakeInactive ingredients: carnauba wax, croscarmellose sodium, FD&C Red No. 40 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, glyceryl behenate, hypromellose, iron oxide black, microcrystalline cellulose, polydextrose, polyethylene glycol, pregelatinized starch, propylene glycol, silicon dioxide, starch, and titanium dioxide.
- CIALIS® (tadalafil) is available as film-coated, almond-shaped tablets for oral administration. Each tablet contains 5, 10, or 20 mg of tadalafil and the following inactive ingredients: croscarmellose sodium, hydroxypropyl cellulose, hypromellose, iron oxide, lactose monohydrate, magnesium stearate, microcrystalline cellulose, sodium lauryl sulfate, talc, titanium dioxide, and triacetin.
- CIPRO XR (ciprofloxacin extended-release tablets) contain ciprofloxacin, a synthetic broad-spectrum antimicrobial agent for oral administration. CIPRO XR tablets are coated, bilayer tablets consisting of an immediate-release layer and an erosion matrix–type controlled-release layer. The tablets contain a combination of two types of ciprofloxacin drug substance: ciprofloxacin hydrochloride and ciprofloxacin betaine (base). The drug substance is a faintly yellowish to light yellow crystalline substance. CIPRO XR is available in 500 and 1000 mg (ciprofloxacin equivalent) tablet strengths. CIPRO XR tablets are nearly white to slightly yellowish, film-coated, oblong-shaped tablets. Each CIPRO XR 500 mg tablet contains 500 mg of ciprofloxacin as ciprofloxacin HCl (287.5 mg, calculated as ciprofloxacin on the dried basis) and ciprofloxacin (212.6 mg, calculated on the dried basis). Each CIPRO XR 1000 mg tablet contains 1000 mg of ciprofloxacin as ciprofloxacin HCl (574.9 mg, calculated as ciprofloxacin on the dried basis) and ciprofloxacin (425.2 mg, calculated on the dried basis). The inactive ingredients are crospovidone, hypromellose, magnesium stearate, polyethylene glycol, silica colloidal anhydrous, succinic acid, and titanium dioxide.
- Citracal Prenatal Rx is a scored, white, modified oval-shaped multivitamin/multimineral tablet. Each tablet contains: vitamin A (vitamin A palmitate), 2700 IU; vitamin C (ascorbic acid), 120 mg; calcium (calcium citrate), 125 mg; iron (carbonyl iron, ferrous gluconate), 27 mg; vitamin D3 (cholecalciferol), 400 IU; vitamin E (DL-tocopheryl acetate), 30 IU; thiamin (vitamin B1), 3 mg; riboflavin (vitamin B2), 3.4 mg; niacinamide (vitamin B3), 20 mg; pyridoxine HCl (vitamin B6), 20 mg; folic acid, 1 mg; iodine (potassium iodide), 150 µg; zinc (zinc oxide), 25 mg; copper (cupric oxide), 2 mg; docusate sodium, 50 mg; calcium (as Ultradense® calcium citrate), 200 mg; polyethylene glycol; croscarmellose sodium; polyvinyl alcohol, part hydrolyzed; color added; magnesium silicate; and magnesium stearate.
- CLARINEX (desloratadine) tablets are light blue, round, film-coated tablets containing 5 mg of desloratadine, an antihistamine, to be administered orally. They also contain the following excipients: dibasic calcium phosphate dihydrate USP, microcrystalline cellulose NF, cornstarch NF, talc USP, carnauba wax NF, white wax NF, and coating material consisting of lactose monohydrate, hydroxypropyl methylcellulose, titanium dioxide, polyethylene glycol, and FD&C Blue No. 2 Aluminum Lake.
- CLARINEX RediTabs® brand of desloratadine orally disintegrating tablets. Each RediTabs tablet contains either 5 or 2.5 mg of desloratadine. It also contains the following inactive ingredients: mannitol USP, microcrystalline cellulose NF, pregelatinized starch NF, sodium starch glycolate USP, magnesium stearate NF, butylated methacrylate copolymer, crospovidone NF, aspartame NF, citric acid USP, sodium bicarbonate USP, colloidal silicon dioxide NF, ferric oxide red NF, and tutti-frutti flavoring.
- CLARINEX-D® 24 hour extended-release tablets are light blue oval-shaped tablets containing 5 mg of desloratadine in the tablet coating for immediate release and 240 mg of pseudoephedrine sulfate, USP in the tablet core for extended release. The inactive ingredients contained in CLARINEX-D® 24 hour extended-release tablets are hypromellose USP, ethylcellulose NF, dibasic calcium phosphate dihydrate USP, magnesium stearate NF, povidone USP, silicon dioxide NF, talc USP, polyacrylate dispersion, polyethylene glycol NF, simethicone USP, Blue Lake Blend 50726 (FD&C Blue No. 2 Lake, titanium dioxide USP, and edetate disodium USP), and ink (Opacode® S-1-17746 or Opacode® S-1-4159).

- CLINORIL (Sulindac) is available in 150 and 200 mg tablets for oral administration. Each tablet contains the following inactive ingredients: cellulose, magnesium stearate, and starch. Sulindac is a nonsteroidal, anti-inflammatory indene derivative.
- CLORPRES® is a combination of clonidine hydrochloride and chlorthalidone. CLORPRES® is available as tablets for oral administration in three dosage strengths: 0.1 mg/15 mg, 0.2 mg/15 mg, and 0.3 mg/15 mg of clonidine hydrochloride/chlorthalidone, respectively. The inactive ingredients are ammonium chloride, colloidal silicon dioxide, croscarmellose sodium (Type A), magnesium stearate, microcrystalline cellulose, sodium lauryl sulfate, and D&C Yellow No. 10.
- Clozapine tablets, for oral administration, are available containing 25 and 100 mg of clozapine. In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, crospovidone, lactose (monohydrate), magnesium stearate, microcrystalline cellulose, and sodium lauryl sulfate. In addition, the 25 mg tablet contains FD&C Red No. 40 Lake, and the 100 mg tablet contains FD&C Blue No. 2 Lake.
- COMBIVIR tablets are combination tablets containing lamivudine and zidovudine. Lamivudine (EPIVIR®, 3TC®) and zidovudine (RETROVIR®, azidothymidine, AZT, or ZDV) are synthetic nucleoside analogues with activity against human immunodeficiency virus (HIV). COMBIVIR tablets are for oral administration. Each film-coated tablet contains 150 mg of lamivudine, 300 mg of zidovudine, and the inactive ingredients colloidal silicon dioxide, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium starch glycolate, and titanium dioxide. Lamivudine is a white to off-white crystalline solid with a solubility of approximately 70 mg/mL in water at 20°C. Zidovudine is a white to beige, odorless, crystalline solid with a solubility of 20.1 mg/mL in water at 25°C.
- Combunox™ tablet contains oxycodone HCl, USP 5 mg, and ibuprofen, USP 400 mg. Combunox™ tablets include sodium starch glycolate, microcrystalline cellulose, colloidal silicon dioxide, stearic acid, calcium stearate, carboxymethylcellulose, povidone, and Opadry® II White, Y-22 7719 coloring agent. Opadry® II White, Y-22 7719 coloring agent consists of titanium dioxide, polydextrose, hypromellose, triacetin, and polyethylene glycol 8000.
- Comtan® (entacapone) is available as tablets containing 200 mg entacapone. The inactive ingredients of the Comtan® tablet are microcrystalline cellulose, mannitol, croscarmellose sodium, hydrogenated vegetable oil, hydroxypropyl methylcellulose, polysorbate 80, glycerol 85%, sucrose, magnesium stearate, yellow iron oxide, red oxide, and titanium dioxide.
- CONCERTA® is available in four tablet strengths. Each extended-release tablet for once-a-day oral administration contains 18, 27, 36, or 54 mg of methylphenidate HCl USP and is designed to have a 12 hour duration of effect. CONCERTA® also contains the following inert ingredients: butylated hydroxytoluene, carnauba wax, cellulose acetate, hypromellose, lactose, phosphoric acid, poloxamer, polyethylene glycol, polyethylene oxides, povidone, propylene glycol, sodium chloride, stearic acid, succinic acid, synthetic iron oxides, titanium dioxide, and triacetin. CONCERTA® uses osmotic pressure to deliver methylphenidate HCl at a controlled rate. The system, which resembles a conventional tablet in appearance, comprises an osmotically active trilayer core surrounded by a semipermeable membrane with an immediate-release drug overcoat. The trilayer core is composed of two drug layers, containing the drug and excipients, and a push layer containing osmotically active components. There is a precision laser-drilled orifice on the drug-layer end of the tablet. In an aqueous environment, such as the gastrointestinal tract, the drug overcoat dissolves within 1 hour, providing an initial dose of methylphenidate. Water permeates through the membrane into the tablet core. As the osmotically active polymer excipients expand, methylphenidate is released through the orifice. The membrane controls the rate at which water enters the tablet core, which in turn, controls drug delivery. Furthermore, the drug release rate from the system increases with time over a period of 6 to 7 hours due to the drug concentration gradient incorporated into the two drug layers of CONCERTA®. The biologically inert components of the tablet remain intact during gastrointestinal transit and are eliminated in the stool as a tablet shell along with insoluble core components.
- COREG (Carvedilol) is a white, oval, film-coated tablet containing 3.125, 6.25, 12.5, or 25 mg of carvedilol. The 6.25, 12.5, and 25 mg tablets are TILTAB® tablets. Inactive ingredients consist of colloidal silicon dioxide, crospovidone, hypromellose, lactose, magnesium stearate, polyethylene glycol, polysorbate 80, povidone, sucrose, and titanium dioxide.
- Covera-HS (verapamil hydrochloride) is for oral administration as pale yellow, round, film-coated tablets containing 240 mg of verapamil hydrochloride and as lavender, round, film-coated tablets containing 180 mg of verapamil hydrochloride. Inactive ingredients are black ferric oxide, butylated hydroxytoluene, cellulose acetate, hydroxyethyl cellulose, hydroxypropyl cellulose, hypromellose, magnesium stearate, polyethylene glycol, polyethylene oxide, polysorbate 80, povidone, sodium chloride, titanium dioxide, and coloring agents: 240 mg, FD&C Blue No. 2 Lake and D&C Yellow

No. 10 Lake; 180 mg, FD&C Blue No. 2 Lake and D&C Red No. 30 Lake. System components and performance: the Covera-HS formulation has been designed to initiate the release of verapamil 4 to 5 hours after ingestion. This delay is introduced by a layer between the active drug core and the outer semipermeable membrane. As water from the gastrointestinal tract enters the tablet, this delay coating is solubilized and released. As tablet hydration continues, the osmotic layer expands and pushes against the drug layer, releasing drug through precision laser-drilled orifices in the outer membrane at a constant rate. This controlled rate of drug delivery in the gastrointestinal lumen is independent of posture, pH, gastrointestinal motility, and fed or fasting conditions. The biologically inert components of the delivery system remain intact during GI transit and are eliminated in the feces as an insoluble shell.

- COZAAR (losartan potassium) is available as tablets for oral administration containing either 25, 50, or 100 mg of losartan potassium and the following inactive ingredients: microcrystalline cellulose, lactose hydrous, pregelatinized starch, magnesium stearate, hydroxypropyl cellulose, hypromellose, titanium dioxide, D&C Yellow No. 10 Aluminum Lake, and FD&C Blue No. 2 Aluminum Lake. COZAAR 25, 50, and 100 mg tablets contain potassium in the following amounts: 2.12 mg (0.054 mEq), 4.24 mg (0.108 mEq), and 8.48 mg (0.216 mEq), respectively. COZAAR 25 mg, COZAAR 50 mg, and COZAAR 100 mg may also contain carnauba wax.
- CRESTOR® (rosuvastatin calcium) tablets for oral administration contain 5, 10, 20, or 40 mg of rosuvastatin and the following inactive ingredients: microcrystalline cellulose NF, lactose monohydrate NF, tribasic calcium phosphate NF, crospovidone NF, magnesium stearate NF, hypromellose NF, triacetin NF, titanium dioxide USP, yellow ferric oxide, and red ferric oxide NF.
- DARANIDE (dichlorphenamide) is supplied as tablets, for oral administration, each containing 50 mg of dichlorphenamide. Inactive ingredients are D&C Yellow No. 10, lactose, magnesium stearate, and starch.
- DARAPRIM (pyrimethamine) tablets contain 25 mg of pyrimethamine and the inactive ingredients corn and potato starch, lactose, and magnesium stearate.
- Darvocet (propoxyphene napsylate). Each tablet of Darvocet A500™ contains 100 mg of propoxyphene napsylate and 500 mg of acetaminophen. Each tablet also contains anhydrous lactose, colloidal silicon dioxide, crospovidone, magnesium stearate (powder), microcrystalline cellulose, povidone, pregelatinized cornstarch, and stearic acid (powder). The film coating is composed of carnauba wax, hypromellose 2910 6cP, polyethylene glycol, purified water, sodium citrate, titanium dioxide, FD&C Red No. 40 Aluminum Lake, and FD&C Yellow No. 6 Aluminum Lake.
- DECADRON (dexamethasone tablets, USP) tablets, for oral administration, are supplied in two potencies, 0.5 and 0.75 mg. Inactive ingredients are calcium phosphate, lactose, magnesium stearate, and starch. DECADRON 0.5 mg tablets also contain D&C Yellow No. 10 and FD&C Yellow No. 6. DECADRON 0.75 mg tablets also contain FD&C Blue No. 1.
- DEPAKOTE (divalproex sodium) is a stable coordination compound composed of sodium valproate and valproic acid in a 1:1 molar relationship and formed during the partial neutralization of valproic acid with 0.5 equivalent of sodium hydroxide. Divalproex sodium occurs as a white powder with a characteristic odor. DEPAKOTE tablets are for oral administration. DEPAKOTE tablets are supplied in three dosage strengths containing divalproex sodium equivalent to 125, 250, or 500 mg of valproic acid. Inactive ingredients in DEPAKOTE tablets: cellulosic polymers, diacetylated monoglycerides, povidone, pregelatinized starch (contains cornstarch), silica gel, talc, titanium dioxide, and vanillin. In addition, 125 mg tablets contain FD&C Blue No. 1 and FD&C Red No. 40, 250 mg tablets contain FD&C Yellow No. 6 and iron oxide, and 500 mg tablets contain D&C Red No. 30, FD&C Blue No. 2, and iron oxide. DEPAKOTE ER 250 and 500 mg tablets are for oral administration. DEPAKOTE ER tablets contain divalproex sodium in a once-a-day extended-release formulation equivalent to 250 and 500 mg of valproic acid. Inactive ingredients for DEPAKOTE ER 250 and 500 mg tablets: FD&C Blue No. 1, hypromellose, lactose, microcrystalline cellulose, polyethylene glycol, potassium sorbate, propylene glycol, silicon dioxide, titanium dioxide, and triacetin. In addition, 500 mg tablets contain iron oxide and polydextrose.
- DESOXYN (methamphetamine hydrochloride tablets, USP) contain 5 mg of methamphetamine hydrochloride for oral administration. Inactive ingredients: cornstarch, lactose, sodium paraminobenzoate, stearic acid, and talc.
- DETROL tablets contain tolterodine tartrate. DETROL tablets for oral administration contain 1 or 2 mg of tolterodine tartrate. The inactive ingredients are colloidal anhydrous silica, calcium hydrogen phosphate dihydrate, cellulose microcrystalline, hypromellose, magnesium stearate, sodium starch glycolate (pH 3.0–5.0), stearic acid, and titanium dioxide.
- DEXEDRINE (dextroamphetamine sulfate) is the dextro isomer of the compound DL-amphetamine sulfate. Each triangular, orange, scored tablet is debossed SKF and E19 and contains dextroamphetamine sulfate, 5 mg. Inactive ingredients consist of

calcium sulfate, FD&C Yellow No. 5 (tartrazine), FD&C Yellow No. 6, gelatin, lactose, mineral oil, starch, stearic acid, sucrose, talc, and trace amounts of other inactive ingredients.

- Didronel tablets contain either 200 or 400 mg of etidronate disodium. Inactive ingredients: each tablet contains magnesium stearate, microcrystalline cellulose, and starch.
- DIGITEK (digoxin) is one of the cardiac (or digitalis) glycosides. Each tablet contains the labeled amount of digoxin USP and the following inactive ingredients: cornstarch, croscarmellose sodium, microcrystalline cellulose, pregelatinized starch, lactose monohydrate and anhydrous lactose, silicon dioxide, and stearic acid. In addition, the 125 μg (0.125 mg) tablet contains D&C Yellow No. 10 Aluminum Lake.
- DILAUDID tablets contain hydromorphone hydrochloride. In addition, the tablets include lactose anhydrous and magnesium stearate. DILAUDID 8 mg tablets may contain traces of sodium metabisulfite. Color-coded tablets (for oral administration) contain 2 mg hydromorphone hydrochloride (orange tablet) and D&C Red No. 30 Lake, D&C Yellow No. 10 Lake, lactose, and magnesium stearate; 4 mg hydromorphone hydrochloride (yellow tablet) and D&C Yellow No. 10 Lake, lactose, and magnesium stearate.
- Diovan® (valsartan) is available as tablets for oral administration containing 40, 80, 160, or 320 mg of valsartan. The inactive ingredients of the tablets are colloidal silicon dioxide, crospovidone, hydroxypropyl methylcellulose, iron oxides (yellow, black and/or red), magnesium stearate, microcrystalline cellulose, polyethylene glycol 8000, and titanium dioxide.
- Diovan HCT® (valsartan and hydrochlorothiazide, USP) tablets are formulated for oral administration to contain valsartan and hydrochlorothiazide, USP 80/12.5 mg, 160/12.5 mg, and 160/25 mg. The inactive ingredients of the tablets are colloidal silicon dioxide, crospovidone, hydroxypropyl methylcellulose, iron oxides, magnesium stearate, microcrystalline cellulose, polyethylene glycol, talc, and titanium dioxide.
- Disulfiram tablets for oral administration contain 250 or 500 mg of disulfiram, USP. Tablets also contain colloidal silicon dioxide, anhydrous lactose, magnesium stearate, microcrystalline cellulose, sodium starch glycolate, and stearic acid.
- DOLOBID. Diflunisal tablets DOLOBID contain the following inactive ingredients: cellulose, FD&C Yellow No. 6, hydroxypropyl cellulose, hydroxypropyl methylcellulose, magnesium stearate, starch, talc, and titanium dioxide.
- DOSTINEX tablets contain 0.5 mg of cabergoline. Inactive ingredients consist of leucine, USP, and lactose, NF.
- E.E.S. (erythromycin ethylsuccinate) is an ester of erythromycin suitable for oral administration. E.E.S. 400® Filmtab tablets: each tablet contains erythromycin ethylsuccinate equivalent to 400 mg of erythromycin. Inactive ingredients: cellulosic polymers, confectioner's sugar (contains cornstarch), cornstarch, D&C Red No. 30, D&C Yellow No. 10, FD&C Red No. 40, magnesium stearate, polacrilin potassium, polyethylene glycol, propylene glycol, sodium citrate, sorbic acid, and titanium dioxide.
- Effexor (venlafaxine hydrochloride) tablets contain venlafaxine hydrochloride equivalent to 25, 37.5, 50, 75, or 100 mg of venlafaxine. Inactive ingredients consist of cellulose, iron oxides, lactose, magnesium stearate, and sodium starch glycolate.
- ENABLEX® (darifenacin) is an extended-release tablet that contains 7.5 or 15 mg of darifenacin as its hydrobromide salt. ENABLEX is a once-a-day extended-release tablet and contains the following inactive ingredients: dibasic calcium phosphate anhydrous, hydroxypropyl methylcellulose (hypromellose), lactose monohydrate, magnesium stearate, titanium dioxide, and triacetin. The 15 mg tablet also contains FD&C Yellow No. 6 Aluminum Lake.
- Encora™ is a prescription vitamin and mineral nutritional supplement with essential fatty acids consisting of two capsules and two tablets on each blister card designated for a.m. and p.m. oral administration as follows. The a.m. tablet is an oval-shaped, light pink, film-coated tablet containing the following ingredients: calcium (calcium carbonate), 400 mg; vitamin D3 (cholecalciferol), 200 IU; vitamin C (as Ester-C®*), 25 mg; folic acid, USP, 2 mg; and vitamin B6 (pyridoxine hydrochloride, USP), 25 mg. The p.m. tablet is an oval-shaped, purple, film-coated tablet containing the following ingredients: calcium (calcium carbonate), 600 mg; vitamin D3 (cholecalciferol), 600 IU; vitamin C (as Ester-C®), 25 mg; folic acid, USP, 0.5 mg; and vitamin B6 (pyridoxine hydrochloride, USP), 12.5 mg. The a.m. and p.m. capsule is a pink soft gelatin capsule containing the following ingredients: essential fatty acids (omega-3), 650 mg; docosahexaenoic acid (DHA) and eicosapentaenoic acid (EPA), 550 mg; α-linolenic acid (ALA), 100 mg; linoleic acid (LA), 10 mg; and vitamin E (DL-tocopheryl acetate), 50 IU. *Ester-C® is a patented pharmaceutical-grade material consisting of calcium ascorbate and calcium theonate. The EPA to DHA ratio is approximately 2.7:1. Inactive ingredients (tablets): acacia, butylated hydroxyanisole, butylated hydroxytoluene, colloidal silicon dioxide, cornstarch, croscarmellose sodium, D&C Red No. 27 Aluminum Lake, hydrolyzed gelatin, lecithin, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polyvinyl alcohol, sodium lauryl sulfate, stearic acid, sucrose, talc, titanium dioxide, and vegetable oil. The AM tablet also contains

FD&C Blue No. 2 Aluminum Lake. The PM tablet also contains FD&C Blue No. 1 Aluminum Lake. Inactive ingredients (capsule): D&C Red No. 33, ethyl vanillin, FD&C Red No. 40, gelatin, glycerin, soybean oil, and titanium dioxide.

- ENJUVIA (synthetic conjugated estrogens, B) tablets contain a blend of 10 synthetic estrogenic substances. The estrogenic substances are sodium estrone sulfate, sodium equilin sulfate, sodium 17α-dihydroequilenin sulfate, sodium 17α-estradiol sulfate, sodium 17β-dihydroequilenin sulfate, sodium 17α-dihydroequilenin sulfate, sodium 17β-dihydroequilenin sulfate, sodium equilenin sulfate, sodium 17β-estradiol sulfate, and sodium Δ8,9-dehydroestrone sulfate. ENJUVIA tablets for oral administration are available in 0.3, 0.45, 0.625, and 1.25 mg strengths of synthetic conjugated estrogens, B. These tablets contain the following inactive ingredients: ascorbyl palmitate, butylated hydroxyanisole, colloidal silicon dioxide, edetate disodium dehydrate, plasticized ethylcellulose, hypromellose, lactose monohydrate, magnesium stearate, purified water, iron oxide red, titanium dioxide, polyethylene glycol, polysorbate 80, triacetate, and triacetin/glycerol. In addition, the 0.45 mg tablets contain iron oxide black and iron oxide yellow, and the 1.25 mg tablets contain iron oxide yellow.
- EPHEDRINE-GUAIFENESIN. Active ingredients (in each tablet): Ephedrine HCl, USP, 12.5 mg; guaifenesin, USP, 200 mg. Inactive ingredients: crospovidone, D&C Yellow no. 10 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, magnesium stearate, microcrystalline cellulose, povidone, and silicon dioxide (colloidal).
- EPIVIR® (also known as 3TC) is lamivudine, a white to off-white crystalline solid with a solubility of approximately 70 mg/mL in water at 20°C. EPIVIR® tablets are for oral administration. Each 150 mg film-coated tablet contains 150 mg of lamivudine and the inactive ingredients hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium starch glycolate, and titanium dioxide. Each 300 mg film-coated tablet contains 300 mg of lamivudine and the inactive ingredients black iron oxide, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium starch glycolate, and titanium dioxide.
- EPIVIR-HBV is lamivudine, a white to off-white crystalline solid with a solubility of approximately 70 mg/mL in water at 20°C. EPIVIR-HBV tablets are for oral administration. Each tablet contains 100 mg of lamivudine and the inactive ingredients hypromellose, macrogol 400, magnesium stearate, microcrystalline cellulose, polysorbate 80, red iron oxide, sodium starch glycolate, titanium dioxide, and yellow iron oxide.
- EPZICOM tablets contain the following two synthetic nucleoside analogues: abacavir sulfate (ZIAGEN®, also a component of TRIZIVIR®) and lamivudine (also known as EPIVIR® or 3TC). EPZICOM tablets are for oral administration. Each orange, film-coated tablet contains the active ingredients 600 mg of abacavir as abacavir sulfate and 300 mg of lamivudine and the inactive ingredients magnesium stearate, microcrystalline cellulose, and sodium starch glycolate. The tablets are coated with a film (Opadry® orange YS 1–13065-A) that is made of FD&C Yellow No. 6, hypromellose, polyethylene glycol 400, polysorbate 80, and titanium dioxide. Abacavir sulfate is a white to off-white solid with a solubility of approximately 77 mg/mL in distilled water at 25°C. *In vivo*, abacavir sulfate dissociates to its free base, abacavir. All dosages for abacavir sulfate are expressed in terms of abacavir. Lamivudine is a white to off-white crystalline solid with a solubility of approximately 70 mg/mL in water at 20°C.
- EryPed chewable tablets contain erythromycin ethylsuccinate equivalent to 200 mg of erythromycin and are scored for division into half-dose (100 mg) portions. Inactive ingredients: citric acid, confectioner's sugar (contains cornstarch), magnesium aluminum silicate, magnesium stearate, sodium carboxymethylcellulose, sodium citrate, and artificial flavor.
- ERY-TAB (erythromycin delayed-release tablets) are available in three dosage strengths, each white oval tablet containing either 250, 333, or 500 mg of erythromycin as the free base. ERY-TAB tablets comply with USP Drug Release Test 1. Inactive ingredients: ammonium hydroxide, colloidal silicon dioxide, croscarmellose sodium, crospovidone, diacetylated monoglycerides, hydroxypropyl cellulose, hypromellose, hypromellose phthalate, magnesium stearate, microcrystalline cellulose, povidone, propylene glycol, sodium citrate, sorbitan monooleate, talc, and titanium dioxide.
- ERYTHROMYCIN STEARATE. Filmtab tablets (erythromycin stearate tablets, USP) containing the stearate salt of erythromycin in a unique film coating. Inactive ingredients: 250 mg tablet—cellulosic polymers, cornstarch, D&C Red No. 7, polacrilin potassium, polyethylene glycol, povidone, propylene glycol, sodium carboxymethylcellulose, sodium citrate, sorbic acid, sorbitan monooleate, and titanium dioxide. 500 mg tablet—cellulosic polymers, cornstarch, FD&C Red No. 3, magnesium hydroxide, polacrilin potassium, povidone, propylene glycol, sorbitan monooleate, titanium dioxide, and vanillin. Erythromycin Base Filmtab (erythromycin tablets, USP) are available in two strengths containing either 250 or 500 mg of erythromycin base. Inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, D&C Red No. 30 Aluminum Lake, hydroxypropyl cellulose, hypromellose,

hydroxypropyl methylcellulose phthalate, magnesium stearate, microcrystalline cellulose, povidone, polyethylene glycol, propylene glycol, sodium citrate, sodium hydroxide, sorbic acid, sorbitan monooleate, talc, and titanium dioxide.

- ESKALITH contains lithium carbonate, a white, light, alkaline powder. ESKALITH CR controlled-release tablets: each round, yellow, biconvex tablet, debossed with SKF and J10 on one side and scored on the other side, contains lithium carbonate, 450 mg. Inactive ingredients consist of alginic acid, gelatin, iron oxide, magnesium stearate, and sodium starch glycolate. ESKALITH CR tablets 450 mg are designed to release a portion of the dose initially and the remainder gradually; the release pattern of the controlled-release tablets reduces the variability in lithium blood levels seen with the immediate-release dosage forms.
- ESTRATEST® tablets: Each dark green, capsule-shaped, sugar-coated oral tablet contains 1.25 mg of esterified estrogens, USP, and 2.5 mg of methyltestosterone, USP. ESTRATEST® H.S. (half-strength) tablets: each light green, capsule-shaped, sugar-coated oral tablet contains 0.625 mg of esterified estrogens, USP, and 1.25 mg of methyltestosterone, USP. Esterified estrogens, USP is a mixture of the sodium salts of the sulfate esters of the estrogenic substances, principally estrone, that are of the type excreted by pregnant mares. Esterified estrogens contain not less than 75.0% and not more than 85.0% of sodium estrone sulfate, and not less than 6.0% and not more than 15.0% of sodium equilin sulfate, in such proportion that the total of these two components is not less than 90.0%. ESTRATEST® and ESTRATEST® H.S. tablets contain the following inactive ingredients: acacia, acetylated monoglycerides, calcium carbonate, carboxymethylcellulose sodium, carnauba wax NF, citric acid, colloidal silicon dioxide, gelatin, iron oxide, lactose, magnesium stearate, methylparaben, microcrystalline cellulose, pharmaceutical glaze, povidone, propylene glycol, propylparaben, shellac glaze, sodium benzoate, sodium bicarbonate, sorbic acid, starch, sucrose, talc, titanium dioxide, and tribasic calcium phosphate. ESTRATEST® tablets also contain FD&C Blue No. 1 Lake, FD&C Yellow No. 6 Lake, and D&C Yellow No. 10 Lake. ESTRATEST®s H.S. tablets also contain: D&C Yellow No. 10 Lake, FD&C Blue No.1 Lake, FD&C Blue No. 2 Lake, FD&C Yellow No. 6 Lake, and FD&C Red No. 40 Lake.
- EVISTA® (raloxifene hydrochloride) tablets contain 60 mg of raloxifene HCl, which is the molar equivalent of 55.71 mg of free base. Inactive ingredients include anhydrous lactose, carnauba wax, crospovidone, FD&C Blue No. 2 Aluminum Lake, hypromellose, lactose monohydrate, magnesium stearate, modified pharmaceutical glaze, polyethylene glycol, polysorbate 80, povidone, propylene glycol, and titanium dioxide.
- FACTIVE (gemifloxacin mesylate). Each white to off-white, oval, film-coated FACTIVE tablet has breaklines and GE 320 debossed on both faces and contains gemifloxacin mesylate equivalent to 320 mg gemifloxacin. The inactive ingredients are crospovidone, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, and titanium dioxide.
- Famvir® (famciclovir) contains famciclovir. Tablets for oral administration: each white, film-coated tablet contains famciclovir. The 125 mg and 250 mg tablets are round. and the 500 mg tablets are oval. Inactive ingredients consist of hydroxypropyl cellulose, hydroxypropyl methylcellulose, lactose, magnesium stearate, polyethylene glycols, sodium starch glycolate, and titanium dioxide.
- FazaClo® (clozapine, USP) is available as scored, yellow, orally disintegrating tablets of 25 and 100 mg for oral administration without water. Each orally disintegrating tablet contains clozapine equivalent to 25 or 100 mg. Active ingredient: each 25 mg orally disintegrating tablet contains 3.1 mg aspartame and thus, 1.74 mg phenylalanine. Each 100 mg orally disintegrating tablet contains 12.4 mg aspartame and thus, 6.96 mg phenylalanine.
- Femara® (letrozole tablets) for oral administration contain 2.5 mg of letrozole. Femara® (letrozole tablets) is available as 2.5 mg tablets for oral administration. Inactive ingredients: colloidal silicon dioxide, ferric oxide, hydroxypropyl methylcellulose, lactose monohydrate, magnesium stearate, maize starch, microcrystalline cellulose, polyethylene glycol, sodium starch glycolate, talc, and titanium dioxide.
- Ferrets tablets are for use as a dietary iron supplement. Each tablet contains iron (from 325 mg ferrous fumarate) 106 mg. Other ingredients: microcrystalline cellulose, sodium starch glycolate, magnesium stearate, Opadry® II clear, and Opadry® II Red 40L15175.
- FLEXERIL 5 mg (cyclobenzaprine HCl) is supplied as a 5 mg tablet for oral administration. FLEXERIL 10 mg (cyclobenzaprine HCl) is supplied as a 10 mg tablet for oral administration. FLEXERIL 5 mg (cyclobenzaprine HCl) tablets contain the following inactive ingredients: hydroxypropyl cellulose, hypromellose, lactose, magnesium stearate, starch, titanium dioxide, Yellow D&C No. 10 Aluminum Lake HT, and Yellow FD&C No. 6 Aluminum Lake. FLEXERIL 10 mg (cyclobenzaprine HCl) tablets contain the following inactive ingredients: hydroxypropyl cellulose, hypromellose, iron oxide, lactose, magnesium stearate, starch, and titanium dioxide.
- Flumadine® (rimantadine hydrochloride) film-coated tablets contain 100 mg of rimantadine hydrochloride plus hydroxypropyl methylcellulose, magnesium

stearate, microcrystalline cellulose, sodium starch glycolate, FD&C Yellow No. 6 Lake, and FD&C Yellow No. 6. The film coat contains hydroxypropyl methylcellulose and polyethylene glycol.

- Focalin™ (dexmethylphenidate hydrochloride) is the *d*-threoenantiomer of racemic methylphenidate hydrochloride, which is a 50/50 mixture of the *d*-threo and *l*-threoenantiomers. Focalin is a central nervous system (CNS) stimulant, available in three tablet strengths. Each tablet contains dexmethylphenidate hydrochloride 2.5, 5, or 10 mg for oral administration. Focalin also contains the following inert ingredients: pregelatinized starch, lactose monohydrate, sodium starch glycolate, microcrystalline cellulose, magnesium stearate, and FD&C Blue No. 1 No. 5516 Aluminum Lake (2.5 mg tablets), D&C Yellow Lake No. 10 (5 mg tablets); the 10 mg tablet contains no dye.
- FORTAMET™ (metformin hydrochloride) extended-release tablets are designed for once-a-day oral administration and deliver 500 or 1000 mg of metformin hydrochloride. In addition to the active ingredient metformin hydrochloride, each tablet contains the following inactive ingredients: candelilla wax, cellulose acetate, hypromellose, magnesium stearate, polyethylene glycols (PEG 400, PEG 8000), polysorbate 80, povidone, sodium lauryl sulfate, synthetic black iron oxides, titanium dioxide, and triacetin.
- FOSAMAX (alendronate sodium) tablets for oral administration contain 6.53, 13.05, 45.68, 52.21 or 91.37 mg of alendronate monosodium salt trihydrate, which is the molar equivalent of 5, 10, 35, 40 and 70 mg, respectively, of free acid, and the following inactive ingredients: microcrystalline cellulose, anhydrous lactose, croscarmellose sodium, and magnesium stearate. Tablets FOSAMAX 10 mg also contain carnauba wax.
- FOSAMAX PLUS D contains alendronate sodium as 91.37 mg of alendronate monosodium salt trihydrate, the molar equivalent of 70 mg of free acid, and 70 µg of cholecalciferol equivalent to 2800 IU vitamin D. Each tablet contains the following inactive ingredients: microcrystalline cellulose, lactose anhydrous, medium-chain triglycerides, gelatin, croscarmellose sodium, sucrose, colloidal silicon dioxide, magnesium stearate, butylated hydroxytoluene, modified food starch, and sodium aluminum silicate.
- FOSRENOL® contains lanthanum carbonate (2:3) hydrate. Each FOSRENOL® white to off-whites chewable tablet contains lanthanum carbonate hydrate equivalent to 250, 500, 750, or 1000 mg of elemental lanthanum and the following inactive ingredients: dextrates (hydrated) NF, colloidal silicon dioxide NF, and magnesium stearate NF.
- FROVA (frovatriptan succinate) tablet for oral administration contain 3.91 mg of frovatriptan succinate, equivalent to 2.5 mg of frovatriptan base. Each tablet also contains the inactive ingredients lactose NF, microcrystalline cellulose NF, colloidal silicon dioxide NF, sodium starch glycolate NF, magnesium stearate NF, hydroxypropyl methylcellulose USP, polyethylene glycol 3000 USP, triacetin USP, and titanium dioxide USP.
- Furosemide tablets for oral administration contain 20, 40, or 80 mg of furosemide and the following inactive ingredients: colloidal silicon dioxide, lactose monohydrate, microcrystalline cellulose, pregelatinized starch, and stearic acid. Furosemide tablets USP 20, 40, and 80 mg meet USP Dissolution Test 1.
- GABITRIL (tiagabine HCl) tablets contain the following inactive ingredients: ascorbic acid, colloidal silicon dioxide, crospovidone, hydrogenated vegetable oil wax, hydroxypropyl cellulose, hypromellose, lactose, magnesium stearate, microcrystalline cellulose, pregelatinized starch, stearic acid, and titanium dioxide. In addition, individual tablets contain the following ingredients: 2 mg tablets—FD&C Yellow No. 6; 4 mg tablets—D&C Yellow No. 10; 12 mg tablets—D&C Yellow No. 10 and FD&C Blue No. 1; and 16 mg tablets—FD&C Blue No. 2.
- Gleevec® (imatinib mesylate) film-coated tablets contain imatinib mesylate equivalent to 100 or 400 mg of imatinib free base. Inactive ingredients: colloidal silicon dioxide (NF), crospovidone (NF), hydroxypropyl methylcellulose (USP), magnesium stearate (NF), and microcrystalline cellulose (NF). Tablet coating: ferric oxide, red (NF); ferric oxide, yellow (NF); hydroxypropyl methylcellulose (USP); polyethylene glycol (NF); and talc (USP).
- Gris-PEG® tablets contain ultramicrosize crystals of griseofulvin. Active ingredient: griseofulvin ultramicrosize 125 mg. Inactive ingredients: colloidal silicon dioxide, lactose, magnesium stearate, methylcellulose, methylparaben, polyethylene glycol 400 and 8000, polyvinylpyrrolidone, and titanium dioxide. Or, active ingredient: griseofulvin ultramicrosize 250 mg. Inactive ingredients: colloidal silicon dioxide, magnesium stearate, methylcellulose, methylparaben, polyethylene glycol 400 and 8000, povidone, sodium lauryl sulfate, and titanium dioxide.
- Guanidine (amino-methanamidine) tablets contain 125 mg of guanidine hydrochloride with no color additive in the base. They also contain the following inactive ingredients: colloidal silicon dioxide, magnesium stearate, mannitol, and microcrystalline cellulose.
- HYDROCORTONE (hydrocortisone) tablets contain 10 mg of hydrocortisone in each tablet. Inactive ingredients are lactose, magnesium stearate, and starch.
- HYZAAR 50-12.5 (losartan potassium-hydrochlorothiazide), HYZAAR 100-12.5 (losartan potassium-hydrochlorothiazide), and HYZAAR 100-25

(losartan potassium-hydrochlorothiazide) are available for oral administration in two tablet combinations of losartan and hydrochlorothiazide. HYZAAR 50-12.5 contains 50 mg of losartan potassium and 12.5 mg of hydrochlorothiazide. HYZAAR 100-12.5 contains 100 mg of losartan potassium and 12.5 mg of hydrochlorothiazide. HYZAAR 100-25 contains 100 mg of losartan potassium and 25 mg of hydrochlorothiazide. Inactive ingredients are microcrystalline cellulose, lactose hydrous, pregelatinized starch, magnesium stearate, hydroxypropyl cellulose, hypromellose, and titanium dioxide. HYZAAR 50-12.5 and HYZAAR 100-25 also contain D&C Yellow No. 10 Aluminum Lake. HYZAAR 50-12.5, HYZAAR 100-12.5, and HYZAAR 100-25 may also contain carnauba wax. HYZAAR 50-12.5 contains 4.24 mg (0.108 mEq) of potassium, HYZAAR 100-12.5 contains 8.48 mg (0.216 mEq) of potassium, and HYZAAR 100-25 contains 8.48 mg (0.216 mEq) of potassium.

- IBUPROFEN. Active ingredient: each tablet, caplet, gel caplet, or liquigel capsule contains ibuprofen (200 mg). Inactive ingredients: tablets and caplets—acetylated monoglyceride, beeswax and/or carnauba wax, croscarmellose sodium, iron oxides, lecithin, methylparaben, microcrystalline cellulose, pharmaceutical glaze, povidone, propylparaben, silicon dioxide, simethicone, sodium benzoate, sodium lauryl sulfate, starch, stearic acid, sucrose, and titanium dioxide; gel caplets—croscarmellose sodium, FD&C Red No. 40, FD&C Yellow No. 6, gelatin, glycerin, hypromellose, iron oxides, medium-chain triglycerides, pharmaceutical ink, propyl gallate, silicon dioxide, sodium lauryl sulfate, starch, stearic acid, titanium dioxide, and triacetin.
- Ibuprofen 50 mg. Inactive ingredients: (grape flavor) artificial flavor, aspartame, cellulose acetate phthalate, D&C Red No. 30 Lake, FD&C Blue No. 2 Lake, gelatin, Magnasweet®, magnesium stearate, mannitol, microcrystalline cellulose, silicon dioxide, and sodium starch glycolate. Active ingredient (in each tablet): ibuprofen 100 mg. Inactive ingredients: acetylated monoglycerides, carnauba wax, colloidal silicon dioxide, croscarmellose sodium, iron oxides, methylparaben, microcrystalline cellulose, povidone, pregelatinized starch, propylene glycol, propylparaben, shellac, sodium benzoate, starch, stearic acid, sucrose, and titanium dioxide.
- Ibuprofen 200 mg. Active ingredient: each brown, oval capsule contains solubilized ibuprofen, a pain reliever, equal to 200 mg of ibuprofen (present as the free acid and potassium salt). Inactive ingredients: D&C Yellow No. 10, FD&C Green No. 3, FD&C Red No. 40, gelatin, light mineral oil, pharmaceutical ink, polyethylene glycol, potassium hydroxide, purified water, sorbitan, and sorbitol.
- Ibuprofen and Psuedoephedrine. Active ingredients (in each caplet): ibuprofen (200 mg) and pseudoephedrine HCl (30 mg). Inactive ingredients: carnauba or equivalent wax, croscarmellose sodium, iron oxide, methylparaben, microcrystalline cellulose, propylparaben, silicon dioxide, sodium benzoate, sodium lauryl sulfate, starch, stearic acid, sucrose, and titanium dioxide.
- IMDUR (isosorbide mononitrate [ISMN]) tablets contain 30, 60, or 120 mg of isosorbide mononitrate in an extended-release formulation. The inactive ingredients are aluminum silicate, colloidal silicon dioxide, hydroxypropyl cellulose, hydroxypropyl methylcellulose, iron oxide, magnesium stearate, paraffin wax, polyethylene glycol, titanium dioxide, and trace amounts of ethanol.
- IMITREX sumatriptan tablets (as the succinate) contain 35, 70, or 140 mg of sumatriptan succinate equivalent to 25, 50, or 100 mg of sumatriptan, respectively. Each tablet also contains the inactive ingredients croscarmellose sodium, dibasic calcium phosphate, magnesium stearate, microcrystalline cellulose, and sodium bicarbonate. Each 100 mg tablet also contains hypromellose, iron oxide, titanium dioxide, and triacetin.
- Indapamide tablets for oral administration contain 1.25 or 2.5 mg of indapamide and the following inactive ingredients: anhydrous lactose, colloidal silicon dioxide, hypromellose, magnesium stearate, microcrystalline cellulose, polydextrose, polyethylene glycol, pregelatinized starch, sodium lauryl sulfate, and titanium dioxide. Additionally, the 1.25 mg product contains glyceryl triacetate and D&C Red No. 30 Aluminum Lake, and the 2.5 mg product contains triacetin.
- Inderal (propranolol hydrochloride) LA capsules contain the following inactive ingredients: cellulose, ethylcellulose, gelatin capsules, hypromellose, and titanium dioxide. In addition, Inderal LA 60, 80, and 120 mg capsules contain D&C Red No. 28 and FD&C Blue No. 1; Inderal LA 160 mg capsules contain FD&C Blue No. 1.
- INTELECTOL® tablets contain vinpocetine 5 mg. Other ingredients: lactose, hydroxypropyl cellulose, magnesium stearate, and talc.
- INVERSINE® (mecamylamine HCl) is supplied as tablets for oral use, each containing 2.5 mg mecamylamine HCl. Inactive ingredients are acacia, calcium phosphate, D&C Yellow No. 10, FD&C Yellow No. 6, lactose, magnesium stearate, starch, and talc.
- IRESSA® (gefitinib tablets) contain 250 mg of gefitinib and are available as brown film-coated tablets for daily oral administration. Gefitinib is a white-colored powder. It is a free base. The molecule has pK_as of 5.4 and 7.2 and therefore, ionizes progressively in solution as the pH falls. Inactive ingredients of IRESSA tablets (core): lactose monohydrate, microcrystalline

cellulose, croscarmellose sodium, povidone, sodium lauryl sulfate, and magnesium stearate. Inactive ingredients of IRESSA tablets (coating): hypromellose, polyethylene glycol 300, titanium dioxide, red ferric oxide, and yellow ferric oxide.

- KALETRA (lopinavir/ritonavir) film-coated tablets are available for oral administration in a strength of 200 mg of lopinavir and 50 mg of ritonavir with the following inactive ingredients: copovidone, sorbitan monolaurate, colloidal silicon dioxide, and sodium stearyl fumarate. The following are the ingredients in the film coating: hypromellose, titanium dioxide, polyethylene glycol 400, hydroxypropyl cellulose, talc, colloidal silicon dioxide, polyethylene 3350, yellow ferric oxide E172, and polysorbate 80.
- K-DUR® 20 is an immediately dispersing extended-release oral dosage form of potassium chloride containing 1500 mg of microencapsulated potassium chloride, USP equivalent to 20 mEq of potassium in a tablet. K-DUR® 10 is an immediately dispersing extended-release oral dosage form of potassium chloride containing 750 mg of microencapsulated potassium chloride, USP equivalent to 10 mEq of potassium in a tablet. K-DUR® is a tablet formulation (not enteric coated or wax matrix) containing individually microencapsulated potassium chloride crystals that disperse upon tablet disintegration. In simulated gastric fluid at 37°C and in the absence of outside agitation, K-DUR begins disintegrating into microencapsulated crystals within seconds and completely disintegrates within 1 minute. The microencapsulated crystals are formulated to provide an extended release of potassium chloride. Inactive ingredients: crospovidone, ethylcellulose, hydroxypropyl cellulose, magnesium stearate, and microcrystalline cellulose.
- Keppra® (levetiracetam) is available as tablets and as a clear, colorless, grape-flavored liquid (100 mg/mL) for oral administration. Inactive ingredients: colloidal silicon dioxide, cornstarch, hydroxypropyl methylcellulose, magnesium stearate, polyethylene glycol 4000, povidone, talc, titanium dioxide, and coloring agents. The individual tablets contain the following coloring agents: 250 mg tablets—FD&C Blue No. 2; 500 mg tablets—yellow iron oxide; 750 mg tablets—FD&C Blue No. 2, FD&C Yellow No. 6, and red iron oxide.
- KETEK® tablets contain telithromycin. KETEK® tablets are light-orange, oval, film-coated tablets, each containing 400 mg telithromycin plus the following inactive ingredients: cornstarch, croscarmellose sodium, hypromellose, lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, red ferric oxide, talc, titanium dioxide, and yellow ferric oxide.
- K-PHOS® ORIGINAL (sodium-free) tablet contains potassium acid phosphate 500 mg. Each tablet yields approximately 114 mg of phosphorus and 144 mg of potassium, or 3.7 mEq. Inactive ingredients: magnesium stearate, microcrystalline cellulose, starch, and syloid. Each tablet of K-PHOS® NEUTRAL contains 852 mg of dibasic sodium phosphate anhydrous, 155 mg of monobasic potassium phosphate, and 130 mg of monobasic sodium phosphate monohydrate. Each tablet yields approximately 250 mg of phosphorus, 298 mg of sodium (13.0 mEq), and 45 mg of potassium (1.1 mEq). Inactive ingredients: magnesium stearate, microcrystalline cellulose, povidone, sodium starch glycolate, and sugar.
- K-TAB (potassium chloride extended-release tablets) 750 mg of potassium chloride, USP, equivalent to 10 mEq of potassium in a film-coated (not enteric-coated), wax matrix tablet. This formulation is intended to slow the release of potassium so that the likelihood of a high localized concentration of potassium chloride within the gastrointestinal tract is reduced. The expended inert, porous, wax/polymer matrix is not absorbed and may be excreted intact in the stool. Inactive ingredients: castor oil, cellulosic polymers, colloidal silicon dioxide, D&C Yellow No. 10, magnesium stearate, paraffin, polyvinyl acetate, titanium dioxide, vanillin, and vitamin E.
- LAMICTAL (lamotrigine) tablets are supplied for oral administration as 25 mg (white), 100 mg (peach), 150 mg (cream), and 200 mg (blue) tablets. Each tablet contains the labeled amount of lamotrigine and the following inactive ingredients: lactose; magnesium stearate; microcrystalline cellulose; povidone; sodium starch glycolate; FD&C Yellow No. 6 Lake (100 mg tablet only); ferric oxide, yellow (150 mg tablet only); and FD&C Blue No. 2 Lake (200 mg tablet only). LAMICTAL chewable dispersible tablets are supplied for oral administration. The tablets contain 2 mg (white), 5 mg (white), or 25 mg (white) of lamotrigine and the following inactive ingredients: blackcurrant flavor, calcium carbonate, low-substituted hydroxypropyl cellulose, magnesium aluminum silicate, magnesium stearate, povidone, saccharin sodium, and sodium starch glycolate.
- LAMISIL® (terbinafine hydrochloride tablets) contain terbinafine hydrochloride (equivalent to 250 mg base). Inactive ingredients: colloidal silicon dioxide, NF; hydroxypropyl methylcellulose, USP; magnesium stearate, NF; microcrystalline cellulose, NF; sodium starch glycolate, NF.
- LANOXIN (digoxin) is supplied as 125 μg (0.125 mg) or 250 μg (0.25 mg) tablets for oral administration. Each tablet contains the labeled amount of digoxin USP and the following inactive ingredients: corn and potato starches, lactose, and magnesium stearate. In addition, the dyes used in the 125 μg (0.125 mg) tablets are D&C Yellow No. 10 and FD&C Yellow No. 6.

- LEUKERAN (chlorambucil) is available in tablet form for oral administration. Each film-coated tablet contains 2 mg chlorambucil and the inactive ingredients colloidal silicon dioxide, hypromellose, lactose (anhydrous), macrogol/PEG 400, microcrystalline cellulose, red iron oxide, stearic acid, titanium dioxide, and yellow iron oxide.
- LEVITRO is formulated as orange, round, film-coated tablets containing 2.5, 5, 10, and 20 mg of vardenafil, respectively. In addition to the active ingredient, vardenafil HCl, each tablet contains microcrystalline cellulose, crospovidone, colloidal silicon dioxide, magnesium stearate, hypromellose, polyethylene glycol, titanium dioxide, yellow ferric oxide, and red ferric oxide.
- Levonorgestrel. Twenty-one pink active tablets each containing 0.10 mg of levonorgestrel. The inactive ingredients present are cellulose, hypromellose, iron oxide, lactose, magnesium stearate, polacrilin potassium, polyethylene glycol, titanium dioxide, and wax E. Seven light green inert tablets, each containing cellulose, FD&C Blue No. 1, hypromellose, iron oxide, lactose, magnesium stearate, polacrilin potassium, polyethylene glycol, titanium dioxide, and wax E.
- LEVOTHROID® (levothyroxine sodium tablets, USP) contain synthetic crystalline L-3,3′,5,5′-tetraiodothyronine sodium salt (levothyroxine [T4] sodium). Inactive ingredients: microcrystalline cellulose, calcium phosphate dibasic, povidone, and magnesium stearate. The following are the coloring additives per tablet strength: 25, FD&C Yellow No. 6 Aluminum Lake; 50, None; 75 FD&C Blue No. 2 Aluminum Lake, FD&C Red No. 40 Aluminum Lake; 88, FD&C Yellow No. 6 Aluminum Lake, FD&C Blue No. 1 Aluminum Lake, D&C Yellow No. 10 Aluminum Lake; 100, FD&C Yellow No. 6 Aluminum Lake, D&C Yellow No. 10 Aluminum Lake; 112, D&C Red No. 27 Aluminum Lake, D&C Red No. 30 Aluminum Lake; 125, FD&C Blue No. 1 Aluminum Lake, FD&C Red No. 40 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake; 137, FD&C Blue No. 1 Aluminum Lake; 150, FD&C Blue No. 2 Aluminum Lake; 175, FD&C Blue No. 1 Aluminum Lake, D&C Red No. 30 Aluminum Lake, D&C Red No. 27 Aluminum Lake; 200, FD&C Red No. 40 Aluminum Lake; 300, FD&C Yellow No. 6 Aluminum Lake, FD&C Blue No.1 Aluminum Lake, D&C Yellow No. 10 Aluminum Lake.
- Lexapro® (escitalopram oxalate) tablets are film-coated, round tablets containing escitalopram oxalate in strengths equivalent to 5, 10, and 20 mg escitalopram base. The 10 and 20 mg tablets are scored. The tablets also contain the following inactive ingredients: talc, croscarmellose sodium, microcrystalline cellulose/colloidal silicon dioxide, and magnesium stearate. The film coating contains hypromellose, titanium dioxide, and polyethylene glycol.
- LEXIVA (fosamprenavir calcium) tablets are available for oral administration in a strength of 700 mg of fosamprenavir as fosamprenavir calcium (equivalent to approximately 600 mg of amprenavir). Each 700 mg tablet contains the inactive ingredients colloidal silicon dioxide, croscarmellose sodium, magnesium stearate, microcrystalline cellulose, and povidone K30. The tablet film coating contains the inactive ingredients hypromellose, iron oxide red, titanium dioxide, and triacetin.
- Librium is available as capsules containing 5, 10, or 25 mg chlordiazepoxide HCl. Each capsule also contains cornstarch, lactose, and talc. Gelatin capsule shells may contain methyl and propyl parabens and potassium sorbate, with the following dye systems: 5 mg capsules—FD&C Yellow No. 6 plus D&C Yellow No. 10 and either FD&C Blue No. 1 or FD&C Green No. 3; 10 mg capsules—D&C Yellow No. 10 and either FD&C Blue No. 1 plus FD&C Red No. 3 or FD&C Green No.3 plus FD&C Red No. 40; 25 mg capsules—D&C Yellow No. 10 and either FD&C Green No. 3 or FD&C Blue No. 1.
- LIPITOR® (atorvastatin calcium) tablets for oral administration contain 10, 20, 40, or 80 mg atorvastatin and the following inactive ingredients: calcium carbonate, USP; candelilla wax, FCC; croscarmellose sodium, NF; hydroxypropyl cellulose, NF; lactose monohydrate, NF; magnesium stearate, NF; microcrystalline cellulose, NF; Opadry® White YS-1–7040 (hypromellose, polyethylene glycol, talc, titanium dioxide); polysorbate 80, NF; simethicone emulsion.
- LOFIBRA® (fenofibrate tablets) is a lipid-regulating agent available as tablets for oral administration. Each tablet contains 54 or 160 mg of fenofibrate. Each 54 mg LOFIBRA® tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, iron oxide yellow, lactose monohydrate, lecithin, microcrystalline cellulose, polyvinyl alcohol, povidone, sodium lauryl sulfate, sodium starch glycolate, sodium stearyl fumarate, talc, titanium dioxide, xanthan gum, and D&C Yellow No. 10 Lake. Each 160 mg LOFIBRA® tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, lactose monohydrate, lecithin, microcrystalline cellulose, polyvinyl alcohol, povidone, sodium lauryl sulfate, sodium starch glycolate, sodium stearyl fumarate, talc, titanium dioxide, and xanthan gum.
- LORATIDINE. Active ingredient (in each tablet): loratadine 10 mg. Inactive ingredients (loratadine orally disintegrating tablets): artificial and natural flavor, aspartame, citric acid, colloidal silicon dioxide, corn syrup solids, crospovidone, magnesium stearate, mannitol, microcrystalline cellulose, modified food starch, and sodium bicarbonate. Inactive

ingredients (loratadine swallow tablets): lactose monohydrate, magnesium stearate, microcrystalline cellulose, and sodium starch glycolate.

- LORATIDINE-PSEUDOEPHEDRINE. Active ingredients (in each tablet): loratadine (5 mg) and pseudoephedrine sulfate (120 mg). Inactive ingredients: croscarmellose sodium, dibasic calcium phosphate, hypromellose, lactose monohydrate, magnesium stearate, pharmaceutical ink, povidone, and titanium dioxide.
- Lortab. Hydrocodone bitartrate and acetaminophen supplied in tablet form for oral administration. Each Lortab 2.5/500 tablet contains hydrocodone bitartrate (2.5 mg) and acetaminophen (500 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, microcrystalline cellulose, povidone, pregelatinized starch, stearic acid, and sugar spheres, which are composed of starch derived from corn, sucrose, and FD&C Red No. 3. Each Lortab 5/500 tablet contains hydrocodone bitartrate (5 mg) and acetaminophen (500 mg). In addition, each tablet contains the following inactive ingredients: cornstarch, FD&C Blue No. 1 Lake, gelatin, magnesium stearate, microcrystalline cellulose, povidone, pregelatinized starch, sodium starch glycolate, and sugar spheres. Each Lortab 7.5/500 tablet contains hydrocodone bitartrate (7.5 mg) and acetaminophen (500 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, microcrystalline cellulose, povidone, pregelatinized starch, stearic acid, and sugar spheres, which are composed of starch derived from corn, sucrose, FD&C Blue No. 1, and D&C Yellow No. 10. Each Lortab 10/500 tablet contains hydrocodone bitartrate (10 mg) and acetaminophen (500 mg). In addition, each tablet contains the following inactive ingredients: D&C Red No. 27 Aluminum Lake, D&C Red No. 30 Aluminum Lake, colloidal silicon dioxide, croscarmellose sodium, crospovidone, microcrystalline cellulose, povidone, pregelatinized starch, starch (corn), and stearic acid.
- Lotensin HCT is a combination of benazepril hydrochloride and hydrochlorothiazide USP. The tablets are formulated for oral administration with a combination of 5, 10, or 20 mg of benazepril hydrochloride and 6.25, 12.5, or 25 mg of hydrochlorothiazide USP. The inactive ingredients of the tablets are cellulose compounds, crospovidone, hydrogenated castor oil, iron oxides (10/12.5 mg, 20/12.5 mg, and 20/25 mg tablets), lactose, polyethylene glycol, talc, and titanium dioxide.
- Lotensin is supplied as tablets containing 5, 10, 20, and 40 mg of benazepril hydrochloride for oral administration. The inactive ingredients are colloidal silicon dioxide, crospovidone, hydrogenated castor oil (5, 10, and 20 mg tablets), hypromellose, iron oxides, lactose, magnesium stearate (40 mg tablets), microcrystalline cellulose, polysorbate 80, propylene glycol (5 and 40 mg tablets), starch, talc, and titanium dioxide.
- LOTRONEX tablets contain alosetron hydrochloride (HCl), a white to beige solid that has a solubility of 61 mg/mL in water, 42 mg/mL in 0.1 M hydrochloric acid, 0.3 mg/mL in pH 6 phosphate buffer, and <0.1 mg/mL in pH 8 phosphate buffer. LOTRONEX tablets are supplied for oral administration as 0.5 mg (white) and 1 mg (blue) tablets. The 0.5 mg tablet contains 0.562 mg alosetron HCl, equivalent to 0.5 mg alosetron, and the 1 mg tablet contains 1.124 mg alosetron HCl, equivalent to 1 mg of alosetron. Each tablet also contains the inactive ingredients: lactose (anhydrous), magnesium stearate, microcrystalline cellulose, and pregelatinized starch. The white film coat for the 0.5 mg tablet contains hypromellose, titanium dioxide, and triacetin. The blue film coat for the 1 mg tablet contains hypromellose, titanium dioxide, triacetin, and indigo carmine.
- MALARONE (atovaquone and proguanil hydrochloride) is a fixed-dose combination of the antimalarial agents atovaquone and proguanil hydrochloride. MALARONE tablets and MALARONE pediatric tablets are for oral administration. Each MALARONE tablet contains 250 mg of atovaquone and 100 mg of proguanil hydrochloride, and each MALARONE pediatric tablet contains 62.5 mg of atovaquone and 25 mg of proguanil hydrochloride. The inactive ingredients in both tablets are low-substituted hydroxypropyl cellulose, magnesium stearate, microcrystalline cellulose, poloxamer 188, povidone K30, and sodium starch glycolate. The tablet coating contains hypromellose, polyethylene glycol 400, polyethylene glycol 8000, red iron oxide, and titanium dioxide.
- MAVIK (trandolapril) tablets contain 1, 2, or 4 mg of trandolapril for oral administration. Each tablet also contains cornstarch, croscarmellose sodium, hypromellose, iron oxide, lactose, povidone, and sodium stearyl fumarate.
- MAXALT contains rizatriptan benzoate. MAXALT tablets and MAXALT-MLT orally disintegrating tablets are available for oral administration in strengths of 5 and 10 mg (corresponding to 7.265 or 14.53 mg of the benzoate salt, respectively). Each compressed tablet contains the following inactive ingredients: lactose monohydrate, microcrystalline cellulose, pregelatinized starch, ferric oxide (red), and magnesium stearate. Each lyophilized orally disintegrating tablet contains the following inactive ingredients: gelatin, mannitol, glycine, aspartame, and peppermint flavor.
- MAXZIDE® (triamterene and hydrochlorothiazide) combines triamterene with hydrochlorothiazide.

Each MAXZIDE® tablet contains: triamterene, USP 75 mg; Hydrochlorothiazide, USP 50 mg. Each MAXZIDE®-25 MG tablet contains: triamterene, USP 37.5 mg; hydrochlorothiazide, USP 25 mg. MAXZIDE® and MAXZIDE®-25 MG tablets for oral administration contain the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, magnesium stearate, microcrystalline cellulose, powdered cellulose, sodium lauryl sulfate, and D&C Yellow No. 10. MAXZIDE®-25 MG tablets also contain FD&C Blue No. 1.

- MEBARAL (mephobarbital) is available as tablets for oral administration. Inactive ingredients: lactose, starch, stearic acid, and talc.
- Melatonin. Each tablet contains melatonin, 3 mg; methylcobalamin (vitamin B12), 1 mg; folic acid, 0.4 mg.
- MEPHYTON phytonadione tablets containing 5 mg of phytonadione are yellow, compressed tablets, scored on one side. Inactive ingredients are acacia, calcium phosphate, colloidal silicon dioxide, lactose, magnesium stearate, starch, and talc.
- MEVACOR® (lovastatin) tablets are supplied as 10, 20, and 40 mg tablets for oral administration. In addition to the active ingredient lovastatin, each tablet contains the following inactive ingredients: cellulose, lactose, magnesium stearate, and starch. Butylated hydroxyanisole is added as a preservative. Tablets MEVACOR 10 mg also contain red ferric oxide and yellow ferric oxide. Tablets MEVACOR 20 mg also contain FD&C Blue No. 2. Tablets MEVACOR 40 mg also contain D&C Yellow No. 10 Aluminum Lake and FD&C Blue No. 2 Aluminum Lake.
- MIDAMOR (amiloride HCl) is available for oral use as tablets containing 5 mg of anhydrous amiloride HCl. Each tablet contains the following inactive ingredients: calcium phosphate, D&C Yellow No. 10, iron oxide, lactose, magnesium stearate, and starch.
- Minocycline hydrochloride tablets for oral administration contain minocycline HCl equivalent to 50, 75, or 100 mg of minocycline. In addition, 50, 75, and 100 mg tablets contain the following inactive ingredients: colloidal silicon dioxide, lactose anhydrous, magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate. The 50 mg tablets also contain Opadry® White, which contains titanium dioxide, hydroxypropyl methylcellulose, polyethylene glycol, and polysorbate 80. The 75 and 100 mg tablets contain Opadry® Gray, which contains titanium dioxide, hydroxypropyl methylcellulose, polyethylene glycol, and iron oxide black.
- MIRADON tablets contain a synthetic anticoagulant, anisindione, an indanedione derivative. Each tablet contains 50 mg anisindione. They also contain cornstarch, FD&C Red No. 3, gelatin, lactose, and hydrogenated cotton-seed oil.
- MOTRIN® IB: each MOTRIN® IB tablet and caplet contains ibuprofen 200 mg. Tablets and caplets: carnauba wax, cornstarch, FD&C Yellow No. 6, hypromellose, iron oxide, polydextrose, polyethylene glycol, silicon dioxide, stearic acid, and titanium dioxide.
- MS CONTIN® controlled-release tablets contain 15, 30, 60, 100, or 200 mg of morphine sulfate and further contain the following inactive ingredients: cetostearyl alcohol, hydroxyethyl cellulose, hypromellose, magnesium stearate, polyethylene glycol, talc, and titanium dioxide. MS CONTIN® controlled-release tablets 15 mg also contain FD&C Blue No. 2, lactose, and polysorbate 80. MS CONTIN® controlled-release tablets 30 mg also contain D&C Red No. 7, FD&C Blue No. 1, lactose, and polysorbate 80. MS CONTIN® controlled-release tablets 60 mg also contain D&C Red No. 30, D&C Yellow No. 10, hydroxypropyl cellulose, and lactose. MS CONTIN® controlled-release tablets 100 mg also contain black iron oxide. MS CONTIN® controlled-release tablets 200 mg also contain D&C Yellow No. 10, FD&C Blue No. 1, and hydroxypropyl cellulose.
- Myfortic® (mycophenolic acid) delayed-release tablets are an enteric formulation of mycophenolate sodium that delivers the active moiety mycophenolic acid (MPA). Myfortic is available for oral use as delayed-release tablets containing either 180 or 360 mg of MPA. Inactive ingredients include colloidal silicon dioxide, crospovidone, lactose anhydrous, magnesium stearate, povidone (K-30), and starch. The enteric coating of the tablet consists of hypromellose phthalate, titanium dioxide, iron oxide yellow, and indigotine (180 mg) or iron oxide red (360 mg).
- MYLERAN (busulfan) film-coated tablets contain 2 mg busulfan and the inactive ingredients hypromellose, lactose (anhydrous), magnesium stearate, pregelatinized starch, triacetin, and titanium dioxide.
- Nadolol tablets for oral administration contain 20, 40, or 80 mg of nadolol and the following inactive ingredients: croscarmellose sodium, lactose (anhydrous), magnesium stearate, microcrystalline cellulose, sodium lauryl sulfate, and D&C Yellow No. 10 Aluminum Lake.
- Namenda® (memantine hydrochloride) capsule-shaped, film-coated tablets contain 5 or 10 mg of memantine hydrochloride. The tablets also contain the following inactive ingredients: microcrystalline cellulose/colloidal silicon dioxide, talc, croscarmellose sodium, and magnesium stearate. In addition, the following inactive ingredients are also present as components of the film coat: hypromellose, titanium dioxide, polyethylene glycol 400, FD&C Yellow No. 6, and FD&C Blue No. 2 (5 mg tablets), and hypromellose, titanium dioxide, macrogol/polyethylene glycol 400, and iron oxide black (10 mg tablets).

- Neurontin® (gabapentin) tablets are elliptical film-coated tablets containing 600 and 800 mg of gabapentin. The inactive ingredients for the tablets are poloxamer 407, copolyvidonum, cornstarch, magnesium stearate, hydroxypropyl cellulose, talc, candelilla wax, and purified water.
- NEXAVAR film-coated tablets contain sorafenib tosylate (274 mg) equivalent to 200 mg of sorafenib and the following inactive ingredients: croscarmellose sodium, microcrystalline cellulose, hypromellose, sodium lauryl sulfate, magnesium stearate, polyethylene glycol, titanium dioxide, and ferric oxide red.
- Nicomide® tablets for oral administration are peach-colored, oval-shaped tablets imprinted "Sirius" in blue ink on one side. Each oral tablet provides nicotinamide, USP, 750 mg; zinc oxide, USP, 25 mg; cupric oxide, USP, 1.5 mg; and folic acid, USP, 500 µg. Nicomide® has been designed to provide biphasic delivery of each of the active ingredients in order to minimize the potential for competitive antagonism in absorption of its ingredients. The biphasic delivery system facilitates the immediate release of 750 mg nicotinamide,1.5 mg cupric oxide, and 500 µg folic acid as well as the sustained release of 25 mg zinc oxide. The biphasic delivery system also minimizes the potential for drug interaction–induced deficiency states and impaired absorption of other therapeutic agents. Inactive ingredients: carnauba wax powder, ethyl cellulose, FD&C Blue No. 1, FD&C Yellow No. 6 Aluminum Lake, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, propylene glycol, shellac, stearic acid, and titanium dioxide.
- NIRAVAM™ (alprazolam orally disintegrating tablets) contains either 0.25, 0.5, 1, or 2 mg of alprazolam and the following inactive ingredients: colloidal silicon dioxide, cornstarch, crospovidone, magnesium stearate, mannitol, methacrylic acid copolymer, microcrystalline cellulose, natural and artificial orange flavor, sucralose, and sucrose. In addition, the 0.25 and 0.5 mg tablets contain yellow iron oxide.
- Nystatin vaginal tablets, USP, are available as oval-shaped compressed tablets for intravaginal administration, each containing 100,000 units nystatin, USP. Inactive ingredients include cornstarch, ethylcellulose, anhydrous lactose, microcrystalline cellulose, polyethylene glycol, and stearic acid.
- OptiNate™ is a prescription prenatal/postnatal multivitamin/mineral capsule and tablet combination with essential fatty acids. Each tablet contains elemental iron (carbonyl iron), 90 mg; biotin, 30 µg; pantothenic acid (calcium pantothenate, USP), 6 mg; calcium (calcium carbonate, USP), 200 mg; copper (cupric oxide), 2 mg; zinc (zinc oxide, USP), 15 mg; folate, 1 mg (L-methylfolate as Metafolin® 600 µg) (folic acid, USP 400 µg); vitamin D3 (cholecalciferol), 400 IU; vitamin E (DL-tocopheryl acetate), 10 IU; vitamin C (ascorbic acid, USP), 120 mg; vitamin B1 (thiamine mononitrate), 3 mg; vitamin B2 (riboflavin, USP), 3.4 mg; vitamin B6 (pyridoxine HCl), 20 mg; vitamin B12 (cyanocobalamin), 12 µg; niacinamide, USP, 20 mg; magnesium (magnesium oxide, USP), 30 mg; and docusate sodium, USP, 50 mg. Each LVcaps™ capsule contains DHA 250 mg. DHA is contained in the oil derived from microalgae. Other ingredients (OptiNate™ Omega-3L-Vcaps™): hypromellose, iron oxide, beeswax, ascorbyl palmitate, mixed tocopherols, and other ingredients. Other ingredients (OptiNate™ tablets): calcium phosphate dibasic, carnauba wax, crospovidone, dextrin, DL-tocopherol, gelatin, hypromellose, lactose, magnesium stearate, mono- and diglycerides, polacrilin, pregelatinized starch, propylene glycol, silicon dioxide, sodium benzoate, partially hydrogenated soybean oil, starch, stearic acid, sucrose, titanium dioxide, and other ingredients.
- ORAP® (pimozide) tablets contain either 1 or 2 mg of pimozide and the following inactive ingredients: calcium stearate, microcrystalline cellulose, lactose anhydrous, and cornstarch.
- OxyContin® (oxycodone hydrochloride controlled-release) tablets contain the following inactive ingredients: ammonio methacrylate copolymer, hypromellose, lactose, magnesium stearate, polyethylene glycol 400, povidone, sodium hydroxide, sorbic acid, stearyl alcohol, talc, titanium dioxide, and triacetin. The 10 mg tablets also contain hydroxypropyl cellulose. The 20 mg tablets also contain polysorbate 80 and red iron oxide. The 40 mg tablets also contain polysorbate 80 and yellow iron oxide. The 80 mg tablets also contain FD&C Blue No. 2, hydroxypropyl cellulose, and yellow iron oxide. The 160 mg tablets also contain FD&C Blue No. 2 and polysorbate 80.
- Pacerone® (amiodarone HCl) tablets are available in four strengths, containing 100, 200, 300, and 400 mg amiodarone hydrochloride, for oral administration. The 100 mg tablets are white tablets with the following inactive ingredients: anhydrous lactose, colloidal silicon dioxide, cornstarch, magnesium stearate, and povidone. The 200 mg tablets are pink, scored tablets with the following inactive ingredients: lactose monohydrate, magnesium stearate, povidone, pregelatinized cornstarch, sodium starch glycolate, stearic acid, FD&C Red No. 40, and FD&C Yellow No. 6. The 300 mg tablets are peach, scored tablets with the following inactive ingredients: colloidal silicon dioxide, cornstarch, anhydrous lactose, magnesium stearate, povidone, and FD&C Yellow No. 6 Lake. The 400 mg tablets are light yellow, scored tablets with the following inactive ingredients: colloidal silicon dioxide, cornstarch, lactose monohydrate,

magnesium stearate, povidone, and D&C Yellow No. 10 Aluminum Lake.

- PARCOPA™ (carbidopa-levodopa orally disintegrating tablets) is a combination of carbidopa and levodopa. PARCOPA™ 25/100 contains 25 mg of carbidopa and 100 mg of levodopa. PARCOPA™ 10/100 contains 10 mg of carbidopa and 100 mg of levodopa. PARCOPA™ 25/250 contains 25 mg of carbidopa and 250 mg of levodopa. Inactive ingredients are aspartame, citric acid, crospovidone, magnesium stearate, mannitol, microcrystalline cellulose, natural and artificial mint flavor, and sodium bicarbonate. PARCOPA™ 10/100 and 25/250 also contain FD&C Blue No. 2 HT Aluminum Lake. PARCOPA™ 25/100 also contains yellow 10 iron oxide.
- PARNATE, tranylcypromine sulfate, rose-red, film-coated tablets contain tranylcypromine sulfate equivalent to 10 mg of tranylcypromine. Inactive ingredients consist of cellulose, citric acid, croscarmellose sodium, D&C Red No. 7, FD&C Blue No. 2, FD&C Red No. 40, FD&C Yellow No. 6, gelatin, iron oxide, lactose, magnesium stearate, talc, titanium dioxide, and trace amounts of other inactive ingredients.
- PAXIL CR (paroxetine hydrochloride) enteric, film-coated, controlled-release tablets contain paroxetine hydrochloride equivalent to paroxetine as follows: 12.5 mg (yellow), 25 mg (pink), and 37.5 mg (blue). One layer of the tablet consists of a degradable barrier layer, and the other contains the active material in a hydrophilic matrix. Inactive ingredients consist of hypromellose, polyvinylpyrrolidone, lactose monohydrate, magnesium stearate, colloidal silicon dioxide, glyceryl behenate, methacrylic acid copolymer type C, sodium lauryl sulfate, polysorbate 80, talc, triethyl citrate, and one or more of the following colorants: yellow ferric oxide, red ferric oxide, D&C Red No. 30, D&C Yellow No. 6, D&C Yellow No. 10, and FD&C Blue No. 2. Each film-coated tablet contains paroxetine hydrochloride equivalent to paroxetine as follows: 10 mg, yellow (scored); 20 mg, pink (scored); 30 mg, blue; 40 mg, green. Inactive ingredients consist of dibasic calcium phosphate dihydrate, hypromellose, magnesium stearate, polyethylene glycols, polysorbate 80, sodium starch glycolate, titanium dioxide, and one or more of the following: D&C Red No. 30, D&C Yellow No. 10, FD&C Blue No. 2, and FD&C Yellow No. 6.
- PCE (erythromycin particles in tablets). The coating protects the antibiotic from the inactivating effects of gastric acidity and permits efficient absorption of the antibiotic in the small intestine. PCE is available in two strengths containing either 333 or 500 mg of erythromycin base. PCE 500 mg tablets contain no synthetic dyes or artificial colors. Inactive ingredients: PCE 333 mg tablets: cellulosic polymers, citrate ester, colloidal silicon dioxide, D&C Red No. 30, hydrogenated vegetable oil wax, lactose, magnesium stearate, microcrystalline cellulose, povidone, propylene glycol, sodium starch glycolate, stearic acid, and vanillin. PCE 500 mg tablets: cellulosic polymers, citrate ester, colloidal silicon dioxide, crospovidone, hydrogenated vegetable oil wax, iron oxide, microcrystalline cellulose, polyethylene glycol, povidone, propylene glycol, stearic acid, talc, titanium dioxide, and vanillin.
- PEGANONE (ethotoin tablets, USP) are available in a dosage strength of 250 mg. Inactive ingredients: acacia, lactose, sodium carboxymethylcellulose, stearic acid, and talc.
- Peri-Colace® (docusate sodium and standardized senna concentrate) is a combination stimulant laxative and stool softener. Peri-Colace® tablets contains the following active ingredients: 50 mg of docusate sodium and 8.6 mg of sennosides. Inactive ingredients: carnauba wax, colloidal silicon dioxide, croscarmellose sodium, dicalcium phosphate, FD&C Blue No. 2, FD&C Red No. 40, hypromellose, magnesium stearate, microcrystalline cellulose, PEG 400, sodium benzoate, stearic acid, and titanium dioxide.
- Phenergan. Each tablet of Phenergan contains 12.5, 25, or 50 mg promethazine HCl. The inactive ingredients present are lactose, magnesium stearate, and methylcellulose. Each dosage strength also contains the following: 12.5 mg—FD&C Yellow No. 6 and saccharin sodium; 25 mg—saccharin sodium; 50 mg—FD&C Red No. 40. Each rectal suppository of Phenergan contains 12.5, 25, or 50 mg promethazine HCl with ascorbyl palmitate, silicon dioxide, white wax, and cocoa butter.
- PLAVIX (clopidogrel bisulfate) for oral administration is provided as pink, round, biconvex, debossed film-coated tablets containing 97.875 mg of clopidogrel bisulfate, which is the molar equivalent of 75 mg of clopidogrel base. Each tablet contains hydrogenated castor oil, hydroxypropyl cellulose, mannitol, microcrystalline cellulose, and polyethylene glycol 6000 as inactive ingredients. The pink film coating contains ferric oxide, hypromellose 2910, lactose monohydrate, titanium dioxide, and triacetin. The tablets are polished with carnauba wax.
- PLENDIL (felodipine) is available as tablets containing 2.5, 5, or 10 mg of felodipine for oral administration. In addition to the active ingredient felodipine, the tablets contain the following inactive ingredients: 2.5 mg tablets—hydroxypropyl cellulose, lactose, FD&C Blue No. 2, sodium stearyl fumarate, titanium dioxide, yellow iron oxide, and other ingredients. 5 and 10 mg tablets—cellulose, red and yellow oxide, lactose, polyethylene glycol, sodium stearyl fumarate, titanium dioxide, and other ingredients.
- PLETAL (cilostazol) tablets for oral administration are available in 50 mg triangular and 100 mg round,

white debossed tablets. Each tablet, in addition to the active ingredient, contains the following inactive ingredients: carboxymethylcellulose calcium, cornstarch, hydroxypropyl methylcellulose 2910, magnesium stearate, and microcrystalline cellulose.

- PRANDIN® (repaglinide) tablets contain 0.5, 1, or 2 mg of repaglinide. In addition each tablet contains the following inactive ingredients: calcium hydrogen phosphate (anhydrous), microcrystalline cellulose, maize starch, polacrilin potassium, povidone, glycerol (85%), magnesium stearate, meglumine, and poloxamer. The 1 and 2 mg tablets contain iron oxides (yellow and red, respectively) as coloring agents.
- PreCare® Chewables are prescription prenatal multivitamin/mineral nutritional supplement tablets. Each orange-colored, flavored, oval, chewable tablet contains folic Acid, USP, 1 mg; vitamin B6 (pyridoxine HCl), 2 mg; vitamin C (as Ester-C®*), 50 mg; vitamin D3 (cholecalciferol), 6 µg; vitamin E (DL-tocopheryl acetate), 3.5 IU; calcium (calcium carbonate), 250 mg; copper (cupric oxide), 2 mg; iron (including MicroMask® ferrous fumarate), 40 mg; magnesium (magnesium oxide, USP), 50 mg; zinc (zinc oxide, USP), 15 mg.*Ester-C® is a patented pharmaceutical-grade material consisting of calcium ascorbate and calcium threonate. Inactive ingredients: citric acid, FD&C Yellow No. 6 Lake, flow agents, natural and artificial nonnutritive and nutritive sweetening agents, and natural and artificial flavors.
- PreCare® Prenatal is a prescription prenatal multivitamin/mineral nutritional supplement. Each dye-free, peach, film-coated caplet contains folic acid, USP 1 mg; vitamin B1 (thiamine mononitrate, USP) 3 mg; vitamin B2 (riboflavin, USP) 3.4 mg; vitamin B3 (niacinamide) 20 mg; vitamin B6 (pyridoxine HCl, USP) 50 mg; vitamin B12 (cyanocobalamin) 12 µg; vitamin C (as Ester-C®) 50 mg; vitamin D3 (cholecalciferol) l6 µg; vitamin E (DL-tocopheryl acetate) 3.5 IU; calcium (as CalciPure™ calcium carbonate) 250 mg; copper (cupric oxide) 2 mg; iron (as MicroMask® ferrous fumarate) 40 mg; magnesium (magnesium oxide, USP) 50 mg; and zinc (zinc oxide, USP) 15 mg. Inactive ingredients: natural oils, natural wax, cellulose polymers, flow agents, and other ingredients. Dye free.
- PRECOSE® (acarbose tablets) is available as 25, 50, and 100 mg tablets for oral use. The inactive ingredients are starch, microcrystalline cellulose, magnesium stearate, and colloidal silicon dioxide.
- PREFEST regimen provides for a single oral tablet to be taken once daily. The estrogenic component of PREFEST is estradiol, USP. It is a white, crystalline solid. The progestational component of PREFEST is micronized norgestimate, a white powder. Each tablet for oral administration contains 1.0 mg estradiol alone or 1.0 mg estradiol and 0.09 mg of norgestimate, and the following inactive ingredients: croscarmellose sodium, microcrystalline cellulose, magnesium stearate, ferric oxide red, and lactose monohydrate.
- Prelief tablets: Each tablet contains 345 mg calcium glycerophosphate (65 mg of elemental calcium). The tablets also contain 0.25% magnesium stearate as a processing aid. Two tablets are equivalent to 690 mg calcium glycerophosphate (130 mg of elemental calcium).
- Premarin® (conjugated estrogens tablets, USP) for oral administration contains a mixture of conjugated estrogens obtained exclusively from natural sources, occurring as the sodium salts of water-soluble estrogen sulfates blended to represent the average composition of material derived from pregnant mares' urine. It is a mixture of sodium estrone sulfate and sodium equilin sulfate. It contains as concomitant components, as sodium sulfate conjugates, 17α-dihydroequilenin, 17α-estradiol, and 17β-dihydroequilenin. Tablets for oral administration are available in 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, and 1.25 mg strengths of conjugated estrogens. Premarin 0.3, 0.45, 0.625, 0.9, and 1.25 mg tablets also contain the following inactive ingredients: calcium phosphate tribasic, hydroxypropyl cellulose, microcrystalline cellulose, powdered cellulose, hypromellose, lactose monohydrate, magnesium stearate, polyethylene glycol, sucrose, and titanium dioxide. The 0.3 mg tablets also contain D&C Yellow No. 10 and FD&C Blue No. 2. The 0.45 mg tablets also contain FD&C Blue No. 2. The 0.625 mg tablets also contain FD&C Blue No. 2 and FD&C Red No. 40. The 0.9 mg tablets also contain D&C Red No. 30 and D&C Red No. 7. The 1.25 mg tablets also contain black iron oxide, D&C Yellow No. 10, and FD&C Yellow No. 6.
- PremCal is a combination calcium and vitamin D nutritional supplement that offers three different strengths of vitamin D3 per tablet—500 IU, 750 IU, and 1000 IU with 500 mg of elemental calcium as the carbonate. PremCal is indicated in those requiring higher than the currently recommended doses of vitamin D, such as vitamin D deficiency, premenstrual syndrome, osteoporosis, osteomalacia, or malabsorption. Ingredients: PremCal tablets are supplied in three different strengths of vitamin D3 (light, 500 IU; regular, 750 IU; extra strength,1000 IU) with a constant amount of calcium 500 mg as calcium carbonate and 15 mg of magnesium oxide. Each tablet also contains hypromellose, croscarmellose sodium, maltodextrin, povidone, stearic acid, magnesium stearate, triacetin, polyethylene glycol, and silicon dioxide. Free of sugar, soy, wheat, gluten, corn, shellfish, and artificial colors.
- Premesis®. Each blue tablet contains vitamin B6 (as pyridoxine HCl), 75 mg; vitamin B12

(cyanocobalamin), 12 µg; folic acid, USP, 1 mg; and calcium (as calcium carbonate), 200 mg. Inactive ingredients: natural waxes, cellulose polymers, FD&C Blue No. 1 Aluminum Lake, D&C Yellow No. 10 Aluminum Lake, flow agents, and other ingredients.

- PREMPRO™ 0.3 mg/1.5 mg therapy consists of a single tablet containing 0.3 mg of the conjugated estrogens (CE) found in PremarinO tablets and 1.5 mg of medroxyprogesterone acetate (MPA) for oral administration. PREMPRO 0.45 mg/1.5 mg therapy consists of a single tablet containing 0.45 mg of the CE found in Premarin tablets and 1.5 mg of medroxyprogesterone acetate for oral administration. PREMPRO 0.625 mg/2.5 mg therapy consists of a single tablet containing 0.625 mg of the CE found in Premarin tablets and 2.5 mg of MPA for oral administration. PREMPRO 0.625 mg/5 mg therapy consists of a single tablet containing 0.625 mg of the CE found in Premarin tablets and 5 mg of MPA for oral administration. PREMPHASE® therapy consists of two separate tablets, a maroon Premarin tablet containing 0.625 mg of CE that is taken orally on days 1 through 14 and a light blue tablet containing 0.625 mg of the CE found in Premarin tablets and 5 mg of MPA that is taken orally on days 15 through 28. Premarin (conjugated estrogens tablets, USP) for oral administration contains a mixture obtained exclusively from natural sources, occurring as the sodium salts of water-soluble estrogen sulfates blended to represent the average composition of material derived from pregnant mares' urine. It is a mixture of sodium estrone sulfate and sodium equilin sulfate. It contains as concomitant components, as sodium sulfate conjugates, 17(α)-dihydroequilenin, 17(α)-estradiol, and 17(β)-dihydroequilenin.
- PREVACID® NapraPAC™ 375 is a combination package containing NAPROSYN 375 mg tablets and PREVACID 15 mg capsules. PREVACID® NapraPAC™ 500 is a combination package containing NAPROSYN 500 mg tablets and PREVACID® 15 mg capsules. NAPROSYN tablets contain 250, 375, or 500 mg of naproxen (active ingredient) and croscarmellose sodium, iron oxides, povidone, and magnesium stearate (inactive ingredients). PREVACID® capsules contain enteric-coated granules consisting of lansoprazole (15 mg) (active ingredient) and hydroxypropyl cellulose, low-substituted hydroxypropyl cellulose, colloidal silicon dioxide, magnesium carbonate, methacrylic acid copolymer, starch, talc, sugar spheres, sucrose, polyethylene glycol, polysorbate 80, and titanium dioxide (inactive ingredients). Components of the gelatin capsule include gelatin, titanium dioxide, D&C Red No. 28, FD&C Blue No. 1, FD&C Green No. 3, and FD&C Red No. 40 (inactive ingredients). PREVACID® I.V. The active ingredient in PREVACID® I.V. (lansoprazole) for injection is a substituted benzimidazole, 2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)-2-pyr idyl] methyl] sulfinyl] benzimidazole, a compound that inhibits gastric acid secretion. PREVACID® I.V. for injection contains 30 mg of the active ingredient lansoprazole, 60 mg mannitol,10 mg meglumine, and 3.45 mg sodium hydroxide and is supplied as a sterile, lyophilized powder for I.V. (intravenous) use. The solution of PREVACID® I.V. for injection has a pH of approximately 11 following the first reconstitution with sterile water for injection, USP, and approximately 10.2, 10.0, or 9.5 after further dilution with either 0.9% sodium chloride injection, USP, lactated Ringer's injection, USP, or 5% dextrose injection, USP, respectively.
- PREVACID® for delayed-release orally disintegrating tablets contain the active ingredient, lansoprazole, in the form of enteric-coated microgranules. The tablets are available in 15 mg and 30 mg dosage strengths. Each tablet contains lansoprazole and the following inactive ingredients: lactose monohydrate, microcrystalline cellulose, magnesium carbonate, hydroxypropyl cellulose, hypromellose, titanium dioxide, talc, mannitol, methacrylic acid, polyacrylate, polyethylene glycol, glyceryl monostearate, polysorbate 80, triethyl citrate, ferric oxide, citric acid, crospovidone, aspartame, artificial strawberry flavor, and magnesium stearate.
- ProAmatine® (midodrine hydrochloride) tablets. Dosage form: 2.5, 5, and 10 mg tablets for oral administration. Active ingredient: midodrine hydrochloride, 2.5, 5, and 10 mg. Inactive ingredients: colloidal silicon dioxide NF, cornstarch NF, FD&C Blue No. 2 Lake (10 mg tablets), FD&C Yellow No. 6 Lake (5 mg tablet), magnesium stearate NF, microcrystalline cellulose NF, and talc USP.
- Proflavanol 90 tablets contain the following: vitamin C (Poly C, a blend of calcium, zinc, potassium, and magnesium ascorbates), 300 mg; grape seed extract, 90 mg; and ascorbyl palmitate, 12 mg.
- ProSom (estazolam) tablets are scored and contain either 1 or 2 mg of estazolam. Inactive ingredients: colloidal silicon dioxide, lactose, povidone, stearic acid, and sodium starch glycolate. In addition, the 2 mg tablets contain FD&C Red No. 40.
- PROTONIX® (pantoprazole sodium) delayed-release tablets are supplied as delayed-release tablets for oral administration, available in two strengths. Each delayed-release tablet contains 45.1 or 22.6 mg of pantoprazole sodium sesquihydrate (equivalent to 40 or 20 mg pantoprazole, respectively) with the following inactive ingredients: calcium stearate, crospovidone, hypromellose, iron oxide, mannitol, methacrylic acid copolymer, polysorbate 80, povidone, propylene glycol, sodium carbonate, sodium lauryl sulfate, titanium dioxide, and triethyl citrate.

- PROVIGIL (modafinil) tablets contain 100 or 200 mg of modafinil and the following inactive ingredients: lactose, microcrystalline cellulose, pregelatinized starch, croscarmellose sodium, povidone, and magnesium stearate.
- Prozac® (fluoxetine hydrochloride) contains fluoxetine hydrochloride equivalent to 10 mg (32.3 µmol), 20 mg (64.7 µmol), or 40 mg (129.3 µmol) of fluoxetine. The Pulvules also contain starch, gelatin, silicone, titanium dioxide, iron oxide, and other inactive ingredients. The 10 and 20 mg Pulvules also contain FD&C Blue No. 1, and the 40 mg Pulvule also contains FD&C Blue No. 1 and FD&C Yellow No. 6. Each tablet contains fluoxetine hydrochloride equivalent to 10 mg (32.3 µmol) of fluoxetine. The tablets also contain microcrystalline cellulose, magnesium stearate, crospovidone, hypromellose, titanium dioxide, polyethylene glycol, and yellow iron oxide. In addition to these ingredients, the 10 mg tablet contains FD&C Blue No. 1 Aluminum Lake and polysorbate 80.
- PURINETHOL (mercaptopurine) tablets contain 50 mg of mercaptopurine and the inactive ingredients corn and potato starch, lactose, magnesium stearate, and stearic acid.
- Ranexa™ (ranolazine) film-coated, extended-release tablets contain 500 mg of ranolazine. Inactive ingredients of the 500 mg tablet include carnauba wax, hypromellose, magnesium stearate, methacrylic acid copolymer (Type C), microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium hydroxide, titanium dioxide, and FD&C Yellow No. 6 Lake.
- Rapamune® (sirolimus) is available as a white, triangular-shaped tablet containing 1 mg sirolimus and as a yellow to beige triangular-shaped tablet containing 2 mg sirolimus, ascorbyl palmitate, and polysorbate 80. The inactive ingredients in Rapamune® tablets include sucrose, lactose, polyethylene glycol 8000, calcium sulfate, microcrystalline cellulose, pharmaceutical glaze, talc, titanium dioxide, magnesium stearate, povidone, poloxamer 188, polyethylene glycol 20,000, glyceryl monooleate, carnauba wax, and other ingredients. The 2 mg dosage strength also contains iron oxide yellow 10 and iron oxide brown 70.
- RELAFEN (nabumetone) oval-shaped, film-coated tablets contain 500 or 750 mg of nabumetone. Inactive ingredients consist of hypromellose, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium lauryl sulfate, sodium starch glycolate, and titanium dioxide. The 750 mg tablets also contain iron oxides.
- RELPAX® (eletriptan) tablets for oral administration contains 24.2 or 48.5 mg of eletriptan hydrobromide, equivalent to 20 or 40 mg of eletriptan, respectively. Each tablet also contains the inactive ingredients microcrystalline cellulose NF, lactose NF, croscarmellose sodium NF, magnesium stearate NF, titanium dioxide USP, hypromellose, triacetin USP, and FD&C Yellow No. 6 Aluminum Lake.
- REQUIP (ropinirole hydrochloride) film-coated TILTAB® tablet with beveled edges contains ropinirole hydrochloride equivalent to ropinirole 0.25, 0.5, 1, 2, 3, 4, or 5 mg. Inactive ingredients consist of croscarmellose sodium, hydrous lactose, magnesium stearate, microcrystalline cellulose, and one or more of the following: carmine, FD&C Blue No. 2 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, hypromellose, iron oxides, polyethylene glycol, polysorbate 80, and titanium dioxide.
- RESCRIPTOR tablets contain delavirdine mesylate. Each RESCRIPTOR tablet, for oral administration, contains 100 or 200 mg of delavirdine mesylate (henceforth referred to as delavirdine). Inactive ingredients consist of lactose, microcrystalline cellulose, croscarmellose sodium, magnesium stearate, colloidal silicon dioxide, and carnauba wax. In addition, the 100 mg tablet contains Opadry® White YS-1-7000-E, and the 200 mg tablet contains hypromellose, Opadry® White YS-1-18202-A, and pharmaceutical ink black.
- RETROVIR (zidovudine) film-coated tablets contain 300 mg of zidovudine and the inactive ingredients hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, sodium starch glycolate, and titanium dioxide.
- REVATIO™ is the citrate salt of sildenafil. REVATIO™ (sildenafil citrate) is formulated as white, film-coated round tablets equivalent to 20 mg of sildenafil for oral administration. In addition to the active ingredient, sildenafil citrate, each tablet contains the following inactive ingredients: microcrystalline cellulose, anhydrous dibasic calcium phosphate, croscarmellose sodium, magnesium stearate, hypromellose, titanium dioxide, lactose monohydrate, and triacetin.
- RILUTEK® (riluzole) is a member of the benzothiazole class. RILUTEK is available as a capsule-shaped, white, film-coated tablet for oral administration containing 50 mg of riluzole. Each tablet is engraved with "RPR 202" on one side. Inactive ingredients (core): anhydrous dibasic calcium phosphate, USP; microcrystalline cellulose, NF; anhydrous colloidal silica, NF; magnesium stearate, NF; croscarmellose sodium, NF. Inactive ingredients (film coating): hypromellose, USP; polyethylene glycol 6000; titanium dioxide, USP.
- Ritalin-SR®: Ritalin hydrochloride, methylphenidate hydrochloride USP, is available as tablets of 5, 10, and 20 mg for oral administration; Ritalin-SR® is available as sustained-release tablets of 20 mg for oral administration. Inactive ingredients (Ritalin tablets): D&C Yellow No. 10 (5 and 20 mg tablets), FD&C Green No. 3 (10 mg tablets), lactose, magnesium stearate, polyethylene glycol, starch (5 and

10 mg tablets), sucrose, talc, and tragacanth (20 mg tablets). Inactive ingredients (Ritalin-SR® tablets): cellulose compounds, cetostearyl alcohol, lactose, magnesium stearate, mineral oil, povidone, titanium dioxide, and zein.

- ROZEREM™ (ramelteon) tablets include the following inactive ingredients: lactose monohydrate, starch, hydroxypropyl cellulose, magnesium stearate, hypromellose, copovidone, titanium dioxide, yellow ferric oxide, polyethylene glycol 8000, and ink containing shellac and synthetic iron oxide black.
- Seasonale® (levonorgestrel/ethinyl estradiol tablets) is an extended-cycle oral contraceptive consisting of 84 pink active tablets each containing 0.15 mg of levonorgestrel, a synthetic progestogen, and 0.03 mg of ethinyl estradiol as well as 7 white inert tablets (without hormones). Each pink active tablet contains the following inactive ingredients: anhydrous lactose NF, FD&C Blue No. 1, FD&C Red No. 40, hydroxypropyl methylcellulose USP, microcrystalline cellulose NF, polyethylene glycol NF, magnesium stearate NF, polysorbate 80 NF, and titanium dioxide USP. Each white inert tablet contains the following inactive ingredients: anhydrous lactose NF, hydroxypropyl methylcellulose USP, microcrystalline cellulose NF, and magnesium stearate NF.
- Sedapap® butalbital and acetaminophen is supplied in tablet form for oral administration. Each Sedapap® tablet contains butalbital (50 mg) and acetaminophen (650 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, crospovidone, microcrystalline cellulose, povidone, pregelatinized starch, and stearic acid.
- SENOKOT tablets: Each tablet contains 8.6 mg of sennosides. Active ingredient: standardized senna concentrate. Inactive ingredients: croscarmellose sodium, dicalcium phosphate, hypromellose, magnesium stearate, microcrystalline cellulose, and mineral oil. SENOKOT-S tablets: Each tablet contains 8.6 mg sennosides and 50 mg of docusate sodium. Active ingredients: docusate sodium and standardized senna concentrate. Inactive ingredients: carnauba wax, colloidal silicon dioxide, croscarmellose sodium, dicalcium phosphate, D&C Yellow No. 10, FD&C Yellow No. 6, hypromellose, magnesium stearate, microcrystalline cellulose, PEG 8000, sodium benzoate, stearic acid, and titanium dioxide.
- Sensipar™ (cinacalcet hydrochloride) tablets are formulated as light green, film-coated, oval-shaped tablets for oral administration in strengths of 30, 60, and 90 mg of cinacalcet HCl as the free base equivalent (33, 66, and 99 mg as the hydrochloride salt, respectively). Sensipar™ tablets are composed of the active ingredient and the following inactive ingredients: pregelatinized starch, microcrystalline cellulose, povidone, crospovidone, colloidal silicon dioxide, and magnesium stearate. Tablets are coated with color (Opadry® II green) and clear film coat (Opadry® clear), carnauba wax, and Opacode® black ink.
- SEROQUEL (quetiapine fumarate) is supplied for oral administration as 25 mg (round, peach), 50 mg (round, white), 100 mg (round, yellow), 200 mg (round, white), 300 mg (capsule-shaped, white), and 400 mg (capsule-shaped, yellow) tablets. Inactive ingredients are povidone, dibasic dicalcium phosphate dihydrate, microcrystalline cellulose, sodium starch glycolate, lactose monohydrate, magnesium stearate, hypromellose, polyethylene glycol, and titanium dioxide. The 25 mg tablets contain red ferric oxide and yellow ferric oxide, and the 100 mg tablets contain only yellow ferric oxide.
- SPECTRACEF® tablets contain cefditoren pivoxil. The tablets contain 200 mg of cefditoren as cefditoren pivoxil and the following inactive ingredients: croscarmellose sodium, D-mannitol, hydroxypropyl cellulose, hypromellose, magnesium stearate, sodium caseinate (a milk protein), and sodium tripolyphosphate. The tablet coating contains carnauba wax, hypromellose, polyethylene glycol, and titanium dioxide. Tablets are printed with ink containing D&C Red No. 27, FD&C Blue No. 1, propylene glycol, and shellac.
- Stalevo® (carbidopa, levodopa, and entacapone) is a combination of carbidopa, levodopa, and entacapone. Stalevo® (carbidopa, levodopa, and entacapone) is supplied as tablets in three strengths: Stalevo® 50, containing 12.5 mg of carbidopa, 50 mg of levodopa, and 200 mg of entacapone; Stalevo® 100, containing 25 mg of carbidopa, 100 mg of levodopa, and 200 mg of entacapone; and Stalevo® 150, containing 37.5 mg of carbidopa, 150 mg of levodopa, and 200 mg of entacapone. The inactive ingredients of the Stalevo® tablet are cornstarch, croscarmellose sodium, glycerol 85%, hypromellose, magnesium stearate, mannitol, polysorbate 80, povidone, sucrose, red iron oxide, titanium dioxide, and yellow iron oxide.
- Starlix® (nateglinide) biconvex tablets contain 60 mg or 120 mg of nateglinide for oral administration. Inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, hydroxypropyl methylcellulose, iron oxides (red or yellow), lactose monohydrate, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, talc, and titanium dioxide.
- Striant® is a white- to off-white-colored, monoconvex, tablet-like, mucoadhesive buccal system. Striant® adheres to the gum tissue above the incisors, with the flat surface facing the cheek mucosa. The active ingredient in Striant® is testosterone. Each buccal system contains 30 mg of testosterone. Other pharmacologically inactive ingredients in Striant® are anhydrous lactose NF, carbomer 934P,

hypromellose USP, magnesium stearate NF, lactose monohydrate NF, polycarbophil USP, colloidal silicon dioxide NF, starch NF, and talc USP.

- SULAR® (nisoldipine) is an extended-release tablet dosage form of the dihydropyridine calcium channel blocker nisoldipine. SULAR tablets consist of an external coat and an internal core. Both coat and core contain nisoldipine, the coat as a slow-release formulation and the core as a fast-release formulation. SULAR tablets contain either 10, 20, 30, or 40 mg of nisoldipine for once-a-day oral administration. Inert ingredients in the formulation are hydroxypropyl cellulose, lactose, cornstarch, crospovidone, microcrystalline cellulose, sodium lauryl sulfate, povidone, and magnesium stearate. The inert ingredients in the film coating are hypromellose, polyethylene glycol, ferric oxide, and titanium dioxide.
- SYNTHROID® (levothyroxine sodium tablets, USP). Inactive ingredients: acacia, confectioner's sugar (contains cornstarch), lactose monohydrate, magnesium stearate, povidone, and talc. The following are the color additives by tablet strength: 25, FD&C Yellow No. 6 Aluminum Lake; 50, none; 75, FD&C Red No. 40 Aluminum Lake and FD&C Blue No. 2 Aluminum Lake; 88, FD&C Blue No. 1 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, and D&C Yellow No. 10 Aluminum Lake; 100, D&C Yellow No. 10 Aluminum Lake and FD&C Yellow No. 6 Aluminum Lake; 112, D&C Red No. 27 and 30 Aluminum Lake; 125, FD&C Yellow No. 6 Aluminum Lake, FD&C Red No. 40 Aluminum Lake, and FD&C Blue No. 1 Aluminum Lake; 137, FD&C Blue No. 1 Aluminum Lake; 150, FD&C Blue No. 2 Aluminum Lake; 175, FD&C Blue No. 1 Aluminum Lake and D&C Red No. 27 and 30 Aluminum Lake; 200, FD&C Red No. 40 Aluminum Lake; 300, D&C Yellow No. 10 Aluminum Lake, FD&C Yellow No. 6 Aluminum Lake, and FD&C Blue No. 1 Aluminum Lake.
- TABLOID scored tablets contain 40 mg of thioguanine and the inactive ingredients gum acacia, lactose, magnesium stearate, potato starch, and stearic acid.
- TAGAMET (cimetidine) film-coated tablets contain cimetidine as follows: 300 mg—round, debossed with the product name TAGAMET, SB and 300; 400 mg—oval TILTAB® tablets, debossed with the product name TAGAMET, SB and 400. Inactive ingredients consist of cellulose, D&C Yellow No. 10, FD&C Blue No. 2, FD&C Red No. 40, FD&C Yellow No. 6, hypromellose, iron oxides, magnesium stearate, povidone, propylene glycol, sodium lauryl sulfate, sodium starch glycolate, starch, titanium dioxide, and trace amounts of other inactive ingredients.
- TAMBOCOR™ (flecainide acetate) is available in tablets of 50, 100 or 150 mg for oral administration. Flecainide acetate is a white crystalline substance with a pK_a of 9.3. It has an aqueous solubility of 48.4 mg/mL at 37°C. TAMBOCOR tablets also contain croscarmellose sodium, hydrogenated vegetable oil, magnesium stearate, microcrystalline cellulose, and starch.
- TARCEVA (erlotinib) is a human epidermal growth factor receptor type 1/epidermal growth factor receptor (HER_1/EGFR) tyrosine kinase inhibitor. TARCEVA tablets are available in three dosage strengths containing erlotinib hydrochloride (27.3, 109.3, and 163.9 mg) equivalent to 25, 100, and 150 mg erlotinib and the following inactive ingredients: lactose monohydrate, hypromellose, hydroxypropyl cellulose, magnesium stearate, microcrystalline cellulose, sodium starch glycolate, sodium lauryl sulfate, and titanium dioxide. The tablets also contain trace amounts of color additives, including FD&C Yellow No. 6 (25 mg only) for product identification.
- TARKA® (trandolapril/verapamil hydrochloride ER). The tablet strengths are trandolapril 2 mg/verapamil hydrochloride ER 180 mg, trandolapril 1 mg/verapamil hydrochloride ER 240 mg, trandolapril 2 mg/verapamil hydrochloride ER 240 mg, and trandolapril 4 mg/verapamil hydrochloride ER 240 mg. The tablets also contain the following ingredients: cornstarch, dioctyl sodium sulfosuccinate, ethanol, hydroxypropyl cellulose, hypromellose, lactose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, povidone, purified water, silicon dioxide, sodium alginate, sodium stearyl fumarate, synthetic iron oxides, talc, and titanium dioxide.
- TASMAR® is available as tablets containing 100 or 200 mg tolcapone. Inactive ingredients (core): lactose monohydrate, microcrystalline cellulose, dibasic calcium phosphate anhydrous, povidone K-30, sodium starch glycolate, talc, and magnesium stearate. Inactive ingredients (film coating): hydroxypropyl methylcellulose, titanium dioxide, talc, ethylcellulose, triacetin, and sodium lauryl sulfate, with the following dye systems: 100 mg of yellow and red iron oxide and 200 mg of red iron oxide.
- Tegretol, carbamazepine USP, is available for oral administration as chewable tablets of 100 mg, tablets of 200 mg, and XR tablets of 100, 200, and 400 mg, and as a suspension of 100 mg/5 mL (teaspoon). Inactive ingredients (tablets): colloidal silicon dioxide, D&C Red No. 30 Aluminum Lake (chewable tablets only), FD&C Red No. 40 (200 mg tablets only), flavoring (chewable tablets only), gelatin, glycerin, magnesium stearate, and sodium starch glycolate (chewable tablets only), and starch, stearic acid, and sucrose (chewable tablets only). Inactive ingredients (suspension): citric acid, FD&C Yellow No. 6, flavoring, polymer, potassium sorbate, propylene glycol, purified water, sorbitol, sucrose, and xanthan gum. Tegretol-XR tablets: cellulose compounds, dextrates, iron oxides, magnesium stearate, mannitol, polyethylene glycol, sodium lauryl sulfate, and titanium dioxide (200 mg tablets only).

- TENORMIN® (atenolol) is available as 25, 50, and 100 mg tablets for oral administration. Inactive ingredients: magnesium stearate, microcrystalline cellulose, povidone, and sodium starch glycolate.
- Thioridazine hydrochloride is available as tablets for oral administration containing 10, 25, 50, or 100 mg. Each tablet for oral administration contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, hydroxypropyl cellulose, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, sodium lauryl sulfate, titanium dioxide, and FD&C Yellow No. 6 Aluminum Lake.
- Thyrolar tablets (Liotrix tablets, USP) contain triiodothyronine (T3 liothyronine) sodium and tetraiodothyronine (T4 levothyroxine) sodium. The inactive ingredients are calcium phosphate, colloidal silicon dioxide, cornstarch, lactose, and magnesium stearate. The tablets also contain the following dyes: Thyrolar 1/4—FD&C Blue No. 1 and FD&C Red No. 40; Thyrolar 1/2—FD&C Red No. 40 and D&C Yellow No. 10; Thyrolar 1—FD&C Red No. 40; Thyrolar 2—FD&C Blue No. 1, FD&C Red No. 40, and D&C Yellow No. 10; Thyrolar 3—FD&C Red No. 40 and D&C Yellow No. 10. Thyrolar tablets (Liotrix tablets, USP) are available in five potencies coded as follows: 3.1 μg/12.5 μg, 6.25 μg/25 μg, 12.5 μg/50 μg, 25 μg/100 μg, and 37.5 μg/150 μg.
- Tinidazole is a synthetic antiprotozoal agent. Tindamax pink film-coated oral tablets contain 500 or 250 mg of tinidazole. Inactive ingredients include croscarmellose sodium, FD&C Red No. 40 Lake, FD&C Yellow No. 6 Lake, hypromellose, magnesium stearate, microcrystalline cellulose, polydextrose, polyethylene glycol, pregelatinized cornstarch, titanium dioxide, and triacetin.
- TRACLEER® (bosentan) is available as 62.5 and 125 mg film-coated tablets for oral administration and contains the following excipients: cornstarch, pregelatinized starch, sodium starch glycolate, povidone, glyceryl behenate, magnesium stearate, hydroxypropyl methylcellulose, triacetin, talc, titanium dioxide, iron oxide yellow, iron oxide red, and ethylcellulose. Each TRACLEER® 62.5 mg tablet contains 64.541 mg of bosentan, equivalent to 62.5 mg of anhydrous bosentan. Each TRACLEER® 125 mg tablet contains 129.082 mg of bosentan, equivalent to 125 mg of anhydrous bosentan.
- TRANXENE T-TAB® tablets contain either 3.75, 7.5, or 15 mg of clorazepate dipotassium for oral administration. TRANXENE-SD and TRANXENE-SD Half Strength tablets contain 22.5 and 11.25 mg of clorazepate dipotassium, respectively. TRANXENE-SD and TRANXENE-SD Half Strength tablets gradually release clorazepate and are designed for once-a-day administration in patients already stabilized on TRANXENE T-TAB® tablets. Inactive ingredients for TRANXENE T-TAB® tablets: colloidal silicon dioxide, FD&C Blue No. 2 (3.75 mg only), FD&C Yellow No. 6 (7.5 mg only), FD&C Red No. 3 (15 mg only), magnesium oxide, magnesium stearate, microcrystalline cellulose, potassium carbonate, potassium chloride, and talc. Inactive ingredients for TRANXENE-SD and TRANXENE-SD Half Strength tablets: castor oil wax, FD&C Blue No. 2 (SD Half Strength, 11.25 mg only), iron oxide (SD, 22.5 mg only), lactose, magnesium oxide, magnesium stearate, potassium carbonate, potassium chloride, and talc.
- TRECATOR TABLET. Ethionamide tablets contain 250 mg of ethionamide. The inactive ingredients present are croscarmellose sodium, FD&C Yellow No. 6, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polyvinyl alcohol, povidone, silicon dioxide, talc, and titanium dioxide.
- Triamterene capsules for oral use, with opaque red cap and body, contain triamterene, 50 or 100 mg, and are imprinted with the product name DYRENIUM, strength (50 or 100) and WPC 002 (for the 50 mg strength) and WPC 003 (for the 100 mg strength). Inactive ingredients consist of D&C Red No. 33, FD&C Yellow No. 6, gelatin NF, lactose NF, magnesium stearate NF, sodium lauryl sulfate NF, titanium dioxide USP, and silicon dioxide NF.
- TRICOR (fenofibrate tablets) is available as tablets for oral administration. Each tablet contains 48 or 145 mg of fenofibrate. Inactive ingredients: each tablet contains hypromellose 2910 (3 cps), docusate sodium, sucrose, sodium lauryl sulfate, lactose monohydrate, silicified microcrystalline cellulose, crospovidone, and magnesium stearate. In addition, individual tablets contain the following ingredients: 48 mg tablets—polyvinyl alcohol, titanium dioxide, talc, soybean lecithin, xanthan gum, D&C Yellow No. 10 Aluminum Lake, FD&C Yellow No. 6/sunset yellow FCF Aluminum Lake, and FD&C Blue No. 2/indigo carmine Aluminum Lake; 145 mg tablets—polyvinyl alcohol, titanium dioxide, talc, soybean lecithin, and xanthan gum.
- TRIGLIDE™ (fenofibrate) tablets contain 50 or 160 mg of fenofibrate. Inactive ingredients: each tablet also contains crospovidone, lactose monohydrate, mannitol, maltodextrin, carboxymethylcellulose sodium, egg lecithin, croscarmellose sodium, sodium lauryl sulfate, colloidal silicon dioxide, magnesium stearate, and monobasic sodium phosphate.
- Trileptal® (oxcarbazepine) is available as 150, 300, and 600 mg film-coated tablets for oral administration. Trileptal film-coated tablets contain the following inactive ingredients: colloidal silicon dioxide, crospovidone, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, talc, titanium dioxide, and yellow iron oxide.

- Triphasil cycle of 28 tablets consists of three different drug phases as follows: Phase 1 composed of 6 brown tablets, each containing 0.050 mg of levonorgestrel (*d*(–)-13 β-ethyl-17-α-ethinyl-17-β-hydroxygon-4-en-3-one), a totally synthetic progestogen, and 0.030 mg of ethinyl estradiol (19 nor-17(α)-pregna-1,3,5(10)-trien-20-yne-3,17-diol); phase 2 composed of 5 white tablets, each containing 0.075 mg levonorgestrel and 0.040 mg ethinyl estradiol; and phase 3 composed of 10 light yellow tablets, each containing 0.125 mg levonorgestrel and 0.030 mg ethinyl estradiol; then followed by 7 light green inert tablets. The inactive ingredients present are cellulose, FD&C Blue No. 1, iron oxides, lactose, magnesium stearate, polacrilin potassium, polyethylene glycol, titanium dioxide, and hydroxypropyl methylcellulose.
- ULTRAM® ER (tramadol hydrochloride) tablets contain 100, 200, or 300 mg of tramadol HCl in an extended-release formulation. The tablets are white in color and contain the inactive ingredients ethylcellulose, dibutyl sebacate, polyvinyl pyrrolidone, sodium stearyl fumarate, colloidal silicon dioxide, and polyvinyl alcohol.
- ULTRAM® ODT (tramadol hydrochloride) orally disintegrating tablets is supplied as orally disintegrating tablets containing 50 mg of tramadol hydrochloride for oral administration. The tablets are white in color and contain the inactive ingredients aspartame, copovidone, crospovidone, ethylcellulose, magnesium stearate, mannitol, mint flavor, and silicon dioxide.
- Uniphyl® (theophylline, anhydrous) tablets in a controlled-release system allow a 24 hour dosing interval. Each controlled-release tablet for oral administration contains 400 or 600 mg of anhydrous theophylline. Inactive ingredients: cetostearyl alcohol, hydroxyethyl cellulose, magnesium stearate, povidone, and talc.
- Uniretic® (moexipril hydrochloride/hydrochlorothiazide) is a combination of an angiotensin-converting enzyme (ACE) inhibitor, moexipril hydrochloride, and a diuretic, hydrochlorothiazide. Uniretic® is available for oral administration in three tablet strengths. The inactive ingredients in all strengths are lactose, magnesium oxide, crospovidone, magnesium stearate, and gelatin. The film coating in all strengths contains hydroxypropyl cellulose, hypromellose, polyethylene glycol 6000, magnesium stearate, and titanium dioxide. In addition, the film coating for Uniretic® 7.5 mg/12.5 mg and Uniretic® 15 mg/25 mg contains ferric oxide.
- Univasc® (moexipril hydrochloride) is supplied as scored, coated tablets containing 7.5 and 15 mg of moexipril hydrochloride for oral administration. In addition to the active ingredient, moexipril hydrochloride, the tablet core contains the following inactive ingredients: lactose, magnesium oxide, crospovidone, magnesium stearate, and gelatin. The film coating contains hydroxypropyl cellulose, hypromellose, polyethylene glycol 6000, magnesium stearate, titanium dioxide, and ferric oxide.
- Urocit®-K is a citrate salt of potassium. Urocit®-K is supplied as wax matrix tablets containing 5 mEq (540 mg) and 10 mEq (1080 mg) of potassium citrate each, for oral administration.
- UROQID-Acid® No. 2 tablet contains methenamine mandelate (500 mg) and sodium acid phosphate, monohydrate (500 mg). Inactive ingredients: calcium phosphate, hydroxypropyl methylcellulose, magnesium stearate, microcrystalline cellulose, povidone, sodium starch glycolate, starch, sugar, syloid, and talc.
- VAGIFEM® (estradiol vaginal tablets) are small, white, film-coated tablets containing 25.8 µg of estradiol hemihydrate, equivalent to 25 µg of estradiol. Each tablet contains the following inactive ingredients: hypromellose, lactose monohydrate, maize starch, and magnesium stearate. The film coating contains hypromellose and polyethylene glycol. Each white tablet is 6 mm in diameter and is placed in a disposable applicator. Each tablet-filled applicator is packaged separately in a blister pack. 17(β)-estradiol hemihydrate is a white, almost white, or colorless crystalline solid, chemically described as estra-1,3,5(10)-triene-3,17,diol.
- VESIcare (solifenacin succinate) tablets contain 5 or 10 mg of solifenacin succinate and are formulated for oral administration. In addition to the active ingredient solifenacin succinate, each VESIcare tablet also contains the following inert ingredients: lactose monohydrate, cornstarch, hypromellose 2910, magnesium stearate, talc, polyethylene glycol 8000, and titanium dioxide with yellow ferric oxide (5 mg VESIcare tablet) or red ferric oxide (10 mg VESIcare tablet).
- VFEND tablets contain 50 or 200 mg of voriconazole. The inactive ingredients include lactose monohydrate, pregelatinized starch, croscarmellose sodium, povidone, magnesium stearate, and a coating containing hypromellose, titanium dioxide, lactose monohydrate, and triacetin.
- VIAGRA®, an oral tablet, is the citrate salt of sildenafil. VIAGRA® (sildenafil citrate) is formulated as blue, film-coated, rounded-diamond-shaped tablets equivalent to 25, 50, and 100 mg of sildenafil for oral administration. In addition to the active ingredient, sildenafil citrate, each tablet contains the following inactive ingredients: microcrystalline cellulose, anhydrous dibasic calcium phosphate, croscarmellose sodium, magnesium stearate, hypromellose, titanium dioxide, lactose, triacetin, and FD & C Blue No. 2 Aluminum Lake.
- VICODIN HP (hydrocodone bitartrate and acetaminophen) is supplied in tablet form for oral administration. Each VICODIN HP tablet contains

hydrocodone bitartrate (10 mg) and acetaminophen (660 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, croscarmellose sodium, magnesium stearate, microcrystalline cellulose, povidone, pregelatinized starch, and stearic acid. Meets USP Dissolution Test 2. Each VICODIN ES tablet contains hydrocodone bitartrate (7.5 mg) and acetaminophen (750 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, pregelatinized starch, magnesium stearate, croscarmellose sodium, povidone, and stearic acid. Meets USP Dissolution Test 2. Each VICODIN tablet contains hydrocodone bitartrate (5 mg) and acetaminophen (500 mg). In addition, each tablet contains the following inactive ingredients: colloidal silicon dioxide, starch, croscarmellose sodium, dibasic calcium phosphate, magnesium stearate, microcrystalline cellulose, povidone, and stearic acid. Meets USP Dissolution Test 2.

- VICOPROFEN® tablets contain hydrocodone bitartrate, USP (7.5 mg) and ibuprofen, USP (200 mg). Inactive ingredients in VICOPROFEN tablets include colloidal silicon dioxide, cornstarch, croscarmellose sodium, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, and titanium dioxide.
- VIRACEPT (nelfinavir mesylate) tablets are available for oral administration as a light blue, capsule-shaped tablet with a clear film coating in 250 mg strength (as nelfinavir free base) and as a white oval tablet with a clear film coating in 625 mg strength (as nelfinavir free base). Each tablet contains the following common inactive ingredients: calcium silicate, crospovidone, magnesium stearate, hypromellose, and triacetin. In addition, the 250 mg tablet contains FD&C Blue No. 2 powder, and the 625 mg tablet contains colloidal silicon dioxide.
- Voltaren® (diclofenac sodium enteric-coated tablets). Voltaren is available as delayed-release (enteric-coated) tablets of 25 mg (yellow), 50 mg (light brown), and 75 mg (light pink) for oral administration. The inactive ingredients in Voltaren include hydroxypropyl methylcellulose, iron oxide, lactose, magnesium stearate, methacrylic acid copolymer, microcrystalline cellulose, polyethylene glycol, povidone, propylene glycol, sodium hydroxide, sodium starch glycolate, talc, titanium dioxide, D&C Yellow No. 10 Aluminum Lake (25 mg tablet only), and FD&C Blue No. 1 Aluminum Lake (50 mg tablet only).
- Voltaren®-XR diclofenac sodium extended-release tablets are available as extended-release tablets of 100 mg (light pink) for oral administration. The inactive ingredients in Voltaren-XR include cetyl alcohol, hydroxypropyl methylcellulose, iron oxide, magnesium stearate, polyethylene glycol, polysorbate, povidone, silicon dioxide, sucrose, talc, and titanium dioxide.
- VYTORIN contains ezetimibe. VYTORIN is available for oral use as tablets containing 10 mg of ezetimibe, 10 mg of simvastatin (VYTORIN 10/10), 20 mg of simvastatin (VYTORIN 10/20), 40 mg of simvastatin (VYTORIN 10/40), or 80 mg of simvastatin (VYTORIN 10/80). Each tablet contains the following inactive ingredients: butylated hydroxyanisole NF, citric acid monohydrate USP, croscarmellose sodium NF, hydroxypropyl methylcellulose USP, lactose monohydrate NF, magnesium stearate NF, microcrystalline cellulose NF, and propyl gallate NF.
- YASMIN provides an oral contraceptive regimen consisting of 21 active film-coated tablets each containing 3.0 mg of drospirenone and 0.030 mg of ethinyl estradiol and 7 inert film-coated tablets. The inactive ingredients are lactose monohydrate NF, cornstarch NF, modified starch NF, povidone 25000 USP, magnesium stearate NF, hydroxypropyl methylcellulose USP, macrogol 6000 NF, talc USP, titanium dioxide USP, ferric oxide pigment, and yellow NF. The inert film-coated tablets contain lactose monohydrate NF, cornstarch NF, povidone 25000 USP, magnesium stearate NF, hydroxypropyl methylcellulose USP, talc USP, and titanium dioxide USP.
- Zelnorm® (tegaserod maleate) tablets contain tegaserod as the hydrogen maleate salt. Each 1.385 mg of tegaserod as the maleate is equivalent to 1 mg of tegaserod. Zelnorm is available for oral use in the following tablet formulations: 2 and 6 mg tablets (blister packs) containing 2 and 6 mg of tegaserod, respectively, and the following inactive ingredients: crospovidone, glyceryl monostearate, hypromellose, lactose monohydrate, poloxamer 188, and polyethylene glycol 4000; 6 mg tablets (bottles) containing 6 mg of tegaserod and the following inactive ingredients: crospovidone, glyceryl behenate, hypromellose, lactose monohydrate, and colloidal silicon dioxide.
- ZESTORETIC® (lisinopril and hydrochlorothiazide) combines an ACE inhibitor, lisinopril, and a diuretic, hydrochlorothiazide. ZESTORETIC® is available for oral use in three tablet combinations of lisinopril with hydrochlorothiazide: ZESTORETIC® 10-12.5 containing 10 mg of lisinopril and 12.5 mg of hydrochlorothiazide; ZESTORETIC® 20-12.5 containing 20 mg of lisinopril and 12.5 mg of hydrochlorothiazide; and ZESTORETIC® 20-25 containing 20 mg of lisinopril and 25 mg of hydrochlorothiazide. Inactive ingredients: 10-12.5 tablets—calcium phosphate, magnesium stearate, mannitol, red ferric oxide, starch, and yellow ferric oxide; 20-12.5 tablets—calcium phosphate, magnesium stearate, mannitol, and starch; 20-25 tablets—calcium phosphate, magnesium stearate, mannitol, red ferric oxide, starch, and yellow ferric oxide.
- ZESTRIL (lisinopril) is supplied as 2.5, 5, 10, 20, 30, and 40 mg tablets for oral administration. Inactive

ingredients: 2.5 mg tablets—calcium phosphate, magnesium stearate, mannitol, and starch; 5, 10, 20, and 30 mg tablets—calcium phosphate, magnesium stearate, mannitol, red ferric oxide, and starch; 40 mg tablets—calcium phosphate, magnesium stearate, mannitol, starch, and yellow ferric oxide.

- ZETIA (ezetimibe) is available as a tablet for oral administration containing 10 mg of ezetimibe and the following inactive ingredients: croscarmellose sodium NF, lactose monohydrate NF, magnesium stearate NF, microcrystalline cellulose NF, povidone USP, and sodium lauryl sulfate NF.
- Zileuton tablets for oral administration are supplied in one dosage strength containing 600 mg of zileuton. Inactive ingredients: crospovidone, hydroxypropyl cellulose, hypromellose, magnesium stearate, microcrystalline cellulose, pregelatinized starch, propylene glycol, sodium starch glycolate, talc, and titanium dioxide.
- ZITHROMAX® tablets contain azithromycin dihydrate equivalent to 600 mg azithromycin. The tablets are supplied as white, modified oval-shaped, film-coated tablets. They also contain the following inactive ingredients: dibasic calcium phosphate anhydrous, pregelatinized starch, sodium croscarmellose, magnesium stearate, sodium lauryl sulfate, and an aqueous film coat consisting of hypromellose, titanium dioxide, lactose, and triacetin.
- ZOLOFT® (sertraline hydrochloride) is supplied for oral administration as scored tablets containing sertraline hydrochloride equivalent to 25, 50, and 100 mg of sertraline and the following inactive ingredients: dibasic calcium phosphate dihydrate, D&C Yellow No. 10 Aluminum Lake (in 25 mg tablet), FD&C Blue No. 1 Aluminum Lake (in 25 mg tablet), FD&C Red No. 40 Aluminum Lake (in 25 mg tablet), FD&C Blue No. 2 Aluminum Lake (in 50 mg tablet), hydroxypropyl cellulose, hypromellose, magnesium stearate, microcrystalline cellulose, polyethylene glycol, polysorbate 80, sodium starch glycolate, synthetic yellow iron oxide (in 100 mg tablet), and titanium dioxide.
- ZOMIG® (zolmitriptan) tablets and ZOMIG-ZMT® (zolmitriptan) orally disintegrating tablets contain zolmitriptan, available as 2.5 mg (yellow) and 5 mg (pink) film-coated tablets for oral administration. The film-coated tablets contain anhydrous lactose NF, microcrystalline cellulose NF, sodium starch glycolate NF, magnesium stearate NF, hydroxypropyl methylcellulose USP, titanium dioxide USP, polyethylene glycol 400 NF, yellow iron oxide NF (2.5 mg tablet), red iron oxide NF (5 mg tablet), and polyethylene glycol 8000 NF. ZOMIG-ZMT® orally disintegrating tablets are available as 2.5 and 5.0 mg white uncoated tablets for oral administration. The orally disintegrating tablets contain mannitol USP, microcrystalline cellulose NF, crospovidone NF, aspartame NF, sodium bicarbonate USP, citric acid anhydrous USP, colloidal silicon dioxide NF, magnesium stearate NF, and orange flavor SN 027512.
- ZYPREXA (olanzapine) tablets contain olanzapine equivalent to 2.5 mg (8 μmol), 5 mg (16 μmol), 7.5 mg (24 μmol), 10 mg (32 μmol), 15 mg (48 μmol), or 20 mg (64 μmol). Inactive ingredients are carnauba wax, crospovidone, hydroxypropyl cellulose, hypromellose, lactose, magnesium stearate, microcrystalline cellulose, and other inactive ingredients. The color coating contains titanium dioxide (all strengths), FD&C Blue No. 2 Aluminum Lake (15 mg), or synthetic red iron oxide (20 mg). The 2.5, 5.0, 7.5, and 10 mg tablets are imprinted with edible ink that contains FD&C Blue No. 2 Aluminum Lake.
- ZYPREXA ZYDIS (olanzapine orally disintegrating tablets) contains olanzapine equivalent to 5 mg (16 μmol), 10 mg (32 μmol),15 mg (48 μmol), or 20 mg (64 μmol). It begins disintegrating in the mouth within seconds, allowing its contents to be subsequently swallowed with or without liquid. ZYPREXA ZYDIS (olanzapine orally disintegrating tablets) also contains the following inactive ingredients: gelatin, mannitol, aspartame, sodium methyl paraben, and sodium propyl paraben.
- ZYRTEC® (tablets and syrup) is cetirizine hydrochloride. ZYRTEC® tablets are formulated as white, film-coated, rounded-off rectangular-shaped tablets for oral administration and are available in 5 and 10 mg strengths. Inactive ingredients are lactose, magnesium stearate, povidone, titanium dioxide, hypromellose, polyethylene glycol, and cornstarch. ZYRTEC® chewable tablets are formulated as purple round tablets for oral administration and are available in 5 and 10 mg strengths. Inactive ingredients of the chewable tablets are acesulfame potassium, artificial grape flavor, betadex NF, blue dye, colloidal silicon dioxide, lactose monohydrate, magnesium stearate, mannitol, microcrystalline cellulose, natural flavor, and red dye (carmine).
- ZYRTEC-D 12 HOUR™ (cetirizine hydrochloride [5 mg] and pseudoephedrine hydrochloride [120 mg]) extended-release tablets for oral administration contain 5 mg of cetirizine hydrochloride for immediate release and 120 mg of pseudoephedrine hydrochloride for extended release in a bilayer tablet. Tablets also contain as inactive ingredients colloidal silicon dioxide, croscarmellose sodium, hypromellose, lactose monohydrate, magnesium stearate, and microcrystalline cellulose.

To the memory of Frederick P. Siegel

Professor Frederick P. Siegel passed away in 2013; my teacher and later a colleague, Fred was a world-class teacher with multiple golden apple awards. He left an indelible mark on my mind how to think like a student when teaching, a piece of advice that changed my perspective on how minds interact.

PART II Manufacturing Formulations

PART III Commercial Pharmaceutical Formulations

Preface to the Series—Third Edition

I am humbled by the wide praise and acceptance of the last two editions of the *Handbook of Pharmaceutical Formulations*, a six-volume series that found home in the R&D laboratories of just about every pharmaceutical company, both generic and branded, and in the classrooms of pharmaceutical technology; and the regulatory agencies used this treatise to compare the quality of pharmaceutical products. In creating this work, back in 2004, my primary objective was to provide a ready source of safe and scalable generic and new pharmaceutical formulations that take a long time to develop and incur a substantial cost, to enable the availability of affordable medicines.

Each of the six volumes in the series has a structured content. Part I includes regulatory guidance, formulation steps, references to active ingredients and excipients, and a self-audit guidance for cGMP compliance. Chapters of common interest to all volumes are distributed across the six volumes, such as the formulations for coating solutions are presented in Volume 5 (OTC), though they are also pertinent to Volume 1 (Compressed Dosage Forms), and global bioequivalence testing guidelines are provided in Volume 4 (Semisolids), though they apply to all volumes. Part II includes scalable formulations and Part III, where applicable, other general formulations. The appendices include a listing of excipients used in FDA approved products and a cGMP compliance self-testing tool. Whereas the main focus of the guidance provided in the handbook pertains to compliance with FDA requirements, these apply equally to EU requirements, and, as a result, to any global agency.

The third edition also gets several significant additions; now each volume includes a self-audit template, several chapters advising how to stay cGMP compliant, including a listing of most common FDA citations to look out for in the audits, a global regulatory focus and an updated list of excipients and the level of their incorporation in the FDA-approved products. The number of formulations is also increased, and the OTC volume now contains several cosmetic formulations, and the semisolid product volume also includes details on chewing gum delivery systems.

The updating of formulations is always cumulative as there is little need to remove any formulation provided previously—if it was right then, it shall remain good now. However, a variety of new drug delivery systems have evolved since the second edition was published, so I have included more details on these formulations, although some of these may not be available to practice due to possible limitations on the intellectual property.

As always, I advise the formulators to be aware of any intellectual property infringements as I cannot provide a guarantee to this effect.

Finally, I wish to acknowledge the leaders of the pharmaceutical world, to whom each of the volumes is dedicated. I have made a few changes to those whom the volumes are dedicated, to recognize those who have since passed away; they provided a role model to me and thousands of leaders and students of pharmacy over the decades of their careers. They are gone, but not without leaving an indelible mark on the profession.

I also consider myself fortunate to have the sponsorship and assistance of the great folks at the CRC Press, more particularly Jessica Poile and Hilary LaFoe. The teams at the CRC Press were very kind to put up with my redundant changes to the manuscript and were extremely generous in their advice in balancing the scientific and practical knowledge and, above all, making sure that the book was framed and published in the highest professional presentation. As always, I take responsibility for any mistakes and errors in my writing, and I am always open to suggestions by the readers to make future editions. I can be contacted at niazi@niazi.com.

Preface to the Series—Second Edition

The science and the art of pharmaceutical formulation keeps evolving as new materials, methods, and machines become readily available to produce more reliable, stable, and release-controlled formulations. At the same time, globalization of sourcing of raw and finished pharmaceuticals brings challenges to regulatory authorities and results in more frequent revisions to current good manufacturing practices, regulatory approval dossier requirements, and the growing need for cost optimization. Since the publication of the first edition of this book, a lot has changed in all of these areas of importance to pharmaceutical manufacturers. The second edition builds on the dynamic nature of the science and art of formulations, and provides an ever more useful handbook that should be highly welcomed by the industry, the regulatory authorities, as well as the teaching institutions.

The first edition of this book was a great success as it brought the myriad choices available to formulators under one umbrella. The readers were very responsive and communicated with me frequently, pointing out the weaknesses as well as the strengths of the book. The second edition totally revised attempts to achieve these by making major changes to the text, some of which include:

1. Complete, revised errors corrected and subject matter reorganized for easy reference. Whereas this series has six volumes differentiated on the basis of the type of dosage form and a separate inclusion of the U.S. OTC products, ideally the entire collection is needed to benefit from the myriad topics relating to formulations, regulatory compliance, and dossier preparation.
2. Total number of pages is increased from 1684 to 2726.
3. Total number of formulations is expanded by about 30% with many newly approved formulations.
4. Novel formulations are now provided for a variety of drugs; these data are collected from the massive intellectual property data and suggest toward the future trend of formulations. While some of these formulations may not have been approved in the United States or Europe, these do provide additional choices, particularly for the NDA preparation. As always, it is the responsibility of the manufacturer to assure that the intellectual property rights are not violated.
5. A significant change in this edition is the inclusion of commercial products; while most of this information is culled out from the open source such as the FOIA (http: //www.fda.gov/foi/default.htm), I have made attempts to reconstruct the critical portions of it based on what I call the generally acceptable standards. The drug companies are advised to assure that any intellectual property rights are not violated and this applies to all information contained in this book. The freedom of information act (FOIA) is an extremely useful conduit for reliable information and manufacturers are strongly urged to make use of this information. Whereas this information is provided free of charge, the process of obtaining the information may be cumbersome, in which case, commercial sources of these databases can prove useful, particularly for the non-U.S. companies.
6. Also included are the new Good Manufacturing Guidelines (2007) with amendments (2008) for the United States and similar updates for the European Union and WHO; it is strongly urged that the companies discontinue using all old documents as there are significant changes in the revised form, and many of them are likely to reduce the cost of GMP compliance.
7. Details on the design of clean rooms is a new entry that will be of great use to sterile product manufacturers; whereas the design and flow of personnel and material flow is of a critical nature, regulatory agencies view these differently and the manufacturer is advised always to comply with the most stringent requirements.
8. Addition of a self-auditing template in each volume of the series. While the cGMP compliance is a complex issue and the requirements diversified across the globe, the basic compliance remains universal. I have chosen the European Union guidelines (as these are more in tune with the ICH) to prepare a self-audit module that I recommend that every manufacturer adopt as a routine to assure GMP compliance. In most instances, reading the template by those responsible for compliance will keep them sensitive to the needs of GMP.
9. OTC products cross-referenced in other volumes where appropriate. This was necessary since the regulatory authorities worldwide define this class of drug differently. It is important to iterate that, regardless of the prescription or the OTC status of a product, the requirements for compliance with the cGMP apply equally.
10. OTC monograph status is a new section added to the OTC volume and this should allow manufacturers to choose appropriate formulations that may not require a filing with the regulatory agencies; it is important to iterate that an approved OTC monograph includes details of formulation, including the types and quantities of active drug and excipients, labeling, and presentation. To qualify the exemption, the manufacturer must comply with the monograph in its entirety. However, subtle modifications that are merely cosmetic in nature and where there

is evidence that the modification will not affect the safety and efficacy of the products can be made but require the prior approval of the regulatory agencies and generally these approvals are granted.

11. Expanded discussion on critical factors in the manufacturing of formulations provided; from basic shortcuts to smart modifications now extend to all dosage forms. Pharmaceutical compounding is one of the oldest professions and whereas the art of formulations has been relegated to more objective parameters, the art nevertheless remains. An experienced formulator, like an artist, would know what goes with what and why; he avoids the pitfalls and stays with conservative choices. These sections of the book present advice that is time-tested, although it may appear random at times; this is intended for experienced formulators.
12. Expanded details on critical steps in the manufacturing processes are provided with details in the prototype formulations. The reader is advised to browse through similar formulations to gain more insight. Where multiple formulations are provided for the same drug, it is intended to show the variety of possibilities in formulating a drug and whereas it pertains to a single drug, the basic formulation practices can be extended to many drugs of the same class or even of diversified classes. Readers have often requested that more details be provided in the Manufacturing Direction sections. Whereas sufficient details are provided, this is restricted to prototype formulations to keep the size of the book manageable and to reduce redundancy.
13. Addition of a listing of approved excipients and the level allowed by regulatory authorities. This new section allows formulators a clear choice on which excipients to choose; the excipients are reported in each volume pertaining to the formulation type covered. The listing is drawn from the FDA-approved entities. For the developers of an ANDA, it is critical that the level of excipients be kept within the range generally approved to avoid large expense in justifying any unapproved level. The only category for which the listing is not provided separately is the OTC volume since it contains many dosage forms and the reader is referred to the dosage form-specific title of the series. The choice of excipients forms keeps increasing with many new choices that can provide many special release characteristics to the dosage forms. Choosing correct excipients is thus a tedious exercise and requires sophisticated multivariate statistical analysis. Whereas the formulator may choose any number of novel or classical components, it is important to know the levels of excipients that are generally allowed in various formulations to reduce the cost of redundant exercises; I have therefore included, as an appendix to each volume, a list of all excipients that are currently approved by the U.S. FDA along their appropriate levels. I suggest that a formulator consult this table before deciding on which level of excipient to use; it does not mean that the excipient cannot be used outside this range but it obviates the need for a validation and lengthy justification studies in the submission of NDAs.
14. Expanded section on bioequivalence submission was required to highlight the recent changes in these requirements. New entries include a comprehensive listing of bioequivalence protocols in abbreviated form as approved by the U.S. FDA; these descriptions are provided in each volume where pertinent. To receive approval for an ANDA, an applicant must generally demonstrate, among other things, equivalence of the active ingredient, dosage form, strength, route of administration, and conditions of use as the listed drug, and that the proposed drug product is bioequivalent to the reference listed drug [21 USC 355(j)(2)(A); 21 CFR 314.94(a)]. Bioequivalent drug products show no significant difference in the rate and extent of absorption of the therapeutic ingredient [21 U.S.C. 355(j)(8); 21 CFR 320.1(e)]. BE studies are undertaken in support of ANDA submissions with the goal of demonstrating BE between a proposed generic drug product and its reference listed drug. The regulations governing BE are provided at 21 CFR in part 320. The U.S. FDA has recently begun to promulgate individual bioequivalence requirements. To streamline the process for making guidance available to the public on how to design product-specific BE studies, the U.S. FDA will be issuing product-specific BE recommendations (www.fda.gov/cder/ogd/index.htm). To make this vital information available, an appendix to each volume includes a summary of all currently approved products by the U.S. FDA where a recommendation on conducting bioequivalence studies is made available by the U.S. FDA. When filing an NDA or an ANDA, the filer is faced with the choice of defending the methods used to justify the bioavailability or bioequivalence data. The U.S. FDA now allows application for waiver of bioequivalence requirement; a new chapter on this topic has been added along with details of the dissolution tests, where applicable, approved for various dosage forms.
15. Dissolution testing requirements are included for all dosage forms where this testing is required by the FDA. Surrogate testing to prove efficacy and compliance is getting more acceptance at regulatory agencies; in my experience, a well-designed dissolution test is the best measure of continuous compliance. Coupled with chapters on waivers of bioequivalence testing, this information on dissolution testing should be of great value to all manufacturers; it is recommended that manufacturers develop their own in-house specifications, more stringent than those allowed in these listings and the USP.

16. Best-selling products (top 200 prescription products) are identified with an asterisk and a brand name where applicable; in all instances, the composition of these products is provided along with the formulation of generic equivalents. Despite the vast expansion of pharmaceutical sales and shifting of categories of blockbuster drugs, basic drugs affecting the gastrointestinal tract, vascular system, and brain remain most widely prescribed.
17. An updated list of approved coloring agents in the United States, Canada, European Union, and Japan is included to allow manufactures to design products for worldwide distribution.
18. Tablet-coating formulations that meet worldwide requirements of color selection are included in the Volume 1 (compressed solids) and Volume 5 (OTC) because these represent the products often coated.
19. Guidelines on preparing regulatory filings are now dispersed throughout the series depending on where these guidelines are more crucial. However, the reader would, as before, need access to all volumes to benefit from the advice and guidelines provided.

As always, comments and criticism from the readers are welcomed and these can be sent to me at Niazi@pharmsci.com or Niazi@niazi.com. I would try to respond to any inquiries requiring clarification of the information enclosed in these volumes.

I would like to express deep gratitude to Sherri R. Niziolek and Michelle Schmitt-DeBonis at Informa, the publisher of this work, for seeing an immediate value to the readers in publishing the second edition of this book and allowing me enough time to prepare this work. The diligent editing and composing staff at Informa, particularly Joseph Stubenrauch, Baljinder Kaur, and others are highly appreciated. Regardless, all errors and omissions remain altogether mine.

In the first edition, I had dedicated each volume to one of my mentors; the second edition continues the dedication to these great teachers.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Taylor & Francis

Preface to the Series—First Edition

No industry in the world is more highly regulated than the pharmaceutical industry because of the potential threat to a patient's life from the use of pharmaceutical products. The cost of taking a new chemical entity (amortized over the cost of all molecules racing) to final regulatory approval is a staggering $800 million, making the pharmaceutical industry one of the most research-intensive industries in the world. In the year 2004, it is anticipated that the industry will spend about $20 billion on research and development. The generic market of drugs as the new entities come off patent is one of the fastest growing segments of the pharmaceutical industry, with every major multinational company having a significant presence in this field.

Whereas many stages of new drug development are inherently constrained with time, the formulation of drugs into desirable dosage forms remains an area where expediency can be practiced with appropriate knowledge by those who have mastered the skills of pharmaceutical formulations. The Handbook of Pharmaceutical Manufacturing Formulations is the first major attempt to consolidate the available knowledge about formulations in a comprehensive and, by nature, rather voluminous presentation.

The book is divided into six volumes, based strictly on the type of formulation science involved in the development of these dosage forms: sterile products, compressed solids, uncompressed solids, liquid products, semisolid products, and OTC products. The separation of OTC products, even though they may easily fall into one of the other five categories, is made to comply with the industry norms of separate research divisions for OTC products. Sterile products require skills related to the sterilization of product, and of less importance is the bioavailability issue, which is an inherent problem of compressed dosage forms. These types of considerations have led to the classification of products into these six categories.

Each volume includes a description of regulatory filing techniques for the formulations described. Also included are the current regulatory guidelines on cGMP compliance specific to the dosage form. Advice is offered on how to scale up the production batches.

It is expected that formulation scientists will use this information to benchmark their internal development protocols and cut the race to file short by adopting formulae that have survived the test of time. Many of us who have worked in the pharmaceutical industry suffer from a close paradigm when it comes to selecting formulations—"not invented here" perhaps reigns in the mind of many seasoned formulations scientists subconsciously when they prefer to choose only a certain platform for development. It is expected that with the quick review of possibilities available to formulate made available in this book, scientists will benefit from the experience of others.

For the teachers of formulation sciences, this series offers a wealth of information. Whether it is a selection of a preservative system or the choice of a disintegrant, the series offers a wide choice to study and rationalize.

Many have assisted me in the development of this work that has taken years to compile, and I thank scores of my graduate students and colleagues for their help. A work of this size cannot be produced without errors, although I hope that these errors do not distract the reader from the utility of the book. I would sincerely appreciate if readers point out these mistakes for corrections in future editions.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Preface to the Volume—First Edition

Uncompressed solid products formulations comprise aggregates of powders, such as powders for topical application, for use as insufflations, and for extemporaneous suspensions, as well as hard gelatin capsules or any other form wherein the final form is not compressed. The rationale for this clear demarcation of formulations based on their state of aggregation is important to understand. Whereas compressed solid products require formulation components to render them compressible while allowing free flow into compression cavities, such considerations are of lesser importance for uncompressed solid products. (The flow requirement, nevertheless, stays because the powders must be forced into capsule shells or poured into bottles or other packaging forms.) Uncompressed solid products, on the other hand, offer their own set of formulation problems related to the segregation of powders due to static charges, environmental contamination during the filling process, and inevitable problems in wetting and dissolution, thus leading to possible bioavailability problems in vivo. In the series of steps that determine the ultimate dissolution of the product, however, uncompressed solid products are one critical step ahead of compressed solid products—disintegration. The formulator is advised to read Chapter 4 of this volume, which discusses guidelines on the waiver of bioavailability requirements. Substantial development costs can be reduced when a drug undergoes fast dissolution, and these considerations must therefore be part of any new formulation effort. The reader is also referred to Volume 1 of this series where current and proposed bioavailability guidelines are provided.

Chapter 1 addresses the fundamental issues of good manufacturing practices (GMPs). The chapter provides access addresses to all major guidelines around the world and also highlights the U.S. Food and Drug Administration (FDA) guidelines. A discussion of the most recent changes in the philosophy of establishing the GMP guidelines based on risk assessment is addressed in this chapter as well.

Chapter 2 presents a more recent discussion of how the U.S. FDA inspectors are supposed to conduct inspections; this topic is of continuous importance to all drug manufacturers. Although it is included in this volume, the guidelines apply to all dosage forms.

Chapter 3 discusses the topic of bioequivalence and bioavailability of solid products. Although this is discussed more thoroughly in Volume 1, the emphasis in Chapter 3 is placed on the guidelines to request a waiver of bioavailability/bioequivalence testing; this is something of great importance to both the innovator and the generic drug manufacturer.

Chapter 4 highlights the manufacturing aspects of uncompressed drugs as well as various topics of general and specific interest.

Part II provides formulations for more than 400 pharmaceutical products. Included in part are not only the currently approved products but also several innovative products such as small proteins, instantly liquefiable powders, and nanoparticles. Formulators are strongly urged to review the methodologies described here to serve as a reference point for their own formulations. Some combination products or dosage forms are described that are not currently approved by the FDA (i.e., not included in the Orange Book), and they may be in the development phase or in experimental phases. As is always the case, it is the responsibility of the manufacturer to ensure that the formulations used in the production do not violate any intellectual property or proprietary practice laws. The most effective means of establishing this is through a study of the Orange Book, which lists the exclusivities and unexpired patents. The patent numbers provided in the Orange Book should then be searched for collateral patents, the FDA freedom of information (FOI) database, and other literature to ensure that the intellectual or proprietary property rights are not violated.

Whereas coating solutions are not as important as in the case of compressed solids, nevertheless, some capsules are coated and the granules that are filled in capsules for sustained or timed release are coated, utilizing nonpareil sugar beads most often. The coating solutions are described here, but the reader is further referred to Volume 1 for a detailed description of coating solutions that can be easily adapted to the product intended for formulation into a sustained release profile. Whereas some forms of powders are meant to be sterile, the sterility considerations are discussed in Volume 6.

The subject of powder technology is vast, with applications in many fields. The serious reader is referred to the journal Advanced Powder Technology (http: //www.vsppub.com/journals/jn-AdvPowTec.html). Such advances as inhalation insulin in a powder form and the new science of nanoparticles open a new phase of pharmaceutical research and development. Nanotechnology describes the ability to create new materials from building blocks the size of an atom cluster. Nanomaterials are powders and materials optimized at the nanoscale (10–9 m or a billionth of a meter in size). Nanopowders consist of particles with dimensions that can be measured by X-ray crystallography to be a few hundred atoms in diameter.

The formulations are presented in this volume with a scale for each unit: per capsule or per unit dose of powder. Quantities are expressed for 1000 units. Sometimes, however, a different presentation is chosen for simplicity and clarity. It is often customary for manufacturers to scale formulae for a specific weight, such as 100 or 1000 kg to match the mixing vessel requirements. This can be done roughly by multiplying the weight of each capsule or unit powder by the quantity desired to calculate the size of the batch. The reader should be aware that the actual yield may be different because of differences in the scale and quantity due to differences in the chemical form of drugs used, excesses added, and loss of moisture during manufacturing. Further, adjustment of quantity based on potency of raw material, where pertinent,

changes the quantity requirements. Most of these products are identified in this volume by a brief description before the listing of the Bill of Materials, which may not necessarily represent the commercially available dosage form; the description includes details of the commercial product.

A distinctive feature of this volume is the identification and inclusion of the most often approved capsules and powders in the United States. It is noteworthy that in the preparation of an abbreviated new drug application (ANDA), it is important for both regulatory and scientific reasons to keep the selection of excipients as close as possible to the innovator's product. The listing provided here includes every excipient used in the innovator listing and quantitative formulae in several instances. Whereas, in most instances, sufficient details are provided to assist in the formulation of a generic equivalent with exact quantities of excipients and conditions appropriate for processing, the examples provided for other drugs of a similar type should be sufficient for an astute formulator to develop quickly these formulations. Should there be a need for assistance in finalizing the formulations, however, the reader is invited, without any obligation, to write to the author at niazi@pharmsci.com. It should be emphasized that manufacturers frequently use colored capsule shells to identify their products and often imprint them with logos or other identification marks. It is important to understand that the coloring dyes are not universally approved and, in some instances, may form the basis for a trademark. The formulator is advised to investigate this aspect carefully; nevertheless, in most formulations, the dyes used are disclosed.

Whereas the science and the art of formulations remain within the domain of experienced hands, the wide dissemination of information about drug formulation compositions and problems related to them makes it easier for one to design excellent benchmarked formulations. The web site of the U.S. FDA (http: //www.fda.gov) remains one of the best sources of information. At times, however, commercial sources of databases, particularly the details that come under the Freedom of Information Act, can be more useful (e.g., http: //www.foiservices.com/). No endorsement is intended here for any company or resource.

I am grateful to CRC Press I LLC for taking the lead in publishing what is possibly the largest such work in the field of pharmaceutical manufacturing. It has been a distinct privilege to have known Stephen Zollo, senior editor at CRC Press, for years. Stephen has done more than any editor I have known to encourage me to complete this work on a timely basis. The editorial assistance provided by the CRC Press staff was indeed exemplary, particularly the assistance of Erika Dery, Samar Haddad, and others at CRC Press. Although much care has gone into correcting errors, any remaining errors are altogether mine. The reader is encouraged to bring any errors to my attention so that I may make corrections in future editions of this volume (niazi@pharmsci.com).

This book is dedicated to Takeru Higuchi. Higuchi was a university regents distinguished professor of pharmaceutical chemistry and chemistry at Kansas University, and the founding chair of the department of pharmaceutical chemistry. He was known for the first systematic application of chemical principles to drug design, delivery, and analysis. His scientific accomplishments earned him the informal title of "father of physical pharmacy." Higuchi died in 1987. A famous quote of Tak Higuchi is that "It is merely a matter of orderly thinking … and a little organization." One of his admirers notes, "His uniqueness is that he can look into the future and see things and imagine things that most of us cannot. Higuchi has the ability to identify what will be important in the future—that is his genius." I met Tak several times during my teaching career and heard a lot more about him from my colleagues and teachers who worked with him directly. (It was rumored that he wrote the entire logarithmic table when flying to Japan because he needed to solve an equation.) I learned much of my science by reading Tak's papers, which are full of insight and fresh approaches to old problems. He was also a good businessman and a wonderful role model for industry–academia partnership. His aura is inspiring and his presence overwhelming even though he is not among us anymore. People like Tak Higuchi are rare in any profession; we were just lucky to have him.

Sarfaraz K. Niazi, Ph.D.
Deerfield, Illinois, U.S.A.

Author

Sarfaraz K. Niazi has been teaching and conducting research in the pharmaceutical industry for over 40 years. He has authored hundreds of scientific papers, scores of textbooks, handbooks, and literary books on the topics of pharmaceutical formulation, biopharmaceutics, pharmacokinetics, bioprocessing, and recombinant engineering, as well as poetry and philosophy. He is also an inventor with 100+ patents in the field of bioprocessing, technology, drug, and dosage form delivery systems; he is also licensed to practice law before the U.S. Patent and Trademark Office. He has formulated hundreds of products ranging from the most popular consumer products to complex generics and biotechnology-derived products. Dr. Niazi advises regulatory agencies and the pharmaceutical industry internationally on and making safe and effective drugs affordable (www.pharmsci.com). He can be contacted at niazi@niazi.com.

Regulatory and Manufacturing Guidelines

Taylor & Francis
Taylor & Francis Group
http://taylorandfrancis.com

1 U.S. FDA Good Manufacturing Practices

I. INTRODUCTION

Good Manufacturing Practices (GMPs) is a universal concept with a dual purpose: to make pharmaceutical products both safe and consistent in their effectiveness. Remarkable changes are taking place in the basic approach to achieve these goals. The key regulations and guidelines for the manufacturing of finished pharmaceuticals (as opposed to raw material or active ingredient manufacturing) in this respect are

1. 21 Code of Federal Regulations, Parts 210 and 211 (Part 210—Current Good Manufacturing Practice in Manufacturing, Processing, Packing, or Holding of Drugs; General Part 211—Current Good Manufacturing Practice for Finished Pharmaceuticals) http://www.fda.gov/cder/dmpq/cgmpregs.htm
2. The World Health Organization (WHO): Quality Assurance of Pharmaceuticals: A compendium of guidelines and related materials, Volume 2, Good Manufacturing Practices and Inspection http://www.who.int/medicines/areas/quality_safety/quality_assurance/production/en/index.html
3. The Rules Governing Medicinal Products in the European Union: Volume 4, Good Manufacturing Practices http://ec.europa.eu/enterprise/pharmaceuticals/eudralex/vol4_en.htm
4. The European Agency for the Evaluation of Medicinal Products—International Conference on Harmonization (ICH) Guidelines http://www.emea.europa.eu/Inspections/GMPhome.html
5. Health Products and Food Branch Inspectorate of Canada. Good Manufacturing Practices Guidelines —http://www.hc-sc.gc.ca/dhp-mps/compli-conform/gmp-bpf/guide-ld-2002/index-eng.php
6. Therapeutic Goods Administration, Government of Australia—Australian Code for Good Manufacturing Practice http://www.tga.gov.au/docs/html/gmpcodau.htm

Though there are many common elements among the approach to GMP taken by the worldwide drug regulatory guidelines, there remains a major difference between the approvals awarded in the United States vis-a-vis Europe and the rest of the world. The U.S. Food and Drug Administration (FDA) inspection is triggered only when an application for marketing authorization has been submitted to the FDA. If the FDA chooses to inspect a facility—the so-called pre-approval inspection (PAI)—the company is so advised and the approval of the pending New Drug Application (NDA) or abbreviated New Drug Application (aNDA) is delayed until the inspection is completed. The main focus of PAI is to establish if the applicant firm is capable of manufacturing a safe product, the issues relating to efficacy, dosing, and label copy being reviewed by the agency office in Washington, D.C. It is important to realize that all documents labeled as guidelines remain guidelines and the FDA inspectors are not bound by any specifications, requirements, or designs suggested in the current Good Manufacturing Practices (cGMP) documents. In almost all instances, the FDA inspector visiting a facility for the first time would take time to explain this to the technical team that receives the inspection team. "We are not bound by the CGMP guidelines because these meant to guide you and not bind us." This comes as a surprise to many who may have otherwise worked out each and every recommendation made in the guideline. In several places, the reader will find the instructions given to the inspection team on what to inspect and how to inspect it and these should be studied carefully. Since PAI is related to a specific product and not to the entire facility, the focus of inspection remains the submitted aNDA or NDA and the facility involved in the manufacturing of that specific product. Except for those systems that directly impinge on the quality of the submitted product, the FDA inspectors would generally keep out of other areas. For example, if the submitted application is a sterile product, the FDA inspection will be limited to the facility filling sterile products. Common elements of warehousing, QC, QA are however always part of any inspection.

The focus of PAI is to establish the robustness of the firm's QA systems that will allow consistent production of a safe product, meaning the product is free from contamination, complies with the listed specifications, and is packed such as to allow it to reach the consumer with sufficient shelf-life remaining. It is not unusual for the PAI team to perform a more in-depth audit of the document trail and a more superficial inspection of the physical facility. (The EDQM/EMEA and WHO inspections are mostly facility intensive.) Generally, the PAI team will ensure that the standard operating procedures (SOPs) as written by the firm are followed faithfully and that those involved in assuring the safety guarantee of the product are properly trained.

Whereas the FDA's PAI results in approval of the marketing authorization application, the facility is not declared compliant except for the product for which the inspection was made; thus it is a misnomer to call a firm, "FDA-approved." The U.S. FDA does not approve facilities, it approves products. The WHO audits can result in awarding a facility preapproval to submit for bids on WHO contracts as a GMP-certified facility.

II. U.S. FDA CGMP GUIDELINES

The U.S. FDA oversees the quality of drug products using a two-pronged approach including a review of information

submitted in applications as well as an inspection of manufacturing facilities for conformance to requirements for cGMPs. These two programs have served the United States well by helping to ensure the quality of drug products available. Now, as we approach the 25th anniversary of the last major revision to the drug cGMP regulations, the U.S. FDA has undertaken a program to overhaul the entire process of cGMP compliance so that

- The most up-to-date concepts of risk management and quality systems approaches are incorporated while continuing to ensure product quality
- The latest scientific advances in pharmaceutical manufacturing and technology are encouraged
- The submission review program and the inspection program operate in a coordinated and synergistic manner
- Regulation and manufacturing standards are applied consistently
- Management of the program encourages innovation in the pharmaceutical manufacturing sector
- FDA resources are used most effectively and efficiently to address the most significant health risks

Over the last two decades, significant changes in the environment of pharmaceutical regulation have occurred and have resulted in incremental adjustments in the FDA's regulatory approach to product quality. These changes include:

- Increased number of pharmaceutical products and a greater role of medicines in health care
- Decreased frequency of FDA manufacturing inspections as a result of fewer resources available for pharmaceutical manufacturing inspections
- The FDA's accumulation of experience with, and lessons learned from, various approaches to the regulation of product quality
- Advances in the pharmaceutical sciences and manufacturing technologies
- Application of biotechnology in drug discovery and manufacturing
- Advances in the science and management of quality
- Globalization of the pharmaceutical industry

The cumulative impact of these changes has been greater than the sum of the parts and warrants a systematic reappraisal of the FDA's approaches to product quality regulation. The following principles will guide implementation of the reappraisal:

Risk-based orientation—To provide the most effective public health protection, the FDA must match its level of effort against the magnitude of risk. Resource limitations prevent uniformly intensive coverage of all pharmaceutical products and production. Although the agency has been implementing risk-based programs, a more systematic and rigorous risk-based approach will be developed.

Science-based policies and standards—Significant advances in pharmaceutical sciences and in manufacturing technologies have occurred over the last two decades. Although this knowledge has been incorporated in an ongoing manner into the FDA's approach to product quality regulation, the fundamental nature of the changes dictates a thorough evaluation of the science base to ensure that product quality regulation not only incorporates up-to-date science, but also encourages further advances in technology. Recent science can also contribute significantly to assessment of risk.

Integrated quality systems orientation—Principles from various innovative approaches to manufacturing quality that have been developed in the past decade will be evaluated for applicability, and cGMP requirements and related preapproval requirements will be evaluated according to applicable principles. In addition, interaction of the premarket chemistry, manufacturing, and control (CMC) review process and the application of cGMP requirements will be evaluated as an integrated system.

International cooperation—The globalization of pharmaceutical manufacturing requires a global approach to regulation. The FDA will collaborate with other regulatory authorities via the International Conference on Harmonization and other venues.

Strong public health protection—The initiative will strengthen the public health protection achieved by the FDA's regulation of drug product manufacturing and will not interfere with strong enforcement of the existing regulatory requirements, even as we are examining and revising our approach to these programs.

To accomplish the reappraisal, the FDA will carry out the following broad actions.

- Perform an external review of the existing cGMP program and product review practices, including an evaluation of potential inconsistencies in implementation.
- Reassess and reevaluate our current scientific approach to both the product review process and the cGMP program to achieve a consistent, integrated systems approach to product quality regulation.
- Enhance the scientific approach of cGMPs to emphasize risk-based control point analysis and to facilitate the latest innovations in pharmaceutical engineering.

The following immediate steps are planned.

- Holding scientific workshops with key stakeholders
- Enhancing expertise in pharmaceutical technologies (e.g., pharmaceutical engineering and industrial pharmacy) by additional training and hiring, and by leveraging external expertise

- Encouraging innovation within the existing framework of statutory provisions and regulations by allowing certain changes in the manufacturing process without prior review/approval (e.g., comparability protocols)
- Evaluating the optimal mechanisms to effectively and efficiently communicate deficiencies to industry, including content, consistency, disclosure, and education
- Shifting the agency lead on the implementation of Part 11 to Center for Drug Evaluation and Research (CDER), with continued involvement from the other centers of the FDA and the Office of Regulatory Affairs
- Including product specialists, as needed, as a part of inspection teams
- Having centers provide a scientific and technical review of all drug cGMP warning letters
- Developing a technical dispute resolution process that integrates technical experts from the centers and addresses perceived inconsistencies between centers
- Emphasizing a risk-based approach in the work planning process
- Improving the operations of team biologics of the Center for Biological Evaluation and Research

Intermediate steps are

- using emerging science and data analysis to enhance compliance programs to target the highest risk areas,
- evaluating the feasibility of establishing dedicated cadres of pharmaceutical inspectors

Long-term steps are

- enhancing training of agency staff on new scientific approaches and innovative pharmaceutical manufacturing technology,
- developing and publishing policies and procedures reflecting a science-based risk management approach,
- educating industry on new regulatory approaches that encourage innovation

In conclusion, the industry must keep a close watch on these developments as new cGMP guidelines are drafted by the U.S. FDA. This is particularly important for the new start-ups wherein much of what the FDA would like to see in the future can be readily provided. Whereas it is anticipated that the FDA will loosen its noose on some of the less risky aspects of cGMP, greater emphasis will be placed on protecting patients when high-risk drugs are involved. The basic guidelines, however, are here to stay and an overview of these fundamental concepts is presented next.

A. General Provisions

Title 21 of CFR Parts 210 and 211 describes the current GMP practices; this chapter contains the guidelines current as of 2007 and their amendments current as of 2008. Section 211.1, "Scope," states:

"The regulations in this part contain the minimum current good manufacturing practice for preparation of drug products for administration to humans or animals. Pending consideration of a proposed exemption, published in the Federal Register of September 29, 1978, the requirements in this part shall not be enforced for over-the-counter (OTC) drug products if the products and all their ingredients are ordinarily marketed and consumed as human foods, and which products may also fall within the legal definition of drugs by virtue of their intended use."

Periodically, the FDA issues amendments, specific product instructions, and other labeling or manufacturing requirements for a variety of drugs. The reader is advised to consult these guidelines routinely. In light of substantial changes made to these guidelines, it is further advised that instead of comparing these guidelines with the older version, the companies discard the old guidelines and adopt the following document in their standard operating procedures.

Manufacturers who have experience in routine FDA inspections as well as special inspections know well that all of these documents are labeled as guidelines, which literally means that the FDA inspectors are not bound by these—these are merely guidelines. In every instance the purpose of inspection is to ensure that the manufacturer is capable of producing a safe product, the efficacy being already established through the filing of the NDA or aNDA.

Part 210—cGMP in Manufacturing, Processing, Packaging, or Holding of Drugs; General

210.1 Status of cGMP regulations
210.2 Applicability of cGMP regulations
210.3 Definitions
210.1 Status of cGMP regulations

a. The regulations set forth in this part and in parts 211 through 226 in the FDA guidelines contain the minimum cGMP for methods to be used in and the facilities or controls to be used for the manufacture, processing, packing, or holding of a drug to ensure that such drug meets the requirements of the act as to safety and has the identity and strength and meets the quality and purity characteristics that it purports or is represented to possess.
b. The failure to comply with any regulation set forth in this part and in parts 211 through 226 in the FDA guidelines in the manufacture, processing, packing, or holding of a drug shall render such drug to be adulterated under section 501(a)(2)(B) of the act and such drug, as well as the person who is responsible for the failure to comply, shall be subject to regulatory action.
c. Owners and operators of establishments engaged in the recovery; donor screening; testing (including donor testing); processing; storage; labeling; packaging; or distribution

of human cells, tissues, and cellular and tissue-based products (HCT/Ps), as defined in 1271.3(d) of this chapter, that are drugs (subject to review under an application submitted under section 505 of the act or under a biological product license application under section 351 of the Public Health Service Act), are subject to the donor eligibility and applicable current good tissue practice procedures set forth in part 1271 subparts C and D of this chapter, in addition to the regulations in this part and in parts 211 through 226 in the FDA guidelines. Failure to comply with any applicable regulation set forth in this part, in parts 211 through 226 in the FDA guidelines, in part 1271 subpart C of this chapter, or in part 1271 subpart D of this chapter with respect to the manufacture, processing, packing or holding of a drug, renders an HCT/P adulterated under section 501(a)(2)(B) of the act. Such HCT/P, as well as the person who is responsible for the failure to comply, is subject to regulatory action.

210.2 Applicability of cGMP regulations

a. The regulations in this part and in parts 211 through 226 in the FDA guidelines as they may pertain to a drug; in parts 600 through 680 of this chapter as they may pertain to a biological product for human use; and in part 1271 of this chapter as they are applicable to a HCT/P that is a drug (subject to review under an application submitted under section 505 of the act or under a biological product license application under section 351 of the Public Health Service Act); shall be considered to supplement, not supersede, each other, unless the regulations explicitly provide otherwise. In the event of a conflict between applicable regulations in this part and in other parts of this chapter, the regulation specifically applicable to the drug product in question shall supersede the more general.
b. If a person engages in only some operations subject to the regulations in this part, in parts 211 through 226 in the FDA guidelines, in parts 600 through 680 of this chapter, and in part 1271 of this chapter, and not in others, that person need only comply with those regulations applicable to the operations in which he or she is engaged.

210.3 Definitions

a. The definitions and interpretations contained in section 201 of the act shall be applicable to such terms when used in this part and in parts 211 through 226 in the FDA guidelines.
b. The following definitions of terms apply to this part and to parts 211 through 226 in the FDA guidelines.
    1. Act means the Federal Food, Drug, and Cosmetic Act, as amended (21 USC 301 et seq.).
    2. Batch means a specific quantity of a drug or other material that is intended to have uniform character and quality, within specified limits, and is produced according to a single manufacturing order during the same cycle of manufacture.
    3. Component means any ingredient intended for use in the manufacture of a drug product, including those that may not appear in such drug product.
    4. Drug product means a finished dosage form, for example, tablet, capsule, solution that contains an active drug ingredient generally, but not necessarily, in association with inactive ingredients. The term also includes a finished dosage form that does not contain an active ingredient but is intended to be used as a placebo.
    5. Fiber means any particulate contaminant with a length at least three times greater than its width.
    6. Non-fiber-releasing filter means any filter, which after any appropriate pretreatment, such as washing or flushing, will not release fibers into the component or drug product that is being filtered. All filters composed of asbestos are deemed to be fiber-releasing filters.
    7. Active ingredient means any component that is intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body of man or other animals. The term includes those components that may undergo chemical change in the manufacture of the drug product and are present in the drug product in a modified form intended to furnish the specified activity or effect.
    8. Inactive ingredient means any component other than an active ingredient.
    9. In-process material means any material fabricated, compounded, blended, or derived by chemical reaction that is produced for, and used in, the preparation of the drug product.
    10. Lot means a batch, or a specific identified portion of a batch, having uniform character and quality within specified limits; or, in the case of a drug product produced by continuous process, it is a specific identified amount produced in a unit of time or quantity in a manner that ensures its having uniform character and quality within specified limits.
    11. Lot number, control number, or batch number means any distinctive combination of letters, numbers, or symbols, or any combination of

them, from which the complete history of the manufacture, processing, packing, holding, and distribution of a batch or lot of drug product or other material can be determined.

12. Manufacture, processing, packing, or holding of a drug product includes packaging and labeling operations, testing, and quality control of drug products.
13. The term medicated feed means any Type B or Type C medicated feed as defined in 558.3 in the FDA guidelines. The feed contains one or more drugs as defined in section 201(g) of the act. The manufacture of medicated feeds is subject to the requirements of part 225 in the FDA guidelines.
14. The term medicated premix means a Type A medicated article as defined in 558.3 in the FDA guidelines. The article contains one or more drugs as defined in section 201(g) of the act. The manufacture of medicated premixes is subject to the requirements of part 226 in the FDA guidelines.
15. Quality control unit means any person or organizational element designated by the firm to be responsible for the duties relating to quality control.
16. Strength means
    i. the concentration of the drug substance (e.g., weight/weight, weight/volume, or unit dose/volume basis) and/or
    ii. the potency, that is, the therapeutic activity of the drug product as indicated by appropriate laboratory tests or by adequately developed and controlled clinical data (expressed, e.g., in terms of units by reference to a standard).
17. Theoretical yield means the quantity that would be produced at any appropriate phase of manufacture, processing, or packing of a particular drug product, based upon the quantity of components to be used, in the absence of any loss or error in actual production.
18. Actual yield means the quantity that is actually produced at any appropriate phase of manufacture, processing, or packing of a particular drug product.
19. Percentage of theoretical yield means the ratio of the actual yield (at any appropriate phase of manufacture, processing, or packing of a particular drug product) to the theoretical yield (at the same phase), stated as a percentage.
20. Acceptance criteria means the product specifications and acceptance/rejection criteria, such as acceptable quality level and unacceptable quality level, with an associated sampling plan, that are necessary for making a decision to accept or reject a lot or batch (or any other convenient subgroups of manufactured units).
21. Representative sample means a sample that consists of a number of units that are drawn based on rational criteria such as random sampling and intended to ensure that the sample accurately portrays the material being sampled.
22. Gang-printed labeling means labeling derived from a sheet of material on which more than one item of labeling is printed.

Part 211—cGMP for Finished Pharmaceuticals

Subpart A—General Provisions
- 211.1 Scope
- 211.3 Definitions

Subpart B—Organization and Personnel
- 211.22 Responsibilities of quality control unit
- 211.25 Personnel qualifications
- 211.28 Personnel responsibilities
- 211.34 Consultants

Subpart C—Buildings and Facilities
- 211.42 Design and construction features
- 211.44 Lighting
- 211.46 Ventilation, air filtration, air heating and cooling
- 211.48 Plumbing
- 211.50 Sewage and refuse
- 211.52 Washing and toilet facilities
- 211.56 Sanitation
- 211.58 Maintenance

Subpart D—Equipment
- 211.63 Equipment design, size, and location
- 211.65 Equipment construction
- 211.67 Equipment cleaning and maintenance
- 211.68 Automatic, mechanical, and electronic equipment
- 211.72 Filters

Subpart E—Control of Components and Drug Product Containers and Closures
- 211.80 General requirements
- 211.82 Receipt and storage of untested components, drug product containers, and closures
- 211.84 Testing and approval or rejection of components, drug product containers, and closures
- 211.86 Use of approved components, drug product containers, and closures
- 211.87 Retesting of approved components, drug product containers, and closures
- 211.89 Rejected components, drug product containers, and closures
- 211.94 Drug product containers and closures

specifications impacting on the identity, strength, quality, and purity of the drug product.

d. The responsibilities and procedures applicable to the quality control unit shall be in writing; such written procedures shall be followed.

211.25 Personnel qualifications

a. Each person engaged in the manufacture, processing, packing, or holding of a drug product shall have education, training, and experience, or any combination thereof, to enable that person to perform the assigned functions. Training shall be in the particular operations that the employee performs and in cGMP (including the cGMP regulations in this chapter and written procedures required by these regulations) as they relate to the employee's functions.

b. Training in cGMP shall be conducted by qualified individuals on a continuing basis and with sufficient frequency to ensure that employees remain familiar with cGMP requirements applicable to them.

c. Each person responsible for supervising the manufacture, processing, packing, or holding of a drug product shall have the education, training, and experience, or any combination thereof, to perform assigned functions in such a manner as to provide assurance that the drug product has the safety, identity, strength, quality, and purity that it purports or is represented to possess.

d. There shall be an adequate number of qualified personnel to perform and supervise the manufacture, processing, packing, or holding of each drug product.

211.28 Personnel responsibilities

a. Personnel engaged in the manufacture, processing, packing, or holding of a drug product shall wear clean clothing appropriate for the duties they perform. Protective apparel, such as head, face, hand, and arm coverings, shall be worn as necessary to protect drug products from contamination.

b. Personnel shall practice good sanitation and health habits.

c. Only personnel authorized by supervisory personnel shall enter those areas of the buildings and facilities designated as limited-access areas.

d. Any person shown at any time (either by medical examination or supervisory observation) to have an apparent illness or open lesions that may adversely affect the safety or quality of drug products shall be excluded from direct contact with components, drug product containers, closures, in-process materials, and drug products until the condition is corrected or determined by competent medical personnel not to jeopardize the safety or quality of drug products. All personnel shall be instructed to report to supervisory personnel any health conditions that may have an adverse effect on drug products.

211.34 Consultants: Consultants advising on the manufacture, processing, packing, or holding of drug products shall have sufficient education, training, and experience, or any combination thereof, to advise on the subject for which they are retained. Records shall be maintained stating the name, address, and qualifications of any consultants and the type of service they provide.

Subpart C—Buildings and Facilities

211.42 Design and construction features

a. Any building or buildings used in the manufacture, processing, packing, or holding of a drug product shall be of suitable size, construction, and location to facilitate cleaning, maintenance, and proper operations.

b. Any such building shall have adequate space for the orderly placement of equipment and materials to prevent mix-ups between different components, drug product containers, closures, labeling, in-process materials, or drug products, and to prevent contamination. The flow of components, drug product containers, closures, labeling, in-process materials, and drug products through the building or buildings shall be designed to prevent contamination.

c. Operations shall be performed within specifically defined areas of adequate size. There shall be separate or defined areas or such other control systems for the firm's operations as are necessary to prevent contamination or mix-ups during the course of the following procedures.

1. Receipt, identification, storage, and withholding from use of components, drug product containers, closures, and labeling, pending the appropriate sampling, testing, or examination by the quality control unit before release for manufacturing or packaging;
2. holding rejected components, drug product containers, closures, and labeling before disposition;
3. storage of released components, drug product containers, closures, and labeling;
4. storage of in-process materials;
5. manufacturing and processing operations;
6. packaging and labeling operations;
7. quarantine storage before release of drug products;
8. storage of drug products after release;
9. control and laboratory operations;
10. aseptic processing, which includes as appropriate:
    i. floors, walls, and ceilings of smooth, hard surfaces that are easily cleanable;

ii. temperature and humidity controls;
iii. an air supply filtered through high-efficiency particulate air filters under positive pressure, regardless of whether flow is laminar or nonlaminar;
iv. a system for monitoring environmental conditions;
v. a system for cleaning and disinfecting the room and equipment to produce aseptic conditions;
vi. a system for maintaining any equipment used to control the aseptic conditions.

d. Operations relating to the manufacture, processing, and packing of penicillin shall be performed in facilities separate from those used for other drug products for human use.

211.44 Lighting: Adequate lighting shall be provided in all areas.

211.46 Ventilation, air filtration, air heating and cooling
a. Adequate ventilation shall be provided.
b. Equipment for adequate control over air pressure, microorganisms, dust, humidity, and temperature shall be provided when appropriate for the manufacture, processing, packing, or holding of a drug product.
c. Air filtration systems, including prefilters and particulate matter air filters, shall be used, when appropriate, on air supplies to production areas. If air is recirculated to production areas, measures shall be taken to control recirculation of dust from production. In areas where air contamination occurs during production, there shall be adequate exhaust systems or other systems adequate to control contaminants.
d. Air-handling systems for the manufacture, processing, and packing of penicillin shall be completely separate from those for other drug products for human use.

211.48 Plumbing
a. Potable water shall be supplied under continuous positive pressure in a plumbing system free of defects that could contribute contamination to any drug product. Potable water shall meet the standards prescribed in the Environmental Protection Agency's Primary Drinking Water Regulations set forth in 40 CFR part 141. Water not meeting such standards shall not be permitted in the potable water system.
b. Drains shall be of adequate size and, where connected directly to a sewer, shall be provided with an air break or other mechanical device to prevent back-siphonage.

211.50 Sewage and refuse: Sewage, trash, and other refuse in and from the building and immediate premises shall be disposed of in a safe and sanitary manner.

211.52 Washing and toilet facilities: Adequate washing facilities shall be provided, including hot and cold water, soap or detergent, air driers or single-service towels, and clean toilet facilities easily accessible to working areas.

211.56 Sanitation
a. Any building used in the manufacture, processing, packing, or holding of a drug product shall be maintained in a clean and sanitary condition, Any such building shall be free of infestation by rodents, birds, insects, and other vermin (other than laboratory animals). Trash and organic waste matter shall be held and disposed of in a timely and sanitary manner.
b. There shall be written procedures assigning responsibility for sanitation and describing in sufficient detail the cleaning schedules, methods, equipment, and materials to be used in cleaning the buildings and facilities; such written procedures shall be followed.
c. There shall be written procedures for use of suitable rodenticides, insecticides, fungicides, fumigating agents, and cleaning and sanitizing agents. Such written procedures shall be designed to prevent the contamination of equipment, components, drug product containers, closures, packaging, labeling materials, or drug products and shall be followed. Rodenticides, insecticides, and fungicides shall not be used unless registered and used in accordance with the Federal Insecticide, Fungicide, and Rodenticide Act (7 USC 135).
d. Sanitation procedures shall apply to work performed by contractors or temporary employees as well as work performed by full-time employees during the ordinary course of operations.

211.58 Maintenance: Any building used in the manufacture, processing, packing, or holding of a drug product shall be maintained in a good state of repair.

Subpart D—Equipment

211.63 Equipment design, size, and location: Equipment used in the manufacture, processing, packing, or holding of a drug product shall be of appropriate design, adequate size, and suitable location to facilitate operations for its intended use and for its cleaning and maintenance.

211.65 Equipment construction
a. Equipment shall be constructed such that surfaces that contact components, in-process materials, or drug products shall not be reactive, additive, or absorptive so as to alter the safety, identity, strength, quality, or purity of the drug product beyond the official or other established requirements.
b. Any substances required for operation, such as lubricants or coolants, shall not come into contact with components, drug product containers, closures, in-process materials, or drug products

so as to alter the safety, identity, strength, quality, or purity of the drug product beyond the official or other established requirements.

211.67 Equipment cleaning and maintenance

a. Equipment and utensils shall be cleaned, maintained, and sanitized at appropriate intervals to prevent malfunctions or contamination that would alter the safety, identity, strength, quality, or purity of the drug product beyond the official or other established requirements.
b. Written procedures shall be established and followed for cleaning and maintenance of equipment, including utensils, used in the manufacture, processing, packing, or holding of a drug product. These procedures shall include, but are not necessarily limited to, the following:
    1. Assignment of responsibility for cleaning and maintaining equipment
    2. Maintenance and cleaning schedules, including, where appropriate, sanitizing schedules
    3. A description in sufficient detail of the methods, equipment, and materials used in cleaning and maintenance operations, and the methods of disassembling and reassembling equipment as necessary to ensure proper cleaning and maintenance
    4. Removal or obliteration of previous batch identification
    5. Protection of clean equipment from contamination prior to use
    6. Inspection of equipment for cleanliness immediately before use
c. Records shall be kept of maintenance, cleaning, sanitizing, and inspection as specified in 211.180 and 211.182.

211.68 Automatic, mechanical, and electronic equipment

a. Automatic, mechanical, or electronic equipment or other types of equipment, including computers, or related systems that will perform a function satisfactorily may be used in the manufacture, processing, packing, and holding of a drug product. If such equipment is so used, it shall be routinely calibrated, inspected, or checked according to a written program designed to ensure proper performance. Written records of those calibration checks and inspections shall be maintained.
b. Appropriate controls shall be exercised over computer or related systems to ensure that changes in master production and control records or other records are instituted only by authorized personnel. Input to and output from the computer or related system of formulas or other records or data shall be checked for accuracy. The degree and frequency of input/output verification shall be based on the complexity and reliability of the computer or related system. A backup file of data entered into the computer or related system shall be maintained except where certain data, such as calculations performed in connection with laboratory analysis, are eliminated by computerization or other automated processes. In such instances a written record of the program shall be maintained along with appropriate validation data. Hard copy or alternative systems, such as duplicates, tapes, or microfilm, designed to ensure that backup data are exact and complete and that it is secure from alteration, inadvertent erasures, or loss shall be maintained.

211.72 Filters: Filters for liquid filtration used in the manufacture, processing, or packing of injectable drug products intended for human use shall not release fibers into such products. Fiber-releasing filters may not be used in the manufacture, processing, or packing of these injectable drug products unless it is not possible to manufacture such drug products without the use of such filters. If use of a fiber-releasing filter is necessary, an additional non-fiber-releasing filter of 0.22-micron maximum mean porosity (0.45 microns if the manufacturing conditions so dictate) shall subsequently be used to reduce the content of particles in the injectable drug product. Use of an asbestos-containing filter, with or without subsequent use of a specific non-fiber-releasing filter, is permissible only upon submission of proof to the appropriate bureau of the FDA that use of a non-fiber-releasing filter will, or is likely to, compromise the safety or effectiveness of the injectable drug product.

Subpart E—Control of Components and Drug Product Containers and Closures

211.80 General requirements

a. There shall be written procedures describing in sufficient detail the receipt, identification, storage, handling, sampling, testing, and approval or rejection of components and drug product containers and closures; such written procedures shall be followed.
b. Components and drug product containers and closures shall at all times be handled and stored in a manner to prevent contamination.
c. Bagged or boxed components of drug product containers, or closures, shall be stored off the floor and suitably spaced to permit cleaning and inspection.
d. Each container or grouping of containers for components or drug product containers, or closures, shall be identified with a distinctive code for each lot in each shipment received. This code shall be used in recording the disposition of each lot. Each lot shall be appropriately identified as to its status (i.e., quarantined, approved, or rejected).

211.82 Receipt and storage of untested components, drug product containers, and closures

a. Upon receipt and before acceptance, each container or grouping of containers of components, drug product containers, and closures shall be examined visually for appropriate labeling as to contents, container damage or broken seals, and contamination.
b. Components, drug product containers, and closures shall be stored under quarantine until they have been tested or examined, as appropriate, and released. Storage within the area shall conform to the requirements of 211.80.

211.84 Testing and approval or rejection of components, drug product containers, and closures

a. Each lot of components, drug product containers, and closures shall be withheld from use until the lot has been sampled, tested, or examined, as appropriate, and released for use by the quality control unit.
b. Representative samples of each shipment of each lot shall be collected for testing or examination. The number of containers to be sampled, and the amount of material to be taken from each container, shall be based upon appropriate criteria such as statistical criteria for component variability, confidence levels, and degree of precision desired, the past quality history of the supplier, and the quantity needed for analysis and reserve where required by 211.170.
c. Samples shall be collected in accordance with the following procedures:
    1. The containers of components selected shall be cleaned where necessary, by appropriate means.
    2. The containers shall be opened, sampled, and resealed in a manner designed to prevent contamination of their contents and contamination of other components, drug product containers, or closures.
    3. Sterile equipment and aseptic sampling techniques shall be used when necessary.
    4. If it is necessary to sample a component from the top, middle, and bottom of its container, such sample subdivisions shall not be composited for testing.
    5. Sample containers shall be identified so that the following information can be determined: name of the material sampled, the lot number, the container from which the sample was taken, the date on which the sample was taken, and the name of the person who collected the sample.
    6. Containers from which samples have been taken shall be marked to show that samples have been removed from them.
d. Samples shall be examined and tested as follows:
    1. At least one test shall be conducted to verify the identity of each component of a drug product. Specific identity tests, if they exist, shall be used.
    2. Each component shall be tested for conformity with all appropriate written specifications for purity, strength, and quality. In lieu of such testing by the manufacturer, a report of analysis may be accepted from the supplier of a component, provided that at least one specific identity test is conducted on such component by the manufacturer, and provided that the manufacturer establishes the reliability of the supplier's analyses through appropriate validation of the supplier's test results at appropriate intervals.
    3. Containers and closures shall be tested for conformance with all appropriate written procedures. In lieu of such testing by the manufacturer, a certificate of testing may be accepted from the supplier, provided that at least a visual identification is conducted on such containers/closures by the manufacturer and provided that the manufacturer establishes the reliability of the supplier's test results through appropriate validation of the supplier's test results at appropriate intervals.
    4. When appropriate, components shall be microscopically examined.
    5. Each lot of a component, drug product container, or closure that is liable to contamination with filth, insect infestation, or other extraneous adulterant shall be examined against established specifications for such contamination.
    6. Each lot of a component, drug product container, or closure that is liable to microbiological contamination that is objectionable in view of its intended use shall be subjected to microbiological tests before use.
e. Any lot of components, drug product containers, or closures that meets the appropriate written specifications of identity, strength, quality, and purity and related tests under paragraph (d) of this section may be approved and released for use. Any lot of such material that does not meet such specifications shall be rejected.

211.86 Use of approved components, drug product containers, and closures: Components, drug product containers, and closures approved for use shall be rotated so that the oldest approved stock is used first. Deviation from this requirement is permitted if such deviation is temporary and appropriate.

211.87 Retesting of approved components, drug product containers, and closures: Components, drug product containers, and closures shall be retested or reexamined, as appropriate, for identity, strength, quality,

purity, and approved or rejected by the quality control unit in accordance with 211.84 as necessary, for example, after storage for long periods or after exposure to air, heat, or other conditions that might adversely affect the component, drug product container, or closure.

211.89 Rejected components, drug product containers, and closures: Rejected components, drug product containers, and closures shall be identified and controlled under a quarantine system designed to prevent their use in manufacturing or processing operations for which they are unsuitable.

211.94 Drug product containers and closures

a. Drug product containers and closures shall not be reactive, additive, or absorptive so as to alter the safety, identity, strength, quality, or purity of the drug beyond the official or established requirements.
b. Container closure systems shall provide adequate protection against foreseeable external factors in storage and use that can cause deterioration or contamination of the drug product.
c. Drug product containers and closures shall be clean and, where indicated by the nature of the drug, sterilized and processed to remove pyrogenic properties to ensure that they are suitable for their intended use.
d. Standards or specifications; methods of testing; and, where indicated, methods of cleaning, sterilizing, and processing to remove pyrogenic properties shall be written and followed for drug product containers and closures.

Subpart F—Production and Process Controls

211.100 Written procedures; deviations

a. There shall be written procedures for production and process control designed to ensure that the drug products have the identity, strength, quality, and purity they purport or are represented to possess. Such procedures shall include all requirements in this subpart. These written procedures, including any changes, shall be drafted, reviewed, and approved by the appropriate organizational units and reviewed and approved by the quality control unit.
b. Written production and process control procedures shall be followed in the execution of the various production and process control functions and shall be documented at the time of performance. Any deviation from the written procedures shall be recorded and justified.

211.101 Charge-in of components

Written production and control procedures shall include the following, which are designed to ensure that the drug products produced have the identity, strength, quality, and purity they purport or are represented to possess.

a. The batch shall be formulated with the intent to provide not less than 100% of the labeled or established amount of active ingredient.
b. Components for drug product manufacturing shall be weighed, measured, or subdivided as appropriate. If a component is removed from the original container to another, the new container shall be identified with the following information.
    1. Component name or item code.
    2. Receiving or control number.
    3. Weight or measure in new container.
    4. Batch for which component was dispensed, including its product name, strength, and lot number.
c. Weighing, measuring, or subdividing operations for components shall be adequately supervised. Each container of component dispensed to manufacturing shall be examined by a second person to ensure that
    1. the component was released by the quality control unit;
    2. the weight or measure is correct as stated in the batch production records;
    3. the containers are properly identified.
d. Each component shall be added to the batch by one person and verified by a second person.

211.103 Calculation of yield: Actual yields and percentages of theoretical yield shall be determined at the conclusion of each appropriate phase of manufacturing, processing, packaging, or holding of the drug product. Such calculations shall be performed by one person and independently verified by a second person.

211.105 Equipment identification

a. All compounding and storage containers, processing lines, and major equipment used during the production of a batch of a drug product shall be properly identified at all times to indicate their contents and, when necessary, the phase of processing of the batch.
b. Major equipment shall be identified by a distinctive identification number or code that shall be recorded in the batch production record to show the specific equipment used in the manufacture of each batch of a drug product. In cases where only one of a particular type of equipment exists in a manufacturing facility, the name of the equipment may be used in lieu of a distinctive identification number or code.

211.110 Sampling and testing of in-process materials and drug products

a. To ensure batch uniformity and integrity of drug products, written procedures shall be established and followed that describe the in-process controls, and tests, or examinations to be conducted on appropriate samples of in-process materials

of each batch. Such control procedures shall be established to monitor the output and to validate the performance of those manufacturing processes that may be responsible for causing variability in the characteristics of in-process material and the drug product. Such control procedures shall include, but are not limited to, the following, where appropriate.

1. Tablet or capsule weight variation;
2. Disintegration time;
3. Adequacy of mixing to ensure uniformity and homogeneity;
4. Dissolution time and rate;
5. Clarity, completeness, or pH of solutions.

b. Valid in-process specifications for such characteristics shall be consistent with drug product final specifications and shall be derived from previous acceptable process average and process variability estimates where possible and determined by the application of suitable statistical procedures where appropriate. Examination and testing of samples shall ensure that the drug product and in-process material conform to specifications.

c. In-process materials shall be tested for identity, strength, quality, and purity as appropriate, and approved or rejected by the quality control unit, during the production process, for example, at commencement or completion of significant phases or after storage for long periods.

d. Rejected in-process materials shall be identified and controlled under a quarantine system designed to prevent their use in manufacturing or processing operations for which they are unsuitable.

211.111 Time limitations on production: When appropriate, time limits for the completion of each phase of production shall be established to ensure the quality of the drug product. Deviation from established time limits may be acceptable if such deviation does not compromise the quality of the drug product. Such deviation shall be justified and documented.

211.113 Control of microbiological contamination

a. Appropriate written procedures, designed to prevent objectionable microorganisms in drug products not required to be sterile, shall be established and followed.

b. Appropriate written procedures, designed to prevent microbiological contamination of drug products purporting to be sterile, shall be established and followed. Such procedures shall include validation of any sterilization process.

211.115 Reprocessing

a. Written procedures shall be established and followed prescribing a system for reprocessing batches that do not conform to standards or specifications and the steps to be taken to ensure that the reprocessed batches will conform with all established standards, specifications, and characteristics.

b. Reprocessing shall not be performed without the review and approval of the quality control unit.

Subpart G—Packaging and Labeling Control

211.122 Materials examination and usage criteria

a. There shall be written procedures describing in sufficient detail the receipt, identification, storage, handling, sampling, examination, and/or testing of labeling and packaging materials; such written procedures shall be followed. Labeling and packaging materials shall be representatively sampled, and examined or tested upon receipt and before use in packaging or labeling of a drug product.

b. Any labeling or packaging materials meeting appropriate written specifications may be approved and released for use. Any labeling or packaging materials that do not meet such specifications shall be rejected to prevent their use in operations for which they are unsuitable.

c. Records shall be maintained for each shipment received of each different labeling and packaging material indicating receipt, examination or testing, and whether accepted or rejected.

d. Labels and other labeling materials for each different drug product, strength, dosage form, or quantity of contents shall be stored separately with suitable identification. Access to the storage area shall be limited to authorized personnel.

e. Obsolete and outdated labels, labeling, and other packaging materials shall be destroyed.

f. Use of gang-printed labeling for different drug products, or different strengths or net contents of the same drug product, is prohibited unless the labeling from gang-printed sheets is adequately differentiated by size, shape, or color.

g. If cut labeling is used, packaging and labeling operations shall include one of the following special control procedures:

1. dedication of labeling and packaging lines to each different strength of each different drug product;
2. use of appropriate electronic or electromechanical equipment to conduct 100% examination for correct labeling during or after completion of finishing operations; or
3. use of visual inspection to conduct 100% examination for correct labeling during or after completion of finishing operations for hand-applied labeling. Such examination shall be performed by one person and independently verified by a second person.

h. Printing devices on, or associated with, manufacturing lines used to imprint labeling upon the

drug product unit label or case shall be monitored to ensure that all imprinting conforms to the print specified in the batch production record.

211.125 Labeling issuance

a. Strict control shall be exercised over labeling issued for use in drug product labeling operations.
b. Labeling materials issued for a batch shall be carefully examined for identity and conformity to the labeling specified in the master or batch production records.
c. Procedures shall be used to reconcile the quantities of labeling issued, used, and returned, and shall require evaluation of discrepancies found between the quantity of drug product finished and the quantity of labeling issued when such discrepancies are outside narrow preset limits based on historical operating data. Such discrepancies shall be investigated in accordance with 211.192. Labeling reconciliation is waived for cut or roll labeling if 100% examination for correct labeling is performed in accordance with 211.122(g)(2).
d. All excess labeling bearing lot or control numbers shall be destroyed.
e. Returned labeling shall be maintained and stored in a manner to prevent mix-ups and provide proper identification.
f. Procedures shall be written describing in sufficient detail the control procedures employed for the issuance of labeling; such written procedures shall be followed.

211.130 Packaging and labeling operations

There shall be written procedures designed to ensure that correct labels, labeling, and packaging materials are used for drug products; such written procedures shall be followed. These procedures shall incorporate the following features:

a. Prevention of mix-ups and cross-contamination by physical or spatial separation from operations on other drug products.
b. Identification and handling of filled drug product containers that are set aside and held in unlabeled condition for future labeling operations to preclude mislabeling of individual containers, lots, or portions of lots. Identification need not be applied to each individual container but shall be sufficient to determine name, strength, quantity of contents, and lot or control number of each container.
c. Identification of the drug product with a lot or control number that permits determination of the history of the manufacture and control of the batch.
d. Examination of packaging and labeling materials for suitability and correctness before packaging operations, and documentation of such examination in the batch production record.
e. Inspection of the packaging and labeling facilities immediately before use to ensure that all drug products have been removed from previous operations. Inspection shall also be made to ensure that packaging and labeling materials not suitable for subsequent operations have been removed. Results of inspection shall be documented in the batch production records.

211.132 TEP requirements for OTC human drug products

a. General. The FDA has the authority under the Federal Food, Drug, and Cosmetic Act (the act) to establish a uniform national requirement for TEP of OTC drug products that will improve the security of OTC drug packaging and help ensure the safety and effectiveness of OTC drug products. An OTC drug product (except a dermatological, dentifrice, insulin, or lozenge product) for retail sale that is not packaged in a tamper-resistant package or that is not properly labeled under this section is adulterated under section 501 of the act or misbranded under section 502 of the act, or both.
b. Requirements for tamper-evident package:
    1. Each manufacturer and packer who packages an OTC drug product (except a dermatological, dentifrice, insulin, or lozenge product) for retail sale shall package the product in a tamper-evident package, if this product is accessible to the public while held for sale. A tamper-evident package is one having one or more indicators or barriers to entry, which, if breached or missing, can reasonably be expected to provide visible evidence to consumers that tampering has occurred. To reduce the likelihood of successful tampering and to increase the likelihood that consumers will discover if a product has been tampered with, the package is required to be distinctive by design or by the use of one or more indicators or barriers to entry that employ an identifying characteristic (e.g., a pattern, name, registered trademark, logo, or picture). For purposes of this section, the term “distinctive by design” means the packaging cannot be duplicated with commonly available materials or through commonly available processes. A tamper-evident package may involve an immediate container and closure system or secondary container or carton system or any combination of systems intended to provide a visual indication of package integrity. The tamper-evident feature shall be designed to and shall remain intact when handled in a reasonable manner during manufacture, distribution, and retail display.

2. In addition to the TEP feature described in paragraph (b)(1) of this section, any two-piece, hard gelatin capsule covered by this section must be sealed using an acceptable tamper-evident technology.

c. Labeling.
   1. To alert consumers to the specific tamper-evident feature(s) used, each retail package of an OTC drug product covered by this section (except ammonia inhalant in crushable glass ampules, containers of compressed medical oxygen, or aerosol products that depend upon the power of a liquefied or compressed gas to expel the contents from the container) is required to bear a statement that
      i. identifies all tamper-evident feature(s) and any capsule sealing technologies used to comply with paragraph (b) of this section;
      ii. is prominently placed on the package; and
      iii. is so placed that it will be unaffected if the tamper-evident feature of the package is breached or missing.
   2. If the tamper-evident feature chosen to meet the requirements in paragraph (b) of this section uses an identifying characteristic, that characteristic is required to be referred to in the labeling statement. For example, the labeling statement on a bottle with a shrink band could say "for your protection, this bottle has an imprinted seal around the neck."

d. Request for exemptions from packaging and labeling requirements. A manufacturer or packer may request an exemption from the packaging and labeling requirements of this section. A request for an exemption is required to be submitted in the form of a citizen petition under 10.30 of this chapter and should be clearly identified on the envelope as a "Request for Exemption from the Tamper-Evident Packaging Rule." The petition is required to contain the following:
   1. The name of the drug product or, if the petition seeks an exemption for a drug class, the name of the drug class, and a list of products within that class.
   2. The reasons that the drug product's compliance with the TEP or labeling requirements of this section is unnecessary or cannot be achieved.
   3. A description of alternative steps that are available, or that the petitioner has already taken, to reduce the likelihood that the product or drug class will be the subject of malicious adulteration.
   4. Other information justifying an exemption.

e. OTC drug products subject to approved new drug applications. Holders of approved new drug applications for OTC drug products are required under 314.70 in the FDA guidelines to provide the agency with notification of changes in packaging and labeling to comply with the requirements of this section. Changes in packaging and labeling required by this regulation may be made before FDA approval, as provided under 314.70(c) in the FDA guidelines. Manufacturing changes by which capsules are to be sealed require prior FDA approval under 314.70(b) in the FDA guidelines.

f. Poison Prevention Packaging Act of 1970. This section does not affect any requirements for "special packaging" as defined under 310.3(l) in the FDA guidelines and required under the Poison Prevention Packaging Act of 1970.

211.134 Drug product inspection

a. Packaged and labeled products shall be examined during finishing operations to provide assurance that containers and packages in the lot have the correct label.

b. A representative sample of units shall be collected at the completion of finishing operations and shall be visually examined for correct labeling.

c. Results of these examinations shall be recorded in the batch production or control records.

211.137 Expiration dating

a. To ensure that a drug product meets applicable standards of identity, strength, quality, and purity at the time of use, it shall bear an expiration date determined by appropriate stability testing described in 211.166.

b. Expiration dates shall be related to any storage conditions stated on the labeling, as determined by stability studies described in 211.166.

c. If the drug product is to be reconstituted at the time of dispensing, its labeling shall bear expiration information for both the reconstituted and un-reconstituted drug products.

d. Expiration dates shall appear on labeling in accordance with the requirements of 201.17 in the FDA guidelines.

e. Homeopathic drug products shall be exempt from the requirements of this section.

f. Allergenic extracts that are labeled "No U.S. Standard of Potency" are exempt from the requirements of this section.

g. New drug products for investigational use are exempt from the requirements of this section, provided that they meet appropriate standards or specifications as demonstrated by stability studies during their use in clinical investigations. Where new drug products for investigational use are to be reconstituted at the time of dispensing, their labeling shall bear expiration information for the reconstituted drug product.

h. Pending consideration of a proposed exemption, published in the federal register of September 29, 1978, the requirements in this section shall not be enforced for human OTC drug products if their labeling does not bear dosage limitations and they are stable for at least 3 years as supported by appropriate stability data.

Subpart H—Holding and Distribution

211.142 Warehousing procedures

Written procedures describing the warehousing of drug products shall be established and followed. They shall include:

a. Quarantine of drug products before release by the quality control unit
b. Storage of drug products under appropriate conditions of temperature, humidity, and light so that the identity, strength, quality, and purity of the drug products are not affected

211.150 Distribution procedures

Written procedures shall be established, and followed, describing the distribution of drug products. They shall include:

a. A procedure whereby the oldest approved stock of a drug product is distributed first. Deviation from this requirement is permitted if such deviation is temporary and appropriate.
b. A system by which the distribution of each lot of drug product can be readily determined to facilitate its recall if necessary.

Subpart I—Laboratory Controls

211.160 General requirements

a. The establishment of any specifications, standards, sampling plans, test procedures, or other laboratory control mechanisms required by this subpart, including any change in such specifications, standards, sampling plans, test procedures, or other laboratory control mechanisms, shall be drafted by the appropriate organizational unit and reviewed and approved by the quality control unit. The requirements in this subpart shall be followed and shall be documented at the time of performance. Any deviation from the written specifications, standards, sampling plans, test procedures, or other laboratory control mechanisms shall be recorded and justified.
b. Laboratory controls shall include the establishment of scientifically sound and appropriate specifications, standards, sampling plans, and test procedures designed to ensure that components, drug product containers, closures, in-process materials, labeling, and drug products conform to appropriate standards of identity, strength, quality, and purity. Laboratory controls shall include:
    1. Determination of conformance to appropriate written specifications for the acceptance of each lot within each shipment of components, drug product containers, closures, and labeling used in the manufacture, processing, packing, or holding of drug products. The specifications shall include a description of the sampling and testing procedures used. Samples shall be representative and adequately identified. Such procedures shall also require appropriate retesting of any component, drug product container, or closure that is subject to deterioration.
    2. Determination of conformance to written specifications and a description of sampling and testing procedures for in-process materials. Such samples shall be representative and properly identified.
    3. Determination of conformance to written descriptions of sampling procedures and appropriate specifications for drug products. Such samples shall be representative and properly identified.
    4. The calibration of instruments, apparatus, gauges, and recording devices at suitable intervals in accordance with an established written program containing specific directions, schedules, limits for accuracy and precision, and provisions for remedial action in the event accuracy and/or precision limits are not met. Instruments, apparatus, gauges, and recording devices not meeting established specifications shall not be used.

211.165 Testing and release for distribution

a. For each batch of drug product, there shall be appropriate laboratory determination of satisfactory conformance to final specifications for the drug product, including the identity and strength of each active ingredient, prior to release. Where sterility and/or pyrogen testing are conducted on specific batches of short-lived radiopharmaceuticals, such batches may be released prior to completion of sterility and/or pyrogen testing, provided such testing is completed as soon as possible.
b. There shall be appropriate laboratory testing, as necessary, of each batch of drug product required to be free of objectionable microorganisms.
c. Any sampling and testing plans shall be described in written procedures that shall include the method of sampling and the number of units per batch to be tested; such written procedure shall be followed.
d. Acceptance criteria for the sampling and testing conducted by the quality control unit shall be adequate to ensure that batches of drug products meet each appropriate specification and appropriate statistical quality control criteria as a condition for their approval and release. The

statistical quality control criteria shall include appropriate acceptance levels and/or appropriate rejection levels.

e. The accuracy, sensitivity, specificity, and reproducibility of test methods employed by the firm shall be established and documented. Such validation and documentation may be accomplished in accordance with 211.194(a)(2).

f. Drug products failing to meet established standards or specifications and any other relevant quality control criteria shall be rejected. Reprocessing may be performed. Prior to acceptance and use, reprocessed material must meet appropriate standards, specifications, and any other relevant criteria.

211.166 Stability testing

a. There shall be a written testing program designed to assess the stability characteristics of drug products. The results of such stability testing shall be used in determining appropriate storage conditions and expiration dates. The written program shall be followed and shall include:
   1. Sample size and test intervals based on statistical criteria for each attribute examined to ensure valid estimates of stability;
   2. Storage conditions for samples retained for testing;
   3. Reliable, meaningful, and specific test methods;
   4. Testing of the drug product in the same container-closure system as that in which the drug product is marketed;
   5. Testing of drug products for reconstitution at the time of dispensing (as directed in the labeling) as well as after they are reconstituted.

b. An adequate number of batches of each drug product shall be tested to determine an appropriate expiration date and a record of such data shall be maintained. Accelerated studies, combined with basic stability information on the components, drug products, and container-closure system, may be used to support tentative expiration dates provided full shelf life studies are not available and are being conducted. Where data from accelerated studies are used to project a tentative expiration date that is beyond a date supported by actual shelf life studies, there must be stability studies conducted, including drug product testing at appropriate intervals, until the tentative expiration date is verified or the appropriate expiration date determined.

c. For homeopathic drug products, the requirements of this section are as follows:
   1. There shall be a written assessment of stability based at least on testing or examination of the drug product for compatibility of the ingredients, and based on marketing experience with the drug product to indicate that there is no degradation of the product for the normal or expected period of use.
   2. Evaluation of stability shall be based on the same container-closure system in which the drug product is being marketed.

d. Allergenic extracts that are labeled "No U.S. Standard of Potency" are exempt from the requirements of this section.

211.167 Special testing requirements

a. For each batch of drug product purporting to be sterile and/or pyrogen-free, there shall be appropriate laboratory testing to determine conformance to such requirements. The test procedures shall be in writing and shall be followed.

b. For each batch of ophthalmic ointment, there shall be appropriate testing to determine conformance to specifications regarding the presence of foreign particles and harsh or abrasive substances. The test procedures shall be in writing and shall be followed.

c. For each batch of controlled-release dosage form, there shall be appropriate laboratory testing to determine conformance to the specifications for the rate of release of each active ingredient. The test procedures shall be in writing and shall be followed.

211.170 Reserve samples

a. An appropriately identified reserve sample that is representative of each lot in each shipment of each active ingredient shall be retained. The reserve sample consists of at least twice the quantity necessary for all tests required to determine whether the active ingredient meets its established specifications, except for sterility and pyrogen testing. The retention time is as follows:
   1. For an active ingredient in a drug product other than those described in paragraph (a)(2) and (3) of this section, the reserve sample shall be retained for 1 year after the expiration date of the last lot of the drug product containing the active ingredient.
   2. For an active ingredient in a radioactive drug product, except for nonradioactive reagent kits, the reserve sample shall be retained for
      i. three months after the expiration date of the last lot of the drug product containing the active ingredient if the expiration dating period of the drug product is 30 days or less; or
      ii. six months after the expiration date of the last lot of the drug product containing the active ingredient if the expiration dating period of the drug product is more than 30 days.

3. For an active ingredient in an OTC drug product that is exempt from bearing an expiration date under 211.137, the reserve sample shall be retained for 3 years after distribution of the last lot of the drug product containing the active ingredient.

b. An appropriately identified reserve sample that is representative of each lot or batch of drug product shall be retained and stored under conditions consistent with product labeling. The reserve sample shall be stored in the same immediate container-closure system in which the drug product is marketed or in one that has essentially the same characteristics. The reserve sample consists of at least twice the quantity necessary to perform all the required tests, except those for sterility and pyrogens. Except for those for drug products described in paragraph (b)(2) of this section, reserve samples from representative sample lots or batches selected by acceptable statistical procedures shall be examined visually at least once a year for evidence of deterioration unless visual examination would affect the integrity of the reserve sample. Any evidence of reserve sample deterioration shall be investigated in accordance with 211.192. The results of the examination shall be recorded and maintained with other stability data on the drug product. Reserve samples of compressed medical gases need not be retained. The retention time is as follows:
   1. For a drug product other than those described in paragraphs (b)(2) and (3) of this section, the reserve sample shall be retained for 1 year after the expiration date of the drug product.
   2. For a radioactive drug product, except for nonradioactive reagent kits, the reserve sample shall be retained for
      i. three months after the expiration date of the drug product if the expiration dating period of the drug product is 30 days or less, or
      ii. six months after the expiration date of the drug product if the expiration dating period of the drug product is more than 30 days.
   3. For an OTC drug product that is exempt for bearing an expiration date under 211.137, the reserve sample must be retained for 3 years after the lot or batch of drug product is distributed.

211.173 Laboratory animals: Animals used in testing components, in-process materials, or drug products for compliance with established specifications shall be maintained and controlled in a manner that ensures their suitability for their intended use. They shall be identified, and adequate records shall be maintained showing the history of their use.

211.176 Penicillin contamination: If a reasonable possibility exists that a non-penicillin drug product has been exposed to cross-contamination with penicillin, the non-penicillin drug product shall be tested for the presence of penicillin. Such drug product shall not be marketed if detectable levels are found when tested according to procedures specified in *Procedures for Detecting and Measuring Penicillin Contamination in Drugs,* which is incorporated by reference. Copies are available from the Division of Research and Testing (HFD-470), Center for Drug Evaluation and Research, Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740 (www.fda.gov/cder/dmpq/penicillin.pdf).

Subpart J—Records and Reports

211.180 General requirements

a. Any production, control, or distribution record that is required to be maintained in compliance with this part and is specifically associated with a batch of a drug product shall be retained for at least 1 year after the expiration date of the batch or, in the case of certain OTC drug products lacking expiration dating because they meet the criteria for exemption under 211.137, 3 years after distribution of the batch.

b. Records shall be maintained for all components, drug product containers, closures, and labeling for at least 1 year after the expiration date or, in the case of certain OTC drug products lacking expiration dating because they meet the criteria for exemption under 211.137, 3 years after distribution of the last lot of drug product incorporating the component or using the container, closure, or labeling.

c. All records required under this part, or copies of such records, shall be readily available for authorized inspection during the retention period at the establishment where the activities described in such records occurred. These records or copies thereof shall be subject to photocopying or other means of reproduction as part of such inspection. Records that can be immediately retrieved from another location by computer or other electronic means shall be considered as meeting the requirements of this paragraph.

d. Records required under this part may be retained either as original records or as copies, such as photocopies, microfilm, microfiche, or other accurate reproductions of the original records. Where reduction techniques, such as microfilming, are used, suitable reader and photocopying equipment shall be readily available.

e. Written records required by this part shall be maintained so that data therein can be used for

evaluating, at least annually, the quality standards of each drug product to determine the need for changes in drug product specifications or manufacturing or control procedures. Written procedures shall be established and followed for such evaluations and shall include provisions for

1. a review of a representative number of batches, whether approved or rejected, and, where applicable, records associated with the batch;
2. a review of complaints, recalls, returned or salvaged drug products, and investigations conducted under 211.192 for each drug product.

f. Procedures shall be established to ensure that the responsible officials of the firm, if they are not personally involved in or immediately aware of such actions, are notified in writing of any investigations conducted under 211.198, 211.204, or 211.208 of these regulations, any recalls, reports of inspectional observations issued by the FDA, or any regulatory actions relating to GMP brought by the FDA.

211.182 Equipment cleaning and use log: A written record of major equipment cleaning, maintenance (except routine maintenance such as lubrication and adjustments), and use shall be included in individual equipment logs that show the date, time, product, and lot number of each batch processed. If equipment is dedicated to manufacture of one product, then individual equipment logs are not required, provided that lots or batches of such product follow in numerical order and are manufactured in numerical sequence. In cases where dedicated equipment is employed, the records of cleaning, maintenance, and use shall be part of the batch record. The persons performing and double-checking the cleaning and maintenance shall date and sign or initial the log indicating that the work was performed. Entries in the log shall be in chronological order.

211.184 Component, drug product container, closure, and labeling records

These records shall include the following:

a. The identity and quantity of each shipment of each lot of components, drug product containers, closures, and labeling; the name of the supplier; the supplier's lot number(s) if known; the receiving code as specified in 211.80; and the date of receipt. The name and location of the prime manufacturer, if different from the supplier, shall be listed if known.
b. The results of any test or examination performed [including those performed as required by 211.82(a), 211.84(d), or 211.122(a)] and the conclusions derived therefrom.
c. An individual inventory record of each component, drug product container, and closure and, for each component, a reconciliation of the use of each lot of such component. The inventory record shall contain sufficient information to allow determination of any batch or lot of drug product associated with the use of each component, drug product container, and closure.
d. Documentation of the examination and review of labels and labeling for conformity with established specifications in accordance with 211.122(c) and 211.130(c).
e. The disposition of rejected components, drug product containers, closure, and labeling.

211.186 Master production and control records

a. To ensure uniformity from batch to batch, master production and control records for each drug product, including each batch size thereof, shall be prepared, dated, and signed (full signature, handwritten) by one person and independently checked, dated, and signed by a second person. The preparation of master production and control records shall be described in a written procedure and such written procedure shall be followed.
b. Master production and control records shall include:
    1. The name and strength of the product and a description of the dosage form;
    2. The name and weight or measure of each active ingredient per dosage unit or per unit of weight or measure of the drug product and a statement of the total weight or measure of any dosage unit;
    3. A complete list of components designated by names or codes sufficiently specific to indicate any special quality characteristic;
    4. An accurate statement of the weight or measure of each component, using the same weight system (metric, avoirdupois, or apothecary) for each component. Reasonable variations may be permitted, however, in the amount of components necessary for the preparation in the dosage form, provided they are justified in the master production and control records;
    5. A statement concerning any calculated excess of component;
    6. A statement of theoretical weight or measure at appropriate phases of processing;
    7. A statement of theoretical yield, including the maximum and minimum percentages of theoretical yield beyond which investigation according to 211.192 is required;
    8. A description of the drug product containers, closures, and packaging materials, including a specimen or copy of each label and all other labeling signed and dated by the person or persons responsible for approval of such labeling;

9. Complete CMC instructions, sampling and testing procedures, specifications, special notations, and precautions to be followed.

211.188 Batch production and control records

Batch production and control records shall be prepared for each batch of drug product produced and shall include complete information relating to the production and control of each batch. These records shall include:

a. An accurate reproduction of the appropriate master production or control record, checked for accuracy, dated, and signed.
b. Documentation that each significant step in the manufacture, processing, packing, or holding of the batch was accomplished, including:
    1. Dates;
    2. Identity of individual major equipment and lines used;
    3. Specific identification of each batch of component or in-process material used;
    4. Weights and measures of components used in the course of processing;
    5. In-process and laboratory control results;
    6. Inspection of the packaging and labeling area before and after use;
    7. A statement of the actual yield and a statement of the percentage of theoretical yield at appropriate phases of processing;
    8. Complete labeling control records, including specimens or copies of all labeling used;
    9. Description of drug product containers and closures;
    10. Any sampling performed;
    11. Identification of the persons performing and directly supervising or checking each significant step in the operation;
    12. Any investigation made according to 211.192;
    13. Results of examinations made in accordance with 211.134.

211.192 Production record review: All drug product production and control records, including those for packaging and labeling, shall be reviewed and approved by the quality control unit to determine compliance with all established, approved written procedures before a batch is released or distributed. Any unexplained discrepancy (including a percentage of theoretical yield exceeding the maximum or minimum percentages established in master production and control records) or the failure of a batch or any of its components to meet any of its specifications shall be thoroughly investigated, whether or not the batch has already been distributed. The investigation shall extend to other batches of the same drug product and other drug products that may have been associated with the specific failure or discrepancy. A written record of the investigation shall be made and shall include the conclusions and follow-up. 211.194 Laboratory records

a. Laboratory records shall include complete data derived from all tests necessary to ensure compliance with established specifications and standards, including examinations and assays as follows.
    1. A description of the sample received for testing with identification of source (that is, location from where sample was obtained), quantity, lot number or other distinctive code, date sample was taken, and date sample was received for testing.
    2. A statement of each method used in the testing of the sample. The statement shall indicate the location of data that establishes that the methods used in the testing of the sample meet proper standards of accuracy and reliability as applied to the product tested. [If the method employed is in the current revision of the *U. S. Pharmacopeia,* National Formulary, AOAC INTERNATIONAL, Book of Methods, (copies may be obtained from AOAC INTERNATIONAL, 481 North Frederick Ave., suite 500, Gaithersburg, MD 20877) or in other recognized standard references, or is detailed in an approved new drug application and the referenced method is not modified, a statement indicating the method and reference will suffice.] The suitability of all testing methods used shall be verified under actual conditions of use.
    3. A statement of the weight or measure of sample used for each test, where appropriate.
    4. A complete record of all data secured in the course of each test, including all graphs, charts, and spectra from laboratory instrumentation, properly identified to show the specific component, drug product container, closure, in-process material, or drug product, and lot tested.
    5. A record of all calculations performed in connection with the test, including units of measure, conversion factors, and equivalency factors.
    6. A statement of the results of tests and how the results compare with established standards of identity, strength, quality, and purity for the component, drug product container, closure, in-process material, or drug product tested.
    7. The initials or signature of the person who performs each test and the date(s) the tests were performed.
    8. The initials or signature of a second person showing that the original records have been

reviewed for accuracy, completeness, and compliance with established standards.

b. Complete records shall be maintained of any modification of an established method employed in testing. Such records shall include the reason for the modification and data to verify that the modification produced results that are at least as accurate and reliable for the material being tested as the established method.
c. Complete records shall be maintained of any testing and standardization of laboratory reference standards, reagents, and standard solutions.
d. Complete records shall be maintained of the periodic calibration of laboratory instruments, apparatus, gauges, and recording devices required by 211.160(b)(4).
e. Complete records shall be maintained of all stability testing performed in accordance with 211.166.

211.196 Distribution records: Distribution records shall contain the name and strength of the product and description of the dosage form, name and address of the consignee, date and quantity shipped, and lot or control number of the drug product. For compressed medical gas products, distribution records are not required to contain lot or control numbers.

211.198 Complaint files

a. Written procedures describing the handling of all written and oral complaints regarding a drug product shall be established and followed. Such procedures shall include provisions for review by the quality control unit, of any complaint involving the possible failure of a drug product to meet any of its specifications and, for such drug products, a determination as to the need for an investigation in accordance with 211.192. Such procedures shall include provisions for review to determine whether the complaint represents a serious and unexpected adverse drug experience, which is required to be reported to the FDA in accordance with 310.305 and 514.80 of this chapter.
b. A written record of each complaint shall be maintained in a file designated for drug product complaints. The file regarding such drug product complaints shall be maintained at the establishment where the drug product involved was manufactured, processed, or packed, or such file may be maintained at another facility if the written records in such files are readily available for inspection at that other facility. Written records involving a drug product shall be maintained until at least 1 year after the expiration date of the drug product, or 1 year after the date that the complaint was received, whichever is longer. In the case of certain OTC drug products lacking expiration dating because they meet the criteria for exemption under 211.137, such written records shall be maintained for 3 years after distribution of the drug product.
    1. The written record shall include the following information, where known: the name and strength of the drug product, lot number, name of complainant, nature of complaint, and reply to complainant.
    2. Where an investigation under 211.192 is conducted, the written record shall include the findings of the investigation and follow-up. The record or copy of the record of the investigation shall be maintained at the establishment where the investigation occurred in accordance with 211.180(c).
    3. Where an investigation under 211.192 is not conducted, the written record shall include the reason that an investigation was found not to be necessary and the name of the responsible person making such a determination.

Subpart K—Returned and Salvaged Drug Products

211.204 Returned drug products: Returned drug products shall be identified as such and held. If the conditions under which returned drug products have been held, stored, or shipped before or during their return, or if the condition of the drug product, its container, carton, or labeling, as a result of storage or shipping, casts doubt on the safety, identity, strength, quality, or purity of the drug product, the returned drug product shall be destroyed unless examination, testing, or other investigations prove the drug product meets appropriate standards of safety, identity, strength, quality, or purity. A drug product may be reprocessed provided the subsequent drug product meets appropriate standards, specifications, and characteristics. Records of returned drug products shall be maintained and shall include the name and label potency of the drug product dosage form, lot number (or control number or batch number), reason for the return, quantity returned, date of disposition, and ultimate disposition of the returned drug product. If the reason for a drug product being returned implicates associated batches, an appropriate investigation shall be conducted in accordance with the requirements of 211.192. Procedures for the holding, testing, and reprocessing of returned drug products shall be in writing and shall be followed.

211.208 Drug product salvaging: Drug products that have been subjected to improper storage conditions including extremes in temperature, humidity, smoke, fumes, pressure, age, or radiation due to natural disasters, fires, accidents, or equipment failures shall not be salvaged and returned to the marketplace. Whenever there is a question whether drug products have been subjected to such conditions, salvaging operations may be conducted only if there is (a)

evidence from laboratory tests and assays (including animal feeding studies where applicable) that the drug products meet all applicable standards of identity, strength, quality, and purity and (b) evidence from inspection of the premises that the drug products and their associated packaging were not subjected to improper storage conditions as a result of the disaster or accident. Organoleptic examinations shall be acceptable only as supplemental evidence that the drug products meet appropriate standards of identity, strength, quality, and purity. Records including name, lot number, and disposition shall be maintained for drug products subject to this section.

III. AMENDMENTS TO PART 211

- 3. The authority citation for 21 CFR part 211 continues to read as follows:
  Authority: 21 USC 321, 351, 352, 355, 360b, 371, 374; 42 USC 216, 262, 263a, 264
- 4. Section 211.48 is amended by revising paragraph (a) to read as follows:
  211.48 Plumbing
  a. Water supplied by the plumbing system of the facility must be safe for human consumption. This water shall be supplied under continuous positive pressure in a plumbing system free of defects that could contribute contamination to any drug product.
- 5. Section 211.67 is amended by revising paragraph (a) to read as follows:
  211.67 Equipment cleaning and maintenance
  b. Equipment and utensils shall be cleaned, maintained, and sanitized and/or sterilized at appropriate intervals to prevent malfunctions or contamination that would alter the safety, identity, strength, quality, or purity of the drug product beyond the official or other established requirements.
- 6. Section 211.68 is amended by adding paragraph (c) to read as follows:
  211.68 Automatic, mechanical, and electronic equipment
  c. Such automated equipment used for performance of operations addressed by 211.101(c) or (d), 211.103, 211.182, or 211.188(b)(n) can satisfy the requirements included in those sections for the performance of an operation by one person and checking by another person if such equipment is used in conformity with this section and one person verifies that the operations addressed in those sections are performed accurately by such equipment.
- 7. Section 211.72 is revised to read as follows:
  211.72 Filters: Filters for liquid filtration used in the manufacture, processing, or packing of injectable drug products intended for human use shall not release fibers into such products. Fiber-releasing filters may not be used in the manufacture, processing, or packing of these injectable drug products unless it is not possible to manufacture such drug products without the use of such filters. If use of a fiber-releasing filter is necessary, an additional non-fiber-releasing filter of 0.22-micron maximum mean porosity (0.45 microns if the manufacturing conditions so dictate) shall subsequently be used to reduce the content of particles in the injectable drug product.
- 8. Section 211.82 is amended by revising paragraph (b) to read as follows:
  211.82 Receipt and storage of untested components, drug product containers, and closures.
  b. Components, drug product containers, and closures shall be stored under quarantine until they have been tested or examined, whichever is appropriate, and released. Storage within the area shall conform to the requirements of 211.80.
- 9. Section 211.84 is amended by revising paragraphs (c)(1), (d)(3), and (d)(6) to read as follows:
  211.84 Testing and approval or rejection of components, drug product containers, and closures
  c. ***
  1. The containers of components selected shall be cleaned when necessary in a manner to prevent introduction of contaminants into the component.
  d. ***
  3. Containers and closures shall be tested for conformity with all appropriate written specifications. In lieu of such testing by the manufacturer, a certificate of testing may be accepted from the supplier, provided that at least a visual identification is conducted on such containers/closures by the manufacturer and provided that the manufacturer establishes the reliability of the supplier's test results through appropriate validation of the supplier's test results at appropriate intervals.
  6. Each lot of a component, drug product container, or closure with potential for microbiological contamination that is objectionable in view of its intended use shall be subjected to microbiological tests before use.
- 10. Section 211.94 is amended by revising paragraph (c) to read as follows:
  211.94 Drug product containers and closures
  c. Drug product containers and closures shall be clean and, where indicated by the nature of the drug sterilized and processed to

remove pyrogenic properties to ensure that they are suitable for their intended use. Such depyrogenation processes shall be validated.

- 11. Section 211.101 is amended by revising paragraphs (c) and (d) to read as follows:

211.101 Charge-in of components.

c. Weighing, measuring, or subdividing operations for components shall be adequately supervised. Each container of component dispensed to manufacturing shall be examined by a second person to ensure that
   1. the component was released by the quality control unit;
   2. the weight or measure is correct as stated in the batch production records;
   3. the containers are properly identified. If the weighing, measuring, or subdividing operations are performed by automated equipment under 211.68, only one person is needed to ensure conditions of paragraphs (c)(1), (c)(2), and (c)(3) of this section have been met.

d. Each component shall either be added to the batch by one person and verified by a second person or, if the components are added by automated equipment under 211.68, only verified by one person.

- 12. Section 211.103 is revised to read as follows:

211.103 Calculation of yield: Actual yields and percentages of theoretical yield shall be determined at the conclusion of each appropriate phase of manufacturing, processing, packaging, or holding of the drug product. Such calculations shall either be performed by one person and independently verified by a second person, or, if the yield is calculated by automated equipment under 211.68, be independently verified by one person.

- 13. Section 211.110 is amended by revising paragraph (a) introductory text and by adding paragraph (a)(6) to read as follows:

211.110 Sampling and testing of in-process materials and drug products

a. To ensure batch uniformity and integrity of drug products, written procedures shall be established and followed that describe the in-process controls, and tests, or examinations to be conducted on appropriate samples of in-process materials of each batch. Such control procedures shall be established to monitor the output and to validate the performance of those manufacturing processes that may be responsible for causing variability in the characteristics of in-process material and the drug product. Such control procedures shall include, but are not limited to, the following, where appropriate:
   6. Bioburden testing

- 14. Section 211.113 is amended by revising paragraph (b) to read as follows:

211.113 Control of microbiological contamination.

b. Appropriate written procedures, designed to prevent microbiological contamination of drug products purporting to be sterile, shall be established and followed. Such procedures shall include validation of all aseptic and sterilization processes.

- 15. Section 211.160 is amended by revising paragraph (b)(1) to read as follows:

211.160 General requirements

b. ***
   1. Determination of conformity to applicable written specifications for the acceptance of each lot within each shipment of components, drug product containers, closures, and labeling used in the manufacture, processing, packing, or holding of drug products. The specifications shall include a description of the sampling and testing procedures used. Samples shall be representative and adequately identified. Such procedures shall also require appropriate retesting of any component, drug product container, or closure that is subject to deterioration.

- 16. Section 211.182 is revised to read as follows:

211.182 Equipment cleaning and use log: A written record of major equipment cleaning, maintenance (except routine maintenance such as lubrication and adjustments), and use shall be included in individual equipment logs that show the date, time, product, and lot number of each batch processed. If equipment is dedicated to manufacture of one product, then individual equipment logs are not required, provided that lots or batches of such product follow in numerical order and are manufactured in numerical sequence. In cases where dedicated equipment is employed, the records of cleaning, maintenance, and use shall be part of the batch record. The persons performing and double-checking the cleaning and maintenance (or, if the cleaning and maintenance is performed using automated equipment under 211.68, only the person verifying the cleaning and maintenance done by the automated equipment) shall date and sign or initial the log indicating that the work was performed. Entries in the log shall be in chronological order.

- 17. Section 211.188 is amended by revising paragraph (b)(11) to read as follows:

- 211.188 Batch production and control records

b. ***
   ii. Identification of the persons performing and directly supervising or

checking each significant step in the operation, or if a significant step in the operation is performed by automated equipment under 211.68, the identification of the person checking the significant step performed by the automated equipment.

IV. U.S. FDA CGMP OVERVIEW CHECKLIST

1. "C" = current dynamic which evolves over time; "GMP" = Good Manufacturing Practices minimal standards
   a. Not "best" practices unless "best" is, in fact, current minimal
   b. cGMP not NDA or firm specific
2. Compliance terms and phrases related to cGMP issues
   a. Adulteration
   b. Quality controls, quality assurance, quality systems
   c. Contamination (e.g., lack of assurance of sterility)
   d. Cross-contamination (e.g., dirty manufacturing facilities)
   e. Out-of-specification (OoS) findings
   f. Equipment-related issues, calibration/ maintenance
   g. Standard operating procedures (SOPs)
   h. Code of Federal Regulations (CFR), Parts 210 and 211
   i. Form FDA-483 (Inspectional Observations)
   j. Establishment Inspection Report (EIR)
   k. Collection Report (CR)
