BE documentation can be useful during the IND period to compare (1) early and late clinical trial formulations; (2) formulations used in clinical trials and stability studies, if different; (3) clinical trial formulations and to-be-marketed drug products, if different; and (4) product strength equivalence, as appropriate. In each comparison, the new formulation, formulation produced by the new method of manufacture, or new strength is the candidate or test product, and the prior formulation, prior method of manufacture, or prior strength is the reference product. The decision to document BE during drug development is generally left to the judgment of the sponsor, using the principles of relevant FDA guidance (in this FDA guidance, see Sections II.C.2, Post-Approval Changes, and III.D, In Vitro Studies) to determine when changes in components, composition, and/or method of manufacture suggest that further in vitro and/or in vivo studies be performed.

2. Post-Approval Changes

In the presence of certain major changes in components, composition, manufacturing site, and/or method of manufacture after approval, FDA recommends that in vivo BE be demonstrated for the drug product after the change in comparison to the drug product before the change. Under Section 506A(c)(2) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) [21 U.S.C. 356a(c)(2)], certain post-approval changes that require completion of studies must be submitted in a supplement and approved by FDA before distributing a drug product made with the change.

Information on the types of recommended in vitro dissolution and in vivo BE studies for immediate-release and modified-release drug products approved as NDAs for specified post-approval changes is provided in the following FDA guidance*:*

- *SUPAC-IR: Immediate Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Control; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*
- *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls, In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*

3. BE Considerations

BE studies are usually conducted using a crossover design. For such studies, intrasubject variability should be considered when determining the study sample size. In cases when a parallel design is necessary to evaluate BE, consideration should be given to total variability, including inter-subject variability instead of just intrasubject variability.

A test product might fail to demonstrate bioequivalence because it has measures of rate and/or extent of absorption compared to the reference product outside acceptable higher or lower limits. For example, when the test product results in a systemic exposure that is significantly higher than that of the reference product, the concern is the typically limited experience from a safety standpoint for higher systemic concentrations. When the test product has a systemic exposure that is significantly lower than that of the reference product, the concern is potentially a lack of therapeutic efficacy of the test product.

When the variability of the test product is greater than the reference product, the concern relates to both safety and efficacy, because it may suggest that the performance of the test product is not comparable to the reference product, and the test product may be too variable to be clinically useful.

When BE is not demonstrated, the sponsor should demonstrate that the differences in rate and extent of absorption do not significantly affect the safety and efficacy based on available dose–response or concentration–response data. In the absence of this evidence, failure to demonstrate BE may suggest that the test product should be reformulated, or the method of manufacture for the test product should be changed, or additional safety or efficacy data may be needed for the test product. In some cases, conclusions of BE based on the peak drug concentration (C_{max}) and area under the plasma concentration–time curve (AUC) between the test product and the reference product may be insufficient to demonstrate that there is no difference in safety or efficacy if the systemic concentration–time profiles of the test product and the reference product are different [e.g., time to reach peak drug concentration (T_{max}) is different]. For example, differences in the shape of the systemic concentration profile between the test and reference products could imply that the test product may not produce the same clinical response as the reference product. In such cases, additional data analysis (e.g., partial AUCs), exposure–response evaluation, or clinical studies may be recommended to evaluate the BE of the two products.

III. METHODS TO DOCUMENT BA AND BE

Under FDA's regulations, applicants must use the most accurate, sensitive, and reproducible method available to demonstrate BA or BE of a product [21 CFR 320.24(a)]. As noted in 21 CFR 320.24, several in vivo and in vitro methods can be used to measure BA and to establish BE. These include, in general order of preference, pharmacokinetic (PK) studies, in vitro tests predictive of human in vivo BA (in vitro–in vivo correlation), pharmacodynamic (PD) studies, studies with clinical benefit endpoints, and other in vitro studies. In addition, where in vivo data are appropriate to demonstrate BA, our regulations provide guidelines on specific types of in vivo BA studies (see 21 CFR 320.25 through 320.29). This FDA guidance predominantly focuses on the use of PK studies to document BA or BE.

A. Pharmacokinetic Studies

1. General Considerations

FDA's regulations generally define BA and BE in terms of rate and extent of absorption of the active ingredient or moiety to the site of action.[9] For in vivo studies, the regulations also provide for use of PK measures in an accessible biological matrix such as blood, plasma, and/or serum to indicate release of the drug substance from the drug product into the systemic circulation.[10] BA and BE frequently rely on PK measures such as AUC to assess extent of systemic exposure and C_{max} and T_{max} to assess rate of systemic absorption. PK-based comparisons to describe relative BA or make BE determinations are predicated on an understanding that measuring the active moiety or ingredient at the site of action is generally not possible and on an assumption that some relationship exists between the efficacy/safety and concentration of the active moiety and/or its important metabolite(s) in the systemic circulation. A typical study is conducted as a crossover study. The crossover design reduces variability caused by patient-specific factors, thereby increasing the ability to discern differences because of formulation.

2. Pilot Study

If the sponsor chooses, a pilot study in a small number of subjects can be carried out before proceeding with a full-scale BA or BE study. The pilot study can be used to validate analytical methodology, assess PK variability, determine sample size to achieve adequate power, optimize sample collection time intervals, and determine the length of the washout period needed between treatments. For example, for conventional immediate-release products, careful timing of initial samples may avoid a subsequent finding in a full-scale study that the first sample collection occurs after the C_{max}. For modified-release products, a pilot study can help determine the sampling schedule needed to assess lag time and dose dumping. The results of a pilot study can be used as the sole basis to document BA or BE provided the study's design and execution are suitable and a sufficient number of subjects have completed the study.

3. Full-Scale Study

General recommendations for a standard BA or BE study based on PK measurements are provided in Appendix A. Non-replicate crossover study designs are recommended for BA and BE studies of immediate-release and modified-release dosage forms. However, sponsors and/or applicants have the option of using replicate designs for BE studies.

Replicate crossover designs are used to allow estimation of (1) within-subject variance for the reference product or for both the test and reference products, and (2) the subject by formulation interaction variance component. This design accounts for the inter- occasion variability that may confound the interpretation of a BE study as compared to a non-replicate crossover approach. The recommended method of analysis for non-replicate or replicate studies to evaluate BE is average BE, as discussed in Section IV. Recommendations for conducting and evaluating replicate study designs can be found in the FDA guidance for industry *Statistical Approaches to Establishing Bioequivalence.*

4. Study Population

Subjects recruited for BA or BE studies should be 18 years of age or older and capable of giving informed consent. In general, BA and BE studies should be conducted in healthy volunteers if the product can be safely administered to this population. A study in healthy volunteers is likely to produce less PK variability compared with that in patients with potentially confounding factors such as underlying and/

or concomitant disease and concomitant medications. Male and female subjects should be enrolled in BA and BE studies unless there is a specific reason to exclude one sex. Such exclusions could be related to the drug product being indicated in only one sex or a greater potential for adverse reactions in one sex compared to the other. For example, oral contraceptives are evaluated in female subjects because the indication is specific to females. If a drug has the potential to be a teratogen, the drug product should be evaluated in male subjects.

Female subjects enrolled in the study should not be pregnant at the beginning of the study and should not become pregnant during the study. In some instances (e.g., when safety considerations preclude use of healthy subjects), it may be necessary to evaluate BA and BE in patients for whom the drug product is intended. In this situation, sponsors and/or applicants should attempt to enroll patients whose disease process is expected to be stable for the duration of the study.

5. Single-Dose and Multiple-Dose (Steady-State) Testing

This FDA guidance generally recommends single-dose PK studies to assess BA and BE because they are generally more sensitive than steady-state studies in assessing rate and extent of release of the drug substance from the drug product into the systemic circulation.

FDA's regulations at 21 CFR 320.27 provide guidelines on the design of a multiple-dose in vivo BA study. This regulation also identifies instances in which multiple-dose BA studies may be required:

i. There is a difference in the rate of absorption but not in the extent of absorption.
ii. There is excessive variability in bioavailability from subject to subject.
iii. The concentration of the active drug ingredient or therapeutic moiety, or its metabolite(s), in the blood resulting from a single dose is too low for accurate determination by the analytical method.
iv. The drug product is an extended-release dosage form.[11]

We recommend that if a multiple-dose study design is performed, appropriate dosage administration and sampling be carried out to document attainment of steady state.

6. Bioanalytical Methodology

We recommend that sponsors ensure that bioanalytical methods for BA and BE studies be accurate, precise, specific, sensitive, and reproducible. A separate FDA guidance, *Bioanalytical Method Validation*, is available to assist sponsors in validating bioanalytical methods.[12]

7. Administration Under Fasted/Fed Conditions

The BA or BE study should be conducted under fasting conditions (after an overnight fast of at least 10 hours) except when tolerability issues are anticipated with fasting. In these cases, we recommend that applicants conduct only a fed study. A separate FDA guidance, *Food-Effect Bioavailability and Fed Bioequivalence Studies*, is available to assist sponsors.

8. Moieties to Be Measured

The active ingredient that is released from the dosage form or its active moiety and, when appropriate, its active metabolites[13] should be measured in biological fluids collected in BA studies.

Measurement of the active ingredient or the active moiety, rather than metabolites, is generally recommended for BE studies because the concentration–time profile of the active ingredient or the active moiety is more sensitive to changes in formulation performance than that of the metabolite, which is more reflective of metabolite formation, distribution, and elimination. The following are instances when an active metabolite(s) should be measured.

- Measurement of a metabolite(s) is necessary when the active ingredient or the active moiety concentrations are too low to allow reliable analytical measurement in blood, plasma, or serum. In this case, the metabolite should be measured in lieu of the active ingredient or active moiety. We recommend that the confidence interval approach be applied to the metabolite data obtained from these studies.
- Measurement of a metabolite(s) is necessary in addition to the active ingredient or active moiety if the metabolite is formed by pre-systemic metabolism and contributes meaningfully to efficacy and/or safety. The confidence interval approach should be used for all moieties measured. However, the BE criteria are only generally applied to the active ingredient or active moiety. Sponsors should contact the appropriate review division to determine which moieties should be measured.

9. Pharmacokinetic Measures of Systemic Exposure

This FDA guidance recommends that systemic exposure measures be used to evaluate BA and BE. Exposure measures are defined relative to peak, partial, and total portions of the plasma, serum, or blood concentration–time profile, as described here:

- Peak Exposure

We recommend that peak exposure be assessed by measuring the C_{max} obtained directly from the systemic drug concentration data without interpolation. The T_{max} can provide important information about the rate of absorption. The first point of a concentration– time curve based on blood and/or plasma measurements is sometimes the highest concentration, which raises a question about the measurement of true C_{max} because of insufficient early sampling times. A carefully conducted pilot study may help to avoid this problem. Collection of an early time point between 5 and 15 minutes after dosing followed by additional sample collections (e.g., two to five) in the first hour after dosing may be sufficient to assess early peak

concentrations. If this sampling approach is followed, we consider the data to be adequate, even when the highest observed concentration occurs at the first time point.

- Total Exposure (Extent of Absorption)

For single-dose studies, we recommend that the measurement of total exposure be:

- Area under the plasma, serum, or blood concentration time curve from time zero to time t (AUC_{0-t}), where t is the last time point with a measurable concentration.
- Area under the plasma, serum, or blood concentration time curve from time zero to time infinity ($AUC_{0-\infty}$), where $AUC_{0-\infty} = AUC_{0-t} + C_t/\lambda_z$. C_t is the last measurable drug concentration, and λ_z is the terminal or elimination rate constant calculated according to an appropriate method.
- For drugs with a long half-life, truncated AUC can be used (see Section VII.D, Long-Half-Life Drugs).

For steady-state studies, we recommend that the measurement of total exposure be the area under the plasma, serum, or blood concentration–time curve from time zero to time tau over a dosing interval at steady state ($AUC_{0-\tau}$), where tau is the length of the dosing interval.

- Partial Exposure

For orally administered drug products, BA and BE can generally be demonstrated by measurements of peak and total exposure. For certain classes of drugs and under certain circumstances (e.g., to assess onset of an analgesic effect), an evaluation of the partial exposure could be used to support the performance of different formulations by providing further evidence of therapeutic effect. This FDA guidance recommends the use of partial AUC as a partial exposure measure. The time to truncate the partial area should be related to a clinically relevant PD measure. We also recommend that sufficient quantifiable samples be collected to allow adequate estimation of the partial area. For questions on the suitability of the PD measure or use of partial exposure in general, we recommend that sponsors and/or applicants consult the appropriate review division.

10. Comparison of PK Measures in BE Studies

An equivalence approach is recommended for BE comparisons. The recommended approach relies on (1) a criterion to allow the comparison, (2) a confidence interval for the criterion, and (3) a BE limit. Log-transformation of exposure measures before statistical analysis is recommended. This FDA guidance recommends use of an average BE criterion to compare systemic exposure measures for replicate and non-replicate BE studies of both immediate- and modified-release products. For additional information on data analysis, refer to Appendix A and to the FDA guidance for industry on *Statistical Approaches to Establishing Bioequivalence.*

B. Other Approaches to Support BA/BE

In certain circumstances, other approaches are recommended to support a demonstration of BA/BE. Below are some general considerations regarding these other approaches. Sponsors should consult FDA's guidance for industry for additional information on these methods as well.[14]

1. In Vitro Tests Predictive of Human In Vivo BA

In vitro–in vivo correlation (IVIVC) is an approach to describe the relationship between an in vitro attribute of a dosage form (e.g., the rate or extent of drug release) and a relevant in vivo response (e.g., plasma drug concentration or amount of drug absorbed). This model relationship facilitates the rational development and evaluation of extended-release dosage forms. Once an IVIVC is validated, the in vitro test serves as a surrogate for BA and/or BE testing, as well as a tool for formulation screening and setting of the dissolution/drug-release acceptance criteria.

Specifically, in vitro dissolution/drug-release characterization is encouraged for all extended-release product formulations investigated (including prototype formulations), particularly if in vivo absorption characteristics are being defined for the different product formulations. Such efforts may enable the establishment of an IVIVC. When an IVIVC or association is established [21 CFR 320.24(b)(1)(ii)], the in vitro test can serve not only as a quality control specification for the manufacturing process but also as an indicator of how the product will perform in vivo.

Additional information on the development and validation of an IVIVC can be found in the FDA guidance for industry *Extended Release Oral Dosage Forms: Development, Evaluation, and Application of In Vitro/In Vivo Correlations*.

2. Pharmacodynamic Studies

PD studies are not recommended for orally administered drug products when the drug is absorbed into systemic circulation and a PK approach can be used to assess systemic exposure and evaluate BA or BE. PK endpoints are preferred because they are generally the most accurate, sensitive, and reproducible approach. However, in instances where a PK endpoint is not possible, a well- justified PD endpoint can be used to demonstrate BA or BE.

3. Comparative Clinical Studies

Clinical endpoints can be used in limited circumstances, for example, for orally administered drug products when the measurement of the active ingredients or active moieties in an accessible biological fluid (PK approach) or PD approach is not possible. Because these circumstances do not occur very often, use of this approach is expected to be rare.

4. In Vitro Studies

Under certain circumstances, BA and BE can be evaluated using in vitro approaches (e.g., dissolution/drug-release testing) during the preapproval and post-approval phases [see 21 CFR 320.24(b)(5) and (6)]. For example, for orally

administered drugs that are highly soluble and highly permeable, and for which the drug product is rapidly dissolving, documentation of BE using an in vitro approach (dissolution/drug-release studies) may be appropriate based on the Biopharmaceutics Classification System.[15]

The following FDA guidance documents provide recommendations on the development of dissolution methodology, setting specifications, and the regulatory applications of dissolution testing:

- *Dissolution Testing of Immediate-Release Solid Oral Dosage Forms*
- *Extended-Release Oral Dosage Forms: Development, Evaluation, and Application of In Vitro/In Vivo Correlations*

In addition, we recommend that sponsors consult other FDA guidance for additional information on when in vitro data may be appropriate to demonstrate BA or BE of a product.

IV. DOCUMENTING BA AND BE FOR VARIOUS DOSAGE FORMS

This section summarizes the recommendations for documenting BA and BE studies based on the specific dosage forms and whether these evaluations occur preapproval or post-approval.

A. Solutions and Other Solubilized Dosage Forms

For oral solutions, elixirs, syrups, tinctures, or other solubilized forms, in vivo BA and/or BE are generally self-evident, and a requirement of in vivo data for a product may be waived [21 CFR 320.22(b)(3)]. In such instances, the applicant would be deemed to have complied with and fulfilled any requirement for in vivo data.[16] Although a comparative study is not necessary, characterization of the pharmacokinetics of the drug is required [21 CFR 314.50(d)(3)]. In addition, in vivo BE studies that compare different solution formulations are waived based on the assumptions that release of drug substance from the drug product is self-evident and that the solutions do not contain any excipients that significantly affect drug absorption. However, there are certain excipients that may alter the BA (e.g., sorbitol may reduce the BA of drugs, and vitamin E may enhance the BA) in amounts sometimes used in oral liquid dosage forms. In this case, evaluation of in vivo BA and/or BE may be required.

B. Immediate-Release Products

Included in this discussion are capsules, tablets (including conventional, buccal, chewable, orally disintegrating, and sublingual dosage forms), and suspensions.

1. Preapproval Changes

For BA and BE studies, we recommend a single-dose, fasting study be performed. Under certain circumstances, multiple-dose BA studies (see Section III.A.5) and/or food-effect studies may be necessary (see the FDA guidance for industry *Food-Effect Bioavailability and Fed Bioequivalence).* Unconventional dosage forms (buccal, chewable, orally disintegrating, and sublingual dosage forms) should be administered according to intended label use/instructions. In addition, a BA study may be needed with the unconventional dosage form swallowed intact to assess the impact of accidental swallowing of the intact product. Sampling should adequately capture the T_{max} and C_{max} in addition to total exposure.

We recommend that in vitro dissolution be evaluated for all orally administered products. In vitro dissolution test conditions could be the same or different for unconventional compared to conventional dosage forms. If differences in dissolution data exist, they should be discussed with the appropriate review division.

2. Post-Approval Changes

Information on the types of in vitro dissolution and in vivo BE studies needed for approved immediate-release drug products when post-approval changes are made is provided in an FDA guidance for industry entitled *SUPAC-IR: Immediate Release Solid Oral Dosage Forms Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls, In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. We recommend that for post-approval changes, the in vitro or in vivo comparison be made between the post-change and pre-change products.

C. Modified-Release Products

Modified-release (MR) products include extended-release (controlled-release, sustained- release)[17] and delayed-release products.

Extended-release (ER) products are dosage forms that are designed to extend or prolong the release of active ingredient or active moiety from the drug product and may allow a reduction in dosing frequency as compared to when the drug is administered in an immediate-release (IR) dosage form. These drug products can be developed to reduce fluctuations in plasma concentrations when compared to an IR product. ER products can be capsules, tablets, granules, pellets, or suspensions.

Delayed-release (DR) drug products are dosage forms that release active ingredient or active moiety at a time later than immediately after administration (i.e., these drug products exhibit a lag time in quantifiable plasma concentrations). Typically, coatings (e.g., enteric coatings) are used to delay the release of the drug substance until the dosage form has passed through the acidic medium of the stomach. Generally, DR products are treated as IR products. However, if the DR product has complex release characteristics, the relevant review division should be contacted for additional FDA guidance.

If the drug product is an ER product, the following recommendations apply.

1. Preapproval: BA and BE Studies

FDA's regulations at 21 CFR 320.25(f) address the purpose of a BA study for an extended-release product, which is to determine if certain delineated conditions are met.[18] This regulation

also provides that "the reference material(s) for such a bioavailability study shall be chosen to permit an appropriate scientific evaluation of the extended release claims made for the drug product."[19] Appropriate reference products may include

> (1) a solution or suspension of the active drug ingredient or therapeutic moiety, (2) a currently marketed non-controlled-release drug product containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling of the non-controlled release drug product, and (3) a currently marketed ER drug product subject to an approved full NDA containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling of currently marketed ER product.[20]

In general, the PK profile of the ER product may not match that of the approved IR product (e.g., T_{max} is different) or, in some cases, to another ER product. In such a case, establishing similar PK profiles using C_{max} and AUC may not be sufficient to show that the ER product is bioequivalent to the IR product. Thus, additional safety or efficacy studies or PK/PD assessments may be recommended. This FDA guidance recommends that the following BA studies and food-effect BA studies be conducted for an ER drug product submitted as an NDA for the scenarios described below:

New ER formulation comparison to an already approved IR product

- For drugs with linear pharmacokinetics over the therapeutic dose range: A fasting study should be conducted comparing the ER product administered as a single dose at the highest strength to the IR reference administered over the least common time interval to achieve equivalent total dose as for the ER product.[21] If for safety reasons the highest strength cannot be used, a lower strength may be acceptable.
- For drugs with nonlinear pharmacokinetics over the therapeutic dose range: At a minimum, a single dose of the highest and lowest strengths of the ER product should be compared to their corresponding IR references administered over the ER dosing interval. If the relative BA of intermediate ER strengths cannot be inferred based on the above studies, a single-dose fasting study for the intermediate strength(s) of the ER product should be compared to the corresponding IR reference administered over the ER dosing interval.
- When the ER strengths are not proportionally similar in composition, a single-dose fasting dosage strength equivalence assessment study[22] or a dosage strength proportionality study[23] for the ER product should be conducted.
- A single-dose food-effect study should be conducted on the highest ER strength (see the 2002 Food-Effect FDA guidance).
- A steady-state study should be conducted on the highest strength of the ER product compared to an approved IR reference dosed to achieve equivalent total dose as for the ER product.

New ER product (ER_{new}) comparison to an approved ER product (ER_{old}) with a different dosing interval (i.e., where ER_{new} and ER_{old} have unequal dosing intervals)

- The recommendations are the same as outlined in the previous section (development of a new ER formulation given an already approved IR product) except for the choice of the reference product. In this case, the reference product could be either the approved ER_{old} or IR product.

New ER product (ER_{new}) comparison to an approved ER product (ER_{old}) with the same dosing interval

- A single-dose fasting BE study on the highest strength of the ER_{new} product compared to the ER_{old} product. If ER_{new} and ER_{old} are of different strength, then comparison of ER_{new} vs. ER_{old} should be made based on dose using the highest strengths.
- A single-dose, food-effect study should be conducted on the highest ER_{new} strength.
- When the ER_{new} strengths are not proportionally similar in composition, a single-dose fasting dosage strength equivalence assessment study or a dosage strength proportionality study[24] for the ER_{new} product should be conducted.
- In some cases, BE between the new and old ER products may not be sufficient to ensure that there is no difference in safety or efficacy if the PK profiles of the two ER products do not match (e.g., T_{max} is different). Additional data analysis or clinical studies may be needed to ensure that the two products are clinically equivalent.

2. Post-Approval Changes

Information on the types of in vitro dissolution and in vivo BE studies for ER drug products approved in the presence of specific post-approval changes are provided in an FDA guidance for industry *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. We recommend that for post-approval changes, the in vitro or in vivo comparison be made between the post-change and pre-change products.

D. Batch Size

For pivotal BE studies, the test batch should be representative of the production batches. Therefore, the size of the test batch should be at least 10% of the planned production batch size or a minimum of 100,000 units, whichever is larger.

V. ADDITIONAL INFORMATION ON IN VITRO APPROACHES

A. In Vitro Studies Conducted in Support of a Waiver of an In Vivo BA or BE Data Requirement

As discussed above, FDA's regulations contemplate that if in vivo BA or BE data are required for a product, a sponsor may seek a waiver of that requirement under certain circumstances.[25]

For example, in some instances, in vivo BA or BE is self-evident based on certain characteristics of the drug product [21 CFR 320.22(b)], and therefore, any in vivo data requirement has been deemed to have been met. In other delineated circumstances, an in vivo BA or BE data requirement may be waived, and in vitro data may be accepted in lieu of in vivo data [21 CFR 320.22(d)]. For example, an in vivo data requirement may be waived for different strengths of an immediate-release drug product under 21 CFR 320.22(d)(2) when (1) the drug product is in the same dosage form, but in a different strength; (2) this different strength is proportionally similar in its active and inactive ingredients to another drug product for which the same manufacturer has obtained approval; and (3) the new strength meets an appropriate in vitro test as outlined in the regulation.[26] In addition, for waiving higher strengths, linearity of the pharmacokinetics over the therapeutic dose range should be demonstrated.

This FDA guidance defines *proportionally similar* in the following ways:

- All active and inactive ingredients are in exactly the same proportion between different strengths (e.g., a tablet of 50-mg strength has all the inactive ingredients, at exactly half the quantities of a tablet of 100-mg strength and twice those of a tablet of 25-mg strength).
- For high-potency drug substances (where the amount of active drug substance in the dosage form is relatively low), (1) the total weight of the dosage form remains nearly the same for all strengths (within ±10 % of the total weight of the strength on which a BE was performed), (2) the same inactive ingredients are used for all strengths, and (3) the change in any strength is obtained by altering the amount of the active ingredients and one or more of the inactive ingredients.
- Bilayer tablets are considered to be one formulation even though they consist of two separate layers with different compositions. In assessing the proportional similarity of the different strengths, all components of both layers should be proportionally similar. The fact that only one layer is proportionally similar and the other is not clearly indicates that the products (whole tablet) are not proportionally similar. This is relevant because there can be interactions between the different tablet layers, which can differ across different strengths because of the different size of the layers and the varying amounts of excipients present in each layer.

Exceptions to the above definitions may be possible if adequate justification is provided and discussed with the appropriate review division.

B. In Vitro Studies Conducted in Support of Demonstrating BA or BE

FDA may determine that in vitro data are the most accurate, sensitive, and reproducible method to demonstrate BA or BE in other contexts [21 CFR 320.24(b)(5) and (6)].[27] Below we provide additional FDA guidance on the conduct of such studies.

1. Immediate-Release Formulations (Capsules, Tablets, and Suspensions)

In vitro data can be used to compare formulations of drug products under certain circumstances. If an applicant seeks to demonstrate the BA or BE of immediate-release formulations for capsules, tablets, and suspensions using in vitro data, FDA recommends that sponsors generate dissolution profiles for all strengths using an appropriate dissolution method. If the dissolution results indicate that the dissolution characteristics of the product are not dependent on the pH and product strength, dissolution profiles in one medium are usually sufficient to support demonstrating BE. Otherwise, dissolution data in at least three media (e.g., pH 1.2, 4.5, and 6.8) are recommended. The f_2 test should be used to compare profiles from the different strengths of the product (see FDA guidance for industry, *Dissolution Testing of Immediate Release Solid Oral Dosage Forms*). An f_2 value $\geq$50 indicates a sufficiently similar dissolution profile to support a biowaiver. For an f_2 value <50, discussion with the appropriate review division is recommended to determine whether an in vivo study is needed. The f_2 approach is not suitable for rapidly dissolving drug products (e.g., $\geq$85% dissolved in 15 minutes or less).

- *Over-Encapsulation of Clinical Trial Formulations*

During the course of drug development, sponsors sometimes have to blind the formulations that they use in the clinical trials. In certain situations, the only difference between the to-be-marketed and clinical trial formulations is that the dosage form is put into a capsule. This over-encapsulation is done mainly for blinding purposes. It may be possible to support bioequivalence of the to-be-marketed and clinical trial formulations using in vitro data only, provided that no other excipients are added to the capsule and the dissolution profiles are comparable in three media: pH 1.2, pH 4.5, and pH 6.8.

- *Scale-up and Post-Approval Changes*

Certain formulation changes in components and composition, scale-up, manufacturing site, manufacturing process, or equipment can be made post-approval. Depending on the possible impact of the manufacturing change on the release of the active ingredient from the formulation and its BA, certain manufacturing changes for IR products can be approved based solely on similarity of the dissolution profiles between

the post-change and pre-change formulations. Information on recommendations for using in vitro dissolution and in vivo BE studies for immediate-release drug products in such circumstances is provided in FDA's FDA guidance for industry on *SUPAC IR: Immediate-Release Solid Oral Dosage Forms: Scale-Up and Post-Approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. The same principles described in the FDA guidance can be applied to preapproval changes in which the to-be-marketed formulation differs from the clinical trial formulation.

2. Modified-Release Formulations

The use of in vitro data may be acceptable for modified-release drug products for which specific post-approval changes are sought. This use of data are delineated in the FDA guidance for industry *SUPAC-MR: Modified Release Solid Oral Dosage Forms: Scale-Up and Post-approval Changes: Chemistry, Manufacturing, and Controls; In Vitro Dissolution Testing, and In Vivo Bioequivalence Documentation*. The same principles described in the FDA guidance may also apply to preapproval changes. Additional considerations for use of in vitro data are described below.

- *Beaded Capsules: Lower/Higher Strength*

For ER beaded capsules where the strength differs only in the number of beads containing the active moiety, a single-dose, fasting BA or BE study, as appropriate, should be carried out on the highest strength. In vivo BA or BE of one or more lower strengths can be demonstrated based on dissolution profile comparisons, with an in vivo BA or BE study only on the highest strength (unless safety reasons preclude the administration of the highest strength to healthy volunteers). The dissolution profiles for each strength should be generated using the recommended dissolution method. If the dissolution method has not been finalized, dissolution profiles should be generated in at least three media (e.g., pH 1.2, 4.5, and 6.8). In vivo BE studies for higher strengths may not be necessary based on (1) clinical safety and/or efficacy data on the proposed dose and the need for the higher strength, (2) linearity of pharmacokinetics over the therapeutic dose range, and (3) the same dissolution procedures being used for all strengths with similar dissolution results. The f_2 test can be used to demonstrate similar profiles among the different strengths of the product.

- *MR Dosage Forms: Lower Strength*

For MR dosage forms, when the drug product is in the same dosage form but in a different strength and when (1) the drug exhibits linear pharmacokinetics, (2) the various strengths are proportionally similar in their active and inactive ingredients,[28] and (3) the drug-release mechanism is the same, an in vivo BA or BE determination of one or more lower strengths can be demonstrated based on dissolution profile comparisons, with an in vivo BA or BE study only on the highest strength. The dissolution profiles for each strength should be generated using the recommended dissolution method. If the dissolution method has not been finalized, dissolution profiles should be generated in at least three media (e.g., pH 1.2, pH 4.5, and pH 6.8). The dissolution profile should be generated on the test and reference products of all strengths using the same dissolution test conditions.

VI. SPECIAL TOPICS

A. Alcoholic Beverage Effects on MR Drug Products

The consumption of alcoholic beverages may affect the release of a drug substance from an MR formulation. The formulation may lose its MR characteristics, leading to more rapid drug release and altered systemic exposure. This more rapid drug release may have deleterious effects on the drug's safety and/or efficacy.

In vitro assessments of the drug release from the drug product using media with various alcohol concentrations should be conducted. Based on the results of the in vitro assessments, an in vivo BA study of the drug product when administered with alcohol may be needed.

B. Enantiomers vs. Racemates

During development of a racemic drug product, the racemate should be measured in BA studies. It may also be important to measure the individual enantiomers of the racemate to characterize the pharmacokinetics of the enantiomers. For the development of a specific enantiomer, chiral inversion should be assessed.

Measurement of the racemate using an achiral assay is recommended for BE studies. Measurement of individual enantiomers in BE studies is recommended only when all of the following conditions are met: (1) the enantiomers exhibit different PD characteristics, (2) the enantiomers exhibit different PK characteristics, (3) primary efficacy and safety activity resides with the minor enantiomer, and (4) nonlinear absorption is present (as expressed by a change in the enantiomer concentration ratio with change in the input rate of the drug) for at least one of the enantiomers. In such cases, we recommend that BE criteria be applied to the enantiomers separately.

C. Drug Products with Complex Mixtures as the Active Ingredients

Certain drug products may contain complex drug substances (i.e., active moieties or active ingredients that are mixtures of multiple synthetic and/or natural source components). Some or all of the components of these complex drug substances may not be fully characterized with regard to chemical structure and/or biological activity. Quantification of all active or potentially active components in BA and BE studies may not be possible. In such cases, we recommend that BA and BE studies be based on a select number of components.

Criteria for component selection typically include the amount of the moiety in the dosage form, plasma or blood levels of the moiety, and biological activity of the moiety. When PK approaches are infeasible to assess rate and extent of absorption of a drug substance from a drug product, PD, clinical, or in vitro approaches may be appropriate.

D. Long-Half-Life Drugs

In a BA or PK study involving an IR oral product with a long half-life (≥24 hours), adequate characterization of the half-life should include blood sampling over a long period of time. For BA or BE determination of a drug product containing a drug with a long half-life, a non-replicate, single-dose, crossover study can be conducted, provided an adequate washout period is used. If the crossover study is problematic, a study with a parallel design can be used. For either a crossover or parallel study, we recommend that the sample collection time be adequate to ensure completion of gastrointestinal transit (approximately 2 to 3 days) of the drug product and absorption of the drug substance. C_{max} and a suitably truncated AUC can be used to characterize peak and total drug exposure, respectively. For drugs that demonstrate low intrasubject variability in distribution and clearance, a truncated AUC (e.g., $AUC_{0-72\,hr}$) can be used in place of AUC_{0-t} or $AUC_{0-\infty}$. For drugs that demonstrate high intrasubject variability in distribution and clearance, AUC truncation should not be used. In such cases, we recommend that sponsors and/or applicants consult the appropriate review division.

E. Orally Administered Drugs Intended for Local Action

Documentation of BA and BE when the drug substance produces its effects by local action in the gastrointestinal tract can be achieved either by using pharmacokinetics, an acceptable PD end point, clinical efficacy and safety studies, and/or suitably designed and validated in vitro studies, as appropriate. For such cases, we recommend that sponsors and/or applicants consult the appropriate review division. Additional safety studies may also be recommended to characterize the local safety of the product. The in vitro studies should reflect important clinical effects or should be more sensitive to changes in product performance compared to a clinical study. To ensure comparable safety, additional studies with and without food may help in understanding the degree of systemic exposure that occurs following administration of a drug product intended for local action in the gastrointestinal tract.

F. Combination/Co-administered Drug Products

Two or more active ingredients can be formulated as a single drug product, which is referred to as a combination drug product. Generally, the purpose of an in vivo BA study involving a combination drug product is to compare the rate and extent of absorption of each active drug ingredient or therapeutic moiety in the combination drug product to the rate and extent of absorption of each active drug ingredient or therapeutic moiety administered concurrently in separate single-ingredient preparations [21 CFR 320.25(g)].

For the purpose of defining BA or determining BE when required, this FDA guidance recommends that the following studies be conducted for a combination drug product:

- A two-treatment, single-dose, fasting study of the combination drug product versus single-ingredient drug products administered concurrently as a single treatment or an approved combination product containing the same active ingredients. This study should use the highest strength of the combination product with matching doses of individual drug products.
- Certain alternative study designs may also be acceptable depending on the specific situation. For instance, in the case of a combination product consisting of two components, a three-treatment study design comparing the combination drug product vs. single-ingredient drug products administered separately may be appropriate.
- A single-dose, food-effect study on the combination drug product.

BE studies for the combination product should include the measurement of systemic concentrations of each active ingredient. The confidence interval approach should be applied to each measured entity of the combination drug product and its reference product.

In specific cases, drug products are given in combination (not co-formulated) with the objective of increasing the exposure of one of the drugs (subject drug). The second drug is not intended to have a therapeutic effect and is given only to increase the systemic exposure of the subject drug. When both the subject and second drug are new molecular entities, the BA of each should be assessed separately. If a BE study is needed for the subject drug for any reason, the subject drug should be administered with the second drug for both test and reference products. The corresponding PK results, including confidence intervals for BE criteria, should be applied to the subject drug. It is not necessary to measure the concentrations of the second drug. BE studies that are needed for the second drug should be conducted only with the second drug; the subject drug is not dosed with the second drug. When the combination includes a new molecular entity and an approved product, only the BA of the new molecular entity should be assessed. It is assumed that the BA of the approved product has been previously evaluated.

G. Endogenous Substances

Drug products can be developed that contain compounds that are endogenous to humans (e.g., testosterone). When the endogenous compounds are identical to the drug that is being administered, determining the amount of drug released from the dosage form and absorbed by each subject is difficult. In most cases, it is important to measure and approximate

the baseline endogenous levels of the compound in blood (plasma) and subtract these levels from the total concentrations measured from each subject after the drug product is administered. In this way, an estimate of actual drug availability from the drug product can be achieved, and therefore BA and BE can be assessed. Endogenous substances may have homeostatic processes that affect their production and therefore impact their systemic concentrations. To reduce the complication of these homeostatic processes and to potentially avoid the need for baseline correction, an alternative approach might be to enroll patients in BA and BE studies with low or no production of the endogenous substances instead of healthy volunteers.

Baseline concentrations of the endogenous substance produced by the body are measured in the time period prior to study drug administration. Depending on the proposed indication, subtraction of the time-averaged baseline or time-matched baseline from the post-dose concentration for each subject may be recommended. When the endogenous levels are influenced by diet, strict control of the dietary intake of the compound prior to and during the study may also be appropriate. To achieve a stable baseline, subjects should be housed at the clinic for a sufficient time prior to the study and served standardized meals with similar content of the compound to that of the meals served on the PK sampling day.

In either case, baseline concentrations should be determined for each dosing period, and baseline corrections should be period-specific. If a negative plasma concentration value results after baseline correction, this should be set to 0 prior to calculating the baseline-corrected AUC. Pharmacokinetics and statistical analysis should be performed on both uncorrected and corrected data as appropriate. Because of the complexities associated with endogenous compounds, we recommend that sponsors and/or applicants contact the appropriate review division for additional FDA guidance.

H. Drug Products with High Intrasubject Variability

In addition to the traditional approach and the use of average BE using replicate designs, the use of a reference-scaled BE approach using a replicate design can be considered. This approach should be reserved for drugs that demonstrate a high intrasubject variability (≥30%). The reference-scaled average BE approach adjusts the BE limits of highly variable drugs by scaling to the within-subject variability of the reference product in the study and imposes a limit of 0.8 to 1.25 on the geometric mean ratio.[29] The appropriate review division should be consulted when planning the use of the reference-scaled BE approach.

APPENDIX A: GENERAL STUDY DESIGN AND DATA HANDLING

The following general approaches are recommended, recognizing that the elements can be adjusted for certain drug substances and drug products.

Study Conduct

- The BA or BE study should be conducted under fasting conditions (after an overnight fast of at least 10 hours). If the BA or BE study needs to be conducted with food, a separate FDA guidance *Food-Effect Bioavailability and Fed Bioequivalence Studies* is available to assist sponsors.
- The test and reference products should be administered with about 8 ounces (240 milliliters) of water to an appropriate number of subjects.
- Generally, the highest marketed strength should be administered as a single unit. If warranted, to achieve sufficient bioanalytical sensitivity multiple units of the highest strength can be administered, provided the total single dose remains within the labeled dose range and the total dose is safe for administration to the study subjects.
- An adequate washout period (e.g., >half-lives of the moieties to be measured) should separate each treatment.
- The lot numbers of both test and reference listed products and the expiration date for the reference product should be stated. We recommend that the assayed drug content of the test product batch not differ from the reference product by more than ±5%. The sponsor should include a statement of the composition of the test product and, if possible, a side-by-side comparison of the compositions of test and reference listed products. In accordance with 21 CFR 320.38, and 21 CFR 320.63, samples of the test and reference listed product must be retained for at least 5 years. For additional information, please refer to the FDA guidance for industry on *Handling and Retention of Bioavailability and Bioequivalence Testing Samples.*
- Before and during each study phase, we recommend that subjects (1) be allowed water as desired except for 1 hour before and after drug administration, (2) be provided standard meals no less than 4 hours after drug administration, and (3) abstain from alcohol for 24 hours before each study period and until after the last sample from each period is collected.

Sample Collection and Sampling Times

- We recommend that under normal circumstances, blood, rather than urine or tissue, be used.

In most cases, drug or metabolites are measured in serum or plasma. However, in certain cases, such as when an assay of sufficient sensitivity cannot be developed for plasma, whole blood may be more appropriate for analysis. We recommend that blood samples be drawn at appropriate times to describe the absorption, distribution, and elimination phases of the drug. For most drugs we recommend that 12 to 18 samples, including a pre-dose sample, be collected per subject per dose.

This sampling should continue for at least three or more terminal elimination half-lives of the drug to capture 90% of the relevant AUC. For multiple-dose studies, sampling should occur across the dose interval and include the beginning and the end of the interval. The exact timing for sample collection depends on the nature of the drug and the rate of input from the administered dosage form. The sample collection should be spaced in such a way that the maximum concentration (C_{max}) of the drug in the blood and terminal elimination rate constant (λz) can be estimated accurately.

Three or more samples should be obtained during the terminal log-linear phase to obtain an accurate estimate of λ_z from linear regression. We recommend recording the actual clock time when samples are drawn, as well as the elapsed time related to drug administration.

Subjects with Pre-Dose Plasma Concentrations

- If the pre-dose concentration is ≤5% of C_{max} value in that subject, the subject's data without any adjustments can be included in all PK measurements and calculations. We recommend that if the pre-dose value is >5% of C_{max}, the subject should be dropped from all PK evaluations. The subject data should be reported, and the subject should be included in safety evaluations.

Data Deletion because of Vomiting

- We recommend that data from subjects who experience emesis during the course of a study for immediate-release products be deleted from statistical analysis if vomiting occurs at or before two times median T_{max}. For modified-release products, subjects who experience emesis at any time during the labeled dosing interval should not be included in PK analysis.

Data Submission and Analysis

The following PK information is recommended for submission:

- Plasma concentrations and time points.
- Subject, period, sequence, treatment.
- Inter-subject, intrasubject, and/or total variability, if available.
- For single-dose studies: AUC_{0-t}, $AUC_{0-\infty}$, C_{max}, T_{max}, λ_z, and $t_{1/2}$.
- For steady-state studies: $AUC_{0-\tau,}$ $C_{maxss,}$ $T_{max,}$ C_{minss} (lowest concentration in a dosing interval), C_{trough} (concentration at the end of the dosing interval), C_{avss} (average concentration during a dosing interval), degree of fluctuation $[(C_{max} - C_{min})/C_{avss}]$, swing $[(C_{maxss} - C_{minss})/C_{minss}]$. C_{trough} should be measured for several dosing intervals to assess whether steady-state was achieved.
- In addition to the above information, clearance and volume of distribution should be reported for BA studies.

In addition, we recommend that the following statistical information be provided for $AUC_{0-t,}$ $AUC_{0-\infty}$, and Cmax:

- Geometric means
- Arithmetic means
- Geometric mean ratios
- 90% confidence intervals (CI)

We also recommend that logarithmic transformation be provided for measures used for BE demonstration. An FDA guidance for industry, *Statistical Approaches to Establishing Bioequivalence*, is available.

Rounding off of Confidence Interval Values

We recommend that applicants *not round off* CI values; therefore, to pass a CI limit of 80% to 125%, the value should be at least 80.00% and not more than 125.00%.

NOTES

1. This FDA guidance was developed by the Office of Clinical Pharmacology, Office of Translational Sciences, and the Office of New Drugs Quality Assessment, Office of Pharmaceutical Science, in the Center for Drug Evaluation and Research (CDER) at the U.S. Food and Drug Administration (FDA).
2. BA and BE information for drug products in abbreviated new drug applications (ANDAs) and ANDA supplements are not the subject of this FDA guidance. FDA has issued a separate draft FDA guidance on this topic entitled *Bioequivalence Studies with Pharmacokinetic Endpoints for Drugs Submitted Under an ANDA* (December 2013) (ANDA BE Draft FDA guidance). The ANDA BE Draft FDA guidance, when finalized, will represent FDA's current thinking on this topic. Many FDA guidance are referenced throughout this document. The FDA guidance referred to in this footnote, as well as others referenced throughout the remainder of the document, can be found on the FDA Drugs FDA guidance Web page at www.fda.gov/Drugs/FDAguidanceComplianceRegulatoryInformation/FDA guidance/default.htm. We update FDA guidance periodically. To make sure you have the most recent version of an FDA guidance, check the FDA Drugs FDA guidance Web page.
3. These dosage forms include tablets, capsules, solutions, suspensions, conventional/immediate-release drug products, and modified (extended, delayed)-release drug products.
4. *Bioequivalence* is a statutory term reflected in the Federal Food, Drug, and Cosmetic Act (FD&C Act) in Section 505(j) [21 U.S.C. 355(j)], which requires ANDA applicants to demonstrate, among other things, that the proposed generic product is bioequivalent to its reference listed drug. Section 505(j)(2)(A)(iv) of the FD&C Act; see also Section 505(j)(8) of the FD&C Act. There is no similar statutory requirement for an NDA applicant either under Section 505(b)(1) or (b)(2) of the FD&C Act to demonstrate bioequivalence of its proposed product to another product. As a scientific matter, however,

the same or a similar showing of the bioavailability of two products in the NDA context may be needed for the purposes of evaluating the safety or effectiveness of a product. For ease of the reader, we refer to such evaluations of the relative bioavailability for two or more products as an evaluation of bioequivalence in this FDA guidance.

5. For information on these types of studies, see FDA's Drugs FDA guidance Web page. See footnote #2 for information on accessing this Web page.
6. Revisions to the March 2003 BA and BE FDA guidance include (1) expansion of the section on modified-release products, (2) addition of a section on concomitant administration of drug products and combination drug products, (3) addition of a section on alcoholic beverage effects on modified-release dosage forms, (4) addition of an endogenous substance section, (5) addition of a section on drug products with high intrasubject variability, and (6) removal of references to BE studies conducted for ANDAs. The FDA guidance also makes other revisions for clarification.
7. See footnote #2
8. Accordingly, the FDA is revising the 2002 Food-Effect FDA guidance.
9. 21 CFR 320.1(a) and (e).
10. See, e.g., 21 CFR 320.24(b)(1)(i). If serial measurements of the drug or its metabolites in plasma, serum, or blood cannot be accomplished, then measurement of urinary excretion can be used.
11. 21 CFR 320.27(a)(3).
12. See also 21 CFR 320.29.
13. See 21 CFR 320.24(b)(1)(i).
14. See footnote #2.
15. See the FDA guidance for industry on *Waiver of In Vivo Bioavailability and Bioequivalence Studies for Immediate-Release Solid Oral Dosage Forms Based on a Biopharmaceutics Classification System*. This document provides complementary information on the Biopharmaceutics Classification System (BCS).
16. See 21 CFR 320.22(b)(3).
17. For the purpose of this FDA guidance, the terms *extended*, *controlled*, and *sustained* are used interchangeably.
18. 21 CFR 320.25(f)(1).
19. 21 CFR 320.25(f)(2).
20. 21 CFR 320.25(f)(2)(i), (ii), and (iv). We recommend that a sponsor seeking to use as a reference product "a currently marketed extended release drug product subject to an approved full new drug application containing the same active drug ingredient or therapeutic moiety and administered according to the dosage recommendations in the labeling proposed for the extended release drug product," under 21 CFR 320.25(f)(2)(iii), consult with the Agency before commencing such a study.
21. For example, when a 150-milligram (mg) ER product administered once daily (QD) is being developed that gives an approved 50-mg IR reference product administered three times a day (TID) or a 75-mg product administered two times a day (BID), a comparison of the 150-mg ER product administered as a single dose could be compared to either the 50-mg IR reference product administered TID or 75-mg IR reference product administered BID. In this case, the least common time interval is 24 hours.
22. If three strengths, 10 mg, 25 mg, and 50 mg, are being developed for a new ER dosage form, the dosage strength equivalence study should be conducted using 5×10 mg, 2×25 mg, and 1×50 mg to achieve constancy of dose.
23. If three strengths, 10 mg, 25 mg, and 50 mg, are being developed for a new ER dosage form, the dosage strength proportionality study should be conducted using 1×10 mg, 1×25 mg, and 1×50 mg to achieve constancy of dose, and the dosage strength proportionality study should be conducted using 1×10 mg, 1×25 mg, and 1×50 mg.
24. 21 CFR 320.21(b) (giving applicants the option of submitting information that "would permit FDA to waive the submission of evidence demonstrating in vivo bioequivalence") and 320.21(f) (requiring that the information submitted in support of a waiver request "shall meet the criteria set forth in § 320.22").
25. 21 CFR 320.21(b) (giving applicants the option of submitting information that "would permit FDA to waive the submission of evidence demonstrating in vivo bioequivalence") and 320.21(f) (requiring that the information submitted in support of a waiver request "shall meet the criteria set forth in § 320.22").
26. See also 21 CFR 322.22(d)(3) and (4) for additional bases for waiver. Also, FDA, for good cause, may waive a requirement for the submission of evidence of in vivo bioavailability or bioequivalence if waiver is compatible with the protection of the public health. For full NDAs, FDA may defer a requirement for the submission of evidence of in vivo bioavailability if deferral is compatible with the protection of the public health [21 CFR 320.22(e)].
27. In such instances, no waiver under 21 CFR 320.21 and 320.22 is necessary.
28. If the formulations of all the strengths are not compositionally proportional, in vitro data can be submitted for the middle strength(s) if the following data are acceptable: (1) BA or BE data, as appropriate, for both the highest and the lowest strengths, and (2) in vitro multimedia dissolution comparison profiles using f_2 evaluation.
29. For general principles of the reference-scaled approach, refer to Davit B, Conner D. Reference-Scaled Average Bioequivalence Approach. In: Kanfer I, Shargel L, Eds. *Generic Drug Product Development*.

18 FDA 483 Observations

FDA's Office of Regulatory Affairs (ORA) is the lead office for all field activities, including inspections and enforcement. During an inspection, ORA investigators may observe conditions they deem to be objectionable. These observations are listed on an FDA Form 483 when, in an investigator's judgment, the observed conditions or practices indicate that an FDA-regulated product may be in violation of FDA's requirements.

The Product and Program Areas where the FDA inspects include the following categories; the numbers indicate the 483s issued for each category in the fiscal year 2017:

- Biologics: 115
- Drugs: 694
- Devices: 1030
- Human Tissue for Transplantation: 61
- Radiological Health: 31
- Parts 1240 and 1250: 75
- Foods (includes Dietary Supplements): 2662
- Veterinary Medicine: 244

The formulations provided in this book should meet all current cGMP requirements, along with the lists of approved excipients and the level of excipients used in the FDA-approved products. However, assuring that the products are manufactured in a cGMP environment is pivotal to marketing success. In providing a summary of the 483s issued by the FDA, it becomes very clear that most of these violations are avoidable, as they pertain to maintaining a documentation system appropriate for the purpose.

Table 18.1 lists the type of citations issued by the FDA for the inspection of drug manufacturing facilities. The description only includes a general category observation; the actual 483 will provide details of how the FDA reached the conclusion.

Part 211 Current Good Manufacturing Practice for Finished Pharmaceuticals

Subpart A—General Provisions

§ 211.1—Scope
§ 211.3—Definitions

Subpart B—Organization and Personnel

§ 211.22—Responsibilities of quality control unit
§ 211.25—Personnel qualifications
§ 211.28—Personnel responsibilities
§ 211.34—Consultants

Subpart C—Buildings and Facilities

§ 211.42—Design and construction features
§ 211.44—Lighting
§ 211.46—Ventilation, air filtration, air heating and cooling
§ 211.48—Plumbing
§ 211.50—Sewage and refuse
§ 211.52—Washing and toilet facilities
§ 211.56—Sanitation
§ 211.58—Maintenance

Subpart D—Equipment

§ 211.63—Equipment design, size, and location
§ 211.65—Equipment construction
§ 211.67—Equipment cleaning and maintenance
§ 211.68—Automatic, mechanical, and electronic equipment
§ 211.72—Filters

Subpart E—Control of Components and Drug Product Containers and Closures

§ 211.80—General requirements
§ 211.82—Receipt and storage of untested components, drug product containers, and closures
§ 211.84—Testing and approval or rejection of components, drug product containers, and closures
§ 211.86—Use of approved components, drug product containers, and closures
§ 211.87—Retesting of approved components, drug product containers, and closures
§ 211.89—Rejected components, drug product containers, and closures
§ 211.94—Drug product containers and closures

Subpart F—Production and Process Controls

§ 211.100—Written procedures; deviations
§ 211.101—Charge-in of components
§ 211.103—Calculation of yield
§ 211.105—Equipment identification
§ 211.110—Sampling and testing of in-process materials and drug products
§ 211.111—Time limitations on production
§ 211.113—Control of microbiological contamination
§ 211.115—Reprocessing

Subpart G—Packaging and Labeling Control

§ 211.122—Materials examination and usage criteria
§ 211.125—Labeling issuance
§ 211.130—Packaging and labeling operations
§ 211.132—Tamper-evident packaging requirements for over-the-counter (OTC) human drug products
§ 211.134—Drug product inspection
§ 211.137—Expiration dating

Subpart H—Holding and Distribution

§ 211.142—Warehousing procedures
§ 211.150—Distribution procedures

Subpart I—Laboratory Controls

§ 211.160—General requirements
§ 211.165—Testing and release for distribution
§ 211.166—Stability testing
§ 211.167—Special testing requirements
§ 211.170—Reserve samples
§ 211.173—Laboratory animals
§ 211.176—Penicillin contamination

Subpart J—Records and Reports

§ 211.180—General requirements
§ 211.182—Equipment cleaning and use log
§ 211.184—Component, drug product container, closure, and labeling records
§ 211.186—Master production and control records
§ 211.188—Batch production and control records
§ 211.192—Production record review
§ 211.194—Laboratory records
§ 211.196—Distribution records
§ 211.198—Complaint files

Subpart K—Returned and Salvaged Drug Products

§ 211.204—Returned drug products
§ 211.208—Drug product salvaging

TABLE 18.1
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.22(d)	Procedures not in writing, fully followed	The responsibilities and procedures applicable to the quality control unit are not [in writing] [fully followed].	185
21 CFR 211.160(b)	Scientifically sound laboratory controls	Laboratory controls do not include the establishment of scientifically sound and appropriate [specifications] [standards] [sampling plans] [test procedures] designed to assure that [components] [drug product containers] [closures] [in-process materials] [labeling] [drug products] conform to appropriate standards of identity, strength, quality, and purity.	124
21 CFR 211.192	Investigations of discrepancies, failures	There is a failure to thoroughly review [any unexplained discrepancy] [the failure of a batch or any of its components to meet any of its specifications] whether or not the batch has been already distributed.	100
21 CFR 211.100(a)	Absence of written procedures	There are no written procedures for production and process controls designed to assure that the drug products have the identity, strength, quality, and purity they purport or are represented to possess.	91
21 CFR 211.67(b)	Written procedures not established/followed	Written procedures are not [established] [followed] for the cleaning and maintenance of equipment, including utensils, used in the manufacture, processing, packing, or holding of a drug product.	68
21 CFR 211.165(a)	Testing and release for distribution	Testing and release of drug product for distribution do not include appropriate laboratory determination of satisfactory conformance to the [final specifications] [identity and strength of each active ingredient] prior to release.	64
21 CFR 211.68(b)	Computer control of master formula records	Appropriate controls are not exercised over computers or related systems to assure that changes in master production and control records or other records are instituted only by authorized personnel.	62

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.113(b)	Procedures for sterile drug products	Procedures designed to prevent microbiological contamination of drug products purporting to be sterile are not [established] [written] [followed].	62
21 CFR 211.68(a)	Calibration/inspection/checking not done	Routine [calibration] [inspection] [checking] of [automatic] [mechanical] [electronic] equipment is not performed according to a written program designed to assure proper performance.	61
21 CFR 211.166(a)	Lack of written stability program	There is no written testing program designed to assess the stability characteristics of drug products.	61
21 CFR 211.110(a)	Control procedures to monitor and validate performance	Control procedures are not established which [monitor the output] [validate the performance] of those manufacturing processes that may be responsible for causing variability in the characteristics of in-process material and the drug product.	56
21 CFR 211.67(a)	Cleaning/sanitizing/maintenance	Equipment and utensils are not [cleaned] [maintained] [sanitized] at appropriate intervals to prevent [malfunctions] [contamination] that would alter the safety, identity, strength, quality, or purity of the drug product.	54
21 CFR 211.25(a)	Training—operations, GMPs, written procedures	Employees are not given training in [the particular operations they perform as part of their function] [current good manufacturing practices] [written procedures required by current good manufacturing practice regulations].	53
21 CFR 211.188	Prepared for each batch, include complete information	Batch production and control records [are not prepared for each batch of drug product produced] [do not include complete information relating to the production and control of each batch].	51
21 CFR 211.165(e)	Test methods	The [accuracy] [sensitivity] [specificity] [reproducibility] of test methods have not been [established] [documented].	50
21 CFR 211.42(c)(10)(iv)	Environmental monitoring system	Aseptic processing areas are deficient regarding the system for monitoring environmental conditions.	47
21 CFR 211.63	Equipment design, size, and location	Equipment used in the manufacture, processing, packing, or holding of drug products is not [of appropriate design] [of adequate size] [suitably located] to facilitate operations for its [intended use] [cleaning and maintenance].	44
21 CFR 211.100(b)	SOPs not followed/documented	Written production and process control procedures are not [followed in the execution of production and process control functions] [documented at the time of performance].	43
21 CFR 211.180(e)(2)	Items to cover on annual reviews	Written procedures are not [established] [followed] for evaluations done at least annually and including provisions for a review of [complaints] [recalls] [returned or salvaged drug products] [investigations conducted for each drug product].	41
21 CFR 211.194(a)	Complete test data included in records	Laboratory records do not include complete data derived from all tests, examinations, and assay necessary to assure compliance with established specifications and standards. Specifically, ***	39
21 CFR 211.42(c)(10)(v)	Cleaning system	Aseptic processing areas are deficient regarding the system for cleaning and disinfecting the [room] [equipment] to produce aseptic conditions.	38
21 CFR 211.22(a)	Lack of quality control unit	There is no quality control unit.	38
21 CFR 211.198(a)	Complaint handling procedure	Procedures describing the handling of written and oral complaints related to drug products are [not written or followed] [deficiently written or followed].	37

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.113(a)	Procedures for non-sterile drug products	Procedures designed to prevent objectionable microorganisms in drug products not required to be sterile are not [established] [written] [followed].	33
21 CFR 211.25(a)	Training, education, experience overall	Employees engaged in the [manufacture] [processing] [packing] [holding] of a drug product lack the [education] [training] [experience] required to perform their assigned functions.	31
21 CFR 211.113(b)	Validation lacking for sterile drug products	Procedures designed to prevent microbiological contamination of drug products purporting to be sterile do not include [adequate] validation of the sterilization process.	30
21 CFR 211.25(a)	GMP training frequency	GMP training is not conducted [on a continuing basis] [with sufficient frequency] to assure that employees remain familiar with cGMP requirements applicable to them.	29
21 CFR 211.192	Written record of investigation incomplete	Written records of investigations into [unexplained discrepancies] [the failure of a batch or any of its components to meet specifications] do not [always] include the conclusions and follow-up.	29
21 CFR 211.160(a)	Following/documenting laboratory controls	Established [specifications] [standards] [sampling plans] [test procedures] [laboratory control mechanisms] are not [followed] [documented at the time of performance].	28
21 CFR 211.165(b)	Microbiological testing	Each batch of drug product required to be free of objectionable microorganisms is not tested through appropriate laboratory testing.	27
21 CFR 211.188(b)	Batch production and batch control record requirements	The batch production and control records are deficient in that they do not include documentation of the accomplishment of each significant step in [manufacturing] [processing] [packing] [holding].	26
21 CFR 211.160(b)(4)	Calibration—at intervals, written program, remedial action	The calibration of [instruments] [apparatus] [gauges] [recording devices] is not done at suitable intervals [in accordance with an established written program] [with provisions for remedial action in the event accuracy and/or precision limits are not met].	26
21 CFR 211.192	Quality control unit review of records	Drug product production and control records are not [reviewed] [approved] by the quality control unit to determine compliance with all established, approved written procedures before a batch is released or distributed.	25
21 CFR 211.194(a)(4)	Complete test data	Laboratory records are deficient in that they do not include a complete record of all data obtained during testing.	25
21 CFR 211.142(b)	Storage under appropriate conditions	Drug products are not stored under appropriate conditions of [temperature] [humidity] [light] so that their identity, strength, quality, and purity are not affected.	25
21 CFR 211.198(a)	Procedures to be written and followed	Procedures describing the handling of all written and oral complaints regarding a drug product are not [established] [written] [followed].	25
21 CFR 211.111	Establishment of time limitations	Time limits are not established when appropriate for the completion of each production phase to assure the quality of the drug product.	24
21 CFR 211.58	Buildings not maintained in good state of repair	Buildings used in the [manufacturing] [processing] [packing] [holding] of a drug product are not maintained in a good state of repair.	24
21 CFR 211.160(a)	Deviations from laboratory control requirements	Deviations from written [specifications] [standards] [sampling plans] [test procedures] [laboratory mechanisms] are not [recorded] [justified].	23
21 CFR 211.84(d)(2)	Establish reliability of supplier's CoA	Establishment of the reliability of the component supplier's report of analyses is deficient in that the test results are not appropriately validated at appropriate intervals.	22

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.180(e)	Records reviewed annually	Records are not maintained so that data therein can be reviewed at least annually to evaluate the quality standards of each drug product to determine the need for changes in specifications or manufacturing or control procedures.	22
21 CFR 211.100(b)	Procedure deviations recorded and justified	Deviations from written production and process control procedures are not [recorded] [justified].	22
21 CFR 211.84(d)(2)	Reports of analysis (components)	Reports of analysis from component suppliers are accepted in lieu of testing each component for conformity with all appropriate written specifications, without [performing at least one specific identity test on each component] [establishing the reliability of the supplier's analyses through appropriate validation of the supplier's test results at appropriate intervals].	22
21 CFR 211.160(a)	Lab controls established, including changes	The establishment of [specifications] [standards] [sampling plans] [test procedures] [laboratory control mechanisms], including any changes thereto, are not [drafted by the appropriate organizational unit] [reviewed and approved by the quality control unit].	21
21 CFR 211.182	Written records kept in individual logs	Written records of major equipment [cleaning] [maintenance] [use] are not included in individual equipment logs.	21
21 CFR 211.170(b)	Annual visual exams of drug products	Reserve samples from representative sample lots or batches of drug products selected by acceptable statistical procedures are not examined visually at least once a year for evidence of deterioration.	21
21 CFR 211.192	No written record of investigation	Written records are not [always] made of investigations into [unexplained discrepancies] [the failure of a batch or any of its components to meet specifications].	20
21 CFR 314.80(b)	Failure to develop written procedures	Written procedures have not been developed for the [surveillance] [receipt] [evaluation] [reporting to FDA] of post-marketing adverse drug experiences.	20
21 CFR 211.192	Extent of discrepancy, failure investigations	Investigations of [an unexplained discrepancy] [a failure of a batch or any of its components to meet any of its specifications] did not extend to [other batches of the same drug product] [other drug products that may have been associated with the specific failure or discrepancy].	19
21 CFR 211.100(a)	Changes to procedures not reviewed, approved	Changes to written procedures are not [drafted, reviewed, and approved by the appropriate organizational unit] [reviewed and approved by the quality control unit].	19
21 CFR 211.22(a)	Authority lacking to review records, investigate errors	The quality control unit lacks authority to [review production records to assure that no errors have occurred] [fully investigate errors that have occurred].	18
21 CFR 211.80(a)	Procedures to be in writing	Written procedures are lacking which describe in sufficient detail the [receipt] [identification] [storage] [handling] [sampling] [testing] [approval] [rejection] of [components] [drug product containers] [closures].	18
21 CFR 211.166(a)	Written program not followed	The written stability testing program is not followed.	18
21 CFR 211.122(a)	Written procedures describing in detail	There is a lack of written procedures describing in sufficient detail the [receipt] [identification] [storage] [handling] [sampling] [examination] [testing] of labeling and packaging materials.	17
21 CFR 211.125(a)	Strict control not exercised over labeling issued	Strict control is not exercised over labeling issued for use in drug product labeling operations.	17
21 CFR 211.56(b)	Written sanitation procedures lacking	There is a lack of written procedures [assigning responsibility] [providing cleaning schedules] [describing in sufficient detail the methods, equipment, and materials to be used] for sanitation.	17

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.28(a)	Clothing appropriate for duties performed	Clothing of personnel engaged in the [manufacturing] [processing] [packing] [holding] of drug products is not appropriate for the duties they perform.	16
21 CFR 211.84(d)(1)	Component identity verification	Drug product component testing is deficient in that at least one specific test to verify the identity of each component is not performed.	16
21 CFR 211.130	Procedures are written and followed	Procedures designed to assure that correct [labels] [labeling] [packaging materials] are used for drug products are not [written] [followed].	15
21 CFR 211.180(e)(1)	Review of representative number of batches	Written procedures are not [established] [followed] for evaluations conducted at least annually to review records associated with a representative number of batches, whether approved or rejected.	15
21 CFR 211.46(b)	Equipment for environmental control	Equipment for adequate control over [air pressure] [micro-organisms] [dust] [humidity] [temperature] is not provided when appropriate for the manufacture, processing, packing, or holding of a drug product.	15
21 CFR 211.137(a)	Expiration date lacking	Drug products do not bear an expiration date determined by appropriate stability data to assure they meet applicable standards of identity, strength, quality, and purity at the time of use.	14
21 CFR 211.103	Actual vs. theoretical yields not determined	Actual yield and percentages of theoretical yield are not determined at the conclusion of each appropriate phase of [manufacturing] [processing] [packaging] [holding] of the drug product.	13
21 CFR 211.166(a)(3)	Valid stability test methods	The written stability program for drug products does not include [reliable] [meaningful] [specific] test methods.	13
21 CFR 211.56(a)	Sanitation—buildings not clean, free of infestation	Buildings used in the manufacture, processing, packing, or holding of drug products are not [maintained in a clean and sanitary condition] [free of infestation by rodents, birds, insects, and other vermin].	13
21 CFR 211.67(b)	Written procedures fail to include	Written procedures for cleaning and maintenance fail to include [assignment of responsibility] [maintenance and cleaning schedules] [description in sufficient detail of methods, equipment, and materials used] [description in sufficient detail of the methods of disassembling and reassembling equipment as necessary to assure proper cleaning and maintenance] [instructions for removal or obliteration of previous batch identification] [instructions for protection of clean equipment from contamination prior to use] [parameters relevant to the operation].	13
21 CFR 211.80(a)	Written procedures not followed	Written procedures are not followed for the [receipt] [identification] [storage] [handling] [sampling] [testing] [approval] [rejection] of [components] [drug product containers] [closures].	13
21 CFR 211.142	Written warehousing procedures established/ followed	Procedures describing the warehousing of drug products are not [established] [followed].	13
21 CFR 314.80(c)(1)(i)	Late submission of 15-day report	Not all adverse drug experiences that are both serious and unexpected have been reported to FDA within 15 calendar days of initial receipt of the information.	13
21 CFR 211.22(a)	Approve or reject components, products	The quality control unit lacks the responsibility and authority to [approve] [reject] all [components] [drug product containers] [closures] [in process materials] [packaging material] [labeling] [drug products].	12

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.80(b)	Handling and storage to prevent contamination	There was a failure to handle and store [components] [drug product containers] [closures] at all times in a manner to prevent contamination.	12
21 CFR 211.42(c)	Defined areas of adequate size for operations	The [separate or defined areas] [control systems] necessary to prevent contamination or mix-ups are deficient.	11
21 CFR 211.84(d)(1)	Identity testing of each component	The identity of each component of a drug product is not verified by conducting at least one test to verify the identity, using specific identity tests if they exist.	11
21 CFR 211.165(f)	Failing drug products not rejected	Drug products failing to meet established [standards] [specifications] [quality control criteria] are not rejected.	11
21 CFR 211.160(b)(4)	Establishment of calibration procedures	Procedures describing the calibration of instruments, apparatus, gauges, and recording devices are [not written or followed] [deficiently written or followed].	11
21 CFR 211.22(c)	Approve or reject procedures or specs	The quality control unit lacks responsibility to [approve] [reject] all procedures or specifications impacting on the [identity] [strength] [quality] [purity] of drug products.	10
21 CFR 211.67(c)	Cleaning/maintenance records not kept	Records are not kept for the [maintenance] [cleaning] [sanitizing] [inspection] of equipment.	10
21 CFR 211.42(c)(10)(iii)	Air supply	Aseptic processing areas are deficient regarding air supply that is filtered through high-efficiency particulate air filters under positive pressure.	10
21 CFR 211.188(a)	Accurate reproduction	The batch production and control records are deficient in that they are not [an accurate reproduction of the appropriate master production or control record] [checked for accuracy, dated, and signed].	10
21 CFR 211.186(b)(9)	Manufacturing instructions and specifications	The master production and control records are deficient in that they do not include complete [manufacturing] [control] [instructions] [sampling] [testing] [procedures] [specifications] [special notations] [precautions].	10
FDCA 503B(a)(10)	Drug product label, outsourcer facility	The labels of your outsourcing facility's drug products are deficient.	10
21 CFR 211.42(a)	Buildings of suitable size, construction, location	Buildings used in the manufacture, processing, packing, or holding of a drug product do not have the suitable [size] [construction] [location] to facilitate cleaning, maintenance, and proper operations.	9
21 CFR 211.42(c)(1)	Incoming material area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to the receipt, identification, storage, and withholding from use of [components] [drug product containers] [closures] [labeling] pending sampling, testing, or examination by the quality control unit before release for manufacturing or packaging.	9
21 CFR 211.105(b)	Distinctive ID or code not recorded in batch record	The batch records do not record the distinctive [identification number] [code] [name of equipment] to identify major equipment to show the specific equipment used in the manufacture of a batch of a drug product.	9
21 CFR 211.150(b)	Distribution recall system	The distribution system is deficient in that each lot of drug product cannot be readily determined to facilitate its recall if necessary. Specifically, ***	9
21 CFR 211.165(c)	Sampling and testing plans not described	Sampling and testing plans for drug products are not described in written procedures which include the [method of sampling] [number of units per batch to be tested].	9
21 CFR 211.166(b)	Adequate number of batches on stability	An adequate number of batches of each drug product are not tested [nor are records of such data maintained] to determine an appropriate expiration date.	9

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.167(a)	Sterility/pyrogen-free testing	Each batch of drug product purporting to be [sterile] [pyrogen-free] is not laboratory tested to determine conformance to such requirements.	9
21 CFR 211.186(a)	Signature and checking of records—two persons	The master production and control records for each batch size of drug product are not [prepared, dated, and signed by one person with a full handwritten signature] [independently checked, dated, and signed by a second person].	9
21 CFR 211.110(a)	Written in-process control procedures	Written procedures are not [established] [followed] that describe the [in-process controls] [tests] [examinations] to be conducted on appropriate samples of in-process materials of each batch.	9
21 CFR 211.160(b)(3)	Acceptance of drug products	Determinations of conformance to appropriate written specifications for acceptance are [not made] [deficient] for drug products.	9
21 CFR 211.22(a)	Contract drug products—lack of responsibility	The quality control unit lacks responsibility for approving or rejecting drug products [manufactured] [processed] [packed] [held] under contract by another company.	8
21 CFR 211.101(d)	Component addition checked by second person	Each component is not added to a batch by one person and verified by a second person.	8
21 CFR 211.87	Retest of approved components/containers/ closures	Approved [components] [drug product containers] [closures] are not retested or reexamined as appropriate for identity, strength, quality, and purity after [storage for long periods] [exposure to conditions that might have an adverse effect] with subsequent approval or rejection by the quality control unit.	8
21 CFR 211.84(a)	Components withheld from use pending release	Each lot of [components] [drug product containers] [closures] is not withheld from use until the lot has been sampled, tested, examined, and released by the quality control unit.	8
21 CFR 211.180(c)	Records not made readily available to FDA	Records associated with drug product [components] [containers] [closures] [labeling] [production] [control] [distribution] and within the retention period for such records were not made readily available for authorized inspection.	8
21 CFR 211.186(a)	Written procedures followed	Procedures for the preparation of master production and control records are not [described in a written procedure] [followed].	8
21 CFR 211.198(b)(2)	Complaint investigation/follow-up findings	Complaint records are deficient in that they do not include the findings of the [investigation] [follow-up].	8
21 CFR 211.84(d)(2)	Component identification test	Specific identification tests are not conducted on components that have been accepted based on the supplier's report of analysis.	8
21 CFR 211.89	Quarantine of rejected components et al.	Rejected [components] [drug product containers] [closures] are not controlled under a quarantine system designed to prevent their use in manufacturing or processing operations for which they are unsuitable.	8
21 CFR 211.68(b)	Backup data not assured as exact and complete	Backup data are not assured as [exact] [complete] [secure from alteration, erasure, or loss] through keeping hard copy or alternate systems.	8
21 CFR 211.166(a)	Results not used for expiration dates, storage cond.	Results of stability testing are not used in determining [appropriate storage conditions] [expiration dates].	8
21 CFR 211.198(b)(2)	Written record of complaint to include findings, follow-up	Written records of investigation of a drug complaint do not include [the findings of the investigation] [the follow-up].	8

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.186(b)(9)	Complete instructions, procedures, specifications et al.	Master production and control records lack [complete manufacturing and control instructions] [sampling and testing procedures] [specifications] [special notations] [precautions to be followed].	8
21 CFR 314.81(b)(1)(ii)	Failure to meet specifications	An NDA-Field Alert Report was not submitted within three working days of receipt of information concerning a failure of one or more distributed batches of a drug to meet the specifications established for it in the application.	8
21 CFR 211.68(b)	Backup file not maintained	Failure to maintain a backup file of data entered into the computer or related system.	7
21 CFR 211.68(a)	Written calibration/inspection records not kept	Records of the [calibration checks] [inspections] of automatic, mechanical, or electronic equipment, including computers or related systems, are not maintained.	7
21 CFR 211.125(f)	Procedures written and followed	Procedures describing in sufficient detail the controls employed for the issuance of labeling are not [written] [followed].	7
21 CFR 211.84(e)	Rejecting when specifications not met	Failure to reject any lot of [components] [drug product containers] [closures] that did not meet the appropriate written specifications for identity, strength, quality, and purity.	7
21 CFR 211.167(a)	Sterility/pyrogens—test methods written, followed	Test procedures relative to appropriate laboratory testing for [sterility] [pyrogens] are not [written] [followed].	7
21 CFR 211.194(d)	Laboratory equipment calibration records	Laboratory records do not include complete records of the periodic calibration of laboratory [instruments] [apparatus] [gauges] [recording devices].	7
21 CFR 211.194(a)(8)	Identification of person performing review of lab records	Laboratory records are deficient in that they do not include the [initials] [signature] of the second person reviewing the record for accuracy.	7
21 CFR 211.198(a)	Reporting of adverse drug experience to FDA	Written procedures describing the handling of all written and oral complaints do not include provisions for review to determine whether the complaint represents a serious and unexpected adverse drug experience which is required to be reported to the Food and Drug Administration.	7
21 CFR 211.194(a)(8)	Second person sign off	Laboratory records do not include the initials or signature of a second person showing that the original records have been reviewed for [accuracy] [completeness] [compliance with established standards].	7
21 CFR 314.81(b)(2)	Timely submission	An annual report was not submitted [each year] [within 60 days of the anniversary date of U.S. approval of the application] to the FDA division responsible for reviewing the application.	7
21 CFR 211.25(b)	Supervisor training/education/experience	Individuals responsible for supervising the [manufacture] [processing] [packing] [holding] of a drug product lack the [education] [training] [experience] to perform their assigned functions in such a manner as to assure the drug product has the safety, identity, strength, quality, and purity that it purports or is represented to possess.	6
21 CFR 211.68(b)	Input/output verification	Input to and output from [the computer] [related systems of formulas] [records or data] are not checked for accuracy.	6
21 CFR 211.42(c)(5)	Mfg/processing operations area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding the manufacturing and processing operations.	6

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.42(c)(10)(vi)	Equipment to control conditions	Aseptic processing areas are deficient regarding systems for maintaining any equipment used to control the aseptic conditions.	6
21 CFR 211.84(d)(2)	Component written specification	Component testing is deficient in that each component is not tested for conformity with all appropriate written specifications for purity, strength, and quality. Specifically, ***	6
21 CFR 211.52	Washing and toilet facilities are deficient	Washing and toilet facilities lack [hot and cold water] [soap or detergent] [air driers or single-service towels] [cleanliness].	6
21 CFR 211.100(a)	Approval and review of procedures	Written procedures are not [drafted, reviewed, and approved by the appropriate organizational units] [reviewed and approved by the quality control unit].	6
21 CFR 211.160(b)(3)	Drug product sample	Drug product samples are not [representative of the entire batch] [properly identified].	6
21 CFR 211.160(b)(4)	Written calibration procedures	Written calibration procedures for instruments, apparatus, gauges, and recording devices are deficient in that they do not include specific [directions] [schedules] [limits for accuracy and precision] [provisions for remedial action if limits are not met].	6
21 CFR 211.165(d)	Acceptance criteria for sampling and testing	Acceptance criteria for the sampling and testing conducted by the quality control unit are not adequate to assure that batches of drug products meet [each appropriate specification] [appropriate statistical quality control criteria] as a condition for their approval and release.	6
21 CFR 211.170(b)	Reserve samples identified, representative, stored	Reserve drug product samples are not [appropriately identified] [representative of each lot or batch of drug product] [retained and stored under conditions consistent with product labeling].	6
21 CFR 211.194(a)(2)	Suitability of testing methods verified	The suitability of all testing methods is not verified under actual conditions of use.	6
21 CFR 211.194(a)(5)	Calculations performed are in the records	Laboratory records do not include a record of all calculations performed in connection with the test.	6
21 CFR 211.42(b)	Adequate space lacking to prevent mix-ups and contamination	The building lacks adequate space for the orderly placement of equipment and materials to prevent mix-ups between [different components] [drug product containers] [closures] [labeling] [in-process materials] [drug products] and to prevent contamination.	6
21 CFR 211.22(b)	Adequate lab facilities not available	Adequate lab facilities for testing and approval or rejection of [components] [drug product containers] [closures] [packaging materials] [in-process materials] [drug products] are not available to the quality control unit.	5
21 CFR 211.42(c)(7)	Quarantined drug products area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to the quarantine storage of drug products prior to release.	5
21 CFR 211.194(c)	Testing and standardization of standards et al.	Laboratory records do not include complete records of any testing and standardization of laboratory [reference standards] [reagents] [standard solutions].	5
21 CFR 211.110(c)	In-process materials characteristics testing	In-process materials are not tested for [identity] [strength] [quality] [purity] and approved or rejected by the quality control unit [during the production process] [after storage for long periods].	5
21 CFR 211.150(b)	Recall facilitation	A system by which the distribution of each lot of drug product can be readily determined to facilitate its recall if necessary has not been established.	5

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.160(b)(4)	Instruments, apparatus, et al. not meeting specs	The use of [instruments] [apparatus] [gauges] [recording devices] not meeting established specifications was observed.	5
21 CFR 211.188(b)(12)	Investigations made into any unexplained discrepancy	Batch production and control records do not include the results of any investigation made into any unexplained discrepancy, whether or not the batch of drug product had already been distributed.	5
21 CFR 211.198(a)	Complaints reviewed by quality control unit	Written procedures describing the handling of complaints do not include provisions for [review by the quality control unit of any complaint involving the possible failure of a drug product to meet any of its specifications] [a determination as to the need for an investigation of any unexplained discrepancy] [explaining the reasons for the failure of the batch or any of its components to meet specifications].	5
21 CFR 211.194(a)(4)	Data secured in course of each test	Laboratory records do not include a complete record of all data secured in the course of each test, including all [graphs] [charts] [spectra] from laboratory instrumentation, properly identified to show the [specific component] [drug product container] [closure] [in-process material] [lot tested] [drug product tested].	5
21 CFR 314.80(c)(2)	Late submission of annual safety reports	Not all annual periodic adverse drug experience reports have been submitted within 60 days of the anniversary date of the approval of the application.	5
21 CFR 211.25(c)	Inadequate number of personnel	The number of qualified personnel is inadequate to [perform] [supervise] the [manufacture] [processing] [packing] [holding] of each drug product.	4
21 CFR 211.28(a)	Protective apparel not worn	Protective apparel is not worn as necessary to protect drug products from contamination.	4
21 CFR 211.42(c)(10)	Aseptic processing area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to aseptic processing of drug products.	4
21 CFR 211.42(c)(10)(i)	Floors, walls, ceiling surfaces	Aseptic processing areas are deficient in that [floors] [walls] [ceilings] are not smooth and/or hard surfaces that are easily cleanable.	4
21 CFR 211.134(a)	Correct labels during finishing operations	Packaged and labeled products are not examined during finishing operations to provide assurance that containers and packages in the lot have the correct label.	4
21 CFR 211.134(c)	Examinations documented	The results of the examination of the packaged and labeled products were not documented in the batch production or control records.	4
21 CFR 211.142(a)	Quarantine—actual practice	Drug products are not quarantined before being released by the quality control unit.	4
21 CFR 211.82(b)	Quarantine storage of components	Incoming [components] [drug product containers] [closures] are not stored under quarantine until they have been tested or examined, as appropriate, and released.	4
21 CFR 211.84(b)	Representative samples	Representative samples are not taken of each shipment of each lot of [components] [drug product containers] [closures] for testing or examination.	4
21 CFR 211.84(d)(3)	Establish reliability of supplier's CofA	Establishment of the reliability of the [container] [closure] supplier's report of analyses is deficient in that the test results are not appropriately validated at appropriate intervals.	4
21 CFR 211.94(b)	Protection from external factors	Container closure systems do not provide adequate protection against foreseeable external factors in storage and use that can cause deterioration or contamination of the drug product.	4

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.94(c)	Containers and closures clean, sterilized, pyrogen-free	Drug product [containers] [closures] were not [clean] [sterilized and processed to remove pyrogenic properties] to assure that they are suitable for their intended use.	4
21 CFR 211.166(a)(4)	Testing in same container—closure system	The written stability program does not assure testing of the drug product in the same container-closure system as that in which the drug product is marketed.	4
21 CFR 211.166(c)(1)	Homeopathic drugs, assessment of stability	There is no written assessment of stability of homeopathic drug products based at least on [testing or examination of the drug product for compatibility of the ingredients] [marketing experience with the drug product to indicate that there is no degradation of the product for the normal or expected period of use].	4
21 CFR 211.182	Specific information required in individual logs	Individual equipment logs do not show [time] [date] [product] [lot number of each batch processed].	4
21 CFR 211.184(c)	Individual inventory record	Records fail to include an individual inventory record of each [component] [reconciliation of the use of each component] [drug product container] [drug product closure] with sufficient information to allow determination of any associated batch or lot of drug product.	4
21 CFR 211.188(b)(8)	Labeling control records and label copies	The batch production and control records are deficient in that they do not include [complete labeling control records] [specimen] [copy] of labeling.	4
21 CFR 211.196	Distribution record requirements	Distribution records do not contain the [name and strength of the drug product] [description of dosage form] [name and address of consignee] [date and quantity shipped] [lot or control number of drug product].	4
21 CFR 211.194(a)(2)	Laboratory test method verification	Verification of the suitability of the testing methods is deficient in that they are not [performed under actual conditions of use] [documented on the laboratory records].	4
21 CFR 211.101(b)	Measured components for manufacturing	Components for drug product manufacturing are not [weighed] [measured] [subdivided as appropriate].	4
21 CFR 211.105(a)	Identification of containers, lines, equipment	All [compounding and storage containers] [processing lines] [major equipment] used during the production of a batch of drug product is not properly identified at all times to indicate [contents] [the phase of processing of the batch].	4
21 CFR 211.160(b)(2)	In-process sample representation/identification	In-process samples are not [representative] [properly identified].	4
21 CFR 211.84(d)(2)	Testing each component for conformity with specs	Each component is not tested for conformity with all appropriate written specifications for purity, strength, and quality.	4
21 CFR 211.150	Written distribution procedure	Written distribution procedures are not [established] [followed].	4
21 CFR 211.170(b)	Reserve drug product sample quantity—all tests	The reserve sample of drug product does not consist of at least twice the quantity necessary to perform all the required tests of drug product.	4
21 CFR 314.80(c)(2)	Interval	Periodic reports of non-alert adverse drug experiences have not been submitted [quarterly for an application which was approved less than three years ago] [yearly for an application which was approved three or more years ago].	4
21 CFR 314.80(c)(2)	Late submission of quarterly safety reports	Not all quarterly periodic adverse drug experience reports have been submitted within 30 days of the close of the quarter.	4
21 CFR 212.30(b)	Equipment not clean	You did not implement procedures to ensure that all your equipment is clean.	4

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.67(b)(2)	Cleaning SOPs/schedules	Procedures for the cleaning and maintenance of equipment are deficient regarding maintenance and cleaning schedules, including, where appropriate, sanitizing schedules.	3
21 CFR 211.67(b)(3)	Cleaning SOPs/instructions	Procedures for the cleaning and maintenance of equipment are deficient regarding sufficient detail of the methods, equipment, and materials used in the cleaning and maintenance operation, and the methods of disassembly and reassembling equipment as necessary to assure proper cleaning and maintenance.	3
21 CFR 211.67(b)(5)	Cleaning SOPs/equipment protection	Procedures for the cleaning and maintenance of equipment are deficient regarding the protection of clean equipment from contamination prior to use.	3
21 CFR 211.42(c)(2)	Rejected material area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to the holding of rejected [components] [drug product containers] [closures] [labeling] before disposition.	3
21 CFR 211.42(c)(9)	Control/lab operations area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding laboratory controls and operations.	3
21 CFR 211.122(a)	Sampling/testing of labeling/packaging materials	Labeling and packaging materials are not [representatively sampled] [examined] [tested] upon receipt and before use in packaging and labeling of a drug product.	3
21 CFR 211.122(d)	Label storage access limited to authorized personnel	Access to the storage area for labels and labeling materials is not limited to authorized personnel.	3
21 CFR 211.122(e)	Destruction of obsolete labeling	Obsolete or outdated labels, labeling, and packaging materials are not destroyed.	3
21 CFR 211.130(c)	Lot or control number assigned	The drug product is not identified with a lot or control number that permits the determination of the history of the manufacture and control of the batch.	3
21 CFR 211.180(b)	Record maintenance 1 year (except exempt OTC)	All records of [production] [control] [distribution] [components] [drug product containers] [closures] [labeling] associated with a batch of drug product were not maintained at least one (1) year after the expiration date.	3
21 CFR 211.166(a)(1)	Sample size—test intervals	The written stability program for drug products does not include [sample size] [test intervals] based on statistical criteria for each attribute examined to assure valid estimates of stability.	3
21 CFR 211.166(b)	Accelerated stability studies	Accelerated stability studies, combined with basic stability information, used to support tentative expiration dates are not supported with ongoing full shelf-life studies.	3
21 CFR 211.188(b)(3)	Identification of components and in-process materials	The batch production and control records are deficient in that they do not include specific identification of each [batch of component] [in-process material] used.	3
21 CFR 211.198(a)	Adverse drug experience	Complaint procedures are deficient in that they do not include provisions that allow for the review to determine if the complaints represent [serious] [unexpected adverse drug experiences] which are required to be reported to FDA.	3
21 CFR 211.46(c)	Air filtration system lacking in production area	The production area air supply lacks an appropriate air filtration system.	3
21 CFR 211.46(c)	Exhaust systems inadequate to control air contamination	Adequate exhaust systems or other systems to control contaminants are lacking in areas where air contamination occurs during production.	3
21 CFR 211.48(a)	Plumbing system defects	The plumbing system contains defects that could contribute to the contamination of drug products.	3

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.56(c)	Written procedures lacking for use of pesticides, etc.	Written procedures are lacking for the use of [rodenticides] [insecticides] [fungicides] [fumigating agents] [cleaning and sanitizing agents] designed to prevent the contamination of [equipment] [components] [drug product containers] [closures] [packaging, labeling materials] [drug products].	3
21 CFR 211.101(d)	Verification of component addition	Each component is not added to the batch by one person and verified by a second person.	3
21 CFR 211.204	Returned drug procedures in writing and followed	Procedures describing the [holding] [testing] [reprocessing] of returned drug products are not [in writing] [followed].	3
21 CFR 211.80(d)	Status of each lot identified	Each lot of [components] [drug product containers] [closures] was not appropriately identified as to its status in terms of being quarantined, approved, or rejected.	3
21 CFR 211.160(b)(3)	Drug products—samples representative, identified properly	Samples taken of drug products for determination of conformance to written specifications are not [representative] [properly identified].	3
21 CFR 211.188(a)	Accurate reproduction included	Batch production and control records for each batch of drug product produced do not include an accurate reproduction of the appropriate master production or control record which was checked for accuracy, dated, and signed.	3
21 CFR 211.188(b)(7)	Actual yield, % of theoretical yield	The batch production and control records do not include a statement of the [actual yield] [percentage of theoretical yield] at appropriate stages of processing for each batch of drug product produced.	3
21 CFR 211.186(b)(7)	Theoretical yield statement including percentages	Master production and control records lack a statement of theoretical yield [including the maximum and minimum percentages of theoretical yield beyond which investigation is required].	3
21 CFR 211.186(b)(8)	Description of containers, labels, et al.	Master production and control records lack [a description of the drug product containers, closures, and packaging materials] [a specimen or copy of each label and all other labeling] [the signatures and dates entered by the person or persons responsible for the approval of labeling].	3
21 CFR 211.194(a)(2)	Reference and method not stated	Laboratory records of methods of testing used do not [indicate the method] [provide the reference] when employing methods in [recognized standard references] [an approved new drug application and the referenced method is not modified].	3
21 CFR 212.30(a)	Prevention of contamination	Your facilities are not adequate to ensure the prevention of contamination of [equipment] [product] by [substances] [personnel] [environmental conditions] that could reasonably be expected to have an adverse effect on product quality.	3
21 CFR 212.20(d)	Determination need for investigation	When errors occurred or a production batch failed to meet specifications, you did not [determine the need for an investigation] [conduct an investigation] [take appropriate corrective actions] when necessary.	3
21 CFR 212.60(b)	Testing procedures—conformance to standards	Each laboratory did not have testing procedures which are designed to ensure that [components] [in-process materials] [PET drug products] conform to appropriate standards including established standards of identity, strength, quality, and purity.	3
FDCA 503B(a)(10)	Container label, outsourcer facility	The container labels of your outsourcing facility's drug products are deficient.	3

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.42(b)	Product flow through building is inadequate	The flow of [components] [drug product containers] [closures] [labeling] [in-process materials] [drug products] though the building is not designed to prevent contamination.	2
21 CFR 211.101(c)	Weighing/measuring/subdividing supervision	Component [weighing] [measuring] [subdividing] operations are not adequately supervised.	2
21 CFR 211.115(a)	Reprocessing procedures not written or followed	Procedures prescribing a system for reprocessing batches to ensure that the reprocessed batches will conform with all established standards, specifications, and characteristics are not [written] [followed].	2
21 CFR 211.125(d)	Destruction of excess labels with lot numbers	Excess labeling bearing lot or control numbers is not destroyed.	2
21 CFR 211.137(d)	Expiration date location on labeling	Drug product expiration dates do not appear on the labeling in the manner prescribed by regulations.	2
21 CFR 211.80(d)	Disposition recorded by lot identification	The distinctive code for each lot of [components] [drug product containers] [closures] is not used in recording the disposition of each lot.	2
21 CFR 211.80(d)	Identification of each lot in each shipment	Each lot in each shipment received was not identified with a distinctive code for each container or grouping of containers for [components] [drug product containers] [closures].	2
21 CFR 211.82(a)	Examination on receipt, before acceptance	Each container or grouping of containers of [components] [drug product containers] [closures] is not examined visually upon receipt and before acceptance for [appropriate labeling as to contents] [container damage] [broken seals] [contamination].	2
21 CFR 211.84(b)	Representative samples criteria	The [number of containers to be sampled] [amount of material taken from each container] is not based upon appropriate criteria.	2
21 CFR 211.84(c)(2)	Appropriate opening of component containers	The containers of components or drug product containers or closures which are sampled are not opened in a manner to prevent [contamination of their contents] [contamination of other components] [contamination of other drug product containers] [contamination of other closures].	2
21 CFR 211.94(a)	Reactive/additive/absorptive containers/ closures	Drug product containers or closures are [reactive] [additive] [absorptive] so as to alter the safety, identity, strength, quality, and purity of the drug beyond the official or established requirements.	2
21 CFR 211.166(a)(2)	Stability sample storage conditions described	The written stability program for drug products does not describe the storage conditions for samples retained for testing.	2
21 CFR 211.180(e)(2)	Review of problem drugs	The procedures for the annual quality standards record evaluation are deficient in that they do not address a review of [complaint] [recall] [returned drug product] [salvaged drug product] [investigation] records for each drug product.	2
21 CFR 211.182	Personnel dating/signing equipment log	The persons [performing] [double-checking] the cleaning and maintenance are not [dating] [signing or initialing] the equipment cleaning and use log.	2
21 CFR 211.194(e)	Stability testing records not included	Laboratory records do not include complete records of all stability testing performed.	2
21 CFR 211.44	Adequate lighting not provided	Adequate lighting is not provided in all areas.	2
21 CFR 211.56(a)	Trash and organic waste timely disposal	There is no provision to hold and dispose of [trash] [organic waste matter] in a timely and sanitary manner.	2

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.84(c)(4)	Composite sample top/middle/bottom	Sampling procedures are deficient regarding compositing for testing of samples collected from the top, middle, and bottom of the component container.	2
21 CFR 211.110(a)(3)	Mixing adequacy	The in-process control procedures were deficient in that they did not include an examination of the adequacy of mixing to assure uniformity and homogeneity.	2
21 CFR 211.110(b)	In-process materials specifications	In-process specifications are not [consistent with drug product final specifications] [derived from previous acceptable process average and process variability estimates where possible] [determined by the application of suitable statistical procedures where appropriate].	2
21 CFR 211.160(b)(1)	Specification description of sample/testing	The specifications for components, drug product containers or closures, and labeling are deficient in that they do not include a description of the [sampling plan] [testing procedures].	2
21 CFR 211.160(b)(4)	Test devices not meeting specifications	Test devices are deficient in that [instruments] [apparatus] [gauges] [recording devices] not meeting established specifications are used.	2
21 CFR 211.170(a)	Active ingredient retained sample kept	A sample which is representative of each lot in each shipment of each active ingredient is not [appropriately identified] [retained].	2
21 CFR 211.204	Record information inclusions	Records of returned drug products do not include the [name] [labeled potency] [lot, control, or batch number] [reason for return] [quantity] [date of disposition] [ultimate disposition].	2
21 CFR 211.84(d)(3)	Certificates of testing (containers, closures)	Certificates of testing of [containers] [closures] are accepted in lieu of testing without [a visual identification] [establishing the reliability of the supplier's test results through appropriate validation of the test results at appropriate intervals].	2
21 CFR 211.101(b)	Identification of new containers	For components removed from the original containers, the new container fails to be identified with [component name or item code] [receiving or control number] [weight or measure] [batch for which component was dispensed including product name, strength, and lot number].	2
21 CFR 211.160(b)(1)	Sampling and testing procedures described	Written specifications for laboratory controls do not include a description of the [sampling] [testing] procedures used.	2
21 CFR 211.160(b)(1)	Samples (various types) representative, identified properly	Samples taken to determine conformance to appropriate written specifications for the acceptance of each lot within each shipment of [components] [drug product containers] [closures] [labeling] are not [representative] [adequately identified].	2
21 CFR 211.160(b)(2)	In-process samples representative, identified properly	Samples taken of in-process materials for determination of conformance to specifications are not [representative] [properly identified].	2
21 CFR 211.165(d)	Acceptance/rejection levels	The statistical quality control criteria fail to include appropriate [acceptance levels] [rejection levels].	2
21 CFR 211.170(b)(1)	Retention time of reserve samples, in general	You did not retain reserve samples for drug products for one year after the expiration dates of the drug products.	2
21 CFR 211.188(b)(8)	Labeling control records including specimens or copies	Batch production and control records do not include complete labeling control records, including specimens or copies of all labeling used for each batch of drug product produced.	2
21 CFR 211.188(b)(5)	In-process and laboratory control results	Batch production and control records do not include [in-process] [laboratory control] results for each batch of drug product produced.	2

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.188(b)(3)	Identification of each component or in-process material	Batch production and control records do not include the specific identification of each batch of [component] [in-process material] used for each batch of drug product produced.	2
21 CFR 211.194(b)	Test method modification records do not include	Records maintained of any modification of an established method employed in testing do not include [the reason for the modification] [the data to verify that the modification produced results that are at least as accurate and reliable for the material being tested as the established method].	2
21 CFR 314.80(b)	Failure to review ADE information	Adverse drug experience information obtained or otherwise received from any source was not [promptly] reviewed, including information from [commercial marketing experience] [post-marketing clinical investigations] [post-marketing epidemiological/surveillance activities] [reports in the scientific literature] [unpublished scientific papers].	2
21 CFR 314.80(c)(2)	Failure to report non-alert ADEs	Individual ADEs which were not reported to FDA in a post-marketing 15-day alert have not been included in a periodic safety report.	2
21 CFR 314.80(c)(2)(ii)(A)	Incomplete periodic safety report	You failed to submit a periodic report containing [a narrative summary and analysis of the ADE information for the reporting interval in the report] [an analysis of the post marketing 15-day Alert Reports submitted during the reporting interval] [a history of actions taken since the last report because of adverse drug experiences] [an index with a line listing of your patient identification code and adverse reaction term(s) for all ICSRs you submitted for the reporting interval].	2
21 CFR 314.80(j)	Failure to maintain records	You failed to maintain for a period of 10 years records of all adverse drug experiences known to you, including raw data and any correspondence.	2
21 CFR 212.50	Adequate controls (general)	Your firm lacks adequate production and process controls to ensure the consistent production of a PET drug that meets the applicable standards of identity, strength, quality, and purity.	2
21 CFR 212.50(b)	Records to document all steps	You did not have master production and control records that document all steps in the PET drug production process.	2
21 CFR 212.60(f)	Lab written procedures	Laboratory written procedures are not [established] [followed] to ensure that the lab equipment is routinely [calibrated] [inspected] [checked] [maintained].	2
21 CFR 212.60(g)(3)	Record of all test data	Laboratory records did not contain a complete record of all data obtained in the course of each test.	2
21 CFR 361.1(c)(2)	Signatures of RDRC Chairman	The RDRC Chairman did not sign all [applications] [minutes] [reports] of the committee.	2
21 CFR 361.1(c)(2)	Numerical votes not in the minutes of any RDRC meetings	The minutes of an RDRC meeting did not include the numerical results of votes on protocols involving use in human subjects.	2
21 CFR 361.1(f)(1)	Packaging, labeling—Rx only	The label of a radioactive drug prepared, packaged, distributed, and primarily intended for use in the RDRC research project did not bear the statement "Rx only."	2
21 CFR 211.28(b)	Habits of good sanitation and health	Production personnel were not practicing good sanitation and health habits.	1
21 CFR 211.67(b)(6)	Cleaning SOP/inspection	Procedures for the cleaning and maintenance of equipment are deficient regarding inspection of the equipment for cleanliness immediately before use.	1

(*Continued*)

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.42(d)	Penicillin processing area not kept separate	The operations relating to the [manufacture] [processing] [packing] of penicillin are not performed in facilities separate from those used for other drug products for human use. Specifically, ***	1
21 CFR 211.101(a)	Batches formulated to less than 100%	Written production and control procedures include batches formulated with the intent to provide less than 100% of the labeled or established amount of active ingredient.	1
21 CFR 211.42(c)(3)	Released material area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to the storage of released [components] [drug product containers] [closures] [labeling].	1
21 CFR 211.42(c)(8)	Released drug products area	Separate or defined areas to prevent contamination or mix-ups are deficient regarding operations related to the storage of drug products after release.	1
21 CFR 211.115(b)	Reprocessing/quality control unit	Reprocessing was performed without the [review] [approval] of the quality control unit.	1
21 CFR 211.122(d)	Labels and labeling stored separately	Labels and other labeling materials are not stored separately with suitable identification for each different drug product, strength, dosage form, or quantity of contents.	1
21 CFR 211.125(b)	Examination of issued labels	Labeling materials issued for a batch were not carefully examined for identity and conformity to the labeling specified in the master or batch production records.	1
21 CFR 211.125(c)	Label reconciliation discrepancies evaluation/ investigation	Discrepancies found outside preset limits when reconciling the quantities of labeling issued, used, and returned were not [evaluated] [investigated].	1
21 CFR 211.130(a)	Prevention of cross-contamination, mix-ups	There is insufficient physical or spatial separation from operations and other drug products to prevent mix-ups and cross-contamination.	1
21 CFR 211.130(b)	Unlabeled filled containers controls	Filled drug product containers which are set aside and held in an unlabeled condition are not [identified] [handled] to preclude mislabeling of individual containers, lots, or portions of lots.	1
21 CFR 211.130(e)	Packaging line inspection before use	Inspection of the [packaging] [labeling] facilities immediately before use is not done to assure that all drug products have been removed from previous operations.	1
21 CFR 211.130(e)	Packaging line inspection after use	Inspection of the [packaging] [labeling] facilities is not done after use to assure that materials not suitable for subsequent operations have been removed.	1
21 CFR 211.86	Rotation of components/containers/closures	There is a lack of rotation so that the oldest approved stock of [components] [drug product containers] [closures] is used first.	1
21 CFR 211.150(a)	Distribution of oldest approved drugs	The oldest approved stock of drug products is not distributed first and there is no justification for this practice. Specifically, ***	1
21 CFR 211.80(c)	Storage off floor, spaced suitably	Bagged or boxed components of drug product [containers] [closures] are not [stored off the floor] [suitably spaced to allow cleaning and inspection].	1
21 CFR 211.84(c)(4)	Top/middle/bottom container sampling	Sampling procedures are deficient regarding sampling components from the top, middle, and bottom of container.	1
21 CFR 211.84(c)(6)	Identifying containers sampled	Markings of containers from which samples have been taken are deficient in that they do not show that samples have been removed from them. Specifically, ***	1

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.84(d)(3)	Container/closure written test procedure	Drug product container and closure test procedures are deficient in that [containers] [closures] are not tested for conformance in accordance with appropriate written procedures. Specifically, ***	1
21 CFR 211.84(d)(6)	Objectionable microbiological contamination	Each lot of a [component] [drug product containers] [closures] liable to objectionable microbiological contamination is deficiently subjected to microbiological tests before use. Specifically, ***	1
21 CFR 211.165(f)	Reprocessed drug products not meeting acceptance criteria	Reprocessed drug material or product has not met appropriate [standards] [specifications] [relevant criteria] prior to acceptance and use.	1
21 CFR 211.167(c)	Controlled release test methods written, followed	Test procedures describing the testing of controlled release dosage form drug product are not [written] [followed].	1
21 CFR 211.180(e)(1)	Representative number of batches for annual review	The procedures for the annual quality standards record evaluation are deficient in that they do not address a review of a representative number of [approved] [rejected] batches.	1
21 CFR 211.180(f)	Responsible firm officials notified in writing	Procedures are not established which are designed to assure that the responsible officials of the firm, if they are not personally involved in or immediately aware of such actions, are notified in writing of [investigations conducted] [recalls] [reports of inspectional observations issued by FDA] [any regulatory actions brought by FDA relating to good manufacturing practices].	1
21 CFR 211.182	Chronological order of equipment log entries	The entries in the equipment cleaning and use logs are not in chronological order.	1
21 CFR 211.184(b)	Component test records	The [component] [drug product container] [closure] [labeling] records do not include the [results of tests or examinations performed] [the conclusions derived from tests or examinations performed].	1
21 CFR 211.184(d)	Labeling: Documentation of exam and review	There is no documentation of the examination and review of labels and labeling for conformity with [established specifications] [the assigning of a lot or control number].	1
21 CFR 211.184(e)	Records of disposition of rejected material	Records do not include the disposition of rejected [components] [drug product containers] [closures] [labeling].	1
21 CFR 211.188(b)(5)	In-process and laboratory control results	The batch production and control records are deficient in that they do not include [in-process] [laboratory] control results.	1
21 CFR 211.188(b)(6)	Documentation of packaging and labeling area inspections	The batch production and control records are deficient in that they do not include documentation of the inspection of the [packaging] [labeling] area before and after use.	1
21 CFR 211.188(b)(11)	Identification of persons performing significant steps	The batch production and control records are deficient in that they do not include identification of persons [performing] [supervising] [checking] each significant step in the operation.	1
21 CFR 211.188(b)(12)	Documentation of batch investigations	The batch production and control records are deficient in that they do not include documentation of batch investigations performed.	1
21 CFR 211.208	No records maintained	No records are maintained for salvaged drug products.	1
21 CFR 211.194(a)(1)	Description and identification of samples	Laboratory records are deficient in that they do not include a [description and identification of the sample received] [quantity] [lot number] [date sample taken] [date sample received for testing].	1
21 CFR 211.194(a)(5)	Testing calculations	Laboratory records are deficient in that they do not include all calculations performed during testing.	1

TABLE 18.1 (CONTINUED)
Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.194(a)(7)	Identification of person performing the testing	Laboratory records are deficient in that they do not include the [initials] [signature] of the person performing the tests and the dates the tests were performed.	1
21 CFR 211.198(a)	Quality control review	Complaint procedures are deficient in that they do not include provisions that allow for the review and determination of an investigation by the quality control unit.	1
21 CFR 211.198(b)(1)	Complaint record required information	Complaint records are deficient in that they do not include the known [name and strength of the drug product] [lot number] [name of complainant] [nature of complaint] [reply to complainant].	1
21 CFR 211.198(b)(3)	Reason for not conducting complaint investigation	Complaint records are deficient in that they do not document the reason and the individual making the decision not to conduct a complaint investigation.	1
21 CFR 211.65(a)	Equipment construction—reactive surfaces	Equipment surfaces that contact [components] [in-process materials] [drug products] are reactive, additive, or absorptive so as to alter the safety, identity, strength, quality, or purity of the drug product beyond the official or other established requirements.	1
21 CFR 211.46(a)	Adequate ventilation not provided	Adequate ventilation is not provided.	1
21 CFR 211.50	Sewage and refuse disposal in safe manner	Disposal of [sewage] [trash] [refuse] from the [building] [immediate premises] is not done in a safe and sanitary manner.	1
21 CFR 211.101(b)(4)	Subdivided component/container/finished drug	Containers holding subdivided components for drug product manufacturing are deficiently identified in that they lack the batch for which component was dispensed, including its name, strength, and lot number.	1
21 CFR 211.132(b)(1)	OTC products requiring tamper-evident packaging	OTC products packaged for retail sale which are not specifically excluded from the requirement for tamper-evident packaging are not sold in tamper-evident packages.	1
21 CFR 211.160(b)(1)	Determination of conformance	Determinations of conformance to appropriate written specifications for acceptance are deficient in that they are not made for each lot within each shipment of [components] [drug product containers] [closures] [labeling] used in the manufacture, processing, packing, or holding of drug products.	1
21 CFR 211.160(b)(2)	Acceptance of in-process materials	Determinations of conformance to appropriate written specifications for acceptance are [not made] [deficient] for in-process materials.	1
21 CFR 211.170(a)	Reserve sample quantity—active ingredients only	The reserve sample of active ingredient does not consist of at least twice the quantity necessary for all tests required to determine whether the active ingredient meets its established specifications.	1
21 CFR 211.56(b)	Written sanitation procedures not followed	Written procedures for sanitation are not followed.	1
21 CFR 211.68(b)	Written record not kept of program and validation data	A written record of the program along with appropriate validation data has not been maintained in situations where backup data is eliminated by computerization or other automated processes.	1
21 CFR 211.84(c)(4)	Compositing of sub-samples	Components which must be sampled from top, middle, and bottom of the container are not kept separate but instead are composited for testing.	1
21 CFR 211.84(d)(3)	Testing containers and closures conformity with specs	Containers and closures are not tested for conformance with all appropriate written procedures.	1

Year 2017 FDA 483 Citations Issued for Inspection of Facilities Manufacturing Drugs

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.101(d)	Component release checked by second person	Each container of component dispensed to manufacturing is not examined by a second person to assure that [the component was released by the quality control unit] [the weight or measure is correct as stated in the batch records] [the containers are properly identified].	1
21 CFR 211.115(a)	Reprocessing procedures lack steps to be taken	Reprocessing procedures lack the steps to be taken to ensure that reprocessed batches will conform with all established standards, specifications, and characteristics.	1
21 CFR 211.110(b)	In-process materials specifications testing	Examination and testing of samples are not done to assure that in-process materials conform to specifications.	1
21 CFR 211.110(a)	Control procedures fail to include the following	Control procedures fail to include [tablet or capsule weight variation] [disintegration time] [adequacy of mixing to assure uniformity and homogeneity] [dissolution time and rate] [clarity, completeness, or pH of solutions].	1
21 CFR 211.122(c)	Records fail to include	Records kept for each different labeling and packaging material shipment fail to include [the receipt] [results of examination or testing] [a statement of whether the shipment was accepted or rejected].	1
21 CFR 211.122(a)	Written procedures not followed	Written procedures for the [receipt] [identification] [storage] [handling] [sampling] [examination] [testing] of packaging and labeling materials are not followed.	1
21 CFR 211.130(e)	Packaging line inspection documentation	Results of inspection of packaging and labeling facilities are not documented in the batch production records.	1
21 CFR 211.142(a)	Quarantine—written procedures	Written procedures for the warehousing of drug products do not include quarantine of drug products before release by the quality control unit.	1
21 CFR 211.160(b)(3)	Drug products—sampling procedures/ specifications	Laboratory controls do not include a determination of conformance to [written descriptions of sampling procedures] [appropriate specifications] for drug products.	1
21 CFR 211.170(b)(3)	Retention time for exempt OTC drug products	You did not retain reserve samples for OTC drug products which were exempt from bearing an expiration date for 3 years after the lots or batches of drug products were distributed.	1
21 CFR 211.176	Failing to test for penicillin cross-contamination	Non-penicillin drug products were not tested for the presence of penicillin, when a reasonable possibility existed that a non-penicillin drug product has been exposed to a cross-contamination with penicillin.	1
21 CFR 211.188(b)(11)	Identification of persons involved, each significant step	Batch production and control records do not include the identification of the persons [performing] [directly supervising] [checking] each significant step in the operation, for each batch of drug product produced.	1
21 CFR 211.188(b)(6)	Inspection of packaging and labeling area	Batch production and control records do not include results of the inspection of the packaging and labeling area [before] [after] use for each batch of drug product produced.	1
21 CFR 211.198(b)(3)	Determination not to conduct investigation of complaint	The written record did not include the [reason an investigation was found not to be necessary] [name of the responsible person making the determination not to conduct an investigation] when an investigation into [unexplained discrepancies] [the failure of a batch or any of its components to meet specifications] was not conducted.	1
21 CFR 211.198(b)(1)	Written complaint record must include	Written complaint records do not include, where known, [the name and strength of the drug product] [lot number] [name of complainant] [nature of complaint] [reply to complainant].	1

(*Continued*)

TABLE 18.1 (CONTINUED)

Reference Number	Short Description	Long Description	Frequency
21 CFR 211.194(a)(1)	Sample identification and other information	Laboratory records do not include [a description of the sample received for testing] [the source or location from where the sample was obtained] [the quantity of the sample] [the lot number or other distinctive code of the sample] [the date the sample was taken] [the date the sample was received for testing].	1
21 CFR 211.204	Returned drug products with doubt cast as to safety et al.	Returned drug products held, stored, or shipped before or during their return under conditions which cast doubt on their safety, identity, strength, quality, or purity are not [destroyed] [subjected to examination, testing, or other investigation to prove the drug products do meet all the necessary parameters].	1
21 CFR 314.80(c)	[NDA prod] Fail to submit report in approved electronic format	You did not submit adverse drug experience information in electronic format.	1
21 CFR 314.80(c)(1)(iii)	Non-applicant reports to applicant	You, as a non-applicant, elected to submit to the applicant (rather than to FDA) all reports of adverse drug experiences that were both serious and unexpected. However, you did not submit each report to the applicant [within 5 calendar days of your receipt of the information].	1
21 CFR 314.81(b)(2) (iv)(b)	Mfg and control changes not requiring a supplemental app.	An annual report did not include a full description of the manufacturing and control changes not requiring a supplemental application, listed by date in the order in which they were implemented.	1
21 CFR 314.81(b)(2)	Form FDA 2252	A [completed] Form FDA 2252 (Transmittal of Periodic Reports for Drugs for Human Use) was not submitted with an annual report.	1
FDCA 760(b)(1)	No label copy submitted with AE report (non-Rx drug)	Copies of labels from on or within the retail package of a non-prescription drug did not accompany serious drug event report.	1
FDCA 760(c)(1)	Timing of AE report submission (non-RX drugs)	An adverse event report for a nonprescription drug was not submitted to the Secretary of HHS within 15 business days of receipt of the report.	1
FDCA 760(c)(2)	New medical information, timing of submission (non-Rx drugs)	An adverse event report for a nonprescription drug was not submitted to the Secretary of HHS within 15 business days of receipt of the report.	1
21 CFR 314.80(c)(1)(iii)	Non-applicant reports directly to FDA	You, as a non-applicant electing not to submit to the applicant all reports of serious and unexpected adverse drug experiences, failed to submit all reports directly to FDA within 15 calendar days of your receipt of the adverse drug experience information.	1
21 CFR 310.305(a)	Failure to develop written procedures	Written procedures have not been developed for the [surveillance] [receipt] [evaluation] [reporting to FDA] of post-marketing adverse drug experiences.	1
21 CFR 212.20(b)	Examine, approve, or reject	You did not approve or reject [components] [containers] [closures] [in-process materials] [packaging materials] [labeling] [finished dosage forms] in a manner that ensures compliance with procedures and specifications affecting the identity, strength, quality, or purity of a PET drug.	1
21 CFR 212.20(e)	Written QA procedures established, followed	You did not [establish] [follow] written quality assurance procedures.	1
21 CFR 212.40(c)	Designation of incoming lots	You did not designate each incoming lot of [components] [containers] [closures] as quarantined, accepted, or rejected.	1
21 CFR 212.40(c)	Use of reliable suppliers	You did not use a reliable supplier as a source of each lot of [component] [container] [closure].	1

19 WHO Good Manufacturing Guidelines

QUALITY MANAGEMENT IN THE DRUG INDUSTRY: PHILOSOPHY AND ESSENTIAL ELEMENTS

The WHO provides GMP guidelines and also offers a program of GMP compliance certification. One of the most valuable documents is the WHO Technical Report 908, which is available at http://whqlibdoc.who.int/trs/WHO_TRS_908.pdf#page=46. In addition, the WHO offers many very useful GMP training programs (http://healthtech.who.int/pq/trainingresources/pq_pres/gmptraining/GMPBasicTraining.htm) that can be of great benefit to companies who may not have access to the inspections by the U.S. FDA or EMEA. It is important to know that the U.S. FDA inspection triggers only when there is an application pending for marketing authorization in the United States, whereas the European as well as the WHO GMP audits can be invited otherwise.

To assure that the interpretation of the WHO guidelines is properly understood, an appendix to this guideline includes the glossary of terms used.

Also included at the end of the chapter is a description of the various types of inspections that the WHO offers. It is important to know that WHO will offer inspections regardless of the status of marketing authorization applications; most manufacturers will request these inspections in anticipation of participation in the WHO Essential Drugs Program and register as certified suppliers, which will qualify the manufacturer to bid on various WHO-sponsored drug purchase programs.

In the drug industry at large, quality management is usually defined as the aspect of management function that determines and implements the "quality policy," that is, the overall intention and direction of an organization regarding quality, as formally expressed and authorized by top management. The basic elements of quality management are as follows:

- An appropriate infrastructure or "quality system," encompassing the organizational structure, procedures, processes, and resources.
- Systematic actions necessary to ensure adequate confidence that a product (or service) will satisfy given requirements for quality. The totality of these actions is termed "quality assurance."

Within an organization, quality assurance serves as a management tool. In contractual situations, quality assurance also serves to generate confidence in the supplier.

The concepts of quality assurance, GMP, and quality control are interrelated aspects of quality management. They are described here in order to emphasize their relationship and their fundamental importance to the production and control of pharmaceutical products.

1. Quality Assurance

1.1 Principle. "Quality assurance" is a wide-ranging concept covering all matters that individually or collectively influence the quality of a product. It is the totality of the arrangements made with the object of ensuring that pharmaceutical products are of the quality required for their intended use. Quality assurance therefore incorporates GMP and other factors, including those outside the scope of this guide such as product design and development.

1.2 The system of quality assurance appropriate to the manufacture of pharmaceutical products should ensure that

(a) Pharmaceutical products are designed and developed in a way that takes account of the requirements of GMP and other associated codes such as those of good laboratory practice (GLP) and good clinical practice (GCP).

(b) Production and control operations are clearly specified in a written form and GMP requirements are adopted.

(c) Managerial responsibilities are clearly specified in job descriptions.

(d) Arrangements are made for the manufacture, supply, and use of the correct starting and packaging materials.

(e) All necessary controls on starting materials, intermediate products, and bulk products and other in-process controls, calibrations, and validations are carried out.

(f) The finished product is correctly processed and checked, according to the defined procedures.

(g) Pharmaceutical products are not sold or supplied before the authorized persons (see also Sections 9.11 and 9.12) have certified that each production batch has been produced and controlled in accordance with the requirements of the marketing authorization and any other regulations relevant to the production, control, and release of pharmaceutical products.

(h) Satisfactory arrangements exist to ensure, as far as possible, that the pharmaceutical products are stored by the manufacturer, distributed, and subsequently handled so that quality is maintained throughout their shelf life.

(i) There is a procedure for self-inspection and/or quality audit that regularly appraises the effectiveness and applicability of the quality assurance system

(j) Deviations are reported, investigated, and recorded
(k) There is a system for approving changes that may have an impact on product quality.
(l) Regular evaluations of the quality of pharmaceutical products should be conducted with the objective of verifying the consistency of the process and ensuring its continuous improvement.

1.3 The manufacturer must assume responsibility for the quality of the pharmaceutical products to ensure that they are fit for their intended use, comply with the requirements of the marketing authorization, and do not place patients at risk due to inadequate safety, quality, or efficacy. The attainment of this quality objective is the responsibility of senior management and requires the participation and commitment of staff in many different departments and at all levels within the company, the company's suppliers, and the distributors. To achieve the quality objective reliably, there must be a comprehensively designed and correctly implemented system of quality assurance incorporating GMP and quality control. It should be fully documented and its effectiveness monitored. All parts of the quality assurance system should be adequately staffed with competent personnel and should have suitable and sufficient premises, equipment, and facilities.

2. GMPs for Pharmaceutical Products

2.1 Good manufacturing practice is that part of quality assurance which ensures that products are consistently produced and controlled to the quality standards appropriate to their intended use and as required by the marketing authorization. GMPs are aimed primarily at diminishing the risks inherent in any pharmaceutical production. Such risks are essentially of two types: Cross-contamination (in particular of unexpected contaminants) and mix-ups (confusion) caused by, for example, false labels being put on containers. Under GMP

(a) All manufacturing processes are clearly defined, systematically reviewed in the light of experience, and shown to be capable of consistently manufacturing pharmaceutical products of the required quality that comply with their specifications.
(b) Qualification and validation are performed.
(c) All necessary resources are provided, including
  (i) Appropriately qualified and trained personnel
  (ii) Adequate premises and space
  (iii) Suitable equipment and services
  (iv) Appropriate materials, containers, and labels
  (v) Approved procedures and instructions
  (vi) Suitable storage and transport and
  (vii) Adequate personnel, laboratories, and equipment for in-process controls
(d) Instructions and procedures are written in clear and unambiguous language, specifically applicable to the facilities provided.
(e) Operators are trained to carry out procedures correctly.
(f) Records are made (manually and/or by recording instruments) during manufacture to show that all the steps required by the defined procedures and instructions have, in fact, been taken and that the quantity and quality of the product are as expected; any significant deviations are fully recorded and investigated.
(g) Records covering manufacture and distribution, which enable the complete history of a batch to be traced, are retained in a comprehensible and accessible form.
(h) The proper storage and distribution of the products minimize any risk to their quality.
(i) A system is available to recall any batch of product from sale or supply.
(j) Complaints about marketed products are examined, the causes of quality defects investigated, and appropriate measures taken in respect of the defective products to prevent recurrence.

3. Sanitation and Hygiene

3.1 A high level of sanitation and hygiene should be practiced in every aspect of the manufacture of drug products. The scope of sanitation and hygiene covers personnel, premises, equipment and apparatus, production materials and containers, products for cleaning and disinfection, and anything that could become a source of contamination to the product. Potential sources of contamination should be eliminated through an integrated comprehensive program of sanitation and hygiene. (For personal hygiene see Section 11, and for sanitation see Section 12, "Premises.")

4. Qualification and Validation

4.1 In accordance with GMP, each pharmaceutical company should identify what qualification and validation work is required to prove that the critical aspects of their particular operation are controlled.

4.2 The key elements of a qualification and validation program of a company should be clearly defined and documented in a validation master plan.

4.3 Qualification and validation should establish and provide documentary evidence that

(a) The premises, supporting utilities, equipment, and processes have been designed in

accordance with the requirements for GMP (design qualification or DQ).

(b) The premises, supporting utilities, and equipment have been built and installed in compliance with their design specifications (installation qualification or IQ).

(c) The premises, supporting utilities, and equipment operate in accordance with their design specifications (operational qualification or OQ).

(d) A specific process will consistently produce a product meeting its predetermined specifications and quality attributes (process validation, or PV, also called performance qualification, or PQ).

4.4 Any aspect of operation, including significant changes to the premises, facilities, equipment, or processes, which may affect the quality of the product, directly or indirectly, should be qualified and validated.

4.5 Qualification and validation should not be considered as one-off exercises. An ongoing program should follow their first implementation and should be based on an annual review.

4.6 The commitment to maintain continued validation status should be stated in the relevant company documentation, such as the quality manual or validation master plan.

4.7 The responsibility of performing validation should be clearly defined.

4.8 Validation studies are an essential part of GMP and should be conducted in accordance with predefined and approved protocols.

4.9 A written report summarizing the results recorded and the conclusions reached should be prepared and stored.

4.10 Processes and procedures should be established on the basis of the results of the validation performed.

4.11 It is of critical importance that particular attention is paid to the validation of analytical test methods, automated systems, and cleaning procedures.

5. Complaints

5.1 Principle. All complaints and other information concerning potentially defective products should be carefully reviewed according to written procedures and the corrective action should be taken.

5.2 A person responsible for handling the complaints and deciding the measures to be taken should be designated, together with sufficient supporting staff to assist him or her. If this person is different from the authorized person, the latter should be made aware of any complaint, investigation, or recall.

5.3 There should be written procedures describing the action to be taken, including the need to consider a recall, in the case of a complaint concerning a possible product defect.

5.4 Special attention should be given to establish whether a complaint was caused because of counterfeiting.

5.5 Any complaint concerning a product defect should be recorded with all the original details and thoroughly investigated. The person responsible for quality control should normally be involved in the review of such investigations.

5.6 If a product defect is discovered or suspected in a batch, consideration should be given to whether other batches should be checked in order to determine whether they are also affected. In particular, other batches that may contain reprocessed product from the defective batch should be investigated.

5.7 Where necessary, appropriate follow-up action, possibly including product recall, should be taken after investigation and evaluation of the complaint.

5.8 All decisions made and measures taken as a result of a complaint should be recorded and referenced to the corresponding batch records.

5.9 Complaints records should be regularly reviewed for any indication of specific or recurring problems that require attention and might justify the recall of marketed products.

5.10 The competent authorities should be informed if a manufacturer is considering action following possibly faulty manufacture, product deterioration, counterfeiting, or any other serious quality problems with a product.

6. Product Recalls

6.1 Principle. There should be a system to recall from the market, promptly and effectively, products known or suspected to be defective.

6.2 The authorized person should be responsible for the execution and coordination of recalls. He or she should have sufficient staff to handle all aspects of the recalls with the appropriate degree of urgency.

6.3 There should be established written procedures, which are regularly reviewed and updated, for the organization of any recall activity. Recall operations should be capable of being initiated promptly down to the required level in the distribution chain.

6.4 An instruction should be included in the written procedures to store recalled products in a secure segregated area while their fate is decided.

6.5 All competent authorities of all countries to which a given product has been distributed should be promptly informed of any intention to recall the product because it is, or is suspected of being, defective.

6.6 The distribution records should be readily available to the authorized person, and they should contain sufficient information on wholesalers and directly supplied customers (including, for exported

products, those who have received samples for clinical tests and medical samples) to permit an effective recall.

6.7 The progress of the recall process should be monitored and recorded. Records should include the disposition of the product. A final report should be issued, including a reconciliation between the delivered and recovered quantities of the products.

6.8 The effectiveness of the arrangements for recalls should be tested and evaluated from time to time.

7. Contract Production and Analysis

7.1 Principle. Contract production and analysis must be correctly defined, agreed, and controlled in order to avoid misunderstandings that could result in a product or work or analysis of unsatisfactory quality.

General

7.2 All arrangements for contract manufacture and analysis, including any proposed changes in technical or other arrangements, should be in accordance with the marketing authorization for the product concerned.

7.3 The contract should permit the contract giver to audit the facilities of the contract accepter.

7.4 In the case of contract analysis, the final approval for release must be given by the authorized person.

The Contract Giver

7.5 The contract giver is responsible for assessing the competence of the contract accepter in successfully carrying out the work or tests required, for approval for contract activities, and for ensuring by means of the contract that the principles of GMP described in this guide are followed.

7.6 The contract giver should provide the contract accepter with all the information necessary to carry out the contracted operations correctly in accordance with the marketing authorization and any other legal requirements. The contract giver should ensure that the contract accepter is fully aware of any problems associated with the product, work, or tests that might pose a hazard to premises, equipment, personnel, other materials, or other products.

7.7 The contract giver should ensure that all processed products and materials delivered by the contract accepter comply with their specifications or that the product has been released by the authorized person.

The Contract Accepter

7.8 The contract accepter must have adequate premises, equipment, knowledge, and experience and competent personnel to carry out satisfactorily the work ordered by the contract giver. Contract manufacture may be undertaken only by a manufacturer who holds a manufacturing authorization.

7.9 The contract accepter should not pass to a third party any of the work entrusted to him or her under the contract without the contract giver's prior evaluation and approval of the arrangements. Arrangements made between the contract accepter and any third party should ensure that the manufacturing and analytical information is made available in the same way as between the original contract giver and contract accepter.

7.10 The contract accepter should refrain from any activity that may adversely affect the quality of the product manufactured and/or analyzed for the contract giver.

The Contract

7.11 There must be a written contract between the contract giver and the contract accepter which clearly establishes the responsibilities of each party.

7.12 The contract must clearly state the way in which the authorized person, in releasing each batch of product for sale or issuing the Certificate of Analysis, exercises his or her full responsibility and ensures that each batch has been manufactured in, and checked for, compliance with the requirements of the marketing authorization.

7.13 Technical aspects of the contract should be drawn up by competent persons suitably knowledgeable in pharmaceutical technology, analysis, and GMP.

7.14 All arrangements for production and analysis must be in accordance with the marketing authorization and agreed by both parties.

7.15 The contract should describe clearly who is responsible for purchasing, testing, and releasing materials and for undertaking production and quality controls, including in-process controls, and who has responsibility for sampling and analysis. In the case of contract analysis, the contract should state whether or not the contract accepter should take samples at the premises of the manufacturer.

7.16 Manufacturing, analytical, distribution records, and reference samples should be kept by, or be available to, the contract giver. Any records relevant to assessing the quality of a product in the event of complaints or a suspected defect must be accessible and specified in the defect/recall procedures of the contract giver.

7.17 The contract should describe the handling of starting materials, intermediate and bulk products, and finished products if they are rejected. It should also describe the procedure to be followed if the contract analysis shows that the tested product must be rejected.

8. Self-Inspection and Quality Audits

8.1 Principle. The purpose of self-inspection is to evaluate the manufacturer's compliance with GMP in all aspects of production and quality control. The self-inspection program should be designed to detect any shortcomings in the implementation of

GMP and to recommend the necessary corrective actions. Self-inspections should be performed routinely, and may be, in addition, performed on special occasions, for example, in the case of product recalls or repeated rejections, or when an inspection by the health authorities is announced. The team responsible for self-inspection should consist of personnel who can evaluate the implementation of GMP objectively. All recommendations for corrective action should be implemented. The procedure for self-inspection should be documented, and there should be an effective follow-up program.

Items for Self-Inspection

8.2 Written instructions for self-inspection should be established to provide a minimum and uniform standard of requirements. These may include questionnaires on GMP requirements covering at least the following items:

(a) Personnel
(b) Premises including personnel facilities
(c) Maintenance of buildings and equipment
(d) Storage of starting materials and finished products
(e) Equipment
(f) Production and in-process controls
(g) Quality control
(h) Documentation
(i) Sanitation and hygiene
(j) Validation and revalidation programs
(k) Calibration of instruments or measurement systems
(l) Recall procedures
(m) Complaints management
(n) Labels control
(o) Results of previous self-inspections and any corrective steps taken

Self-Inspection Team

8.3 Management should appoint a self-inspection team consisting of experts in their respective fields and familiar with GMP. The members of the team may be appointed from inside or outside the company.

Frequency of Self-Inspection

8.4 The frequency at which self-inspections are conducted may depend on company requirements but should preferably be at least once a year. The frequency should be stated in the procedure.

Self-Inspection Report

8.5 A report should be made at the completion of a self-inspection. The report should include

(a) Self-inspection results
(b) Evaluation and conclusions and
(c) Recommended corrective actions

Follow-Up Action

8.6 There should be an effective follow-up program. The company management should evaluate both the self-inspection report and the corrective actions as necessary.

Quality Audit

8.7 It may be useful to supplement self-inspections with a quality audit. A quality audit consists of an examination and assessment of all or part of a quality system with the specific purpose of improving it. A quality audit is usually conducted by outside or independent specialists or a team designated by the management for this purpose. Such audits may also be extended to suppliers and contractors (see Section 7, "Contract Production and Analysis").

Suppliers' Audits and Approval

8.8 The person responsible for quality control should have responsibility together with other relevant departments for approving suppliers who can reliably supply starting and packaging materials that meet established specifications.

8.9 Before suppliers are approved and included in the approved suppliers' list or specifications, they should be evaluated. The evaluation should take into account a supplier's history and the nature of the materials to be supplied. If an audit is required, it should determine the supplier's ability to conform with GMP standards.

9. Personnel

9.1 Principle. The establishment and maintenance of a satisfactory system of quality assurance and the correct manufacture and control of pharmaceutical products and active ingredients rely upon people. For this reason, there must be sufficient qualified personnel to carry out all the tasks for which the manufacturer is responsible. Individual responsibilities should be clearly defined and understood by the persons concerned and recorded as written descriptions.

General

9.2 The manufacturer should have an adequate number of personnel with the necessary qualifications and practical experience. The responsibilities placed on any one individual should not be so extensive so as to present any risk to quality.

9.3 All responsible staff should have their specific duties recorded in written descriptions and adequate authority to carry out their responsibilities. Their duties may be delegated to designated deputies of a satisfactory qualification level. There should be

no gaps or unexplained overlaps in the responsibilities of personnel concerned with the application of GMP. The manufacturer should have an organization chart.

9.4 All personnel should be aware of the principles of GMP that affect them and receive initial and continuing training, including hygiene instructions, relevant to their needs. All personnel should be motivated to support the establishment and maintenance of high-quality standards.

9.5 Steps should be taken to prevent unauthorized people from entering production, storage, and quality control areas. Personnel who do not work in these areas should not use them as a passageway.

Key Personnel

9.6 Key personnel include the head of production, the head of quality control, and the authorized person. Normally, key posts should be occupied by full-time personnel. The heads of production and quality control should be independent of each other. In large organizations, it may be necessary to delegate some of the functions; however, the responsibility cannot be delegated.

9.7 Key personnel responsible for supervising the manufacture and quality control of pharmaceutical products should possess the qualifications of a scientific education and practical experience required by national legislation. Their education should include the study of an appropriate combination of

(a) Chemistry (analytical or organic) or biochemistry
(b) Chemical engineering
(c) Microbiology
(d) Pharmaceutical sciences and technology
(e) Pharmacology and toxicology
(f) Physiology and
(g) Other related sciences

They should also have adequate practical experience in the manufacture and quality assurance of pharmaceutical products. In order to gain such experience, a preparatory period may be required, during which they should exercise their duties under professional guidance. The scientific education and practical experience of experts should be such as to enable them to exercise independent professional judgment, based on the application of scientific principles and understanding to the practical problems encountered in the manufacture and quality control of pharmaceutical products.

9.8 The heads of the production and quality control generally have some shared, or jointly exercised, responsibilities relating to quality. These may include, depending on national regulations,

(a) To ensure that products are produced and stored according to the appropriate documentation in order to obtain the required quality
(b) To approve the instructions relating to production operations, including the in-process controls, and to ensure their strict implementation
(c) To ensure that the production records are evaluated and signed by a designated person
(d) To check the maintenance of the department, premises, and equipment
(e) To ensure that the appropriate process validations and calibrations of control equipment are performed and recorded and the reports made available and
(f) To ensure that the required initial and continuing training of production personnel is carried out and adapted according to need

9.9 The head of the production generally has the following responsibilities:

(a) Authorization of written procedures and other documents, including amendments
(b) Monitoring and control of the manufacturing environment
(c) Plant hygiene
(d) Process validation and calibration of analytical apparatus
(e) Training, including the application and principles of quality assurance
(f) Approval and monitoring of suppliers of materials
(g) Approval and monitoring of contract manufacturers
(h) Designation and monitoring of storage conditions for materials and products
(i) Performance and evaluation of in-process controls
(j) Retention of records
(k) Monitoring of compliance with GMP requirements and
(l) Inspection, investigation, and taking of samples in order to monitor factors that may affect product quality

9.10 The head of the quality control generally has the following responsibilities:

(a) To approve or reject starting materials, packaging materials, and intermediate, bulk, and finished products in relation to their specifications
(b) To evaluate batch records
(c) To ensure that all necessary testing is carried out
(d) To approve sampling instructions, specifications, test methods, and other quality control procedures
(e) To approve and monitor analyses carried out under contract
(f) To check the maintenance of the department, premises, and equipment
(g) To ensure that the appropriate validations, including those of analytical procedures, and calibrations of control equipment are carried out and

(h) To ensure that the required initial and continuing training of quality control personnel is carried out and adapted according to need

Other duties of the quality control are summarized in Sections 17.3 and 17.4.

9.11 The authorized person is responsible for compliance with technical or regulatory requirements related to the quality of finished products and the approval of the release of the finished product for sale.

9.12 The authorized person will also be involved in other activities, including

(a) Implementation (and, when needed, establishment) of the quality system
(b) Participation in the development of the company's quality manual
(c) Supervision of the regular internal audits or self-inspections
(d) Oversight of the quality control department
(e) Participation in external audit (vendor audit) and
(f) Participation in validation programs

9.13 The function of the approval of the release of a finished batch or a product can be delegated to a designated person with appropriate qualifications and experience who will release the product in accordance with an approved procedure. This is normally done by quality assurance by means of batch review.

9.14 The person responsible for approving a batch for release should always ensure that the following requirements have been met:

(a) The marketing authorization and the manufacturing authorization requirements for the product have been met for the batch concerned.
(b) The principles and guidelines of GMP, as laid down in the guidelines published by WHO, have been followed.
(c) The principal manufacturing and testing processes have been validated, if different.
(d) All the necessary checks and tests have been performed and account taken of the production conditions and manufacturing records.
(e) Any planned changes or deviations in manufacturing or quality control have been notified in accordance with a well-defined reporting system before any product is released. Such changes may need notification to, and approval by, the drug regulatory authority.
(f) Any additional sampling, inspection, tests, and checks have been carried out or initiated, as appropriate, to cover planned changes and deviations.
(g) All necessary production and quality control documentation has been completed and endorsed by supervisors trained in appropriate disciplines.
(h) Appropriate audits, self-inspections, and spot-checks are carried out by experienced and trained staff.
(i) Approval has been given by the head of quality control.
(j) All relevant factors have been considered, including any not specifically associated with the output batch directly under review (e.g., subdivision of output batches from a common input, factors associated with continuous production runs).

10. Training

10.1 The manufacturer should provide training in accordance with a written program for all personnel whose duties take them into manufacturing areas or into control laboratories (including the technical, maintenance, and cleaning personnel) and for other personnel as required.

10.2 Besides basic training on the theory and practice of GMP, newly recruited personnel should receive training appropriate to the duties assigned to them. Continuing training should also be given and its practical effectiveness periodically assessed. Approved training programs should be available. Training records should be kept.

10.3 Personnel working in areas where contamination is a hazard, for example, clean areas or areas where highly active, toxic, infectious, or sensitizing materials are handled, should be given specific training.

10.4 The concept of quality assurance and all the measures which aid its understanding and implementation should be fully discussed during the training sessions.

10.5 Visitors or untrained personnel should preferably not be taken into the production and quality control areas. If this is unavoidable, they should be given relevant information in advance (particularly about personal hygiene) and the prescribed protective clothing. They should be closely supervised.

10.6 Consultant and contract staff should be qualified for the services they provide. Evidence of this should be included in the training records.

11. Personal Hygiene

11.1 All personnel, prior to and during employment, as appropriate, should undergo health examinations. Personnel conducting visual inspections should also undergo periodic eye examinations.

11.2 All personnel should be trained in the practices of personal hygiene. A high level of personal hygiene should be observed by all those concerned with manufacturing processes. In particular, personnel should be instructed to wash their hands before entering production areas. Signs to this effect should be posted and instructions observed.

11.3 Any person shown at any time to have an apparent illness or open lesions that may adversely affect the quality of products should not be allowed to handle starting materials, packaging materials, in-process materials, or drug products until the condition is no longer judged to be a risk.

11.4 All employees should be instructed and encouraged to report to their immediate supervisor any conditions (relating to plant, equipment, or personnel) that they consider may adversely affect the products.

11.5 Direct contact should be avoided between the operator's hands and starting materials, primary packaging materials, and intermediate or bulk product.

11.6 To ensure protection of the product from contamination, personnel should wear clean body coverings appropriate to the duties they perform, including appropriate hair covering. Used clothes, if reusable, should be stored in separate closed containers until properly laundered and, if necessary, disinfected or sterilized.

11.7 Smoking, eating, drinking, chewing, and keeping plants, food, drink, smoking material, and personal medicines should not be permitted in production, laboratory, and storage areas or in any other areas where they might adversely influence product quality.

11.8 Personal hygiene procedures including the use of protective clothing should apply to all persons entering production areas, whether they are temporary or fulltime employees or nonemployees, for example, contractors' employees, visitors, senior managers, and inspectors.

12. Premises

12.1 Principle. Premises must be located, designed, constructed, adapted, and maintained to suit the operations to be carried out.

General

12.2 The layout and design of premises must aim to minimize the risk of errors and permit effective cleaning and maintenance in order to avoid cross-contamination, build-up of dust or dirt, and, in general, any adverse effect on the quality of products.

12.3 Where dust is generated (e.g., during sampling, weighing, mixing and processing operations, packaging of powder), measures should be taken to avoid cross-contamination and facilitate cleaning.

12.4 Premises should be situated in an environment that, when considered together with measures to protect the manufacturing process, presents minimum risk of causing any contamination of materials or products.

12.5 Premises used for the manufacture of finished products should be suitably designed and constructed to facilitate good sanitation.

12.6 Premises should be carefully maintained, and it should be ensured that repair and maintenance operations do not present any hazard to the quality of products.

12.7 Premises should be cleaned and, where applicable, disinfected according to detailed written procedures. Records should be maintained.

12.8 Electrical supply, lighting, temperature, humidity, and ventilation should be appropriate and such that they do not adversely affect, directly or indirectly, either the pharmaceutical products during their manufacture and storage or the accurate functioning of equipment.

12.9 Premises should be designed and equipped so as to afford maximum protection against the entry of insects, birds, or other animals. There should be a procedure for rodent and pest control.

12.10 12.10. Premises should be designed to ensure the logical flow of materials and personnel.

Ancillary Areas

12.11 Rest and refreshment rooms should be separate from manufacturing and control areas.

12.12 Facilities for changing and storing clothes and for washing and toilet purposes should be easily accessible and appropriate for the number of users. Toilets should not communicate directly with production or storage areas.

12.13 Maintenance workshops should if possible be separated from production areas. Whenever parts and tools are stored in the production area, they should be kept in rooms or lockers reserved for that use.

12.14 Animal housing should be well isolated from other areas, with separate entrance (animal access) and air-handling facilities.

Storage Areas

12.15 Storage areas should be of sufficient capacity to allow orderly storage of the various categories of materials and products with proper separation and segregation: Starting and packaging materials; intermediates, bulk, and finished products; products in quarantine; and released, rejected, returned, or recalled products.

12.16 Storage areas should be designed or adapted to ensure good storage conditions. In particular, they should be clean, dry, sufficiently lit, and maintained within acceptable temperature limits. Where special storage conditions are required (e.g., temperature, humidity), these should be provided, controlled, monitored, and recorded where appropriate.

12.17 Receiving and dispatch bays should be separated and protect materials and products from the weather. Receiving areas should be designed and equipped to allow containers of incoming materials to be cleaned if necessary before storage.

12.18 Where quarantine status is ensured by storage in separate areas, these areas must be clearly marked and their access restricted to authorized personnel. Any system replacing the physical quarantine should give equivalent security.

12.19 Segregation should be provided for the storage of rejected, recalled, or returned materials or products.

12.20 Highly active and radioactive materials, narcotics, other dangerous drugs, and substances presenting special risks of abuse, fire, or explosion should be stored in safe and secure areas.

12.21 Printed packaging materials are considered critical to the conformity of the pharmaceutical product to its labeling and special attention should be paid to sampling and the safe and secure storage of these materials.

12.22 There should normally be a separate sampling area for starting materials. (If sampling is performed in the storage area, it should be conducted in such a way as to prevent contamination or cross-contamination.)

Weighing Areas

12.23 The weighing of starting materials and the estimation of yield by weighing should be carried out in separate weighing areas designed for that use, for example, with provisions for dust control. Such areas may be part of either storage or production areas.

Production Areas

12.24 In order to minimize the risk of a serious medical hazard due to cross-contamination, dedicated and self-contained facilities must be available for the production of particular pharmaceutical products, such as highly sensitizing materials (e.g., penicillins) or biological preparations (e.g., live microorganisms). The production of certain other highly active products, such as some antibiotics, hormones, cytotoxic substances, and certain nonpharmaceutical products, should not be conducted in the same facilities. In exceptional cases, the principle of campaign working in the same facilities can be accepted provided that specific precautions are taken and the necessary validations (including cleaning validation) are made. The manufacture of technical poisons, such as pesticides and herbicides, should not be allowed in premises used for the manufacture of pharmaceutical products.

12.25 Premises should preferably be laid out in such a way as to allow the production to take place in areas connected in a logical order corresponding to the sequence of the operations and to the requisite cleanliness levels.

12.26 The adequacy of the working and in-process storage space should permit the orderly and logical positioning of equipment and materials so as to minimize the risk of confusion between different pharmaceutical products or their components, to avoid cross-contamination, and to minimize the risk of omission or wrong application of any of the manufacturing or control steps.

12.27 Where starting and primary packaging materials and intermediate or bulk products are exposed to the environment, interior surfaces (walls, floors, and ceilings) should be smooth and free from cracks and open joints, should not shed particulate matter, and should permit easy and effective cleaning and, if necessary, disinfection.

12.28 Pipework, light fittings, ventilation points, and other services should be designed and sited to avoid the creation of recesses that are difficult to clean. As far as possible, for maintenance purposes, they should be accessible from outside the manufacturing areas.

12.29 Drains should be of adequate size and designed and equipped to prevent backflow. Open channels should be avoided where possible, but if they are necessary they should be shallow to facilitate cleaning and disinfection.

12.30 Production areas should be effectively ventilated, with air-control facilities (including filtration of air to a sufficient level to prevent contamination and cross-contamination, as well as control of temperature and, where necessary, humidity) appropriate to the products handled, to the operations undertaken, and to the external environment. These areas should be regularly monitored during both production and nonproduction periods to ensure compliance with their design specifications.

12.31 Premises for the packaging of pharmaceutical products should be specifically designed and laid out so as to avoid mix-ups or cross-contamination.

12.32 Production areas should be well lit, particularly where visual online controls are carried out.

Quality Control Areas

12.33 Quality control laboratories should be separated from production areas. Areas where biological, microbiological, or radioisotope test methods are employed should be separated from each other.

12.34 Quality control laboratories should be designed to suit the operations to be carried out in them. Sufficient space should be given to avoid mix-ups and cross-contamination. There should be adequate suitable storage space for samples, reference standards (if necessary, with cooling), solvents, reagents, and records.

12.35 The design of the laboratories should take into account the suitability of construction materials, prevention of fumes, and ventilation. There should be separate air supply to laboratories and production areas. Separate air-handling units and other provisions are needed for biological, microbiological, and radioisotope laboratories.

12.36 A separate room may be needed for instruments to protect them against electrical interference, vibration, contact with excessive moisture, and other external factors or where it is necessary to isolate the instruments.

13. Equipment

13.1 Equipment must be located, designed, constructed, adapted, and maintained to suit the operations to be carried out. The layout and design of equipment must aim to minimize the risk of errors and permit effective cleaning and maintenance in order to avoid cross-contamination, build-up of dust or dirt, and, in general, any adverse effect on the quality of products.

13.2 Equipment should be installed in such a way as to minimize any risk of error or of contamination.

13.3 Fixed pipework should be clearly labeled to indicate the contents and, where applicable, the direction of flow.

13.4 All service piping and devices should be adequately marked and special attention paid to the provision of noninterchangeable connections or adaptors for dangerous gases and liquids.

13.5 Balances and other measuring equipment of an appropriate range and precision should be available for production and control operations and should be calibrated on a scheduled basis.

13.6 Production equipment should be thoroughly cleaned on a scheduled basis.

13.7 Laboratory equipment and instruments should be suited to the testing procedures undertaken.

13.8 Washing, cleaning, and drying equipment should be chosen and used so as not to be a source of contamination.

13.9 Production equipment should not present any hazard to the products. The parts of the production equipment that come into contact with the product must not be reactive, additive, or absorptive to an extent that would affect the quality of the product.

13.10 Defective equipment should be removed from production and quality control areas. If this is not possible, it should be clearly labeled as defective to prevent use.

13.11 Closed equipment should be used whenever appropriate. Where open equipment is used or equipment is opened, precautions should be taken to minimize contamination.

13.12 Nondedicated equipment should be cleaned according to validated cleaning procedures between production of different pharmaceutical products to prevent cross-contamination.

13.13 Current drawings of critical equipment and support systems should be maintained.

14. Materials

14.1 Principle. The main objective of a pharmaceutical plant is to produce finished products for patients' use from a combination of materials (starting and packaging).

14.2 Materials include starting materials, packaging materials, gases, solvents, process aids, reagents, and labeling materials.

General

14.3 No materials used for operations such as cleaning, lubrication of equipment, and pest control should come into direct contact with the product. Where possible, such materials should be of a suitable grade (e.g., food grade) to minimize health risks.

14.4 All incoming materials and finished products should be quarantined immediately after receipt or processing, until they are released for use or distribution.

14.5 All materials and products should be stored under the appropriate conditions established by the manufacturer and in an orderly fashion to permit batch segregation and stock rotation by a first-expire, first-out rule.

14.6 Water used in the manufacture of pharmaceutical products should be suitable for its intended use.

Starting Materials

14.7 The purchase of starting materials is an important operation that should involve staff who have a particular and thorough knowledge of the products and suppliers.

14.8 Starting materials should be purchased only from approved suppliers and, where possible, directly from the producer. It is also recommended that the specifications established by the manufacturer for the starting materials be discussed with the suppliers. It is of benefit that all critical aspects of the production and control of the starting material in question, including handling, labeling, and packaging requirements as well as complaints and rejection procedures, are contractually agreed between the manufacturer and the supplier.

14.9 For each consignment, the containers should be checked for at least integrity of package and seal and for correspondence between the order, the delivery note, and the supplier's labels.

14.10 All incoming materials should be checked to ensure that the consignment corresponds to the order. Containers should be cleaned where necessary and labeled, if required, with the prescribed information. Where additional labels are attached to containers, the original information should not be lost.

14.11 Damage to containers and any other problem that might adversely affect the quality of a material

should be recorded and reported to the quality control department and investigated.

14.12 If one delivery of material is made up of different batches, each batch must be considered as separate for sampling, testing, and release.

14.13 Starting materials in the storage area should be appropriately labeled. Labels should bear at least the following information:

(a) The designated name of the product and the internal code reference where applicable
(b) The batch number given by the supplier and, on receipt, the control or batch number given by the manufacturer, if any, documented so as to ensure traceability
(c) The status of the contents (e.g., on quarantine, on test, released, rejected, returned, recalled) and
(d) Where appropriate, an expiry date or a date beyond which retesting is necessary

When fully validated computerized storage systems are used, not all of the above information need be in a legible form on the label.

14.14 There should be appropriate procedures or measures to ensure the identity of the contents of each container of starting material. Bulk containers from which samples have been drawn should be identified.

14.15 Only starting materials released by the quality control department and within their shelf life should be used.

14.16 Starting materials should be dispensed only by designated persons, following a written procedure, to ensure that the correct materials are accurately weighed or measured into clean and properly labeled containers.

14.17 Each dispensed material and its weight or volume should be independently checked and the check recorded.

14.18 Materials dispensed for each batch of the final product should be kept together and conspicuously labeled as such.

Packaging Materials

14.19 The purchase, handling, and control of primary and printed packaging materials should be as for starting materials.

14.20 Particular attention should be paid to printed packaging materials. They should be stored in secure conditions so as to exclude the possibility of unauthorized access. Roll-feed labels should be used wherever possible. Cut labels and other loose printed materials should be stored and transported in separate closed containers so as to avoid mix-ups. Packaging materials should be issued for use only by designated personnel following an approved and documented procedure.

14.21 Each delivery or batch of printed or primary packaging material should be given a specific reference number or identification mark.

14.22 Outdated or obsolete primary packaging material or printed packaging material should be destroyed and its disposal recorded.

14.23 All products and packaging materials to be used should be checked on delivery to the packaging department for quantity, identity, and conformity with the packaging instructions.

Intermediate and Bulk Products

14.24 Intermediate and bulk products should be kept under appropriate conditions.

14.25 Intermediate and bulk products purchased as such should be handled on receipt as though they were starting materials.

Finished Products

14.26 Finished products should be held in quarantine until their final release, after which they should be stored as usable stock under conditions established by the manufacturer.

14.27 The evaluation of finished products and the documentation necessary for release of a product for sale are described in Section 17, "Good Practices in Quality Control."

Rejected, Recovered, Reprocessed, and Reworked Materials

14.28 Rejected materials and products should be clearly marked as such and stored separately in restricted areas. They should either be returned to the suppliers or, where appropriate, reprocessed or destroyed in a timely manner. Whatever action is taken should be approved by authorized personnel and recorded.

14.29 The reworking or recovery of rejected products should be exceptional. It is permitted only if the quality of the final product is not affected, if the specifications are met, and if it is done in accordance with a defined and authorized procedure after evaluation of the risks involved. A record should be kept of the reworking or recovery. A reworked batch should be given a new batch number.

14.30 The introduction of all or part of earlier batches, conforming to the required quality, into a batch of the same product at a defined stage of manufacture should be authorized beforehand. This recovery should be carried out in accordance with a defined procedure after evaluation of the risks involved, including any possible effect on shelf life. The recovery should be recorded.

14.31 The need for additional testing of any finished product that has been reprocessed, reworked, or into which a recovered product has been incorporated should be considered by the quality control department.

Recalled Products

14.32 Recalled products should be identified and stored separately in a secure area until a decision is taken on their fate. The decision should be made as soon as possible.

Returned Goods

14.33 Products returned from the market should be destroyed unless it is certain that their quality is satisfactory; in such cases they may be considered for resale or relabeling or alternative action taken only after they have been critically assessed by the quality control function in accordance with a written procedure. The nature of the product, any special storage conditions it requires, its condition and history, and the time elapsed since it was issued should all be taken into account in this assessment. Where any doubt arises over the quality of the product, it should not be considered suitable for reissue or reuse. Any action taken should be appropriately recorded.

Reagents and Culture Media

14.34 There should be records for the receipt and preparation of reagents and culture media.

14.35 Reagents made up in the laboratory should be prepared according to written procedures and appropriately labeled. The label should indicate the concentration, standardization factor, shelf life, the date when re-standardization is due, and the storage conditions. The label should be signed and dated by the person preparing the reagent.

14.36 Both positive and negative controls should be applied to verify the suitability of culture media each time they are prepared and used. The size of the inoculum used in positive controls should be appropriate to the sensitivity required.

Reference Standards

14.37 Whenever official reference standards exist, these should preferably be used.

14.38 Official reference standards should be used only for the purpose described in the appropriate monograph.

14.39 Reference standards prepared by the producer should be tested, released, and stored in the same way as official standards. They should be kept under the responsibility of a designated person in a secure area.

14.40 Secondary or working standards may be established by the application of appropriate tests and checks at regular intervals to ensure standardization.

14.41 Reference standards should be properly labeled with at least the following information:

(a) Name of the material
(b) Batch or lot number and control number
(c) Date of preparation
(d) Shelf life
(e) Potency and
(f) Storage conditions

14.42 All in-house reference standards should be standardized against an official reference standard, when available, initially and at regular intervals thereafter.

14.43 All reference standards should be stored and used in a manner that will not adversely affect their quality.

Waste Materials

14.44 Provision should be made for the proper and safe storage of waste materials awaiting disposal. Toxic substances and flammable materials should be stored in suitably designed, separate, enclosed cupboards, as required by national legislation.

14.45 Waste material should not be allowed to accumulate. It should be collected in suitable receptacles for removal to collection points outside the buildings and disposed of safely and in a sanitary manner at regular and frequent intervals.

Miscellaneous

14.46 Rodenticides, insecticides, fumigating agents, and sanitizing materials should not be permitted to contaminate equipment, starting materials, packaging materials, in-process materials, or finished products.

15. Documentation

15.1 Principle. Good documentation is an essential part of the quality assurance system and, as such, should exist for all aspects of GMP. Its aims are to define the specifications and procedures for all materials and methods of manufacture and control, to ensure that all personnel concerned with manufacture know what to do and when to do it, to ensure that authorized persons have all the information necessary to decide whether or not to release a batch of a drug for sale, to ensure the existence of documented evidence, traceability, and to provide records and an audit trail that will permit investigation. It ensures the availability of the data needed for validation, review, and statistical analysis. The design and use of documents depend upon the manufacturer. In some cases, some or all of the documents described below may be brought together, but they will usually be separate.

General

15.2 Documents should be designed, prepared, reviewed, and distributed with care. They should comply with the relevant parts of the manufacturing and marketing authorizations.

15.3 Documents should be approved, signed, and dated by the appropriate responsible persons. No

document should be changed without authorization and approval.

15.4 Documents should have unambiguous contents: The title, nature, and purpose should be clearly stated. They should be laid out in an orderly fashion and be easy to check. Reproduced documents should be clear and legible. The reproduction of working documents from master documents must not allow any error to be introduced through the reproduction process.

15.5 Documents should be regularly reviewed and kept up-to-date. When a document has been revised, a system should exist to prevent inadvertent use of the superseded version. Superseded documents should be retained for a specific period of time.

15.6 Where documents require the entry of data, these entries should be clear, legible, and indelible. Sufficient space should be provided for such entries.

15.7 Any alteration made to a document should be signed and dated; the alteration should permit the reading of the original information. Where appropriate, the reason for the alteration should be recorded.

15.8 Records should be made or completed when any action is taken and in such a way that all significant activities concerning the manufacture of pharmaceutical products are traceable. Records should be retained for at least one year after the expiry date of the finished product.

15.9 Data (and records for storage) may be recorded by electronic data-processing systems or by photographic or other reliable means. Master formulae and detailed standard operating procedures relating to the system in use should be available, and the accuracy of the records should be checked. If documentation is handled by electronic data-processing methods, only authorized persons should be able to enter or modify data in the computer, and there should be a record of changes and deletions; access should be restricted by passwords or other means, and the entry of critical data should be independently checked. Batch records stored electronically should be protected by back-up transfer on magnetic tape, microfilm, paper printouts, or other means. It is particularly important that, during the period of retention, the data are readily available.

Documents Required

Labels

15.10 Labels applied to containers, equipment, or premises should be clear, unambiguous, and in the company's agreed format. It is often helpful in addition to the wording on the labels to use colors to indicate status (e.g., quarantined, accepted, rejected, clean).

15.11 All finished drug products should be identified by labeling, as required by the national legislation, bearing at least the following information:

(a) The name of the drug product
(b) A list of the active ingredients (if applicable, with the INNs), showing the amount of each present and a statement of the net contents (e.g., number of dosage units, weight, volume)
(c) The batch number assigned by the manufacturer
(d) The expiry date in an uncoded form
(e) Any special storage conditions or handling precautions that may be necessary
(f) Directions for use, and warnings and precautions that may be necessary and
(g) The name and address of the manufacturer or the company or the person responsible for placing the product on the market

15.12 For reference standards, the label and/or accompanying document should indicate potency or concentration, date of manufacture, expiry date, date the closure is first opened, storage conditions, and control number, as appropriate.

Specifications and Testing Procedures

15.13 Testing procedures described in documents should be validated in the context of available facilities and equipment before they are adopted for routine testing.

15.14 There should be appropriately authorized and dated specifications, including tests on identity, content, purity, and quality, for starting and packaging materials and for finished products; where appropriate, they should also be available for intermediate or bulk products. Specifications for water, solvents, and reagents (e.g., acids and bases) used in production should be included.

15.15 Each specification should be approved, signed, and dated and maintained by quality control, quality assurance unit, or documentation center. Specifications for starting materials, intermediates, and bulk, finished products, and packaging materials are referred to in Sections 15.18–15.21.

15.16 Periodic revisions of the specifications may be necessary to comply with new editions of the national pharmacopoeia or other official compendia.

15.17 Pharmacopoeias, reference standards, reference spectra, and other reference materials should be available in the quality control laboratory.

Specifications for Starting and Packaging Materials

15.18 Specifications for starting, primary, and printed packaging materials should provide, if applicable, a description of the materials, including

(a) The designated name (if applicable, the INN) and internal code reference
(b) The reference, if any, to a pharmacopoeial monograph and
(c) Qualitative and quantitative requirements with acceptance limits

Depending on the company's practice, other data may be added to the specification, such as

(a) The supplier and the original producer of the materials
(b) A specimen of printed materials
(c) Directions for sampling and testing, or a reference to procedures
(d) Storage conditions and precautions and
(e) The maximum period of storage before reexamination

Packaging material should conform to specifications and should be compatible with the material and/or with the drug product it contains. The material should be examined for compliance with the specification and for defects as well as for the correctness of identity markings.

15.19 Documents describing testing procedures should state the required frequency for re-assaying each starting material, as determined by its stability.

Specifications for Intermediate and Bulk Products

15.20 Specifications for intermediate and bulk products should be available. The specifications should be similar to specifications for starting materials or for finished products, as appropriate.

Specifications for Finished Products

15.21 Specifications for finished products should include
(a) The designated name of the product and the code reference, where applicable
(b) The designated name(s) of the active ingredient(s) [if applicable, with the INN(s)]
(c) The formula or a reference to the formula
(d) A description of the dosage form and package details
(e) Directions for sampling and testing or a reference to procedures
(f) The qualitative and quantitative requirements, with acceptance limits
(g) The storage conditions and precautions, where applicable, and
(h) The shelf life

Master Formulae

15.22 A formally authorized master formula should exist for each product and batch size to be manufactured.

15.23 The master formula should include
(a) The name of the product, with a product reference code relating to its specification;
(b) A description of the dosage form, strength of the product, and batch size;
(c) A list of all starting materials to be used (if applicable, with the INNs), with the amount of each, described using the designated name and a reference that is unique to that material (mention should be made of any substance that may disappear in the course of processing)
(d) A statement of the expected final yield with the acceptable limits, and of relevant intermediate yields, where applicable
(e) A statement of the processing location and the principal equipment to be used
(f) The methods, or reference to the methods, to be used for preparing and operating the critical equipment, for example, cleaning (especially after a change in product), assembling, calibrating, sterilizing, use
(g) Detailed stepwise processing instructions (e.g., checks on materials, pretreatments, sequence for adding materials, mixing times, temperatures)
(h) The instructions for any in-process controls with their limits
(i) Where necessary, the requirements for storage of the products, including the container, the labeling, and any special storage conditions, and
(j) Any special precautions to be observed

Packaging Instructions

15.24 Formally authorized packaging instructions should exist for each product, pack size, and type. These should normally include, or make reference to,
(a) The name of the product
(b) A description of its pharmaceutical form, strength, and, where applicable, method of application
(c) The pack size expressed in terms of the number, weight, or volume of the product in the final container
(d) A complete list of all the packaging materials required for a standard batch size, including quantities, sizes, and types, with the code or reference number relating to the specifications for each packaging material
(e) Where appropriate, an example or reproduction of the relevant printed packaging materials and specimens, indicating where the batch number and expiry date of the product have been marked
(f) Special precautions to be observed, including a careful examination of the packaging area and equipment in order to ascertain the line clearance before and after packaging operations
(g) A description of the packaging operation, including any significant subsidiary operations, and equipment to be used and
(h) Details of in-process controls with instructions for sampling and acceptance limits

Batch Processing Records

15.25 A batch processing record should be kept for each batch processed. It should be based on the relevant

parts of the currently approved specifications on the record. The method of preparation of such records should be designed to avoid errors. (Copying or validated computer programs are recommended. Transcribing from approved documents should be avoided.)

15.26 Before any processing begins, a check should be made that the equipment and workstation are clear of previous products, documents, or materials not required for the planned process and that the equipment is clean and suitable for use. This check should be recorded.

15.27 During processing, the following information should be recorded at the time each action is taken, and after completion the record should be dated and signed by the person responsible for the processing operations:

(a) The name of the product
(b) The number of the batch being manufactured
(c) Dates and times of commencement, of significant intermediate stages, and of completion of production
(d) The name of the person responsible for each stage of production
(e) The initials of the operator(s) of different significant steps of production and, where appropriate, of the person(s) who checked each of these operations (e.g., weighing)
(f) The batch number and/or analytical control number and the quantity of each starting material actually weighed (including the batch number and amount of any recovered or reprocessed material added)
(g) Any relevant processing operation or event and the major equipment used
(h) The in-process controls performed, the initials of the person(s) carrying them out, and the results obtained
(i) The amount of product obtained at different and pertinent stages of manufacture (yield), together with comments or explanations for significant deviations from the expected yield and
(j) Notes on special problems including details, with signed authorization for any deviation from the master formula

Batch Packaging Records

15.28 A batch packaging record should be kept for each batch or part batch processed. It should be based on the relevant parts of the approved packaging instructions, and the method of preparing such records should be designed to avoid errors. (Copying or validated computer programs are recommended. Transcribing from approved documents should be avoided.)

15.29 Before any packaging operation begins, checks should be made that the equipment and workstation are clear of previous products, documents, or materials not required for the planned packaging operations and that equipment is clean and suitable for use. These checks should be recorded.

15.30 The following information should be recorded at the time each action is taken, and the date and the person responsible should be clearly identified by signature or electronic password:

(a) The name of the product, the batch number, and the quantity of bulk product to be packed, as well as the batch number and the planned quantity of finished product that will be obtained, the quantity actually obtained, and the reconciliation
(b) The date(s) and time(s) of the packaging operations
(c) The name of the responsible person carrying out the packaging operation
(d) The initials of the operators of the different significant steps
(e) The checks made for identity and conformity with the packaging instructions, including the results of in-process controls
(f) Details of the packaging operations carried out, including references to equipment and the packaging lines used, and, when necessary, the instructions for keeping the product unpacked or a record of returning product that has not been packaged to the storage area
(g) Whenever possible, samples of the printed packaging materials used, including specimens bearing the approval for the printing of and regular check (where appropriate) of the batch number, expiry date, and any additional overprinting
(h) Notes on any special problems, including details of any deviation from the packaging instructions, with written authorization by an appropriate person
(i) The quantities and reference number or identification of all printed packaging materials and bulk product issued, used, destroyed, or returned to stock and the quantities of product obtained to permit an adequate reconciliation

Standard Operating Procedures and Records

15.31 Standard operating procedures and associated records of actions taken or, where appropriate, conclusions reached should be available for

(a) Equipment assembly and validation
(b) Analytical apparatus and calibration
(c) Maintenance, cleaning, and sanitization

(d) Personnel matters including qualification, training, clothing, and hygiene
(e) Environmental monitoring
(f) Pest control
(g) Complaints
(h) Recalls and
(i) Returns

15.32 There should be standard operating procedures and records for the receipt of each delivery of starting material and primary and printed packaging material.

15.33 The records of the receipts should include
(a) The name of the material on the delivery note and the containers
(b) The "in-house" name and/or code of the material if different from (a)
(c) The date of receipt
(d) The supplier's name and, if possible, manufacturer's name
(e) The manufacturer's batch or reference number
(f) The total quantity and number of containers received
(g) The batch number assigned after receipt and
(h) Any relevant comment (e.g., state of the containers)

15.34 There should be standard operating procedures for the internal labeling, quarantine, and storage of starting materials, packaging materials, and other materials, as appropriate.

15.35 Standard operating procedures should be available for each instrument and piece of equipment (e.g., use, calibration, cleaning, maintenance) and placed in close proximity to the equipment.

15.36 There should be standard operating procedures for sampling, which specify the person(s) authorized to take samples.

15.37 The sampling instructions should include
(a) The method of sampling and the sampling plan
(b) The equipment to be used
(c) Any precautions to be observed to avoid contamination of the material or any deterioration in its quality
(d) The amount(s) of sample(s) to be taken
(e) Instructions for any required subdivision of the sample
(f) The type of sample container(s) to be used, and whether they are for aseptic sampling or for normal sampling, and labeling and
(g) Any specific precautions to be observed, especially in regard to the sampling of sterile or noxious material

15.38 There should be a standard operating procedure describing the details of the batch (lot) numbering system, with the objective of ensuring that each batch of intermediate, bulk, or finished product is identified with a specific batch number.

15.39 The standard operating procedures for batch numbering that are applied to the processing stage and to the respective packaging stage should be related to each other.

15.40 The standard operating procedure for batch numbering should ensure that the same batch numbers will not be used repeatedly; this applies also to reprocessing.

15.41 Batch-number allocation should be immediately recorded, for example, in a logbook. The record should include at least the date of allocation, product identity, and size of batch.

15.42 There should be written procedures for testing materials and products at different stages of manufacture, describing the methods and equipment to be used. The tests performed should be recorded.

15.43 Analysis records should include at least the following data:
(a) The name of the material or product and, where applicable, dosage form
(b) The batch number and, where appropriate, the manufacturer and/or supplier
(c) References to the relevant specifications and testing procedures
(d) Test results, including observations and calculations, and reference to any specifications (limits)
(e) Date(s) and reference number(s) of testing
(f) The initials of the persons who performed the testing
(g) The date and initials of the persons who verified the testing and the calculations, where appropriate, and
(h) A clear statement of release or rejection (or other status decision) and the dated signature of the designated responsible person

15.44 Written release and rejection procedures should be available for materials and products and in particular for the release for sale of the finished product by an authorized person.

15.45 Records should be maintained of the distribution of each batch of a product in order, for example, to facilitate the recall of the batch if necessary.

15.46 Records should be kept for major and critical equipment, as appropriate, of any validations, calibrations, maintenance, cleaning, or repair operations, including dates and the identities of the people who carried these operations out.

15.47 The use of major and critical equipment and the areas where products have been processed should be appropriately recorded in chronological order.

15.48 There should be written procedures assigning responsibility for cleaning and sanitation and describing in sufficient detail the cleaning schedules, methods, equipment, and materials to be used, and facilities and equipment to be cleaned. Such written procedures should be followed.

16. Good Practices in Production

16.1 Principle. Production operations must follow clearly defined procedures in accordance with manufacturing and marketing authorizations, with the objective of obtaining products of the requisite quality.

General

16.2 All handling of materials and products, such as receipt and cleaning, quarantine, sampling, storage, labeling, dispensing, processing, packaging, and distribution, should be done in accordance with written procedures or instructions and, where necessary, recorded.

16.3 Any deviation from instructions or procedures should be avoided as far as possible. If deviations occur, they should be done in accordance with an approved procedure. The authorization of the deviation should be approved in writing by a designated person, with the involvement of the quality control department, when appropriate.

16.4 Checks on yields and reconciliation of quantities should be carried out as necessary to ensure that there are no discrepancies outside acceptable limits.

16.5 Operations on different products should not be carried out simultaneously or consecutively in the same room or area unless there is no risk of mix-up or cross-contamination.

16.6 At all times during processing, all materials, bulk containers, major items of equipment, and where appropriate, the rooms and packaging lines being used should be labeled or otherwise identified with an indication of the product or material being processed, its strength (where applicable), and the batch number. Where applicable, this indication should also mention the stage of production. In some cases, it may be useful to record also the name of the previous product that has been processed.

16.7 Access to production premises should be restricted to authorized personnel.

16.8 Normally, nonmedicinal products should not be produced in areas or with equipment destined for the production of pharmaceutical products.

16.9 In-process controls are usually performed within the production area. The performance of such in-process controls should not have any negative effect on the quality of the product or another product (e.g., cross-contamination or mix-up).

Prevention of Cross-Contamination and Bacterial Contamination During Production

16.10 When dry materials and products are used in production, special precautions should be taken to prevent the generation and dissemination of dust. Provision should be made for proper air control (e.g., supply and extraction of air of suitable quality).

16.11 Contamination of a starting material or of a product by another material or product must be avoided. This risk of accidental cross-contamination arises from the uncontrolled release of dust, gases, particles, vapors, sprays, or organisms from materials and products in process; from residues on equipment; from intruding insects; and from operators' clothing, skin, etc. The significance of this risk varies with the type of contaminant and of the product being contaminated. Among the most hazardous contaminants are highly sensitizing materials, biological preparations such as living organisms, certain hormones, cytotoxic substances, and other highly active materials. Products in which contamination is likely to be most significant are those administered by injection or applied to open wounds and those given in large doses and/or over a long time.

16.12 Cross-contamination should be avoided by taking appropriate technical or organizational measures, for example,

(a) Carrying out production in dedicated and self-contained areas (which may be required for products such as penicillins, live vaccines, live bacterial preparations, and certain other biologicals)
(b) Conducting campaign production (separation in time) followed by appropriate cleaning in accordance with a validated cleaning procedure
(c) Providing appropriately designed airlocks, pressure differentials, and air supply and extraction systems
(d) Minimizing the risk of contamination caused by recirculation or reentry of untreated or insufficiently treated air
(e) Wearing protective clothing where products or materials are handled
(f) Using cleaning and decontamination procedures of known effectiveness
(g) Using a "closed system" in production
(h) Testing for residues and
(i) Using cleanliness status labels on equipment

16.13 Measures to prevent cross-contamination and their effectiveness should be checked periodically according to standard operating procedures.

16.14 Production areas where susceptible products are processed should undergo periodic environmental monitoring (e.g., for microbiological monitoring and particulate matter where appropriate).

Processing Operations

16.15 Before any processing operation is started, steps should be taken to ensure that the work area and equipment are clean and free from any starting materials, products, product residues, labels, or documents not required for the current operation.

16.16 Any necessary in-process controls and environmental controls should be carried out and recorded.

16.17 Means should be instituted of indicating failures of equipment or of services (e.g., water, gas) to equipment. Defective equipment should be withdrawn from use until the defect has been rectified. After use, production equipment should be cleaned without delay according to detailed written procedures and stored under clean and dry conditions in a separate area or in a manner that will prevent contamination.

16.18 Time limits for storage of equipment after cleaning and before use should be stated and based on data.

16.19 Containers for filling should be cleaned before filling. Attention should be given to avoiding and removing any contaminants such as glass fragments and metal particles.

16.20 Any significant deviation from the expected yield should be recorded and investigated.

16.21 Checks should be carried out to ensure that pipelines and other pieces of equipment used for the transportation of products from one area to another are connected in a correct manner.

16.22 Pipes used for conveying distilled or deionized water and, where appropriate, other water pipes should be sanitized and stored according to written procedures that detail the action limits for microbiological contamination and the measures to be taken.

16.23 Measuring, weighing, recording, and control equipment and instruments should be serviced and calibrated at prespecified intervals and records maintained. To ensure satisfactory functioning, instruments should be checked daily or prior to use for performing analytical tests. The date of calibration and servicing and the date when recalibration is due should be clearly indicated, preferably on a label attached to the instrument.

16.24 Repair and maintenance operations should not present any hazard to the quality of the products.

Packaging Operations

16.25 When the program for packaging operations is being set up, particular attention should be given to minimizing the risk of cross-contamination, mix-ups, or substitutions. Different products should not be packaged in close proximity unless there is physical segregation or an alternative system that will provide equal assurance.

16.26 Before packaging operations are begun, steps should be taken to ensure that the work area, packaging lines, printing machines, and other equipment are clean and free from any products, materials, or documents used previously and which are not required for the current operation. The line clearance should be performed according to an appropriate procedure and checklist, and recorded.

16.27 The name and batch number of the product being handled should be displayed at each packaging station or line.

16.28 Normally, filling and sealing should be followed as quickly as possible by labeling. If labeling is delayed, appropriate procedures should be applied to ensure that no mix-ups or mislabeling could occur.

16.29 The correct performance of any printing (e.g., of code numbers or expiry dates) done separately or in the course of the packaging should be checked and recorded. Attention should be paid to printing by hand, which should be rechecked at regular intervals.

16.30 Special care should be taken when cut labels are used and when overprinting is carried out off-line, and in hand-packaging operations. Roll-feed labels are normally preferable to cut labels in helping to avoid mix-ups. Online verification of all labels by automated electronic means can be helpful in preventing mix-ups, but checks should be made to ensure that any electronic code readers, label counters, or similar devices are operating correctly. When labels are attached manually, in-process control checks should be performed more frequently.

16.31 Printed and embossed information on packaging materials should be distinct and resistant to fading or erasing.

16.32 Regular online control of the product during packaging should include at least checks on

(a) The general appearance of the packages
(b) Whether the packages are complete
(c) Whether the correct products and packaging materials are used
(d) Whether any overprinting is correct and
(e) The correct functioning of line monitors

Samples taken away from the packaging line should not be returned.

16.33 Products that have been involved in an unusual event during packaging should be reintroduced into the process only after special inspection, investigation, and approval by authorized personnel. A detailed record should be kept of this operation.

16.34 Any significant or unusual discrepancy observed during reconciliation of the amount of bulk product and printed packaging materials and the number of units produced should be investigated, satisfactorily accounted for, and recorded before release.

16.35 Upon completion of a packaging operation, any unused batch-coded packaging materials should be destroyed and the destruction recorded. A documented procedure requiring checks to be performed before returning unused materials should

be followed if uncoded printed materials are returned to stock.

17. Good Practices in Quality Control

17.1 Quality control is the part of GMP concerned with sampling, specifications, and testing, and with the organization, documentation, and release procedures which ensure that the necessary and relevant tests are actually carried out and that materials are not released for use, nor products released for sale or supply, until their quality has been judged to be satisfactory. Quality control is not confined to laboratory operations but must be involved in all decisions concerning the quality of the product.

17.2 The independence of quality control from production is considered fundamental.

17.3 Each manufacturer (the holder of a manufacturing authorization) should have a quality control function. The quality control function should be independent of other departments and under the authority of a person with appropriate qualification and experience, who has one or several control laboratories at his or her disposal. Adequate resources must be available to ensure that all the quality control arrangements are effectively and reliably carried out. The basic requirements for quality control are as follows:

(a) Adequate facilities, trained personnel, and approved procedures must be available for sampling, inspecting, and testing starting materials, packaging materials, and intermediate, bulk, and finished products, and where appropriate for monitoring environmental conditions for GMP purposes.

(b) Samples of starting materials, packaging materials, intermediate products, bulk products, and finished products must be taken by methods and personnel approved of by the quality control department.

(c) Qualification and validation must be performed.

(d) Records must be made (manually and/or by recording instruments) demonstrating that all the required sampling, inspecting, and testing procedures have actually been carried out and that any deviations have been fully recorded and investigated.

(e) The finished products must contain ingredients complying with the qualitative and quantitative composition of the product described in the marketing authorization; the ingredients must be of the required purity, in their proper container, and correctly labeled.

(f) Records must be made of the results of inspecting and testing the materials and intermediate, bulk, and finished products against specifications; product assessment must include a review and evaluation of the relevant production documentation and an assessment of deviations from specified procedures.

(g) No batch of product is to be released for sale or supply prior to certification by the authorized person(s) that it is in accordance with the requirements of the marketing authorization. In certain countries, by law, the batch release is a task of the authorized person from production together with the authorized person from quality control.

(h) Sufficient samples of starting materials and products must be retained to permit future examination of the product if necessary; the retained product must be kept in its final pack unless the pack is exceptionally large.

17.4 Quality control as a whole will also have other duties, such as to establish, validate, and implement all quality control procedures; to evaluate, maintain, and store the reference standards for substances; to ensure the correct labeling of containers of materials and products; to ensure that the stability of the active pharmaceutical ingredients and products is monitored; to participate in the investigation of complaints related to the quality of the product; and to participate in environmental monitoring. All these operations should be carried out in accordance with written procedures and, where necessary, recorded.

17.5 Assessment of finished products should embrace all relevant factors, including the production conditions, the results of in-process testing, the manufacturing (including packaging) documentation, compliance with the specification for the finished product, and an examination of the finished pack.

17.6 Quality control personnel must have access to production areas for sampling and investigation as appropriate.

Control of Starting Materials and Intermediate, Bulk, and Finished Products

17.7 All tests should follow the instructions given in the relevant written test procedure for each material or product. The result should be checked by the supervisor before the material or product is released or rejected.

17.8 Samples should be representative of the batches of material from which they are taken in accordance with the approved written procedure.

17.9 Sampling should be carried out so as to avoid contamination or other adverse effects on quality. The containers that have been sampled should be

marked accordingly and carefully resealed after sampling.

17.10 Care should be taken during sampling to guard against contamination or mix-up of, or by, the material being sampled. All sampling equipment that comes into contact with the material should be clean. Some particularly hazardous or potent materials may require special precautions.

17.11 Sampling equipment should be cleaned and, if necessary, sterilized before and after each use and stored separately from other laboratory equipment.

17.12 Each sample container should bear a label indicating
(a) The name of the sampled material
(b) The batch or lot number
(c) The number of the container from which the sample has been taken
(d) The number of the sample
(e) The signature of the person who has taken the sample and
(f) The date of sampling

17.13 Out-of-specification results obtained during testing of materials or products should be investigated in accordance with an approved procedure. Records should be maintained.

Test Requirements

Starting and Packaging Materials

17.14 Before releasing a starting or packaging material for use, the quality control manager should ensure that the materials have been tested for conformity with specifications for identity, strength, purity, and other quality parameters.

17.15 An identity test should be conducted on a sample from each container of starting material (see also Section 14.14).

17.16 Each batch (lot) of printed packaging materials must be examined following receipt.

17.17 In lieu of testing by the manufacturer, a Certificate of Analysis may be accepted from the supplier, provided that the manufacturer establishes the reliability of the supplier's analysis through appropriate periodic validation of the supplier's test results (see Sections 8.8 and 8.9) and through on-site audits of the supplier's capabilities. (This does not affect Section 17.15.) Certificates must be originals (not photocopies) or otherwise have their authenticity assured. Certificates must contain at least the following information:
(a) Identification (name and address) of the issuing supplier
(b) Signature of the competent official, and statement of his or her qualifications
(c) The name of the material tested
(d) The batch number of the material tested
(e) The specifications and methods used
(f) The test results obtained and
(g) The date of testing

In-Process Control

17.18 In-process control records should be maintained and form a part of the batch records (see Section 15.25).

Finished Products

17.19 For each batch of drug product, there should be an appropriate laboratory determination of satisfactory conformity to its finished product specification prior to release.

17.20 Products failing to meet the established specifications or any other relevant quality criteria should be rejected.

Batch Record Review

17.21 Production and quality control records should be reviewed as part of the approval process of batch release. Any divergence or failure of a batch to meet its specifications should be thoroughly investigated. The investigation should, if necessary, extend to other batches of the same product and other products that may have been associated with the specific failure or discrepancy. A written record of the investigation should be made and should include the conclusion and follow-up action.

17.22 Retention samples from each batch of finished product should be kept for at least one year after the expiry date. Finished products should usually be kept in their final packaging and stored under the recommended conditions. If exceptionally large packages are produced, smaller samples might be stored in appropriate containers. Samples of active starting materials should be retained for at least 1 year beyond the expiry date of the corresponding finished product. Other starting materials (other than solvents, gases, and water) should be retained for a minimum of two years if their stability allows. Retention samples of materials and products should be of a size sufficient to permit at least two full reexaminations.

Stability Studies

17.23 Quality control should evaluate the quality and stability of finished pharmaceutical products and, when necessary, of starting materials and intermediate products.

17.24 Quality control should establish expiry dates and shelf-life specifications on the basis of stability tests related to storage conditions.

17.25 A written program for ongoing stability determination should be developed and implemented to include elements such as
(a) A complete description of the drug involved in the study
(b) The complete set of testing parameters and methods, describing all tests for potency, purity, and physical characteristics and documented evidence that these tests indicate stability

(c) Provision for the inclusion of a sufficient number of batches;
(d) The testing schedule for each drug
(e) Provision for special storage conditions
(f) Provision for adequate sample retention and
(g) A summary of all the data generated, including the evaluation and the conclusions of the study

17.26 Stability should be determined prior to marketing and following any significant changes in processes, equipment, packaging materials, etc.

WHO INSPECTIONS SUMMARY

- Types of GMP Inspection
  - Routine inspection
  - Concise inspection
  - Follow-up inspection
  - Special inspection
  - Quality systems review
- Routine Inspection
  - Full inspection of all components of GMP
  - Newly established manufacturer
  - Renewal of a license
  - Changes:
    - New product or product lines
    - Modifications to manufacturing methods
  - Key personnel, premises, or equipment
  - History of noncompliance with GMP
  - Not inspected in the last 3–5 years
- Concise Inspection
  - Consistent record of compliance with GMP
  - Focus on limited number of GMP requirements
  - Selected as indicators
  - Identify significant changes
  - Indicate attitude toward GMP
  - Noncompliance
  - Should trigger comprehensive inspection
- Follow-up Inspection
  - Reassessment or reinspection
  - Monitor result of corrective actions
  - 6 weeks to 6 months after initial inspection
  - Nature of defects
  - Work undertaken
  - Specific GMP requirements
  - Not observed
  - Not adequately implemented
- Special Inspection
  - Spot-check focusing on
    - One product, a group of related products
    - Specific operations, for example, mixing, labeling
  - Complaints or recalls
  - Adverse drug reactions
  - Marketing approval or export certificate
  - Information or investigation
  - Specific information
  - Advice on regulatory requirements
- Quality Systems Review
  - Assess the quality assurance (QA) system
  - Description of the QA system (e.g., manual)
  - Policy and standards to be observed
  - Management structure
  - Implementation
  - Procedures
  - Quality standards set for products
  - Correctly defined manufacturing processes
  - Records kept
  - QC and QA functions are performed
- Frequency of Inspections
  - Depends on type of inspection
  - Inspectorate resources (e.g., workload, number of inspectors)
  - New facilities—before licensed
  - All companies—regular schedule
  - Ideally annual
    - Large companies
    - Several visits over a period, for example, 5 years
    - Validity of manufacturing license or GMP certificate
- Duration of Inspections
  - Depends on type of inspection
  - Inspectorate resources (e.g., workload, number of inspectors)
  - Size of the company
  - Purpose of the visit
  - Days to weeks
  - Number of inspectors
  - Including specialist support
- Announced and Unannounced Inspections
  - Announced
    - Comprehensive inspection
  - Unannounced
    - Routine inspection (depending on country policy)
    - Concise inspection
    - Follow-up inspection
    - Special inspection
- Regulatory Actions
  - Based on national regulations
  - Correction of unsatisfactory situations
  - Closing down of a factory
  - Withholding of authorizations
  - Product recall
- Group Session
  - The inspectorate received a complaint that an injectable product [water for injection (WFI), 10 mL ampoule] is possibly contaminated with microorganisms. You have to organize an inspection of the company in question.
  - What type of inspection would be performed?
  - Will the inspection be announced or unannounced?
  - Who will be part of the inspection team?
  - What will you consider in preparation for the inspection?

- Possible Issues
  - Purpose of the inspection
  - Notification (or not) of the company in advance
  - Makeup of the team
  - Program for the inspection
  - Sterility test, leak test, and visual inspection
  - Validation and qualification
  - Documentation review

		Compliance 1 2 3[a]	Remarks	EU-Guide
1	**PERSONNEL**			
1.1	Qualified personnel available?	☐☐☐		2.1
1.2	Organization charts available?	☐☐☐		2.2
1.3	Job descriptions available?	☐☐☐		2.2
1.4	Responsibilities clearly defined?	☐☐☐		2.2
	Key Personnel			
	Responsible persons designated for			
1.5	• Production?	☐☐☐		2.5
1.6	• Quality control?	☐☐☐		2.6
1.7	Are they independent of each other?	☐☐☐		2.3
1.8	Are joint functions clearly defined?	☐☐☐		2.7
1.9	Are the responsible persons working full time?	☐☐☐		2.3
1.10	Do the responsible persons have the appropriate formulation, knowledge, and experience?	☐☐☐		2.1/2.2
1.11	Do the relevant departments have enough personnel?	☐☐☐		2.1
	Training			
1.12	Continuous training programs for the production and QC staff?	☐☐☐		2.8
1.13	Initial job training for all employees?	☐☐☐		2.9
1.14	Teaching aids (videos, slides, and brochures) available?	☐☐☐		2.9
1.15	External training courses for the staff?	☐☐☐		2.9
1.16	Training records?	☐☐☐		2.9
1.17	Special training in sensitive areas (sterile production and toxic substances)?	☐☐☐		2.10
1.18	Information for visitors to the manufacturing area?	☐☐☐		2.11
2	**HYGIENE**			
	Personnel Hygiene			
	Detailed written hygiene programs for			
2.1	• Clothing?	☐☐☐		2.13
2.2	• Use of washrooms?	☐☐☐		2.13
2.3	• Behavior in production areas?	☐☐☐		2.13
2.4	Precautions against sick personnel or personnel with open wounds in production?	☐☐☐		2.14
	Medical examination:			
2.5	• On recruitment?	☐☐☐		2.15
2.6	• Regular reexaminations?	☐☐☐		2.15
	Duty of notification after			
2.7	• Trips to tropical countries?	☐☐☐		2.15
2.8	• Cases of contagious illness in the family?	☐☐☐		2.15
2.9	Instructions for appropriate working clothes?	☐☐☐		2.16
2.10	Absence of food and drink (chewing gum!) in the working area?	☐☐☐		2.17
2.11	Measures against contact with open product (gloves etc.)?	☐☐☐		2.18
2.12	Instructions for hand washing in production?	☐☐☐		2.19
2.13	Change of clothes when entering and leaving the production area?	☐☐☐		5.19
2.14	Change rooms and toilets easily within reach?	☐☐☐		3.31
2.15	Toilets and restrooms sufficiently separated from production areas?	☐☐☐		3.30/3.31
2.16	Workshops separate from production areas?	☐☐☐		3.32
2.17	Laboratory animal rooms totally segregated from production rooms?	☐☐☐		3.33
3	**WAREHOUSE**			
	Rooms, General			
3.1	Suitable for the intended use?	☐☐☐		3
3.2	• Adequate size?	☐☐☐		3
3.3	• Clean?	☐☐☐		3
3.4	Located and designed to exclude external contamination?	☐☐☐		3.1
3.5	Appropriate level of maintenance?	☐☐☐		3.2

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
3.6	Maintenance works possible without contamination risk?	☐☐☐		3.2
3.7	Appropriate lighting and air-conditioning?	☐☐☐		3.3
3.8	Recording of temperature and humidity?	☐☐☐		3.3
3.9	Protection against the entry of insects or other animals?	☐☐☐		3.4
3.10	Controlled access for authorized personnel only?	☐☐☐		3.5
	Rooms, Special Requirements			
	Type of warehousing:			
3.11	Separation of goods sufficient?	☐☐☐		3.18
3.12	Provision for different storage temperatures?	☐☐☐		3.19
3.13	Goods receiving zone weather protected?	☐☐☐		3.20
3.14	Cleaning zone for incoming goods?	☐☐☐		3.20
3.15	Separate quarantine area with controlled access?	☐☐☐		3.21
3.16	Separate, protected sampling area?	☐☐☐		3.22
	Separate and safe storage of			
3.17	• Returned goods?	☐☐☐		3.23
3.18	• Rejected goods?	☐☐☐		3.23
3.19	Separate and safe storage of highly active, toxic, or dangerous substances?	☐☐☐		3.24
3.20	Safe storage of narcotics?	☐☐☐		3.24
3.21	Safe storage of printed packaging materials?	☐☐☐		3.25
3.22	Security measurements against theft?	☐☐☐		3.25
3.23	Smoke detectors?	☐☐☐		3.25
3.24	Fire extinguishing system?	☐☐☐		3.25
	Operations			
3.25	Reception, sampling, and labeling according to written procedures?	☐☐☐		5.2
3.26	Is a sampling plan available?	☐☐☐		Suppl. 4
3.27	Cleaning of incoming containers?	☐☐☐		5.3
3.28	Investigation and recording of damaged deliveries?	☐☐☐		5.4
3.29	First In First Out (FIFO) principle?	☐☐☐		5.7
3.30	Inventory system?	☐☐☐		5.8
3.31	Can the location of materials be detected at all times?	☐☐☐		
3.32	Incoming goods: containers and seals intact?	☐☐☐		5.27
3.33	Incoming goods: conformity with bill of delivery?	☐☐☐		5.27
	Labeling of incoming containers with			
3.34	• Internal name and code?	☐☐☐		5.29
3.35	• Allocated batch number?	☐☐☐		5.29
3.36	• Quarantine status?	☐☐☐		5.29
3.37	• Expiry date or reanalysis date?	☐☐☐		5.29
3.38	Identity test for each incoming container?	☐☐☐		5.29
3.39	Are the sampled containers marked?	☐☐☐		5.30
3.40	Are reference samples taken?	☐☐☐		5.30
3.41	Safe storage of printed packaging materials?	☐☐☐		5.41
3.42	Lot tracing of all packaging materials possible?	☐☐☐		5.42
3.43	Are excessive packaging materials destroyed?	☐☐☐		5.43

Release of starting materials by physical/inventory checks on raw materials, packaging materials, and finished goods:

Item	Stocks: Physical	Stocks: Inventory	Storage conditions

4	**DISPENSING/ASSEMBLING**			
	Rooms, General			
4.1	Suitable for the intended use?	☐☐☐		3
4.2	• Adequate size?	☐☐☐		3
4.3	• Clean?	☐☐☐		3
4.4	Located and designed to exclude external contamination?	☐☐☐		3.1
4.5	Appropriate level of maintenance?	☐☐☐		3.2
4.6	Maintenance works possible without contamination risk?	☐☐☐		3.2
4.7	Appropriate lighting and air-conditioning?	☐☐☐		3.3
4.8	Recording of temperature and humidity?	☐☐☐		
4.9	Protection against the entry of insects or other animals?	☐☐☐		3.4
4.10	Controlled access for authorized personnel only?	☐☐☐		3.5
	Rooms, Special Requirements			
4.11	Segregated from production and warehouse?	☐☐☐		3.13
4.12	Separate weighing cabins?	☐☐☐		3.13
4.13	Separate air handling unit (AHU) for each cabin?	☐☐☐		3.12
	Air pressure gradient from weighing cabin → corridor:			3.3
4.14	Dust extraction systems available?	☐☐☐		5.11
	Operations			
4.15	Balances regularly calibrated?	☐☐☐		3.41
4.16	Only pharmaceutical raw materials in this area?	☐☐☐		5.17
4.17	Check on remains from previous materials before entering of new materials into a weighing cabin?	☐☐☐		5.9/5.35
4.18	Only one material in one cabin?	☐☐☐		5.9
4.19	Are dispensed materials correctly labeled?	☐☐☐		5.29
4.20	Only released products in the dispensing?	☐☐☐		5.31
4.21	Cleaning SOPs for the dispensing?	☐☐☐		4.28
4.22	Previously dispensed material recorded on weighing protocol?	☐☐☐		4.8
4.23	Safety measures against mix-ups during assembling (e.g., cage pallets)?	☐☐☐		5.32/5.34
5	**SOLIDS MANUFACTURING**			
	Field of activity:			
	• Granulation	☐		
	• Compression	☐		
	• Encapsulation	☐		
	• Film and sugar coating	☐		
	• Visual inspection (capsules, tablets, etc.)	☐		
	• Premix (human)	☐		
	Rooms, General			
5.1	Suitable for the intended use?	☐☐☐		3
5.2	• Adequate size?	☐☐☐		3
5.3	• Clean?	☐☐☐		3
5.4	Located and designed to exclude external contamination?	☐☐☐		3.1
5.5	Appropriate level of maintenance?	☐☐☐		3.2
5.6	Maintenance works possible without contamination risk?	☐☐☐		3.2
5.7	Appropriate lighting and air-conditioning?	☐☐☐		3.3
5.8	Recording of temperature and humidity?	☐☐☐		
5.9	Protection against the entry of insects or other animals?	☐☐☐		3.4
5.10	Controlled access for authorized personnel only?	☐☐☐		3.5
	Rooms, Special Requirements			
5.11	Separate manufacturing area for penicillins/cephalosporins or highly sensitizing substances?	☐☐☐		3.6
5.12	Only for processing of pharmaceuticals?	☐☐☐		3.6
5.13	Logical flow of materials?	☐☐☐		3.7
5.14	Walls, floors, and ceilings: smooth surface and free of cracks?	☐☐☐		3.8
5.15	Easy cleaning possible?	☐☐☐		3.10

(*Continued*)

		Compliance 1 2 3[a]	Remarks	EU-Guide
5.16	Adequate drains with traps and grilles?	☐☐☐		3.11
5.17	Appropriate air handling system?	☐☐☐		3.12
	Air pressure gradient from working bay → corridor: Classification according to EC guide?			
5.18	Appropriate dust extraction system?	☐☐☐		3.14
5.19	Appropriate lighting?	☐☐☐		3.16
5.20	Separate rest rooms?	☐☐☐		3.30
5.21	Changing rooms designed to avoid contamination?	☐☐☐		3.31
5.22	Toilets segregated from manufacturing areas?	☐☐☐		3.31
	Equipment			
5.23	Suitable for the intended use?	☐☐☐		3.34
5.24	Well maintained?	☐☐☐		3.34
5.25	Written and validated cleaning procedures?	☐☐☐		3.36
5.26	Maintenance without contamination risk (separate area)?	☐☐☐		3.35
5.27	Equipment in contact with product: suitable materials quality?	☐☐☐		3.39
5.28	Machinery equipped with measuring and control devices?	☐☐☐		3.40
5.29	Calibration at fixed intervals according to written procedures?	☐☐☐		3.41
5.30	Calibration records available?	☐☐☐		3.41
5.31	Contents and flow direction marked on pipes?	☐☐☐		3.42
5.32	Pipes for distilled and demineralized water regularly monitored and sanitized?	☐☐☐		3.43
5.33	Not functioning equipment in the production area (if yes: clearly marked)?	**Y N**		3.44
5.34	Status of cleanliness indicated?	☐☐☐		5.13
5.35	Previous product indicated?	☐☐☐		5.13
	Operations			
5.36	Are written and validated procedures for all manufacturing steps available?	☐☐☐		5.2
5.37	Are all manufacturing steps recorded with actual parameters?	☐☐☐		5.2
5.38	Check of each single container of the starting materials (contents, weight, and identity)?	☐☐☐		5.3
5.39	Limits for yields?	☐☐☐		5.8
5.40	Only one batch of one product processed?	☐☐☐		5.9
5.41	Protection against microbial contamination?	☐☐☐		5.10
5.42	Appropriate measures against generation of dust (e.g., closed systems)?	☐☐☐		5.11
	Correct labeling of containers, materials, equipment, and rooms with			5.12
5.43	• Product name and batch no.?	☐☐☐		5.12
5.44	• Quarantine status?	☐☐☐		5.12
5.45	Deviations from standard procedures recorded and signed by the supervisor?	☐☐☐		5.14
5.46	Special procedures for the production of antibiotics, hormones, etc.?	☐☐☐		5.19
5.47	• Campaign production?	☐☐☐		5.19
5.48	• Special monitoring?	☐☐☐		5.19
5.49	• Validated decontamination procedure?	☐☐☐		5.19
5.50	Double check on weight?	☐☐☐		5.34
5.51	Line clearance before start of production?	☐☐☐		5.35
5.52	Investigation of deviations in yields?	☐☐☐		5.39
5.53	Validated procedures for reworking of rejected batches?	☐☐☐		5.62
5.54	Detailed procedures for the addition of previous batches?	☐☐☐		5.63
5.55	Special release procedure (QA) for those batches?	☐☐☐		5.64
5.56	Use of protective clothing (hair cover, shoes, masks, and gloves)?	☐☐☐		2.16
5.57	Clothing regulation for visitors?	☐☐☐		2.11
	In-Process Control (IPC)			5.38
	Who performs IPC?			

(*Continued*)

[a] 1. Fulfilled or available; 2. partially fulfilled; 3. not fulfilled or not available.

GLOSSARY

Acceptance Criteria: Numerical limits, ranges, or other suitable measures for acceptance of test results.

Active Pharmaceutical Ingredient (API) (or Drug Substance): Any substance or mixture of substances intended to be used in the manufacture of a drug (medicinal) product and that, when used in the production of a drug, becomes an active ingredient of the drug product. Such substances are intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure and function of the body.

Air Lock: An enclosed space with two or more doors, which is interposed between two or more rooms, for example, of differing classes of cleanliness, for the purpose of controlling the airflow between those rooms when they need to be entered. An air lock is designed for use either by people or for goods and/or equipment.

API Starting Material: A raw material, intermediate, or API that is used in the production of an API and that is incorporated as a significant structural fragment into the structure of the API. An API Starting Material can be an article of commerce, a material purchased from one or more suppliers under contract or commercial agreement, or produced in house. API Starting Materials are normally of defined chemical properties and structure.

Authorized Person: The person recognized by the national regulatory authority as having the responsibility for ensuring that each batch of finished product has been manufactured, tested, and approved for release in compliance with the laws and regulations in force in that country.

Batch (or Lot): A specific quantity of material produced in a process or series of processes so that it is expected to be homogeneous within specified limits. In the case of continuous production, a batch may correspond to a defined fraction of the production. The batch size can be defined either by a fixed quantity or by the amount produced in a fixed time interval.

Batch Number (or Lot Number): A unique combination of numbers, letters, and/or symbols that identifies a batch (or lot) and from which the production and distribution history can be determined. .

Batch Records: All documents associated with the manufacture of a batch of bulk product or finished product. They provide a history of each batch of product and of all circumstances pertinent to the quality of the final product.

Bioburden: The level and type (e.g., objectionable or not) of microorganisms that can be present in raw materials, API starting materials, intermediates, or APIs. Bioburden should not be considered contamination unless the levels have been exceeded or defined objectionable organisms have been detected.

Bulk Product: Any product that has completed all processing stages up to, but not including, final packaging.

Calibration: The demonstration that a particular instrument or device produces results within specified limits by comparison with those produced by a reference or traceable standard over an appropriate range of measurements. The set of operations that establish, under specified conditions, the relationship between values indicated by an instrument or system for measuring (especially weighing), recording, and controlling, or the values represented by a material measure, and the corresponding known values of a reference standard. Limits for acceptance of the results of measuring should be established.

Clean Area: An area with defined environmental control of particulate and microbial contamination, constructed and used in such a way as to reduce the introduction, generation, and retention of contaminants within the area.

Computer System: A group of hardware components and associated software designed and assembled to perform a specific function or group of functions. A process or operation integrated with a computer system.

Consignment (or Delivery): The quantity of a pharmaceutical(s) made by one manufacturer and supplied at one time in response to a particular request or order. A consignment may comprise one or more packages or containers and may include material belonging to more than one batch.

Contamination: The undesired introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or on to a starting material or intermediate during production, sampling, packaging or repackaging, and storage or transport.

Contract Manufacturer: A manufacturer performing some aspect of manufacturing on behalf of the original manufacturer.

Critical: Describes a process step, process condition, test requirement, or other relevant parameter or item that must be controlled within predetermined criteria to ensure that the API meets its specification.

Critical Operation: An operation in the manufacturing process that may cause variation in the quality of the pharmaceutical product.

Cross-Contamination: Contamination of a material or product with another material or product. Contamination of a starting material, intermediate product, or finished product with another starting material or product during production.

Deviation: Departure from an approved instruction or established standard.

Drug (Medicinal) Product: The dosage form in the final immediate packaging intended for marketing. (See ICH Guidance Q1A.)

Drug Substance: See Active Pharmaceutical Ingredient.

Expiry Date (or Expiration Date): The date placed on the container/labels of an API designating the time during which the API is expected to remain within established shelf-life specifications if stored under defined conditions, and after which it should not be used.

Finished Product: A finished dosage form that has undergone all stages of manufacture, including packaging in its final container and labeling.

Impurity: Any component present in the intermediate or API that is not the desired entity.

Impurity Profile: A description of the identified and unidentified impurities present in an API.

In-Process Control: Checks performed during production in order to monitor and if necessary, to adjust the process to ensure that the product conforms to its specifications. The control of the environment or equipment may also be regarded as a part of in-process control.

Intermediate: A material produced during steps of the processing of an API that undergoes further molecular change or purification before it becomes an API. Intermediates may or may not be isolated. Partly processed product that must undergo further manufacturing steps before it becomes a bulk product.

Large-Volume Parenterals: Sterile solutions intended for parenteral application with a volume of 100 mL or more in one container of the finished dosage form.

Lot: See Batch.

Lot Number: See Batch Number.

Manufacture: All operations of receipt of materials, production, packaging, repackaging, labeling, relabeling, quality control, release, storage, and distribution of APIs and related controls.

Manufacturer: A company that carries out operations such as production, packaging, repackaging, labeling, and relabeling of pharmaceuticals.

Marketing Authorization (Product License, Registration Certificate): A legal document issued by the competent drug regulatory authority that establishes the detailed composition and formulation of the product and the pharmacopoeial or other recognized specifications of its ingredients and of the final product itself, and includes details of packaging, labeling, and shelf life.

Master Formula: A document or set of documents specifying the starting materials with their quantities and the packaging materials, together with a description of the procedures and precautions required to produce a specified quantity of a finished product as well as the processing instructions, including the in-process controls.

Master Record: A document or set of documents that serve as a basis for the batch documentation (blank batch record).

Material: A general term used to denote raw materials (starting materials, reagents, and solvents), process aids, intermediates, APIs, and packaging and labeling materials.

Mother Liquor: The residual liquid that remains after the crystallization or isolation processes. A mother liquor may contain unreacted materials, intermediates, levels of the API, and/or impurities. It may be used for further processing.

Packaging: All operations, including filling and labeling, that a bulk product has to undergo in order to become a finished product. Filling of a sterile product under aseptic conditions, or a product intended to be terminally sterilized, would not normally be regarded as part of packaging.

Packaging Material: Any material intended to protect an intermediate or API during storage and transport. Any material, including printed material, employed in the packaging of a pharmaceutical, but excluding any outer packaging used for transportation or shipment. Packaging materials are referred to as primary or secondary according to whether or not they are intended to be in direct contact with the product.

Pharmaceutical Product: Any material or product intended for human or veterinary use presented in its finished dosage form, or as a starting material for use in such a dosage form, that is subject to control by

pharmaceutical legislation in the exporting state and/or the importing state.

Procedure: A documented description of the operations to be performed, the precautions to be taken, and measures to be applied directly or indirectly related to the manufacture of an intermediate or API.

Process Aids: Materials, excluding solvents, used as an aid in the manufacture of an intermediate or API that do not themselves participate in a chemical or biological reaction (e.g., filter aid, activated carbon, and so on).

Process Control: See In-Process Control.

Production: All operations involved in the preparation of a pharmaceutical product, from receipt of materials, through processing, packaging and repackaging, and labeling and relabeling, to completion of the finished product.

Qualification: Action of proving and documenting that equipment or ancillary systems are properly installed, work correctly, and actually lead to the expected results. Qualification is part of validation, but the individual qualification steps alone do not constitute process validation.

Quality Assurance (QA): The sum total of the organized arrangements made with the object of ensuring that all APIs are of the quality required for their intended use and that quality systems are maintained.

Quality Control (QC): Checking or testing that specifications are met.

Quality Unit(s): An organizational unit independent of production that fulfills both Quality Assurance and Quality Control responsibilities. This can be in the form of separate QA and QC units or a single individual or group, depending upon the size and structure of the organization.

Quarantine: The status of starting or packaging materials, intermediates, or bulk or finished products isolated physically or by other effective means while a decision is awaited on their release, rejection, or reprocessing.

Raw Material: A general term used to denote starting materials, reagents, and solvents intended for use in the production of intermediates or APIs.

Reconciliation: A comparison between the theoretical quantity and the actual quantity.

Recovery: The introduction of all or part of previous batches (or of redistilled solvents and similar products) of the required quality into another batch at a defined stage of manufacture. It includes the removal of impurities from waste to obtain a pure substance or the recovery of used materials for a separate use.

Reference Standard, Primary: A substance that has been shown by an extensive set of analytical tests to be authentic material that should be of high purity.

Reference Standard, Secondary: A substance of established quality and purity, as shown by comparison to a primary reference standard, used as a reference standard for routine laboratory analysis.

Reprocessing: Subjecting all or part of a batch or lot of an in-process drug, bulk process intermediate (final biological bulk intermediate), or bulk product of a single batch/lot to a previous step in the validated manufacturing process due to failure to meet predetermined specifications. Reprocessing procedures are foreseen as occasionally necessary for biological drugs and in such cases, are validated and preapproved as part of the marketing authorization.

Retest Date: The date when a material should be reexamined to ensure that it is still suitable for use.

Reworking: Subjecting an in-process or bulk process intermediate (final biological bulk intermediate) or final product of a single batch to an alternate manufacturing process due to a failure to meet predetermined specifications. Reworking is an unexpected occurrence and is not preapproved as part of the marketing authorization.

Self-Contained Area: Premises that provide complete and total separation of all aspects of an operation, including personnel and equipment movement, with well-established procedures, controls, and monitoring. This includes physical barriers as well as separate air-handling systems but does not necessarily imply two distinct and separate buildings.

Signature (Signed): See definition for signed.

Signed (Signature): The record of the individual who performed a particular action or review. This record can be initials, a full handwritten signature, a personal seal, or an authenticated and secure electronic signature.

Solvent: An inorganic or organic liquid used as a vehicle for the preparation of solutions or suspensions in the manufacture of an intermediate or API.

Specification: A list of detailed requirements with which the products or materials used or obtained during manufacture have to conform. They serve as a basis for quality evaluation.

Standard Operating Procedure (SOP): An authorized written procedure giving instructions for performing operations not necessarily specific to a given product or material (e.g., equipment operation, maintenance, and cleaning; validation; cleaning of premises and environmental control; sampling and inspection). Certain SOPs may be used to supplement product-specific master and batch production documentation.

Starting Material: Any substance of a defined quality used in the production of a pharmaceutical product, but excluding packaging materials.

Validation: A documented program that provides a high degree of assurance that a specific process, method, or system will consistently produce a result meeting predetermined acceptance criteria. Action of proving, in accordance with the principles of GMP, that any procedure, process, equipment, material,

activity, or system actually leads to the expected results (see also Qualification).

Validation Protocol: A written plan stating how validation will be conducted and defining acceptance criteria. For example, the protocol for a manufacturing process identifies processing equipment, critical process parameters/operating ranges, product characteristics, sampling, test data to be collected, number of validation runs, and acceptable test results.

Yield, Expected: The quantity of material or the percentage of theoretical yield anticipated at any appropriate phase of production based on previous laboratory, pilot-scale, or manufacturing data.

Yield, Theoretical: The quantity that would be produced at any appropriate phase of production, based upon the quantity of material to be used, in the absence of any loss or error in actual production.

Appendix B

DISSOLUTION TESTING OF SEMISOLID DOSAGE FORMS

Drug Name	Dosage Form	USP Apparatus	Speed (RPMs)	Medium	Volume (mL)	Recommended Sampling Times (min)	Date Updated
Prochlorperazine	Suppository	I (Suppository, dissolution baskets, Palmieri type)	100	0.1 N HCl at 38°C	900	10, 20, 30, and 45	08/17/2006
Acetaminophen	Suppository	II (Paddle)	50	Phosphate buffer, pH 5	900	15, 30, 45, 60, and 90	08/17/2006
Mesalamine	Suppository	II (Paddle) with option to use a sinker	75 (for 500 mg) and 125 (for 1000 mg)	For 500-mg strength: 0.2 M phosphate buffer, pH 7.5 at 37°C; For 1000-mg strength: 0.2 M phosphate buffer, pH 7.5 at 40°C	900	30, 60, 90, 120, and 150	01/30/2006

Semisolid Formulations

ACECLOFENAC GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg Tablets (g)
1.5	1	Aceclofenac	1.5
9.9	2	Miglyol® 812 (Dynamit-Nobel)	9.9
4.9	3	Lutrol E 400	4.9
64.0	4	Deionized water	64.0
19.7	5	Lutrol F 127	19.7

Manufacturing Directions

1. Mix item 1 with water and cool to approximately 5°C.
2. Add slowly Lutrol F 127 and continue stirring until it is dissolved.
3. Maintain cool until the air bubbles escape. A milky, firm gel is obtained.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
80.00	1	Acetaminophen (micronized)	80.00
836.80	2	Hard fat (Suppocire AM®)	836.80
3.20	3	Sorbitan monostearate (Crill-3)	3.20

Manufacturing Directions

1. Fill weight is 920 mg/suppository. Stir the molten suppository mass throughout the storage period and during manufacturing and filling to avoid sedimentation of the active drug.
2. Load items 2 and 3 into the fat-melting vessel and heat to 50°C ± 3°C.
3. Transfer the molten mass to a mixer through filter sieves.
4. Set the temperature at 45°C ± 2°C.
5. Load item 1 into the mixer containing molten item 2.
6. Carefully mix the powder with molten item 2 for 20 minutes at 10 rpm, at a temperature of 45°C ± 2°C, and at a vacuum of 0.4 to 0.5 bar, then homogenize for 10 minutes at low speed.
7. Continue mixing at 10 rpm.
8. Heat the storage vessel and set the temperature at 45°C ± 2°C.
9. Transfer the molten mass from the mixer to the storage vessel.
10. Hold the mass at 45°C ± 2°C, with continuous mixing at low speed.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
125.00	1	Acetaminophen micronized, 5% excess	131.25
785.54	2	Suppocire AM	785.54
3.21	3	Crill-3	3.21

Manufacturing Directions

1. Load item 2 in the fat-melting vessel and heat to 60°C.
2. Transfer about one-third of step 1 to a Becomix vessel through filter sieves. Set the temperature to 60°C.
3. Add item 3 to step 2. Mix at 10 rpm and homogenize at speed I for 15 minutes at 60°C under vacuum of 0.4 to 0.6 bar to dissolve.
4. Cool down to 50°C to 55°C.
5. Load item 1 in step 4 and mix at 10 rpm and homogenize at speed I for 10 minutes maintaining the temperature of 50°C to 55°C under vacuum as above to make a smooth slurry.
6. Transfer balance quantity of item 2 from step 1 into step 5 through filter sieve, set the temperature at 50°C and speed at 10 rpm, homogenize at speed II and under vacuum for 10 minutes.
7. Transfer into storage vessel and set temperature at 45°C.
8. Fill 920 mg in a suppository mold.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
150.00	1	Acetaminophen (fine powder), excess	150.00
20.00	2	Aerosil® 200	20.00
1290.00	3	Lutrol E 1500	1290.00
554.00	4	Lutrol E 4000	554.00

Manufacturing Directions

1. Melt the mixture of items 1 and 2 in a mixture of items 3 and 4.
2. Fill the molten mass in suppository molds.
3. Average weight is 2 g.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
500.00	1	Acetaminophen (fine powder)	500.00
100.00	2	Lutrol E 400	100.00
600.00	3	Lutrol E 1500	600.00
800.00	4	Lutrol E 4000	800.00

Manufacturing Directions

1. Fill weight is 2.09 g. Melt items 2 through 4 and add and dispense item 1.
2. Fill the molten mass in suppository molds.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
250.00	1	Acetaminophen micronized, 5% excess	252.50
1137.50	2	Suppocire AM	1137.50

Manufacturing directions

1. Load item 2 in the fat-melting vessel and heat to 60°C.
2. Transfer step 1 to a Becomix vessel through filter sieves; set the temperature to 60°C.
3. Cool down to 50°C to 55°C and apply vacuum 0.4 to 0.6 bar.
4. Load item 1 and mix at 10 rpm and homogenize at speed I for 10 minutes, maintaining the temperature of 50°C to 55°C under vacuum as above to make a smooth slurry.
5. Transfer into storage vessel and set temperature at 45°C.
6. Fill 1390 mg in a suppository mold.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
500.00	1	Acetaminophen micronized, 5% excess	525.00
1137.50	2	Suppocire AM	1137.50

Manufacturing Directions

1. Load item 2 in the fat-melting vessel and heat to 60°C.
2. Transfer step 1 to a Becomix vessel through filter sieves. Set the temperature to 60°C.
3. Cool down to 50°C to 55°C and apply vacuum 0.4 to 0.66 bar.
4. Load item 1 and mix at 10 rpm and homogenize at speed I for 10 minutes maintaining the temperature of 50°C to 55° C under vacuum as above to make a smooth slurry.
5. Transfer into storage vessel and set temperature at 45°C.
6. Fill 1390 mg in a suppository mold.

ACETYLSALICYLIC ACID SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Acetylsalicylic acid	100.00
400.00	2	Suppocire AM	400.00

Manufacturing Directions

1. Heat item 2 to 50°C.
2. Allow to cool to 40°C and add item 1 while stirring with a turbine mixer.
3. Continue mixing and cooling and pour into molds at 35°C that were previously chilled to 0° to 5°C. Remove suppositories from molds after 7 minutes.
4. Fill to appropriate weight for strength desired.

ACNE COVER CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
37.00	1	Glyceryl stearate S/E	37.00
46.00	2	Mineral oil/lanolin alcohol (liquid base CB3939)	46.00
9.00	3	Polawax GP2000	9.00
18.00	4	Stearic acid	18.00
QS	5	Deionized water	QS
36.00	6	Propylene glycol	36.00
2.00	7	Carboxymethylcellulose (CMC-7HF)	2.00
9.00	8	Magnesium aluminum silicate (regular) Veegum®	9.00
9.00	9	Triethanolamine (99%)	9.00
120.00	10	Titanium dioxide	120.00
QS	11	Iron oxides	QS
50.00	12	Actives	50.00
QS	13	Perfume, preservative	QS

Manufacturing Directions

1. Disperse CMC in propylene glycol and triethanolamine and add warm water (60–65° C) while stirring, until the gum is hydrated.
2. Add Veegum and stir until hydrated.
3. Heat oil phase to 60°C to 65°C.
4. Add water phase to oil phase while stirring.
5. Add pigments and stir to cool, adding the actives at 30°C.
6. Homogenize using suitable equipment.
7. Fill. (*Note*: Active ingredients may be added as required to this base formula.)

ACNE TREATMENT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Polychol 10 (Laneth-10)	20.00
5.00	2	Lanolin alcohols (Super Hartolan)	5.00
55.00	3	Cetyl alcohol C90	55.00
60.00	4	Polawax, NF	60.00
14.00	5	Sulfur	14.00
QS	6	Deionized water	QS
40.00	7	Veegum (regular)	40.00
20.00	8	Propylene glycol	20.00
20.00	9	Resorcinol	20.00
QS	10	Perfume, preservative	QS

Manufacturing Directions

1. Hydrate Veegum in water.
2. Add rest of the water-phase ingredients and heat to 70°C.
3. Heat oil phase to 70°C.
4. Disperse sulfur in the oil phase.
5. Add oil phase to water phase while stirring.
6. Stir to cool. Fill.

ACYCLOVIR CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Acyclovir: Use acyclovir micronized	52.00
5.20	2	Acyclovir: Use acyclovir micronized	52.00
1.63	3	Polyoxyl 20 cetostearyl ether (cetomacrogol 1000)	16.35
20.40	4	Propylene glycol	204.00
17.00	5	Propylene glycol	170.00
9.65	6	Petrolatum (white soft paraffin)	96.50
6.50	7	Cetostearyl alcohol	65.00
3.50	8	Mineral oil (liquid paraffin)	35.00
36.50	9	Purified water	365.00

Manufacturing Directions

1. Oil phase
   a. Load items 5 to 7 in fat-melting vessel and melt at 70°C. Maintain temperature at 70°C ± 2°C.
2. Aqueous phase
   a. Heat item 8 in mixer at 90°C. Cool down to 70°C. Add item 2 in item 8 at 70°C and stir to dissolve.
   b. Add item 4 to mixer (step 2b) and mix. Maintain temperature at 70°C ± 2°C.
3. Cream phase
   a. Add oil phase through stainless-steel filter to aqueous phase in mixer while mixing at 10 to 12 rpm, manual mode, and temperature 70°C ± 2°C.
   b. Homogenize at low speed with mixing 10 to 12 rpm, vacuum 0.4 to 0.6 bar, temperature 70°C ± 2°C for 10 minutes.
   c. Cool down to 50°C with mixing.
4. Drug phase
   a. Heat 169 g of item 3 at 50°C in water bath.
   b. Disperse item 1 in item 3 (step 4a) with the help of homogenizer. Homogenize two times with homogenizer (gap setting 1) to make smooth dispersion. Dispersion should be smooth with no gritty particles.

c. Add the drug phase from step 4b to cream base at step 3.3 in mixer.
d. Rinse the homogenizer and the container with 35 g of item 3 (50°C) and add the rinsing to cream base in mixer.

5. Final mixing
   a. Homogenize at high speed for 15 minutes at a temperature of 45°C with continuous mixing at 10 to 12 rpm.
   b. Cool down to 25°C to 30°C with continuous mixing.
   c. Unload in stainless-steel drum lined with polythene bag.

ACYCLOVIR OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.000	1	Acyclovir micronized (4% excess)	52.00
28.000	2	Polyethylene glycol 3350	280.00
41.800	3	Polyethylene glycol 400	418.00
25.000	4	Propylene glycol	250.00

Manufacturing Directions

1. Oil phase
   a. Heat items 2 and 3 to 70°C ± 2°C in mixer to melt. Cool down to 45°C with mixing.
2. Drug dispersion
   a. Disperse item 1 in 200 g of item 4 at 50°C in a water bath with the help of homogenizer. The drug dispersion should be smooth with no gritty particles.
   b. Add the drug dispersion to mixer at step 1.
   c. Rinse the container with 50 g of item 4 at 50°C and add the rinsing to mixer.
3. Final mixing
   a. Homogenize at high speed with mixing under vacuum 0.4 to 0.6 bar at 45°C ± 2°C for 30 minutes.
   b. Cool down to 25° to 30°C with continuous mixing.
   c. Unload in stainless-steel drum lined with polythene bag.

ADAPALENE CREAM

Adapalene cream, 0.1%, contains adapalene, 0.1%, in an aqueous cream emulsion consisting of carbomer 934P, cyclomethicone, edetate disodium, glycerin, methyl glucose sesquistearate, methyl paraben, PEG-20 methyl glucose sesquistearate, phenoxyethanol, propyl paraben, purified water, squalane, and trolamine.

ALCLOMETASONE DIPROPIONATE CREAM AND OINTMENT

Each gram of cream contains 0.5 mg of alclometasone dipropionate in a hydrophilic, emollient cream base of propylene glycol, white petrolatum, cetearyl alcohol, glyceryl stearate, PEG-100 stearate, ceteth-20, monobasic sodium phosphate, chlorocresol, phosphoric acid, and purified water. Each gram of ointment contains 0.5 mg of alclometasone dipropionate in an ointment base of hexylene glycol, white wax, propylene glycol stearate, and white petrolatum.

ALOE VERA GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
4.0	1	Aloe vera extract 200X	4.0
50.0	2	Propylene glycol	50.0
QS	3	Preservative	QS
736.0	4	Water	736.0
11.0	5	Cremophor RH 40	11.0
QS	6	Perfume	QS
200.0	7	Lutrol F 127	200.0

Manufacturing Directions

1. Prepare solutions items 1 to 4 and items 5 and 6 separately and add second to first mixture.
2. Cool this mixture to < 10°C (or heat to 70–80°C) and dissolve item 7. Maintain the temperature until the air bubbles escape and the appearance is clear. Viscosity should be approximately 60 Pa, pH approximately 5.5 (20–25°C) in the storage vessel.
3. Mix for 2 minutes. Store in a clean storage vessel.

ALUM CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
4.00	1	Cetostearyl alcohol	40.00
5.00	2	Octyldodecanol	50.00
4.00	3	Lanolin alcohol	40.00
2.00	4	Ethoxylated castor oil	20.00
2.00	5	White petrolatum	20.00
6.50	6	Alum (aluminum potassium sulfate, 12 H_20)	65.00
2.50	7	Cetylpyridinium ammonium chloride	25.00
95.00	8	Water purified	740.00

Manufacturing Directions

1. Heat cetostearyl alcohol, ethoxylated castor oil, lanolin alcohol, octyldodecanol, and white petrolatum that are weighed and mixed in the ratio defined above to 60°C.
2. Dissolve alum and item 7 in water at room temperature and then the solution is heated to 62°C.
3. Combine both phases in an ointment mixer and homogenize by stirring.
4. While stirring, cool the cream to approximately 30°C and supplement its weight with purified water.
5. Homogenize the cream again by stirring and then fill into an electrolyte-resistant storage bottle

6-AMINONICOTINAMIDE OINTMENT

Manufacturing Directions

1. Dissolve 0.1 g 6-Aminonicotinamide in 3.6 mL of 0.22 N HCl and 6.3 mL water.
2. Admix the solution thus obtained with commercially available USP grade hydrophilic ointment (90 g) to a uniform consistency.
3. Store the ointment thus prepared preferably in opaque jars at room temperature.

6-AMINONICOTINIC ACID METHYL ESTER OINTMENT

Manufacturing Directions

1. Dissolve 1 g 6-Aminonicotinic acid methyl ester in anhydrous ethanol (9 mL) and admix the solution with white petrolatum USP grade (54 g) and liquid petrolatum USP grade (36 g) to a uniform consistency.
2. This ointment also may be stored in opaque jars at room temperature.

6-AMINONICOTINIC ACID OINTMENT

Manufacturing Directions

1. Dissolve 1 g 6-Aminonicotinic acid in 7 mL of 1 N HCl and 2mL of water.
2. Admix the solution with USP grade hydrophilic ointment (90 g) to a uniform consistency.
3. The ointment thus prepared may also be stored in opaque jars at room temperature.

AMINACRINE HYDROCHLORIDE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Aminacrine hydrochloride	1.00
5.00 mg	2	Thymol	50.00 mg
9.50	3	Glyceryl monostearate	95.00
3.20	4	Cetostearyl alcohol	32.00
1.90	5	Polyoxyl 40 stearate	19.00
10.00	6	Liquid paraffin	100.00
0.45	7	Cetrimide	4.50
QS	8	Isopropyl alcohol	1.30 L
QS	9	Perfume	QS
QS	10	Water purified	QS to 1 kg

Manufacturing Directions

1. Load items 3 to 5 and half of item 6 into a suitable mixing vessel. Heat to 60°C and mix well.
2. Prepare slurry of item 1 in the balance of item 6 and add to step 1 slowly at 60°C under constant stirring.
3. Heat item 10 to 60° C and add to step 2 with stirring to form an emulsion.
4. Cool down to 45°C and add perfume. Continue to mix to cool down to room temperature.
5. Fill in appropriate containers.

AMOXICILLIN LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Ethoxylated cetyl stearyl alcohol	70.00
0.75	2	Cetyl alcohol	7.50
5.00	3	Isopropyl myristate	50.00
0.10	4	Butylated hydroxyanisole	1.00
0.25	5	Polyoxyl 40 stearate	2.50
71.80	6	Water purified	718.00
3.00	7	Propylene glycol	30.00
10.00	8	Acetone	100.00
0.10	9	Dioctyl sodium sulfosuccinate	1.00
2.00	10	Amoxicillin	20.00

AMPICILLIN LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Ethoxylated cetyl stearyl alcohol	70.00
0.75	2	Cetyl alcohol	7.50
5.00	3	Isopropyl myristate	50.00
0.10	4	Butylated hydroxyanisole	1.00
0.25	5	Polyoxyl 40 stearate	2.50
71.80	6	Water purified	718.00
3.00	7	Propylene glycol	30.00
10.00	8	Acetone	100.00
0.10	9	Dioctyl sodium sulfosuccinate	1.00
2.00	10	Ampicillin	20.00

ANALGESIC CLEAR GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
25.00	1	Hydroxypropyl cellulose	25.00
QS	2	Deionized water	QS to 1 kg
400.00	3	Ethanol DEB 100	400.00
100.00	4	Menthol	100.00
150.00	5	Methyl salicylate	150.00
25.00	6	DEA-oleath-3-phosphate	25.00

Manufacturing Directions

1. Hydrate hydroxypropyl cellulose in water at 60°C to 65° C.
2. Stir to cool.
3. Add ethanol.
4. Add remaining ingredients and stir until homogeneous.

ANALGESIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
130.00	1	Methyl salicylate	130.00
60.00	2	Menthol	60.00
20.00	3	Eucalyptus oil	20.00
5.00	4	Lanolin	5.00
1.00	5	Chloroxylenol	1.00
150.00	6	Glyceryl stearate and PEG-100 stearate	150.00
73.00	7	Cetearyl alcohol	73.00
70.00	8	Glyceryl stearate	70.00
QS	9	Deionized water	QS to 1 kg
QS	10	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 30°C.

ANALGESIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Methyl salicylate	150.00
70.00	2	Menthol	70.00
10.00	3	Lanolin oil	10.00
30.00	4	PEG-40 stearate	30.00
20.00	5	Glyceryl stearate	20.00
QS	6	Deionized water	QS
1.50	7	Carbopol® 980	1.50
10.00	8	Potassium hydroxide (10% aqueous solution)	10.00
QS	9	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases (except potassium hydroxide) separately to 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add potassium hydroxide solution to neutralize.
4. Stir to cool.
5. Fill at 30°C.

ANTHRALIN CREAM

Anthralin cream, 1% USP, is a smooth, yellow cream acid, sodium hydroxide, and purified water. For topical containing 1% anthralin USP in an aqueous cream base dermatological use only.

ANTIACNE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
422.00	1	Witch hazel (distilled, 14% alcohol)	422.00
5.00	2	Salicylic acid	5.00
5.00	3	Aloe vera gel	5.00
10.00	4	Sorbitol	10.00
500.00	5	Polyglycerylmethacrylate	500.00
10.00	6	Propylene glycol	10.00
0.80	7	Methyl paraben	0.80
0.20	8	Propyl paraben	0.20

Manufacturing Directions

1. Premix items 1 to 4.
2. Add item 5 with low-shear mixing until homogeneous.
3. Mix together items 6 to 8 and add them to the formulation.

ANTIFUNGAL FOOT POWDER

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Dichlorobenzyl alcohol (Myacide SF)	5.00
5.00	2	Allantoin	5.00
200.00	3	Cornstarch	200.00
790.00	4	Talc	790.00

Manufacturing Directions

1. Mix all ingredients using geometric dilution technique.

ANTIFUNGAL TOPICAL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
39.00	1	Urea[a]	390.00
0.15	2	Carbopol 940	1.50
5.94	3	Petrolatum	59.40
12.06	4	Mineral oil	120.60
1.875	5	Glyceryl stearate	187.50
0.626	6	Cetyl alcohol	6.26
3.00	7	Propylene glycol	30.00
0.05	8	Xanthan gum	0.50
0.15	9	Trolamine	1.50
1.00–5.00	10	Antifungal compound[a]	10.00–50.00

[a] Adjust quantity of urea for the quantity of antifungal compound; this formula is for 1% level of antifungal added.

ANTISEPTIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Polawax GP200	50.00
10.00	2	Lanolin	10.00
150.00	3	Mineral oil (70 cS)	150.00
70.00	4	Cetearyl alcohol	70.00
30.00	5	Dimethicone	30.00
QS	6	Deionized water	QS to 1 kg
5.00	7	Cetrimonium bromide	5.00
0.50	8	Chlorhexidine gluconate	0.50
QS	9	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases to 65°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill.

ANTISEPTIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Cetearyl alcohol and ceteareth-20	30.00
50.00	2	Mineral oil (70 cS)	50.00
2.00	3	Lanolin alcohol	2.00
QS	4	Deionized water	QS to 1 kg
5.00	5	Cetrimonium bromide (as 40% cetrimide solution BP)	5.00
20.00	6	Glycerin	20.00
QS	7	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill at 30°C.

ANTISEPTIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Cetearyl alcohol and ceteareth-20	30.00
45.00	2	Mineral oil (70 cS)	45.00
25.00	3	Stearyl alcohol	25.00
10.00	4	Lanolin	10.00
5.00	5	Polysorbate 60	5.00
15.00	6	Laneth-15	15.00
QS	7	Deionized water	QS to 1 kg
5.00	8	Cetrimonium bromide (as 40% cetrimide solution BP)	5.00
20.00	9	Glycerin	20.00
QS	10	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill at 30°C.

ARGININE AND OLEORESIN CAPSICUM CREAM

Active ingredients: L-arginine and oleoresin capsicum. Other ingredients: Water, choline chloride, sodium chloride,magnesium chloride, white oil, glyceryl stearate SE, squalane, cetyl alcohol, propylene glycol stearate SE, wheat germ oil, glyceryl stearate, isopropyl myristate, stearyl stearate, polysorbate-60, propylene glycol, oleic acid, tocopheryl acetate, collagen, sorbitan stearate, vitamins A and D, triethanolamine, aloe vera extract, imidazolidinyl urea, oleoresin capsicum,methyl paraben, propyl paraben, BHA.

ARGININE CREAM

Active ingredient: L-arginine. Other ingredients: Water, choline chloride, sodium chloride, magnesium chloride, white oil, glyceryl stearate SE, squalane, cetyl alcohol, propylene glycol stearate SE, wheat germ oil, glyceryl stearate, isopropyl myristate, stearyl stearate, polysorbate-60, propylene glycol, oleic acid, tocopheryl acetate, collagen, sorbitan stearate, vitamins A and D, triethanolamine, aloe vera extract, imidazolidinyl urea, methyl paraben, propyl paraben, BHA.

ARGININE–ASPARTATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.50	1	Cetostearyl alcohol	35.00
40.00	2	Squalane	400.00
3.00	3	Beeswax	30.00
5.00	4	Reduced lanolin	50.00
0.30	5	Ethyl p-oxybenzoate	3.00
2.00	6	Polyoxyethylene (20 mol) sorbitan monopalmitate	20.00
2.00	7	Monoglyceride stearate	20.00
0.50	8	Sodium N-stearoyl glutamate	5.00
1.00	9	2-Hydroxy-4-methoxy benzophenone	10.00
2.00	10	Retinol acetate	20.00
0.05	11	Evening primrose oil	0.50
0.03	12	Perfume	0.30
0.01	13	L-Arginine-L-aspartate	0.10
5.00	14	1,3-Butylene glycol	50.00
5.00	15	Polyethylene glycol 1500	50.00
QS	16	Water purified	QS to 1 kg

Manufacturing Directions

1. Place items 1 to 12 in a heating vessel and dissolve and mix.
2. In another vessel, prepare a solution of items 13 to 16 heated to 75°C with stirring.
3. Add step 2 into step 1 and homogenize to reduce the size of emulsified particles.
4. Cool rapidly to produce a cream.

ATROPINE OPTHALMIC OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Atropine sulfate	10.00
5.00	2	Liquid paraffin	50.00
5.00	3	Cetostearyl alcohol	50.00
5.00	4	Hard paraffin	50.00
84.00	5	Soft paraffin	840.00

Manufacturing Directions

1. Load items 2 to 5 in a melting vessel. Heat to 145°C and keep it at this temperature for 45 minutes.
2. Allow to cool to room temperature.
3. In a separate vessel, dissolve item 1 in 200 mL of water for injection and add to step 1 under aseptic conditions.
4. Fill and sterilize in tubes (gamma radiation).

AZELAIC ACID CREAM AND GEL

Azelaic acid cream, 20%, contains azelaic acid, a naturally occurring saturated dicarboxylic acid. Each gram contains azelaic acid (0.2 g, 20% w/w). Inactive ingredients: Cetearyl octanoate, glycerin, glyceryl stearate, cetearyl alcohol, cetyl palmitate, cocoglycerides, PEG-5 glyceryl stearate, propylene glycol, and purified water. Benzoic acid is present as a preservative. Azelaic acid in a gel form is manufactured by the following method: Benzoic acid and EDTA are dissolved in usual concentrations in 60 to 70 parts of water. Then a mixture of 1 part midchain triglycerides and 1.5 parts polysorbate 80 is added and homogenized while being stirred (preemulsion). One part lecithin is introduced into twelve parts propylene glycol. The solution that is produced is stirred into the preemulsion and homogenized. After 1 part polyacrylic acid is added, 15 parts azelaic acid are added. Sodium hydroxide is used to neutralize the carbomer to form the gel.

BABY CREAM, BENZALKONIUM CHLORIDE, AND ZINC OXIDE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.002 mL	1	Benzalkonium chloride solution	2.30 mL
85.00 mg	2	Zinc oxide (powder)	85.00
100.00 mg	3	Polawax (emulsifying, nonionic wax)	100.00
16.00 mg	4	Alcohol cetostearyl	16.00
4.00 mg	5	Lanolin (acetylated/ anhydrous, regular)	4.00
80.00 mg	6	Glycerin (96%)	80.00
10.00 mg	7	Oil (neutral, vegetable triglycerides mixture; Miglyol)	10.00
0.50 mg	8	Propyl paraben (Aseptoform(tm) P)	0.50
1.00 mg	9	Methyl paraben (Aseptoform(tm) M)	1.00
0.80 mL	10	Purified water	QS to 800.00 mL
0.24 mg	11	Perfume (Diabolo 110.388/B)	0.24

Manufacturing Directions

Avoid mixing air into emulsion. Emulsify under vacuum to minimize air entrapment. Use jacketed tank with vacuum with high-speed agitator (adjustable, slow-speed, anchor type with Teflon sweep blades).

1. If necessary, mill zinc oxide in a Fitz mill or similar device (impact forward, maximum speed), fitted with a 250 µm screen.
2. Repeat 3 times.
3. Heat 800 mL of water to 75°C in a steam-jacketed mixing tank and dissolve methyl paraben.
4. Maintain temperature at 75°C.
5. Disperse milled zinc oxide in solution of previous step.
6. Maintain temperature at 75°C.
7. Dissolve benzalkonium chloride and glycerin in solution and maintain temperature at 75°C.
8. In a separate steam-jacketed tank, add Polawax, cetostearyl alcohol, acetylated lanolin, oil, and propyl paraben. Carefully melt at 70°C.
9. Adjust the turbomixer of the steam-jacketed tank containing the aqueous phase to maximum speed, keeping the temperature at 75°C.
10. Slowly add the oil phase to the aqueous phase.
11. Generate as much vacuum as possible and maintain it for the rest of the process.
12. Circulate cold water to allow for a very slow temperature decrease (down to 60°C).
13. Stop the turbomixer and set the anchor-type agitator at minimum speed until 40°C to 45°C is reached.
14. The temperature decrease must be very slow.
15. Break the vacuum and add perfume to cream with anchortype agitator set at slow speed.
16. Continue to mix until the perfume is completely dispersed.

BABY LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L
50.00	1	Alcohol (ethanol; natural cosmetic grade)	50.00 g
50.00	2	Propylene glycol	50.00 g
0.80	3	Ethoxylated nonyl phenol	0.80 g
0.005	4	FD&C Red Dye No. 40	5.70 mg
0.41	5	FD&C blue dye No. 1	0.41 g
0.70	6	FD&C yellow dye No. 5	0.70 g
0.40	7	Perfume essence (Nelandia)	0.40 g
QS	8	Hydrochloric acid (reagent-grade bottles)	~0.01 g
QS	9	Purified water	QS to 1.00 L

Manufacturing Directions

Use 316 or more resistant-grade stainless-steel tank.

1. Place approximately 800 mL of purified water in main mixing tank.
2. Add alcohol and propylene glycol and mix for 5 minutes.
3. Separately dissolve each dye in sufficient water to obtain 0.5% dye solutions.

4. Add color solutions to main tank and mix.
5. Rinse containers with small portions of purified water and add rinsings.
6. Dissolve perfume essence in ethoxylated nonyl phenol.
7. Add solution from previous step to main tank and mix for 5 minutes.
8. Determine pH of solution and adjust if necessary with 5% hydrochloric acid solution.
9. Mix well. ph should be 5.7 to 5.9.
10. QS to 1 L with purified water.

BABY LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
50.00	1	Alcohol	50.0
50.00	2	Propylene glycol	50.0
0.80	3	Ethoxylated nonyl phenol	0.80
0.57	4	Dye red FD&C No. 40	0.57
0.41	5	Dye blue FD&C No. 1	0.41
0.70	6	Dye yellow FD&C No. 5	0.70
0.40	7	Perfume essence nelandia	0.40
QS	8	Acid hydrochloric reagent grade bottles	~0.012
QS	9	Water purified	QS to 1 L

Manufacturing Directions

1. Use 316 or more resistant grade stainless-steel tank.
2. Place approximately 800 mL of purified water in main mixing tank.
3. Add alcohol and propylene glycol and mix for 5 minutes. Separately dissolve each dye in sufficient water to obtain 0.5% dye solutions.
4. Add color solutions to main tank and mix. Rinse containers with small portions of purified water and add rinsings.
5. Dissolve perfume essence nelandia in ethoxylated nonyl phenol.
6. Add solution from step above to main tank and mix for 5 minutes.
7. Determine pH of solution and adjust if necessary with 5% hydrochloric acid solution.
8. Mix well (pH 5.7–5.9). QS to 1 L with purified water.

BABY SHAMPOO

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg
250.00	1	Sodium alkyl ether sulfate/ sulfonate	250.00 g
30.00	2	Monateric CAB surfactant	30.00 g
30.00	3	Cocamide DEA surfactant (Synotol CN 90)	30.00 g
1.00	4	Methyl paraben	1.00 g
0.52	5	Anhydrous citric acid	0.52 g
0.003	6	FD&C yellow dye No. 6	3.50 mg
0.01	7	FD&C yellow dye No. 5	15.00 mg
4.00	8	Ethoxylated nonyl phenol	4.00 g
3.00	9	Perfume I	3.00 g
1.00	10	Perfume II	1.00 g
8.50	11	Sodium chloride	8.50 g
QS	12	Purified water	QS to 1.00 kg

Manufacturing Directions

Use 315 or more resistant-grade stainless-steel tank.

1. Add approximately 270 g of purified water to the main mixing tank.
2. With slow agitation add cocamide DEA surfactant.
3. Add and dissolve methyl paraben and mix for approximately 10 minutes.
4. Add the following ingredients to tank: Sodium alkyl sulfate/sodium alkyl ether sulfate/sulfonate, monateric CAB surfactant, and approximately 280 g of purified water.
5. Mix for 15 minutes until complete solution is obtained.
6. With constant stirring, slowly add citric acid (10% solution) until a pH of 6.9 to 7.1 is maintained constantly for 5 minutes after the last addition of the citric acid solution.
7. Separately dissolve FD&C yellow dyes No. 6 and 5 (if used) in sufficient purified water.
8. Add dye solution from step above to main tank and mix.
9. Rinse containers with a small portion of purified water and add rinsings.
10. Separately mix ethoxylated nonyl phenol with perfumes (perfume available from Firmenich; Plainsboro, NJ) and add to main mixing tank.
11. Rinse container with purified water and add rinsing.
12. Mix until completely dissolved.
13. Slowly add in small portions sodium chloride to adjust the viscosity to between 1500 and 3500 cps.
14. Mix for 15 minutes.
15. If necessary, QS to 1 kg with purified water.

BACITRACIN ZINC AND POLYMYXIN B SULFATE OPTHALMIC OINTMENT

The bacitracin zinc and polymyxin B sulfate ophthalmic ointment USP is a sterile antimicrobial ointment formulated for ophthalmic use. Bacitracin zinc is the zinc salt of bacitracin, a mixture of related cyclic polypeptides (mainly bacitracin A) produced by the growth of an organism of the licheniformis group of *Bacillus subtilis* var. Tracy. It has a potency of not less than 40 bacitracin units per milligram. Polymyxin B sulfate is the sulfate salt of polymyxin B1 and B2, which are produced by the growth of *Bacillus polymyxa* (Prazmowski) Migula (family Bacillaceae). It has a potency of not less than 6000 polymyxin B units per milligram, calculated on an anhydrous basis. Each gram contains the following actives: Bacitracin zinc equal to 500 bacitracin units and polymyxin B sulfate equal to 10,000 polymyxin B units. Inactives: White petrolatum and mineral oil.

BASE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.0	1	Cetyl stearyl alcohol	70.00
1.5	2	Cremophor A 6	15.00
1.5	3	Cremophor A 25	15.00
12.0	4	Liquid paraffin	120.00
0.2	5	Paraben(s)	2.00
67.8–69.7	6	Water	678–697
8.0	7	Propylene glycol	80.00
0.1–2.0	8	Active ingredient	1–2.00

Manufacturing Directions

1. Heat a mixture of items 1 to 5 and the water separately to approximately 80°C.
2. With rigorous stirring, add the water to the obtained solution.
3. Heat items 7 and 8 until the active ingredient is dissolved, mix with aqueous solution, and continue to stir during cooling to room temperature.
4. This white basic cream can be readily used for active ingredients soluble in 1, 2-propylene glycol.

BASE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.50	1	Propylene glycol	25.00
2.50	2	Triacetin	25.00
57.00	3	Mineral oil	570.00
35.00	4	Microcrystalline wax	350.00
3.00	5	Propylene glycol stearate	30.00
0.05	6	Citric acid	0.50

Manufacturing Directions

1. The mineral oil, microcrystalline wax, and propylene glycol stearate are melted together by heating to 75°C to 85°C and mixed, thus creating the oleaginous phase.
2. The citric acid, if used, is dissolved in the triacetin by stirring and using heat is necessary.
3. If used optionally, add the propylene glycol to the triacetin and mix.
4. After cooling the oleaginous phase to approximately 55°C, add the triacetin solution to the oleaginous phase while mixing. Mixing should be of sufficient intensity to disperse the triacetin finely and uniformly.
5. Continue mixing while cooling the ointment to 30°C or lower.

BASE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
10.00	1	Triacetin	100.00
30.00	2	Lanolin alcohol and petrolatum (Americhol CAB)	300.00
1.00	3	Cholesterol	10.00
59.00	4	White petrolatum	590.00

Manufacturing Directions

1. Melt together Amerchol CAB, white petrolatum, and cholesterol by heating to 75°C to 85°C and mix to form the oleaginous phase.
2. After cooling the oleaginous phase to approximately 45°C, add the triacetin to the oleaginous phase while mixing. Mixing should be of sufficient intensity to disperse the triacetin finely and uniformly.
3. Continue mixing while cooling the ointment to 30°C or lower.

BASE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Triacetin	50.00
25.00	2	Dimethicone (1000 cS)	250.00
61.50	3	White petrolatum	615.00
5.00	4	Microcrystalline wax	50.00
1.00	5	Cholesterol	10.00
2.50	6	Sucrose distearate	25.00

Manufacturing Directions

1. To make the oleaginous phase, melt white petrolatum, sucrose distearate, cholesterol, and microcrystalline wax at 75°C to 85°C.
2. Add dimethicone and mix. After cooling the oleaginous phase to approximately 55° C, add the triacetin to the oleaginous phase while mixing. Mixing should be of sufficient intensity to disperse the triacetin finely and uniformly.
3. Continue mixing while cooling the ointment to 30° C or lower.

BASE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Liquid paraffin	50.00
10.00	2	White paraffin	100.00
30.00	3	Glycerin	300.00
8.00	4	Cetostearyl alcohol	80.00
0.30	5	Methyl paraben	3.00
3.60	6	Polyoxyethylene sorbitan monostearate	36.00
2.00	7	Glyceryl monostearate	20.00
QS	8	Water purified	QS to 1 kg

Manufacturing Directions

1. Preparation of water phase
   a. Add purified water, polysorbate 60, and glycerin with agitation to a melting kettle.
   b. Heat the contents to 61°C to 65°C.
   c. Add methyl paraben and mix the composition to dissolve while maintaining temperature.
2. Preparation of oil phase
   a. In a suitable vessel, place liquid paraffin, cetostearyl alcohol, white petrolatum, glycerol monostearate, and white beeswax and mix continuously while heating to 71°C to 75°C.
3. Mixing of phases
   a. The mixture of step 2 is transferred to step 1 kettle with the water phase maintained less than 300 mbar vacuum.
   b. With mixing and keeping the temperature at 61°C to 65°C, draw the oil phase into the water phase.
   c. Mix for 15 minutes with agitation and vacuum at 300 mbar and 61°C to 65°C.
   d. While mixing and under vacuum, allow the mixture to cool gradually to room temperature.
4. Fill in appropriate container.

BECAPLERMIN GEL (0.01%)

The gel contains becaplermin, a recombinant human platelet-derived growth factor for topical administration. Becaplermin is produced by recombinant DNA technology by insertion of the gene for the B chain of platelet-derived growth factor into the yeast *Saccharomyces cerevisiae*. Becaplermin has a molecular weight of approximately 25 kDa and is a homodimer composed of two identical polypeptide chains that are bound together by disulfide bonds. The gel is a nonsterile, low-bioburden, preserved, sodium carboxymethylcellulose-based topical gel containing the active ingredient becaplermin and the following inactive ingredients: Sodium chloride, sodium acetate trihydrate, glacial acetic acid, water for injection, and methyl paraben, propyl paraben, and M-cresol as preservatives, and L-lysine hydrochloride as a stabilizer. Each gram of gel contains 100 g of becaplermin.

BENZALKONIUM CHLORIDE AND ZINC OXIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.0023 mL	1	Benzalkonium chloride solution	2.3 mL
85.0	2	Zinc oxide USP powder	85.0
100.0	3	Wax emulsifying nonionic (Polawax®)	100.0
16.0	4	Alcohol cetostearyl	16.0
4.0	5	Lanolin acetylated/ anhydrous USP regular	4.0
80.0	6	Glycerin USP (96%)	80.0
10.0	7	Oil-neutral vegetable triglycerides mixture Miglyol	10.0
0.5	8	Propyl paraben NF (Aseptoform P)	0.5
1.0	9	Methyl paraben NF (Aseptoform M)	1.0
0.80 mL	10	Purified water	QS to 800.0 mL
0.24	11	Perfume diabolo 110.388/B	0.24 g

Manufacturing Directions

1. Avoid mixing air into emulsion. Emulsify under vacuum to minimize air entrapment. Use jacketed tank with vacuum with high-speed agitator and an adjustable slow-speed anchor type with Teflon sweep blades.
2. If necessary, mill zinc oxide in a Fitz mill or similar impactforward, maximum-speed mill, fitted with a 250 μm aperture screen. Repeat three times. Heat 800 mL of water to 75°C in a steam-jacketed mixing tank and dissolve methyl paraben.
3. Maintain temperature at 75°C. Disperse milled zinc oxide in solution of step above. Maintain temperature at 75°C.
4. Dissolve benzalkonium chloride and glycerin in solution. Maintain temperature at 75°C.
5. In a separate steam-jacketed tank, add Polawax, cetostearyl alcohol, acetylated lanolin, oil-neutral vegetable triglycerides mixture, and propyl paraben and carefully melt at 70°C.
6. Adjust the turbomixer of the steam-jacketed tank containing the aqueous phase to maximum speed, keeping the temperature at 75°C. Slowly add the oil phase into the aqueous phase. Generate as much vacuum as possible and maintain it for the rest of the process.
7. Circulate cold water to allow for a very slow temperature decrease (down to 60°C). Stop turbomixer and put the anchor-type agitator at minimum speed until 40°C to 45°C is reached. The temperature decrease must be very slow.
8. Break the vacuum and add perfume to cream with anchortype agitator at slow speed.
9. Continue to mix until the perfume is completely dispersed.

BENZALKONIUM CHLORIDE CONTRACEPTIVE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PEG-6, PEG-32, and glycol stearate (Tefose® 63)	50.00
30.00	2	Apricot kernel oil PEG-6 esters (Labrafil® M 1944 CS)	30.00
816.00	3	Deionized water	816.00
80.00	4	Hydroxyethyl cellulose	80.00
24.00	5	Benzalkonium chloride (50 wt% in water)	24.00

Manufacturing Directions

1. Mix items 3 and 4 at room temperature.
2. Heat to 75°C and add items 1 and 2 while stirring.
3. Cool with gentle stirring to 30°C, then add item 5 and stir.

BENZOCAINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
180.00	1	Trilaneth-4 phosphate and glyceryl stearate and PEG-2 stearate	180.00
20.00	2	Hydrogenated palm/kernel oil PEG-6 esters	20.00
80.00	3	Mineral oil	80.00
0.30	4	Sodium methyl paraben	0.30
0.70	5	Sorbic acid	0.70
646.70	6	Deionized water	646.70
10.00	7	Benzocaine	10.00
10.00	8	Butamben	10.00
2.00	9	Menthol	2.00
0.30	10	Resorcinol	0.30
50.00	11	Ethoxydiglycol	50.00

Manufacturing Directions

1. Dissolve items 7 to 10 in item 11.
2. Mix and heat items 1 to 6 to 75°C. Allow to cool slowly with constant stirring. At 35°C, add this to mixture above.
3. Homogenize if necessary.

BENZOYL PEROXIDE AND ALPHA-BISABOLOL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
2.00	1	Alpha-bisabolol, natural (BASF)	2.00
60.00	2	Propylene glycol	60.00
100.00	3	Triethanolamine	100.00
30.00	4	Cremophor RH 40	30.00
30.00	5	Kollidon 30	30.00
408.00	6	Water	408.00
10.00	7	Carbopol 940	10.00
400.00	8	Water	400.00
50.00	9	Benzoyl peroxide	50.00

Manufacturing Directions

1. Prepare suspension of items 7 and 8, then let swell for 1 hour.
2. Add this suspension to the well-stirred solution of items 1 to 5.
3. Add item 9 to create a colorless transparent gel.

BENZOYL PEROXIDE ANTIACNE MICROEMULSION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
470.00	1	Ethoxydiglycol (Transcutol®)	470.00
250.00	2	PEG-8 caprylic/Capric glycerides (Labrasol®)	250.00
150.00	3	Dipelargonate propylene glycol (DPPG)	150.00
80.00	4	Benzoyl peroxide	80.00
50.00	5	Propylene glycol laurate (Lauroglycol®)	50.00

Manufacturing Directions

1. Mix items 1 to 3.
2. Dissolve item 4 in this mixture with mixing for 1.5 to 2.0 hours.
3. Add item 5 to mixture and mix until uniform emulsion is obtained.

BENZOYL PEROXIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
460.50	1	Deionized water	460.50
5.00	2	Carbomer 940	5.00
10.00	3	Hydroxypropylmethylcellulose, medium viscosity	10.00
137.50	4	Deionized water	137.50
70.00	5	Purified bentonite (Polargel NF)	70.00
2.00	6	Methyl paraben	2.00
1.00	7	Propyl paraben	1.00
20.00	8	Glyceryl stearate	20.00
60.00	9	Propylene glycol	60.00
20.00	10	Polyethylene glycol 600	20.00
20.00	11	Myristyl propionate	20.00
50.00	12	Dimethicone	50.00
70.00	13	Purified bentonite (Polargel NF)	70.00
10.00	14	Titanium dioxide	10.00
100.00	15	Benzoyl peroxide 70%	100.00

Manufacturing Directions

1. Sift carbomer 940 into vortex in water; when completely dispersed, sift in item 3.
2. Add parabens with stirring and heat (to 80°C at least) until dissolved.
3. Add glyceryl stearate.
4. Blend items 10 to 13 in propylene glycol in order and mix well. With the addition of Polargel, allow 15 minutes of mixing to complete hydration.
5. Blend propylene glycol portion into the first part. Finally, add benzoyl peroxide and titanium dioxide to the mixture and mill.

BENZOYL PEROXIDE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
2.50	1	Acrylates/C10–30 alkyl acrylate crosspolymer	2.50
4.00	2	Carbopol 980	4.00
QS	3	Deionized water	QS to 1 kg
40.00	4	Isopropyl myristate	40.00
10.00	5	Cetyl alcohol	10.00
20.00	6	Glyceryl stearate	20.00
50.00	7	Sodium hydroxide 0.5 *M*	50.00
15.00	8	Deionized water	15.00
50.00	9	Benzoyl peroxide	50.00
50.00	10	PEG-600	50.00
QS	11	Perfume, preservative	QS

Manufacturing Directions

1. Hydrate Carbopol and pemulen in warm water, 60°C. When fully hydrated, heat to 70°C.
2. Heat oil phase to 70°C. Add water phase to oil phase while stirring.
3. Add sodium hydroxide and continue stirring. Combine benzoyl peroxide, PEG-600, and water (item 8) and add to the emulsion.
4. At 35°C, homogenize with caution, using suitable equipment.

BENZOYL PEROXIDE LOTION

The cleansing lotions contain benzoyl peroxide, 4% and 8% respectively, in a lathering vehicle containing purified water, cetyl alcohol, citric acid, dimethyl isosorbide, docusate sodium, hydroxypropylmethylcellulose, laureth-12, magnesium aluminum silicate, propylene glycol, sodium hydroxide, sodium lauryl sulfoacetate, and sodium octoxynol-2 ethane sulfonate.

BENZOYL PEROXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Purified bentonite (Polargel NF)	40.00
10.00	2	Hydroxypropylmethylcellulose	10.00
522.20	3	Water	522.20
190.00	4	Water	190.00
2.00	5	Methyl paraben	2.00
2.00	6	Propyl paraben	2.00
20.00	7	Glyceryl stearate	20.00
60.00	8	Propylene glycol	60.00
20.00	9	Myristyl propionate	20.00
5.00	10	Dimethicone	5.00
QS	11	Iron oxides	QS
10.00	12	Titanium dioxide	10.00
100.00	13	Benzoyl peroxide 77%	100.00

Manufacturing Directions

1. Sift the Polargel NF into water with rapid mixing. Allow to hydrate for 15 minutes.
2. Pass through coarse sieve, add item 2, and mix until all lumps are removed.
3. Add parabens to the water with stirring and heat to 90°C to dissolve parabens.
4. Add items 4 to 10 and mix well and then add these to the item 2 part. Mix well again. Finally, add items 11 to 13 and mix.
5. Mill it and fill.

BETAMETHASONE AND CINCHOCAINE SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
1.00	1	Betamethasone valerate	1.00
1.00	2	Cinchocaine hydrochloride	1.00
1798.00	3	Witepsol W 45®	1798.00

Manufacturing Directions

1. Charge item 3 in the fat-melting vessel and heat to 55°C; transfer molten mass to Becomix through stainless-steel sieve. Set the temperature at 50°C.
2. Add items 1 and 2, mix well at 50°C, and mix for 20 minutes.
3. Homogenize at 0.6 bar vacuum and 50°C.
4. Transfer to storage at 40°C.
5. Fill suppository mold.

BETAMETHASONE AND NEOMYCIN GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
1.30	1	Betamethasone valerate	0.13
6.50	2	Neomycin sulfate	0.65
150.00	3	Lutrol E 400	15.00
100.00	4	Miglyol 812	10.00
200.00	5	Lutrol F 127	20.00
QS	6	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve betamethasone valerate in a mixture of Lutrol E 400 and Miglyol 812.
2. Dissolve Lutrol F127 and neomycin sulfate in water at 5°C to 10°C.
3. Mix both solutions.
4. Maintain cool temperature until the air bubbles disappear. A milky-white soft gel cream is obtained.

BETAMETHASONE AND SALICYLIC ACID LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Betamethasone dipropionate micronized, 5% excess[a]	1.05
1.90	2	Salicylic acid	19.00
0.032	3	Disodium edetate	0.32
0.55	4	Hydroxypropylmethylcellulose	5.50
0.55	5	Sodium hydroxide	5.50
40.00	6	Isopropyl alcohol	400.00
QS	7	Water purified	QS to 1 kg

[a] Adjust quantity on the basis of assay.

Manufacturing Directions

1. Charge about half of item 7 into a suitable vessel and slowly add item 4 with vigorous mixing.
2. Use item 7 to rinse the container for item 4 and add rinsings to the mixing vessel.
3. In 10% of the amount of item 6, add and dissolve item 1 in a separate vessel and then add an additional 20% of item 6 and mix well until completely dissolved.
4. Add 10% of item 7 in a separate vessel and add and dissolve item 5 into it.
5. Add 10% of item 7 in a separate vessel and add and dissolve item 3 into it.
6. Add 20% of item 7 in a separate vessel and add and dissolve item 2 into it.

7. Add 50% of item 6 to step 4 and mix slowly for 15 minutes. Add to this vessel step 3 and step 5 and mix vigorously.
8. Use item 7 to rinse all vessels and add rinsings.
9. Check pH to 4.8 to 5.3 and adjust if necessary.
10. Add step 1 to this and mix.
11. Fill in appropriate containers.

BETAMETHASONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
70.00	1	Cetyl stearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
12.00	4	Liquid paraffin	12.00
2.00	5	Paraben(s)	2.00
697.00	6	Water	697.00
80.00	7	Propylene glycol	80.00
1.00	8	Betamethasone	1.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and item 6 separately to approximately 80°C.
2. Add together with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved.
4. Mix with above mixture and continue to stir to cool to room temperature to produce white cream.

BETAMETHASONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
70.00	1	Cetyl stearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
12.00	4	Liquid paraffin	120.00
2.00	5	Paraben(s)	2.00
697.00	6	Water	697.00
80.00	7	Propylene glycol	80.00
1.00	8	Betamethasone	1.00

Manufacturing Directions

1. Heat a mixture of items 1 to 5 and item 6 separately to approximately 80°C.
2. Add together with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved, mix with above mixture, and continue to stir to cool to room temperature. This creates a white cream.

BETAMETHASONE DIPROPIONATE CREAM, LOTION, AND OINTMENT

Each gram of cream, 0.05%, contains 0.643 mg betamethasone dipropionate USP (equivalent to 0.5 mg betamethasone) in a hydrophilic emollient cream consisting of purified water USP, mineral oil USP, white petrolatum USP, ceteareth-30, cetearyl alcohol 70/30 (7.2%), sodium phosphate monobasic monohydrate R, and phosphoric acid NF, with chlorocresol and propylene glycol USP as preservatives. It may also contain sodium hydroxide R to adjust pH to approximately 5. Each gram of lotion, 0.05%, w/w contains 0.643 mg betamethasone dipropionate USP (equivalent to 0.5 mg betamethasone) in a lotion base of isopropyl alcohol USP (39.25%) and purified water USP and is slightly thickened with carbomer 974P; the pH is adjusted to approximately 4.7 with sodium hydroxide R. Each gram of lotion, 0.05%, contains 0.643 mg betamethasone dipropionate USP (equivalent to 0.5 mg betamethasone) in a lotion base of purified water USP, isopropyl alcohol USP (30%), hydroxypropyl cellulose NF, propylene glycol USP, and sodium phosphate monobasic monohydrate R, with phosphoric acid NF used to adjust the pH to 4.5. Each gram of ointment, 0.05%, contains 0.643 mg betamethasone dipropionate USP (equivalent to 0.5 mg betamethasone) in an ointment base of mineral oil USP and white petrolatum USP.

BETAMETHASONE DIPROPIONATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.064	1	Betamethasone dipropionate	0.64
2.50	2	Propylene glycol stearate	25.00
3.50	3	Triacetin	35.00
0.05	4	Citric acid	0.50
35.00	5	Microcrystalline wax	350.00
58.88	6	Mineral oil	588.80

Manufacturing Directions

1. Dissolve betamethasone dipropionate and citric acid in the triacetin with mixing and heat to 35°C if needed.
2. Melt microcrystalline wax, propylene glycol stearate, and mineral oil together by heating to 75°C to 85°C while stirring to make the oleaginous phase.
3. After cooling the oleaginous phase to approximately 55°C, add the triacetin solution while mixing to make a homogenous dispersion. Mixing should be of sufficient intensity to disperse the triacetin solution finely and uniformly.
4. Continue mixing while cooling at room temperature.

BETAMETHASONE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
1.00	1	Betamethasone valerate	1.00
100.00	2	Ethanol (96%)	100.00
200.00	3	Propylene glycol	200.00
220.00	4	Lutrol F 127	220.00
QS	5	Water QS	470.00

Manufacturing Directions

1. Prepare a solution of items 1 to 3 at room temperature and a solution of items 4 and 5 at approximately 6°C (or at >70°C).
2. Mix both solutions.
3. Maintain the temperature until the air bubbles disappear.
4. A certain amount of propylene glycol could be substituted by water. The obtained gel is clear and colorless.

BETAMETHASONE OPTHALMIC OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Betamethasone sulfate	10.00
5.00	2	Liquid paraffin	50.00
5.00	3	Cetostearyl alcohol	50.00
5.00	4	Hard paraffin	50.00
84.00	5	Soft paraffin	840.00

Manufacturing Directions

1. Load items 2 to 5 in a melting vessel. Heat to 145°C and keep it at this temperature for 45 minutes.
2. Allow to cool to room temperature.
3. In a separate vessel, dissolve item 1 in 200 mL of water for injection and add to step 1 under aseptic condition.
4. Fill and sterilize in tubes.

BETAMETHASONE VALERATE AND CINCHOCAINE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Cinchocaine hydrochloride	5.00
1.00	2	Betamethasone valerate	1.00
75.00	3	Hydrogenated castor oil	75.00
400.00	4	Eutenol G (2-octyldodecanol)	400.00
75.00	5	PEG-400 monoricinoleate	75.00
0.08	6	Lavender oil	0.08
443.00	7	Castor oil	443.00

Manufacturing Directions

1. Charge items 3, 4, 5, and 7 in a melting vessel and heat to 85°C. Melt to a clear solution and cool down to 65°C. Transfer to Becomix.
2. Mix in Becomix at 65°C under vacuum. Cool down to 50°C.
3. Add items 1 and 2 in a small portion of the melt from step 2 in a separate vessel and homogenize and then add to step 3.
4. Add item 6 at 30°C and mix for 10 minutes.
5. Transfer to storage vessel and fill.

BETAMETHASONE VALERATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Betamethasone valerate (34% excess)	1.34
2.00	2	Polyoxyl 20 cetosteaiyl ether (Cetomacrogol 1000)	20.00
8.00	3	Cetosteaiyl alcohol	80.00
0.10	4	Methyl paraben	1.00
0.034	5	Propyl paraben	0.34
0.10	6	Chlorocresol	1.00
6.00	7	Mineral oil (liquid paraffin)	60.00
0.29	8	Monobasic sodium phosphate	2.90
17.80	9	Petrolatum (soft white paraffin)	178.00
66.00	10	Purified water	660.00

Manufacturing Directions

1. Heat item 10 to 90°C in a mixer.
2. Dissolve items 4 and 5 (parabens) to a clear solution by stirring.

3. Dissolve 3 g of item 2 in the parabens solution while stirring.
4. Dissolve items 6 and 8 in the parabens solution while stirring.
5. Set the mixer at a temperature of 65°C to 70°C and speed at 8 rpm. Use manual mode.
6. Load 17 g of items 2, 3, and 9 and 45 g of item 7 in a fat-melting vessel.
7. Heat to 70°C to 75°C while stirring. Maintain temperature at 65°C to 75°C.
8. Mix item 1 in 10 g of item 7 in a stainless-steel container.
9. Homogenize for 10 minutes to make a smooth slurry.
10. Check the temperature of the aqueous phase in the mixer (should be 65–70°C).
11. Check the temperature of the fatty phase in the fat-melting vessel (should be 65–70°C).
12. Set the mixer speed 8 rpm and vacuum at 0.4 to 0.6 bar.
13. Transfer the fatty phase to the aqueous phase in mixer vessel through filter under vacuum, while mixing.
14. Start the homogenizer at high speed. Homogenize for 10 minutes.
15. Check and record the pH of cream (limit: 4.5–5.2 at 30°C).
16. Cool the temperature to 50°C while mixing. Release the vacuum.
17. Take out 400 g of the cream into the stainless-steel vessel and set aside.
18. Add slurry from earlier step to the remaining cream base in mixer.
19. Rinse the container of slurry using 5 g of item 7 and transfer the rinsing to the mixer.
20. Homogenize for 10 minutes at high speed (mixer speed 8 rpm).
21. Load 400 g cream from step above to the mixer.
22. Set the mixer in manual mode at 8 rpm and a vacuum of 0.4 to 0.6 bar.
23. Homogenize at high speed with recirculation, temperature 25°C. Homogenize for 10 minutes with recirculation, stop the homogenizer, and continue mixing to produce a white, homogeneous cream of pH 4.5 to 5.2 at 30°C.

BETAMETHASONE VALERATE FOAM

Each gram of foam contains 1.2 mg betamethasone valerate USP in a hydroalcoholic, thermolabile foam. The foam also contains cetyl alcohol, citric acid, ethanol (60.4%), polysorbate 60, potassium citrate, propylene glycol, purified water, and stearyl alcohol and is dispensed from an aluminum can pressurized with a hydrocarbon propellant (propane/butane).

BETAMETHASONE VALERATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.100	1	Betamethasone, USE: Betamethasone valerate	1.300
84.870	2	Petrolatum (white soft paraffin)	848.700
15.000	3	Mineral oil (liquid paraffin)	150.000

Manufacturing Directions

1. Melt item 2 in a fat-melting vessel at 75°C. While mixing, do not overheat.
2. Maintain temperature of the molten mass in the melting vessel at 60°C to 65°C.
3. Start the steam on the mixer vessel and set the temperature at 60°C.
4. Transfer 160 g of the molten mass at 60°C to the mixer vessel. Retain the rest of the quantity in the fat-melting vessel.
5. Start mixing in the mixer vessel at medium speed with vacuum between 0.4 and 0.6 bar until obtaining an actual temperature of 40°C to 45°C.
6. Maintain the temperature of mixer vessel at 40°C to 45°C. Add item 1 to 80 g of item 3 and homogenize for 3 minutes, using homogenizer. Keep the slurry aside.
7. Rinse the homogenizer and container with 70 g of item 3. Transfer item 1 slurry from step above and the rinsing from previous step to the mixer vessel. Start mixing under vacuum 0.4 to 0.6 bar for 15 minutes. Temperature should be maintained at 40°C to 45°C.
8. Transfer the rest of the quantity of molten mass (temperature 60°C) into mixer vessel slowly, continuing to mix for 5 minutes after each addition. At the end of addition, mix a further 10 minutes under vacuum 0.4 to 0.6 bar.
9. Homogenize for 5 minutes at high speed under vacuum 0.4 to 0.6 bar.
10. Cool the ointment to 30°C to 35°C while stirring under a vacuum of 0.4 to 0.6 bar.

BETAMETHASONE VALERATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.100	1	Betamethasone USE betamethasone valerate with 10% excess	1.34
0.020	2	Vitamin E oily	0.20
79.34	3	White soft paraffin	793.40
3.00	4	Cetostearyl alcohol	20.00
2.50	5	Cetmacrogol 1000	25.00
15.00	6	Liquid paraffin	150.00

Manufacturing Directions

1. Melt item 3 in a fat-melting vessel at 60°C, add items 4 and 5, and mix until clear.
2. Transfer to Becomix at 60°C. Mix at 9 rpm under vacuum of 0.4 to 0.6 bar. Cool to 40°C to 45°C.
3. Add items 1, 2, and 6 to a stainless-steel container and homogenize for 3 minutes. Transfer slurry to step 2.
4. Mix under vacuum at 40°C to 45°C.
5. Transfer to storage vessel and fill.

BIFONAZOLE CREAM (1%)

Formulation

I. Cetyl stearyl alcohol, 7.0 g, Cremophor A 6 (1), 1.5 g, Cremophor A 25 (1), 1.5 g, liquid paraffin, 12.0 g, paraben(s), 0.2 g
II. Water, 68.8 g
III. Propylene glycol (1), 8 g, bifonazole, 1 g

Manufacturing Directions

Heat the mixture I and the water II separately to approximately 80°C. Add the water II to the obtained solution I with rigorous stirring. Heat III until the active ingredient is dissolved, mix with I/II, and continue to stir during cooling to room temperature.

This formulation could be used for other active ingredients too.

BISACODYL SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
5.000	1	Bisacodyl (micronized)[a] 2% excess	5.10
447.500	2	Hard fat (Witepsol E 76®)	447.50
447.500	3	Hard fat (Witepsol W 45)	447.50

[a] 100% particles should be less than 70 m. Fill weight: 1800 mg/ suppository

Manufacturing Directions

1. The molten suppository mass must be kept stirred throughout the storage period during manufacturing and during filling to avoid the sedimentation of active drug. The active ingredient causes skin irritation, which vanishes after sometime without having after effects. Avoid dust formation during processing. In particular, protect eyes and mucous membranes.
2. Load items 2 and 3 in the fat-melting vessel and heat to 50°C ± 3°C.
3. Transfer the molten mass to mixer through filter sieves. Set the temperature at 40°C ± 2°C. Load item 1 to the mixer containing the molten mass. Carefully mix the powder with the molten mass.
4. Set the mixer at temperature 40°C ± 2°C, speed 10 rpm (manual mode), and mix for 20 minutes. Set the mixer at temperature 40°C ± 2°C, speed 10 rpm (manual mode), vacuum 0.6 bar.
5. Homogenize at low speed while mixing for 10 minutes. Homogenize at high speed while mixing for 3 minutes.
6. Continue mixing of the mass under vacuum in mixer.
7. Heat the storage vessel, set the temperature at 40°C ± 2°C.
8. Transfer the molten mass from mixer to the storage vessel. Hold the mass at 40°C ± 2°C while mixing continuously at low speed.
9. Fill weight is 900 mg/suppository, but use a fill weight of 1.8 g for 10 mg suppositories.

BISACODYL SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
10.00	1	Bisacodyl (micronized) 2% excess	10.02
895.00	2	Witepsol E 76	895.00
895.00	3	Witepsol W 45	895.00

Manufacturing Directions

1. Charge items 2 and 3 to a melting vessel, heat to 50°C, transfer to Becomix through filter sieve. Set temperature to 40°C.
2. Charge item 1 and mix carefully. Set temperature to 40°C, speed 10 rpm for 20 minutes.
3. Homogenize for 3 minutes. Continue mixing under vacuum.
4. Transfer to storage vessel and fill.

BISCARBOXYCHROMONYLOXY PROPANOL OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
4.00	1	Disodium 1,3-bis(2-carboxychromonyloxy) propan-2-ol (micronized)	40.00
76.80	2	Yellow soft paraffin	768.00
9.60	3	Liquid paraffin	96.00
9.60	4	Lanolin acetylated (Modulan R)	96.00

Manufacturing Directions

1. Slowly add the disodium salt of 1,3-bis(2-carboxy-chromon-5-yloxy) propan-2-ol in small portions, with vigorous mixing, to a small portion of the pre-heated and sterilized components of the ointment base at 90°C.
2. When the addition is complete, continue mixing for a further 15 minutes and then sterilize the concentrated dispersion by heating at 150°C for 1 hour.
3. Then add the concentrated dispersion to a homogenizer heated at 80°C to 100°C and slowly add the remaining components of the ointment basis with continuous blending.
4. When this addition is complete, blend the molten ointment for a further 15 minutes and then cool to a temperature of 58°C to 62°C.
5. Then fill the ointment in presterilized eye ointment tubes, which are crimped and allowed to cool to room temperature.

BLEACHING AND ANTIMICROBIAL DENTIFRICE

Manufacturing Directions

Weight percentage: Hydrogen peroxide (50%), 10.00; carbamide peroxide, 14.00; sodium fluoride, 0.38; Pecogel S-2120 (VP/Dimethicolylacrylate is an inclusion complex polymer to retard the solubility of emulsified bleaching actives. It is obtained from Phoenix Chemical, Inc.), 0.50; hydroxyethyl cellulose, 0.50; triethanolamine, 0.30; water purified, 10.00; glycerin, 10.75; tetrafluoroethylene (Teflon), 50.58; sodium lauryl sulfate, 1.25; sodium saccharine, 0.18; sodium citrate, 0.20; citric acid, 0.20; triclosan, 0.06; flavor, 1.10.

BREAST CARE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Polysorbate 60	20.00
70.00	2	Cetyl alcohol	70.00
60.00	3	Mineral oil 70cS	60.00
40.00	4	Glyceryl stearate	40.00
QS	5	Deionized water	QS
QS	6	Preservative	QS

Manufacturing Directions

1. Heat oil and water phases separately at 65°C to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 20°C. Only food-grade materials should be used in this preparation. Do not use unapproved preservatives.

BUDESONIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.25	1	Budesonide	0.25
30.00	2	Polyoxy 40 stearate	30.00
80.00	3	Stearyl alcohol	80.00
150.00	4	Liquid paraffin	150.00
30.00	5	White soft paraffin	30.00
0.10	6	Ethylene diamine tetraacetate	0.10
3.00	7	Carbopol 934	3.00
0.67	8	Sodium hydroxide	0.67
0.70	9	Sodium methyl paraben	0.70
0.30	10	Sodium propyl paraben	0.30
QS	11	Water purified	685.00

Manufacturing Directions

1. Melt white soft paraffin, stearyl alcohol, and polyoxyl 40 stearate in the fat-melting vessel at 70°C to 75°C.
2. Heat the purified water in the manufacturing vessel to a temperature of 80°C to 90°C. Disperse Carbopol 934 in the heated water. Homogenize the dispersion to obtain clear gel.

3. Dissolve item 6, sodium methyl paraben, sodium propyl paraben, and sodium hydroxide in purified water. Transfer this solution to the clear gel from step 2 in the manufacturing vessel and homogenize well.
4. Transfer the fat phase (70–75°C) into the manufacturing vessel containing aqueous phase (70–75°C) while mixing. Homogenize under vacuum for few minutes.
5. Disperse budesonide with liquid paraffin in a stainless-steel container at 40°C to 45°C and transfer this dispersion to the manufacturing vessel from step 4 at temperature 40°C to 45°C; mix and homogenize under vacuum to obtain a smooth, homogeneous cream and the stated amount of budesonide per 100 g.
6. Cool the cream to 25°C to 30°C while stirring continuously.

BUDESONIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.25	1	Budesonide	0.25
369.75	2	Liquid paraffin	369.75
450.00	3	Hard paraffin	450.00
150.00	4	White wax	150.00
30.00	5	Hydrogenated castor oil	30.00

Manufacturing Directions

1. Melt hard paraffin, white wax, and hydrogenated castor oil in the fat-melting vessel at 100°C and maintain this temperature for 20 minutes. Then transfer this melted mass to the manufacturing vessel preheated to 85°C through 0.150 mm. Cool to 33°C while stirring.
2. Disperse budesonide with liquid paraffin at 33°C; use homogenizer to get homogeneous suspension.
3. Transfer the dispersion from step 2 to the ointment base from step 1 in the manufacturing vessel while stirring. Homogenize well to obtain a homogeneous ointment containing the stated amount of budesonide per 100 g ointment.
4. Filling in the tube is performed in an aseptic area at 33°C.

BUPRENORPHINE HYDROCHLORIDE SUPPOSITORY

Manufacturing Directions

1. Propylene glycol, 10 g; polyethylene glycol 400, 10 g; polyethylene glycol 1000, 30 g; polyethylene glycol 6000, 50 g; buprenorphine hydrochloride, 43.2 mg.
2. After mixing propylene glycol and polyethylene glycol 400, blend and dissolve buprenorphine hydrochloride, and blend the mixture with the separately heated and dissolved polyethylene glycol 1000 and 6000.
3. Place the combined mixture into a container for suppository. Cool and let solidify to obtain a suppository of buprenorphine hydrochloride (suppository weight 1.5 g/piece, each containing 0.6 mg of buprenorphine).

BURN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
120.00	1	Glyceryl stearate SE (monthybase)	120.00
80.00	2	Octyldodecyl myristate (MOD)	80.00
20.00	3	Apricot kernel oil PEG-6 esters (Labrafil M 1944 CS)	20.00
0.50	4	Sodium methyl paraben	0.50
0.50	5	Sodium propyl paraben	0.50
0.50	6	Sorbic acid	0.50
767.50	7	Deionized water	767.50
10.00	8	Avocado oil	10.00
1.00	9	Fragrance	1.00

Manufacturing Directions

1. Mix and heat items 1 to 7 to 75°C. Cool slowly with stirring.
2. At 30°C, add item 8 and then item 9.

BURN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate (Veegum)	15.00
568.00	2	Deionized water	568.00
30.00	3	Propylene glycol	30.00
2.00	4	Dimethicone emulsion	2.00
100.00	5	Mineral oil, light	100.00
170.00	6	Acetylated lanolin alcohol	170.00
50.00	7	Benzocaine USP	50.00
30.00	8	C-18-C36 acid	30.00
120.00	9	Glyceryl stearate and PEG-100 stearate	120.00
5.00	10	Polysorbate 60	5.00
QS	11	Preservatives	QS

Manufacturing Directions

1. Add item 1 to water slowly, agitating with extensive shear force until smooth.
2. Add items 3 and 4 to the mixture and heat to 75°C to 80°C. Mix and heat items 5 to 11, keeping item 7 suspended to 75°C to 80°C. Mix the two parts while cooling. Pour and fill at 40°C.

BUTENAFINE HYDROCHLORIDE CREAM

Butenafine cream, 1%, contains the synthetic antifungal agent butenafine hydrochloride. Each gram of cream, 1%, contains 10 mg of butenafine hydrochloride in a white cream base of purified water USP, propylene glycol dicaprylate, glycerin USP, cetyl alcohol NF, glyceryl monostearate SE, white petrolatum USP, stearic acid NF, polyoxyethylene cetyl ether, benzyl alcohol NF, diethanolamine NF, and sodium benzoate NF.

BUTESIN PICRATE AND METAPHEN OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
6.48	1	Lanolin anhydrous	6.48
0.219	2	Metaphen chloride powder	0.219
QS	3	Acetone	0.96
8.80	4	Sodium borate	8.80
2.48	5	Potassium chloride	2.48
QS	6	Water purified	253.70
115.00	7	Beeswax white	115.00
80.00	8	Wax ceresin white	80.00
510.00	9	Mineral oil	510.00
10.00	10	Butyl aminobenzoate (Butesin) picrate powder	10.00
13.31	11	2-Ethoxyethanol (Cellosolve)	13.31

Manufacturing Directions

1. Melt lanolin in vacuum flask and heat to 45°C to 60°C. Use sufficient acetone to completely dissolve metaphen chloride. Add metaphen solution to melted lanolin and mix thoroughly. Use vacuum to remove all acetone.
2. Dissolve borax and potassium chloride in the purified water at 85°C to 90°C.
3. Melt beeswax, ceresin wax, and mineral oil and strain into ointment mixing tub at 95°C.
4. Add prepared base (step 1) to melted oil–wax mixture (step 4).
5. Add borax–potassium chloride solution (step 2) to oil–wax mixture with constant stirring.
6. Mix for 1 hour.
7. Dissolve Butesin picrate in warm (50°C) Cellosolve and filter. Hold solution at 50°C for use in following step.
8. Adjust temperature of mass from step 5 to 50°C (this temperature is important).
9. Add Butesin picrate solution (at 50°C) to mass (at 50°C), with constant stirring.
10. Mix for several hours. Circulate cold water in jacket overnight.
11. Mill to smooth ointment and fill suitable containers.

BUTESIN PICRATE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
249.40	1	Water purified	249.40
8.85	2	Sodium borate powder	8.85
2.47	3	Potassium chloride	2.47
1.00	4	Methyl paraben	1.00
1.00	5	Propyl paraben	1.00
6.65	6	Lanolin anhydrous	6.65
114.60	7	Beeswax white	114.60
79.82	8	Wax ceresin white	79.82
405.30	9	Oil mineral light	405.30
119.90	10	Oil-neutral vegetable triglycerides mixture: Miglyol 812; Neobee M-5	119.90
10.00	11	Butyl aminobenzoate picrate (butesin picrate), 11% excess	11.10

Manufacturing Directions

1. Place purified water into a suitable steam tank and begin heating to 85°C to 90°C.
2. Add borax and potassium chloride and mix until dissolved (at 85–90°C).
3. Add parabens to above solution and mix for at least 15 minutes (at 85–90°C) or until dissolution.
4. Melt lanolin, beeswax, ceresin wax, and mineral oil into a suitable equipment. Heat mixture to 90°C to 95°C. Mix until uniform.
5. Filter the melted waxes from step 4 through a 74 µm aperture SS screen into a suitable mixing tank.
6. Heat waxes to 90°C to 95°C while mixing slowly.
7. Filter approximately 6.3 mL of borax-potassium-paraben solution (at 85–90°C) from step 2 slowly through a 74 µm aperture SS screen into the wax-oil mixture from step 5. *Caution*: Slow the addition of water solution if the product shows tendency to bubble over the side of the equipment.
8. While mixing, slowly pass the remaining borax-potassium-paraben solution (at 85–90°C) from step 2 through a 74 µm aperture SS screen into the wax-oil mixture from step 5. See caution above.
9. If necessary, adjust batch temperature to 85°C to 90°C and maintain temperature of batch at 85°C to 90°C while mixing for 60 minutes (range 60–75 minutes).

10. Add Neobee M-5 oil to a clean suitable SS container and start heating to 72°C (70–74°C). Add and dissolve the butyl aminobenzoate picrate while mixing and maintaining temperature at 72°C (70–74°C).
11. Reduce main batch temperature to 70°C (68–72°C) while continuing mixing slowly.
12. Filter Neobee M-5 oil-butyl picrate solution at 72°C (70–74°C) through a 74 µm aperture SS screen into the main batch, mixing and maintaining temperature at 70°C (68–72°C).
13. Continue mixing and maintain main batch temperature at 70°C (68–72°C) for 15 to 30 minutes.
14. While mixing slowly cool the main batch to 40°C to 45°C. Maintain 40°C to 45°C temperature and continue mixing for at least 10 minutes. *Note*: Use 35°C (30–40°C) water for cooling. Do not force cool with cold water.
15. Set cooling water to 20°C (range 18–25°C) and continue cooling batch to 25°C to 30°C while mixing. When batch reaches 25°C to 30°C, stop mixing. The product is ready for milling. *Note*: The cooling water temperature must not drop below 18°C.
16. Pump product to roller mill and mill at high speed to a smooth uniform consistency.
17. Collect product in suitable bulk containers.
18. Fill in suitable containers. Theoretical tube fill weight: 30 g, minimum 28.35 g. If product does not flow freely, heat the water in hopper jacket to a maximum of 40°C.

BUTOCONAZOLE NITRATE VAGINAL CREAM

The butoconazole nitrate vaginal cream, 2%, contains butoconazole nitrate, 2%, in a cream of edetate disodium, glyceryl monoisostearate, methyl paraben, mineral oil, polyglyceryl-3 oleate, propylene glycol, propyl paraben, colloidal silicon dioxide, sorbitol solution, purified water, and microcrystalline wax. Another formulation contains inactive ingredients cetyl alcohol, glyceryl stearate and PEG-100 stearate, methyl paraben and propyl paraben (preservatives), mineral oil, polysorbate 60, propylene glycol, sorbitan monostearate, stearyl alcohol, and water (purified).

CALAMINE AND DIPHENHYDRAMINE HYDROCHLORIDE LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
8.00	1	Calamine	80.00
1.00	2	Diphenhydramine hydrochloride	10.00
0.10	3	Camphor	1.00
2.40	4	Alcohol	24.00
70.00	5	Water purified	700.00
2.70	6	Carboxymethylcellulose	27.00
7.00	7	Zinc oxide	70.00
2.00	8	Water purified	20.00
0.06	9	Ferric oxide yellow	0.60
1.00	10	Zinc oxide	10.00
1.00	11	Glycerin	10.00
1.50	12	Glycerin	15.00
0.12	13	Ferric oxide red	1.20
QS	14	Perfume	QS
QS	15	Water purified	QS to 1 kg

Manufacturing Directions

1. Hydrate item 6 in item 5 and disperse item 7 in the suspension.
2. Mix the ferric oxides in items 10 and 11, homogenize, and add to step 1.
3. Dissolve item 2 in item 15 at 75°C, dissolve camphor and perfume in alcohol, and add to step 2.
4. Add item 12 and blend well.
5. QS to volume with item 15.

CALAMINE AND PRAMOXINE HYDROCHLORIDE LOTION

Active ingredients are calamine, 8%, and pramoxine hydrochloride, 1%. Inactive ingredients include caladryl lotion, alcohol USP, camphor, diazolidinyl urea, fragrance, hydroxypropylmethylcellulose, methyl paraben, oil of lavender, oil of rosemary, polysorbate 80, propylene glycol, propyl paraben, purified water, and xanthan gum.

CALAMINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
80.00	1	Polawax GP200	80.00
10.00	2	Polysorbate 60	10.00
50.00	3	Caprylic/Capric triglyceride	50.00
QS	4	Deionized water	QS to 1 kg
100.00	5	Witch hazel distillate	100.00
50.00	6	Glycerin	50.00
20.00	7	Zinc oxide	20.00
20.00	8	Calamine	20.00
QS	9	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add zinc oxide and calamine under high shear. Stir to cool.

CALAMINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Microcrystalline cellulose (Avicel RC-591)	20.00
100.00	2	Glycerin	100.00
1.80	3	Methyl paraben	1.80
0.20	4	Propyl paraben	0.20
100.00	5	Glyceryl stearate and PEG-100 stearate	100.00
25.00	6	Cetyl alcohol	25.00
50.00	7	Zinc oxide	50.00
50.00	8	Calamine	50.00
653.00	9	Distilled water	653.00

Manufacturing Directions

1. Mix item 2 with item 9 and heat to 75°C.
2. Add items 3 and 4. Mix until dissolved using a shearing mixer.
3. Maintain temperature at 75°C and gradually add item 1. Continue mixing at 75°C for 15 minutes or until item 1 is homogenously dispersed. Mix well.
4. When temperature drops to 60°C to 65°C, gradually add items 7 and 8. Mix well until powders are homogenously dispersed.
5. Pass through homogenizer if necessary. Adjust theoretical weight with warm distilled water and continue mixing until the cream congeals.

CALAMINE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
78.30	1	Calamine	78.30
78.30	2	Zinc oxide	78.30
19.60	3	Glycerin	19.60
230.80	4	Deionized water	230.80
558.00	5	Calcium hydroxide solution	558.00
34.40	6	Purified bentonite (Polargel NF)	34.40
0.60	7	Carboxymethylcellulose	0.60

Manufacturing Directions

1. Prepare a saturated item 5 solution using 3 g of item 5 in 1000 mL purified water, mixing vigorously for 1 hour.
2. Decant the clear supernatant liquid for use in the formula.
3. Add the balance of water. Add item 6 and item 7 to the above solution with rapid mixing for 15 minutes.
4. In a separate vessel, blend items 1 and 2.
5. Add item 3 and mix until uniform. Begin adding the aqueous solution with mixing until it is blended into a lotion.

CALCIPOTRIENE CREAM

Calcipotriene cream, 0.005%, contains calcipotriene monohydrate, a synthetic vitamin D3 derivative, for topical dermatological use. The cream contains calcipotriene monohydrate equivalent to 50 g/g anhydrous calcipotriene in a cream base of cetearyl alcohol, ceteth-20, diazolidinyl urea, dichlorobenzyl alcohol, dibasic sodium phosphate, edetate disodium, glycerin, mineral oil, petrolatum, and water.

CALCIPOTRIENE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00 mg	1	Calcipotriene	10.00 mg
1.00	2	Almond oil	10.00
40.00	3	Mineral oil	400.00
20.00	4	Self-emulsifying beeswax	200.00
QS	5	Water purified	QS to 1 kg

Manufacturing Directions

1. Add and dissolve item 1 in item 2.
2. Add to this solution item 3 and item 4.

3. Heat the mixture to liquefy at 70°C.
4. In a separate vessel, heat item 5 to 80°C and add to step 3.
5. Mix well and then homogenize.
6. Cool and fill.

CALCIUM CARBONATE OINTMENT

Formulation

Calcium carbonate, 250 mg; magnesium hydroxide, 200 mg; aluminum hydroxide, 225 mg; dibucaine (1% in petrolatum), 100 mg; anhydrous lanolin, 28.35 g; hydrophilic ointment, 28.35 g; petrolatum, 10 g; water, 5 mL.

1. Calcium carbonate, magnesium hydroxide, and the aluminum hydroxide are substantially insoluble in water. To assist in the dispersion of these components in the base carrier material, form a paste therefrom by adding a little water at a time to form a relatively homogeneous dispersion thereof.
2. Then add dibucaine (1%), which is provided in a petrolatum base, with mixing to obtain a smooth homogeneous mixture.
3. Then mix nhydrous lanolin and hydrophilic ointment to provide a homogeneous composition; then blend with the dispersion of calcium carbonate, magnesium hydroxide, aluminum hydroxide, and dibucaine.
4. Mix the entire composition thoroughly to ensure a homogeneous dispersion of all of the ingredients.
5. Calcium carbonate and magnesium hydroxide provide a relatively rapid neutralization of the area under treatment. Aluminum hydroxide, however, provides a slower, longer-lasting neutralization in addition to a mild astringent effect. The 1% dibucaine hydrochloride dispersed in petrolatum is used for its analgesic or anesthetic effect and the amount may be varied to increase or decrease the anesthetic effect depending on the condition being treated. Anhydrous lanolin and hydrophilic ointment are utilized to provide a base for the composition, which facilitates its application and retention in the area of treatment.

CAMPHOR, EUCALYPTUS OIL, AND MENTHOL OINTMENT

Camphor, eucalyptus oil, and menthol ointment contains camphor, 5.2%, eucalyptus oil, 1.2%, and menthol, 2.8%. Inactive ingredients are carbomer 954, cedar leaf oil, cetyl alcohol, cetyl palmitate, cyclomethicone copolyol, dimethicone copolyol, dimethicone, ethylene diamine tetraacetate, glycerin, imidazolidinyl urea, isopropyl palmitate, methyl paraben, nutmeg oil, PEG-100 stearate, propyl paraben, purified water, sodium hydroxide, stearic acid, stearyl alcohol, thymol, titanium dioxide, turpentine oil.

CARBAMAZEPINE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Carbamazepine	10.00
50.00	2	Propylene glycol	500.00
5.00	3	Cetostearyl alcohol	50.00
1.00	4	Sodium lauryl sulfate	10.00
43.00	5	Water purified	430.00

Manufacturing Directions

1. Prepare an oil-in-water emulsion to form an elegant cream. Dissolve carbamazepine in pure powder form in propylene glycol (e.g., up to approximately 95%). Alternatives for the aqueous phase include alcohol, such as ethanol or isopropanol, with a thickener added, for example, carbomer 934 or 940.
2. The oil phase preferably includes mineral oil, petrolatum, cetyl alcohol, or stearyl alcohol. Emulsifiers such as polysorbate 80, sorbitan monostearate, or others known in the art may be used. Buffering agents, antioxidants, and chelating agents may be added to improve the characteristics of the formulation.

CARBAMAZEPINE GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Carbamazepine	50.00
93.00	2	Propylene glycol	930.00
2.00	3	Carbopol 934	20.00
QS	4	Sodium hydroxide (to neutralize item 3)	QS

CARBAMAZEPINE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	Carbamazepine	30.00
5.00	2	Mineral oil	50.00
92.00	3	Petrolatum	920.00

Manufacturing Directions

1. Micronize carbamazepine to provide particles with a size distribution primarily below 10 μm.
2. Add item 1 to mineral oil to form a finely dispersed suspension. Homogenize.
3. Add and mix item 3 and homogenize again.

CARBAMIDE PEROXIDE CHEWING GUM

Formulation

Gum base, 26.25 g; calcium carbonate, 3.75 g; sorbitol, 28.05 g; mannitol, 7.50 g; maltitol, 21.62 g; glycerin, 1.00 g; flavorant, 3.15 g; gum arabic, 1.16 g; titanium dioxide, 0.17 g; wax candellia, 0.03 g; sodium stearate/sodium palmitate 50%, each 3.00 g; tripolyphosphate sweetener, 0.82 g; Imwitor 370, 1.00 g; carbamide peroxide, 3.00 g.

Manufacturing Directions

1. Heat the gum base to sufficiently soften the base without adversely affecting the physical and chemical makeup of the base.
2. Then add the molten gum base and the filler to a mixing kettle.
3. Add the sugar alcohols, glycerin, flavor, high-intensity sweetener, and stain-removing agent carbamide peroxide last with mixing to obtain a homogenous mixture.
4. Then discharge the mixture from the mixing kettle and roll and scor into a desired piece size by conventional techniques.

2-CARBAMOYLPYRAZINAMIDE OINTMENT

Manufacturing Directions

1. Dissolve 2-Carbamoylpyrazinamide, also known as 2, 3-pyrazinedicarboxamide, 1 g, in 5 L of water and 4 mL of acetone.
2. Admix the solution with USP grade hydrophilic ointment (90 g) to a uniform consistency.
3. Store the ointment thus prepared in opaque jars at room temperature.

CASTOR OIL OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
68.80	1	Castor oil	688.00
10.00	2	Hydrogenated castor oil	100.00
8.70	3	Balsam Peru oil	87.00
0.018	4	Trypsin	0.180
QS	5	Safflower oil	QS to 1 kg

Manufacturing Directions

This is an enzymatic wound debrider.

1. Disperse the aluminum/magnesium hydroxide stearate in the castor oil.
2. Add the hydrogenated castor oil while mixing with a high-shear mixer.
3. Continue mixing until a semisolid forms.
4. Then blend the remaining ingredients with the semisolid until homogeneous mixing appears.

CEFACLOR AND BENZOYL PEROXIDE GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	Cefaclor	30.00
5.00	2	Benzoyl peroxide	50.00
92.00	3	Gel carrier or vehicle	920.00
QS	4	Alcohol 70%	QS
QS	5	Citric acid for pH adjustment	QS

Manufacturing Directions

1. To a first container, add the benzoyl peroxide and the gel carrier or vehicle ingredients (approximately 5 g of benzoyl peroxide and approximately 89 g of gel carrier or vehicle).
2. To a second container, add powdered cefaclor (approximately 3 g of cefaclor) and dissolve in item 4 and add to step 1.
3. Adjust pH using citric acid.

CEFACLOR AND BENZOYL PEROXIDE LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Ethoxylated cetyl stearyl alcohol	70.00
0.75	2	Cetyl alcohol	7.50
5.00	3	Isostearyl neopentanoate	50.00
0.10	4	Butylated hydroxyanisole	1.00
0.25	5	Polyoxyl 40 stearate	2.50
66.80	6	Water purified	668.00
3.00	7	Propylene glycol	30.00
5.00	8	Benzoyl peroxide micronized	50.00
10.00	9	Acetone	100.00
0.10	10	Dioctyl sodium sulfosuccinate	1.00
2.00	11	Cefaclor	20.00

CETRIMIDE ANTISEPTIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Cetearyl alcohol and cetrimonium bromide	50.00
75.00	2	White petroleum jelly	75.00
60.00	3	Mineral oil 70 cS	60.00
QS	4	Deionized water	QS to 1 kg
QS	5	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 60°C to 65°C.
2. Add the water phase to the oil phase while stirring.
3. Stir to cool.

CETRIMONIUM BROMIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Cetearyl alcohol and cetrimonium bromide	50.00
75.00	2	White petroleum jelly	75.00
60.00	3	Mineral oil (70 cS)	60.00
QS	4	Deionized water	QS to 1 kg
QS	5	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 60°C to 65°C.
2. Add water phase to oil phase while stirring. Stir to cool.

CHLORAMPHENICOL OPTHALMIC OINTMENT

Each gram of ophthalmic ointment, 1%, contains 10 mg chloramphenicol in a special base of liquid petrolatum and polyethylene. It contains no preservatives. Another formulation contains active ingredient chloramphenicol, 11%.

CHLORHEXIDINE AND CETRIMONIUM BROMIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Polawax GP200	50.00
10.00	2	Lanolin	10.00
150.00	3	Mineral oil 70 cS	150.00
70.00	4	Cetearyl alcohol	70.00
30.00	5	Dimethicone	30.00
QS	6	Deionized water	QS to 1 kg
5.00	7	Cetrimonium bromide	5.00
0.50	8	Chlorhexidine gluconate	0.50
QS	9	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil (items 1–5) and water (items 6–9) phases to 65°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool. Fill.

CHLORHEXIDINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Chlorhexidine diacetate	20.00
300.00	2	1,2-Propylene glycol pharma	300.00
220.00	3	Lutrol F 127	220.00
460.00	4	Water	460.00

Manufacturing Directions

1. Dissolve chlorhexidine diacetate in propylene glycol at >70°C, stir well, and slowly add Lutrol F 127 and water.
2. Maintain the temperature until the air bubbles escape. A clear, colorless gel is obtained.

CHLORPROMAZINE SUPPOSITORIES

Each suppository contains chlorpromazine (25 or 100 mg), glycerin, glyceryl monopalmitate, glyceryl monostearate (10 mg/g), and preservative chlorobutanol (chloral derivative), 0.5% (5 mg/g), and inactives white petrolatum, mineral oil, polyoxyl 40 stearate, polyethylene glycol 300 and petrolatum and lanolin alcohol, hydrogenated coconut oil fatty acids, and hydrogenated palm kernel oil fatty acids.

CICLOPIROX CREAM, LOTION, AND GEL

Cream, 0.77%, and lotion, 0.77%, are for topical use. Each gram of cream contains 7.70 mg ciclopirox (as ciclopirox olamine) in a water-miscible vanishing cream base consisting of purified water USP, cetyl alcohol NF, mineral oil USP, octyl-dodecanol NF, stearyl alcohol NF, cocamide DEA, polysorbate 60 NF, myristyl alcohol NF, sorbitan monostearate NF, lactic acid USP, and benzyl alcohol NF (1%) as preservative. Each gram of lotion contains 7.70 mg ciclopirox (as ciclopirox olamine) in a water-miscible lotion base consisting of purified water USP, cocamide DEA, octyldodecanol NF, mineral oil USP, stearyl alcohol.

CICLOPIROX NAIL VARNISH

NF, cetyl alcohol NF, polysorbate 60 NF, myristyl alcohol NF, sorbitan monostearate NF, lactic acid USP, and benzyl alcohol NF (1%) as preservative. Cream and lotion contain a synthetic, broad-spectrum antifungal agent ciclopirox (as ciclopirox olamine). Each gram of gel contains 7.70 mg ciclopirox in a gel consisting of purified water USP, isopropyl alcohol USP, octyldodecanol NF, dimethicone copolyol 190, carbomer 980, sodium hydroxide NF, and docusate sodium USP.

CICLOPIROX NAIL VARNISH

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
57.50	1	Isopropyl alcohol	575.00
33.00	2	Ethyl acetate	330.00
3.80	3	Polyvinyl butyral	38.00
3.10	4	Cellulose nitrate	31.00
0.60	5	Dibutyl phthalate	6.00
2.00	6	Ciclopirox	20.00

Manufacturing Directions

1. Mix all items to a uniform mixture. Pigments may be added to color the varnish.
2. Prepare a thixotropic paste by slowly stirring ten parts of an organically modified montmorillonite (e.g., bentone 27) into 80 parts toluene and subsequently adding eight parts wetting agent (e.g., anti-terra-U) and two parts methanol. Also prepare a clear varnish by dissolving 22 parts butanol-moist collodion cotton (e.g., type E 510) and eight parts toluene sulfonamide resin (e.g., santolite MS 80) in a mixture of three parts dibutyl phthalate, 20 parts ethyl acetate, ten parts butyl acetate, seven parts ethyl alcohol, and 30 parts toluene; also process 40 parts DC ROT No. 7 calcium varnish (e.g., color pigment C 19021) and 60 parts dibutyl phthalate to give a color paste with a particle size of less than 1 μm.
3. To prepare the pigmented nail varnish, disperse 12 parts thixotropic paste and 0.8 parts antisettling agent (e.g., MPA 2000 X) in 83.7 parts clear varnish, during which operation a temperature of at least 38°C is to be reached; then dissolve one part 1-hydroxy-4-methyl-6-(2,4,4-trimethylpentyl)-2-pyridone in the thixotropic clear varnish and stir in 2.5 parts color paste. Filter the finished nail varnish through a 70 μm sieve.

CIPROFLOXACIN HYDROCHLORIDE OPTHALMIC OINTMENT

The ciprofloxacin hydrochloride ophthalmic ointment consists of synthetic, sterile, multiple-dose antimicrobials for topical ophthalmic use. Each gram of ophthalmic ointment contains active ingredients ciprofloxacin HCl, 3.33 mg equivalent to 3 mg base. Inactive ingredients are mineral oil and white petrolatum.

CLINDAMYCIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Clindamycin USE clindamycin phosphate	11.90
0.15	2	Methyl paraben	1.50
0.20	3	Carbopol 941	2.00
15.00	4	Propylene glycol 400	50.00
5.00	5	Polyethylene glycol	50.00
QS	6	Sodium hydroxide 10% solution for pH adjustment	QS
QS	7	Water purified	QS to 1 kg

Manufacturing Directions

The viscosity of this composition is approximately 1000 cP.

1. Weigh approximately 90% of the purified water into a stainless-steel kettle.
2. Add the propylene glycol 400 and polyethylene glycol. Stir with a propeller mixer.

3. At room temperature, add methyl paraben to step 1 with continued stirring. Mix until dissolved.
4. While continuing to mix, add clindamycin phosphate to step 2. Mix until dissolved.
5. While continuing to mix, add Carbopol 941 slowly to step above. Avoiding clumping.
6. Mix vigorously at room temperature until a uniform and lump-free dispersion is achieved.
7. While mixing, add sufficient sodium hydroxide, 10% solution, to achieve a pH of 5.3 to 5.7. Mix until uniform.
8. Add the remaining water to make 100% and mix until uniform. Please note that a commercial preparation contains an additional component, allantoin.

CLINDAMYCIN LOTION AND GEL

The topical lotion contains clindamycin phosphate USP at a concentration equivalent to 10 mg clindamycin per milliliter. The lotion contains cetostearyl alcohol (2.5%), glycerin, glyceryl stearate SE (with potassium monostearate), isostearyl alcohol (2.5%), methyl paraben (0.3%), sodium lauroyl sarcosinate, stearic acid, and purified water. Topical gel contains clindamycin phosphate USP at a concentration equivalent to 10 mg clindamycin per gram. The gel contains allantoin, carbomer 934P, methyl paraben, polyethylene glycol 400, propylene glycol, sodium hydroxide, and purified water.

CLINDAMYCIN PHOSPHATE SUPPOSITORY

Manufacturing Directions

1. Melt 29 kg of Witepsol H 32® hard fat NF base in a manufacturing kettle by heating to and maintaining at 40°C.
2. Using a preheated filter, transfer 26.614 kg of the molten base to a second manufacturing vessel equipped with a homogenizing mixer.
3. Add 1.386 kg of clindamycin phosphate, equivalent to 1.12 kg of clindamycin free base, to the kettle and mix and homogenize to obtain a uniform dispersion.
4. Transfer the drug dispersion to a jacketed kettle and transport to the form/fill/seal suppository machine.
5. While maintaining mixing and a temperature of 40°C, form the drug dispersion into 2.5 g suppositories using the automated form/fill/seal equipment. The final batch size is 11,200 units.

CLINDAMYCIN PHOSPHATE TOPICAL GEL

The topical gel also contains benzoyl peroxide for topical use. Each gram of topical gel contains, as dispensed, 10 mg (1%) clindamycin as phosphate and 50 mg (5%) benzoyl peroxide in a base of carbomer, sodium hydroxide, dioctyl sodium sulfosuccinate, and purified water.

CLINDAMYCIN PHOSPHATE VAGINAL CREAM

Vaginal cream, 2%, is a semisolid white cream that contains 2% clindamycin phosphate USP at a concentration equivalent to 20 g clindamycin per gram. The pH of the cream is between 3 and 6. The cream also contains benzyl alcohol, cetostearyl alcohol, cetyl palmitate, mineral oil, polysorbate 60, propylene glycol, purified water, sorbitan monostearate, and stearic acid. Each applicatorful of 5 g of vaginal cream contains approximately 100 mg of clindamycin phosphate.

CLINDAMYCIN PHOSPHATE VAGINAL SUPPOSITORY

Each 2.5-g suppository contains clindamycin phosphate equivalent to 100 mg clindamycin in a base consisting of a mixture of glycerides of saturated fatty acids.

CLOBETASOL PROPIONATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.050	1	Clobetasol propionate (5% excess)	0.525
44.500	2	Propylene glycol	445.000
0.050	3	Sodium citrate	0.500
0.050	4	Citric acid	0.500
5.000	5	Glyceryl monostearate A/S	50.000
4.000	6	Cetostearyl alcohol	40.000
0.600	7	White wax (beeswax bleached)	6.000
0.075	8	Chlorocresol	0.750
1.000	9	Glyceryl monostearate SE	10.000
7.000	10	Propylene glycol	70.000
2.675	11	Propylene glycol	26.750
35.000	12	Purified water	350.000

Manufacturing Directions

1. Aqueous phase
   a. Heat item 12 to 90°C in mixer. Bring down the temperature to 60°C. Dissolve all ingredients to a clear solution. Maintain temperature at 60°C.
   b. Filter through a polyester cloth. Check the weight. Clean the manufacturing vessel with item 12. Adjust the weight with item 12, if required. Record the quantity of extra item 12.
   c. Transfer again to manufacturing vessel. Maintain temperature at 60°C.
2. Oil phase
   a. Melt items 5 to 9 in melting vessel at 70°C to 75°C while stirring. Cool to 60°C. Maintain temperature at 60°C.

3. Dispersed phase
   a. Transfer the oil phase to aqueous phase in the manufacturing vessel through mesh by vacuum while stirring at manual mode 10 rpm, temperature 60°C. Mix at 10 rpm for 10 minutes at 60°C. Homogenize at high speed under vacuum 0.4 bar for 5 minutes at temperature 60°C. Cool down the temperature to 50°C while mixing at 10 rpm.
4. Drug phase
   a. Mix item 1 in item 10 in a water bath at 50°C
   b. Cool to 30°C while mixing at 10 rpm, auto mode under vacuum 0.4 bar, mixing time 20 minutes until a clear solution is obtained. A homogenizer may be used.
   c. Add to dispersed phase from step 4b. Rinse with item 11 and add to dispersed phase at step 3a. Mix and homogenize under vacuum 0.4 bar for 5 minutes, high speed, 10 rpm, temperature 50°C.
   d. Unload the cream in stainless-steel drum and fill.

CLOBETASOL PROPIONATE CREAM, OINTMENT, AND GEL

Cream contains clobetasol propionate 0.5 mg/g in a cream base of propylene glycol, glyceryl monostearate, cetostearyl alcohol, glyceryl stearate, PEG-100 stearate, white wax, chlorocresol, sodium citrate, citric acid monohydrate, and purified water. Ointment contains clobetasol propionate 0.5 mg/g in a base of propylene glycol, sorbitan sesquioleate, and white petrolatum. Gel contains clobetasol propionate 0.5 mg/g in a base of propylene glycol, carbomer 934P, sodium hydroxide, and purified water.

CLOBETASOL PROPIONATE OINTMENT GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.050	1	Clobetasol propionate (5% excess)	0.525
94.460	2	Petrolatum (white soft paraffin)	944.600
0.500	3	Sorbitan sesquioleate (Arlacel 83)	5.000
4.000	4	Propylene glycol	40.000
0.500	5	Propylene glycol	5.000

Manufacturing Directions

1. Melt items 2 and 3 in a fat-melting vessel at temperature 75°C while mixing.
2. Start heating mixer vessel to 75°C. Transfer molten items 2 and 3 to mixer through stainless-steel mesh under vacuum 0.4 to 0.6 bar. Start mixer at 10 rpm manual mode.
3. Cool down to 50°C.
4. In a water bath (temperature 60°C), dissolve item 1 in item 4 using homogenizer for 5 minutes. Add this to mixer with stirring.
5. Rinse with item 5 and add to mixer at temperature 50°C.
6. Start homogenizer under vacuum 0.4 to 0.6 bar while stirring at 10 rpm high speed for 10 minutes.
7. Cool down the temperature to 30°C, 10 rpm, auto mode, vacuum 0.4 to 0.6 bar.
8. Transfer the ointment to a stainless-steel container. Fill.

CLOTRIMAZOLE AND BETAMETHASONE CREAM AND LOTION

Each gram of cream contains 10 mg clotrimazole and 0.643 mg betamethasone dipropionate (equivalent to 0.5 mg betamethasone) in a hydrophilic cream consisting of purified water, mineral oil, white petrolatum, cetearyl alcohol 70/30, ceteareth-30, propylene glycol, sodium phosphate monobasic monohydrate, and phosphoric acid, with benzyl alcohol as preservative. Each gram of lotion contains 10 mg clotrimazole and 0.643 mg betamethasone dipropionate (equivalent to 0.5 mg betamethasone) in a hydrophilic base of purified water, mineral oil, white petrolatum, cetearyl alcohol 70/30, ceteareth-30, propylene glycol, sodium phosphate monobasic monohydrate, and phosphoric acid, with benzyl alcohol as a preservative. Lotion may also contain sodium hydroxide.

CLOTRIMAZOLE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Cetyl stearyl alcohol	70.00
1.50	2	Cremophor A6	15.00
1.50	3	Cremophor A25	15.00
12.00	4	Liquid paraffin	120.00
0.20	5	Methyl and propyl parabens	2.00
68.80	6	Water purified	688.00
8.00	7	Propylene glycol	80.00
1.00	8	Clotrimazole	1.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and item 6 separately to approximately 80°C.
2. Add item 6 to the obtained solution step 1 mixture of items 1 to 5 with rigorous stirring.

3. Heat items 7 and 8 until the active ingredient is dissolved, mix with step 2, and continue to stir during cooling to room temperature.

CLOTRIMAZOLE LOTION

Each gram of lotion contains 10 mg clotrimazole USP dispersed in an emulsion vehicle composed of benzyl alcohol NF (1%), cetearyl alcohol 70/30 (3.7%), cetyl esters wax NF, octyldodecanol NF, polysorbate 60 NF, sodium phosphate dibasic anhydrous R, sodium phosphate monobasic monohydrate USP, sorbitan monostearate NF, and purified water USP.

CLOTRIMAZOLE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Clotrimazole	40.00
50.00	2	White petrolatum	50.00
20.00	3	Mineral oil	60.00
24.00	4	Cetearyl alcohol	72.00
22.50	5	Ceteth-20	22.50
10.00	6	Benzyl alcohol	10.00
100.00	7	Propylene glycol	100.00
0.35	8	Sodium phosphate dibasic anhydrous	0.35
5.00	9	Sodium phosphate monobasic monohydrate	5.00
QS	10	Water purified	QS to 1 kg

Manufacturing Directions

1. Heat 75% of the water to 70°C in a suitable vessel. Add the monobasic sodium phosphate monohydrate, anhydrous dibasic sodium phosphate, propylene glycol, and benzyl alcohol to the vessel with agitation, maintaining the temperature at 70°C.
2. In a separate vessel, melt the petrolatum and heat to 70°C.
3. Add the mineral oil and mix. Add the cetearyl alcohol and 95% of the ceteth-20. Mix and maintain at 70°C.
4. Combine the contents of the two vessels with agitation, maintaining at 70°C.
5. Cool to 38°C with agitation.
6. In a separate vessel, dissolve the remaining ceteth-20 in the remaining water at 65°C with agitation.
7. Cool to room temperature and slurry the clotrimazole with vigorous agitation until smooth uniform slurry is obtained.
8. Add the slurry to the previous emulsion mixture and agitate while cooling to room temperature.

CLOTRIMAZOLE VAGINAL CREAM

The vaginal cream's active ingredient is clotrimazole 2% (100 mg per applicator). The inactive ingredients are benzyl alcohol, cetearyl alcohol, cetyl esters wax, octyldodecanol, polysorbate 60, purified water, and sorbitan monostearate.

CLOTRIMAZOLE VAGINAL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Clotrimazole	40.00
150.00	2	White petrolatum	150.00
60.00	3	Mineral oil	60.00
72.00	4	Cetearyl alcohol	72.00
22.50	5	Ceteth-20	22.50
10.00	6	Benzyl alcohol	10.00
100.00	7	Propylene glycol	100.00
0.35	8	Sodium phosphate dibasic anhydrous	0.35
5.00	9	Sodium phosphate monobasic monohydrate	5.00
QS	10	Water purified	QS to 1 kg

Manufacturing Directions

1. Heat 75% of the water to 70°C in a suitable vessel. Add the monobasic sodium phosphate monohydrate, anhydrous dibasic sodium phosphate, propylene glycol, and benzyl alcohol to the vessel with agitation, maintaining the temperature at 70°C.
2. In a separate vessel, melt the petrolatum and heat to 70°C.
3. Add the mineral oil and mix. Add the cetearyl alcohol and 95% of the ceteth-20. Mix and maintain at 70°C.
4. Combine the contents of the two vessels with agitation, maintaining at 70°C.
5. Cool to 38°C with agitation.
6. In a separate vessel, dissolve the remaining ceteth-20 in the remaining water at 65°C with agitation.
7. Cool to room temperature and slurry the clotrimazole with vigorous agitation until smooth uniform slurry is obtained.
8. Add the slurry to the previous emulsion mixture and agitate while cooling to room temperature.

CLOTRIMAZOLE VAGINAL CREAM INSERTS

Each clotrimazole vaginal insert contains 100 mg clotrimazole with inactive ingredients benzyl alcohol, cetostearyl alcohol, cetyl esters wax, octyldodecanol, polysorbate 60, purified water, and sorbitan monostearate. The inserts are made of cornstarch, lactose, magnesium stearate, and povidone.

CLOTRIMAZOLE AND CLINDAMYCIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Clotrimazole	20.00
4.00	2	Clindamycin base USE clindamycin hydrochloride	4.54
20.00	3	Sorbitan monostearate	20.00
30.00	4	Tween 60	30.00
130.46	5	Paraffin viscous	130.46
100.00	6	Cetyl stearyl alcohol	100.00
10.00	7	Benzyl alcohol	10.00
670.00	8	Water purified	670.00

Manufacturing Directions

1. One application unit is equivalent to 5 g. This comprises 100 mg clotrimazole and 20 mg clindamycin.
2. Add and dissolve items 1 and 2 in items 7 and 8 in a blender.
3. Add and dissolve remaining items in a separate blender and heat to 40°C.
4. Add into step 2 with vigorous mixing to form a cream base.

CLOTRIMAZOLE AND CLINDAMYCIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Clotrimazole	100.00
20.00	2	Clindamycin base USE clindamycin hydrochloride	22.70
77.30	3	Calcium lactate pentahydrate	77.30
250.00	4	Gelatin	250.00
250.00	5	Water purified	250.00
1250.00	6	Glycerol	1250.00

Manufacturing Directions

1. Dissolve items 1 and 2 in item 5.
2. Heat item 4 in item 6 in a separate vessel and add item 3.
3. Mix well and add to step 1.
4. Fill suppository 2 g each.

CLOTRIMAZOLE AND CLINDAMYCIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Clotrimazole	100.00
20.00	2	Clindamycin base USE clindamycin hydrochloride	22.70
77.30	3	Calcium lactate pentahydrate	77.30
1000.00	4	Macrogol 400	1000.00
800.00	5	Macrogol 6000	800.00
200.00	6	Lactic acid	200.00

Manufacturing Directions

1. Add and mix all ingredients.
2. Heat to 70°C and mix well.
3. Cool to 40°C and fill.

COAL TAR AND ALLANTOIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Lanolin alcohol	40.00
50.00	2	White petroleum jelly	50.00
120.00	3	Paraffin wax 140F	120.00
300.00	4	Mineral oil 70 cS	300.00
20.00	5	Coal tar	20.00
2.50	6	Allantoin	2.50
QS	7	Deionized water	QS to 1 kg
QS	8	Preservative	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Slowly add water phase in increments to the oil phase.
3. Allow each addition time to be fully incorporated.
4. Stir to cool. Fill just above melting point. Further homogenization may improve stability before filling.

COAL TAR AND ALLANTOIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
160.00	1	Stearic acid	16.00
60.00	2	Oleyl alcohol	6.00
20.00	3	Lanolin	2.00
20.00	4	Coal tar	2.00
6.00	5	Triethanolamine 99%	0.60
2.50	6	Allantoin	0.25
QS	7	Deionized water	QS to 1 kg
QS	8	Preservative	QS

Manufacturing Directions

1. Heat water (items 7 and 8) and oil phases (all other items) separately to 80°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 40°C. May homogenize.

COAL TAR CREAM

The active ingredient in coal tar cream is 5% coal tar solution USP, equivalent to 0.8% coal tar. Inactive ingredients include acetylated lanolin alcohol, alcohol (4.7%), carbomer-934P, ceteth-2, ceteth-16, cetyl acetate, cetyl alcohol, D&C; red no. 28, fragrance, glyceryl tribehenate, laneth-16, lanolin alcohol, laureth-23, methyl gluceth-20, methylchloroisothia-zolinone, methylisothiazolinone, mineral oil, octyldodecanol, oleth-16, petrolatum, potassium hydroxide, purified water, steareth-16, stearyl alcohol, titanium dioxide.

COLLAGENASE OINTMENT

Collagenase ointment is a sterile enzymatic debriding ointment that contains 250 collagenase units per gram of white petrolatum USP. The enzyme collagenase is derived from the fermentation by *Clostridium histolyticum*. It possesses the unique ability to digest collagen in necrotic tissue exclusively from natural sources, occurring as the sodium salts of water-soluble estrogen sulfates blend to represent the average composition of material derived from pregnant mares' urine. It contains estrone, equilin, and 17 (alpha)-dihydroequilin, together with smaller amounts of 17 (alpha)-estradiol, equilenin, and 17 (alpha)-dihydroequilin as salts of their sulfate esters.

CONJUGATED ESTROGENS VAGINAL CREAM

Each gram of conjugated estrogens vaginal cream contains 0.625 mg conjugated estrogens USP in a nonliquefying base containing cetyl esters wax, cetyl alcohol, white wax, glyceryl monostearate, propylene glycol monostearate, methyl stearate, benzyl alcohol, sodium lauryl sulfate, glycerin, and mineral oil. It is applied intravaginally.

CYANOCOBALAMIN GEL

Cyanocobalamin gel for intranasal administration is a solution of cyanocobalamin USP (vitamin B12) for administration as a metered gel to the nasal mucosa. Each bottle of gel contains 2.3 mL of a 500 µg/0.1 mL gel solution of cyanocobalamin with methylcellulose, sodium citrate, citric acid, glycerin, and benzalkonium chloride in purified water. The gel solution has a pH between 4.5 and 5.5. After initial priming, each metered gel delivers an average of 500 µg of cyanocobalamin, and the 2.3 mL of gel contained in the bottle will deliver eight doses.

DBcAMP OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	DBcAMP	35.10
68.49	2	Polyethylene glycol 400	684.90
28.00	3	Polyethylene glycol 4000	280.00

Manufacturing Directions

1. In a glass-lined melting vessel, place 90% of item 3 and item 2 and melt at 70°C to 80°C.
2. Transfer to a homogenizer and cool to 50°C.
3. Prepare a dispersion of item 1 in balance of item 3 in a separate vessel and add to step 2.
4. Rinse the container with item 2 and add rinsings.
5. Mix at 50°C. Cool and fill.

DESONIDE CREAM, OINTMENT, AND LOTION

Cream 0.05%, ointment 0.05%, and lotion 0.05% contain desonide. Each gram of cream contains 0.5 mg of desonide in a base of purified water, emulsifying wax, propylene glycol, stearic acid, isopropyl palmitate, synthetic beeswax, polysorbate 60, potassium sorbate, sorbic acid, propyl gallate, citric acid, and sodium hydroxide. Each gram of ointment contains 0.5 mg of desonide in a base of mineral oil and polyethylene. Each gram of lotion contains 0.5 mg of desonide in a base of sodium lauryl sulfate, light mineral oil, cetyl alcohol, stearyl alcohol, propylene glycol, methyl paraben, propyl paraben, sorbitan monostearate, glyceryl stearate SE, edetate sodium, and purified water and may contain citric acid or sodium hydroxide for pH adjustment.

DESOXIMETASONE EMOLLIENT CREAM, GEL, AND OINTMENT

Desoximetasone emollient cream 0.25%, desoximetasone gel 0.05%, desoximetasone ointment 0.25%, and desoximetasone emollient cream 0.05% contain the active synthetic corticosteroid desoximetasone. Each gram of emollient cream

0.25% contains 2.5 mg desoximetasone in an emollient cream consisting of white petrolatum USP, purified water USP, isopropyl myristate NF, lanolin alcohols NF, mineral oil USP, cetostearyl alcohol NF, aluminum stearate, and magnesium stearate. Each gram of gel 0.05% contains 0.5 mg desoximetasone in a gel consisting of purified water USP, SD alcohol 40 (20% w/w), isopropyl myristate NF, carbomer 940, trolamine NF, edetate disodium USP, and docusate sodium USP. Each gram of ointment 0.25% contains 2.5 mg of desoximetasone in a base consisting of white petrolatum USP, propylene glycol USP, sorbitan sesquioleate, beeswax, fatty alcohol citrate, fatty acid pentaerythritol ester, aluminum stearate, citric acid, and butylated hydroxyanisole. Each gram of emollient cream 0.05% contains 0.5 mg desoximetasone in an emollient cream consisting of white petrolatum USP, purified water USP, isopropyl myristate NF, lanolin alcohols NF, mineral oil USP, cetostearyl alcohol NF, aluminum stearate, edetate disodium USP, lactic acid USP, and magnesium stearate.

DEXAMETHASONE SODIUM PHOSPHATE OINTMENT

Sterile ophthalmic ointment dexamethasone sodium phosphate is a topical steroid ointment containing dexamethasone sodium phosphate equivalent to 0.5 mg (0.05%) dexamethasone phosphate in each gram. Inactive ingredients are white petrolatum and mineral oil.

DEXPANTHENOL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Dexpanthenol	50.00
10.00	2	White soft paraffin	100.00
5.00	3	Cetostearyl alcohol	50.00
2.00	4	Lanolin anhydrous	20.00
10.00	5	Liquid paraffin	100.00
11.00	6	Propylene glycol	110.00
0.15	7	Methyl paraben	1.50
0.05	8	Propyl paraben	0.50
1.00	9	Tween 60	10.00
1.00	10	Simethicone M30	10.00
0.072	11	Lavender oil	0.072
0.028	12	Rose oil perfume	0.28
64.70	13	Water purified	647.00

Manufacturing Directions

1. Place items 2 to 5 in a melting vessel and heat to 70°C.
2. Combine portion of item 13 (at 70°C), item 1, and item 9 and heat to 70°C and mix for 10 minutes.
3. In a separate container add and dissolve items 7 and 8 in item 6 at 70°C and add to step 2.
4. Add step 1 into step 3. Mix under vacuum and at 70°C for 20 minutes.
5. Cool to 35°C to 40°C and add item 10. Mix again under vacuum.
6. Add items 11 and 12 and mix (without vacuum) and cool down to 25°C.
7. Transfer to storage vessel and fill.

DEXPANTHENOL GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Dexpanthenol (BASF)	50.00
100.00	2	Liquid paraffin	100.00
150.00	3	Lutrol E 400	150.00
180.00	4	Lutrol F 127	180.00
QS	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve dexpanthenol and Lutrol E 400 in water, add liquid paraffin, and stir, heating to 60°C to 70°C.
2. Slowly add Lutrol F 127 and stir until it is dissolved.
3. Cool to room temperature, stirring continuously until the air bubbles disappear.

DICLOFENAC DIETHYLAMINE GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Diclofenac diethylamine, 10% excess	11.00
1.20	2	Carbopol 934P	12.00
23.00	3	Isopropyl alcohol	230.00
5.00	4	Propylene glycol	50.00
2.50	5	Liquid paraffin	25.00
2.50	6	Cetiol LC	25.00
2.00	7	Cetomacrogol 1000	20.00
0.90	8	Diethylamine	9.00
0.028	9	Perfume	0.28
0.072	10	Perfume	0.72
68.00	11	Water purified	680.00

Manufacturing Directions

1. Place 90% of item 11 in a mixing vessel, heat to 80°C, stir to produce vortex, and add item 2 to disperse after passing through 1 mm sieve. Mix for 5 minutes, avoiding foam.
2. Transfer step 1 into Becomix and maintain temperature at 70°C.

3. Combine items 5 to 7 in a separate vessel, melt at 70°C, transfer to step 2.
4. Mix at speed II under vacuum of 0.4 to 0.6 bar for 5 minutes at 10 rpm.
5. Cool down to 30°C.
6. Add and dissolve item 8 in item 11 separately and then add to step 5 and mix for 10 minutes.
7. Dissolve item 1 in items 3 and 4 separately and transfer to step 6 through a cloth filter. Mix for 20 minutes.
8. Homogenize at speed I for 5 minutes under vacuum at 10 rpm.
9. Add perfumes and mix for 5 minutes.
10. Fill in appropriate containers.

DICLOFENAC DIETHYLAMMONIUM GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
QS	1	Water purified	465.53
500.00	2	Alcohol 190 proof	500.00
2.00	3	Menthol	2.00
10.00	4	Diclofenac USE diclofenac diethylammonium	12.47
8.00	5	Carbopol 940	8.00
12.00	6	Trolamine	12.00

Manufacturing Directions

1. Place purified water and alcohol in a 316-grade stainless-steel mixing tank.
2. Add menthol crystals to the alcohol–water mixture. Mix for 5 minutes or until completely dissolved.
3. Add diclofenac diethylammonium to the mixing tank. Mix for 10 minutes or until completely dissolved.
4. While mixing, sprinkle in carbomer. Continue mixing slowly at intervals for 1 to 2 hours or until carbomer swells completely in the hydroalcoholic solution.
5. Add trolamine and mix for 10 minutes or until gel forms.
6. Fill into suitable lined collapsible aluminum tube.

DICLOFENAC SODIUM SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
12.50	1	Diclofenac sodium micronized, 1% excess	12.62
530.32	2	Suppocire CM	530.32
353.00	3	Suppocire AS2X	353.00
2.90	4	Crill 3	2.90
1.15	5	Aerosil 200	1.15

Manufacturing Directions

1. Load items 2 to 4 in the fat-melting vessel and heat to 55°C.
2. Transfer to a mixing vessel through filter sieves. Set the temperature to 50°C.
3. Add item 1 and 5 to step 2. Mix at 10 rpm and homogenize at speed I for 15 minutes at 0.6 bar vacuum.
4. Cool down to 50°C to 55°C.
5. Transfer into storage vessel and set temperature at 50°C.
6. Fill 900 mg in a suppository mold.

DICLOFENAC SODIUM SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
25.00	1	Diclofenac sodium micronized, 1% excess	25.25
522.70	2	Suppocire CM	522.70
348.00	3	Suppocire AS2X	348.00
2.90	4	Crill 3	2.90
1.15	5	Aerosil 200	1.15

Manufacturing Directions

1. Load items 2 to 4 in the fat-melting vessel and heat to 55°C.
2. Transfer to a Becomix vessel through filter sieves. Set the temperature to 50°C.
3. Add items 1 and 5 to step 2. Mix at 10 rpm and homogenize at speed I for 15 minutes at 0.6 bar vacuum.
4. Cool down to 50°C to 55°C.
5. Transfer into storage vessel and set temperature at 50°C.
6. Fill 900 mg in a suppository mold.

DICLOFENAC SODIUM SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
50.00	1	Diclofenac sodium micronized, 1% excess	50.50
1045.40	2	Suppocire CM	1045.40
696.00	3	Suppocire AS2X	696.00
5.80	4	Crill 3	5.80
2.30	5	Aerosil 200	2.30

Manufacturing Directions

1. Load items 2 to 4 in the fat-melting vessel and heat to 55°C.
2. Transfer to a mixing vessel through filter sieves. Set the temperature to 50°C.
3. Add items 1 and 5 to step 2. Mix at 10 rpm and homogenize at speed I for 15 minutes at 0.6 bar vacuum.
4. Cool down to 50°C to 55°C.
5. Transfer into storage vessel and set temperature at 50°C.
6. Fill 1800 mg in a suppository mold.

DICLOFENAC SODIUM SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Diclofenac sodium micronized, 1% excess	101.00
1015.00	2	Suppocire CM	1015.00
675.00	3	Suppocire AS2X	675.00
6.00	4	Crill 3	6.00
2.50	5	Aerosil 200	2.50

Manufacturing Directions

1. Load items 2 to 4 in the fat-melting vessel and heat to 55°C.
2. Transfer to a mixing vessel through filter sieves. Set the temperature to 50°C.
3. Add items 1 and 5 to step 2. Mix at 10 rpm and homogenize at speed I for 15 minutes at 0.6 bar vacuum.
4. Cool down to 50°C to 55°C.
5. Transfer into storage vessel and set temperature at 50°C.
6. Fill 1800 mg in a suppository mold.

DICHLOROBENZYL ALCOHOL TOOTH GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	2,4-dichlorobenzyl alcohol (Myacid)	10.00
2.00	2	Sodium carboxymethylcellulose[a]	20.00
QS	3	Water purified	QS to 1 kg

[a] To obtain thicker gel, the quantity can be increased to 4.00.

Manufacturing Directions

1. Disperse item 2 in item 3 heated to 70°C.
2. Cool and add item and mix well.
3. Cool to 40°C and fill.

DIENESTROL VAGINAL CREAM

The active ingredient in dienestrol vaginal cream is dienestrol 0.01%. It is compounded in a cream base suitable for intravaginal use only. The cream base is composed of glyceryl monostearate, peanut oil, glycerin, benzoic acid, glutamic acid, butylated hydroxyanisole, citric acid, sodium hydroxide, and water. The pH is approximately 4.3. Available in 2.75-oz (78-g) tubes with or without a measured dose applicator.

DIETHYLAMINE SALICYLATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
22.50	1	White soft paraffin	225.00
12.50	2	Glyceryl monostearate	125.00
5.00	3	Criss-3 (span 60)	50.00
0.10	4	Vitamin E oily	1.00
45.24	5	Water purified	452.40
0.71	6	Sodium phosphate monobasic	7.10
0.13	7	Sodium hydroxide pellets	1.30
0.10	8	Sodium disulfide pure	1.00
0.166	9	Sodium ethylene diamine tetraacetate	1.66
12.00	10	Diethylamine salicylate	120.00
0.12	11	Menthol	1.20
0.50	12	Chlorbutol	5.00
0.30	13	Lavender oil	3.00
0.40	14	Glycerin	4.00
0.20	15	Methyl paraben	2.00
0.12	16	Propyl paraben	1.20

Manufacturing Directions

1. Charge, one by one, items 1 to 4 to a melting vessel at 75°C to 79°C. Hold molten fat at 70°C with continuous stirring at low speed.
2. In a separate vessel, heat 90% of item 5 to 90°C, add, and dissolve parabens by stirring. Cool to 65°C to 70°C.
3. In a separate vessel, take the balance of item 5 and sodium hydroxide pellets and sodium phosphate monobasic and dissolve.
4. Transfer step 3 to the paraben solution and mix for 5 to 10 minutes at slow speed and at 65°C to 70°C.
5. Cool to 25°C. Check and adjust pH 6.8 to 7.2. Add items 8 to 10 and mix to dissolve at 50°C.
6. Filter solution through polyester cloth and keep aside at 50°C.
7. Set Becomix temperature to 70°C, 10 rpm, and vacuum 6 bar.
8. Transfer molten fat at 70°C after passing through a stainless-steel filter to step above while mixing.
9. Homogenize at slow speed for 10 minutes. Temperature 65°C to 70°C.
10. Set Becomix to 50°C and transfer diethylamine salicylate solution to the cream at 50°C while stirring.
11. Continue mixing and add chlorbutol, menthol, lavender oil, and glycerin at 40°C. (Menthol and chlorbutol first dissolve in a separate container.)
12. Homogenize for 10 minutes under vacuum.
13. Cool to 25°C, transfer to storage vessel, fill.

DIFLORASONE DIACETATE CREAM AND OINTMENT

Each gram of cream contains 0.5 mg diflorasone diacetate in a cream base. Each gram of cream contains 0.5 mg diflorasone diacetate in a hydrophilic vanishing cream base of propylene glycol, stearyl alcohol, cetyl alcohol, sorbitan monostearate, polysorbate 60, mineral oil, and purified water. Each gram of ointment contains 0.5 mg diflorasone diacetate in an ointment base. Emollient ointment contains diflorasone diacetate in an emollient occlusive base consisting of polyoxypropylene 15-stearyl ether, stearic acid, lanolin alcohol, and white petrolatum.

DIMETHICONE AND ZINC OXIDE OINTMENT

Active ingredients in dimethicone and zinc oxide ointment are dimethicone, 1%, and zinc oxide, 10%. Inactive ingredients include aloe extract, benzyl alcohol, cod liver oil (contains vitamins A and D), fragrance, glyceryl oleate, light mineral oil, ozokerite, paraffin, propylene glycol, sorbitol, synthetic beeswax, and water.

DINOPROSTONE CERVICAL GEL

Dinoprostone is the naturally occurring form of prostaglandin E_2 (PGE_2). The active constituent of gel is dinoprostone 0.5 mg/3 g (2.5 mL gel); other constituents are colloidal silicon dioxide NF (240 mg/3 g) and triacetin USP (2760 mg/3 g).

DINOPROSTONE VAGINAL INSERT AND SUPPOSITORIES

Dinoprostone vaginal insert is a thin, flat polymeric slab that is rectangular with rounded corners, contained within the pouch of a knitted polyester retrieval system, an integral part of which is a long tape. Each slab is buff colored and semitransparent and contains 10 mg of dinoprostone. The hydrogel insert is contained within the pouch of an off-white knitted polyester retrieval system designed to aid retrieval at the end of the dosing interval. The finished product is a controlled-release formulation that has been found to release dinoprostone in vivo at a rate of approximately 0.3 mg/h. Each insert contains 10 mg of dinoprostone in 241 mg of a cross-linked polyethylene oxide/urethane polymer that is a semiopaque, beige-colored, flat rectangular slab measuring 29 mm × 9.5 mm × 0.8 mm in thickness. The insert and its retrieval system, made of polyester yarn, are nontoxic, and when placed in a moist environment they absorb water, swell, and release dinoprostone. The insert contains 10 mg dinoprostone. The product is wound and enclosed in an aluminum sleeve that is contained in an aluminum-polyethylene pack. Vaginal suppositories are available. Each suppository contains 20 mg of dinoprostone in a mixture of glycerides of fatty acids.

DIPHENHYDRAMINE HYDROCHLORIDE AND ZINC ACETATE OINTMENT

Diphenhydramine hydrochloride and zinc acetate ointment contain diphenhydramine hydrochloride 1% and zinc acetate 0.1%. The extra-strength formulation is diphenhydramine hydrochloride 2% and zinc acetate 0.1%. Inactive ingredients include cetyl alcohol, diazolidinyl urea, methyl paraben, polyethylene glycol monostearate 1000, propylene glycol, propyl paraben, and purified water.

DOCOSANOL LOTION

Docosanol, 10%, is a cold sore/fever blister treatment. Inactive ingredients include benzyl alcohol, light mineral oil, propylene glycol, purified water, sucrose distearate, and sucrose stearate.

ECONAZOLE NITRATE AND BENZOYL PEROXIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
200.00	1	PEG-6 and PEG-32 and glyceryl stearate (Tefose 63)	200.00
30.00	2	Mineral oil	30.00
30.00	3	Apricot kernel oil PEG-6 esters (Labrafil M 1944)	30.00
0.50	4	Sorbic acid	0.50
0.50	5	Sodium methyl paraben	0.50
724.00	6	Deionized water	724.00
5.00	7	Benzoyl peroxide	5.00
10.00	8	Econazole nitrate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 6 together and bring temperature to 75°C.
2. Allow to cool while stirring. Add items 7 and 8 at 30°C and mix well until uniform.

ECONAZOLE NITRATE AND BENZOYL PEROXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PEG-6 stearate and cetech-20 and steareth-20 (Tefose 2000)	50.00
30.00	2	Mineral oil	30.00
20.00	3	Cetyl alcohol	20.00
0.70	4	Sodium methyl paraben	0.70
0.30	5	Sorbic acid	0.30
884.00	6	Deionized water	884.00
5.00	7	Benzoyl peroxide	5.00
10.00	8	Econazole nitrate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 3 together and bring temperature to 75°C.
2. Allow to cool while stirring. Mix items 4 to 6 and add to above while stirring.
3. Cool with stirring. Add items 7 and 8 at 30°C while stirring.

EFLORNITHINE HYDROCHLORIDE CREAM

The cream contains 13.9% (139 mg/g) anhydrous eflornithine hydrochloride as eflornithine hydrochloride monohydrate (150 mg/g). Other ingredients include ceteareth-20, cetearyl alcohol, dimethicone, glyceryl stearate, methyl paraben, mineral oil, PEG-100 stearate, phenoxyethanol, propyl paraben, stearyl alcohol, and water.

ENZYME EXTRACT OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
50.00	1	Fumed silica	500.00
18.50	2	Enzyme extract[a]	185.00
0.20	3	Methyl paraben	2.00
0.50	4	Propyl paraben	5.00
0.03	5	Bromopal	0.30
0.02	6	Fragrance	0.20
QS	7	Water purified	QS to 1 kg

[a] This is a generic formula to incorporate proteins, tissue components, or enzyme extracts (in powder form).

ERYTHROMYCIN AND NEOMYCIN OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	Erythromycin-base fine powder 10% excess (900 µg/mg potency)[a]	12.22
3.50	2	Neomycin-base USE neomycin sulfate (200 Waksman units/mg potency)[a]	5.00
100.00	3	Mineral oil light	100.00
QS	4	Petrolatum white	QS to 1 kg

[a] Adjust petrolatum weight to compensate for change in weight of erythromycin base and neomycin.

Manufacturing Directions

1. Heat petrolatum and mineral oil in a steam kettle to 115°C and maintain temperature for at least 3 hours.
2. Strain into mixing tank and cool to 40°C to 45°C.
3. Reserve portion of petrolatum–oil mixture for step 5.
4. Mix erythromycin and neomycin with 95 g of base and stir until thoroughly dispersed.
5. Run through a 200 mesh (74 µm aperture) screen on Homoloid mill directly into main portion of petrolatum–oil mixture.

6. Rinse mill with reserved petrolatum–oil mixture from step 3.
7. Mix 2 hours before cooling. Cool slowly to avoid condensation.
8. Fill into suitable approved containers.

ERYTHROMYCIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Erythromycin base	10.00
20.00	2	Lutrol E 400	200.00
20.00	3	Propylene glycol	200.00
20.00	4	Lutrol F 127	200.00
39.00	5	Water purified	390.00

Manufacturing Directions

1. Heat solution of items 1 to 3 to approximately 70°C.
2. Dissolve item 4, mix with item 5, and cool when the air bubbles escape.

ERYTHROMYCIN OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	Erythromycin powder 850 µg/mg, 10% excess[a]	12.94
100.00	2	Mineral oil light	100.00
QS	3	Petrolatum white	QS to 1 kg

[a] Adjust petrolatum weight to compensate for change in weight of erythromycin base calculated from its potency.

Manufacturing Directions

1. Heat petrolatum and mineral oil in a steam kettle to 115°C and maintain temperature for at least 3 hours.
2. Strain into mixing tank and cool to 40°C to 45°C.
3. Reserve portion of petrolatum–oil mixture for step 6.
4. Mix erythromycin with 78 g of base and stir until thoroughly dispersed.
5. Run through a 200 mesh (74 µm aperture) screen on Homoloid mill directly into main portion of petrolatum–oil mixture.
6. Rinse mill with reserved petrolatum–oil mixture from step 3.
7. Mix 2 hours before cooling. Cool slowly to avoid condensation.
8. Fill into suitable approved containers.

ERYTHROMYCIN OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
23.75	1	Isostearyl benzoate	237.50
23.85	2	Bis (2-ethylhexyl) maleate	238.50
10.00	3	Cyclomethicone	100.00
5.00	4	Stearyl alcohol	50.00
10.00	5	Starch	100.00
10.00	6	Microcrystalline cellulose	100.00
15.00	7	Ethylene/vinyl copolymer	150.00
0.10	8	Propyl paraben	1.00
0.10	9	Butylparaben	1.00
0.10	10	Fragrance	1.00
2.00	11	Erythromycin	21.00

Manufacturing Directions

1. Blend items 1 to 4 in a high-shear mixer.
2. Add balance ingredients and mix well.
3. Fill.

ESTRADIOL AND NORETHINDRONE ACETATE TRANSDERMAL SYSTEM

The estradiol/norethindrone acetate transdermal system is an adhesive-based matrix transdermal patch designed to release both estradiol and norethindrone acetate, a progestational agent, continuously on application to intact skin. The patch is an alcohol-free, adhesive-based matrix transdermal drug delivery system comprising three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are a backing, an adhesive layer, and a protective liner. The adhesive matrix containing estradiol and norethindrone acetate is applied to an adhesive backing of polyester/ethylene vinyl acetate laminate film on one side and is protected on the other side by a transparent fluoropolymer-coated release liner. The transparent release liner must be removed before the system can be used. Each system is enclosed in a heat-sealed pouch. The active components of the system are estradiol USP and norethindrone acetate USP. The remaining components of the system are pharmacologically inactive: A silicone and acrylic-based multipolymeric adhesive, povidone USP, oleic acid NF, and dipropylene glycol.

ESTRADIOL TRANSDERMAL SYSTEM

Estradiol transdermal system is designed to deliver 17 (beta)-estradiol continuously and consistently for more than a 3- or 4-day interval on application to intact skin. Three strengths of Alora systems are available, having nominal in vivo delivery of 0.05, 0.075, and 0.1 mg estradiol per day through skin of average permeability (interindividual variation in skin

permeability is approximately 20%). Alora systems have contact surface areas of 18, 27, and 36 cm^2 and contain 1.5, 2.3, and 3.0 mg of estradiol USP respectively. The composition of the systems per unit active surface area is identical. Estradiol USP 17 (beta)-estradiol is a white crystalline powder that is chemically described as estra-1,3,5(10)-triene-3,17(beta)-diol, has an empirical formula of $C_{18}H_{24}O_2$, and has a molecular weight of 272.37. The delivery system consists of three layers. Proceeding from the polyethylene backing film, the adhesive matrix drug reservoir that is in contact with the skin consists of estradiol USP and sorbitan monooleate dissolved in an acrylic adhesive matrix. The polyester overlapped release liner protects the adhesive matrix during storage and is removed before application of the system to the skin.

Manufacturing Directions

Estradiol-containing matrices are prepared by mixing acrylic adhesive (National Starch Durotac 1194), sorbitan monooleate (Arlacel 80), and estradiol at a ratio of 80-*X*/(20/*X*), where *X* is the proportion (wt%) of estradiol. The matrix contains 25 estradiol (8% estradiol was saturated) for optimal permeation.

ESTRADIOL VAGINAL CREAM

Each gram of estradiol vaginal cream USP 0.01% contains 0.1 mg estradiol in a nonliquefying base containing purified water, propylene glycol, stearyl alcohol, white ceresin wax, mono- and diglycerides, hydroxypropylmethylcellulose, 2208 (4000 CPS; CPS refers to centipoise, a designation of viscosity) sodium lauryl sulfate, methyl paraben, edetate disodium, and tertiary butylhydroquinone. Tubes contain 1.5 oz (42.5 g), with a calibrated plastic applicator for delivery of 1, 2, 3, or 4 g. Each gram of estradiol vaginal cream USP 0.01% contains 0.1 mg estradiol in a nonliquefying base containing purified water, propylene glycol, stearyl alcohol, white ceresin wax, mono- and diglycerides, hydroxypropylmethylcellulose, 2208 (4000 CPS) sodium lauryl sulfate, methyl paraben, edetate disodium, and tertiary butyl-hydroquinone.

ESTRADIOL VAGINAL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/10 kg (g)
7.00	1	Stearyl alcohol	700.00
4.00	2	Glyceryl monostearate (nonemulsifying)	400.00
7.00	3	Ceresin wax 160	700.00
0.02	4	Monotertiary butylhydroquinone	2.00
0.01	5	17-Beta-estradiol	1.00
10.00	6	Propylene glycol	1000.00
0.15	7	Methyl paraben	15.00
0.30	8	Hydroxypropylmethylcellulose 4000 CPS	30.00
0.05	9	Disodium edetate	5.00
0.30	10	Sodium lauryl sulfate	30.00
71.77	11	Water purified	7177.00

Manufacturing Directions

1. Prepare a nonaqueous phase premix by thoroughly mixing stearyl alcohol (700 g), glyceryl monostearate, nonself-emulsifying (400 g), white ceresin wax 160 (160 signifies the approximate melting point in degrees Fahrenheit, 700 g), and monotertiary butylhydroquinone (2 g) while heating to 75°C.
2. Continue mixing with heating until all solids are dissolved and then add 17-beta-estradiol (1 g dry weight). Then continue the mixing until this phase is in the form of a clear solution, at which point hold at 75°C for later use.
3. Mix propylene glycol (1000 g) and methyl paraben (15 g) together until all solids are dissolved. Add hydroxypropylmethylcellulose 4000 CPS (CPS refers to centipoise, a designation of viscosity, 30 g) to the propylene glycol solution and disperse; then add this resulting mixture to an aqueous solution of disodium edetate (5 g) and sodium lauryl sulfate (30 g) in 7117 g purified water. Heat this mixture and hold at 75°C while stirring to facilitate the formation of an oil-in-water emulsion.
4. Then add the hot nonaqueous phase premix, prepared earlier, to this hot aqueous phase slowly while mixing with an appropriate mixer. If the equipment used permits moisture loss, water may be added during this step to compensate for the loss.
5. Allow the resultant hot emulsion to cool to 60°C, at which point thoroughly homogenize using a recirculating homogenizer, homomixer, or other suitable equipment to provide a particle size reduction to a range of 5 to 20 μm for most particles.

6. Pass the fluid emulsion, still at 60°C, through a No. 100 to No. 200 stainless-steel or nylon screen into a vessel equipped for slow stirring.
7. Then cool the emulsion under vacuum while using slow sweep stirring until the temperature reaches 25°C.

ETHYLENEDIAMINE TETRACETATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Liquid paraffin	50.00
10.00	2	White paraffin	100.00
30.00	3	Glycerin	300.00
8.00	4	Cetostearyl alcohol	80.00
0.30	5	Methyl paraben	3.00
3.60	6	Polyoxyethylene sorbitan monostearate	36.00
2.00	7	Glyceryl monostearate	20.00
QS	8	Water purified	QS to 1 kg
1.00	9	Ethylene diamine tetraacetate	10.00

Manufacturing Directions

1. Water phase:
   a. Charge purified water, polysorbate 60, and glycerin with agitation in a melting kettle.
   b. Heat the contents to 61°C to 65°C.
   c. Add methyl paraben and mix the composition to dissolve while maintaining temperature.
2. Oil phase:
   a. In a suitable vessel, place liquid paraffin, cetostearyl alcohol, white petrolatum, glycerol monostearate, and white beeswax and mix continuously while heating to 71°C to 75°C.
3. Mixing of phases:
   a. Transfer the mixture of step 2 to the step 1 kettle, with the water phase maintained at less than 300 mbar vacuum.
   b. Add EDTA and dissolve.
   c. With mixing and keeping the temperature at 61°C to 65°C, draw the oil phase into the water phase.
   d. Mix for 15 minutes with agitation and vacuum at 300 mbar and 61°C to 65°C.
   e. While mixing and under vacuum, allow the mixture to cool gradually to room temperature.
4. Fill in appropriate container.

EUCALYPTUS AND MINT OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
160.00	1	Menthol	160.00
40.00	2	Eucalyptus	40.00
800.00	3	Anhydrous lanolin, USP	800.00

Manufacturing Directions

1. Mix lanolin until melted (approximately at 50°C), add remaining ingredients, and mix for 1 hour.
2. Fill hot.

FOOT FRESHENER CREAM

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/L (g)
30.00	1	Alcohol and ceteareth-20 (Cosmowax® EM5483)	30.00
30.00	2	Isopropyl myristate (Crodamol® IPM)	30.00
5.00	3	Cetyl esters (Crodamol® SS)	5.00
20.00	4	Oleyl alcohol	20.00
5.00	5	Propylene glycol	5.00
5.00	6	Carbopol 980	5.00
QS	7	Deionized water	QS to 1 L
300.00	8	Ethanol (DEB100)	300.00
2.00	9	Triclosan (Irgasan® DP300)	2.00
0.50	10	Menthol	0.50
4.00	11	Triethanolamine 99 (to give pH 6 to 7)	~4.00

Manufacturing Directions

1. Preblend ethanol, Irgasan, and menthol and warm to 50°C.
2. Heat water and oil phases separately to 70°C.
3. Add the water phase to the oil phase while stirring.
4. Stir to cool, adding the preblend at 60°C. Adjust pH.

FOOT MOUSSE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
300.00	1	Ethanol (DEB100)	300.00
1.00	2	Menthol	1.00
QS	3	Deionized water	QS
20.00	4	Undecyleneamide DEA and diethanolamine	20.00
5.00	5	Cetrimonium bromide	5.00
10.00	6	PEG-75 and water	10.00
QS	7	Perfume, preservative, color	QS

Manufacturing Directions

1. Dissolve menthol in ethanol.
2. Add remaining ingredients.
3. Pack into mechanical mousse applicator.

FLUOCINONIDE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.05	1	Fluocinonide	0.50
7.00	2	Crotamiton	70.00
10.00	3	Liquid paraffin	100.00
1.00	4	Polyoxyethylene lauryl ether	10.00
20.00	5	Carboxyvinyl polymer	200.00
1.20	6	Disodium edetate	12.00
4.68	7	Triethanolamine	46.80
QS	8	Water purified	QS to 1 kg

Manufacturing Directions

1. Dissolve fluocinonide (50 mg) in crotamiton (7 g) with warming and thereto add liquid paraffin (10 g), propylene glycol (10 g), polyoxyethylene lauryl ether (1 g), a 4% aqueous solution of carboxyvinyl polymer (20 g), purified water (47 g), and a 1% aqueous solution of disodium edetate (1.2 g).
2. Heat the mixture until approximately 70°C to 80°C and then add a 2% aqueous solution of triethanolamine (4.68 g) to it with stirring and then add further purified water until the amount becomes 100 g.
3. Stir the mixture well and then cool to give a creamy preparation having a viscosity of 65,000 centipoises and a pH of 4.47.

FLUOCINONIDE CREAM, OINTMENT, AND GEL

The cream contains fluocinonide 0.5 mg/g in a specially formulated cream base consisting of citric acid, 1,2,6-hexanetriol, polyethylene glycol 8000, propylene glycol, and stearyl alcohol. This white cream vehicle is greaseless, nonstaining, anhydrous, and completely water miscible. The base provides emollient and hydrophilic properties. In this formulation, the active ingredient is totally in solution. The cream contains fluocinonide 0.5 mg/g in a water-washable aqueous emollient base of cetyl alcohol, citric acid, mineral oil, polysorbate 60, propylene glycol, sorbitan monostearate, stearyl alcohol, and water (purified). Another strength of cream contains fluocinolone acetonide 0.25 mg/g in a water-washable aqueous base of butylated hydroxytoluene, cetyl alcohol, citric acid, edetate disodium, methyl paraben and propyl paraben (preservatives), mineral oil, polyoxyl 20 cetostearyl ether, propylene glycol, simethicone, stearyl alcohol, water (purified), and white wax. The gel contains fluocinonide 0.5 mg/g in a specially formulated gel base consisting of carbomer 940, edetate disodium, propyl gallate, propylene glycol, sodium hydroxide or hydrochloric acid (to adjust the pH), and water (purified). This clear, colorless thixotropic vehicle is grease-less, nonstaining, and completely water miscible. In this formulation, the active ingredient is totally in solution. The ointment contains fluocinonide 0.5 mg/g in a specially formulated ointment base consisting of glyceryl monostearate, white petrolatum, propylene carbonate, propylene glycol, and white wax. It provides the occlusive and emollient effects desirable in an ointment. In this formulation, the active ingredient is totally in solution. In another formulation, the ointment contains fluocinolone acetonide 0.25 mg/g in a white petroleum USP vehicle.

FLUOROMETHOLONE OPTHALMIC OINTMENT

The fluorometholone ophthalmic ointment, 0.1%, contains active ingredients fluorometholone 0.1% and the preservative phenylmercuric acetate (0.0008%). Inactives are white petrolatum, mineral oil, and petrolatum and lanolin alcohol.

FLUOROURACIL CREAM

Fluorouracil cream, 0.5%, contains fluorouracil for topical dermatologic use. Cream contains 0.5% fluorouracil, with 0.35% being incorporated into a patented porous microsphere (Microsponge®) composed of methyl methacrylate/glycol dimethacrylate crosspolymer and dimethicone. The cream formulation contains the following other inactive ingredients: Carbomer 940, dimethicone, glycerin, methyl gluceth-20, methyl methacrylate/glycol dimethacrylate crosspolymer, methyl paraben, octyl hydroxy stearate, polyethylene glycol 400, polysorbate 80, propylene glycol, propyl paraben, purified water, sorbitan monooleate, stearic acid, and trolamine.

The 5% cream contains fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60, and parabens (methyl and propyl).

The 1% topical cream contains inactive ingredients benzyl alcohol, emulsifying wax, mineral oil, isopropyl myristate, sodium hydroxide, and purified water.

FLURANDRENOLIDE LOTION

Each milliliter of lotion contains 0.5 mg (1.145 mol) (0.05%) flurandrenolide in an oil-in-water emulsion base composed of glycerin, cetyl alcohol, stearic acid, glyceryl monostearate, mineral oil, polyoxyl 40 stearate, menthol, benzyl alcohol, and purified water.

FLURANDRENOLIDE TOPICAL FILM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Flurandrenolide	1.00
9.00	2	Polyvinyl alcohol	90.00
11.00	3	Polyvinylpyrrolidone (PVP)	110.00
9.00	4	Glycerin	90.00
10.00	5	Alcohol	100.00
2.00	6	Benzyl alcohol	20.00
3.00	7	Propylene glycol	30.00
0.02	8	Disodium edetate	0.20
0.10	9	Citric acid	1.00
QS	10	Water purified	QS to 1 kg

Manufacturing Directions

1. Add and dissolve flurandrenolide in propylene glycol, glycerin, and ethyl alcohol.
2. Dissolve all the remaining items (including some water) separately and add to step 1.
3. Mix thoroughly and make up the volume.
4. Spread the formulation manually or with an applicator. On evaporation of the solvents including water more than a period of 20 to 30 minutes, a continuous medicated adherent film of approximately 0.05- to 0.15 mm (average 0.08 mm) thickness is formed. After 18 to 24 hours or another desirable time span, the film is removed with water or is peeled.

FLUTICASONE OINTMENT

Fluticasone ointment, 0.005%, contains fluticasone propionate. Each gram of ointment contains fluticasone propionate 0.05 mg in a base of propylene glycol, sorbitan sesquioleate, microcrystalline wax, and liquid paraffin.

FLUTICASONE PROPIONATE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.05	1	Fluticasone propionate	0.05
87.00	2	Propylene glycol	87.00
21.00	3	Sorbitan sesquioleate	21.00
200.00	4	Liquid paraffin	200.00
180.00	5	Microcrystalline wax	180.00
481.95	6	White soft paraffin	481.95
30.00	7	Hard paraffin	30.00

Manufacturing Directions

1. Melt microcrystalline wax, hard paraffin, and sorbitan sesquioleate in a fat-melting vessel at 70°C to 75°C while mixing. Add liquid paraffin and mix well.
2. Transfer the mixture in step 1 to the manufacturing vessel through stainless-steel filter. Mix and homogenize for 10 minutes under vacuum at 0.5 bar. Cool the mixture to 40°C to 45°C.
3. Disperse fluticasone propionate in propylene glycol, mix, and homogenize at a temperature of 40°C to 45°C.
4. Transfer the drug mixture from step 3 into the manufacturing vessel from step 2 while mixing. Mix and homogenize for 10 minutes under vacuum at 0.5 bar to obtain uniform homogeneous ointment to contain label amount of fluticasone propionate per gram.
5. Cool to a temperature of 25°C to 30°C with continuous stirring.
6. Fill the ointment into the tube.

FLUTICASONE PROPIONATE CREAM

Each gram of cream contains fluticasone propionate 0.5 mg in a base of propylene glycol, mineral oil, cetostearyl alcohol, ceteth-20, isopropyl myristate, dibasic sodium phosphate, citric acid, purified water, and imidurea as preservative.

FLUTICASONE PROPIONATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.50	1	Fluticasone propionate	0.50
40.00	2	Propylene glycol	40.00
100.00	3	Liquid paraffin	100.00
70.70	4	Cetostearyl alcohol	70.70
40.00	5	Cetomacrogol 1000	40.00
50.00	6	Isopropyl myristate	50.00
4.80	7	Dibasic sodium phosphate	4.80
1.50	8	Citric acid monohydrate	1.50
2.50	9	Imidurea	2.50
690.00	10	Purified water	690.00

Manufacturing Directions

1. Melt cetostearyl alcohol and cetomacrogol 1000 in a fat-melting vessel at 70°C. Add liquid paraffin and isopropyl myristate and mix well. Hold the temperature between 60°C and 70°C.
2. Add purified water to the manufacturing vessel and heat to 70°C to 80°C.
3. Dissolve dibasic sodium phosphate, citric acid, and imidurea in purified water. Hold the temperature between 60°C and 70°C.
4. Transfer the fat phase of step 1 through a stainless-steel filter to the manufacturing vessel while stirring at a temperature of 60°C to 70°C. Mix and homogenize for 10 minutes under vacuum at 0.5 bar. Cool the mixture to 40°C to 45°C.
5. Disperse fluticasone propionate in propylene glycol at a temperature of 40°C to 45°C.
6. Transfer the drug mixture of step 5 into step 4 to the manufacturing vessel while mixing. Mix and homogenize for 10 minutes under vacuum at 0.5 bar to obtain a uniform homogenous cream to contain labeled amount of drug per gram.
7. Cool the cream to a temperature of 25°C to 30°C with continuous stirring.
8. Transfer into stainless-steel storage container with product identification label.

FOLIC ACID SUPPOSITORY

Manufacturing Directions

1. Folic acid, 0.2%; allantoin, 0.5%; protein hydrolysate, 0.8%; lactose, 8.0%; lactic acid, 1.0%; magnesium sulfate, 1.0%; sodium chloride, 2.0%; polyoxyethylene glycol 1540, 66.5%; polyoxyethylene sorbitan monolaurate, 15.0%; polyoxyethylene sorbitan monostearate, 5%.
2. After mixing folic acid with an adequate amount of lactose, successively add the remainder of lactose, magnesium sulfate, and sodium chloridewhile stirring.
3. Mix rotein hydrolysate immediately with the powder mixture before preparing the suspension.
4. Simultaneously, after melting the polyoxyethylene glycol and polyoxyethylene glycol fatty acid esters and reaching a temperature of 60°C, mix lactic acid with the melt, suspend the powder mixture in the liquid suppository base containing lactic acid, then homogenize the mass in a colloid mill.
5. At a temperature of approximately 55°C, fill the mass into cooled moulds.
6. The percentages given above refer to suppositories weighing 3.5 to 4.0 g each.

6-FORMYLAMINONICOTINAMIDE OINTMENT AND LOTION

Manufacturing Directions

1. Ointment: Dissolve 6-Formylaminonicotinamide 0.1 g in 5 mL of water and 4.9 mL of ethanol. Admix the solution with hydrophilic ointment USP grade (90 g) to a uniform consistency. This ointment also may be stored in opaque jars at room temperature.
2. Lotion: Dissolve 6-Aminonicotinamide 0.2 g in 7.2 mL of 0.2 N HCl and admix the solution with 92.6 g of a water-in-oil lotion prepared from mineral oil, cottonseed oil, isopropyl palmitate, and water with a surfactant such as sorbitan sesquioleate. The ingredients in said water-in-oil lotion are present for example in 10:10:5:70:5 parts by weight respectively. Store the lotion thus prepared in a plastic squeeze bottle.
3. Fill the cream into the tube.

FOSCARNET CREAM

Bill of Materials

Scale (mg/100 g)	Item	Material Name	Qty/kg (mg)
3.00	1	Trisodium phosphonoformate hexahydrate (foscarnet sodium)	30.00
4.40	2	Polyoxyethylene fatty acid ester	44.00
2.00	3	Cetyl alcohol	20.00
2.00	4	Stearic acid	20.00
2.00	5	Liquid paraffin	20.00
2.00	6	Propylene glycol	20.00
1.50	7	Glycerin	15.00
0.07	8	Methyl paraben	0.70
0.03	9	Propyl paraben	0.30
QS	10	Water purified	QS to 1 kg

GAMMA BENZENE HEXACHLORIDE LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Gamma benzene hexachloride, 1% excess	10.10
2.00	2	Emulsifying wax	20.00
5.00	3	Xylene	50.00
0.50	4	Cetomacrogol 1000	5.00
10.00	5	Liquid paraffin	100.00
72.00	6	Water purified	720.00

Manufacturing Directions

1. Heat items 2, 4, and 5 to 95°C and pass through a stainless-steel sieve.
2. Heat water to 65°C and add to step 1.
3. Dissolve item 1 in item 3 with stirring and add to step 2 at 35°C.
4. Adjust pH to 7.5 to 8.0 if necessary and mix for 2 hours.

GENTAMICIN SULFATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.100	1	Gentamycin USE gentamycin sulfate[a]	1.82
15.000	2	Petrolatum (white soft paraffin)	150.00
1.800	3	Polyoxyl 20 cetostearyl ether (cetomacrogol 1000)	18.00
7.200	4	Cetostearyl alcohol	72.00
0.100	5	Chlorocresol	1.00
6.000	6	Mineral oil (liquid paraffin)	60.00
0.300	7	Monobasic sodium phosphate	3.00
69.417	8	Purified water	694.17

[a] Considering the potency of the gentamicin sulfate is 700 µg/mg (anhydrous basis) with 15.0% water content. Quantity of gentamicin sulfate per batch will vary according to the actual potency. Required quantity should be calculated as below. Quantity of gentamicin sulfate required per batch is based on potency.

Manufacturing Directions

1. Fat phase: Load items 2 to 6 in a fat-melting vessel. Heat to 70°C. Stir to melt. Hold the molten fat at 70°C while stirring at low speed in the fat-melting vessel.
2. Aqueous phase: Set the mixer at temperature 70°C. Heat 608 g of item 8 to 70°C in mixer.
3. Cream preparation: Transfer the molten fat at 70°C from step 1 into mixer through a stainless-steel filter while mixing at speed 10 rpm, vacuum 0.6 bar.
4. When the transfer is over, start the homogenizer at low speed. Homogenize for 10 minutes with recirculation. Temperature, 65°C to 70°C.
5. Stop the homogenizer, set the mixer at temperature 50°C, speed 10 rpm (manual mode), and vacuum 0.6 bar. Cool the cream to 50°C.
6. Drug phase: Dissolve items 7 and 1 in 86.17 g of item 8 in a stainless-steel container while mixing with a stirrer. Hold the temperature at 50°C.
7. Transfer the drug solution from step 4 to the cream phase in mixer at 50°C while mixing.
8. Start the homogenizer at high speed, mixer speed 10 rpm. Mix and homogenize for 10 minutes under vacuum 0.6 bar.
9. While homogenization is in progress, set the temperature at 25°C so that the cream temperature shall not increase. Continue mixing at 10 rpm under vacuum 0.6 bar until the temperature reaches 25°C.
10. When the cream is cooled to 25°C, unload the cream in stainless-steel container and fill.

GENTAMICIN SULFATE OINTMENT

Each gram of ointment contains gentamicin sulfate USP (equivalent to 3 mg gentamicin) in a base of white petrolatum, with methyl paraben (0.5 mg) and propyl paraben (0.1 mg) as preservatives. Active ingredients are gentamicin sulfate equivalent to 0.3% gentamicin base, prednisolone acetate 0.6%, and the preservative (chloral derivative) 0.5%. Inactives are white petrolatum, mineral oil, petrolatum and lanolin alcohol, and purified water.

GENTAMICIN SULFATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.100	1	Gentamycin sulfate (100% excess)	2.00
0.400	2	Cetostearyl alcohol	4.00
0.100	3	Polyoxyl 20 cetostearyl ether (cetomacrogol 1000)	1.00
1.500	4	Mineral oil (liquid paraffin)	15.00
1.000	5	Mineral oil (liquid paraffin)	10.00
96.600	6	Petrolatum (white soft paraffin)	966.00
0.200	7	Purified water	2.00

Manufacturing Directions

1. Melt items 2, 3, and 5 at 70°C in a small container using water bath. Put the melt under homogenizer (keep homogenizer warm to avoid losses caused by sticking).
2. Dissolve item 1 in item 7 and heat to 50°C in water bath. Add step 2 to step 1 and homogenize for 2 to 3 minutes using homogenizer. Maintain the temperature around 50°C.
3. Load item 6 in a fat-melting vessel while stirring at 70°C. Transfer the molten mass through filter to mixer and cool it down to 50°C. Note that the mixer should be warmed before the transfer starts to avoid sticking on the wall. Add step 2 to the step 3 while stirring. Maintain temperature at around 50°C.

4. Rinse the homogenizer with warm item 4 and transfer the rinsing to the mixer.
5. Mix and homogenize for 10 minutes at low speed, mixer speed 10 to 12 rpm, vacuum 0.4 to 0.6 bar, and temperature 50°C.
6. Cool the ointment to 30°C to 35°C with stirring under vacuum 0.4 to 0.6 bar.
7. Transfer the ointment to stainless-steel drum and fill.

GLYCERIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
1800.00	1	Glycerin (glycerol)	1800.00
178.00	2	Sodium stearate	178.00
99.00	3	Purified water	99.00

Manufacturing Directions

1. The suppository mass is manufactured at a temperature of 120°C. Care must be taken to see that molten suppository mass does not accidentally spill on the person. The inside of the vessel should not be touched with a bare hand, as it is at a temperature of 120°C. Sodium stearate powder is light and fluffy. Avoid inhaling the dust.
2. Load item 1 into the mixer and heat to 120°C ± 2°C while stirring at low speed.
3. Load item 2 to the mixer containing item 1. Mix until complete solubilization occurs. Cool to 105°C ± 2°C.
4. Add item 3 slowly to the mixer containing mass while stirring. Mix for 20 minutes. Immediately transfer the hot mass to the heated storage vessel or heated vessel of suppository filling machine.
5. Check the temperature; it should be 105°C ± 2°C. Fill weight: 2077 mg/suppository.

GLYCERIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
900.00	1	Glycerin (glycerol) excess 0.06%	900.50
89.00	2	Sodium stearate	89.00
49.50	3	Purified water	49.50

Manufacturing Directions

See above; fill weight: 1039 mg/suppository.

GLYCOLIC ACID CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	Polyoxyethylene (40) stearate	30.00
2.00	2	Polyoxyethylene (200) sorbitan monooleate	20.00
8.00	3	Glycerol monostearate	80.00
2.00	4	Lanolin	20.00
1.00	5	Mineral oil	10.00
49.00	6	Water purified	490.00
5.00	7	Propylene glycol	50.00
3.00	8	Sorbitol	30.00
1.00	9	Carbopol 940	10.00
10.00	10	Glycolic acid	100.00
16.00	11	Triisopropanolamine	160.00

Manufacturing Directions

1. Heat items 1 to 5 in a stainless-steel container to 80°C.
2. In a separate container, heat items 6 to 9 to 80°C.
3. Add step 2 to step 1 with agitation.
4. After the mixture is congealed, add glycolic acid and triisopropanolamine.
5. Continue agitation until a uniform consistency is obtained. The pH of the cream is 3.8.

GRAMICIDIN, NEOMYCIN, NYSTATIN, AND TRIAMCINOLONE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.025	1	Gramicidin	0.025
10.00	2	Liquid paraffin	10.00
0.48	3	Neomycin sulfate	0.48
2.72	4	Nystatin micronized	2.72
1.00	5	Syncrowax	1.00
0.105	6	Triamcinolone acetonide micronized	0.105
86.72	7	White soft paraffin	86.72

Manufacturing Directions

1. Charge items 5 and 7 in a melting vessel and heat to 70°C to melt. Transfer to Becomix through stainless-steel filters and cool to 40°C while mixing.
2. Add items 2 (half quantity) and 4 to a separate vessel and disperse using a spatula. Homogenize twice with

fine-gap setting to make smooth dispersion and add this dispersion to step 1.
3. Charge items 1, 2 (balance quantity), 3, and 6 in a separate stainless-steel vessel and homogenize to a smooth dispersion until here are no lumps.
4. Transfer to step 2.
5. Rinse homogenizer with liquid paraffin and add rinsings.
6. Homogenize the final mixture under a vacuum of 0.4 to 6 bar at 10 rpm and set temperature to 28°C to 30°C.
7. Mix until ointment is smooth, transfer to a stainless-steel vessel, and fill.

HALOBETASOL PROPIONATE CREAM AND OINTMENT

Each gram of cream contains 0.5 mg/g of halobetasol propionate in a cream base of cetyl alcohol, glycerin, isopropyl isostearate, isopropyl palmitate, steareth-21, diazolidinyl urea, methylchloroisothiazolinone, methylisothiazolinone, and water. Each gram of ointment contains 0.5 mg/g of halobetasol propionate in a base of aluminum stearate, beeswax, pentaerythritol cocoate, petrolatum, propylene glycol, sorbitan sesquioleate, and stearyl citrate.

HEMORRHOID CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Lanolin alcohol (Ivarlan 3310)	20.00
448.00	2	Petrolatum	448.00
450.00	3	Petrolatum amber	450.00
30.00	4	Shark liver oil	30.00
10.00	5	Live yeast cell derivative (Biodyne's TRF)	10.00
10.00	6	Deionized water	10.00
20.90	7	Lanolin	20.90
1.00	8	Thyme oil	1.00
0.10	9	Phenyl mercuric nitrate	0.10

Manufacturing Directions

1. Mix and heat items 1 to 4 to 70°C, cool to 50°C, and hold.
2. Separately combine items 5 to 7 and heat to 40°C and mix until homogenous dispersion is achieved; with rapid mixing add this mixture to previous mixture. Mix again and cool to 40°C. Add items 8 and 9.
3. Continue mixing while cooling to 35°C.

HEPARIN GEL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.186	1	Heparin sodium	1.86
15.00	2	Lutrol E 400	150.00
10.00	3	Liquid paraffin	100.00
23.00	4	Lutrol F 127	230.00
QS	5	Water purified	QS to 1 kg

Manufacturing Directions

1. Dissolve heparin sodium in water. Add Lutrol E 400 and liquid paraffin.
2. Stir and cool to 6°C. Add Lutrol F 127 slowly and stir until it is dissolved.
3. Heat to room temperature when the air bubbles escape.

HEXACHLOROPHENE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
45.80	1	Olive oil, low acidity	45.80
45.00	2	Diglycol stearate S	45.00
5.00	3	Cetyl alcohol	5.00
5.00	4	Lanolin anhydrous	5.00
5.00	5	Petrolatum white	5.00
1.03	6	Polysorbate 40	1.03
5.00	7	Hexachlorophene	5.00
0.10	8	Simethicone	0.10
50.00	9	Glycerin	50.00
1.00	10	Methyl paraben	1.00
10.00	11	Sodium borate	10.00
1.30	12	Sodium lauryl sulfate	1.30
1.76	13	Perfume	1.76
2.00	14	Menthol	2.00
14.02	15	Alcohol	14.02
QS	16	Water purified	779.0 mL

Manufacturing Directions

1. Strain olive oil through voile cloth or equivalent into a suitable stainless-steel jacketed tank.
2. Add diglycol stearate. While heating oil–stearate mix, add cetyl alcohol, lanolin, petrolatum, and polysorbate 40 with mixing. Mix until all are dissolved and temperature of mixture reaches 65°C to 70°C.
3. Add and dissolve hexachlorophene in the oil mix, then add and disperse the simethicone.

4. Start heating another jacketed tank as 820 mL of purified water is added to it. Add and dissolve glycerin, methyl paraben, and borax as purified water is added and as solution is heated to 65°C to 70°C.
5. Stop mixer, add sodium lauryl sulfate, and continue mixing under vacuum.
6. Reserve 4 mL of solution from step 5 in a separate container to rinse equipment in step 2.
7. While both solutions are at 65°C to 70°C, form the primary emulsion by pumping the aqueous solution from step 5 into the oil mixture from step 3 and QS to 200 mL with vigorous agitation.
8. Homogenize primary emulsion through a Troy Mill, or similar device, into the balance of aqueous solution, mixing continually under vacuum. Rinse pump, mill, tank, and lines with reserved solution from step 6. Note that the primary emulsion should be strained through voile cloth or equivalent before being run through the Troy mill.
9. Cool emulsion to 40°C to 50°C with agitation under vacuum.
10. Dissolve perfume and menthol in the alcohol and add.
11. Using purified water, QS to 1 liter.
12. Continue mixing and cooling to 25°C.
13. Fill.

HYDROCORTISONE ACETATE AND PRAMOXINE HYDROCHLORIDE CREAM AND LOTION

The cream contains hydrocortisone acetate, 1% or 2.5%, and pramoxine HCl, 1%, in a hydrophilic cream base containing stearic acid, cetyl alcohol, Aquaphor, isopropyl palmitate, polyoxyl-40 stearate, propylene glycol, potassium sorbate, sorbic acid, triethanolamine lauryl sulfate, and water. The lotion 2.5% contains hydrocortisone acetate, 2.5%, and pramoxine hydrochloride, 1%, in a hydrophilic lotion base containing stearic acid, cetyl alcohol, forlan-L, glycerin, triethanolamine, polyoxyl 40 stearate, diisopropyl adipate, povidone, silicone, potassium sorbate, sorbic acid, and purified water. Topical corticosteroids are anti-inflammatory and antipruritic agents. Other formulations include cream, which contains hydrocortisone acetate, 1% or 2.5%, and pramoxine HCl, 1%, in a hydrophilic base containing stearic acid, cetyl alcohol, Aquaphor, isopropyl palmitate, polyoxyl 40 stearate, propylene glycol, potassium sorbate, sorbic acid, triethanolamine lauryl sulfate, and water; lotion, which contains hydrocortisone acetate, 1% or 2.5%, and pramoxine HCl, 1%, in a base containing forlan-L, cetyl alcohol, stearic acid, diisopropyl adipate, polyoxyl 40 stearate, silicone, triethanolamine, glycerin, polyvinylpyrrolidone, potassium sorbate, sorbic acid, and water; and ointment, which contains hydrocortisone acetate, 1% or 2.5%, and pramoxine HC1, 1%, in an emollient ointment base containing sorbitan sesquioleate, water, Aquaphor, and white petrolatum.

HYDROCORTISONE ACETATE SUPPOSITORIES

Each Anusol-HC 25 mg suppository contains 25 mg hydrocortisone acetate in a hydrogenated cocoglyceride base.

HYDROCORTISONE AND NITROFURAZONE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.20	1	Nitrofurazone, 4% excess	2.08
1.00	2	Hydrocortisone acetate, 5% excess	10.50
7.20	3	Cetostearyl alcohol	72.00
1.80	4	Cetomacrogol 1000	18.00
6.00	5	Liquid paraffin	60.00
15.00	6	White soft paraffin	150.00
1.00	7	Propylene glycol	10.00
0.020	8	Chlorocresol	0.20
69.00	9	Water purified	690.00

Manufacturing Directions

1. Place items 3, 4, 5 (90%), and 6 in a melting vessel after passing through stainless-steel sieve and heat to melt.
2. In a separate vessel, heat two-thirds of item 9 to 50°C and dissolve item 8 in it. Add to step 1.
3. Add and mix item 1 with item 5 (balance) and add to step 2.
4. Dissolve item 2 in balance of item 9 and a portion of item 5 in a separate vessel and homogenize. Add to step 3 with stirring. Mix for several hours.
5. Fill.

HYDROCORTISONE BUTYRATE CREAM AND OINTMENT

The cream, ointment, and topical solution contain the topical corticosteroid hydrocortisone butyrate. Each gram of cream contains 1 mg hydrocortisone butyrate in a hydrophilic base consisting of cetostearyl alcohol, ceteth-20, mineral oil, white petrolatum, citric acid, sodium citrate, propyl paraben and butylparaben (preservatives), and purified water. Each gram of ointment contains 1 mg of hydrocortisone butyrate in a base consisting of mineral oil and polyethylene.

HYDROCORTISONE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.000	1	Hydrocortisone, micronized (3% excess)	10.30
6.000	2	Propylene glycol	60.00
0.100	3	Chlorocresol	1.00
5.000	4	Mineral oil (liquid paraffin)	50.00
2.000	5	Polyoxyl 20 cetostearyl ether (cetomacrogol 1000)	20.00
8.000	6	Cetostearyl alcohol	80.00
18.000	7	Petrolatum (white soft paraffin)	180.00
0.290	8	Monobasic sodium phosphate	2.90
0.035	9	Propyl paraben	0.35
0.100	10	Methyl paraben	1.00
59.600	11	Purified water	596.00

Manufacturing Directions

1. Load 10 g of item 5 and items 4, 6, and 7 in a fat-melting vessel.
2. Heat to 70°C to 75°C while stirring. Cool down the temperature to 65°C.
3. Maintain temperature at 65°C to 70°C.
4. Heat item 11 to 90°C in mixer. Dissolve items 9 and 10 to a clear solution by stirring. Cool down the temperature to 65°C. Maintain temperature at 65°C to 70°C.
5. Add 10 g of item 5 and items 3 and 8 to the parabens solution to dissolve.
6. Mix for 10 to 15 minutes. Maintain temperature at 65°C to 70°C.
7. Transfer the oil phase to the aqueous phase in a mixer vessel through mesh by vacuum while stirring at manual mode, 10 rpm, temperature 60°C.
8. Homogenize at high speed, temperature 60°C, vacuum 0.4 bar, 10 minutes.
9. Cool down temperature to 45°C. Mix item 1 in 48g of item 2 in a separate container at 45°C using homogenizer to make slurry.
10. Add to the dispersed phase while mixing at 10 rpm and temperature 45°C.
11. Rinse the container with 12 g of item 2 and add to the dispersed phase.
12. Mix and homogenize under vacuum 0.4 bar for 10 minutes, low speed, 10 rpm, temperature 45°C.
13. Cool down the temperature to 30°C while mixing at 10 rpm, auto mode, under vacuum 0.4 bar.

HYDROCORTISONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
70.00	1	Cetyl stearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
120.00	4	Liquid paraffin	120.00
2.00	5	Paraben	2.00
688.00	6	Water	688.00
80.00	7	Propylene glycol	80.00
10.00	8	Hydrocortisone	10.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and the water separately to approximately 80°C.
2. Add the water to the obtained solution of items 1 to 5 with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved, mix with product of step 2, and continue to stir during cooling to room temperature. White cream.

HYDROCORTISONE CREAM

Bill of Materials

Scale (mg/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Hydrocortisone, micronized	10.00
6.00	2	Propylene glycol	60.00
0.10	3	Chlorocresol	1.00
5.00	4	Liquid paraffin	5.00
2.00	5	Cetomacrogol 1000	20.00
8.00	6	Cetostearyl alcohol	80.00
18.00	7	Soft white paraffin	180.00
0.29	8	Sodium phosphate monobasic	2.90
0.035	9	Propyl paraben	0.35
0.10	10	Methyl paraben	1.00
59.60	11	Deionized water	596.00

Manufacturing Directions

1. Load items 4 to 7 in a fat-melting vessel (the oily phase; use only half of item 5) and heat to 70°C to 75°C while stirring.
2. Cool down temperature to 65°C and maintain within the range of 65°C to 70°C.
3. In a Becomix vessel, heat item 11 to 90°C.
4. Add and dissolve items 9 and 10 in step 3. Cool down to 65°C and maintain temperature between 65°C and 70°C.

5. Add item 3, balance of item 5, and item 8 and dissolve by mixing for 10 to 15 minutes at 65°C to 70°C.
6. Transfer the oil phase from step 2 into step 5 through vacuum transfer while stirring at manual 10 rpm and temperature of 60°C.
7. Homogenize at speed II at 60°C and vacuum of 0.4 bar for 10 minutes. Cool down to 45°C.
8. In a separate vessel, place items 1 and 2 at 45°C using Ultra-Turrax homogenizer to make a slurry.
9. Add step 8 into step 7 at 10 rpm and 45°C. Rinse container with item 2 and add to mix for 10 minutes at speed II.
10. Cool down to 30°C while mixing at 10 rpm auto mode and under vacuum of 0.4 bar.
11. Fill appropriate quantity into collapsible tubes.

HYDROCORTISONE CREAM AND OINTMENT

For the 1% cream, the inactive ingredients are aloe vera, benzyl alcohol, ceteareth-20, cetearyl alcohol, cetyl palmitate, glycerin, isopropyl myristate, isostearyl neopentanoate, methyl paraben, and purified water. For the 1% ointment, they are butylparaben, cholesterol, methyl paraben, microcrystalline wax, mineral oil, and white petrolatum. The 0.5% cream includes aloe vera, butylparaben, cetyl palmitate, glyceryl stearate, methyl paraben, polyethylene glycol, stearamido ethyl diethylamine, and purified water. The intensive therapy cream includes cetyl alcohol, citric acid, glyceryl stearate, isopropyl myristate, methyl paraben, polyoxyl 40 stearate, polysorbate 60, propylene glycol, propyl paraben, purified water, sodium citrate, sorbic acid, sorbitan monostearate, stearyl alcohol, and white wax. Another formulation of cream with aloe contains the active ingredient hydrocortisone 1% and the inactive ingredients aloe barbadensis gel, aluminum sulfate, calcium acetate, cetearyl alcohol, glycerin, light mineral oil, maltodextrin, methyl paraben, potato dextrin, propyl paraben, purified water, sodium cetearyl sulfate, sodium lauryl sulfate, white petrolatum, and white wax. Hydrocortisone 0.5% ointment comprises active ingredient hydrocortisone, 0.5%, and inactive ingredients aloe barbadensis extract and white petrolatum. Hydrocortisone 0.5% cream includes aloe barbadensis gel, aluminum sulfate, calcium acetate, cetearyl alcohol, glycerin, light mineral oil, maltodextrin, methyl paraben, potato dextrin, propyl paraben, purified water, sodium cetearyl sulfate, sodium lauryl sulfate, white petrolatum, and white wax.

HYDROCORTISONE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	Hydrocortisone acetate	10.00
100.00	2	Lutrol E 400	100.00
50.00	3	Cremophor RH 40	50.00
5.00	4	Carpopol 940 (Goodrich)	5.00
495.00	5	Water	495.00
QS	6	Preservative	QS
260.00	7	Water	260.00
8.00	8	Triethanolamine	8.00
QS	9	Water	7.20

Manufacturing Directions

1. Suspend item 1 in a mixture of items 2 and 3 at 70°C that contains item 6.
2. Add item 8 and continue to stir until the gel is cooled to room temperature.

HYDROCORTISONE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	Hydrocortisone acetate	10.00
150.00	2	Cremophor A 25	150.00
20.00	3	Cremophor RH 40	20.00
QS	4	Preservative	QS
640.00	5	Water	640.00

Manufacturing Directions

1. Suspend item 1 in the mixture of items 2 and 3 at 70°C.
2. Prepare solution of item 4, heat item 5 to 70°C and add slowly to the hot mixture item 4.
3. Continue to stir until the gel is cool (clear, colorless gel).

HYDROCORTISONE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Hydrocortisone acetate	5.00
60.00	2	Cremophor RH 40	60.00
9.00	3	Triethanolamine	9.00
76.00	4	Water	76.00
600.00	5	Ethanol 96%	600.00
5.00	6	Carbopol 940 (Goodrich)	5.00
245.00	7	Water	245.00

Manufacturing Directions

1. Prepare solution of items 6 and 7 and mix slowly with solution of items 1 to 5.
2. Form a clear, colorless gel.

HYDROCORTISONE OINTMENT

Bill of Materials

Scale (mg/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Hydrocortisone micronized 6% excess	10.60
91.50	2	White soft paraffin	915.00
7.00	3	Liquid paraffin	70.00
0.50	4	Sorbitan sesquioleate (Arlacel 83)	5.00

Manufacturing Directions

1. Charge items 2 and 4 in a melting vessel and melt at 75°C.
2. Transfer to preheated Becomix at 75°C through stainless-steel mesh under 0.4 to 0.6 bar vacuum.
3. Start mixing at 10 rpm manual mode. Cool to 50°C.
4. In a separate vessel, disperse item 1 in item 3, using a spatula, in a water bath maintained at 60°C. Homogenize for 6 minutes using Ultra-Turrax homogenizer.
5. Add to step 3 while mixing.
6. Rinse with item 3 and add and mix.
7. Homogenize dispersion under vacuum at 0.4 to 0.6 bar at 10 rpm.
8. Cool down to 30°C while mixing.
9. Transfer to storage vessel.
10. Fill appropriate quantity at a suitable temperature.

HYDROGEN PEROXIDE AND CARBAMIDE PEROXIDE BLEACHING ORAL DENTIFRICE

Manufacturing Directions

1. Gel composition as weight percent contains sodium fluoride, 0.32 (0.14 w/v fluoride ion); Carbopol 974 P-NF, 1.25; sorbitol (70% soln), 10.00; glycerin, 10.00; carbamide peroxide, 14.00; sodium lauryl sulfate, 1.50; sodium saccharine, 0.20; flavor, 1.25; FD&C yellow 5, 0.15; FD&C red 40, 0.05; water purified, 29.60.
2. Paste composition in weight percent contains sodium fluoride, 0.32; hydrogen peroxide (50% solution), 10.00; Carbopol 943, 0.51; sorbitol (70% soln), 5.18; glycerin, 5.18; sodium lauryl sulfate, 1.50; sodium saccharine, 0.20; flavor, 1.25; polytetrafluoroethylene (Teflon), 52.00; water purified, 29.86.
3. Both phases (steps 1 and 2) are neutralized to a pH of approximately 5.5 and 6.5 with freshly prepared 10% sodium hydroxide and the stripe composition to the main composition is approximately 15:100.
4. The above hydrogen peroxide/carbamide peroxide blend composition is effective and stable when used topically for bleaching tooth surfaces.
5. When extruded from the tube container, the gel composition will be in the form of one or more stripes enclosed in the periphery of the toothpaste surrounded by the paste composition.
6. The gel and the paste composition must be of sufficiently heavy viscosities to prevent migration (bleeding) of the colored gel into the white paste composition.

HYDROGEN PEROXIDE BLEACHING DENTIFRICE PASTE

Manufacturing Directions

1. To 50 g purified water, add 1.5 g of emulsifier Carbopol 934/polyvinylpyrrolidone in 75:25 ratio and dissolve with gradual stirring.
2. To the mixture, add 20 mL of hydrogen peroxide (50%) and mix for additional 5 to 10 minutes.
3. Then adjust the acid composition between pH 5.5 and 6.5 with 10% NaOH.
4. The composition thickens to a gel and set aside.
5. In a separate vessel, add 210 g of methyl methacrylate crosspolymer GMX-0610 obtained from Perspere Corp.
6. In another separate vessel, continuous phase of the invention is prepared comprising the following ingredients: Weight% sodium fluoride, 1.05; propylene glycol, 24.10; sodium lauryl sulfate, 5.04; water, 43.40; vinyl pyrrolidone/acrylic acid*, 1.02; hydroxyethyl cellulose, 2.01; glycerin, 18.85; sodium saccharine, 0.47; flavor, 2.76; sodium benzoate, 0.55; benzoic acid, 0.06; sodium EDTA, 0. 14; sodium hydroxide, (10% solution) 0.55*; dry blend copolymer containing 25% vinyl pyrrolidone and 75% Carbopol.
7. The vinyl pyrrolidone in the mixture delays the solubility of the emulsion further than Carbopol alone.
8. After the bleaching composition (step 1) has been prepared to desired consistency, add 50 g of this composition to 50 g of the water insoluble abrasive suspension (step 2) and disperse the intimate mixture of the two immiscible phases in each other and then, with the aid of the colloidal mill, agitate until extremely fine homogeneous dispersion is obtained.
9. Then add 100 g of the dispersion so obtained to 50 g of the continuous phase (step 3) and mix the two phases in a colloidal mill, and the resultant composition comprises the discontinuous phases (step 1) dispersed homogenously throughout the continuous phase (step 2) and (step 3) of the present invention.
10. The final formulation is as follows expressed as weight in percentage: purified water, 15.75; methyl

methacrylate crosspolymer GMX-0610, 53.71; hydrogen peroxide, 10.00; Carbopol 934, 0.37; hydroxyethyl cellulose, 0.73; sodium fluoride, 0.38 (0.17% F ions); sodium lauryl sulfate, 1.83; propylene glycol, 8.75; glycerin, 6.84; sodium saccharine, 0.17; sodium benzoate, 0.20; benzoic acid, 0.02; sodium EDTA, 0.05; flavor, 1.00; sodium hydroxide (10%) QS pH 6.5, 0.20.

11. Carbopol in this composition sufficiently retards the dissolution of the emulsified hydrogen peroxide to allow the abrasive agent methyl methacrylate crosspolymer GMX-0610 to remove the dental plaque and pellicles from the enamel surface and thus allow the bleaching active hydrogen peroxide to diffuse through the plaque-free enamel with ease.

HYDROGEN PEROXIDE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Liquid paraffin	50.00
10.00	2	White paraffin	100.00
30.00	3	Glycerin	300.00
8.00	4	Cetostearyl alcohol	80.00
0.30	5	Methyl paraben	3.00
3.60	6	Polyoxyethylene sorbitan monostearate	36.00
2.00	7	Glyceryl monostearate	20.00
QS	8	Water purified	QS to 1 kg
8.00	9	Hydrogen peroxide[a]	80.00

[a] Hydrogen peroxide, at different strengths, is used as an anti-infective in the oral cavity or topically for minor wounds.

Manufacturing Directions

1. Preparation of water phase:
   a. Charge purified water, polysorbate 60, and glycerin with agitation in a melting kettle.
   b. Heat the contents to 61°C to 65°C.
   c. Add methyl paraben and mix the composition to dissolve while maintaining temperature.
2. Preparation of oil phase:
   a. In a suitable vessel, place liquid paraffin, cetostearyl alcohol, white petrolatum, glycerol monostearate, and white beeswax and mix continuously while heating to 71°C to 75°C.
3. Mixing of phases:
   a. Transfer the mixture of step 2 to the step 1 kettle, with the water phase maintained under 300-mbar vacuum.
   b. Add hydrogen peroxide and dissolve.
   c. With mixing and keeping the temperature at 61°C to 65°C, draw the oil phase into the water phase.
   d. Mix for 15 minutes with agitation and vacuum at 300 mbar and 61°C to 65°C.
   e. While mixing and under vacuum, allow the mixture to cool gradually to room temperature.
4. Fill in appropriate container.

HYDROPHILIC OINTMENT USP

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.0250	1	Methyl paraben	0.250
0.015	2	Propyl paraben	0.15
1.00	3	Sodium lauryl sulfate	10.00
12.00	4	Propylene glycol	120.00
25.00	5	Stearyl alcohol	250.00
25.00	6	White petrolatum	250.00
37.00	7	Water purified	370.00

Manufacturing Directions

1. Melt the stearyl alcohol and the white petrolatum on a steam bath and warm to approximately 75°C.
2. Dissolve the other ingredients in the purified water and warm to approximately 75°C.
3. Mix all ingredients together and stir until the mixture congeals.

HYDROQUINONE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.50	1	Ascorbyl palmitate	15.00
1.00	2	Tocopherol acetate	10.00
2.00	3	Linoleic acid	20.00
3.00	4	Safflower oil	30.00
4.00	5	Oleyl alcohol	40.00
1.00	6	Jojoba oil	10.00
8.00	7	SDA 40 anhydrous alcohol	80.00
0.50	8	Benzyl alcohol	5.00
0.50	9	Butylated hydroxyanisole	5.00
0.15	10	Sodium bisulfite	1.50
3.00	11	Petrolatum	30.00
5.00	12	PEG-4 diheptanoate	50.00
4.00	13	Glyceryl stearate SE	40.00
1.80	14	Cetyl alcohol	18.00
2.00	15	Polyacrylamide and C13-14 isoparaffin and laureth-7	20.00
0.20	16	Hydroxyethyl cellulose	2.00
QS	17	Water purified	QS
4.00	18	Hydroquinone	40.00
QS	19	Fragrance	QS

Manufacturing Directions

1. Charge linoleic acid, safflower oil, jojoba oil, petrolatum, behenyl erucate, and cetyl alcohol and heat to 70°C.
2. Add tocopherol to above just before adding the rest of the ingredients (see below).
3. Heat item 15 to 70°C and add and dissolve item 18. Add and disperse item 16.
4. In a separate vessel, add item 1 and BHA and heat to 45°C. Dissolve items 5, 7, and 8 and heat to 45°C. Add sodium bisulfite. Stir to dissolve.
5. Add step 2 to step 1 in a homogenizer and then during homogenization add step 4 and also add tocopherol. Homogenize well.
6. Add items 18 and 19 and mix well. Cool to 35°C and fill.

HYDROQUINONE CREAM AND GEL

Each gram of 4% cream contains 40 mg of hydroquinone USP in a vanishing cream base of purified water USP, stearic acid NF, propylene glycol USP, polyoxyl 40 stearate NF, polyoxyethylene (25) propylene glycol stearate, glycerol monostearate, light mineral oil NF, squalane NF, propyl paraben NF, and sodium metabisulfite NF. The sunblocking 4% cream contains 40 mg hydroquinone USP in a tinted sunblocking-cream base of purified water USP, stearic acid NF, talc USP, polyoxyl 40 stearate NF, polyoxyethylene (25) propylene glycol stearate, propylene glycol USP, glycerol monostearate, iron oxides, light mineral oil NF, squalane NF, edetate disodium USP, sodium metabisulfite NF, and potassium sorbate NF. In another formulation, each gram of 4% cream contains 40 mg hydroquinone USP, 80 mg padimate O USP, 30 mg dioxybenzone USP, and 20 mg oxybenzone USP in a vanishing cream base of purified water USP, glycerol monostearate and polyoxyethylene stearate, ootyldodecyl stearoyl stearate, glyceryl dilaurate, quaternium-26, cetearyl alcohol and ceteareth-20, stearyl alcohol NF, propylene glycol USP, diethylaminoethyl stearate, polydimethylsiloxane, polysorbate 80 NF, lactic acid USP, ascorbic acid USP, hydroxyethyl cellulose, quaternium-14 and myristalkonium chloride, edetate disodium USP, and sodium metabisulfite NF. Each gram of 4% gel contains 40 mg hydroquinone USP, 50 mg padimate O USP, and 30 mg dioxybenzone USP in a hydroalcoholic base of alcohol USP, purified water USP, propylene glycol USP, entprol, carbomer 940, edetate disodium USP, and sodium metabisulfite NF.

HYDROQUINONE GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.50	1	Ascorbyl palmitate	15.00
1.00	2	Tocopherol acetate	10.00
4.00	3	Linoleic acid	40.00
17.75	4	Safflower oil	177.50
12.00	5	Oleyl alcohol	120.00
12.00	6	SDA 40 anhydrous alcohol	120.00
0.50	7	Benzyl alcohol	5.00
0.50	8	Butylated hydroxyanisole	5.00
16.60	9	Cyclomethicone	166.00
0.15	10	Sodium bisulfite	1.50
2.00	11	Sorbitol laurate	20.00
5.00	12	C18-C36 acid glyco ester	50.00
5.00	13	Tribehenin	50.00
7.50	14	Petrolatum	75.00
15.00	15	Behenyl erucate	150.00
4.00	16	Hydroquinone	40.00
QS	17	Fragrance	QS

Manufacturing Directions

1. Place ascorbyl palmitate and butylated hydroxyanisole in a suitable vessel and dissolve in oleyl alcohol, SDA anhydrous alcohol, and benzyl alcohol. Heat to 45°C.
1. Add sodium bisulfite and mix while keeping it covered. Keep it aside.
3. In a separate vessel, place items 11 to 16 and heat to 70°C.
4. Cool to 55°C and then add tocopherol acetate, linoleic acid, and safflower oil.
5. Add step 4 into step 2 while mixing to minimize air entrapment.
6. Add item 16 and mix well. Add item 17 and mix well.
7. Cool to 30°C and fill.

IBUPROFEN AND DOMPERIDONE MALEATE SUPPOSITORY

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
22.50	1	Domperidone maleate	22.50
600.00	2	Ibuprofen	600.00
120.00	3	Polysorbate 60	120.00
1800.00	4	Witepsol H 185	1800.00

Manufacturing Directions

1. Disperse the polysorbate in the molten Witepsol; then add the ibuprofen and domperidone.
2. Then inject the mixture into molds to produce a suppository shape and cool to ambient temperature.
3. The suppository contains 600 mg ibuprofen and 22.5 mg domperidone maleate.

IBUPROFEN CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	50.00
24.00	2	Glyceryl stearate and PEG-75 stearate (Gelot 64)	240.00
5.00	3	Labrafil M 1944	50.00
3.00	4	Octyldodecyl myristate	30.00
0.07	5	Sodium methyl paraben	0.70
0.03	6	Sorbic acid	0.30
1.00	7	Stearic acid	10.00
15.00	8	Ethoxydiglycol (Transcutol)	150.00
0.150	9	Lavender oil	1.50
46.75	10	Water purified	467.50

Manufacturing Directions

1. Place item 9 in Becomix and heat to 80°C. Add items 2 to 7 one by one and mix for 20 minutes.
2. Homogenize at speed I under vacuum. Cool to 25°C.
3. In a separate container, place items 1, 8, and 9. Dissolve and filter through polyester filter.
4. Add step 3 into step 2.
5. Mix well and fill.

IBUPROFEN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	50.00
10.00	2	Alcohol	100.00
20.00	3	Propylene glycol	200.00
22.00	4	Lutrol F 127	220.00
QS	5	Preservatives	QS
43.00	6	Water purified	430.00

Manufacturing Directions

1. Heat solution of items 1 to 3 to 70°C to 80°C.
2. Dissolve item 4 and cool.
3. Add solution of item 5.
4. Fill.

IBUPROFEN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	50.00
10.00	2	Alcohol	100.00
10.00	3	Propylene glycol	100.00
15.00	4	Lutrol F 127	150.00
1.00	5	Isopropyl myristate	10.00
QS	6	Preservatives	QS
59.00	7	Water purified	590.00

Manufacturing Directions

The addition of item 5 to the formulation makes the product less sticky and is preferred.

1. Heat solution of items 1 to 3 to 70°C to 80°C.
2. Dissolve items 4 and 5 and cool. Add solution of item 6.
3. Fill.

IBUPROFEN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	51.00
27.35	2	Propylene glycol	273.50
10.00	3	Isopropyl alcohol	100.00
5.00	4	Isopropyl alcohol	50.00
0.10	5	Potassium sorbate	1.00
2.50	6	Carbopol 940	25.00
0.20	7	Sodium methyl paraben	2.00
0.0025	8	FD&C red No. 40	0.025
22.50	9	Ethoxydiglycol (Transcutol)	225.00
0.150	10	Lavender oil	1.50
27.09	11	Water purified	270.90

Manufacturing Directions

1. Place and mix items 2,3, and 11 in a stainless-steel vessel.
1. Add and dissolve item 5 in step 1 by stirring.
2. Add and dissolve item 6 in step 1 after passing through a stainless-steel sieve.
3. Mix and homogenize suspension.

4. Dissolve item 7 in item 11 and add to step 4.
6. Add and dissolve item 8 in item 11 separately and add to step 5.
7. Place item 2 in a separate vessel, dissolve, and add to step 7.
8. Combine items 9 and 10 in a separate container, mix, and transfer to step 8.
9. Mix thoroughly, transfer to storage vessel, and fill.

IBUPROFEN GEL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	50.00
12.00	2	Propylene glycol	120.00
12.00	3	Isopropyl alcohol	120.00
12.00	4	Lutrol F 127	120.00
44.00	5	Water purified	440.00
15.00	6	Nonionic hydrophilic cream: DAB 1996	150.00

IBUPROFEN GEL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Polysorbate 60	50.00
10.00	2	Cetyl stearyl alcohol	100.00
10.00	3	Glycerin	100.00
25.00	4	White petrolatum	250.00
50.00	5	Water purified	500.00

Manufacturing Directions

1. Prepare solution of items 1 to 3 and cool to approximately 8°C. Dissolve item 4 in items 5 and 6.
2. Maintain cool until the air bubbles escape.

IBUPROFEN GEL CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Ibuprofen	50.00
24.00	2	Glyceryl stearate and PEG-75 stearate (Gelot 64)	240.00
5.00	3	Labrafil M 1944	50.00
3.00	4	Octyldodecyl myristate	30.00
0.07	5	Sodium methyl paraben	0.70
0.03	6	Sorbic acid	0.30
1.00	7	Stearic acid	10.00
15.00	8	Ethoxydiglycol (Transcutol)	150.00
0.150	9	Lavender oil	1.50
46.75	10	Water purified	467.50

Manufacturing Directions

1. Place item 9 in Becomix and heat to 80°C. Add items 2 to 7 one by one and mix for 20 minutes.
2. Homogenize at speed I under vacuum. Cool to 25°C.
3. In a separate container, combine items 1, 8, and 9; dissolve and filter through polyester filter.
4. Add step 3 into step 2. Mix well and fill.

IMIQUIMOD CREAM

Each gram of the 5% cream contains 50 mg of imiquimod in an off-white oil-in-water vanishing cream base consisting of isostearic acid, cetyl alcohol, stearyl alcohol, white petrolatum, polysorbate 60, sorbitan monostearate, glycerin, xanthan gum, purified water, benzyl alcohol, methyl paraben, and propyl paraben.

INDOMETHACIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Indomethacin	10.00
10.00	2	Cremophor RH 40	100.00
15.00	3	Lutrol F 127	150.00
74.00	4	Water purified	740.00

Manufacturing Directions

1. Dissolve indomethacin in Cremophor RH 40 at 60°C to 70°C.
2. Add the water slowly (60–70°C), stir the mixture well, and dissolve Lutrol F 127.
3. Cool to room temperature.
4. Fill.

INDOMETHACIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Indomethacin	10.00
20.00	2	Propylene glycol	200.00
20.00	3	Lutrol E 400	200.00
21.00	4	Lutrol F 127	210.00
38.00	5	Water purified	380.00

Manufacturing Directions

1. Heat solution of items 1 to 3 to approximately 70°C.
2. Dissolve item 4 with stirring for approximately 30 minutes.
3. Add and mix item 5 and cool to form a yellow gel.
4. Fill.

INDOMETHACIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Indomethacin	10.00
15.00	2	Alcohol	150.00
22.00	3	Lutrol E 400	220.00
23.00	4	Lutrol F 127	230.00
39.00	5	Water purified	390.00

INDOMETHACIN SUPPOSITORIES

The suppositories for rectal use contain 50 mg of indomethacin and the following inactive ingredients: Butylated hydroxyanisole, butylated hydroxytoluene, edetic acid, glycerin, polyethylene glycol 3350, polyethylene glycol 8000, and sodium chloride.

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Indomethacin	100.00
0.082	2	Butylated hydroxyanisole	0.082
0.082	3	Butylated hydroxytoluene	0.082
0.163	4	Edetic acid	0.163
128.00	5	Glycerin	128.00
128.00	6	Polyethylene glycol 6000	128.00
1630.00	7	Polyethylene glycol 4000	1630.00

Manufacturing Directions

1. Charge the polyethylene glycol 6000, polyethylene glycol 4000 (16.3 kg), and glycerol to the Becomix machine.
2. Heat to 70°C to melt, stir until homogenous, and cool to 60°C to 65°C.
3. Maintain temperature at 60°C to 65°C. Apply a head of nitrogen gas to hopper, then add the parabens to the hopper.
4. Stir until dissolved.
5. Charge indomethacin slowly to hopper while stirring. Stir until completely dissolved. A clear yellow melt is produced.
6. Charge edetic acid to the hopper and stir for 15 minutes to disperse it (material does not dissolve), then cool to 55°C to 60°C.
7. Stir the mixture for 30 minutes, maintaining the temperature at 55°C to 60°C, then commence filling into molds at filling limits 1.581 g to 1.679 g.

INDOMETHACIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
50.00	1	Indomethacin	50.00
8.30 ljg	2	Butyl hydroxytoluene	8.30 mg
141.00	3	Lutrol E 4000	141.00
14.00	4	Lutrol E 6000	14.00
16.30 ljg	5	EDTA	16.30 mg
3.00	6	Water purified	3.00

Manufacturing Directions

1. Prepare solution of items 5 and 6.
2. Mix with the melted mixture of items 1 to 4 and fill into the molds of suppositories. Fill 1.6 g/suppository.

INSECT BITE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
180.00	1	Trilaneth-4 phosphate, glyceryl stearate, and PEG-2 stearate	180.00
20.00	2	Hydrogenated palm/kernel oil PEG-6 esters	20.00
80.00	3	Mineral oil	80.00
0.30	4	Sodium methyl paraben	0.30
0.70	5	Sorbic acid	0.70
646.70	6	Deionized water	646.70
10.00	7	Benzocaine	10.00
10.00	8	Butamben	10.00
2.00	9	Menthol	2.00
0.30	10	Resorcinol	0.30
50.00	11	Ethoxydiglycol	50.00

Manufacturing Directions

1. Dissolve items 7 to 10 in item 11.
2. Mix and heat items 1 to 6 to 75°C.
3. Allow to cool slowly with constant stirring.
4. At 35°C add this to previous mixture.
5. Homogenize if necessary.

KERATOLYTIC CREAM

Bill of Materials

Scale (mg/10 g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax (self-emulsifying wax)	15.00
150.00	2	PPG-2 myristyl ether propionate (Crodamol PMP)	15.00
50.00	3	Sorbitol isostearate	5.00
35.00	4	Safflower oil, super-refined	3.50
20.00	5	Avocado oil, super-refined	2.00
20.00	6	Cetyl palmitate	2.00
50.00	7	Salicylic acid	5.00
1.50	8	Propyl paraben	0.15
1.00	9	Butylated hydroxyanisole	0.10
487.50	10	Deionized water	48.75
10.00	11	Sodium borate	1.00
3.00	12	Methyl paraben	0.30
2.00	13	Imidazolidinyl urea	0.20
20.00	14	Hydrolyzed collagen + hyaluronic acid (Cromoist HTA)	2.00

Manufacturing Directions

1. Dissolve item 7 in item 2 with mixing and heating to 70°C.
2. Add balance of items 1 to 9 and mix with heat to 80°C and mix items 10 to 13 together separately and heat to 80°C.
3. Add this mixture to the first mixture with mixing and cool to 40°C.
4. Add item 14 with mixing and cool to the desired fill temperature.
5. Adjust pH if necessary to 3 to 4 with 10% triethanolamine solution.

KETOCONAZOLE CREAM

The ketoconazole 2% cream contains the broad-spectrum synthetic antifungal agent ketoconazole, 2%, formulated in an aqueous cream vehicle consisting of propylene glycol, stearyl and cetyl alcohols, sorbitan monostearate, polysorbate 60, isopropyl myristate, sodium sulfite anhydrous, polysorbate 80, and purified water.

KETOCONAZOLE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.00	1	Ketoconazole micronized	20.00
20.00	2	Propylene glycol	200.00
8.00	3	Stearyl alcohol	80.00
2.00	4	Cetyl alcohol	20.00
2.00	5	Span 60	20.00
1.50	6	Tween 60	15.00
1.00	7	Isopropyl myristate	10.00
0.20	8	Sodium sulfite anhydrous	2.00
0.10	9	Tween 80	1.00
QS	10	Water purified	QS to 1 kg

Manufacturing Directions

1. Place items 3 to 5 in a steam-jacketed kettle. Heat to 75°C and then begin stirring to ensure complete melting. Maintain temperature, keep stirring.
2. Combine items 2 and 10 in a separate heating vessel and heat to 75°C. Add item 6 and stir, preferably under vacuum of 0.5 bar to avoid frothing and add to step 1, passing through a 100 mesh screen by a pump. Rinse with item 10 and add rinsings.
3. Stir for 1 hour. Cool to 40°C while stirring.
4. In a separate vessel, add 10% of item 10 and item 1 to make a slurry, heat to 40°C, and pass through colloid mill after adding another 10% of item 10.

5. Separately dissolve in 5% of item 10, item 8, and add to step above. Mix for 30 minutes.
6. Pass again through colloid mill and add to step 3, mix, and pass again through colloid mill.
7. Fill in appropriate containers.

KOJIC DIPALMITATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.20	1	Kojic dipalmitate	2.00
6.00	2	Finetex TN	60.00
3.00	3	Bernel FAO	30.00
2.00	4	CarboSil M-5 (fumed silica)	20.00
0.30	5	Microtitanium dioxide	3.00
0.50	6	Lecithin Z-3	5.00
5.00	7	Bentone TN (hectorite compound)	50.00
2.00	8	Mineral oil	20.00
8.00	9	Isopropyl myristate	80.00
0.08	10	Fragrance	0.80

Manufacturing Directions

1. Heat the Kojic dipalmitate, Finetex, FAO, bentone, and isopropyl myristate to 70°C in a jacketed kettle.
2. Transfer to a homogenizer mill.
3. Slowly add, with high-shear agitation, the CarboSil and the microtitanium dioxide.
4. Mill and cool to 45°C to 50°C.
5. Add, with milling, the remaining ingredients except the fragrance and SD alcohol. Cool with milling (and cooling jacket if needed) to 25°C to 30°C.
6. Add, with mixing, the fragrance and alcohol. Package immediately.

LACTIC ACID CREAM

The cream is a formulation of 12% lactic acid neutralized with ammonium hydroxide, as ammonium lactate, with a pH of 4.4 to 5.4. The cream also contains cetyl alcohol, glycerin, glyceryl stearate, laureth-4, light mineral oil, magnesium aluminum silicate, methylcellulose, methyl and propyl parabens, PEG-100 stearate, polyoxyl 40 stearate, propylene glycol, and water. Lactic acid is a racemic mixture of 2-hydroxypropanoic acid.

LANOLIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
60.00	1	Stearic acid	60.00
145.00	2	White petrolatum jelly	145.00
116.00	3	Mineral oil 25 cS	116.00
10.00	4	Lanolin	10.00
20.00	5	Cetearyl alcohol	20.00
QS	6	Deionized water	QS to 1 kg
14.00	7	Triethanolamine 99%	14.00
QS	8	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool, adding triethanolamine at 60°C and perfuming at 40°C to 50°C.
3. This cream serves as a base for drugs as well. Triethanolamine may be omitted, because it gives a higher pH.

LIDOCAINE ADHESIVE SYSTEM GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
8.00	1	Lidocaine base	80.00
5.00	2	Dipropylene glycol	50.00
8.00	3	Lecithin 60% in propylene glycol	80.00
10.00	4	Karaya gum	100.00
2.00	5	Bentonite (Polargel)[a]	20.00
0.10	6	Zinc oxide	1.00
6.00	7	Glycerin	60.00

[a] Optional ingredients.

Manufacturing Directions

1. Blend the lidocaine base, the propylene glycol, lecithin, and glycerin at approximately 70°C to 90°C until the entire drug is dissolved.
2. Cool the solution to 20°C to 35°C before adding the karaya gum and clay.
3. Once the karaya gum and clay are added, apply the final composition to a suitable backing material such as a nonwoven polyester film (e.g., the film sold under the trademark Sontara 8100, manufactured by DuPont de Nemours, EI and Co, Wilmington, DE) and warm to approximately 100°C to accelerate the formation of the gel into its final, finite form.

LIDOCAINE AND PRILOCAINE TOPICAL ADHESIVE SYSTEM CREAM

Lidocaine, 2.5%, and prilocaine, 2.5%, are emulsions in which the oil phase is a eutectic mixture of lidocaine and prilocaine in a ratio of 1:1 by weight. This eutectic mixture has a melting point below room temperature; therefore, both local anesthetics exist as liquid oil rather than as crystals. It is also packaged in the anesthetic disc, which is a single-dose unit contained within an occlusive dressing. The anesthetic disc is composed of a laminate backing, an absorbent cellulose disc, and an adhesive tape ring. The disc contains 1 g of emulsion, the active contact surface being approximately 10 cm^2. The surface area of the entire anesthetic disc is approximately 40 cm^2.

LIDOCAINE AND TRIBENOSIDE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Tribenoside	50.00
2.00	2	Lidocaine hydrochloride	20.00
5.00	3	Cetyl alcohol	50.00
9.00	4	Stearic acid	90.00
10.00	5	Liquid paraffin	100.00
2.00	6	Isopropyl palmitate	20.00
4.45	7	Cetomacrogol 1000	44.50
1.55	8	Crill 3	15.50
0.180	9	Methyl paraben	1.80
0.05	10	Propyl paraben	0.50
6.00	11	Sorbitol 70% solution	60.00
54.80	12	Water purified	548.00

Manufacturing Directions

1. Mix and dissolve items 9 and 10 in portion of item 12 at 90°C.
2. Place item 11 into Becomix and heat to 60°C.
3. Add item 2 to step 3 and dissolve, maintaining temperature at 60°C.
4. Place items 3, 4, 7, and 8 in a melting vessel and melt at 70°C. Cool to 55°C.
5. Add items 1, 5, and 6 to a fat-melting vessel and melt at 60°C.
6. Transfer step 5 to step 4 and mix well. Cool down to 25°C.
7. Transfer to storage vessel and fill.

LIDOCAINE AND TRIBENOSIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Tribenoside	5.00
2.00	2	Lidocaine	2.00
79.20	3	White soft paraffin	79.20
0.30	4	Hard paraffin	0.30
3.50	5	Microcrystalline wax	3.50

Manufacturing Directions

1. Place items 3 to 5 in a melting vessel and heat to 70°C to melt, transfer to Becomix, and maintain 40°C to 45°C.
2. In a portion of the melt above, add items 1 and 2 in a separate vessel and homogenize for 5 minutes. Transfer to step 1 using the melt to rinse and adding rinsings.
3. Allow to cool to 40°C. Transfer to storage vessel and fill.

LIDOCAINE AND TRIBENOSIDE SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
40.00	1	Lidocaine	40.00
400.00	2	Tribenoside	400.00
281.00	3	Witepsol E 85	281.00
1124.60	4	Witepsol W 35	1124.60
4.40	5	Miglyol 812 N	4.40

Manufacturing Directions

1. Load items 3 and 4 in a fat-melting vessel and heat to 50°C. Transfer molten material to Becomix through filter sieves, keeping a small portion on the side.
2. Add items 1, 2, and 4 to product of step 1, rinsing the container of item 2 with the molten portions kept aside in step 1.
3. Mix for 20 minutes at 10 rpm (manual), temperature 50°C, homogenize at speed II for 4 minutes under 0.6 bar vacuum. Check for clarity; if not clear, homogenize again.
4. Set the temperature to 39°C and mix at 10 rpm.
5. Fill 1850 mg in suppository molds.

LIDOCAINE ANORECTAL CREAM

Anorectal cream (lidocaine 5%) is a topical anesthetic cream. Each gram of anorectal cream contains lidocaine 50 mg, benzyl alcohol, carbomer 940, cholesterol, hydrogenated lecithin, isopropyl myristate, polysorbate 80, propylene glycol, triethanolamine, vitamin E acetate, and water.

LIDOCAINE, EUGENOL, AND MENTHOL DENTAL OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
55.2	1	Beeswax white	55.2
150.0	2	Lanolin anhydrous	150.0
723.7	3	Petrolatum	723.7
40.0	4	Lidocaine base	40.0
1.2	5	Saccharin sodium powder	1.2
QS	6	Water purified	3.0 mL
1.0	7	Eugenol	1.0
5.0	8	Menthol	5.0
0.8	9	Oil peppermint	0.8
20.16	10	Metaphen ointment base	20.16

Manufacturing Directions

1. Melt beeswax white, lanolin, and petrolatum white together at 70°C to 80°C and strain into a suitable container.
2. Do not heat above 70°C to 80°C.
3. Melt Lidocaine base and strain into the container while mixing.
4. Dissolve the sodium saccharin in purified water heated to 70°C. Add to the container while mixing. Cool down to 45°C to 50°C while mixing.
5. Liquefy eugenol, menthol, and peppermint oil together by mixing all three items.
6. Warm gently to 35°C to 40°C if necessary. Strain into the container while mixing. Gently melt metaphen ointment base and strain into the container while mixing.
7. Mix thoroughly until congealed.

LIDOCAINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
20.00	1	Lidocaine hydrochloride	2
560.00	2	Water	56
200.00	3	Propylene glycol pharma	20
220.00	4	Lutrol F 127	22

Manufacturing Directions

1. Prepare solution of items 1 to 3 at room temperature, heat to 70°C or cool to 6°C, and slowly add item 4 to the well-stirred solution until it is dissolved.
2. Maintain the temperature until the air bubbles escape. A clear, colorless gel is obtained.

LIDOCAINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Lidocaine hydrochloride	5
500.00	2	Water	50
150.00	3	Propylene glycol pharma	15
100.00	4	Liquid paraffin	10
200.00	5	Lutrol F 127	20

Manufacturing Directions

1. Prepare solution of items 1 to 3 at room temperature and mix with item 4.
2. Heat to 70°C or cool to 6°C and slowly add item 5 to the well-stirred solution until it is dissolved. Maintain cool until the air bubbles escape. A gel cream is obtained.

LIDOCAINE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Lidocaine base	50.00
28.00	2	Polyethylene glycol (PEG-3350)	280.00
40.00	3	Polyethylene glycol (PEG-400)	400.00
25.00	4	Propylene glycol	250.00
2.00	5	Purified water	20.00

Manufacturing Directions

1. Load items 2 and 3 into a fat-melting vessel and heat to 70°C.
2. Cool to 40°C while stirring at slow speed (10–12 rpm).
3. Maintain the temperature between 40°C and 45°C under continuous stirring.
4. Heat 200 g of item 4 to 40°C to 45°C in a stainless-steel container.

5. Dissolve item 1 by stirring with stirrer. Add item 5 with continuous stirring.
6. Maintain the temperature between 40°C and 45°C with continuous stirring.
7. Filter through cloth filter. Transfer the drug solution into mixer previously set with temperature at 40°C to 45°C.
8. Rinse the stainless-steel container with 50 g of item 4.
9. Add the rinsing into mixer. Transfer the molten mass from the fat-melting vessel at 40°C through a stainless-steel filter to the mixer containing the drug solution while mixing at 10 to 12 rpm.
10. When the transfer is over, start the homogenizer at low speed, vacuum 0.6 bar, with stirrer speed at 10 rpm (manual mode).
11. Mix and homogenize for 10 minutes with recirculation at temperature 40°C to 45°C.
12. Stop the homogenizer, set the mixer at temperature 25°C, with stirrer speed at 10 rpm (manual mode).
13. Cool the cream to 25°C. When the ointment is cooled to 25°C, unload the ointment in stainless-steel container.

LINDANE LOTION

Lindane lotion USP, 1%, is an ectoparasiticide and ovicide effective against *Sarcoptes scabiei* (scabies). In addition to the active ingredient, lindane, it contains glycerol monostearate, cetyl alcohol, stearic acid, trolamine, carrageenan, 2-amino-2-methyl-1-propanol, methyl paraben, butyl paraben, perfume, and water to form a nongreasy lotion, which is the highly purified gamma isomer of 1,2,3, 4, 5, 6-hexachlorocyclohexane. Cream spreads easily and can be washed off readily with water. It has a slight acetic odor. Each gram of cream contains mafenide acetate equivalent to 85 mg of the base. The cream vehicle consists of cetyl alcohol, stearyl alcohol, cetyl esters wax, polyoxyl 40 stearate, polyoxyl 8 stearate, glycerin, and water, with methyl paraben, propyl paraben, sodium metabisulfite, and edetate disodium as preservatives.

MAFENIDE ACETATE CREAM

The cream is a soft, white, nonstaining, water-miscible antiinfective cream for topical administration to burn wounds.

MALATHION LOTION

The lotion contains 0.005 g of malathion per milliliter in a vehicle of isopropyl alcohol (78%), terpineol, dipentene, and pine needle oil.

MANDELIC ACID CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.00	1	Polyoxyethylene (40) stearate	20.00
1.00	2	Polyoxyethylene (20) sorbitan monooleate	10.00
5.00	3	Glycerol monostearate	50.00
3.00	4	Beeswax	30.00
2.00	5	Mineral oil	20.00
71.00	6	Water purified	710.00
5.00	7	Propylene glycol	50.00
0.50	8	Carbopol 934	5.00
5.00	9	DL-mandelic acid	50.00
1.7 mL	10	Ammonium hydroxide concentrated	17.00 mL

Manufacturing Directions

1. Heat items 1 to 5 in a stainless-steel container to 80°C.
1. In a separate container, heat items 6 to 8 to 80°C.
2. Add step 2 to step 1 with agitation.
4. After the mixture is congealed, add mandelic acid and ammonium hydroxide.
5. Continue agitation until a uniform consistency is obtained. The pH of the cream is 4.

MEDICATED FOOT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Lanolin	5.00
90.00	2	Stearic acid	90.00
5.00	3	Cetyl alcohol	5.00
40.00	4	Isopropyl palmitate	40.00
10.00	5	Oleyl alcohol	10.00
20.00	6	Mineral oil and lanolin alcohol (liquid base CB3929)	20.00
7.50	7	Oil of wintergreen	7.50
3.00	8	Oil of thyme	3.00
5.00	9	Oil of pine	5.00
5.00	10	Menthol	5.00
5.00	11	Camphor	5.00
QS	12	Deionized water	QS to 1 kg
80.00	13	Glycerin	80.00
18.00	14	Triethanolamine 99%	18.00
QS	15	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately at 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add the triethanolamine drop-wise.
4. Stir to cool.

This product can be used as a disinfecting and soothing cream for the feet.

MENTHOL, METHYL SALICYLATE, AND MENTHOL CREAM AND OINTMENT

This cream and ointment contain menthol in an alcohol base gel, combinations of methyl salicylate, and menthol in cream and ointment bases, as well as a combination of methyl salicylate, menthol, and camphor in a nongreasy cream base; all are suitable for topical application. The varieties include the ointment (methyl salicylate, 18.3%; menthol, 16%), the cream (methyl salicylate, 15%; menthol, 10%), an arthritis formula cream (methyl salicylate, 30%; menthol, 8%), an ultrastrength pain-relieving cream (methyl salicylate, 30%; menthol, 10%; camphor, 4%), vanishing gel (2.5% menthol), and cream (10% menthol) with a fresh scent.

MERCURIC OXIDE OINTMENT

Manufacturing Directions

1. Prepare an oleaginous ointment composition containing yellow mercuric oxide as its active ingredient using the following ingredients in the relative weight percentages indicated: White petrolatum USP, 54.55; mineral oil NF, 31.50; microcrystalline wax, 5.00; stearic acid NF, 0.40; boric acid NF, 2.50; yellow mercuric oxide, 1.05; wheat germ oil, 5.00.
2. Charge the white petrolatum, mineral oil, microcrystalline wax, and stearic acid NF into a suitably sized No. 316 stainless-steel tank with an agitator. Heat the ointment base while mixing to 80°C to 85°C until the base is completely melted.
3. Then filter the ointment base through a 0.22 μm membrane-filtering unit into the main No. 316 stainless-steel mixing tank.
4. When the ointment base has cooled down to approximately 45°C, withdraw a portion of the base into a stainless-steel container.
5. Then add the boric acid (sterilized) to the base and disperse with the aid of a homomixer for 10 minutes.
6. Then add the yellow mercuric oxide (sterilized) to the mixture and disperse for at least 30 minutes until a homogeneous slurry is achieved.
7. Add the slurry to the main ointment batch and mix until the batch is homogeneous and free of lumps. Then cool the batch to approximately 28°C and add the filtered wheat germ oil thereto. Mix the resulting ointment for approximately 15 minutes until homogeneous.

MESALAMINE SUPPOSITORY

The rectal suppository contains 500 mg of mesalamine in a base of hard fat NF.

METHOTREXATE CATAPLASMS

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Diisopropanolamine	50.00
3.00	2	Methotrexate	30.00
10.00	3	Polysodium acrylate	100.00
10.00	4	Gelatin	100.00
30.00	5	Glycerin	300.00
QS	6	Water purified	QS to 1 kg

Manufacturing Directions

1. Mix diisopropanolamine and methotrexate with a portion of purified water.
2. Mix the resulting aqueous mixture with an aqueous solution of the corresponding base components (polysodium acrylate, gelatin, and glycerin) in the remaining portion of the purified water.
3. Cast the mass in step 2 on a release sheet; apply a nonwoven fabric backing to a surface of the mass.

METHOTREXATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Stearic acid	70.00
0.50	2	Behenyl alcohol	5.00
7.00	3	Squalene	70.00
2.00	4	Polyethylene glycol monostearate	20.00
5.00	5	Glyceryl monostearate (self-emulsifying type)	50.00
0.10	6	Butyl hydroxybenzoate	1.00
0.10	7	Methyl hydroxybenzoate	2.00
5.00	8	1,3-Butylene glycol	50.00
3.00	9	Methotrexate	30.00
5.00	10	Diisopropanolamine[a]	50.00
QS	11	Water purified	QS to 1 kg

[a] May be omitted.

Manufacturing Directions

1. Mix diisopropanolamine and methotrexate with a portion of purified water.

2. Mix the resulting aqueous mixture under heat with a liquid mixture of stearic acid, behenyl alcohol, squalane, polyethylene glycol stearate, glyceryl monostearate acid, and butyl parahydroxybenzoate and also with an aqueous mixture of methyl parahydroxybenzoate, 1,3-butylene glycol, and the remaining portion of the purified water.
3. Cool the resulting mass whereby the cream is obtained.

METHOTREXATE GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
92.00	1	Hydrocarbon gel	920.00
5.00	2	Diisopropanolamine	50.00
3.00	3	Methotrexate	30.00

Manufacturing Directions

1. Mix diisopropanolamine and methotrexate and stir with gelated hydrocarbon gel, whereby the ointment is obtained. An alternate formulation mixes methotrexate directly into gel with item 2.

METHOTREXATE LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Stearic acid	10.00
0.50	2	Behenyl alcohol	5.00
1.00	3	Polyoxyethylene sorbitan monooleate	10.00
1.00	4	Glyceryl monostearate (self-emulsifying type)	10.00
0.10	5	Butyl hydroxybenzoate	1.00
0.10	6	Methyl hydroxybenzoate	2.00
5.00	7	1,3-Butylene glycol	50.00
1.00	8	Carboxyvinyl polymer	10.00
3.00	9	Methotrexate	30.00
5.00	10	Diisopropanolamine[a]	50.00
QS	11	Water purified	QS to 1 kg

[a] May be omitted.

Manufacturing Directions

1. Mix diisopropanolamine and methotrexate with a portion of purified water.
2. Mix the resulting aqueous mixture under heat with a liquid mixture of stearic acid, behenyl alcohol, polyoxyethylene sorbitan monostearate, glyceryl monostearate, and butyl parahydroxybenzoate and also with an aqueous mixture of methyl parahydroxybenzoate, 1,3-butylene glycol, and another portion of the purified water.
3. Cool the resulting mixture to room temperature and mix with a water-base dispersion of carboxyvinyl polymer in the remaining water, whereby the lotion is obtained.

METHOXSALEN LOTION

Each milliliter of lotion contains 10 mg methoxsalen in an inert vehicle containing alcohol (71% v/v), propylene glycol, acetone, and purified water.

METHYL SALICYLATE AND MENTHOL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
130.00	1	Methyl salicylate	130.00
60.00	2	Menthol	60.00
20.00	3	Eucalyptus oil	20.00
5.00	4	Lanolin	5.00
1.00	5	Chloroxylenol	1.00
150.00	6	Glyceryl stearate and PEG-100 stearate	150.00
73.00	7	Cetearyl alcohol	73.00
70.00	8	Glyceryl stearate	70.00
QS	9	Deionized water	QS to 1 kg
QS	10	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70˚C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 30˚C.

METHYL SALICYLATE AND MENTHOL LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
110.00	1	Methyl salicylate	110.00
50.00	2	Menthol	50.00
200.00	3	Lutrol E 400	200.00
60.00	4	Cremophor RH 40	60.00
70.00	5	Propylene glycol pharma	70.00
320.00	6	Lutrol F 127	320.00
190.00	7	Water	190.00

Manufacturing Directions

1. Dissolve item 6 in solution of items 1 to 5 and mix with item 7.
2. The clear gel can be diluted with water. Because of the high concentration of the active ingredients and of Lutrol F127, the consistency of the colorless clear gel is extremely hard. By reducing the concentration of the active ingredients, the amount of Lutrol F 127 could be reduced too, and the consistency of the gel will be normal.

METHYL SALICYLATE AND MENTHOL LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Methyl salicylate	150.00
70.00	2	Menthol	70.00
10.00	3	Lanolin oil	10.00
30.00	4	PEG-40 stearate	30.00
20.00	5	Glyceryl stearate	20.00
QS	6	Deionized water	QS
1.50	7	Carbopol 980	1.50
10.00	8	Potassium hydroxide (10% aqueous solution)	10.00
QS	9	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases (except potassium hydroxide) separately to 65°C to 70°C.
2. Add water phase to oil phase while stirring. Add potassium hydroxide solution to neutralize.
3. Stir to cool. Fill at 30°C.

METHYL SALICYLATE AND MENTHOL OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax	150.00
100.00	2	Methyl salicylate	100.00
50.00	3	Menthol	50.00
100.00	4	Mineral oil 70 cS	100.00
QS	5	Deionized water	QS to 1 kg
QS	6	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70˚C.
2. Add water to oil phase while stirring. Stir to cool. Fill at 30°C.

METHYL SALICYLATE CLEAR GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
25.00	1	Hydroxypropyl cellulose	25.00
QS	2	Deionized water	QS to 1 kg
400.00	3	Ethanol DEB 100	400.00
100.00	4	Menthol	100.00
150.00	5	Methyl salicylate	150.00
25.00	6	DEA-oleth-3-phosphate	25.00

Manufacturing Directions

1. Hydrate hydroxypropyl cellulose in water at 60°C to 65°C.
2. Stir to cool. Add ethanol.
3. Add remaining ingredients and stir until homogenous.

METHYL SALICYLATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Tromethamine magnesium aluminum silicate (Veegum PRO)	30.00
30.00	2	Hydroxypropyl cellulose	30.00
350.00	3	Deionized water	350.00
350.00	4	Ethanol	350.00
40.00	5	Cocoyl sarcosine (Vanseal CS)	40.00
25.00	6	Oleath-10	25.00
25.00	7	PEG-25 hydrogenated castor oil	25.00
50.00	8	Isopropyl myristate	50.00
20.00	9	Triethanolamine	20.00
5.00	10	Camphor	5.00
5.00	11	Menthol	5.00
2.00	12	Eucalyptus oil	2.00
65.00	13	Methyl salicylate	65.00
QS	14	Preservatives	QS

Manufacturing Directions

1. Dry blend items 1 and 2 and slowly add them to items 2 and 4, agitating to ensure homogenous dispersion.
2. Combine items 5 to 9 separately and items 10 to 14 separately and mix them together. Add this mixture to the first mix and then mix until uniform.

METHYL SALICYLATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate (Veegum)	1.50
547.00	2	Deionized water	54.70
2.00	3	Simethicone emulsion	0.20
30.00	4	Propylene glycol	3.00
150.00	5	Methyl salicylate	15.00
50.00	6	Menthol	5.00
6.00	7	Polysorbate	0.60
50.00	8	C18-C36 acid	5.00
150.00	9	Glyceryl stearate and PEG-100 stearate	15.00
QS	10	Preservatives	QS

Manufacturing Directions

1. Add item 1 slowly to water and mix vigorously to smooth dispersion.
2. Add items 3 and 4, mixing one at a time. Heat to 75°C to 80°C.
3. Separately mix and heat items 5 to 9 to 75°C to 80°C and add the two parts while mixing. Cool while mixing and add item 10 at 40°C.

METHYL SALICYLATE HEAT RUB LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
25.00	1	PPG-5-Cetech-10-phosphate (Crodafos SG)	25.00
40.00	2	Emulsifying wax, NF (Polawax)	40.00
45.00	3	PPG-1 cetyl ether (Procetyl 10)	45.00
10.00	4	Menthol	10.00
10.00	5	Camphor	10.00
75.00	6	Methyl salicylate	75.00
30.00	7	Glycerin	30.00
10.00	8	Gelatin, NF (Crodyne BY-19)	10.00
3.00	9	Diethanolamine	3.00
742.00	10	Deionized water	742.00
10.00	11	Propylene glycol, diazolidinyl urea, methyl paraben, and propyl paraben	10.00

Manufacturing Directions

1. Premix items 4, 5, and 6 with item 3.
2. When completely dissolved, add items 1 and 2 and heat to 75°C to 80°C.
3. Dissolve item 8 in water and add items 7 and 9.
4. Heat to 80°C. Slowly add this part to previous part using good mechanical mixing.
5. Allow to cool while mixing to 40°C and then add item 11.
6. Cool to 30°C and fill.

METHYL SALICYLATE LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
25.00	1	PPG-5-cetech-10-phosphate (Crodafos SG)	25.00
40.00	2	Emulsifying wax NF (Polawax)	40.00
45.00	3	PPG-1 cetyl ether (Procetyl 10)	45.00
10.00	4	Menthol	10.00
10.00	5	Camphor	10.00
75.00	6	Methyl salicylate	75.00
30.00	7	Glycerin	30.00
10.00	8	Gelatin (Crodyne BY-19)	10.00
3.00	9	Diethanolamine	3.00
742.00	10	Deionized water	742.00
10.00	11	Propylene glycol, diazolidinyl urea, methyl paraben, and propyl paraben	10.00

Manufacturing Directions

1. Premix items 4, 5, and 6 with item 3.
2. When completely dissolved, add items 1 and 2 and heat to 75˚C to 80˚C.
3. Dissolve item 8 in water and add items 7 and 9.
4. Heat to 80˚C. Add this part to previous part slowly, using good mechanical mixing.
5. Allow to cool while mixing to 40˚C and then add item 11. Cool to 30˚C and fill.

METHYL SALICYLATE, THYME, PINE, AND MENTHOL FOOT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Lanolin	5.00
90.00	2	Stearic acid	90.00
5.00	3	Cetyl alcohol	5.00
40.00	4	Isopropyl palmitate	40.00
10.00	5	Oleyl alcohol	10.00
20.00	6	Mineral oil and lanolin alcohol (liquid base CB3929)	20.00
7.50	7	Oil of wintergreen	7.50
3.00	8	Oil of thyme	3.00
5.00	9	Oil of pine	5.00
5.00	10	Menthol	5.00
5.00	11	Camphor	5.00
QS	12	Deionized water	QS to 1 kg
80.00	13	Glycerin	8.00
18.00	14	Triethanolamine 99%	1.80
QS	15	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately at 65°C to 70°C.
2. Add water phase to oil phase while stirring. Add the triethanolamine dropwise.
3. Stir to cool. This product can be used as a disinfectant and soothing cream for the feet.

METOCLOPRAMIDE SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
005.00	1	Metoclopramide (5.0% excess)	5.25
894.75	2	Hard fat (Suppocire AM)	894.75
QS	3	Ethanol 95%[a]	35.00

[a] To be evaporated during manufacturing process.

Manufacturing Directions

1. Load item 2 in the fat-melting vessel and heat to 65°C ± 2°C.
2. Transfer the molten mass in a stainless-steel container through clean polyester cloths.
3. Wash the mixer with purified water (65°C ± 2°C). Set the temperature to 65°C ± 2°C. Transfer the molten mass to the mixer.
4. Heat 32.5 g of item 3 in a stainless-steel container using a water bath at 65°C ± 2°C.
5. Dissolve item 1 in hot item 3 (step 4) by a stirrer. Maintain temperature at 65°C.
6. Add the ethanol–drug solution to the molten suppository base in mixer at 65°C ± 2°C while mixing.
7. Wash the drug container with 2.5 g of hot item 3 (65°C ± 2°C) and add the rinsing to the mixer while mixing.
8. Set the mixer under vacuum with air circulation. Maintain temperature at 50°C ± 2°C, mixing 10 rpm manual mode. Homogenize under vacuum with air circulation at temperature 50°C ± 2°C for 1 hour 45 minutes.
9. After completion of evaporation, continue the mixing of the mass under vacuum 0.4 to 0.6 bar while cooling it to 40°C ± 2°C.
10. Heat the storage vessel; set temperature at 40°C ± 2°C.
11. Transfer the molten mass from the mixer to the storage vessel.
12. Hold the molten mass 40°C ± 2°C while mixing continuously at low speed.
13. Fill 900 mg/suppository.

METOCLOPRAMIDE SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
10.00	1	Metoclopramide (5% excess)	10.50
1339.50	2	Hard fat (Suppocire AM)	1339.50
QS	3	Ethanol 95%[a]	62.00

[a] To be evaporated during manufacturing process.

Manufacturing Directions

1. Load item 2 in the fat-melting vessel and heat to 65°C ± 2°C.
2. Transfer the molten mass in a stainless-steel container through clean polyester cloths.
3. Wash the mixer with purified water (65°C ± 2°C). Set the temperature to 65°C ± 2°C. Transfer the molten mass to the mixer.
4. Heat 57 g of item 3 in a stainless-steel container using a water bath at 65°C ± 2°C.
5. Dissolve item 1 in hot item 3 (step 4) by a stirrer. Maintain temperature at 65°C.
6. Add the ethanol–drug solution to the molten suppository base in the mixer at 65°C ± 2°C while mixing.
7. Wash the drug container with 5 g of hot item 3 (65° C ± 2°C) and add the rinsing to the mixer while mixing.

8. Set the mixer under vacuum with air circulation. Maintain temperature at 50°C ± 2°C, mix, homogenize under vacuum with air circulation at temperature 50°C ± 2°C for 1 hour 45 minutes.
9. After completion of evaporation, continue the mixing of the mass under vacuum 0.4 to 0.6 bar while cooling to 40°C ± 2°C.
10. Heat the storage vessel, set temperature at 40° ± 2°C.
11. Transfer the molten mass from mixer to the storage vessel.
12. Hold the molten mass at 40°C ± 2°C while mixing continuously at low speed.
13. Fill 1350 mg/suppository.

METOCLOPRAMIDE SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
20.00	1	Metoclopramide (5% excess)	21.00
1779.00	2	Hard fat (Suppocire AM)	1779.00
QS	3	Ethanol 95%[a]	90.00

[a] To be evaporated during manufacturing process.

Manufacturing Directions

Fill weight: 1800 mg/suppository.

Precaution: The molten suppository mass must be kept under stirring throughout the storage period, during manufacturing, and during filling to avoid the sedimentation of the active drug.

1. Load item 2 in the fat-melting vessel and heat to 65°C ± 2°C.
2. Transfer the molten mass in a stainless-steel container through clean polyester cloths.
3. Wash the mixer with purified water (65 ± 2°C). Set the temperature to 65°C ± 2°C. Transfer the molten mass to the mixer.
4. Heat 82.5 g of item 3 in a stainless-steel container using a water bath at 65°C ± 2°C.
5. Dissolve item 1 in hot item 3 (step 4) by a stirrer. Maintain temperature at 65°C.
6. Add the ethanol–drug solution to the molten suppository base in the mixer at 65°C ± 2°C while mixing.
7. Wash the drug container with 7.5 g of hot item 3 (65°C ± 2°C) and add the rinsing to the mixer while mixing.
8. Set the mixer under vacuum with air circulation. Maintain temperature at 50°C ± 2°C, homogenize under vacuum with air circulation at temperature 50°C ± 2°C for 1 hour 45 minutes.
9. After completion of evaporation, continue the mixing of the mass under vacuum 0.4 to 0.6 bar while cooling to 40°C ± 2°C.
10. Heat the storage vessel, set temperature at 40°C ± 2°C.
11. Transfer the molten mass from mixer to the storage vessel.
12. Hold the molten mass at 40°C ± 2°C while mixing continuously at low speed.
13. Fill 1800 mg/suppository.

METOCLOPRAMIDE SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
10.00	1	Metoclopramide base 5% excess	10.50
1339.00	2	Suppocire AM	1339.00
QS	3	Alcohol	QS

Manufacturing Directions

1. Add and melt item 2 in a melting vessel at 65°C. Transfer to mixing vessel through filter sieve at 65°C.
2. Heat item 3 to 65°C in a separate vessel and add item 1 to dissolve. Add to step 1.
3. Set mixing vessel under vacuum with air circulation and at 50°C. Homogenize at speed II.
4. Completely evaporate alcohol and continue to mix at 0.4 to 0.6 bar and cool down to 40°C.
5. Fill suppository mold.

METRONIDAZOLE CREAM

The topical cream contains metronidazole USP at a concentration of 7.5 mg/g (0.75%) in an emollient cream consisting of emulsifying wax, sorbitol solution, glycerin, isopropyl palmitate, benzyl alcohol, lactic acid or sodium hydroxide to adjust pH, and purified water. Metronidazole is a member of the imidazole class of antibacterial agents and is classified therapeutically as an antiprotozoal and antibacterial agent. For metronidazole cream, 1%, each gram contains 10 mg micronized metronidazole USP in a base of purified water USP, stearic acid NF, glyceryl monostearate NF, glycerin USP, methyl paraben NF, trolamine NF, and propyl paraben NF.

METRONIDAZOLE GEL SOLUTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Metronidazole	10.00
5.00	2	Hydroxy-beta-cyclodextrin	50.00
0.15	3	Methyl paraben	1.50
0.03	4	Propyl paraben	0.30
5.00	5	Glycerin	50.00
1.50	6	Hydroxyethyl cellulose	15.00
0.05	7	Disodium edetate	0.50
QS	8	Water purified	QS to 1 kg

METRONIDAZOLE LOTION

Metronidazole lotion contains metronidazole USP at a concentration of 7.5 mg/g (0.75% w/w) in a lotion consisting of benzyl alcohol, carbomer 941, cyclomethicone, glycerin, glyceryl stearate, light mineral oil, PEG-100 stearate, polyethylene glycol 400, potassium sorbate, purified water, steareth-21, stearyl alcohol, and sodium hydroxide or lactic acid to adjust pH. Metronidazole is an imidazole and is classified therapeutically as an antiprotozoal and antibacterial agent.

METRONIDAZOLE VAGINAL GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.20	1	Metronidazole	1.20
21.00	2	Lutrol F 127	21.00
40.00	3	Lutrol E 400	40.00
37.80	4	Water purified	37.80

Manufacturing Directions

1. Heat mixture of items 1 to 3 to 70°C to 80°C and slowly add the water heated to approximately 70°C.
2. Maintain the temperature until the air bubbles disappear.

MICONAZOLE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.00	1	Cetostearyl alcohol	70.00
1.50	2	Cremophor A6	15.00
1.50	3	Cremophor A 25	15.00
12.00	4	Liquid paraffin	120.00
0.10	5	Parabens mixture	1.00
67.80	6	Water purified	678.00
8.00	7	Propylene glycol	80.00
2.00	8	Miconazole nitrate	20.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and the water separately to approximately 80°C.
2. Add the water to the obtained solution with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved, mix with step 2, and continue to stir during cooling to room temperature.

MICONAZOLE MOUTH GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.00	1	Miconazole nitrate	20.00
0.10	2	Orange flavor	1.00
20.00	3	Lutrol F 127	200.00
10.00	4	Cremophor RH 40	100.00
10.00	5	Propylene glycol	100.00
5.00	6	Kollidon 90F	50.00
0.30	7	Saccharin sodium	3.00
52.60	8	Water purified	526.00

Manufacturing Directions

1. Dissolve items 1 and 2 in the molten mixture of items 3 and 4.
2. Heat solution of items 6 to 8 to 90°C and mix slowly with step 1.
3. Let cool to room temperature when the air bubbles have escaped.

MICONAZOLE NITRATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
21.00	1	Miconazole nitrate (5% excess)	21.00
200.0	2	Tefose 63	200.0
30.00	3	Labrafil M[a]	30.00
30.00	4	Mineral oil (liquid paraffin)	30.00
0.05	5	Butylated hydroxyanisole	0.05
2.00	6	Benzoic acid	2.00
720.00	7	Purified water	720.00

[a] Synonyms: Labrafil M 1944 CS, oleoyl macrogolglycerides, apricot kernel oil PEG-6 complex.

Manufacturing Directions

1. Melt items 2, 3, and 4 (fatty phase) in fat-melting vessel.
2. Heat to 65°C to 70°C.
3. Disperse items 5 and 1 in the fatty phase while mixing at high speed for 20 minutes.
4. Add item 7 to the mixer and heat to 80°C to 90°C.
5. Dissolve item 6 and cool down to 65°C to 70°C.
6. Transfer the fatty phase to the mixer with vacuum at 0.2 to 0.3 bar.
7. Start cooling down while mixing at 10 rpm and homogenize at high speed for 20 minutes, then cool down to 25°C to 28°C while mixing at a vacuum of 0.2 to 0.3 bar (65–45°C) or 0.5 to 0.7 bar (45–25°C).

MICONAZOLE NITRATE VAGINAL SUPPOSITORIES

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/1000 Ovules (g)
200.00	1	Miconazole nitrate micronized	200.00
1250.00	2	Hard fat (Witepsol H 37)	1250.00
1250.00	3	Hard fat (Witepsol H 35®)	1250.00

Manufacturing Directions

Fill weight: 2700 mg/ovule. The following are additional requirements: All particle sizes must be below 30 gm and 60% to 80% must be less than 20 µm.

Precaution: The molten suppository mass must be kept under stirring throughout the storage period, during the manufacturing, and during filling to avoid the sedimentation of the active drug. Check the molten witepsols for phase separation by draining approximately 18mL to 37 mL of molten witepsols in a glass beaker.

1. Load items 2 and 3 in the fat-melting vessel and heat to 50°C ± 3°C.
2. Check the molten mass for phase separation.
3. Transfer the molten mass to the mixer through filter sieves. Set the temperature at 40°C ± 2°C.
4. Load item 1 to the mixer containing molten Witepsol (items 2 and 3).
5. Carefully mix the powder with the Witepsol melt.
6. Set the mixer at temperature 40°C ± 2°C, speed 10 rpm (manual mode), and mix for 10 minutes.
7. Set the mixer at temperature 40°C ± 2°C, speed 10 rpm (manual mode), vacuum 0.6 bar.
8. Homogenize at low speed while mixing for 5 minutes.
9. Homogenize at high speed while mixing for 3 minutes.
10. Continue mixing of the mass under vacuum in mixer.
11. Heat the storage vessel, set the temperature at 40°C ± 2°C.
12. Transfer the molten mass from the mixer to the storage vessel.
13. Hold the mass at 40°C ± 2°C, while mixing continuously at low speed. Fill.

MICONAZOLE NITRATE VAGINAL SUPPOSITORIES (400 MG)

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/1000 Ovules (g)
400.00	1	Miconazole nitrate micronized	200.00
1150.00	2	Hard fat (Witepsol H 37)	1250.00
1150.00	3	Hard fat (Witepsol H 35)	1250.00

Manufacturing Directions

1. Load items 2 and 3 in the fat-melting vessel and heat to 50°C ± 3°C.
2. Check the molten mass for phase separation.
3. Transfer the molten mass to the mixer through filter sieves. Set the temperature at 40°C ± 2°C.
4. Load item 1 to the mixer containing molten Witepsol (items 2 and 3).
5. Carefully mix the powder with the Witepsol melt.
6. Set the mixer at temperature 40°C ± 2°C, speed 10 rpm (manual mode), and mix for 10 minutes.
7. Set the mixer at temperature 40°C ± 2°C, mix under vacuum 0.6 bar.
8. Homogenize at low speed while mixing for 5 minutes.

9. Homogenize at high speed while mixing for 3 minutes.
10. Continue mixing of the mass under vacuum in mixer.
11. Heat the storage vessel, set the temperature at 40°C ± 2°C.
12. Transfer the molten mass from the mixer to the storage vessel.
13. Hold the mass at 40°C ± 2°C while mixing continuously at low speed.
14. Fill 2700 mg.

MINOXIDIL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20	1	Minoxidil	20
5	2	Carbopol 934	5
5	3	Propylene glycol	5
3	4	Ethanol	3
QS	5	Triethanolamine	QS
2	6	Water	2

Manufacturing Directions

1. Dissolve minoxidil in the mixture of ethanol: propylene glycol:water in 50:30:20 proportion, adjust pH to 7.4 with triethanolamine, and gel the solution by adding 0.5% Carbopol 934 with constant stirring at 900 rpm to 1000 rpm.

MINOXIDIL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20	1	Minoxidil	20
40	2	HPMC	40
5	3	Propylene glycol	5
3	4	Ethanol	3
QS	5	Triethanolamine	QS
2	6	Water	2
40	7	HPC	40

Manufacturing Directions

1. Dissolve minoxidil in the mixture of ethanol: propylene glycol:water in 50:30:20 proportion, adjust pH to 7.4 with triethanolamine, and gel the solution by adding 4% HPMC and 4% HPC with constant stirring at 900 rpm to 1000 rpm.

MINOXIDIL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20	1	Minoxidil	20
60	2	HPMC	60
5	3	Propylene glycol	5
3	4	Ethanol	3
QS	5	Triethanolamine	QS
2	6	Water	2

Manufacturing Directions

1. Dissolve minoxidil in the mixture of ethanol: propylene glycol:water in 50:30:20 proportion, adjust pH to 7.4 with triethanolamine, and gel the solution by adding 6% HPMC with constant stirring at 900 rpm to 1000 rpm.

MINOXIDIL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20	1	Minoxidil	20
80	2	HPC	80
5	3	Propylene glycol	5
3	4	Ethanol	3
QS	5	Triethanolamine	QS
2	6	Water	2

Manufacturing Directions

1. Dissolve minoxidil in the mixture of ethanol: propylene glycol:water in 50:30:20 proportion, adjust pH to 7.4 with triethanolamine, and gel the solution by adding 8% HPC with constant stirring at 900 rpm to 1000 rpm.

MOMETASONE FUROATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.20	1	Mometasone furoate micronized	2.00
40.00	2	Isopropyl alcohol	400.00
0.15	3	Hydroxypropyl cellulose	1.50
0.226	4	Sodium acid phosphate	0.226
30.00	5	Propylene glycol	300.00
QS	6	Water purified	QS to 1 kg
QS	7	Phosphoric acid to adjust pH (10% w/v solution)	QS

Manufacturing Directions

1. Place item 2 in a suitable vessel, add item 1, and mix for 25 minutes to dissolve completely.
2. Add item 3 slowly to step 1 and mix for 15 minutes to disperse evenly.
3. In a separate vessel, dissolve item 4 in a suitable quantity of item 6 and add to step above and mix for 10 minutes. Circulate cold water in the jacket to aid in gel formation.
4. Add item 5 to step above and mix until uniform.
5. Check and adjust the pH to 4.5 ± 0.2 with 10% w/v phosphoric acid solution. Mix the batch for at least 2 hours for pH adjustment and check the final pH.
6. Adjust the volume; pass through a 100 mesh screen.
7. Fill in a suitable container.

MOMETASONE FUROATE LOTION

Each gram of cream, 0.1%, contains 1 mg mometasone furoate in a cream base of hexylene glycol, phosphoric acid, propylene glycol stearate, stearyl alcohol and ceteareth-20, titanium dioxide, aluminum starch ocetenylsuccinate, white wax, white petrolatum, and purified water. Each gram of ointment, 0.1%, contains 1 mg mometasone furoate in an ointment base of hexylene glycol, phosphoric acid, propylene glycol stearate, white wax, white petrolatum, and purified water. Each gram of lotion, 0.1%, contains 1 mg of mometasone furoate in a lotion base of isopropyl alcohol (40%), propylene glycol, hydroxypropyl cellulose, sodium phosphate, and water. It may also contain phosphoric acid and sodium hydroxide used to adjust the pH to approximately 4.5.

MONOBENZONE CREAM

Each gram of benoquin cream contains 200 mg monobenzone USP in a water-washable base consisting of purified water USP, cetyl alcohol NF, propylene glycol USP, sodium lauryl sulfate NF, and white wax NF.

MULTIVITAMIN ORAL GEL VETERINARY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
18,700 IU	1	Vitamin A palmitate 1.7 million IU/g (BASF)	1.10
1.06	2	Vitamin E acetate (BASF)	10.60
0.50	3	Butyl hydroxytoluene	500.00
20.00	4	Cremophor RH 40	20.00
725.00	5	Water	725.00
0.35	6	Thiamine hydrochloride (BASF)	3.55
0.03	7	Riboflavin (BASF)	0.35
0.17	8	Pyridoxine hydrochloride (BASF)	1.77
0.03	9	Cyanocobalamin gelatin coated 1%	0.35
0.35	10	Nicotinamide	3.53
0.03	11	Folic acid	0.35
0.35	12	Dexpanthenol (BASF)	3.53
0.30	13	EDTA sodium	3.00
0.43	14	Ferrous sulfate (7 H2 0)	4.38
0.63	15	Manganese chloride (4 H2 0)	6.38
0.11	16	Potassium iodide	1.15
50.00	17	Kollidon 90 F	50.00
100.00	18	Lutrol F 127	100.00
100.00	19	Lutrol F 127	100.00

Manufacturing Directions

1. Heat mixture of items 1 to 4 to approximately 60°C to obtain a clear solution and slowly add the water (item 5) to the well-stirred solution.
2. Dissolve items 6 to 16 and item 17 separately in this mixed solution at room temperature, cool to approximately 6°C, add item 19, and stir until all Lutrol F 127 is dissolved.
3. Maintain the cool temperature until the air bubbles have escaped.

MULTIVITAMIN ORAL GEL WITH LINOLEIC AND LINOLENIC ACID

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/100 mL (g)
0.050	1	Evening primrose oil (EPO Pure, Prima Rosa/SA)	5.0 mL
0.30	2	Vitamin A palmitate 1.7 million IU/g (BASF)	0.30

0.00150	4	Vitamin D_3 40 million IU/g	150 µg
200.00	5	Cremophor RH 40	20.0
550.00	6	Water	55.0
0.030	7	Thiamine hydrochloride (BASF)	0.03
0.030	8	Riboflavin (BASF)	0.03
0.150	9	Pyridoxine hydrochloride (BASF)	0.15
0.001	10	Cyanocobalamin, crystalline	10 µg
0.001	11	Calcium D-pantothenate (BASF)	0.10
0.005	12	Nicotinamide	0.50
10.00	13	Ascorbic acid, crystalline (BASF)	1.0
140.00	14	Lutrol F 127	14.0
50.00	15	Lutrol F 127	5.0

Manufacturing Directions

1. Prepare mixture of items 1 to 5 and heat to approximately 65°C.
2. Add the warm water (item 6 at 65°C) slowly to the well-stirred mixture as before.
3. Dissolve items 7 to 14 at 20°C to 25°C in this clear solution.
4. Cool the obtained solution to approximately 5°C and dissolve the rest of Lutrol F 127 item 15.
5. Maintain the cool temperature until the air bubbles have escaped.
6. A clear yellow gel was obtained. 5 mL of evening primrose oil epopure contains 3.5 g linoleic acid and 0.45 g gamma-linolenic acid.

MUPIROCIN CALCIUM CREAM

Mupirocin calcium cream 2% contains the dihydrate crystalline calcium hemisalt of the antibiotic mupirocin. Cream is a white cream that contains 2.15% w/w mupirocin calcium (equivalent to 2.0% mupirocin free acid) in an oil-and-water-based emulsion. The inactive ingredients are benzyl alcohol, cetomacrogol 1000, cetyl alcohol, mineral oil, phenoxyethanol, purified water, stearyl alcohol, and xanthan gum.

MUPIROCIN OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.00	1	Mupirocin crystalline USE mupirocin calcium dihydrate equivalent	20.00
1.00	2	Hydrocortisone	10.00
87.30	3	White soft paraffin	873.00
4.85	4	Softisan 649	48.50

Manufacturing Directions

1. Heat appropriate proportions of white soft paraffin and Softisan 649 together to meet at 60°C to 70°C.
2. Mix thoroughly.
3. Allow to cool with stirring to room temperature.
4. Add items 2 and 3 with stirring.
5. Pass ointment through a mill (such as triple roller mill).

MUPIROCIN OINTMENT

Each gram of mupirocin ointment, 2%, contains 20 mg mupirocin in a bland water-miscible ointment base (polyethylene glycol ointment NF) consisting of polyethylene glycol 400 and polyethylene glycol 3350. Mupirocin is a naturally occurring antibiotic. The nasal ointment, 2%, contains the dihydrate crystalline calcium hemisalt of the antibiotic mupirocin. It is a white to off-white ointment that contains 2.15% w/w mupirocin calcium (equivalent to 2% pure mupirocin free acid) in a soft, white ointment base. The inactive ingredients are paraffin and a mixture of glycerin esters (Softisan®).

NAFTIFINE HYDROCHLORIDE CREAM

The cream, 1%, contains the synthetic, broad-spectrum antifungal agent naftifine hydrochloride. It is for topical use only. The active ingredient is naftifine hydrochloride, 1%; the inactive ingredients are benzyl alcohol, cetyl alcohol, cetyl esters wax, isopropyl myristate, polysorbate 60, purified water, sodium hydroxide, sorbitan monostearate, and stearyl alcohol. Hydrochloric acid may be added to adjust pH.

NAFTIFINE HYDROCHLORIDE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
39.00	1	Urea	390.00
0.15	2	Carbopol 940	1.50
5.94	3	Petrolatum	59.40
12.06	4	Mineral oil	120.60
1.875	5	Glyceryl stearate	187.50
0.626	6	Cetyl alcohol	6.26
3.00	7	Propylene glycol	30.00
0.05	8	Xanthan gum	0.50
0.15	9	Trolamine	1.50
1.00	10	Naftifine hydrochloride[a]	10.00

[a] This formulation can serve as a generic formula for topical antifungals.

NANOXYNOL SUPPOSITORY WITH BACTERIAL CULTURE

Bill of Materials

Scale (mg/ suppositoiy)	Item	Material Name	Qty/1000 Suppositories (g)
125.00	1	Benzalkonium chloride or methyl benzethonium chloride	125.00
110.00	2	Imidiazolidinyl urea	110.00
11.00	3	Diazolidinyl urea	11.00
400.00	4	Hydroxypropylmethylcellulose	400.00
200.00	5	Microcrystalline cellulose	200.00
100.00	6	Ascorbic acid	100.00
110.00	7	Nanoxynol 9	110.00
QS	8	Lactic acid for pH adjustment	QS
1 million	9	Encapsulated lactobacilli (bacteria)[a]	1 billion
30.00	10	Magnesium stearate	30.00
30.00	11	Silicon dioxide	30.00
30.00	12	Lactose	30.00
QS	13	Sterile normal saline	QS

[a] Encapsulation methods: Viable lyophilized lactobacilli bacteria that have been lyophilized after the removal of the media are used for encapsulation. The organisms are grown to log phase in nutrient media. The removal of the nutrient media is done by centrifugation at 14,000 *g* at 0°C to 4°C and then washing with sterile, balanced salts and 5% glucose solution at least three times after the initial centrifugation. The bacteria are then "snap frozen" with liquid nitrogen and lyophilized under high vacuum. The freshly obtained, washed, and lyophilized bacteria are suspended in 10 mL of 5% glucose saline solution in such volume so as to obtain a heavy suspension of bacteria that contains between 1 and 10 billion organisms per milliliter at 0°C to 4°C. The suspension of bacteria is rapidly, but gently, stirred while 0.2 mL to 0.4 mL of sodium alginate solution (1.5% weight by volume) is added. The above mixture is then transferred into a 4-L round-bottom flask by using a nitrogen stream through a sheathed 14-gauge needle. The 4-L round-bottom flask was previously washed with a 5% albumin solution and, thereafter, heated for at least 10 hours at 65°C, and the needle and the tubing used in the process have also been treated this way. Thereafter, the above mixture is forced through a 30-gauge multibeveled needle under pressure, using a large syringe and nitrogen stream. Very small droplets are generated at the end of the needle, which are dried by the nitrogen and airstream around the 30-gauge needle, and the droplets are collected in an aqueous solution of 1.3% to 2% calcium chloride, where they gel. Thereafter, they are washed at least three times with 0.08% to 0.13% 2-(N-cyclohexyl-amino) ethanesulfonic acid (CHES) solution and 1.0% to 1.5% calcium chloride solution. The gelled droplets or little spheres are further washed with at least a fivefold excess of the 0.1% CHES 1.1% calcium chloride and normal saline solution. The resultant spheres are then "snap frozen" in liquid nitrogen and then lyophilized. After these steps, the encapsulated organisms can be used in the formulation below.

Manufacturing Directions

1. Add the benzalkonium chloride or methylbenzethonium chloride, imidiazolidinyl urea, and diazolidinyl urea slowly, while thoroughly stirring, to a suspension of hydroxypropylmethylcellulose and microcrystalline cellulose in a sterile normal saline solution (quantity sufficient to make a thick paste) at 35°C to 37°C.
2. Slowly lower the pH to approximately 6.0 to 6.3 with reagent grade lactic acid. (This step binds the antimicrobials to the "cellulose" excipients.)
3. Stir the suspension for 2 hours and then slowly add ascorbic acid that was dissolved in approximately 10 mL to 15 mL sterile saline with gentle stirring.
4. The material is, at this point, a very thick paste. Now add spermicide (Nonoxynol 9) and thoroughly mix. After this step, perform the process at 0°C to 4°C.
5. Then lower the pH of the mixture to 4.3 to 4.5 with reagent-grade lactic acid.
6. Then add freshly obtained encapsulated lactobacilli bacteria to achieve a final concentration of at least 1 million viable bacteria per suppository. (In as much as the goal is to achieve a final concentration of at least 1 million viable bacteria per suppository, a four- to sixfold excess of bacteria are usually added because some loss of the viability occurs during the various mixing processes. This means that approximately 500 mg of the encapsulated bacteria are usually added.) It is important to mix these organisms not only thoroughly to ensure uniformity but also quickly because moisture adversely affects the viability of the organisms.
7. Rapid and thorough mixing can be done, for example, by spreading the paste in a thin layer on a sterile glass plate and then using a replicator to spread the bacteria evenly over the paste.

8. Add magnesium stearate and silicon dioxide, with or without lactose.
9. After the materials are thoroughly mixed at 0°C to 4°C, press them into a mold and dry in a desiccating jar under vacuum at 0°C to 4°C. [Drying at room temperature (25°C) or at higher temperatures decreases the number of viable bacteria.]
10. Then seal the suppositories in air- and moisture-proof containers until used. During storage they should be protected from moisture and extreme temperatures to ensure the viability of the lactobacilli.

NEOMYCIN AND BACITRACIN OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
50,000 IU	1	Bacitracin zinc, 8% excess (69 IU/mg)	7.80
0.50	2	Neomycin sulfate, 8% excess	5.40
85.00	3	White soft paraffin	850.00
5.00	4	Hard paraffin	50.00
10.00	5	Liquid paraffin	100.00
0.10	6	Edetate disodium	1.00

Manufacturing Directions

1. Place items 3 and 4 and half of item 5 in a melting vessel and heat to 100°C; bubble nitrogen gas to remove moisture and reduce oxygen load.
2. In a separate vessel, place balance of item 5 and mix items 1 and 2 to make a paste.
3. Add step 2 to step 1 and mix at 30°C for 2 hours.

NEOMYCIN GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.50	1	Neomycin sulfate	0.50
50.00	2	Propylene glycol	50.00
5.00	3	Parabens	5.00
200.00	4	Lutrol F 127	200.00
745.00	5	Water	745.00

Manufacturing Directions

1. Dissolve the parabens and Lutrol F 127 in water heated to approximately 80°C.
2. Add the propylene glycol and dissolve neomycin sulfate.
3. Either cool to room temperature when the air bubbles escape or dissolve parabens in hot water, cool to 5°C to 10°C, dissolve Lutrol F 127, add propylene glycol, and dissolve neomycin sulfate.
4. Maintain the cool temperature until the air bubbles have escaped.

NEOMYCIN, POLYMYXIN B SULFATE, AND BACITRACIN ZINC OPTHALMIC OINTMENT

The neomycin and polymyxin B sulfates and bacitracin zinc ophthalmic ointment is a sterile antimicrobial ointment for ophthalmic use. Each gram contains neomycin sulfate equivalent to 3.5 mg neomycin base, polymyxin B sulfate equivalent to 10,000 polymyxin B units, bacitracin zinc equivalent to 400 bacitracin units, and white petrolatum, QS.

NICOTINE POLYMER GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
66.70	1	N-30 PVP	667.00
28.60	2	Lauryl methylacrylate	286.00
5.00	3	Sodium stearate	50.00
1.25	4	Hydrogen peroxide (30%)	12.50
QS	5	Water purified	QS to 1 kg

Manufacturing Directions

1. Carry out the emulsion copolymerization of 66.7 parts N-30 vinyl pyrrolidone and 28.6 parts lauryl methacrylate in 200 parts water containing five parts sodium stearate and 1.25 parts 30% hydrogen peroxide as catalyst.
2. Heat the mixture with stirring and carry out the polymerizationat 75°C for approximately 10 hours. The conversion is approximately 92%.
3. Spray dry the emulsion at approximately 210°C to yield a fine off-white powder.
4. The nitrogen content of the copolymer is 8.6%, indicating an item 1 content of 68%.
5. Prepare a gel base by vigorously mixing the following ingredients (in parts by weight): Copolymer prepared above, 6.75; propylene glycol, hydroxypropyl cellulose, isopropyl myristate, stearic acid, cetyl alcohol, fumed silica, 12.45; and ethanol, 80.80. The resultant gel has a viscosity of 12,000 cps and a specific gravity of 0.8.
6. To 40 g of the above gel, add 140 mg nicotine. Mix thoroughly to obtain a composition containing 3.5 mg/g (2.8 mg/mL).

NITROFURAZONE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.20	1	Nitrofurazone, 4% excess	2.08
7.20	2	Cetostearyl alcohol	72.00
1.80	3	Cetomacrogol 1000	18.00
6.00	4	Liquid paraffin	60.00
15.00	5	White soft paraffin	150.00
1.00	6	Propylene glycol	10.00
0.020	7	Chlorocresol	0.20
69.00	8	Water purified	690.00

Manufacturing Directions

1. Place items 3, 4, 5 (90%), and 6 in a melting vessel after passing it through a stainless-steel sieve and heat to melt. In a separate vessel, heat two-thirds of item 9 to 50°C and dissolve item 8 in it. Add to step 1.
2. Add and mix item 1 with item 5 (balance) and add to step 2.
3. Fill.

NONDETERGENT NEUTRAL DRY SKIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
60.00	1	Stearic acid	60.00
145.00	2	White petrolatum jelly	145.00
116.00	3	Mineral oil (25 cS)	116.00
10.00	4	Lanolin	10.00
20.00	5	Cetearyl alcohol	20.00
QS	6	Deionized water	QS to 1 kg
14.00	7	Triethanolamine (99%)	14.00
QS	8	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool, adding triethanolamine at 60°C and perfuming at 40°C to 50°C.
4. This cream serves as a base for drugs as well.
5. Triethanolamine may be omitted, because it gives a higher pH.

NYSTATIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
80.00	1	Cetostearyl alcohol	80.00
20.00	2	Polyoxyl 20 cetostearyl ether (Cetomacrogol 1000)	20.00
80.00	3	Mineral oil (liquid paraffin)	80.00
2.00	4	Methyl paraben	2.00
100,000 IU	5	Nystatin microfine[a] (30% excess) 5420 IU/mg	24.00
1.00	6	Propyl paraben	1.00
100.00	7	Propylene glycol	100.00
4.86	8	Dibasic sodium phosphate	4.86
2.36	9	Monobasic sodium phosphate	2.36
180.00	10	Petrolatum (soft white paraffin)	180.00
506.00	11	Purified water	506.00

[a] Particle size NLT 90% less than 45 pm and 100% less than 80 pm.

Manufacturing Directions

1. Add item 3 to the fat-melting vessel.
2. Heat to 70°C while stirring.
3. Add items 1, 2, and 10 to the fat-melting vessel while stirring.
4. Mix well and maintain the temperature at 65°C to 70°C.
5. Load 466 g of item 11 and item 7 into mixer and heat to 90°C.
6. Add items 4 and 6 to dissolve while stirring on manual mode.
7. Mix for 15 minutes at 10 rpm.
8. Cool to 65°C to 70°C.
9. Add items 8 and 7 to the parabens solution to dissolve.
10. Mix for 5 to 10 minutes at 10 rpm.
11. Maintain temperature at 65°C to 70°C.
12. Take a sample of approximately 0.40 mL from mixer and cool to 25°C.
13. Check the pH (6.3–7.0).
14. Withdraw 80 g of preservative/buffer solution from mixer at 65°C to 70°C in a stainless-steel container.
15. Cool the solution in stainless-steel container to 30°C to 35°C.
16. Disperse item 5 carefully using a spatula.
17. Homogenize using homogenizer to make a smooth dispersion.
18. Transfer the molten fat to the mixer containing the preservative/buffer solution through a stainless-steel sieve by vacuum at 0.6 bar while mixing at 10 rpm in manual mode at a temperature of 65°C.

19. Homogenize and mix the cream for 10 minutes at low speed (10 rpm, manual mode) and vacuum of 0.6 bar.
20. Cool to 40°C ± 5°C.
21. Transfer the 104 g of drug phase (35°C ± 5°C) to the mixer while mixing.
22. Rinse the stainless-steel container of the drug phase with 40 g of item 11 (25–35°C) and transfer to the mixer while mixing.
23. Rinse the homogenizer and the container with item 11 and transfer the rinsing to the mixer.
24. Mix for 5 minutes.
25. Set the mixer at a mixing speed of 10 rpm (manual mode) and the homogenizer at low speed with a vacuum of 6 bar.
26. Mix and homogenize for 15 minutes.
27. Cool to 30°C with mixer speed of 10 rpm and vacuum of 6 bar.
28. Transfer the cream to a stainless-steel drum.

NYSTATIN OINTMENT

Bill of Materials

Scale mg/g	Item	Material Name	Qty/kg (g)
21.05	1	Nystatin microfine[a]	21.05
22.00	2	Cetostearyl alcohol	22.00
8.00	3	Paraffin (hard paraffin)	8.00
100.00	4	Mineral oil (liquid paraffin)	100.00
848.95	5	Petrolatum (white soft paraffin)	848.95

[a] Actual quantity to be calculated as per the actual potency; adjust with soft paraffin. Meets the current USP requirements with following additional requirement: Particle size not less than 90% less than 45 µm, 100% less than 80 µm.

Manufacturing Directions

1. Melt items 2, 3, and 5 at 70°C in a fat-melting vessel.
2. Disperse item 1 in 80 g of item 4 in a separate stainless-steel container by using a spatula.
3. Pass the dispersion through homogenizer twice, then transfer the dispersion to mixer.
4. Rinse the homogenizer and container with 20 g of item 4 and transfer the rinsings to the mixer.
5. Homogenize the dispersion at high speed for 15 minutes. Set the mixer at 40°C to 45°C.
6. Transfer the molten mass from the fat-melting vessel to the mixer at 45°C to 50°C.
7. Mix for 10 minutes at manual mode and 10 minutes at auto mode at 12 rpm and vacuum 0.4 to 0.6 bar.
8. Homogenize at high speed for 10 minutes with recirculation. Mix until the temperature of the ointment reaches 28°C to 30°C.
9. Transfer the ointment to a stainless-steel drum. Keep tightly closed.

NYSTATIN, NEOMYCIN SULFATE, GRAMICIDIN, AND TRIAMCINOLONE ACETONIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
22.96	1	Nystatin microfine[a]	22.96
4.43	2	Neomycin sulfate[b]	4.43
0.28	3	Gramicidin[c]	0.28
1.00	4	Triamcinolone acetonide micronized	1.00
80.00	5	Cetostearyl alcohol	80.00
20.00	6	Polyoxyl 20 cetostearyl ether (cetomacrogol 1000)	20.00
80.00	7	Mineral oil (liquid paraffin)	80.00
2.00	8	Methyl paraben	2.00
1.00	9	Propyl paraben	1.00
60.00	10	Propylene glycol	60.00
4.86	11	Dibasic sodium phosphate	4.86
2.36	12	Monobasic sodium phosphate	2.36
180.00	13	Petrolatum (white soft paraffin)	180.00
531.86	14	Purified water	531.86

[a] Actual quantity to be calculated as per the actual potency. Difference in quantity to be adjusted by purified water. Meets current USP requirements with the following additional requirement: Particle size NLT 90% less than 45 µm, 100% less than 80 µm.

[b] Meets the current USP requirements with the following additional requirement: Particle size 99% less than 20 µm, 75% less than 10 µm.

[c] Meets the current USP requirements with the following additional requirement: Particle size 98% less than 50 µm.

Manufacturing Directions

1. Load items 5, 6, 7, and 13 in a fat-melting vessel and heat to 70°C. Stir to melt. Maintain temperature 70°C to 75°C. Heat 420 g of item 14 to 90°C in mixer.
2. Dissolve items 8 and 9 by stirring. Mix for 15 minutes at 10 to 12 rpm.
3. Cool to 65°C to 70°C. Dissolve items 11 and 12 in 71.86 g of item 14 at 40°C to 45°C in a stainless-steel drum.
4. Check the pH limit 6.3 to 7.0 (at 25°C).
5. Dissolve item 2 into 79.08 g phosphate solution. The solution should be clear.
6. Disperse item 1 in the neomycin–phosphate solution above.
7. Homogenize twice to make a smooth dispersion. The dispersion should be smooth with no lumps.
8. Add 50 g of item 10 in a separate stainless-steel container and heat to 40°C to 45°C, then dissolve item 3 by using homogenizer. The solution should be clear. Disperse item 4 in the clear solution of gramicidin–propylene glycol by using the homogenizer. Homogenize until there are no lumps.

9. Maintain temperature at 40°C to 45°C.
10. Transfer the melt from the step above to the mixer through a stainless-steel sieve while mixing at temperature 65°C.
11. Homogenize at high speed for 10 to 12 minutes at 60°C to 65°C, vacuum 0.6 bar. Scrape the sides and blade. Cool down to 50°C. Transfer the homogenized dispersion from the mixer.
12. Rinse the container with 10 g item 10. Add to the mixer and mix for 10 minutes. Transfer the dispersion to the mixer.
13. Rinse the container with 40 g item 14. Add to the mixer and mix for 10 minutes.
14. Homogenize at high speed for 20 minutes at temperature 45°C, mixer speed 10 to 12 rpm, and vacuum 0.6 bar.
15. Cool down to 25°C to 30°C while mixing. Transfer the cream to stainless-steel drum.

NYSTATIN, NEOMYCIN SULFATE, GRAMICIDIN, AND TRIAMCINOLONE ACETONIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
22.96	1	Nystatin microfine[a]	22.96
4.43	2	Neomycin sulfate[a]	4.43
0.28	3	Gramicidin[a]	0.28
1.00	4	Triamcinolone acetonide micronized	1.00
100.00	5	Mineral oil (liquid paraffin)	100.00
10.00	6	Syncrowax	10.00
861.33	7	Petrolatum (white soft paraffin)	861.33

[a] Actual quantity to be calculated as per the actual potency. Difference in quantity to be adjusted by white soft paraffin.

Manufacturing Directions

1. Melt item 7 at 70°C in a fat-melting vessel.
2. Add item 6 to the melt while mixing. Transfer the melt to the mixer through filters and cool to 40°C while mixing.
3. Add 60 g of item 5 in stainless-steel container and disperse item 1 manually by using a spatula. Homogenize two times with homogenizer (gap setting 1) to make smooth dispersion and then transfer to the mixer.
4. Add 20 g of item 5 in a stainless-steel container and disperse items 2, 3, and 4 by using homogenizer to make a smooth dispersion. Homogenize until no lumps.
5. Transfer the dispersion to the mixer. Rinse the homogenizer and stainless-steel container with 20 g of item 5 and transfer the rinsing to the mixer.
6. Mix for 10 minutes, mixer speed 10 rpm, vacuum 0.4 to 0.6 bar, and set thermostat at 28°C to 30°C. Homogenize at high speed for 20 minutes with recirculation.
7. Mix until the temperature of the ointment reaches 28°C to 30°C.
8. Transfer the ointment to a stainless-steel drum. Keep tightly closed.

OCTYL METLIOXYCINNAINATE, OCTYL SALICYLATE, AND OXYBENZONE GEL

The active ingredients in octyl methoxycinnamate, octyl salicylate, and oxybenzone gel are octyl methoxycinnamate, 7.5%, octyl salicylate, 4%, and oxybenzone, 3%. The inactive ingredients are purified water, C12–15 alkyl benzoate, cetearyl alcohol and ceteareth-20, cetyl alcohol, glyceryl monostearate, propylene glycol, petrolatum, diazolidinyl urea, triethanolamine, disodium ethylene diamine tetraacetate, xanthan gum, acrylates/C10–30 alkyl acrylate crosspolymer, to-copheryl acetate, iodopropynyl butylcarbamate, fragrance, carbomer.

OLIBANUM GUM CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Gum olibanum powder	50.00
26.00	2	Emulsifying ointment	260.00
0.15	3	Methyl paraben	1.50
0.15	4	Propyl paraben	1.50
QS	5	Water purified	QS to 1 kg

Manufacturing Directions

1. Take the naturally occurring gum olibanum exudate in dry state as it is.
2. Powder the lumps (1 kg) in an edge runner mill for 30 minutes.
3. Pass the powdered raw gum olibanum through a 100 mesh sieve.
4. Disperse weighed quantity of the powder in appropriate quantity of water along with methyl paraben (0.15%).
5. Melt weighed quantity of emulsifying ointment in another vessel and disperse propyl paraben (0.15%) in it (oily phase).
6. Heat the dispersion containing gum olibanum powder and methyl parabento the same temperature as that of emulsifying ointment.
7. Add the aqueous dispersion containing gum olibanum powder to the molten emulsifying ointment and stir the mixture continuously at 10,000 rpm for 1 hour using a homogenizer to obtain cream consistency.

OXICONAZOLE CREAM AND LOTION

The cream and lotion formulations contain the antifungal active compound oxiconazole nitrate. Both formulations are for topical dermatologic use only. The cream contains 10 mg oxiconazole per gram of cream in a white to off-white, opaque cream base of purified water USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, and cetyl alcohol NF, with benzoic acid USP 0.2% as a preservative. The lotion contains 10 mg oxiconazole per gram of lotion in a white to off-white, opaque lotion base of purified water USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, and cetyl alcohol NF, with benzoic acid USP, 0.2%, as a preservative.

OXYMORPHONE HYDROCHLORIDE SUPPOSITORIES

The rectal suppository is available in a concentration of 5 mg of oxymorphone hydrochloride in a base consisting of polyethylene glycol 1000 and polyethylene glycol 3350.

OXYTETRACYCLINE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	Oxytetracycline hydrochloride micronized	3.00
93.00	2	White soft paraffin	93.00
3.70	3	Liquid paraffin	3.70
0.02	4	Vitamin E oily	0.02

Manufacturing Directions

1. Charge item 2 in a fat-melting vessel and heat to 75°C.
2. In a separate vessel, add and mix items 1, 3, and 4 and mix manually using a spatula.
3. Transfer step 1 to Becomix through a stainless-steel mesh. Cool down to 50°C.
4. Add step 2 to step 3 and mix for 20 minutes. Check for smoothness of dispersion.
5. Homogenize under 0.4 to 0.6 bar vacuum and cool down to 30°C.
6. Fill.

PANTHENOL AND CHLORHEXIDINE LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	D-Panthenol (adjusted for potency)	26.25
2.50	2	DL-Lactone pure	2.50
1.00	3	Sequestrene disodium	1.00
3.00	4	Chlorhexidine hydrochloride micropowder	3.00
5.00	5	POEG 300-stearate[a]	5.00
50.00	6	Paraffin oil low viscosity	50.00
5.00	7	Polydimethylsiloxane M 350	5.00
3.00	8	Perfume PCV 1155/8	3.00
–	9	Purified water	QS to 1 L

[a] POEG 300 is a mixture of monoesters and diesters of polyoxyethylene glycol 300, with palmitic and stearic acids and free polyoxyethylene glycol 300.

Manufacturing Directions

1. Aqueous phase: Prepare a solution of DL-lactone (previously liquefied at approximately 100°C) in water.
2. Add the DL-lactone solution to the main part of water at 70°C.
3. Incorporate the D-panthenol (previously liquefied at approximately 45°C).
4. Admix and dissolve sequestrene disodium.
5. Fatty phase: Melt at approximately 65°C under stirring POEG 300-stearate, paraffin oil, and polydimethylsiloxane M 350.
6. Emulsion: Add the fatty phase at 65°C to the aqueous phase at approximately 45°C. Cool to approximately 36°C while stirring and homogenizing.
7. Chlorhexidine suspension: Suspend chlorhexidine in water. Lotion: Add the chlorhexidine suspension to the emulsion at approximately 36°C. Stir, homogenize, and deaerate.
8. Finally, add the perfume, homogenize again, and filter.

PANTHENOL OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Protegin X	50.00
18.00	2	Cetyl alcohol	18.00
12.00	3	Stearyl alcohol	12.00
40.00	4	Wax white	40.00
250.00	5	Wool fat deodorized	250.00
130.00	6	Vaseline® (white)	130.00
50.00	7	Almond oil	50.00
150.00	8	Paraffin oil	150.00
50.00	9	D-Panthenol	50.00
250.00	10	Deionized water	250.00

Manufacturing Directions

1. Place wool fat, Vaseline, almond oil, and paraffin in a heating vessel. Heat and melt the fats together at 80°C with stirring to keep the fatty phase at this temperature until further processing.
2. In a separate container, add protegin X, cetyl alcohol, stearyl alcohol, and wax white; melt these fats with stirring at 80°C. Add to above. The final temperature in the melt should be approximately 70°C. Keep this temperature until further processing.
3. Transfer D-panthenol into a suitable container by pouring and then rinsing it with hot deionized water 1.67 kg, continue to mix another 5 minutes, check the final weight, and make up for evaporated water.
4. Place into kettle and heat to 70°C while stirring. Transfer the melted fatty mass under vacuum (–0.3 atm) through the inline sieve (mesh size 0.150 mm). After the addition, evacuate again to –0.3 atm, then stir for another 15 minutes and homogenize for 5 minutes under the same condition.
5. Cool to 30°C. (The cooling should be within 4 hours.) When this temperature is reached, continue stirring until the ointment has reached 24°C to 26°C. Stop cooling. Then evacuate to –0.3 atm and stir for 5 minutes.
6. Transfer the ointment in a mixer and mix for 5 minutes with electric mixture. Fill the ointment.

PANTHENOL LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L Tablets (g)
26.25	1	D-Panthenol (2.5%)[a]	26.25
2.50	2	DL-Lactone (pure)	2.50
1.00	3	Sequestrene disodium	1.00
3.00	4	Chlorhexidine hydrochloride (micropowder)	3.00
5.00	5	POEG 300-stearate[b]	5.00
50.00	6	Paraffin oil (low viscosity)	50.00
5.00	7	Polydimethylsiloxane M 350	5.00
3.00	8	Perfume PCV 1155/8	3.00
–	9	Purified water	QS to 1 L

[a] Based on 100% content; adjust for assay.

[b] POEG 300 is a mixture of monoesters and diesters of polyoxyethylene glycol 300, with palmitic and stearic acids and free polyoxyethylene glycol 300.

Manufacturing Directions

1. Aqueous phase: Prepare a solution of DL-lactone (previously liquefied at approximately 100°C) in water.
2. Add the DL-lactone solution to the main part of water at 70°C.
3. Incorporate the D-panthenol (previously liquefied at approximately 45°C).
4. Admix and dissolve sequestrene disodium.
5. Fatty phase: Melt at approximately 65°C under stirring POEG 300 stearate, paraffin oil, and polydimethylsiloxane M 350.
6. Emulsion: Add the fatty phase at 65°C to the aqueous phase at approximately 45°C.
7. Cool to approximately 36°C while stirring and homogenizing.
8. Chlorhexidine suspension: Suspend chlorhexidine in water.
9. Lotion: Add the chlorhexidine suspension to the emulsion at approximately 36°C.
10. Stir, homogenize, and deaerate.
11. Finally, add the perfume, homogenize again, and filter.

PANTOPRAZOLE–CHOLESTEROL COMPLEX SUPPOSITORY

1. Dissolve 7 g of cholesterol and 5 g of ethocel in 100 mL of dichloromethane.
2. Suspend 5 g of pantoprazole sodium sesquihydrate in the solution.
3. Spray dry the suspension in a laboratory spray dryer.
4. Spray conditions: Drying gas nitrogen, inlet temperature 51°C; pump output 10%. Heat 100 g of cetyl alcohol to 65°C. Spray congealing: Slowly add 50 g of pantoprazole sodium sesquihydrate.
5. Stir the mixture until a homogeneous suspension is obtained and subsequently spray through a nozzle in a spray dryer.
6. A white free-flowing powder is obtained with particle size in the range 10 to 40 microns.
7. By variation of the spraying conditions, larger or smaller particles can be obtained.
8. Fuse 194.7 g of suppository base (Adeps solidus/Neutralis) to give a clear mass at 40°C to 45°C.
9. After cooling the mass to 39°C to 40°C, introduce the preparation obtained above (15.3 g) homogeneously using a stirrer.
10. Cool the suspension obtained to 37°C to 38°C and cast into suppositories of 2.1 g each containing 45.6 mg of pantoprazole sodium sesquihydrate.

PAPAIN CHEWING GUM

Formulation

Gum base, 31.20%; sorbitol, 28.08%; mannitol, 5.23%; papain, 1.00%; acesulfame K, 0.16%; aspartame, 0.16%; menthol powder, 1.00%; liquid flavor, 0.47%; isomalt PF, 11.70%; isomalt DC, 16.00%; anticaking agents (magnesium stearate, talc, or silica gel), 4.00%; flavor, 2.00%.

PAPAIN OINTMENT

The ointment is an enzymatic debriding-healing ointment that contains standardized papain USP (not less than 521,700 USP units per gram of ointment), urea USP, 10%, and chlorophyllin copper complex sodium, 0.5%, in a hydrophilic base composed of purified water USP, propylene glycol USP, white petrolatum USP, stearyl alcohol NF, polyoxyl 40 stearate NF, sorbitan monostearate NF, boric acid NF, chlorobutanol (anhydrous) NF (as a preservative), and sodium borate NF. In another formulation, each gram of enzymatic debriding ointment contains papain (8.3×10^5 USP units of activity) and 100 mg urea in a hydrophilic ointment base composed of purified water, emulsifying wax, glycerin, isopropyl palmitate, potassium phosphate monobasic, fragrance, methyl paraben, and propyl paraben.

PENCICLOVIR CREAM

The cream contains penciclovir, an antiviral agent active against herpes viruses for topical administration as a 1% white cream. Each gram of cream contains 10 mg penciclovir and the following inactive ingredients: Cetomacrogol 1000 BP cetostearyl alcohol, mineral oil, propylene glycol, purified water, and white petrolatum.

PEPPERMINT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
25.00	1	Sorbitol stearate	25.00
15.00	2	Polysorbate 60	15.00
300.00	3	Peppermint oil	300.00
20.00	4	Cetyl alcohol	20.00
40.00	5	Stearic acid	40.00
10.00	6	Triethanolamine 99%	10.00
2.00	7	Carbopol 980	2.00
QS	8	Deionized water	QS
QS	9	Preservative, color	QS

Manufacturing Directions

1. Hydrate Carbopol in water 60°C to 65°C.
2. Add remaining water-phase ingredients.
3. Heat oil and water phases separately to 70°C to 75°C.
4. Add water phase to oil phase while stirring. Stir to cool, neutralizing at 65°C with triethanolamine.

PERMETHRIN CREAM AND LOTION

Permethrin cream, 5%, is a topical scabicidal agent for the treatment of infestation with *S. scabiei* (scabies). It is available in an off-white vanishing cream base. Each gram of cream, 5%, contains permethrin 50 mg (5%) and the inactive ingredients butylated hydroxytoluene, carbomer 934P, coconut oil, glycerin, glyceryl stearate, isopropyl myristate, lanolin alcohols, light mineral oil, polyoxyethylene cetyl ethers, purified water, and sodium hydroxide. Formaldehyde 1 mg (0.1%) is added as a preservative. Each fluid ounce of lotion contains permethrin 280 mg (1%) as its active ingredient and balsam fir Canada, cetyl alcohol, citric acid, FD&C yellow No. 6, fragrance, hydrolyzed animal protein, hydroxyethyl cellulose, polyoxyethylene 10 cetyl ether, propylene glycol, stearalkonium chloride, water, isopropyl alcohol 5.6 g (20%), methyl paraben 56 mg (0.2%), and propyl paraben 22 mg (0.08%) as its inactive ingredients.

PETROLATUM AND LANOLIN OINTMENT

Active ingredients in petrolatum and lanolin ointment are petrolatum, 53.4%, and lanolin, 15.5%. Inactive ingredients

are cod liver oil (contains vitamins A and D), fragrance, light mineral oil, microcrystalline wax, and paraffin.

PHENYLEPHRINE OINTMENT, CREAM, SUPPOSITORIES, AND GEL

The ointment contains petrolatum, 71.9%, mineral oil, 14%, shark liver oil, 3%, and phenylephrine HCl, 0.25%. The cream contains petrolatum, 18%, glycerin, 12%, shark liver oil, 3%, and phenylephrine HCl, 0.25%. The suppositories contain cocoa butter, 85.5%, shark liver oil, 3%, and phenylephrine HCl, 0.25%. The cooling gel contains phenylephrine HCl, 25%, and witch hazel, 50%.

PIROXICAM OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Piroxican	10.00
1.00	2	Carbopol 940	10.00
30.00	3	Alcohol	300.00
30.00	4	Propylene glycol	300.00
1.50	5	Diethanolamine	15.00
0.50	6	Hydroxyethyl cellulose	5.00
0.50	7	PVP K-30	5.00
QS	8	Water purified	QS to 1 kg

Manufacturing Directions

Blend all items uniformly together to produce an ointment formulation having a pH of 7.9. Neutralize the Carbopol using item 5.

PIROXICAM AND DEXPANTHENOL GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.50	1	Piroxicam	5.00
25.00	2	1,2-Propylene glycol	250.00
5.00	3	Alcohol	50.00
0.40	4	Triethanolamine	~4.00
23.00	5	Lutrol F 127	230.00
46.00	6	Water purified	460.00

Manufacturing Directions

1. Prepare the solution of piroxicam in propylene glycol and dexpanthenol at 70°C to 80°C.
   a. Add ethanol and Lutrol F 127.
   b. Stir the highly viscous mixture. Add 50% of the hot water (70°C).
   c. Adjust the pH with triethanolamine to approximately 7.
   d. Add the rest of the water, cool to room temperature when the air bubbles escape, and adjust the pH to approximately 8.

or

1. Dissolve piroxicam in propylene glycol, dexpanthenol, and triethanolamine.
   a. Cool the mixture of Lutrol F 127 and water to approximately 5°C and mix with the piroxicam solution.
   b. Add the ethanol.
   c. Maintain the cool temperature until the air bubbles escape.

POLYMYXIN, BACITRACIN, HYDROCORTISONE, AND ZINC OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
18.00	1	Wax	180.00
69.80	2	Petrolatum	698.00
7.50	3	Polymyxin B sulfate	75.00
0.60	4	Bacitracin	6.00
4.00	5	Zinc oxide	40.00
0.50	6	Hydrocortisone acetate	5.00

Manufacturing Directions

1. Add items 1 and 2 to a melting vessel. Heat to 75°C.
2. Add items 3 to 5 one by one and mix to dissolve.
3. Cool to 40°C and fill.

POVIDONE–IODINE AND LIDOCAINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Lidocaine hydrochloride	10.00
10.00	3	Sodium chloride	10.00
200.00	4	Lutrol F 127	200.00
79.00	5	Sodium hydroxide solution, 1 M	79.00
61.10	6	Water	61.10

Manufacturing Directions

1. Dissolve items 1 to 3 in item 6, cool to approximately 6°C, dissolve item 4, and adjust the pH value (4.5–5.0) with item 5.
2. Maintain the cool temperature until the air bubbles escape. Viscosity (Brookfield, 23°C) 54,000 mPa.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP–iodine 30/06	50.00
10.00	2	Fragrance	10.00
75.00	3	Water	75.00
940.00	4	Syndet base	940.00

Manufacturing Directions

1. Dissolve PVP–iodine in water and mix the solution with the fragrance and the syndet base.
2. Pass the blend four times through a three-roller mill.
3. Blend three times through a plodder with a narrow sieve hole disk.
4. Pass the blended material through a wide sieve hole disk combined with a mouth hole disk.
5. Heat the area of the two disks to 50°C using a heating collar.
6. Cut the bar in pieces on a lab stamper.
7. Composition of the syndet base (in sequence of concentration): Disodium lauryl sulfosuccinate, sodium lauryl sulfate, cetyl stearyl alcohol, paraffin, glycerol stearate, water, titanium dioxide.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP–iodine 30/06	50.00
75.00	2	Water	75.00
241.5	3	Texapon® K 12	241.5
241.5	4	Setacin® F special paste	241.5
241.5	5	Emcol® 4400.1	241.5
145.00	6	Cetyl stearyl alcohol	145.00
96.50	7	Paraffin	96.50
226.00	8	Glycerol monostearate	226.00

Manufacturing Directions

1. Heat mixture of items 3 to 8 to 75°C to 80°C and cool to approximately 50°C stirring well.
2. Add solution of items 1 and 2 and let cool to room temperature, stirring continuously.
3. Pass the blend four times through a three-roller mill and let dry overnight at room temperature.
4. Cut the bar into pieces on a lab stamper.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP–iodine 30/06	50.00
75.00	2	Water	75.00
241.5	3	Texapon® K 12	241.5
241.5	4	Setacin® F special paste	241.5
241.5	5	Emcol® 4400.1	241.5
145.00	6	Cetyl stearyl alcohol	145.00
96.50	7	Paraffin	96.50
226.00	8	Glycerol monostearate	226.00

Manufacturing Directions

1. Heat mixture of items 3 to 8 to 75°C to 80°C and cool to approximately 50°C stirring well.
2. Add solution of item 1 and let cool to room temperature, stirring continuously.
3. Pass the blend four times through a three-roller mill and let dry overnight at room temperature.
4. Cut the bar into pieces on a lab stamper.

POVIDONE–IODINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
241.00	2	Citric acid solution, 0.1 M	241.00
369.00	3	Na_2HPO_4 solution, 0.2 M	369.00
20.00	4	Cremophor A 6	20.00
20.00	5	Cremophor A 25	20.00
100.00	6	Cetyl stearyl alcohol	100.00
100.00	7	Liquid paraffin	100.00
50.00	8	Glycerol	50.00

Manufacturing Directions

1. Prepare a basic cream from the emulsifying agents and the fatty substances, items 4 to 8.
2. Stir in the PVP–iodine dissolved in the buffer solutions made from items 2 and 3.
3. Brown cream having a pH of 4.5 is obtained.

POVIDONE–IODINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
100.00	2	Liquid paraffin	100.00
100.00	3	Vaseline	100.00
50–80	4	Cetyl stearyl alcohol	50–80
20.00	5	Cremophor A 6	20.00
20.00	6	Cremophor A 25	20.00
50.00	7	Propylene glycol pharma	50.00
530–560	8	Water	530–560

Manufacturing Directions

This cream is suitable for veterinary mastitis treatment.

1. Dissolve PVP–iodine in the solvents, items 7 and 8.
2. Mix items 2 to 6 by heating, stir the solution in the previous mixture, and cool by stirring.

POVIDONE–IODINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
359.00	2	Citric acid solution, 0.1 M	359.00
181.00	3	$NA_2HPO_4 \bullet 12H_2O$ solution, 0.2 M	181.00
50.00	4	Lutrol E 400	50.00
100.00	5	Liquid paraffin	100.00
150.00	6	Lutrol F 127	150.00
70.00	7	Lutrol F 127	70.00

Manufacturing Directions

1. Dissolve item 1 in a solution of items 2 to 4, mix with item 5, and dissolve item 6 at approximately 20°C.
2. Cool to 5°C to 8°C and dissolve item 7. Maintain cool until all air bubbles have disappeared (brown turbid gel).

POVIDONE–IODINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
241.00	2	Citric acid (0.1-M solution)	241.00
369.00	3	Na2HPO4 (0.2-M solution)	369.00
20.00	4	Cremophor A 6	20.00
20.00	5	Cremophor A 25	20.00
100.00	6	Cetyl stearyl alcohol	100.00
100.00	7	Liquid paraffin	100.00
50.00	8	Glycerol	50.00

Manufacturing Directions

1. Prepare a basic cream from the emulsifying agents and the fatty substances (items 4–8).
2. Stir in the PVP–iodine dissolved in the buffer solutions made from items 2 and 3.
3. A brown cream having a pH of 4.5 is obtained.

POVIDONE–IODINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Sodium chloride	10.00
200.00	3	Lutrol F 127	200.00
79.00	4	Sodium hydroxide solution, 1 M	79.00
610.00	5	Water	610.00

Manufacturing Directions

1. Dissolve items 1 and 2 in item 5 and cool to approximately 6°C.
2. Dissolve Lutrol F 127 and item 2 and adjust the pH value with item 4.
3. Maintain cool until all air bubbles have escaped. Viscosity 61,000 mPa to 54,000 mPa (Brookfield, 23°C); pH value (20% in water) 2.2 to 4.6.

POVIDONE–IODINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
600.00	2	Lutrol E 400	600.00
46.00	3	Sodium hydroxide, 1 M solution	46.00
4.00	4	Water	4.00
250.00	5	Lutrol E 4000	250.00

Manufacturing Directions

1. Prepare solution of items 1 to 4, heat to approximately 60°C, incorporate item 6, stir very well, and cool to room temperature.
2. A transparent ointment like a gel having a pH of 4 is achieved, miscible and washable with water.

POVIDONE–IODINE GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
359.00	2	Citric acid (0.1-M solution)	359.00
181.00	3	$NA_2HPO_4 \cdot 12H_2O$ (0.2-M solution)	181.00
50.00	4	Lutrol E 400	50.00
100.00	5	Liquid paraffin	100.00
150.00	6	Lutrol F 127	150.00
70.00	7	Lutrol F 127	70.00

Manufacturing Directions

1. Dissolve item 1 in solution of items 2 to 4, mix with item 5, and dissolve item 6 at approximately 20°C.
2. Cool to 5°C to 8°C and dissolve item 7.
3. Maintain cool temperature until all air bubbles have disappeared.
4. A brown, turbid gel is obtained.

POVIDONE–IODINE GELS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Sodium chloride	10.00
200.00	3	Lutrol F 127	200.00
79.00	4	Sodium hydroxide (1-M solution)	79.00
610.00	5	Water	610.00

Manufacturing Directions

1. Dissolve items 1 and 2 in item 5 and cool to approximately 6°C.
2. Dissolve Lutrol F 127 and item 2 and adjust the pH value with item 4.
3. Maintain cool until all air bubbles escape.
4. Viscosity (Brookfield, 23°C) is 61,000 mPa to 54,000 mPa; pH value (20% in water) is 2.2 to 4.6.

POVIDONE–IODINE GLUCOSE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	PVP–iodine 30/06, with excess	26.00
45.00	2	Ethanol (96%)	45.00
849.00	3	Glucose	849.00
34.00	4	Lutrol E 4000	34.00
6.00	5	Glycerol	6.00
6.00	6	Water	6.00

Manufacturing Directions

1. Dissolve Lutrol E 4000 in the hot mixture of glycerol and water and add the glucose warmed to 60°C to 80°C.
2. Incorporate item 4 to obtain a brown, viscous, and turbid paste.

POVIDONE–IODINE GLUCOSE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	PVP–iodine 30/06, with excess	26.00
45.00	2	Ethanol 96%	45.00
849.00	3	Glucose	849.00
34.00	4	Lutrol E 4000	34.00
6.00	5	Glycerol	6.00
6.00	6	Water	6.00

Manufacturing Directions

1. Dissolve Lutrol E 4000 in the hot mixture of glycerol and water and add the glucose warmed to 60°C to 80°C.
2. Incorporate solution in the obtained paste (brown viscous and turbid paste).

POVIDONE–IODINE MASTITIS CREAM FOR CATTLE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
100.00	2	Liquid paraffin	100.00
100.00	3	Vaseline	100.00
50–80	4	Cetyl stearyl alcohol	50–80
20.00	5	Cremophor A 6	20.00
20.00	6	Cremophor A 25	20.00
50.00	7	Propylene glycol	50.00
QS	8	Water	530–560

Manufacturing Directions

1. Dissolve PVP–iodine in the solvents (items 7 and 8).
2. Mix items 2 to 6 by heating, stir the solution in the previous mixture, and cool by stirring.

POVIDONE–IODINE SOFT GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	PVP–iodine 30/06	10.00
25.00	2	Natrosol® HR 250	25.00
QS	3	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve PVP–iodine and Natrosol HR 250 in the water and stir well to produce a clear, brown gel.
2. Viscosity (Brookfield, 23°C) is 31,500 mPa.

POVIDONE–IODINE TRANSPARENT OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
600.00	2	Lutrol E 400	600.00
46.00	3	Sodium hydroxide (1-M solution)	46.00
4.00	4	Water	4.00
250.00	5	Lutrol E 4000	250.00

Manufacturing Directions

1. Prepare solution of items 1 to 4, heat to approximately 60° C, incorporate item 6 (stirring very well), and cool to room temperature.
2. The transparent ointment, similar to a gel, has a pH of 4 and is miscible and washable with water.

POVIDONE–IODINE VAGINAL OVULE

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/1000 Ovules (g)
100.00	1	PVP–iodine 30/06	5.00
200.00	2	Lutrol E 400	10.00
170.00	3	Lutrol E 4000	85.00

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating.
2. Stir in the micronized PVP–iodine product in small portions into the melt.
3. After a uniform suspension has been obtained, pour it into polyethylene molds.
4. The homogeneous brown-colored ovule has a weight of 2 g.

POVIDONE–IODINE VAGINAL OVULE

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/kg (g)
200.00	1	PVP–iodine 30/06	200.00
100.00	2	Lutrol E 400	100.00
100.00	3	Lutrol E 1500	100.00
700.00	4	Lutrol E 4000	700.00

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating.
2. Stir in the micronized PVP–iodine product in small portions into the melt.
3. After a uniform suspension has been obtained, pour it into polyethylene molds.
4. The homogeneous brown-colored ovule has a weight of 2 g.

POVIDONE–IODINE VAGINAL OVULES

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/1000 Ovules (g)
100.00	1	PVP–iodine 30/06 M 10	5
200.00	2	Lutrol E 400	10
170.00	3	Lutrol E 4000	85

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating. Stir the micronized PVP–iodine product in small portions into the melt.
2. After a uniform suspension has been obtained, pour it into polyethylene molds. The result is a homogeneous brown-colored ovule having a weight of 2 g.

POVIDONE–IODINE VAGINAL OVULES

Bill of Materials

Scale (mg/ovule)	Item	Material Name	Qty/kg (g)
200.00	1	PVP–iodine 30/06 M 10	200.00
100.00	2	Lutrol E 400	100.00
100.00	3	Lutrol E 1500	100.00
700.00	4	Lutrol E 4000	700.00

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating. Stir the micronized PVP–iodine product in small portions into the melt.
2. After a uniform suspension has been obtained, pour it into polyethylene mold. The result is a homogeneous brown-colored ovula having a weight of 2 g.

PRAMOXINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Cetyl alcohol[a]	150.00
50.00	2	Cetyl esters wax[a]	50.00
0.72 mL	3	Water purified	720 mL
1.80	4	Methyl paraben	1.80
0.20	5	Propyl paraben	0.20
20.00	6	Sodium lauryl sulfate	20.00
50.00	7	Glycerin	50.00
10.00	8	Pramoxine hydrochloride	10.00

[a] Beeswax 75.00 mg/g can be added and adjusted with items 1 and 2.

Manufacturing Directions

1. Phase A: Add the cetyl alcohol (item 1) and the cetyl esters wax (item 2) to a suitable jacketed stainless-steel tank fitted with efficient agitation. Heat to 60°C to 65°C and mix until materials are melted and phase is uniform.
2. Preheat a suitable jacketed stainless-steel batch tank to 60°C to 65°C. Strain phase A (step 1) into the batch tank, maintaining temperature at 60°C to 65°C and gentle agitation.
3. Phase B: Charge 530 mL of purified water (item 3) into a suitable jacketed stainless-steel tank fitted with a high-speed mixer. Adjust the water temperature to 80°C to 90°C and add methyl paraben (item 4) and propyl paraben (item 5). Stir until dissolved, ensuring that no solids are entrained in the bottom valve. Commence cooling to 60°C to 65°C.
4. Add the sodium lauryl sulfate (item 6) with care and stir to dissolve.
5. Add the glycerin (item 7) and mix until uniform. *Caution*: Do not create excessive foam.
6. Cool to 60°C to 65°C.
7. Strain phase A and sweep mix. Rinse through with 12 mL of purified water.
8. Phase C: In a suitable jacketed stainless-steel tank fitted with high-speed agitation, place 166 mL of purified water and raise the temperature to 60°C to 65°C. Add the pramoxine hydrochloride (item 8) and mix until dissolved. Strain the solution via a 100- to 150-gm aperture mesh into the mass from step

above. Rinse through with 12 mL of purified water. Reduce agitation rate to prevent air entrainment and commence cooling to 32°C to 36°C. Please note that you should maintain cooling water at 10° C below batch temperature until 45°C, switching then to full cooling.

9. Fill.

PRAMOXINE HYDROCHLORIDE AND ZINC ACETATE LOTION AND OINTMENT

The lotion contains pramoxine hydrochloride, 1%, and zinc acetate, 0.1%, and inactive ingredients alcohol USP, camphor, citric acid, diazolidinyl urea, fragrance, glycerin, hydroxypropylmethylcellulose, methyl paraben, oil of lavender, oil of rosemary, polysorbate 40, propylene glycol, propyl paraben, purified water, and sodium citrate. The ointment contains active ingredients pramoxine HCl, 1%, zinc oxide, 12.5%, and mineral oil as well as benzyl benzoate, calcium phosphate dibasic, cocoa butter, glyceryl monooleate, glyceryl monostearate, kaolin, peruvian balsam, and polyethylene wax.

PRAMOXINE SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
1782.00	1	Witepsol H 15®	1782.00
18.00	2	Pramoxine hydrochloride	18.00

Manufacturing Directions

1. Conventional method:
   a. In a suitable jacketed stainless-steel tank, premelt the Witepsol H 15 at 35°C to 45°C.
   b. Transfer 200 g of premelted Witepsol H 15 from step 1 into a suitable premix tank fitted with an efficient agitator. Slowly add the pramoxine and mix for 15 minutes.
   c. Run the premix through a suitable colloid mill into a jacketed stainless-steel batching tank fitted with a suitable homogenizer. Maintain the temperature at 40°C.
   d. Flush the premix tank, lines, and colloid mill with 50 g of premelted Witepsol H 15 from step 1 into the batching tank. Homogenize the contents of the batch tank at high speed for 15 minutes.
   e. Add the balance of the premelted Witepsol H 15 from step 1 to the contents of the batching tank. Homogenize for 15 minutes, then cool with mixing to 27°C to 38°C.
   f. Commence batch recirculation through a 150-gm aperture screen. Maintain until the batch is filled. Fill 1.8 g/suppository.
2. CTurbomixer/emulsifier method:
   a. In a suitable jacketed stainless-steel tank fitted with a turbomixer/emulsifier, premelt the Witepsol H 15 at 35°C to 45°C.
   b. After melting, adjust the mixer/emulsifier in a batching tank containing the premelted mass to maximum speed and slowly add the pramoxine and mix.
   c. Homogenize the contents of the batching tank at 38°C with mixer at high speed. Then cool to 35°C to 36°C, always maintaining the whole mass under agitation.
   d. Filter the mass through a 150-gm screen and maintain the blending until the batch is filled.
3. Fill 1.8 g/suppository.

PRAMOXINE SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
1781.00	1	Witepsol W 32	1781.00
17.10	2	Pramoxine base	17.10
1.01	3	Pramoxine hydrochloride	1.01

Manufacturing Directions

This formula is less irritating and preferred.

1. In a suitable stainless-steel tank fitted with an efficient agitator, melt Witepsol W 32 (No. 3) at approximately 45°C.
2. Activate mixer and maintain temperature of 40°C to 50°C.
3. Weigh pramoxine base into a separate suitable stainless-steel container.
4. Slowly add pramoxine hydrochloride to step 3 and premix using homomixer or similar. Take precaution to minimize spread of powder to adjacent areas.
5. Continue to mix for 15 minutes. Make certain that pramoxine hydrochloride is completely dispersed and the mixture is free of lumps.
6. Verify that Witepsol W 32 from step 2 is completely melted and is less than 50°C, then add the premix to it from step 5.
7. Continue mixing at least 15 minutes while maintaining temperature less than 50°C.
8. Commence batch recirculation through a 150-gm aperture stainless-steel screen. Maintain until batch is filled.

9. Cool batch slowly, approximately 3°C per hour, until it reaches 31°C.
10. Maintain product temperature at 31°C to 33.5°C with constant recirculation or mixing throughout filling operation. Adjust mixing as necessary to prevent aeration of the product.

PRANOPROFEN OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Pranoprofen	10.00
2.00	2	Triisopropanolamine	20.00
5.00	3	Carboxyvinyl polymer solution (Hiviswako 104)	50.00
52.00	4	Alcohol	520.00
QS	5	Water purified	QS to 1 kg

Manufacturing Directions

1. To 52 g of ethanol add 1 g of pranoprofen and 2 g of triisopropanolamine. To the mixture add 30 g of a 5% carboxyvinyl polymer solution and 15 g of purified water.
2. The pH of ointment thus obtained is 6.6, and the viscosity, which is measured at 20°C and 20 rpm, is 460 poises.

PREDNICARBATE EMOLLIENT CREAM

Prednicarbate emollient cream, 0.1%, contains prednicarbate. Each gram of emollient cream, 0.1%, contains 1 mg of prednicarbate in a base consisting of white petrolatum USP, purified water USP, isopropyl myristate NF, lanolin alcohols NF, mineral oil USP, cetostearyl alcohol NF, aluminum stearate, edetate disodium USP, lactic acid USP, and magnesium stearate DAB 9.

PROCHLORPERAZINE SUPPOSITORIES

Prochlorperazine suppositories contain prochlorperazine base. Each suppository contains 2.5, 5, or 25 mg of prochlorperazine with glycerin, glyceryl monopalmitate, glyceryl monostearate, hydrogenated coconut oil fatty acids, and hydrogenated palm kernel oil fatty acids.

PROGESTERONE GEL

Progesterone gel is a bioadhesive vaginal gel containing micronized progesterone in an emulsion system, which is contained in single-use, one-piece polyethylene vaginal applicators. The carrier vehicle is an oil-in-water emulsion containing the water-swellable, but insoluble polymer, polycar-bophil. The progesterone is partially soluble in both the oil and the water phases of the vehicle, with the majority of the progesterone existing as a suspension. The active ingredient, progesterone, is present in either a 4% or an 8% concentration (w/w). Each applicator delivers 1.125 g of gel containing either 45 mg (4% gel) or 90 mg (8% gel) of progesterone in a base containing glycerin, mineral oil, polycarbophil, carbomer 934P, hydrogenated palm oil glyceride, sorbic acid, sodium hydroxide, and purified water.

PROMETHAZINE HYDROCHLORIDE SUPPOSITORIES

Each rectal suppository contains 12.5, 25, or 50 mg promethazine hydrochloride with ascorbyl palmitate, silicon dioxide, white wax, and cocoa butter.

PROMETHAZINE SUPPOSITORY

Each rectal suppository contains 12.5, 25, or 50 mg promethazine hydrochloride with ascorbyl palmitate, silicon dioxide, white wax, and cocoa butter. Promethazine hydrochloride is a racemic compound; the empirical formula is $C_{17}H_{20}N_2S.HCl$ and its molecular weight is 320.88. Phenergan suppositories are for rectal administration only.

PSORIASIS CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Lanolin alcohol	40.00
50.00	2	White petroleum jelly	50.00
120.00	3	Paraffin wax 140F	120.00
300.00	4	Mineral oil (70 cS)	300.00
20.00	5	Coal tar	20.00
2.50	6	Allantoin	2.50
QS	7	Deionized water	QS to 1 kg
QS	8	Preservative	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Slowly add water phase in increments to the oil phase.
3. Allow each addition time to be fully incorporated.
4. Stir to cool.
5. Fill just above melting point.
6. Further homogenization may improve stability prior to filling.

PSORIASIS CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
160.00	1	Stearic acid	16.00
60.00	2	Oleyl alcohol	6.00
20.00	3	Lanolin	2.00
20.00	4	Coal tar	2.00
6.00	5	Triethanolamine (99%)	0.60
2.50	6	Allantoin	0.25
QS	7	Deionized water	QS to 1 kg
–	8	Preservative	QS

Manufacturing Directions

1. Heat water and oil phases separately to 80°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Pass through homogenizer.
5. Fill at 40°C.

RESORCINOL ACNE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Polychol 10 (Laneth-10)	20.00
5.00	2	Lanolin alcohols (Super Hartolan)	5.00
55.00	3	Cetyl alcohol C90	55.00
60.00	4	Polawax	60.00
14.00	5	Sulfur	14.00
QS	6	Deionized water	QS
40.00	7	Veegum regular	40.00
20.00	8	Propylene glycol	20.00
20.00	9	Resorcinol	20.00
QS	10	Perfume, preservative	QS

Manufacturing Directions

1. Hydrate Veegum in water. Add rest of water-phase ingredients and heat to 70˚C.
2. Heat oil phase to 70˚C. Disperse sulfur in oil phase.
3. Add oil phase to water phase while stirring. Stir to cool. Fill.

RUBEFACIENT ANALGESIC OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax, NF	150.00
100.00	2	Methyl salicylate	100.00
50.00	3	Menthol	50.00
100.00	4	Mineral oil (70 cS)	100.00
QS	5	Deionized water	QS to 1 kg
QS	6	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 30°C.

SALICYLIC ACID CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Glyceryl stearate and PEG-75 stearate	150.00
5.00	2	Stearic acid	5.00
80.00	3	Mineral oil	80.00
665.00	4	Deionized water	665.00
100.00	5	Salicylic acid	100.00

Manufacturing Directions

1. Mix and heat items 1 to 4 to 75°C.
2. Allow to cool with gentle stirring.
3. At 30°C, add item 5. Homogenize if necessary.

SALICYLIC ACID CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/100 g (g)
150.00	1	Polawax (self-emulsifying wax)	15.00
150.00	2	PPG-2 myristyl ether propionate (Crodamol PMP)	15.00
50.00	3	Sorbitol isostearate	5.00
35.00	4	Safflower oil, super refined	3.50
20.00	5	Avocado oil, super refined	2.00
20.00	6	Cetyl palmitate	2.00
50.00	7	Salicylic acid	5.00
1.50	8	Propyl paraben	0.15
1.00	9	Butylated hydroxyanisole	0.10
487.50	10	Deionized water	48.75
10.00	11	Sodium borate	1.00
3.00	12	Methyl paraben	0.30
2.00	13	Imidazolidinyl urea	0.20
20.00	14	Hydrolyzed collagen + hyaluronic acid (Cromoist HTA)	2.00

Manufacturing Directions

1. Dissolve item 7 in item 2 with mixing and heating to 70°C.
2. Add balance of items 1 to 9 and mix with heat to 80°C.
3. Mix together items 10 to 13 separately and heat to 80°C.
4. Add this mixture to earlier mixture with mixing and cool to 40°C.
5. Add item 14 with mixing and cool to desired fill temperature.
6. Adjust pH if necessary to 3 to 4 with 10% triethanolamine solution.

SALICYLIC ACID GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
422.00	1	Witch hazel distilled, 14% alcohol	422.00
5.00	2	Salicylic acid	5.00
5.00	3	Aloe vera gel	5.00
10.00	4	Sorbitol	10.00
500.00	5	Polyglyceiylmethylacrylate	500.00
10.00	6	Propylene glycol	10.00
0.80	7	Methyl paraben	0.80
0.20	8	Propyl paraben	0.20

Manufacturing Directions

1. Premix items 1 to 4. Add item 5 with low-shear mixing until homogenous.
2. Mix items 6 to 8 together and then add them to the formulation.

SCOPOLAMINE TRANSDERMAL THERAPEUTIC SYSTEM

The transdermal scopolamine system is a circular flat patch designed for continuous release of scopolamine following application to an area of intact skin on the head, behind the ear. Each system contains 1.5 mg of scopolamine base. The transdermal system is a film 0.2 mm thick and 2.5 cm^2, with four layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are a backing layer of tan-colored, aluminized polyester film; a drug reservoir of scopolamine, light mineral oil, and polyisobutylene; a microporous polypropylene membrane that controls the rate of delivery of scopolamine from the system to the skin surface; and an adhesive formulation of mineral oil, polyisobutylene, and scopolamine. A protective peel strip of siliconized polyester, which covers the adhesive layer, is removed before the system is used. The inactive components, light mineral oil (12.4 mg) and polyisobutylene (11.4 mg), are not released from the system.

SELENIUM SULFIDE DETERGENT LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.0	1	Selenium sulfide	10.0
2.0	2	Methyl paraben	2.0
10.0	3	Magnesium aluminum silicate type IIA	10.0
20.0	4	Titanium	20.0
0.170	5	Dye	0.170
230.0	6	Sodium alkyl ether sulfate/sulfonate	230.0
30.0	7	Surfactant cocamide DEA	30.0
40.0	8	Cocoamphocarboxyglycinate	40.0
10.0	9	Protein hydrolyzed	10.0
4.0	10	Perfume	4.0
QS	11	Acid citric	QS
QS	12	Sodium chloride	QS
QS	13	Water purified	QS to 1 L

Note: Item 11 used for pH adjustment, if necessary. Item 12 used for viscosity adjustment, if necessary.

Manufacturing Directions

1. Selenium sulfide is toxic. Handle carefully and use approved respiratory protection.

2. Add selenium sulfide. Seal the mill and agitate for approximately 10 minutes to wet down the powdered material.
3. Recycle for approximately 5 minutes. Stop agitation. If necessary, add purified water (25–30°C) to nearly cover the grinding media.
4. Seal the mill and recirculate the slurry for 1 to 2 hours to the required particle size specifications for the selenium sulfide.
5. Load 250 mL of purified water into a suitable jacketed mixing tank and heat to 60°C to 70°C. With good stirring, add and dissolve methyl paraben. Slowly add and disperse magnesium aluminum silicate. Continue mixing until fairly smooth. Stop mixing and allow hydrating for 1 hour.
6. Add and disperse titanium dioxide. Mix for 30 minutes.
7. With good stirring, add selenium sulfide slurry and rinse the mill with purified water. Mix for 30 minutes.
8. Stop mixing and add sodium lauryl ether sulfate/sulfonate. Mix slowly for 5 minutes. Add cocamide DEA. Mix slowly for approximately 3 minutes.
9. Add cocoamphocarboxyglycinate. Mix slowly for 30 minutes.
10. Separately dissolve hydrolyzed protein (Hydro gel) in 4 mL of purified water and mix until uniform. Add solution from above to the tank and mix until uniform.
11. Add perfume and mix for 1 minute. Dissolve dye in 2 mL warm purified water (50–60°C) and add to mixing tank. Mix until uniform. Check and record pH and adjust it to 4.5 to 5.0, if necessary, using citric acid.
12. Add purified water QS to 980 mL. Mix for 30 minutes. Check and record viscosity. If necessary, adjust by adding sodium chloride.
13. Deaerate by slow stirring under vacuum or use of a suitable deaerator. Mix for 1 hour.

SELENIUM SULFIDE LOTION

The active ingredient for selenium sulfide lotion is selenium sulfide, 2.5% w/v, in aqueous suspension; it also contains bentonite, lauric diethanolamide, ethylene glycol monostearate, titanium dioxide, amphoteric-2, sodium lauryl sulfate, sodium phosphate (monobasic), glyceryl monoricinoleate, citric acid, captan, and perfume.

SILICONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax NF	150.00
40.00	2	Oleyl alcohol	40.00
50.00	3	PEG-75 lanolin	50.00
150.00	4	Mineral oil 70 cS	150.00
50.00–100.00	5	Dimethicone	50.00–100.00
QS	6	Deionized water	QS to 1 kg

Manufacturing Directions

1. Heat water and oil phase separately to 60˚C to 65˚C.
2. Add water phase to oil phase while stirring. Stir to cool to 30˚C. Add perfume or color as desired.

SILVER SULFADIAZINE CREAM

Silver sulfadiazine cream, 1%, is a soft, white water-miscible cream containing the antimicrobial agent silver sulfadiazine in micronized form. Each gram of cream, 1%, contains 10 mg micronized silver sulfadiazine. The cream vehicle consists of white petrolatum, stearyl alcohol, isopropyl myristate, sorbitan monooleate, polyoxyl 40 stearate, propylene glycol, and water, with methyl paraben, 0.3%, as a preservative.

SILVER SULFADIAZINE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Silver sulfadiazine	10.00
5.00	2	Cetyl alcohol	50.00
8.00	3	Glyceryl monostearate A/S	80.00
8.00	4	Liquid paraffin	80.00
3.00	5	Tween 80	30.00
2.00	6	Tween 60	20.00
15.00	7	Propylene glycol	150.00
58.00	8	Water purified	580.00

Manufacturing Directions

1. Place items 2 to 6 in a fat-melting vessel, heat to 75°C, and then cool down to 60°C.
2. Add item 8 to Becomix and heat to 90°C. Cool down to 65°C.
3. Transfer step 1 into step 2, mix under vacuum, cool to 40°C.
4. In a separate vessel, add items 7 and 1 and homogenize.
5. Add to step 3 and mix. Cool to 25°C.
6. Transfer to storage vessel and fill.

SODIUM CHLORIDE OINTMENT

Sodium chloride ointment is a sterile ophthalmic ointment used to draw water out of the cornea of the eye. Each gram contains active ingredient sodium chloride, 5%, and inactives lanolin, mineral oil, white petrolatum, and purified water. Sodium chloride (approximately 0.9%) is used for treating cold sores and fever blisters and lesions associated with herpes virus.

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Liquid paraffin	50.00
10.00	2	White paraffin	100.00
30.00	3	Glycerin	300.00
8.00	4	Cetostearyl alcohol	80.00
0.30	5	Methyl paraben	3.00
3.60	6	Polyoxyethylene sorbitan monostearate	36.00
2.00	7	Glyceryl monostearate	20.00
QS	8	Water purified	QS to 1 kg
0.90	9	Sodium chloride	9.00

Manufacturing Directions

1. Preparation of water phase:
   a. Add purified water, polysorbate 60, and glycerin with agitation to a melting kettle.
   b. Heat the contents to 61°C to 65°C.
   c. Add methyl paraben and mix the composition to dissolve while maintaining temperature.
2. Preparation of oil phase:
   a. In a suitable vessel, place liquid paraffin, cetostearyl alcohol, white petrolatum, glycerol monostearate, and white beeswax and mix continuously while heating to 71°C to 75°C.
3. Mixing of phases:
   a. The mixture of step 2 is transferred to step 1's kettle, with the water phase maintained at less than 300 mbar vacuum.
   b. Add sodium chloride and dissolve.
   c. With mixing and keeping the temperature at 61°C to 65°C, draw the oil phase into the water phase.
   d. Mix for 15 minutes with agitation and vacuum at 300 mbar and 61°C to 65°C.
   e. While mixing and under vacuum, allow the mixture to cool gradually to room temperature.
4. Fill in appropriate container.

SODIUM SULFACETAMIDE LOTION

Each milliliter of sodium sulfacetamide lotion 10% contains 100 mg of sodium sulfacetamide in a vehicle consisting of purified water, propylene glycol, lauramide DEA and diethanolamine, polyethylene glycol 400 monolaurate, hydroxyethyl cellulose, sodium chloride, sodium metabisulfite, methyl paraben, xanthan gum, EDTA, and simethicone. Sodium sulfacetamide is a sulfonamide with antibacterial activity. Chemically, sodium sulfacetamide is N'-[(4-aminophenyl) sulfonyl]-acetamide, monosodium salt, monohydrate.

SPERMATOCIDAL EFFERVESCENT SUPPOSITORY

Manufacturing Directions

1. Melt together 80 g of polyethylene glycol (average molecular weight 950–1050), 23.5 g of polyethylene glycol (average molecular weight 1300–1600), 6 g of Menfegol, and 0.5 g of dioctyl sodium sulfosuccinate by heating to obtain a uniform mixture.
2. To this mixture add 5 g of anhydrous sodium sulfate and stir the mixture thoroughly to disperse. Then, successively add 10 g of sodium bicarbonate, 25 g of potassium hydrogen-tartrate, and 0.15 g of saponin, stir, and knead to uniformly disperse.
3. Inject the mixture, while hot, into a mold having a predetermined shape and cooled to below room temperature. Thereby, an effervescent vaginal suppository having a spermatocidal effect and weighing 1.5 g per unit is obtained.

SQUALENE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Polyoxyethylene sorbitan monooleate	50.00
23.00	2	Cetyl alcohol	230.00
0.40	3	Cholesterol	4.00
0.20	4	Squalene	2.00
56.00	5	Water purified	560.00
10.00	6	Propylene glycol	100.00
5.00	7	L-cysteic acid	50.00
1.00 mL	8	Ethanolamine	10.00 mL

Manufacturing Directions

1. Heat items 1 to 4 in a jacketed kettle to 70°C.
2. In a separate kettle, heat items 5 to 8 to 70°C.
3. Add step 1 to step 2 at 72°C slowly with agitation.
4. Continue agitation until the mixture is congealed. The water-washable cream thus prepared consists of 5% active ingredient.

STARCH OINTMENT

The active ingredient in starch ointment is topical starch, 51%. It also contains benzyl alcohol, hydrogenated vegetable oil, and tocopheryl acetate.

SUCRALAFATE AND HYALURONIC ACID OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
30.00	1	Sucralafate (2–10 nm)	300.00
0.60	2	Hyaluronic acid	6.00
10.00	3	Pectin	100.00
10.00	4	Gelatin	100.00
4.00	5	Carboxymethylcellulose	40.00
60.00	6	Fractionated coconut oil	600.00

Manufacturing Directions

1. Mix finely divided sucralfate thoroughly with the other ingredients also in finely divided form.
2. Add fractionated coconut oil to the resulting powder and homogenize.

SUCRALAFATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
30.00	1	Sucralafate (2–10 urn)	300.00
10.00	2	Pectin	100.00
10.00	3	Gelatin	100.00
10.00	4	Carboxymethylcellulose	100.00
60.00	5	Fractionated coconut oil	600.00

Manufacturing Directions

1. Mix finely divided sucralfate thoroughly with the other ingredients also in finely divided form.
2. Add fractionated coconut oil to the resulting powder to a suitable consistency and homogenize.

SUCRALAFATE OPTHALMIC OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.00	1	Sucralafate (micronized less than 10 nm)	20.00
0.50	2	Carbopol 934	5.00
5.00	3	Mannitol	50.00
0.01	4	Benzalkonium chloride	0.10
0.05	5	Sodium EDTA	0.50
QS	6	Sodium hydroxide	QS
QS	7	Water purified	QS to 1 kg

SULFACETAMIDE OINTMENT

Sulfacetamide sodium ophthalmic solution and ointment USP, 10%, are sterile topical antibacterial agents for ophthalmic use. They contain sulfacetamide sodium, 10% (100 mg/g). The preservative is phenylmercuric acetate (0.0008%). Inactive ingredients are white petrolatum, mineral oil, and petrolatum and lanolin alcohol.

SULFACETAMIDE SODIUM AND PREDNISOLONE ACETATE OPTHALMIC OINTMENT

The sulfacetamide sodium and prednisolone acetate ophthalmic ointment USP is a sterile topical ophthalmic ointment combining an antibacterial and a corticosteroid. Active ingredients are sulfacetamide sodium, 10%, and prednisolone acetate, 0.2%. Inactives are phenylmercuric acetate (0.0008%), mineral oil, white petrolatum, and petrolatum and lanolin alcohol.

SULFANILAMIDE SUPPOSITORIES

The suppositories contain sulfanilamide, 15%, in a water-miscible, nonstaining base made from lactose, propylene glycol, stearic acid, diglycol stearate, methyl paraben, propyl paraben, trolamine, and water, buffered with lactic acid to an acid pH of approximately 4.3. Each suppository contains sulfanilamide 1.05 g with lactose in a base made from polyethylene glycol 400, polysorbate 80, polyethylene glycol 3350, and glycerin, buffered with lactic acid to an acid pH of approximately 4.5. The suppositories have an inert, white nonstaining covering that dissolves promptly in the vagina. The covering is composed of gelatin, glycerin, water, methyl paraben, propyl paraben, and coloring.

SULFATHIAZOLE CREAM

The cream contains sulfathiazole (benzenesulfonamide, 4-amino-N-2-thiazolyl-N1-2-thiazolylsulfanilamide), 3.42%, sulfacetamide (acetamide,N-[(4-aminophenyl)sulfonyl]-N-sulfanilylacetamide), 2.86%, and sulfabenzamide (benzamide,N-[(4-aminophenyl)sulfonyl]-N-sulfanilylbenzamide), 3.7%, compounded with cetyl alcohol, 2%, cholesterol, di-ethylaminoethyl stearamide, glyceryl monostearate, lanolin, lecithin, methyl paraben, peanut oil, phosphoric acid, propylene glycol, propyl paraben, purified water, stearic acid, and urea.

SULFUR OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Sulfur precipitated	15.00
85.00	2	Kaolin	85.00
QS	3	White petroleum jelly	QS to 1 kg
60.00	4	Isopropyl palmitate	60.00
13.00	5	Camphor	13.00
13.00	6	Methyl salicylate	13.00
20.00	7	Lanolin	20.00
50.00	8	Tribehenin	50.00
50.00	9	Ozokerite wad	50.00
35.00	10	Sorbitan oleate	35.00
15.00	11	Deionized water	15.00
4.00	12	Salicylic acid	4.00
24.00	13	Glycerin	24.00
QS	14	Preservative	QS

Manufacturing Directions

1. Heat oils except sulfur and lanolin to 70°C. Disperse sulfur and kaolin in oil phase.
2. Heat water, glycerin, and salicylic acid gently. Add to oil phase while stirring. Stir to 55°C.
3. Mill to disperse sulfur.

TACROLIMUS OINTMENT

Tacrolimus ointment contains tacrolimus, a macrolide immunosuppressant produced by *Streptomyces tsukubaensis*. Each gram of ointment contains (w/w) either 0.03% or 0.1% of tacrolimus in a base of mineral oil, paraffin, propylene carbonate, white petrolatum, and white wax.

TERCONAZOLE VAGINAL CREAM

Terconazole vaginal cream, 0.4%, is a white to off-white water-washable cream for intravaginal administration containing 0.4% of the antifungal agent terconazole, compounded in a cream base consisting of butylated hydroxyanisole, cetyl alcohol, isopropyl myristate, polysorbate 60, polysorbate 80, propylene glycol, stearyl alcohol, and purified water. Terconazole vaginal cream, 0.8%, is a white to off-white water-washable cream for intravaginal administration containing 0.8% of the antifungal agent terconazole, cis-1-[p-([2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy)phenyl]-4-isopropylpiperazine, compounded in a cream base consisting of butylated hydroxyanisole, cetyl alcohol, isopropyl myristate, polysorbate 60, polysorbate 80, propylene glycol, stearyl alcohol, and purified water.

TERCONAZOLE VAGINAL SUPPOSITORIES

Terconazole vaginal suppositories are white to off-white suppositories for intravaginal administration containing 80 mg of the antifungal agent terconazole, cis-1-[p-([2-(2,4-dichlorophenyl)-2-(1H-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy)phenyl]-4-isopropylpiperazine in triglycerides derived from coconut or palm kernel oil (a base of hydrogenated vegetable oils) and butylated hydrox-yanisole.

TESTOSTERONE GEL

Testosterone gel is a clear, colorless hydroalcoholic gel containing 1% testosterone. It provides continuous transdermal delivery of testosterone, the primary circulating endogenous androgen, for 24 hours following a single application to intact, clean dry skin of the shoulders, upper arms, or abdomen. A daily application of 5, 7.5, or 10 g contains 50, 75, or 100 mg of testosterone respectively, to be applied daily to the skin surface. Approximately 10% of the applied testosterone dose is absorbed across skin of average permeability during a 24-hour period. The active pharmacologic ingredient is testosterone. Testosterone USP is a white to practically white crystalline powder chemically described as 17-beta hydroxyandrost-4-en-3-one. Inactive ingredients are ethanol 68.9%, purified water, sodium hydroxide, carbomer 940, and isopropyl myristate; these ingredients are not pharmacologically active.

TESTOSTERONE TRANSDERMAL SYSTEM

The testosterone transdermal system provides continuous delivery of testosterone (the primary endogenous androgen) for 24 hours following application to intact, nonscrotal skin (e.g., back, abdomen, thighs, and upper arms). Two strengths are available that deliver in vivo either 2.5 or 5 mg of testosterone per day across skin of average permeability. It has a central drug delivery reservoir surrounded by a peripheral adhesive area. The 2.5 mg system has a total contact surface area of 37 cm^2 with a 7.5-cm^2 central drug delivery reservoir

containing 12.2 mg testosterone USP dissolved in an alcohol-based gel. The 5 mg system has a total contact surface area of 44 cm^2 with a 15-cm^2 central drug delivery reservoir containing 24.3 mg testosterone USP dissolved in an alcohol-based gel. The delivery systems have six components. Proceeding from the top toward the surface attached to the skin, the system is composed of (1) metallized polyester/Surlyn (E.I. DuPont de Nemours Co; ethylene-methacrylic acid copolymer)/ethylene vinyl acetate backing film with alcohol-resistant ink; (2) a drug reservoir of testosterone USP, alcohol USP, glycerin USP, glycerol monooleate, methyl laurate, and purified water USP, gelled with an acrylic acid copolymer; (3) a permeable polyethylene microporous membrane; and (4) a peripheral layer of acrylic adhesive surrounding the central, active drug delivery area of the system. Before opening of the system and application to the skin, the central delivery surface of the system is sealed with a peelable laminate disc (5) composed of a five-layer laminate containing polyester/polyester urethane adhesive/aluminum foil/polyester urethane adhesive/polyethylene. The disc is attached to and removed with the release liner (6), a silicone-coated polyester film, which is removed before the system can be used.

TETRACAINE GEL AND CREAM

Tetracaine gel's active ingredient is tetracaine HCl, 2%, and it also contains ethoxydiglycol, eucalyptus oil, hydroxyethyl cellulose, maleated soybean oil, methyl paraben, propyl paraben, sodium lauryl sulfate, and water. The cream contains active ingredient tetracaine 2% as well as chloroxylenol, eucalyptus oil, hydrochloric acid, lauramide DEA, methyl paraben, sodium borate, sodium lauryl sulfate, steareth-2, steareth-21, stearic acid, water, and white wax.

TETRACYCLINE HYDROCHLORIDE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
3.00	1	Tetracycline hydrochloride micronized (10% excess)	33.00
93.00	2	Petrolatum (white soft paraffin)	930.00
3.70	3	Mineral oil (liquid paraffin)	37.00
0.02	4	Vitamin E (oily)	0.20

Manufacturing Directions

1. Melt item 2 at 75°C in a fat-melting vessel.
2. In a suitable stainless-steel container, disperse item 1 in items 3 and 4 manually by using a spatula.
3. Transfer 89 g to 111 g of molten item 2 from step 1 to the mixer through stainless-steel mesh. Cool down to 50°C.
4. Load tetracycline dispersion from step 2 to the mixer. Start mixer at speed 10 rpm, homogenizer high speed for 20 minutes. Check evenness and smoothness of the dispersion.
5. Transfer the remaining quantity of molten item 2 from step 1 at 50°C to 55°C to the mixer through stainless-steel mesh while mixing and cooling at mixer speed 10 rpm, homogenizer high speed, under vacuum 0.4 to 0.6 bar for 30 minutes.
6. Stop homogenizer, continue mixing at 10 rpm, under vacuum 0.4 to 0.6 bar. Cool down to 28°C. Fill.

TGF ALPHA-OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
35.00	1	Polyethylene glycol 8000	350.00
36.70	2	Mineral oil	367.00
0.70	3	Tween 80	7.00
QS	4	Water purified	QS to 1 kg
29.30	5	Hydroxypropylmethylcellulose	293.00
2.50 mg	6	TGF-alpha	25.00 mg

Manufacturing Directions

1. Dissolve item 1 and add item 4 and heat to 80°C.
2. Add item 2 to step 1 and pass the mixture through a homogenizer until a fine emulsion is obtained.
3. Add item 5 to the emulsion in step 2 with vigorous mixing.
4. Homogenize again.
5. Sterilize the ointment at 121°C for 15 minutes in an autoclave.
6. Under sterile condition and at 4°C, transfer item 6 and mix thoroughly.
7. Sterile fill 5 g in capped ointment tube.

THERAPEUTIC SKIN LOTION

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
73.44	1	Water purified	734.40
2.50	2	Aloe vera gel	25.00
2.00	3	Walnut oil	20.00
2.00	4	Tocopherol acetate (vitamin E)	20.00
2.00	5	Glycerin	20.00
2.00	6	Stearic acid	20.00
2.00	7	1-Hexadecanol	20.00
2.00	8	Polysorbate 60	20.00
2.00	9	Apricot kernel oil	20.00
2.00	10	Jojoba oil	20.00
2.00	11	Glyceryl stearate	20.00
1.00	12	PEG-100 stearate	10.00
1.00	13	Dimethicone	10.00
1.00	14	PVP	10.00
0.50	15	Hyaluronic acid	5.00
0.50	16	Fibronectin	5.00
0.50	17	Allantoin	5.00
0.50	18	Triethanolamine	5.00
0.20	19	Carbopol 934	2.00
0.20	20	Potassium chloride	2.00
0.06	21	Urea	0.60
0.03	22	Calcium phosphate	0.30

TOLNAFTATE AND UNDECYLENATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Glyceryl stearate and PEG-75 stearate	150.00
20.00	3	Hydrogenated palm/palm kernel oil PEG-6 esters	20.00
60.00	4	Mineral oil	60.00
0.50	5	Sorbic acid	0.50
0.50	6	Sodium methyl paraben	0.50
509.00	7	Deionized water	509.00
50.00	8	Undecylenic acid	50.00
200.00	9	Zinc undecylenate	200.00
10.00	10	Tolnafate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 8 to 75°C.
2. Allow to cool and with gentle stirring. At 30°C add items 9 and 10.
3. Homogenize if necessary.

TRETINOIN AND ALPHA-BISABOLOL GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.05	1	Tretinoin	0.50
5.00	2	Lutrol E400	50.00
6.00	3	Cremophor RH400	60.00
0.04	4	Butylated hydroxytoluene	0.40
0.10	5	(-)Alpha-bisabolol natural (BASF)	1.00
70.30	6	Water purified	703.00
QS	7	Preservatives	QS
18.50	8	Lutrol F127	185.00

Manufacturing Directions

1. Add solution of items 7 and 6 slowly to the clear solution of items 1 to 5 at approximately 40°C.
2. Heat to approximately 50°C and dissolve approximately 14 g of item 8 in the combined solution of step 1.
3. Cool to approximately 6°C and dissolve the rest of the items. Maintain cool until the air bubbles have escaped.

TRETINOIN AND DEXPANTHENOL GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
50.00 mg	1	Tretinoin (BASF)	0.50
5.00	2	Lutrol E400	50.00
6.00	3	Cremophor RH40	60.00
40.00 mg	4	Butyl hydroxytoluene	0.40
68.40	5	Water purified	684.00
2.50	6	Dexpanthenol (BASF)	25.00
18.00	7	Lutrol F127	180.00

Manufacturing Directions

1. Add items 5 and 6 slowly to the clear solution of items 1 to 4 at approximately 40°C.
2. Heat to approximately 50°C and dissolve approximately 40 g of item 7 in step 1.
3. Cool to approximately 6°C and dissolve the rest of item 7.
4. Maintain cool until the air bubbles have escaped.

TRETINOIN CREAM

Tretonin cream, a topical retinoid, contains tretinoin 0.025% by weight in a hydrophilic cream vehicle of stearic acid, polyolprepolymer-2, isopropyl myristate, polyoxyl 40 stearate, propylene glycol, stearyl alcohol, xanthan gum, sorbic acid, butylated hydroxytoluene, and purified water. The tretinoin cream, 0.02%, contains the active ingredient tretinoin in a cream base. It is available at a concentration of 0.02% w/w in an oil-in-water emulsion formulation consisting of benzyl alcohol, butylated hydroxytoluene, caprylic/capric triglyceride, cetyl alcohol, edetate disodium, fragrance, methyl paraben, propyl paraben, purified water, stearic acid, stearyl alcohol, steareth 2, steareth 20, and xanthan gum.

TRETINOIN CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.05	1	Tretinoin (BASF)	0.50
8.00	2	Luvitol EHO	80.00
3.00	3	Cremophor A6	30.00
1.50	4	Cremophor A25	15.00
3.00	5	Glyceryl monostearate	30.00
3.00	6	Cetyl alcohol	30.00
0.50	7	Tegiloxan 100 (Goldschmidt)	5.00
0.04	8	Butyl hydroxytoluene	0.40
4.00	9	Propylene glycol	40.00
0.50	10	Preservatives	5.00
0.20	11	Perfumes	2.00
76.20	12	Water purified	762.00

Manufacturing Directions

1. Separately prepare solution of items 1 and 2 and a mixture of items 3 to 7 by heating to approximately 75°C.
2. Heat mixture of items 8 to 12 until a clear solution is formed.
3. To the warm mixture of step 2, mix step 1 and cool by stirring.

TRETINOIN GEL

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.05	1	Tretinoin (BASF)	0.50
15.00	2	Alcohol	150.00
1.00	3	Cremophor RH40	10.00
QS	4	Perfume	QS
0.04	5	Butyl hydroxytoluene	0.40
0.50	6	Carbopol 940	5.00
76.00	7	Water purified	760.00
0.70	8	Triethanolamine	7.00
6.60	9	Water purified	66.00

Manufacturing Directions

1. Prepare suspension of items 6 and 7 and add solution of items 8 and 9 to the well-stirred suspension.
2. When a clear mixture is formed, add solution of items 1 to 5.

TRETINOIN GEL MICROSPHERE

Tretinoin gel microsphere, 0.1%, is a formulation containing 0.1% by weight tretinoin for the topical treatment of acne vulgaris. This formulation uses patented methyl methacrylate/glycol dimethacrylate crosspolymer porous microspheres (Microsponge System®) to enable inclusion of the active ingredient tretinoin in an aqueous gel. Other components of this formulation are purified water, carbomer 934P, glycerin, disodium EDTA, propylene glycol, sorbic acid, PPG-20 methyl glucose ether distearate, cyclomethicone and dimethicone copolyol, benzyl alcohol, trolamine, and butylated hydroxytoluene.

TRIACONTANOL OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.0250	1	Methyl paraben	0.250
0.015	2	Propyl paraben	0.15
1.00	3	Sodium lauryl sulfate	10.00
12.00	4	Propylene glycol	120.00
25.00	5	Stearyl alcohol	250.00
25.00	6	White petrolatum	250.00
37.00	7	Water purified	370.00
0.01	8	Triacontanol	0.10

Manufacturing Directions

1. Melt the stearyl alcohol and the white petrolatum on a steam bath and warm to approximately 75°C.
2. Dissolve the other ingredients in the purified water and also warm to approximately 75°C.
3. Then mix all ingredients together and stir until the mixture congeals.

TRICLOSAN FOOT CARE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Glyceryl stearate (Gelol)	50.00
50.00	2	Propylene glycol stearate	50.00
100.00	3	Octyldodecyl myristate	100.00
50.00	4	Isostearyl isostearate	50.00
20.00	5	Dimethicone (100 cS)	20.00
651.00	6	Deionized water	651.00
50.00	7	Sucrose distearate	50.00
4.00	8	Phenoxyethanol, methyl paraben, ethyl paraben, and propyl paraben	4.00
20.00	9	Propylene glycol	20.00
3.00	10	Triclosan	3.00
2.00	11	Fragrance	2.00

Manufacturing Directions

1. Heat items 1 to 5 and items 6 to 7 separately to 75°C. Mix the two parts with turbine mixing for 1 minute.
2. Cool with gentle stirring.
3. Add items 9 and 10 and then item 11 with mixing at 30°C to 35°C.

TRICLOSAN FOOT CREAM

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/L (g)
30.00	1	Alcohol and ceteareth-20 (Cosmowax EM5483)	30.00
30.00	2	Isopropyl myristate (Crodamol IPM)	30.00
5.00	3	Cetyl esters (Crodamol SS)	5.00
20.00	4	Oleyl alcohol	20.00
5.00	5	Propylene glycol	5.00
5.00	6	Carbopol 980	5.00
QS	7	Deionized water	QS to 1 L
300.00	8	Ethanol DEB100	300.00
2.00	9	Triclosan (Irgasan DP300)	2.00
0.50	10	Menthol	0.50
4.00	11	Triethanolamine 99% approximately to give pH 6–7	4.00

Manufacturing Directions

1. Preblend ethanol, Irgasan, and menthol and warm to 50°C.
2. Heat water and oil phases separately to 70°C.
3. Add water phase to oil phase while stirring. Stir to cool, adding the preblend at 60°C. Adjust pH.

TRIDAX PROCUMBENS OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	*Tridax procumbens* leaf extract	50.00
3.00	2	Carbopol 934	30.00
0.15	3	Methyl paraben	1.50
0.15	4	Propyl paraben	1.50
QS	5	Monoethanol amine	QS
QS	6	Propylene glycol:water purified (50:50)	QS to 1 kg

Manufacturing Directions

1. Shade dry the leaves of *T. procumbens* for 48 hours at room temperature.
2. Then soak the crushed leaves (500 g) with water (1 L) for 72 hours at room temperature.
3. Decant water and then concentrate to 100 mL by evaporating under vacuum at room temperature.
4. Then lyophilize this concentrated solution to obtain powder (item 1).
5. Disperse the *T. procumbens* leaf extract in pure propylene glycol along with propyl paraben (0.15%).
6. Thoroughly agitate the mixture to get a clear solution. Disperse Carbopol 934 in a propylene glycol and water (50:50) mixture along with methyl paraben in another vessel.
7. Stir the mixture continuously at 300 rpm for 2 to 3 hours.
8. Then add the *T. procumbens* solution and continue stirring for approximately 1 hour until a gel preparation is obtained.
9. Adjust the pH of this gel to 6 using monoethanolamine.

TROLAMINE SALICYLATE CREAM

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/kg (g)
50.00	1	Glyceryl stearate	5.00
25.00	2	Cetyl alcohol	2.50
30.00	3	Cetyl phosphate and DEA cetyl phosphate	3.00
40.00	4	Stearyl stearoyl stearate	4.00
40.00	5	Cococaprylate/Caprate	4.00
40.00	6	Cetyl palmitate	4.00
5.00	7	Dimethicone	0.50
502.00	8	Deionized water	50.20
10.00	9	Propylene glycol, diazolidinyl urea, methyl paraben, and propyl paraben	1.00
5.50	10	Magnesium aluminum silicate	0.55
2.50	11	Xanthan gum	0.25
100.00	12	Deionized water	10.00
100.00	13	Trolamine salicylate (TEA salicylate)	10.00
50.00	14	Propylene glycol	5.00

Manufacturing Directions

1. Heat items 8 and 9 to 85°C, add items 10 and 11, and mix until well dispersed.
2. Add items 1 to 7 and mix well at 80°C to 85°C. Continue mixing.
3. While cooling to 65°C, add items 12 to 14 and continue mixing and cooling to 35°C. pH should be 5.5 to 5.6.

ULINASTATIN SUPPOSITORY

Manufacturing Directions

1. Weigh hard fat (Witepsol W 35, 167.4 g), pluronic F-127 (0.6 g), propyl paraoxybenzoate (0.2 g), and methyl paraoxybenzoate (0.2 g), melt at 50°C, and process to prepare a uniform oil-phase component which is held at 35°C to 45°C.
2. Prepare an aqueous solution of ulinastatin (ulinastatin: 4900 U/mL) to have a sodium chloride concentration of 9 mg/mL; to 24 mL of the solution, add gelatin (2.4 g), concentrated glycerin (4.8 g), and arginine hydrochloride (0.4 g) and heat the mixture to prepare a uniform aqueous-phase component which is held at 35°C to 45°C.
3. Mix steps 1 and 2 and emulsify with a homomixer; fill into suppository containers such that each contains a 1.7 g portion. Leave the contents to cool and solidify, yielding suppositories containing ulinastatin in a uniform amount.

ULTRASONIC ADHESIVE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Preservative (e.g., parabens)	5.00
754.00	2	Water	754.00
6.00	3	Carbopol 940 (Goodrich)	6.00
20.00	4	Sodium hydroxide solution 10%	20.00
15.00	5	Kollidon 30	15.00
200.00	6	Water	200.00

Manufacturing Directions

1. Prepare solution of item 1 in item 2 by heating to 70°C to 80°C and add item 3 slowly to obtain a homogeneous suspension.
2. Add items 4 to 6. A clear, colorless adhesive gel is obtained. Addition of sodium chloride changes consistency.

VITAMIN A OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
2.20	1	Vitamin A propionate	22.00
70.00	2	Alcohol SD40-A	700.00
5.00	3	Glycolic acid	50.00
20.00	4	Propylene glycol	200.00
4.00	5	Hydroxypropyl cellulose	40.00
5.00	6	Aloe vera extract	50.00
0.10	7	Lactil	1.00

Manufacturing Directions

1. Add 2.2 g vitamin A propionate to 70 g alcohol (SD40-A) and mix.
2. Add 5 g of glycolic acid to 20 g of propylene glycol and mix.
3. Add step 1 to step 2 at room temperature until the solution is homogeneous.
4. Sift in 4 g hydroxypropyl cellulose slowly, more than approximately 15 minutes while blending to avoid clumping.
5. While stirring, add 5 g extract of the aloe vera plant and 1 g Lactil.
6. Stir gently until cellulose is dissolved.

VITAMIN A SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
150,000 IU	1	Vitamin A palmitate 1.7 M IU/g	88.23 g
1.00	2	Butyl hydroxytoluene	10
400.00	3	Cremophor RH 40	400
800.00	4	Lutrol E 1500	800
500.00	5	Lutrol E 4000	505

Manufacturing Directions

1. Dissolve butyl hydroxytoluene in the warm vitamin A, add Cremophor, and mix with the molten Lutrol E grades.
2. Fill into molds of suppositories to obtain the weight of 2 g.

VITAMIN C VAGINAL OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
12.50	1	Vitamin C	125.00
21.80	2	White Vaseline	218.00
23.00	3	Cetyl stearyl alcohol	230.00
39.50	4	Liquid paraffin	395.00

Manufacturing Directions

1. Charge items 2 to 4 in a melting tank and melt at 80°C.
2. Stir and homogenize for 20 minutes and cool.
3. At 30°C, add item 1 under vacuum and homogenize.

VITAMIN E GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	Vitamin E acetate	100.00
150.00	2	Propylene glycol pharma	150.00
200.00	3	Lutrol F 127	200.00
550.00	4	Water	550.00

Manufacturing Directions

1. Mix vitamin E acetate with propylene glycol and add the water. After cooling to approximately 6°C, dissolve Lutrol F 127 slowly in the well-stirred mixture.
2. Maintain cool until the air bubbles escape. A turbid white gel forms at temperatures between 20°C and 50°C. Viscosity at 25°C is approximately 120,000 mPa.

WOUND DEBRIDING OINTMENT

Manufacturing Directions

1. (% w/w) Castor oil, 90.0; hydrogenated castor oil, 10.0. Add the hydrogenated castor oil to the castor oil while mixing with a high shear mixer and mix until a semisolid is formed.
2. Wound debriding ointment (% w/w) Castor oil, 68.8; hydrogenated castor oil, 10.0; balsam Peru oil, 8.70; aluminum/magnesium hydroxide stearate, 2.00; trypsin, 0.018; safflower oil, QS add 100%.
3. In step 3, the wound debrider, disperse the aluminum/magnesium hydroxide stearate in the castor oil.
4. Thereafter add the hydrogenated castor oil while mixing with a high shear mixer, in particular, a turbo shear mixer.
5. Continue mixing until a semisolid forms. Then blend the remaining ingredients to the semisolid until homogeneous mixing appears.

ZINC OXIDE AND VITAMIN E CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
7.50	1	Zinc oxide	75.00
5.00	2	White soft paraffin	50.00
6.50	3	Cetostearyl alcohol	65.00
11.00	4	Lanolin anhydrous	110.00
2.00	5	Castor oil	20.00
12.00	6	Liquid paraffin	120.00
0.50	7	Vitamin E oily	5.00
1.04	8	Sodium lauryl sulfate	10.40
10.00	9	Propylene glycol	100.00
1.00	10	Simethicone M30	10.00
0.04	11	Lavender oil	0.40
43.20	12	Water purified	432.00

Manufacturing Directions

1. Add item 12 (two-thirds) to Becomix, heat to 80°C to 85°C, and transfer to a stainless-steel covered container.
2. Place in a melting vessel items 2 to 7, one at a time, and heat to 70°C. Stir to meet and maintain temperature at 70°C to 75°C.
3. Transfer step 2 to Becomix after passing through a stainless-steel sieve while mixing.
4. Load item 12, set aside in a separate vessel, and stir to dissolve item 8 at 70°C to 75°C. Transfer this solution to Becomix through a stainless-steel sieve.
5. Homogenize for 10 minutes under vacuum 0.4 to 0.6 bar at 70°C to 75°C.
6. Cool down to 40°C to 45°C while mixing.
7. Place balance of item 12 at 70°C to 75°C and items 9 and 1 in a separate vessel. Mix using a stirrer, then cool down to 40°C to 45°C. Disperse zinc oxide in the solution while stirring and then pass dispersion twice through a homogenizer.
8. Transfer dispersion to Becomix and mix at slow speed.
9. Use item 12 to rinse vessel and add rinsings.
10. Homogenize at 35°C to 45°C under vacuum.
11. Add items 11 and 12 and mix again, homogenize again, and cool down to 25°C to 30°C.
12. Transfer to storage container and fill.

ZINC OXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
7.00	1	Magnesium aluminum silicate	7.00
641.00	2	Water	641.00
7.00	3	Unimulse C	7.00
30.00	4	Propylene glycol	30.00
30.00	5	Eucalyptus oil	30.00
30.00	6	Lanolin oil	30.00
50.00	7	Dimethicone 350 cs	50.00
50.00	8	C12-C15 alcohols benzoate	50.00
100.00	9	Polysorbate 80	100.00
50.00	10	Zinc oxide	50.00
10.00	11	Cornstarch	10.00
QS	12	Preservatives	QS

Manufacturing Directions

1. Add item 1 to the water slowly, agitating with maximum shear until smooth.
2. Add item 3 and 4, mixing each time, until uniform.
3. Mix items 5 to 10 until uniform and mix with other portions until uniform.
4. Add item 11 and 12 and mix until smooth.

ZINC OXIDE OINTMENT

(% w/w) Methyl benzethonium chloride, 0.1; sebacic acid, 10.0; acetylated lanolin, 2.0; zinc oxide, 20.0; perfume, 0.075; mineral oil gelled with 5% polyethylene (Plastibase 50 W), 67.825.

ZINC OXIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
120.00	1	Ceteaiyl alcohol, PEG-40 castor oil, and sodium ceteaiyl sulfate	120.00
180.00	2	Petrolatum	180.00
60.00	3	Oleayl oleate	60.00
60.00	4	Mineral oil, light	60.00
100.00	5	Zinc oxide	100.00
QS	6	Water	QS to 1 kg
10.00	7	Propylene glycol, diazolidinyl urea, methyl paraben, and propyl paraben	10.00

Manufacturing Directions

1. Mix and heat item 1 to 5 to 70°C to 75°C.
2. Mix and heat items 6 and 7 to 70°C to 75°C. While stirring, add this to the mixture made earlier.
3. Begin cooling, continue stirring until batch reaches 30°C, and then homogenize.

ZINC OXIDE OINTMENT WITH VITAMIN E AND ALOE

Zinc oxide ointment with vitamin E and aloe's active ingredient is zinc oxide (11.3%). Its inactive ingredients are aloe vera gel, balsam (specially purified balsam Peru), beeswax, benzoic acid, dimethicone, methyl paraben, mineral oil, propyl paraben, purified water, sodium borate, and tocopheryl (vitamin E acetate).

ZINC PYRITHIONE DETERGENT LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg
547.50	1	Deionized water	547.50
7.50	2	Hydroxyethyl cellulose	7.50
347.00	3	TEA-lauryl sulfate	347.00
43.00	4	PEG-20 lanolin alcohol ether	43.00
20.00	5	Glycol stearate	20.00
15.00	6	Cocamide MEA	15.00
10.00	7	Zinc pyrithione 48%	20.00
QS	8	Fragrance, preservative	QS

Manufacturing Directions

1. Add item 2 to the water and mix. In a separate vessel, combine items 3 to 5, heat to 80°C, and mix.
2. Cool to 50°C. Add items 6 and 7 and mix. Add this mixture to mixture of item 2.
3. Cool to 40°C and add item 8.

ZINC UNDECYLENATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
7.50	1	Magnesium aluminum silicate	7.50
487.50	2	Deionized water	487.50
100.00	3	Sorbitol 70%	100.00
10.00	4	Polysorbate 80	10.00
200.00	5	Zinc undecylenate	200.00
50.00	6	Caprylic acid	50.00
30.00	7	C12-C15 alcohols benzoate	30.00
15.00	8	Polysorbate 80	15.00
20.00	9	C18-C36 acid	20.00
80.00	10	Glyceryl stearate and PEG-100 stearate	80.00
QS	11	Preservatives	QS

Manufacturing Directions

1. Slowly add item 1 in the water, mixing with maximum available shear until smooth.
2. Add items 2 to 5 in order, mixing each until uniform. Avoid incorporating air. Heat while stirring to 70°C to 75°C.
3. Heat items 6 to 10 separately to 70°C to 75°C and add to the above mixture, mixing while cooling. Fill at 45°C to 50°C.

ZIRCONIUM OXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate	15.00
3.00	2	Carboxymethylcellulose sodium medium viscosity	3.00
796.50	3	Water	796.50
40.00	4	Zirconium oxide	40.00
50.00	5	Propylene glycol	50.00
80.00	6	Isopropyl alcohol	80.00
15.00	7	Benzocaine	15.00
0.50	8	Menthol	0.50
QS	9	Preservative	QS

Manufacturing Directions

1. Dry blend items 1 and 2 and add them to water slowly while agitating with maximum shear until smooth.
2. Add items 4 and 5 and then items 6 to 9. Mix.

Part III

Commercial Pharmaceutical Formulations

Taylor & Francis
Taylor & Francis Group
http://taylorandfrancis.com

Commercial Pharmaceutical Formulations

- Accuzyme contains papain, USP (6.5 × 10.5 USP units of activity per gram of ointment) and urea, USP 10%, in a hydrophilic ointment base composed of emulsifying wax, fragrance, glycerin, isopropyl palmitate, lactose, methyl paraben, potassium phosphate monobasic, propyl paraben, and purified water.
- Acticin (permethrin) cream 5% is available in an off-white vanishing cream base. It is a yellow to light orange-brown, low-melting solid or viscous liquid. Each gram of Acticin cream, 5%, contains permethrin 50 mg (5%) and the inactive ingredients butylated hydroxytoluene, carbomer 934P, coconut oil, glycerin, glyceryl stearate, isopropyl myristate, lanolin alcohols, light mineral oil, polyoxyethylene cetyl ethers, purified water, and sodium hydroxide. Formaldehyde 1 mg (0.1%) is added as a preservative.
- Aldara: Each gram of the 5% cream contains 50 mg of imiquimod in an off-white oil-in-water vanishing cream base consisting of isostearic acid, cetyl alcohol, stearyl alcohol, white petrolatum, polysorbate 60, sorbitan monostearate, glycerin, xanthan gum, purified water, benzyl alcohol, methyl paraben, and propyl paraben.
- Anbesol, active ingredients: Anbesol is an oral anesthetic which is available in a maximum strength gel and liquid. Anbesol Junior, available in a gel, is an oral anesthetic. Baby Anbesol, available in a grape-flavored gel, is an oral anesthetic and is alcohol free. Maximum strength Anbesol gel and liquid contain benzocaine, 20%. Anbesol junior gel contains benzocaine, 10%. Baby Anbesol gel contains benzocaine, 7.5%. Inactive ingredients: Maximum strength gel: Benzyl alcohol, carbomer 934P, D&C Yellow No. 10, FD&C Blue No. 1, FD&C Red No. 40, flavor, glycerin, methyl paraben, polyethylene glycol, propylene glycol, saccharin. Maximum strength liquid: Benzyl alcohol, D&C Yellow No. 10, FD&C Blue No. 1, FD&C Red No. 40, flavor, methyl paraben, polyethylene glycol, propylene glycol, saccharin. Junior gel: Artificial flavor, benzyl alcohol, carbomer 934P, D&C Red No. 33, glycerin, methyl paraben, polyethylene glycol, potassium acesulfame. Grape baby gel: Benzoic acid, carbomer 934P, D&C Red No. 33, edetate disodium, FD&C Blue No. 1, flavor, glycerin, methyl paraben, polyethylene glycol, propyl paraben, saccharin, water.
- AndroGel® (testosterone gel), 1%, is a clear, colorless hydroalcoholic gel containing 1% testosterone. AndroGel provides continuous transdermal delivery of testosterone, the primary circulating endogenous androgen, for 24 hours following a single application to intact, clean dry skin of the shoulders, upper arms, and/or abdomen. A daily application of AndroGel 5 g, 7.5 g, or 10 g contains 50 mg, 75 mg, or 100 mg of testosterone respectively, to be applied daily to the skin's surface. Approximately 10% of the applied testosterone dose is absorbed across skin of average permeability during a 24-hour period. The active pharmacologic ingredient in AndroGel is testosterone. Testosterone USP is a white to practically white crystalline powder. Inactive ingredients in AndroGel are ethanol, 67.0%, purified water, sodium hydroxide, carbomer 980, and isopropyl myristate; these ingredients are not pharmacologically active.
- Avar™-E emollient cream (sodium sulfacetamide, 10%, and sulfur, 5%) in each gram contains 100 mg of sodium sulfacetamide and 50 mg of colloidal sulfur in an emollient cream vehicle containing purified water, isostearyl palmitate, glyceryl stearate and PEG-100 stearate, sodium lactate USP, glycerin USP, self-emulsifying wax NF, zinc oxide USP, benzyl alcohol NF, nicotinamide, cetyl alcohol NF, dimethicone, sodium thiosulfate, phenoxyethanol, disodium EDTA, fragrance. Each gram of Avar-E green cream (sodium sulfacetamide 10% and sulfur 5%) color corrective emollient cream contains 100 mg of sodium sulfacetamide and 50 mg of colloidal sulfur in an emollient cream vehicle containing purified water, isostearyl palmitate, glyceryl stearate and PEG-100 stearate, sodium lactate USP, glycerin USP, self-emulsifying wax NF, zinc oxide USP, benzyl alcohol NF, chromium oxide green, nicotinamide, cetyl alcohol NF, dimethicone, sodium thiosulfate, phenoxyethanol, disodium EDTA, fragrance.
- Avar gel (sodium sulfacetamide 10% and sulfur 5%) in each gram contains 100 mg of sodium sulfacetamide and 50 mg of colloidal sulfur in an aqueous-based emollient gel vehicle containing purified water USP, sodium magnesium silicate, emulsifying lipids, nicotinamide, disodium EDTA, sodium thiosulfate, zinc oxide, benzyl alcohol, phenoxyethanol, glycerin, xanthan gum, sodium lactate, polyacrylamide, C13-C14 isoparaffin, laureth-7, fragrance. Each gram of Avar green (sodium sulfacetamide, 10%, and sulfur, 5%) color corrective gel contains 100 mg of sodium sulfacetamide and 50 mg of colloidal sulfur in an aqueous-based emollient gel vehicle containing purified water USP, sodium magnesium silicate, emulsifying lipids, nicotinamide, disodium EDTA, sodium thiosulfate, zinc oxide, benzyl alcohol, phenoxyethanol, glycerin, xanthan gum, sodium lactate, polyacrylamide, C13-C14 isoparaffin, laureth-7, fragrance, chromium oxide green.

- Avita® cream, a topical retinoid, contains tretinoin 0.025% by weight in a hydrophilic cream vehicle of stearic acid, polyolprepolymer-2, isopropyl myristate, polyoxyl 40 stearate, propylene glycol, stearyl alcohol, xanthan gum, sorbic acid, butylated hydroxytoluene, and purified water.
- Avita gel, a topical retinoid, contains tretinoin 0.025% by weight in a gel vehicle of butylated hydroxytoluene, hydroxypropyl cellulose, polyolprepolymer-2, and ethanol (denatured with tertiary butyl alcohol and brucine sulfate) 83% w/w.
- BenzaClin® topical gel contains clindamycin phosphate. BenzaClin topical gel also contains benzoyl peroxide for topical use. Each gram of BenzaClin topical gel contains, as dispensed, 10 mg (1%) clindamycin as phosphate and 50 mg (5%) benzoyl peroxide in a base of carbomer, sodium hydroxide, dioctyl sodium sulfosuccinate, and purified water.
- Brevoxyl-4 creamy wash and Brevoxyl-8 creamy wash are topical preparations containing benzoyl peroxide as the active ingredient. Brevoxyl-4 creamy wash and Brevoxyl-8 creamy wash contain 4% and 8% benzoyl peroxide respectively, in a lathering cream vehicle containing cetostearyl alcohol, cocamidopropyl betaine, cornstarch, dimethyl isosorbide, glycerin, glycolic acid, hydrogenated castor oil, imidurea, methyl paraben, mineral oil, peg-14 M, purified water, sodium hydroxide, sodium PCA, sodium potassium lauryl sulfate, titanium dioxide.
- Brevoxyl-4 gel and Brevoxyl-8 gel are topical preparations containing benzoyl peroxide 4% and 8% respectively, as the active ingredient in a gel vehicle containing purified water, cetyl alcohol, dimethyl isosorbide, fragrance, simethicone, stearyl alcohol, and ceteareth-20.
- Camptosar injection (irinotecan hydrochloride injection) is supplied as a sterile, pale yellow, clear, aqueous solution. It is available in two single-dose sizes: 2 mL fill vials contain 40 mg irinotecan hydrochloride, and 5 mL fill vials contain 100 mg irinotecan hydrochloride. Each milliliter of solution contains 20 mg of irinotecan hydrochloride (on the basis of the trihydrate salt), 45 mg of sorbitol NF powder, and 0.9 mg of lactic acid, USP. The pH of the solution has been adjusted to 3.5 (range: 3.0–3.8) with sodium hydroxide or hydrochloric acid. Camptosar is intended for dilution with 5% dextrose injection, USP (D5W), or 0.9% sodium chloride injection, USP, prior to intravenous infusion. The preferred diluent is 5% dextrose injection, USP.
- Carac® (fluorouracil cream) cream, 0.5%, contains fluorouracil for topical dermatologic use. Carac cream contains 0.5% fluorouracil, with 0.35% being incorporated into a patented porous microsphere (Microsponge) composed of methyl methacrylate/glycol dimethacrylate crosspolymer and dimethicone. The cream formulation contains the following other inactive ingredients: Carbomer 940, dimethicone, glycerin, methyl gluceth-20, methyl methacrylate/glycol dimethacrylate crosspolymer, methyl paraben, octyl hydroxy stearate, polyethylene glycol 400, polysorbate 80, propylene glycol, propyl paraben, purified water, sorbitan monooleate, stearic acid, and trolamine.
- Caverject contains alprostadil as the naturally occurring form of prostaglandin E 1. Caverject Impulse is available as a disposable, single-dose dual-chamber syringe system. The system includes a glass cartridge, which contains sterile, freeze-dried alprostadil in the front chamber and sterile bacteriostatic water for injection in the rear chamber. The alprostadil is reconstituted with the sterile bacteriostatic water just before injection. Caverject Impulse is available in two strengths for intracavernosal administration: (1) 10 μg—the reconstituted solution has a volume of 0.64 mL. The delivered volume, 0.5 mL, contains 10 μg of alprostadil, 324.7 μg of alpha-cyclodextrin, 45.4 mg of lactose, 23.5 μg of sodium citrate, and 4.45 mg of benzyl alcohol. (2) 20 μg—the reconstituted solution has a volume of 0.64 mL. The delivered volume, 0.5 mL, contains 20 μg of alprostadil, 649.3 μg of alpha-cyclodextrin, 45.4 mg of lactose, 23.5 μg of sodium citrate, and 4.45 mg of benzyl alcohol. When necessary, the pH of the alprostadil for injection was adjusted with hydrochloric acid and/or sodium hydroxide before lyophilization.
- Claripel cream, active ingredient: Hydroquinone USP 4%. Other ingredients: Avobenzone, ceteareth-20, cetostearyl alcohol, citric acid, diethylaminoethyl stearate, dimethicone, edetate disodium, glyceryl dilaurate, glyceryl monostearate, glyceryl stearate, PEG-100 stearate, hydroxyethyl cellulose, methyl paraben, octyldodecyl stearoyl stearate, octinoxate, oxybenzone, polysorbate 80, propylene glycol, propyl gallate, propyl paraben, purified water, quaternium-26, sodium metabisulfite, sodium PCA, squalane, ubiquinone, stearyl alcohol, water, glycerin, *Rumex occidentalis* extract.
- Cleocin vaginal ovules are semisolid, white to off-white suppositories for intravaginal administration. Each 2.5-g suppository contains clindamycin phosphate equivalent to 100 mg clindamycin in a base consisting of a mixture of glycerides of saturated fatty acids.
- Climara Pro™ (estradiol/levonorgestrel transdermal system) is an adhesive-based matrix transdermal patch designed to release both estradiol and levonorgestrel, a progestational agent, continuously upon application to intact skin. The 22 cm^2 Climara Pro system contains 4.40 mg estradiol and 1.39 mg levonorgestrel and provides a nominal delivery rate (mg/d) of 0.045 estradiol and 0.015 levonorgestrel. The Climara Pro system comprises three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are

(1) a translucent polyethylene backing film, (2) an acrylate adhesive matrix containing estradiol and levonorgestrel, and (3) a protective liner of either siliconized or fluoropolymer-coated polyester film. The protective liner is attached to the adhesive surface and must be removed before the system can be used. The active components of the system are estradiol and levonorgestrel. The remaining components of the system (acrylate copolymer adhesive and polyvinylpyrrolidone/vinyl acetate copolymer) are pharmacologically inactive.

- Climara®, estradiol transdermal system, is designed to release 17(beta)-estradiol continuously upon application to intact skin. Six (6.5, 9.375, 12.5, 15.0, 18.75, and 25.0 cm^2) systems are available to provide nominal in vivo delivery of 0.025, 0.0375, 0.05, 0.060, 0.075, or 0.1 mg respectively of estradiol per day. The period of use is 7 days. Each system has a contact surface area of either 6.5, 9.375, 12.5, 15.0, 18.75, or 25.0 cm^2 and contains 2.0, 2.85, 3.8, 4.55, 5.7, or 7.6 mg of estradiol USP respectively. The composition of the systems per unit area is identical. The Climara system comprises three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are (1) a translucent polyethylene film and (2) an acrylate adhesive matrix containing estradiol USP. A protective liner (3) of siliconized or fluoropolymer-coated polyester film is attached to the adhesive surface and must be removed before the system can be used. The active component of the system is 17(beta)-estradiol. The remaining components of the system (acrylate copolymer adhesive, fatty acid esters, and polyethylene backing) are pharmacologically inactive.
- Clindagel® (clindamycin phosphate gel) topical gel, 1%, a topical antibiotic, contains clindamycin phosphate, USP, at a concentration equivalent to 10 mg clindamycin per gram in a gel vehicle consisting of carbomer 941, methyl paraben, polyethylene glycol 400, propylene glycol, sodium hydroxide, and purified water.
- Clindesse™ is a semisolid white cream, which contains clindamycin phosphate, USP, at a concentration equivalent to 20 mg clindamycin base per gram. The cream also contains edetate disodium, glycerol monoisostearate, lecithin, methyl paraben, microcrystalline wax, mineral oil, polyglyceryl-3-oleate, propyl paraben, purified water, silicon dioxide, and sorbitol solution.
- Clobevate® (clobetasol propionate gel) for topical administration contains clobetasol propionate 0.5 mg in a base of propylene glycol, carbomer 934P, sodium hydroxide, and purified water.
- Colace® (glycerin) suppositories, active ingredient (per suppository): Colace suppositories contain glycerin, USP 2.1 g. Inactive ingredients: Purified water, sodium hydroxide, stearic acid. Colace suppositories contains glycerin, USP 1.2 g.
- CombiPatch® (estradiol/norethindrone acetate transdermal system) is an adhesive-based matrix transdermal patch. The remaining components of the system are pharmacologically inactive. Two systems are available, providing the following delivery rates of estradiol and norethindrone acetate: 9 cm^2 round 0.62 mg estradiol and 2.7 mg NETA; release rates: 0.05/0.14 mg/d; 16 cm^2 round 0.51 estradiol and 4.8 mg NETA; release rates 0.05/0.25 mg/d respectively. Estradiol USP (estradiol) is a white to creamy-white, odorless crystalline powder. Norethindrone acetate USP is a white to creamy-white, odorless crystalline powder. CombiPatch transdermal systems are comprised of three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are (1) a translucent polyolefin film backing; (2) an adhesive layer containing estradiol, norethindrone acetate, acrylic adhesive, silicone adhesive, oleyl alcohol, oleic acid NF, povidone USP, and dipropylene glycol; and (3) a polyester-release protective liner, which is attached to the adhesive surface and must be removed before the system can be used.
- Cutivate (fluticasone propionate ointment) ointment, 0.005%, contains fluticasone propionate, a synthetic fluorinated corticosteroid for topical dermatologic use. Each gram of Cutivate ointment contains fluticasone propionate 0.05 mg in a base of liquid paraffin, microcrystalline wax, propylene glycol, and sorbitan sesquioleate. Each gram of Cutivate lotion contains 0.5 mg fluticasone propionate in a base of cetostearyl alcohol, isopropyl myristate, propylene glycol, cetomacrogol 1000, dimethicone 360, citric acid, sodium citrate, and purified water, with imidurea, methyl paraben, and propyl paraben as preservatives. Each gram of Cutivate cream contains fluticasone propionate 0.5 mg in a base of propylene glycol, mineral oil, cetostearyl alcohol, ceteth-20, isopropyl myristate, dibasic sodium phosphate, citric acid, purified water, and imidurea as preservative.
- Denavir containing penciclovir is available for topical administration as a 1% white cream. Each gram of Denavir contains 10 mg of penciclovir and the following inactive ingredients: Cetomacrogol 1000 BP, cetostearyl alcohol, mineral oil, propylene glycol, purified water, and white petrolatum.
- Diastat rectal delivery system is a nonsterile diazepam gel provided in a prefilled, unit-dose, rectal delivery system. Diastat contains 5 mg/mL diazepam, propylene glycol, ethyl alcohol (10%), hydroxypropylmethylcellulose, sodium benzoate, benzyl alcohol (1.5%), benzoic acid, and water. Diastat is clear to slightly yellow and has a pH between 6.5 and 7.2. Diazepam, the active ingredient of Diastat, is a benzodiazepine anticonvulsant with the chemical name 7-chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1, 4-benzodiazepin-2-one.

- Differin® (adapalene) cream, 0.1%, contains adapalene 0.1% in an aqueous cream emulsion consisting of carbomer 934P, cyclomethicone, edetate disodium, glycerin, methyl glucose sesquistearate, methyl paraben, PEG-20 methyl glucose sesquistearate, phenoxyethanol, propyl paraben, purified water, squalane, and trolamine.
- Dilaudid suppositories (for rectal administration) contain 3 mg hydromorphone hydrochloride in a cocoa butter base with silicon dioxide.
- Dinoprostone vaginal insert is a thin, flat polymeric slab, which is rectangular in shape with rounded corners contained within the pouch of an off-white knitted polyester retrieval system. Each slab is buff-colored, semitransparent, and contains 10 mg of dinoprostone in a hydrogel insert. An integral part of the knitted polyester retrieval system is a long tape designed to aid retrieval at the end of the dosing interval or earlier if clinically indicated. The finished product is a controlled-release formulation, which has been found to release dinoprostone in vivo at a rate of approximately 0.3 mg/h. Each insert contains 10 mg of dinoprostone in 241 mg of a cross-linked polyethylene oxide/urethane polymer which is a semi-opaque, beige-colored, flat rectangular slab measuring 29 mm × 9.5 mm × 0.8 mm in thickness. The insert and its retrieval system, made of polyester yarn, are nontoxic and when placed in a moist environment absorb water, swell, and release dinoprostone.
- Diprolene® ointment contains betamethasone dipropionate. Each gram of Diprolene ointment 0.05% contains 0.643 mg betamethasone dipropionate. USP (equivalent to 0.5 mg betamethasone), in Actibase®, an optimized vehicle of propylene glycol, propylene glycol stearate (55% monoester), white wax, and white petrolatum.
- Diprolene AF cream, 0.05%, contains betamethasone dipropionate. Each gram of Diprolene AF cream 0.05% contains 0.643 mg betamethasone dipropionate, USP (equivalent to 0.5 mg betamethasone), in an emollient cream base of purified water, USP; chlorocresol; propylene glycol, USP; white petrolatum, USP; white wax, NF; cyclomethicone; sorbitol solution, USP; glyceryl oleate/propylene glycol; ceteareth-30; carbomer 940, NF; and sodium hydroxide.
- Diprolene gel contains betamethasone dipropionate. Each gram of Diprolene gel contains 0.643 mg betamethasone dipropionate, USP (equivalent to 0.5 mg betamethasone), in an augmented gel base of purified water, USP; propylene glycol, USP; carbomer 940, NF; and sodium hydroxide, NF or R. May also contain phosphoric acid, NF, to adjust the pH to approximately 4.5.
- Diprolene lotion contains betamethasone dipropionate. Each gram of Diprolene lotion 0.05% contains 0.643 mg betamethasone dipropionate, USP (equivalent to 0.5 mg betamethasone), in a lotion base of purified water; isopropyl alcohol (30%); hydroxypropyl cellulose; propylene glycol; sodium phosphate monobasic monohydrate R; phosphoric acid used to adjust the pH to 4.5.
- Diprosone cream, 0.05%, contains betamethasone dipropionate. Each gram of Diprosone cream 0.05% contains 0.643 mg betamethasone dipropionate, USP (equivalent to 0.5 mg betamethasone), in a hydrophilic emollient cream consisting of purified water, USP; mineral oil, USP; white petrolatum, USP; ceteareth-30; cetearyl alcohol 70/30 (7.2%); sodium phosphate monobasic monohydrate R; and phosphoric acid, NF; chlorocresol and propylene glycol, USP as preservatives. May also contain sodium hydroxide R to adjust pH to approximately 5.
- Dovonex® (calcipotriene ointment) ointment, 0.005%, contains calcipotriene 50 μg/g in an ointment base of dibasic sodium phosphate, edetate disodium, mineral oil, petrolatum, propylene glycol, tocopherol, steareth-2, and water. Dovonex (calcipotriene cream) cream, 0.005%, contains calcipotriene monohydrate, a synthetic vitamin D_3 derivative, for topical dermatological use. Calcipotriene monohydrate is a white or off-white crystalline substance. Dovonex cream contains calcipotriene monohydrate equivalent to 50 μg/g anhydrous calcipotriene in a cream base of cetearyl alcohol, ceteth-20, diazolidinyl urea, dichlorobenzyl alcohol, dibasic sodium phosphate, edetate disodium, glycerin, mineral oil, petrolatum, and water.
- Duac® topical gel contains clindamycin phosphate, equivalent to 1% clindamycin, and 5% benzoyl peroxide. Each gram of Duac topical gel contains 10 mg (1%) clindamycin, as phosphate and 50 mg (5%) benzoyl peroxide in a base consisting of carbomer 940, dimethicone, disodium lauryl sulfosuccinate, edetate disodium, glycerin, silicon dioxide, methyl paraben, poloxamer, purified water, and sodium hydroxide.
- Duac topical gel contains clindamycin phosphate, equivalent to 1% clindamycin, and 5% benzoyl peroxide. Each gram of Duac topical gel contains 10 mg (1%) clindamycin, as phosphate, and 50 mg (5%) benzoyl peroxide in a base consisting of carbomer 940, dimethicone, disodium lauryl sulfosuccinate, edetate disodium, glycerin, silicon dioxide, methyl paraben, poloxamer, purified water, and sodium hydroxide.
- Efudex cream is a topical preparation containing the fluorinated pyrimidine 5-fluorouracil. Efudex cream contains 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60, and parabens (methyl and propyl).
- Elidel® (pimecrolimus) cream, 1%, contains the compound pimecrolimus. Each gram of Elidel cream, 1%, contains 10 mg of pimecrolimus in a whitish

cream base of benzyl alcohol, cetyl alcohol, citric acid, mono- and diglycerides, oleyl alcohol, propylene glycol, sodium cetostearyl sulphate, sodium hydroxide, stearyl alcohol, triglycerides, and water.

- Elocon® (mometasone furoate cream) cream, 0.1%, contains mometasone furoate, USP, for dermatologic use. Each gram of Elocon cream 0.1% contains 1 mg mometasone furoate, USP, in a cream base of hexylene glycol, phosphoric acid, propylene glycol stearate (55% monoester), stearyl alcohol and ceteareth-20, titanium dioxide, aluminum starch octenylsuccinate (gamma irradiated), white wax, white petrolatum, and purified water.
- Elocon (mometasone furoate ointment, USP) ointment, 0.1%, contains mometasone furoate, USP, for dermatologic use. Each gram contains 1 mg mometasone furoate, USP, in an ointment base of hexylene glycol, phosphoric acid, propylene glycol stearate (55% monoester), white wax, white petrolatum, and purified water.
- Elocon (mometasone furoate topical solution) lotion, 0.1%, contains mometasone furoate, USP, for dermatologic use. Each gram of Elocon lotion, 0.1%, contains 1 mg mometasone furoate, USP, in a lotion base of isopropyl alcohol (40%), propylene glycol, hydroxypropyl cellulose, sodium phosphate monobasic monohydrate R, and water. May also contain phosphoric acid used to adjust the pH to approximately 4.5.
- Elspar (asparaginase): The specific activity of Elspar is at least 225 IU/mg of protein, and each vial contains 10,000 IU of asparaginase and 80 mg of mannitol, an inactive ingredient, as a sterile, white lyophilized plug or powder for intravenous or intramuscular injection after reconstitution.
- Erygel® topical gel contains erythromycin. Each gram of Erygel topical gel contains 20 mg of erythromycin, USP, in a base of alcohol 92% and hydroxypropyl cellulose.
- EstroGel® (estradiol gel) contains 0.06% estradiol in an absorptive hydroalcoholic gel base formulated to provide a controlled release of the active ingredient. An EstroGel unit dose of 1.25 g contains 0.75 mg of estradiol. The active component of the transdermal gel is estradiol. The remaining components of the gel (purified water, alcohol, triethanolamine, and carbomer 934P) are pharmacologically inactive.
- Evoclin (clindamycin phosphate) foam, 1%, a topical antibiotic in a foam vehicle, contains clindamycin phosphate, USP, at a concentration equivalent to 10 mg clindamycin per gram in a vehicle consisting of cetyl alcohol, dehydrated alcohol (ethanol 58%), polysorbate 60, potassium hydroxide, propylene glycol, purified water, and stearyl alcohol, pressurized with a hydrocarbon (propane/butane) propellant.
- Finacea® (azelaic acid) gel, 15%: Each gram of Finacea gel, 15%, contains 0.15 g azelaic acid (15% w/w) as the active ingredient in an aqueous gel base containing benzoic acid (as a preservative), disodium-EDTA, lecithin, medium-chain triglycerides, polyacrylic acid, polysorbate 80, propylene glycol, purified water, and sodium hydroxide to adjust pH.
- Gynazole 1® (butoconazole nitrate) vaginal cream, 2%, contains butoconazole nitrate 2%, an imidazole derivative with antifungal activity. Gynazole 1 contains 2% butoconazole nitrate in a cream of edetate disodium, glyceryl monoisostearate, methyl paraben, mineral oil, polyglyceryl-3 oleate, propylene glycol, propyl paraben, colloidal silicon dioxide, sorbitol solution, purified water, and microcrystalline wax.
- Hydrocortisone, 1%, inactive ingredients: BHA, car-boxymethylcellulose sodium, cetyl alcohol, citric acid, edetate disodium, glycerin, glyceryl oleate, glyceryl stearate, lanolin, methyl paraben, petrolatum, propyl gallate, propylene glycol, propyl paraben, simethicone, sodium benzoate, sodium lauryl sulfate, stearyl alcohol, water, xanthan gum.
- Indocin suppositories for rectal use contain 50 mg of indomethacin and the following inactive ingredients: Butylated hydroxyanisole, butylated hydroxytoluene, edetic acid, glycerin, polyethylene glycol 3350, polyethylene glycol 8000, and sodium chloride.
- Klaron® (sodium sulfacetamide lotion) lotion, 10%, contains 100 mg of sodium sulfacetamide in a vehicle consisting of purified water; propylene glycol; lauramide DEA (and) diethanolamine; polyethylene glycol 400, monolaurate; hydroxyethyl cellulose; sodium chloride; sodium metabisulfite; methyl paraben; xanthan gum; EDTA; and simethicone.
- Loprox® gel (ciclopirox), 0.77%: Each gram of Loprox gel contains 7.70 mg of ciclopirox in a gel consisting of purified water USP, isopropyl alcohol USP, octyldodecanol NF, dimethicone copolyol 190, carbomer 980, sodium hydroxide NF, and docusate sodium USP. Loprox gel is a white slightly fluid gel.
- Lotrimin cream contains 10 mg clotrimazole, USP, in a vanishing cream base of benzyl alcohol NF (1%), cetearyl alcohol 70/30 (10%), cetyl esters wax NF, octyldodecanol NF, polysorbate 60 NF, sorbitan monostearate NF, and purified water USP.
- Lotrisone cream and lotion contain combinations of clotrimazole and betamethasone dipropionate. Each gram of Lotrisone cream contains 10 mg clotrimazole and 0.643 mg betamethasone dipropionate (equivalent to 0.5 mg betamethasone) in a hydrophilic cream consisting of purified water, mineral oil, white petrolatum, cetyl alcohol plus stearyl alcohol, ceteareth-30, propylene glycol, sodium phosphate monobasic monohydrate, and phosphoric acid; benzyl alcohol as preservative.
- Lotrisone lotion contains 10 mg clotrimazole and 0.643 mg betamethasone dipropionate (equivalent to 0.5 mg betamethasone) in a hydrophilic base of purified water, mineral oil, white petrolatum, cetyl

alcohol plus stearyl alcohol, ceteareth-30, propylene glycol, sodium phosphate monobasic monohydrate, and phosphoric acid; benzyl alcohol as a preservative. Lotrisone lotion may contain sodium hydroxide.

- Lustra-Ultra™, USP 4%, other ingredients (Lustra®): Purified water USP, phenyl trimethicone, glycerin 99% USP, glyceryl stearate (and) PEG-100 stearate, alcohol, cetyl alcohol NF, cyclopentasiloxane (and) polysilicone-11, linoleic acid, glycolic acid, polyacrylamide (and) c13-14 isoparaffin (and) laureth-7, cetearyl alcohol (and) ceteareth-20, triethanolamine 99% USP, tocopheryl acetate USP, hydrogenated lecithin, phenoxyethanol, magnesium 1-ascorbyl phosphate NF, benzyl alcohol NF, dimethiconol, sodium metabisulfite NF, sodium citrate USP, disodium EDTA USP, butylated hydroxytoluene, vitamin E USP, carbomer NF, fragrance. Other ingredients (Lustra-AF®): Purified water USP, octyl methoxycinnamate, glycerin 99% USP, phenyl trimethicone, glyceryl stearate (and) PEG-100 stearate, cetyl alcohol NF, alcohol, avobenzone, cyclopentasiloxane (and) polysilicone-11, linoleic acid, glycolic acid, polyacrylamide (and) C 13-14 isoparaffin (and) laureth-7, cetearyl alcohol (and) ceteareth-20, triethanolamine 99% USP, hydrogenated lecithin, tocopheryl acetate USP, phenoxyethanol, benzyl alcohol NF, magnesium 1-ascorbyl phosphate NF, dimethiconol, sodium metabisulfite NF, sodium citrate USP, disodium EDTA USP, butylated hydroxytoluene, vitamin E USP, carbomer NF, fragrance. Other ingredients (Lustra-Ultra): Purified water USP, octinoxate USP, propylene glycol USP, cetyl alcohol NF, glyceryl stearate (and) PEG-100 stearate, avobenzone USP, cyclomethicone NF, cetearyl glucoside, capric caprylic triglyceride, microcrystalline wax NF, dimethicone NF, magnesium ascorbyl phosphate, polysorbate 20 NF, xanthan gum NF, retinol, sodium metabisulfite NF, methyl paraben NF, disodium EDTA USP, propyl paraben NF, vitamin E USP
- Luxiq contains betamethasone valerate, USP. Each gram of Luxiq contains 1.2 mg betamethasone valerate, USP, in a hydroalcoholic, thermolabile foam. The foam also contains cetyl alcohol, citric acid, ethanol (60.4%), polysorbate 60, potassium citrate, propylene glycol, purified water, and stearyl alcohol and is dispensed from an aluminum can pressurized with a hydrocarbon propellant (propane/butane).
- Mederma® is a topical gel for scar treatment. Ingredients: Water (purified), PEG-4, *Allium cepa* (onion) bulb extract, xanthan gum, allantoin, fragrance, methyl paraben, sorbic acid.
- Menostar, estradiol transdermal system, is designed to provide nominal in vivo delivery of 14 μg 17(beta)-estradiol per day continuously upon application to intact skin. The period of use is 7 days. The transdermal system has a contact surface area of 3.25 cm^2 and contains 1 mg of estradiol USP. The Menostar transdermal system comprises three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are (1) a translucent polyethylene film and (2) an acrylate adhesive matrix containing estradiol USP. A protective liner (3) of siliconized or fluoropolymer-coated polyester film is attached to the adhesive surface and must be removed before the transdermal system can be used. The active component of the transdermal system is 17(beta)-estradiol. The remaining components of the transdermal system (acrylate copolymer adhesive, fatty acid esters, and polyethylene backing) are pharmacologically inactive.
- Mentax® cream, 1%, contains the synthetic antifungal agent, butenafine hydrochloride. Each gram of Mentax cream, 1%, contains 10 mg of butenafine HCl in a white cream base of purified water USP, propylene glycol dicaprylate, glycerin USP, cetyl alcohol NF, glyceryl monostearate SE, white petrolatum USP, stearic acid NF, polyoxyethylene (23) cetyl ether, benzyl alcohol NF, diethanolamine NF, and sodium benzoate NF.
- Metrogel-Vaginal is the intravaginal dosage form of the synthetic antibacterial agent, metronidazole, USP, at a concentration of 0.75%. Metrogel-Vaginal is a gelled, purified water solution containing metronidazole at a concentration of 7.5 mg/g (0.75%). The gel is formulated at pH 4. The gel also contains carbomer 934P, edetate disodium, methyl paraben, propyl paraben, propylene glycol, and sodium hydroxide. Each applicator full of 5 g of vaginal gel contains approximately 37.5 mg of metronidazole.
- Naftin® cream, 1%, contains naftifine hydrochloride 1%. Inactive ingredients: Benzyl alcohol, cetyl alcohol, cetyl esters wax, isopropyl myristate, polysorbate 60, purified water, sodium hydroxide, sorbitan monostearate, and stearyl alcohol. Hydrochloric acid may be added to adjust pH.
- Naftin gel, 1%, contains naftifine hydrochloride. Naftin gel, 1%, is for topical use only. Active ingredient: Naftifine hydrochloride, 1%. Inactive ingredients: Polysorbate 80, carbomer 934P, diisopropanolamine, edetate disodium, alcohol (52% v/v), and purified water.
- Nitro-Dur (nitroglycerin) transdermal infusion system is a flat unit designed to provide continuous controlled release of nitroglycerin through intact skin. The rate of release of nitroglycerin is linearly dependent upon the area of the applied system; each square centimeter of applied system delivers approximately 0.02 mg of nitroglycerin per hour. Thus, the 5, 10, 15, 20, 30, and 40 cm^2 systems deliver approximately 0.1, 0.2, 0.3, 0.4, 0.6, and 0.8 mg of nitroglycerin per hour respectively. The remainder of the nitroglycerin in each system serves as a reservoir and is not delivered in normal use. After 12 hours, for example, each system has delivered approximately 6%

of its original content of nitroglycerin. The Nitro-Dur transdermal system contains nitroglycerin in acrylic-based polymer adhesives with a resinous cross-linking agent to provide a continuous source of active ingredient. Each unit is sealed in a paper polyethylene-foil pouch.

- Noritate® (metronidazole cream) cream, 1%, is an emollient cream; each gram contains 10 mg micronized metronidazole USP, in a base of purified water USP, stearic acid NF, glyceryl monostearate NF, glycerin USP, methyl paraben NF, trolamine NF, and propyl paraben NF.
- Olux foam contains clobetasol propionate, USP. Each gram of Olux Foam contains 0.5 mg clobetasol propionate, USP, in thermolabile foam, which consists of cetyl alcohol, citric acid, ethanol (60%), polysorbate 60, potassium citrate, propylene glycol, purified water, and stearyl alcohol. Olux foam is dispensed from an aluminum can pressurized with a hydrocarbon propellant (propane/butane).
- Ovide lotion contains 0.005 g of malathion per milliliter in a vehicle of isopropyl alcohol (78%), terpineol, dipentene, and pine needle oil.
- Oxistat cream and lotion, Oxistat cream contains 10 mg of oxiconazole per gram of cream in a white to off-white opaque cream base of purified water USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, cetyl alcohol NF, and benzoic acid USP 0.2% as a preservative. Oxistat lotion contains 10 mg of oxiconazole per gram of lotion in a white to off-white opaque lotion base of purified water USP, white petrolatum USP, stearyl alcohol NF, propylene glycol USP, polysorbate 60 NF, cetyl alcohol NF, and benzoic acid USP 0.2% as a preservative.
- Oxytrol (oxybutynin) transdermal system is designed to deliver oxybutynin continuously and consistently over a 3 to 4 day interval after application to intact skin. Oxytrol is available as a 39 cm^2 system containing 36 mg of oxybutynin. Oxytrol has a nominal in vivo delivery rate of 3.9 mg oxybutynin per day through skin of average permeability (interindividual variation in skin permeability is approximately 20%).
- Panafil ointment contains papain, USP (not less than 405,900 USP units of activity based on Lot I0C389 per gram of ointment), urea, USP 10%, and chlorophyllin copper complex sodium USP 0.5% in a hydrophilic base composed of boric acid, chlorobutanol (anhydrous) as a preservative, polyoxyl 40 stearate, propylene glycol, purified water, sodium borate, sorbitan monostearate, stearyl alcohol, and white petrolatum.
- Pandel cream contains hydrocortisone probutate. Each gram of Pandel (hydrocortisone probutate cream) cream, 0.1%, contains 1 mg of hydrocortisone probutate in a cream base of propylene glycol, white petrolatum, light mineral oil, stearyl alcohol, polysorbate 60, sorbitan monostearate, glyceryl monostearate, PEG-20 stearate, glyceryl stearate SE, methyl paraben, butylparaben, citric acid, sodium citrate anhydrous, and purified water.
- Permethrin lotion, each fluid ounce contains active ingredient: Permethrin 280 mg (1%). Inactive ingredients: Balsam fir Canada, cetyl alcohol, citric acid, FD&C Yellow No. 6, fragrance, hydrolyzed animal protein, hydroxyethyl cellulose, polyoxyethylene 10 cetyl ether, propylene glycol, stearalkonium chloride, water, isopropyl alcohol 5.6 g (20%), methyl paraben 56 mg (0.2%), and propyl paraben 22 mg (0.08%).
- Premarin®, each gram of Premarin (conjugated estrogens) vaginal cream contains 0.625 mg conjugated estrogens, USP, in a non-liquefying base containing cetyl esters wax, cetyl alcohol, white wax, glyceryl monostearate, propylene glycol monostearate, methyl stearate, benzyl alcohol, sodium lauryl sulfate, glycerin, and mineral oil. Premarin vaginal cream is applied intravaginally. Premarin (conjugated estrogens) vaginal cream contains a mixture of conjugated estrogens obtained exclusively from natural sources, occurring as the sodium salts of water-soluble estrogen sulfates blended to represent the average composition of material derived from pregnant mares' urine. It is a mixture of sodium estrone sulfate and sodium equilin sulfate. It contains as concomitant components, as sodium sulfate conjugates, 17-alpha-dihydroequilin, 17-alpha-estradiol, and 17-beta-dihydroequilin.
- Preparation H is available in ointment, cream, gel, and suppository product forms. The ointment contains petrolatum, 71.9%, mineral oil, 14%, shark liver oil, 3%, and phenylephrine HCl, 0.25%. The maximum strength cream contains white petrolatum, 15%, glycerin, 14.4%, pramoxine HCl, 1%, and phenylephrine HCl, 0.25%. The suppositories contain cocoa butter, 85.5%, shark liver oil, 3%, and phenylephrine HCl, 0.25%. The cooling gel contains phenylephrine HCl, 0.25%, and witch hazel, 50%. Inactive ingredients: Ointment: Benzoic acid, BHA, BHT, corn oil, glycerin, lanolin, lanolin alcohol, methyl paraben, paraffin, propyl paraben, thyme oil, tocopherol, water, wax. Maximum strength cream: Aloe barbadensis leaf extract, BHA, carboxymethylcellulose sodium, cetyl alcohol, citric acid, edetate disodium, glyceryl stearate, laureth-23, methyl paraben, mineral oil, panthenol, propyl gallate, propylene glycol, propyl paraben, purified water, sodium benzoate, steareth-2, steareth-20, stearyl alcohol, tocopherol, vitamin E, xanthan gum. Suppositories: Methyl paraben, propyl paraben, starch. Cooling gel: Aloe barbadensis gel, benzophenone-4, edetate disodium, hydroxyethyl cellulose, methyl paraben, polysorbate 80, propylene glycol, propyl paraben, sodium citrate, vitamin E, water.

- Prochieve® (progesterone gel) is a bioadhesive vaginal gel containing micronized progesterone in an emulsion system, which is contained in single-use, one-piece polyethylene vaginal applicators. The carrier vehicle is an oil-in-water emulsion containing the water-swellable, but insoluble, polymer, polycarbophil. The progesterone is partially soluble in both the oil and water phases of the vehicle, with the majority of the progesterone existing as a suspension. Physically, Prochieve has the appearance of a soft, white to off-white gel. The active ingredient, progesterone, is present in either a 4% or an 8% concentration (w/w). Progesterone exists in two polymorphic forms. Form 1, which is the form used in Prochieve, exists as white orthorhombic prisms with a melting point of 127°C to 131°C. Each applicator delivers 1.125 g of Prochieve gel containing either 45 mg (4% gel) or 90 mg (8% gel) of progesterone in a base containing glycerin, mineral oil, polycarbophil, carbomer 934P, hydrogenated palm oil glyceride, sorbic acid, purified water, and may contain sodium hydroxide. Form 2, which is not used in pharmaceutical dosage forms, is thermodynamically unstable.
- Proctofoam®-HC (hydrocortisone acetate, 1%, and pramoxine hydrochloride, 1%) is a topical aerosol foam for anal use containing hydrocortisone acetate, 1%, and pramoxine hydrochloride, 1%, in a hydrophilic base containing cetyl alcohol, emulsifying wax, methyl paraben, polyoxyethylene-10-stearyl ether, propylene glycol, propyl paraben, purified water, trolamine, and inert propellants: Isobutane and propane.
- Protopic (tacrolimus) ointment contains (w/w) either 0.03% or 0.1% of tacrolimus in a base of mineral oil, paraffin, propylene carbonate, white petrolatum, and white wax.
- Psoriatec (anthralin cream, 1%, USP) is a smooth yellow cream containing 1% anthralin USP in an aqueous cream base of glyceryl monolaurate, glyceryl monomyristate, citric acid, sodium hydroxide, and purified water.
- Rosac cream, each gram of Rosac® cream with sunscreens contains 100 mg of sodium sulfacetamide and 50 mg of sulfur in a cream containing avobenzone, benzyl alcohol, C12-15 alkyl benzoate, cetostearyl alcohol, dimethicone, edetate disodium, emulsifying wax, monobasic sodium phosphate, octinoxate, propylene glycol, purified water, sodium thiosulfate, steareth-2, steareth-21.
- Sulfamylon cream is a soft, white, non-staining, water-miscible, anti-infective cream for topical administration to burn wounds. Each gram of Sulfamylon cream contains mafenide acetate equivalent to 85 mg of the base. The cream vehicle consists of cetyl alcohol, stearyl alcohol, cetyl esters wax, polyoxyl 40 stearate, polyoxyl 8 stearate, glycerin, and water, with methyl paraben, propyl paraben, sodium metabisulfite, and edetate disodium as preservatives.
- Temovate (clobetasol propionate cream and ointment) cream contains clobetasol propionate 0.5 mg/g in a cream base of propylene glycol, glyceryl monostearate, cetostearyl alcohol, glyceryl stearate, PEG-100 stearate, white wax, chlorocresol, sodium citrate, citric acid monohydrate, and purified water. Temovate ointment contains clobetasol propionate 0.5 mg/g in a base of propylene glycol, sorbitan sesquioleate, and white petrolatum.
- Temovate (clobetasol propionate gel) contains clobetasol propionate 0.5 mg/g in a base of propylene glycol, carbomer 934P, sodium hydroxide, and purified water.
- Temovate (clobetasol propionate scalp application) contains clobetasol propionate 0.5 mg/g in a base of purified water, isopropyl alcohol (39.3%), carbomer 934P, and sodium hydroxide.
- Testim® (testosterone gel) is a clear to translucent hydroalcoholic topical gel containing 1% testosterone. Testim provides continuous transdermal delivery of testosterone for 24 hours, following a single application to intact, clean, dry skin of the shoulders and upper arms. The active pharmacological ingredient in Testim is testosterone.
- Vivelle® (estradiol transdermal system) contains estradiol in a multi-polymeric adhesive. The system is designed to release estradiol continuously upon application to intact skin. Five systems are available to provide nominal in vivo delivery of 0.025, 0.0375, 0.05, 0.075, or 0.1 mg of estradiol per day via skin of average permeability. Each corresponding system having an active surface area of 7.25, 11.0, 14.5, 22.0, or 29.0 cm^2 contains 2.17, 3.28, 4.33, 6.57, or 8.66 mg of estradiol USP respectively. The composition of the systems per unit area is identical. The Vivelle system comprises three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are (1) a translucent flexible film consisting of an ethylene vinyl alcohol copolymer film, a polyurethane film, urethane polymer, and epoxy resin; (2) an adhesive formulation containing estradiol USP, acrylic adhesive, polyisobutylene, ethylene vinyl acetate copolymer, 1,3-butylene glycol, styrene-butadiene rubber, oleic acid NF, lecithin, propylene glycol, bentonite NF, mineral oil USP, and dipropylene glycol; and (3) a polyester release liner that is attached to the adhesive surface and must be removed before the system can be used. The active component of the system is estradiol. The remaining components of the system are pharmacologically inactive.
- Thera-Gesic, active ingredients: Methyl salicylate 25%, menthol 4%. Inactive ingredients: Aloe vera, carbomer 980, dimethicone, glycerin, methyl paraben, propyl paraben, sodium lauryl sulfate, trolamine, water.

- Topicort® LP (desoximetasone) cream, 0.05%, Topicort (desoximetasone) cream, 0.25%, Topicort (desoximetasone) gel, 0.05%, and Topicort (desoximetasone) ointment, 0.25%, contain the active synthetic corticosteroid desoximetasone. Each gram of Topicort LP cream, 0.05%, contains 0.5 mg of desoximetasone in an emollient cream base consisting of white petrolatum, purified water, isopropyl myristate, lanolin alcohols, mineral oil, cetostearyl alcohol, and edetate disodium. Each gram of Topicort cream, 0.25%, contains 2.5 mg of desoximetasone in an emollient cream base consisting of white petrolatum, purified water, isopropyl myristate, lanolin alcohols, mineral oil, and cetostearyl alcohol. Each gram of Topicort gel, 0.05%, contains 0.5 mg of desoximetasone in a gel base consisting of purified water, docusate sodium, edetate disodium, isopropyl myristate, carbomer 940, trolamine, and SDAG-3, 95% alcohol. Each gram of Topicort ointment, 0.25%, contains 2.5 mg of desoximetasone in an ointment base consisting of white petrolatum and fractionated coconut oil.
- Tri-Luma® cream (fluocinolone acetonide, 0.01%, hydroquinone, 4%, tretinoin, 0.05%) contains fluocinolone acetonide, USP, hydroquinone, USP, and tretinoin, USP, in a hydrophilic cream base for topical application. Each gram of Tri-Luma cream contains active ingredients: Fluocinolone acetonide, 0.01% (0.1 mg), hydroquinone, 4% (40 mg), and tretinoin, 0.05% (0.5 mg). Inactive ingredients: Butylated hydroxytoluene, cetyl alcohol, citric acid, glycerin, glyceryl stearate, magnesium aluminum silicate, methyl gluceth-10, methyl paraben, PEG-100 stearate, propyl paraben, purified water, sodium metabisulfite, stearic acid, and stearyl alcohol.
- U-Kera™ is a keratolytic emollient, which is a gentle, yet potent, tissue softener for nails and/or skin. Each gram of U-Kera contains urea USP (40%), purified water USP, light mineral oil NF, white petrolatum USP, glycolic acid, propylene glycol USP, trolamine NF, glyceryl stearate SE, cetyl alcohol NF, L-arginine USP, and xanthan gum NF.
- Vanos™ (fluocinonide) cream, 0.1%, 1 mg micronized fluocinonide in a cream base of propylene glycol USP, dimethyl isosorbide, glyceryl stearate (and) PEG-100 stearate, glyceryl monostearate NF, purified water USP, Carbopol 980 NF, diisopropanolamine, and citric acid USP.
- Vicks® VapoRub® active ingredients: Camphor, 4.8%, eucalyptus oil, 1.2%, menthol, 2.6%.
- Vivelle-Dot® (estradiol transdermal system) contains estradiol in a multi-polymeric adhesive. The system is designed to release estradiol continuously upon application to intact skin. Five dosage strengths of Vivelle-Dot are available to provide nominal in vivo delivery rates of 0.025, 0.0375, 0.05, 0.075, or 0.1 mg of estradiol per day via the skin. Each corresponding system has an active surface area of 2.5, 3.75, 5.0, 7.5, or 10.0 cm^2 and contains 0.39, 0.585, 0.78, 1.17, or 1.56 mg of estradiol USP respectively. The composition of the systems per unit area is identical. Vivelle-Dot is comprised of three layers. Proceeding from the visible surface toward the surface attached to the skin, these layers are (1) a translucent polyolefin film; (2) an adhesive formulation containing estradiol, acrylic adhesive, silicone adhesive, oleyl alcohol, NF, povidone, USP, and dipropylene glycol; and (3) a polyester release liner which is attached to the adhesive surface and must be removed before the system can be used. The active component of the system is estradiol. The remaining components of the system are pharmacologically inactive.
- Zovirax ointment, 5%, contains 50 mg of acyclovir in a polyethylene glycol (PEG) base. Zovirax cream, 5%, is a formulation for topical administration. Each gram of Zovirax cream, 5%, contains 50 mg of acyclovir and the following inactive ingredients: Cetostearyl alcohol, mineral oil, poloxamer 407, propylene glycol, sodium lauryl sulfate, water, and white petrolatum.

PART II Manufacturing Formulations

PART III Cosmetic Formulations

PART IV Tablet Coating Formulations

Preface to the Series—Third Edition

I am humbled by the wide praise and acceptance of the last two editions of the *Handbook of Pharmaceutical Formulations*, a six-volume series that found home in the R&D laboratories of just about every pharmaceutical company, both generic and branded, and in the classrooms of pharmaceutical technology; and the regulatory agencies used this treatise to compare the quality of pharmaceutical products. In creating this work, back in 2004, my primary objective was to provide a ready source of safe and scalable generic and new pharmaceutical formulations that take a long time to develop and incur a substantial cost, to enable the availability of affordable medicines.

Each of the six volumes in the series has a structured content. Part I includes regulatory guidance, formulation steps, references to active ingredients and excipients, and a self-audit guidance for cGMP compliance. Chapters of common interest to all volumes are distributed across the six volumes, such as the formulations for coating solutions are presented in Volume 5 (OTC), though they are also pertinent to Volume 1 (Compressed Dosage Forms), and global bioequivalence testing guidelines are provided in Volume 4 (Semisolids), though they apply to all volumes. Part II includes scalable formulations and Part III, where applicable, other general formulations. The appendices include a listing of excipients used in FDA approved products and a cGMP compliance self-testing tool. Whereas the main focus of the guidance provided in the handbook pertains to compliance with FDA requirements, these apply equally to EU requirements, and, as a result, to any global agency.

The third edition also gets several significant additions; now each volume includes a self-audit template, several chapters advising how to stay cGMP compliant, including a listing of most common FDA citations to look out for in the audits, a global regulatory focus and an updated list of excipients and the level of their incorporation in the FDA-approved products. The number of formulations is also increased, and the OTC volume now contains several cosmetic formulations, and the semisolid product volume also includes details on chewing gum delivery systems.

The updating of formulations is always cumulative as there is little need to remove any formulation provided previously—if it was right then, it shall remain good now. However, a variety of new drug delivery systems have evolved since the second edition was published, so I have included more details on these formulations, although some of these may not be available to practice due to possible limitations on the intellectual property.

As always, I advise the formulators to be aware of any intellectual property infringements as I cannot provide a guarantee to this effect.

Finally, I wish to acknowledge the leaders of the pharmaceutical world, to whom each of the volumes is dedicated. I have made a few changes to those whom the volumes are dedicated, to recognize those who have since passed away; they provided a role model to me and thousands of leaders and students of pharmacy over the decades of their careers. They are gone, but not without leaving an indelible mark on the profession.

I also consider myself fortunate to have the sponsorship and assistance of the great folks at the CRC Press, more particularly Jessica Poile and Hilary LaFoe. The teams at the CRC Press were very kind to put up with my redundant changes to the manuscript and were extremely generous in their advice in balancing the scientific and practical knowledge and, above all, making sure that the book was framed and published in the highest professional presentation. As always, I take responsibility for any mistakes and errors in my writing, and I am always open to suggestions by the readers to make future editions. I can be contacted at niazi@niazi.com.

Preface to the Series—Second Edition

The science and the art of pharmaceutical formulation keeps evolving as new materials, methods, and machines become readily available to produce more reliable, stable, and release-controlled formulations. At the same time, globalization of sourcing of raw and finished pharmaceuticals brings challenges to regulatory authorities and results in more frequent revisions to the current good manufacturing practices, regulatory approval dossier requirements, and the growing need for cost optimization. Since the publication of the first edition of this book, a lot has changed in all of these areas of importance to pharmaceutical manufacturers. The second edition builds on the dynamic nature of the science and art of formulations and provides an evermore useful handbook that should be highly welcomed by the industry, the regulatory authorities, as well as the teaching institutions.

The first edition of this book was a great success as it brought under one umbrella the myriad of choices available to formulators. The readers were very responsive and communicated with me frequently pointing out to the weaknesses as well as the strengths of the book. The second edition totally revised attempts to achieve these by making major changes to the text, some of which include:

1. Complete, revised errors corrected and subject matter reorganized for easy reference. Whereas this series has six volumes differentiated on the basis of the type of dosage form and a separate inclusion of the U.S. OTC products, ideally the entire collection is needed to benefit from the myriad of topics relating to formulations, regulatory compliance, and dossier preparation.
2. Total number of pages is increased from 1684 to 2726.
3. Total number of formulations is expanded by about 30% with many newly approved formulations.
4. Novel formulations are now provided for a variety of drugs; these data are collected from the massive intellectual property data and suggest toward the future trend of formulations. While some of these formulations may not have been approved in the United States or Europe, these do provide additional choices, particularly for the NDA preparation. As always, it is the responsibility of the manufacturer to assure that the intellectual property rights are not violated.
5. A significant change in this edition is the inclusion of commercial products; while most of this information is culled out from the open source such as the FOIA (http://www.fda.gov/foi/default.htm), I have made attempts to reconstruct the critical portions of it based on what I call the generally acceptable standards. The drug companies are advised to assure that any intellectual property rights are not violated and this applies to all information contained in this book. The freedom of information act (FOIA) is an extremely useful conduit for reliable information and manufacturers are strongly urged to make use of this information. Whereas this information is provided free of charge, the process of obtaining the information may be cumbersome, in which case, commercial sources of these databases can prove useful, particularly for the non-U.S. companies.
6. Also included are the new Good Manufacturing Guidelines (2007) with amendments (2008) for the United States and similar updates for European Union and WHO; it is strongly urged that the companies discontinue using all old documents as there are significant changes in the revised form, and many of them are likely to reduce the cost of GMP compliance.
7. Details on design of clean rooms is a new entry that will be of great use to sterile product manufacturers; whereas the design and flow of personnel and material flow is of critical nature, regulatory agencies view these differently and the manufacturer is advised always to comply with most stringent requirements.
8. Addition of a self-auditing template in each volume of the series. While the cGMP compliance is a complex issue and the requirements diversified across the globe, the basic compliance remains universal. I have chosen the European Union guidelines (as these are more in tune with the ICH) to prepare a self-audit module that I recommend that every manufacturer adopt as a routine to assure GMP compliance. In most instances reading the template by those responsible for compliance with keep them sensitive to the needs of GMP.
9. OTC products cross-referenced in other volumes where appropriate. This was necessary since the regulatory authorities worldwide define this class of drug differently. It is important to iterate that regardless of the prescription or the OTC status of a product, the requirements for compliance with the cGMP apply equally.
10. OTC monograph status is a new section added to the OTC volume and this should allow manufacturers to chose appropriate formulations that may not require a filing with the regulatory agencies; it is important to iterate that an approved OTC monograph includes details of formulation including the types and quantities of active drug and excipients, labeling, and presentation. To qualify the exemption, the manufacturer must comply with the monograph in its entirety. However, subtle modifications that are merely cosmetic in nature and where there is an evidence that

the modification will not affect the safety and efficacy of the products can be made but require prior approval of the regulatory agencies and generally these approvals are granted.

11. Expanded discussion on critical factors in the manufacturing of formulations provided; from basic shortcuts to smart modifications now extend to all dosage forms. Pharmaceutical compounding is one of the oldest professions and whereas the art of formulations has been relegated to more objective parameters, the art nevertheless remains. An experienced formulator, like an artist, would know what goes with what and why; he avoids the pitfalls and stays with conservative choices. These sections of the book present advice that is time tested, although it may appear random at times; this is intended for experienced formulators.
12. Expanded details on critical steps in the manufacturing processes provided but to keep the size of the book manageable, and these are included for prototype formulations. The reader is advised to browse through similar formulations to gain more insight. Where multiple formulations are provided for the same drug, it intended to show the variety of possibilities in formulating a drug and whereas it pertains to a single drug, the basic formulation practices can be extended to many drugs of same class or even of diversified classes. Readers have often requested that more details be provided in the Manufacturing Direction sections. Whereas sufficient details are provided, this is restricted to prototype formulations to keep the size of the book manageable and to reduce redundancy.
13. Addition of a listing of approved excipients and the level allowed by regulatory authorities. This new section allows formulators a clear choice on which excipients to choose; the excipients are reported in each volume pertaining to the formulation type covered. The listing is drawn from the FDA-approved entities. For the developers of an ANDA, it is critical that the level of excipients be kept within the range generally approved to avoid large expense in justifying any unapproved level. The only category for which the listing is not provided separately is the OTC volume since it contains many dosage forms and the reader is referred to dosage form–specific title of the series. The choice of excipients forms keeps increasing with many new choices that can provide many special release characteristics to the dosage forms. Choosing correct excipients is thus a tedious exercise and requires sophisticated multivariate statistical analysis. Whereas the formulator may choose any number of novel or classical components, it is important to know the levels of excipients that are generally allowed in various formulations to reduce the cost of redundant exercises; I have therefore included, as an appendix to each volume, a list of all excipients that are currently approved by the U.S. FDA along their appropriate levels. I suggest that a formulator consult this table before deciding on which level of excipient to use; it does not mean that the excipient cannot be used outside this range but it obviates the need for a validation and lengthy justification studies in the submission of NDAs.
14. Expanded section on bioequivalence submission was required to highlight the recent changes in these requirements. New entries include a comprehensive listing of bioequivalence protocols in abbreviated form as approved by the U.S. FDA; these descriptions are provided in each volume where pertinent. To receive approval for an ANDA, an applicant must generally demonstrate, among other things, equivalence of the active ingredient, dosage form, strength, route of administration and conditions of use as the listed drug, and that the proposed drug product is bioequivalent to the reference listed drug [21 USC 355(j)(2)(A); 21 CFR 314.94(a)]. Bioequivalent drug products show no significant difference in the rate and extent of absorption of the therapeutic ingredient [21 U.S.C. 355(j)(8); 21 CFR 320.1(e)]. BE studies are undertaken in support of ANDA submissions with the goal of demonstrating BE between a proposed generic drug product and its reference listed drug. The regulations governing BE are provided at 21 CFR in part 320. The U.S. FDA has recently begun to promulgate individual bioequivalence requirements. To streamline the process for making guidance available to the public on how to design product-specific BE studies, the U.S. FDA will be issuing product-specific BE recommendations (www.fda.gov/cder/ogd/index.htm). To make this vital information available, an appendix to each volume includes a summary of all currently approved products by the U.S. FDA where a recommendation on conducting bioequivalence studies is made available by the U.S. FDA. When filing an NDA or an ANDA, the filer is faced with the choice of defending the methods used to justify the bioavailability or bioequivalence data. The U.S. FDA now allows application for waiver of bioequivalence requirement; a new chapter on this topic has been added along with details of the dissolution tests, where applicable, approved for various dosage forms.
15. Dissolution testing requirements are included for all dosage forms where this testing is required by the FDA. Surrogate testing to prove efficacy and compliance is getting more acceptance at regulatory agencies; in my experience, a well-designed dissolution test is the best measure of continuous compliance. Coupled with chapters on waivers of bioequivalence testing, this information on dissolution testing should be great value to all manufacturers; it is recommended that manufacturers develop their own in-house specifications, more stringent than those allowed in these listings and the USP.

16. Best-selling products (top 200 prescription products) are identified with an asterisk and a brand name where applicable; in all instances, composition of these products is provided and formulation of generic equivalents. Despite the vast expansion of pharmaceutical sales and shifting of categories of blockbuster drugs, basic drugs affecting gastrointestinal tract, vascular system, and brain remain most widely prescribed.
17. Updated list of approved coloring agents in the United States, Canada, European Union, and Japan is included to allow manufactures to design products for worldwide distribution.
18. Tablet-coating formulations that meet worldwide requirements of color selection are included in the Volume 1 (compressed solids) and Volume 5 (OTC) because these represent the products often coated.
19. Guidelines on preparing regulatory filings are now dispersed throughout the series depending on where these guidelines are more crucial. However, the reader would, as before, need access to all volumes to benefit from the advice and guidelines provided.

As always, comments and criticism from the readers are welcomed and these can be sent to me at Niazi@pharmsci .com or Niazi@niazi.com. I would try to respond to any inquiries requiring clarification of the information enclosed in these volumes.

I would like to express deep gratitude to Sherri R. Niziolek and Michelle Schmitt-DeBonis at Informa, the publisher of this work, for seeing an immediate value to the readers in publishing the second edition of this book and allowing me enough time to prepare this work. The diligent editing and composing staff at Informa, particularly Joseph Stubenrauch, Baljinder Kaur and others are highly appreciated. Regardless, all errors and omissions remain altogether mine.

In the first edition, I had dedicated each volume to one of my mentors; the second edition continues the dedication to these great teachers.

Preface to the Series—First Edition

No industry in the world is more highly regulated than the pharmaceutical industry because of potential threat to a patient's life from the use of pharmaceutical products. The cost of taking a new chemical entity (amortized over the cost of all molecules racing) to final regulatory approval is a staggering $800 million, making the pharmaceutical industry one of the most research-intensive industries in the world. In the year 2004, it is anticipated that the industry will spend about $20 billion on research and development. The generic market of drugs as the new entities come off patent is one of the fastest growing segments of the pharmaceutical industry, with every major multinational company having a significant presence in this field.

Whereas many stages of new drug development are inherently constrained with time, the formulation of drugs into desirable dosage forms remains an area where expediency can be practiced with appropriate knowledge by those who have mastered the skills of pharmaceutical formulations. The *Handbook of Pharmaceutical Manufacturing Formulations*—is the first major attempt to consolidate the available knowledge about formulations in a comprehensive, and by nature a rather voluminous, presentation.

The book is divided into six volumes, based strictly on the type of formulation science involved in the development of these dosage forms: sterile products, compressed solids, uncompressed solids, liquid products, semisolid products, and OTC products. The separation of OTC products, even though they may easily fall into one of the other five categories, is made to comply with the industry norms of separate research divisions for OTC products. Sterile products require skills related to sterilization of product, and of less importance is the bioavailability issue, which is an inherent problem of compressed dosage forms. These types of considerations have led to the classification of products into these six categories.

Each volume includes a description of regulatory filing techniques for the formulations described. Also included are the current regulatory guidelines on cGMP compliance specific to the dosage form. Advice is offered on how to scale up the production batches.

It is expected that formulation scientists will use this information to benchmark their internal development protocols and cut the race to file short by adopting formulae that have survived the test of time. Many of us who have worked in the pharmaceutical industry suffer from a close paradigm when it comes to selecting formulations—"not invented here" perhaps reigns in the mind of many seasoned formulations scientists subconsciously when they prefer to choose only a certain platform for development. It is expected that with the quick review of possibilities available to formulate made available in this book, scientists will benefit from the experience of others.

For the teachers of formulation sciences, this series offers a wealth of information. Whether it is a selection of a preservative system or the choice of a disintegrant, the series offers a wide choice to study and rationalize.

Many have assisted me in the development of this work that has taken years to compile, and I thank scores of my graduate students and colleagues for their help. A work of this size cannot be produced without errors, although I hope that these errors do not distract the reader from the utility of the book. I would sincerely appreciate if readers point out these mistakes for corrections in future editions.

Sarfaraz K. Niazi, Ph.D.

Preface to the Volume—First Edition

The *Handbook of Pharmaceutical Manufacturing Formulations* OTC Drugs is written for the pharmaceutical scientist and others involved in the regulatory filing and manufacturing of new OTC products. Because of the wide variety of products involved, from those bordering on cosmetics to proton pump inhibitors, the OTC products are manufactured by the most sophisticated global manufacturers as well as small one-room makeshift manufacturing houses.

The OTC products comprise a special category of healthcare products in that they can be dispensed without prescription; the rationale being that the use of these products does not expose patients to serious risks associated with side effects even if some misuse or overuse of these products occurs. The OTC category includes three types of products:

Products that require full filing with the U.S. Food and Drug Administration (FDA) for marketing approval (the NDA/NADA or ANDA/ANADA process) including products or compositions not included in the monographs (see below) or administered in controlled release formulations.

Products that do not require filing with the U.S. FDA because they comply with the monographs issued by the U.S. FDA in its Code of Federal Regulations (CFR).

Products that fall under the category of grandfather products which have been in use prior to the 1960s and have not been specifically excluded by the FDA; not all grandfather products fall under the OTC category—only those that are generally regarded as safe (GRAS).

The U.S. FDA provides excellent support through its OTC website (http://www.fda.gov/cder/otc/index.htm) and formulators are highly encouraged to make use of the information available, particularly the updates in the monograph label requirements and withdrawal of approvals of formulations.

With the safety of consumers in mind, the U.S. FDA is in the process of establishing guidelines for all OTC products. Although the U.S. FDA began this work over three decades ago, much remains to be done. The U.S. FDA process begins with the issuance of Proposed Rules; this notification is like a warning (or advice) to the industry that this category of products is now under the U.S. FDA watch. Often years go by before Proposed Rules are published in the Code of Federal Regulations. The Proposed Rules include not only identification of approved active ingredients but also inactive ingredients that are deemed compatible with the active ingredients and safe for consumers. The Proposed Rules are subject to criticism by the industry health-care practitioners and consumers. After receiving these comments over what can be a period of several years, the U.S. FDA issues Final Rules on a specific category of products; these become official on the date of publication in the Code of Federal Regulations. In many cases, however, the U.S. FDA issues subsequent rules either to delay application of Final Rules or to modify the Final Rules if new information has become available.

The Final Rule requirements have primarily been applied to products on the market and a newcomer is well advised to study competitor products for market leaders as ample opportunities are available to innovate these products. Examples include the Tylenol® Hot Therapy products and loratidine tablets that dissolve in the mouth and do not require water. I foresee more such products entering into the ever-competitive OTC market.

It is imperative that any prospective entry into the OTC market should begin with a thorough consultation of the Final Rules; an examination of Proposed Rules and notifications to issue Proposed Rules is also helpful in determining what rules are about to become Final Rules. Reviewing the discussions about Proposed Rules that have affected their finalization can be very helpful in understanding the relevant issues of safety, efficacy, and labeling. Because the marketing of OTC products requires a large investment in marketing efforts, it is prudent to develop a clear understanding of the legality of formulations and claims made in the initial phases of product development.

A large number of products on the market today are not covered by the U.S. FDA monographs but does that make them legitimate? This is the often-asked question. The U.S. FDA has limited resources to tackle everything that is out there on the market. When emergencies arise, however, the U.S. FDA reacts immediately as it did in the case of phenylpropanolamine, pseudoephedrine, and recently, kava. Here are some broad guidelines adopted by the U.S. FDA for the most commonly abused categories of products:

No treatments are approved for hair growth except for minoxidil.

No treatments are approved for enhancing sexual performance except for sildenafil citrate (and that only in MED).

The few treatments approved for weight loss include olristat phentermine and sibutramine (phenylpropanolamine is no longer a recommended compound).

It is noteworthy that the U.S. FDA does not differentiate between botanical products and chemical-based products. If a product bears an efficacy claim, it must be governed by the U.S. FDA rules; however, a product that falls into a drug category that makes nutritional claims falls under a food category with its own set of detailed rules. Vitamins and minerals fall under food labeling guidelines; however, a single-entity vitamin product with specific claims to treat or ameliorate a disease is a drug product. These definitions do not necessarily coincide with the rulings of regulatory authorities worldwide. In many countries nutritional products are controlled as drugs and require prescriptions; these same products would be considered nonprescription items in the United States.

On the other hand, a number of highly active drugs are available without prescription in many countries such as the Traditional Chinese Medicine (TCM) in China and Ayurvedic and Unani medicines in South Asia.

A reclassification of a drug to OTC status can be requested by drug manufacturers. Recent examples of such a prescription-to-OTC switch include ibuprofen (200 mg), ranitidine hydrochloride (75 mg), and loratidine (10 mg). Note that specific strengths, not necessarily the chemical entity itself, are made OTC. In other words, it is not necessary to have an official monograph to secure OTC status for a drug. The decision to request reclassification of a drug as OTC is always a well-calculated business decision. Generally, drugs with an OTC status will not qualify for medical reimbursement by insurance companies or federal assistance programs in the United States. This can substantially reduce sales of the product; on the other hand, ease of availability to a greater number of patients can easily compensate for this loss. The most lucrative opportunities arise when one strength is made OTC while other strengths remain available by prescription only.

It is noteworthy that the decision to allow a switch from prescription to OTC by the U.S. FDA is primarily driven by the side effects or toxicity of the drug. For example, in Australia a Roche request for a prescription-to-OTC switch for its weight-loss drug orlistat (Xenical®) was recently turned down because of extensive side effects associated with the use of Xenical. The drug itself is very safe as it does not enter the body and acts only locally to partially block absorption of fat. The unabsorbed fat produces many gastrointestinal symptoms which though temporary were sufficient to disallow the status switch. Obviously, Roche would have been best advised to develop an OTC formulation with fewer side effects before requesting this switch. (In the case of orlistat, the solution was simple as described in U.S. Patent No. 6,251,421 by this author wherein combining orlistat with a natural fiber reduced the side effects by 70%.)

The OTC category of products represents a wide range of dosage forms. These formulations have much in common with their prescription counterparts but are presented in this volume of the *Handbook of Pharmaceutical Manufacturing Formulations* because of the development approach taken, labeling considerations, and support available from suppliers of ingredients in designing these products. Because the consumer is inevitably involved in the selection of these products, packaging considerations are much more important than in the prescription category of products. Additional considerations include ease of administration, palatability, and stability in storage as consumers are likely to keep leftovers around for a long time. Additionally, price constraints often make it difficult to enjoy some freedom of choice in formulations, especially if the innovator company faces the competition of house brands. All of these considerations taken together make the OTC category one that should be presented in a single volume of this series of books.

Formulating OTC products is generally easier than formulating prescription products if the product is described in U.S. FDA monographs (either as Proposed Rules or Final Rules); such formulations become merely an exercise in mechanics. Whereas a manufacturer is not bound by these rules, complying with them reduces the costs and time involved securing approval from regulatory authorities. The multibillion-dollar market of OTC products has attracted major chemical suppliers to develop support ingredients that are much easier to use; they have also developed typical formulations for hundreds of these products.

The most notable industry leaders include

Amerchol, American Colloid, Aqualon, BASF, BF Goodrich, Calgon, Colorcon, Croda, Dow Corning, FMC, Gattefose, General Electric, Henkel, Hormel, Huls America, ICI Americas, Inolex, International Sourcing, International Specialty, Laboratoires Serobioligique, Lonza, NIPA, PPG Industries, R.I.T.A., Reheis, Rheox, Rhone-Poulenc, Rohm and Haas, Southern Clay, Sutton, and Vanderbilt.

The formulations recommended by these and other companies have acquired almost a universal appeal; throughout this book you will find formulations recommended by these laboratories, as acknowledged by the listing of a brand name in the formula. The best way to connect to these companies is to search the Internet for contact information; it is no longer necessary to reproduce such information here. Whereas many companies prefer to use generic components in the dosage form, it has been found that the use of proprietary components can indeed reduce costs in the long run.

The choice of color is a highly sensitive issue in the formulation of OTC products; only FDC colors are allowed. Whereas there is a great need to make the products attractive and appealing, the choices of safe colors are dwindling quickly, such as for red colors. The formulator is encouraged to review the status of approved colors around the world before committing to a specific color.

Many OTC solid dosage forms are available in coated form. Sugar coatings have yielded to film coatings, and this book contains a large number of sugar-coating, seal-coating, subcoating, film-coating, and polish-coating formulations that can be easily adapted to various dosage form sizes. The use of organic solvent-based coatings has become prohibitive because of environment considerations, but in those cases where formulations are extremely sensitive to moisture, organic coatings may still offer a valid choice. A few companies offer ready-made coating formulations, and these are worth considering. The Appendix to this book includes a large number of formulations of coatings of solid dosage forms. A keen formulator will have no difficulty based on these formulations in adopting a coating system that will provide the necessary protection and offer esthetic appeal as well. Solid dosage forms are coated for many reasons, including masking the taste, making them easier to swallow, and providing protection against the environment.

Stability considerations remain paramount, and the data in the final packaging must be evaluated carefully before adjusting formulae for excesses; in this book, most formulations are provided without this consideration. A strip or blister dosage form is more popular around the world, but the plastic bottle is the most popular final form in the United States.

The development of OTC products is similar to the development of prescription dosage forms; as a result, cGMP and Good Laboratory Practice (GLP) considerations apply equally. The first chapter describes in greater detail the cGMP considerations. An appendix to chapter 1 provides a comprehensive checklist of items to review to ensure that a manufacturing facility is in compliance with cGMP standards. Appropriate identification is made in this checklist of those items that comply with EC guidelines. The U.S. FDA guidelines are available from the U.S. FDA website: http://www.fda.gov. The World Health Organization (WHO) provides GMP guidelines that are less stringent than those of the U.S. FDA and EC, and formulators should be aware of the fact that all of these are simply guidelines. One should be fully cognizant of the fact that no agencies are bound by these guidelines, particularly the U.S. FDA. Manufacturers cannot take refuge in the defense that they have complied with these guidelines. It is further worthwhile remembering that all of these guidelines are continuously revised, and the "c" in the cGMP does refer to current.

The second chapter deals with the most popular category of dosage forms encountered in OTC offerings—solids. Issues specific to manufacturing of these dosage forms are described from a practical viewpoint, indicating the problem areas frequently encountered in manufacturing practice.

The third chapter deals with liquids and suspensions and includes, like the chapter above, practical advice on how to bring manufacturing practices into compliance with regulatory requirements.

The fourth chapter offers highlights of cleaning validation, a topic often ignored by OTC manufacturers as not being significant because of the safety of ingredients used. It is true that the same stringent standards may not apply, but compliance with cleaning standards and validation of processes go a long way toward ensuring overall compliance.

The first four chapters were drawn from the advice which the U.S. FDA gives to its inspectors before they inspect a manufacturer. The CFR includes complete details of what is considered acceptable by the U.S. FDA; this advice is of a practical nature, and I find it to be extremely helpful in enhancing awareness of the guidelines of regulatory authorities. It is noteworthy that EC guidelines, particularly in light of the harmonization of specifications, are somewhat identical to the U.S. FDA guidelines; in chapter 1, specific references are made to EC guidelines. The Appendix includes formulations of coating solutions; these should prove useful for the pharmaceutical formulation teams.

The formulations in this book generally fall into three categories. Some formulations are presented in greater detail, including indications of where quality assurance (QA)/quality control (QC) sampling is to be done and describing the tooling and in-process and finished product specifications. The other extreme is a mere listing of components with a bare minimum of manufacturing methods. This was necessary for two reasons: first, to contain the size of this book, and second, to keep from presenting superfluous information, as formulators would eventually adopt such a formula to their own delivery forms. Also, at times the various strengths are merely achieved through adjustment of dosage size, so it was considered unnecessary to reproduce manufacturing steps where they are obvious.

The primary source of these formulations is publicly available knowledge about formulae that have proven to provide stable products. No representation is made that these formulations meet U.S. FDA monographs or any other regulatory guidelines for safety of inert ingredients. The formulator is advised to determine guideline compliance before adopting any of the formulations given in this book. Those interested in obtaining detailed information about these formulations are encouraged to contact the author at http://www.pharmsci.com. Because of the wide variety of sources from which the information has been gathered in the book, the format of formulations also varies. For example, in some instances scale is provided, whereas in others a percentage by weight is described. In still other instances, quantities for a specific batch size are provided. Obviously, it would be desirable to convert these formulations into a uniform format, but the task would be daunting and inevitably would lead to inclusion of errors. Professional formulators should not encounter any difficulty in adapting these formulations to their own system.

As mentioned before, not all formulations contain the required overages for stability considerations and losses during manufacturing; formulators are expected to develop these based on the final packaging chosen for the product. The author would appreciate being notified of any special problems encountered in adopting these formulations or of any errors (niazi@pharmsci.com). Whereas much care has gone into ensuring the accuracy of quantities and proper identification of ingredients, such errors shall remain in a work as large as that presented here.

Regulatory Guidance

Taylor & Francis
Taylor & Francis Group
http://taylorandfrancis.com

1 European Directorate for the Quality of Medicines (EDQM) Certification

European legislation does not require mandatory routine good manufacturing practice (GMP) inspections for active substance manufacturers. The responsibility for using only active substances that have been manufactured in accordance with GMP is placed on the holders of a manufacturing authorization. Art. 111 Directive 2001/83/EC (Art. 80 Directive 2001/82/EC for veterinary medicinal products), however, makes provision for GMP inspections of active substance manufacturing sites to be carried out at the request of the manufacturer itself. The request for the inspection should be made to the European Economic Area (EEA) competent authority where the site is located or, in case of sites located in third countries, to a competent authority where the active substance is used as a starting material in the manufacture of medicinal products. If this is not the case, any EEA authority can be approached. There is no guarantee that such a request will be fulfilled, as the competent authorities need to balance such requests with other priorities. It should also be borne in mind that an inspection does not replace the responsibility of the manufacturing authorization holder using the active substance in question as a starting material and will not be accepted alone as adequate assurance that the manufacturing authorization holder has fulfilled its responsibilities.

Manufacturing authorization holders sometimes confuse the role of inspectorates with their own obligations, but nevertheless, when inspection reports or GMP certificates issued by the EEA, Medicines and Healthcare Products Regulatory Agency (MHRA) partners, or other recognized authorities are available, these can provide useful information to manufacturing authorization holders. However, these alone cannot fulfill the statutory obligations of the manufacturing authorization holder or the requirements of section 5.25 of the GMP Guide, but the results of inspections may be used together with other supporting information in a risk-based approach by the manufacturer in establishing priorities for its own audit program of active substance suppliers.

A GMP certificate is a certificate issued, following a GMP inspection, by the competent authority responsible for carrying out the inspection to confirm the GMP compliance status of the inspected site. GMP certificates are site specific but can be restricted to particular activities depending on the scope of the inspection (e.g., manufacturing activities related to a specific product). Directives 2001/82/EC and 2001/83/EC, as amended, state that after every GMP inspection, and within 90 days of the inspection, a GMP certificate shall be issued to a manufacturer if the outcome of the inspection shows that the manufacturer complies with GMP.

Certificates of a medicinal product (CMPs) are product-specific certificates issued by the competent authority that granted the marketing authorization (the European Medicines Agency [EMA] issues CMPs on behalf of the European Commission for centrally authorized products), in the context of the World Health Organization (WHO) certification scheme on the quality of pharmaceutical products moving in international commerce, to confirm the marketing authorization status of the products. These certificates also confirm the GMP compliance status of the manufacturing site(s). CMPs are mainly used by companies to support applications to export their pharmaceutical products to countries with less developed regulatory systems.

CEPs are certificates issued by the European Directorate for the Quality of Medicines (EDQM) to confirm that a certain active substance is produced according to the requirements of the relevant monograph of the European Pharmacopoeia or of the monograph on transmissible spongiform encephalopathy (TSE). Certificates of Suitability to the monographs of the European Pharmacopoeia (CEPs) can be used by companies when submitting an application for marketing authorization and replace much of the documentation required for the active substance in the marketing authorization dossier. GMP inspections of active substance manufacturers can be requested by EDQM in the context of the CEP certification scheme.

EMEA does not perform inspections; they are carried out on its behalf by the national competent authorities of the member states of the EEA in connection with products under the centralized marketing authorization procedure. The competent authority responsible for carrying out the inspection issues the GMP certificate or makes an entry of noncompliance into the EudraGMP Database.

The EDQM allows raw material manufacturers to submit and secure approval for their active pharmaceutical ingredients (APIs) besides the approval of the finished products; such approvals are not available in the jurisdictions of the FDA. Given in the following is a submission requirement that can be used by the manufacturers to audit for the quality of the API in those instances where such certificates and/or DMF are not available.

1.2.3.S DRUG SUBSTANCE

A.2.3.S.1 General Information

Use of the substance: Route(s) of administration, maximum daily dose.

Commercialization history: Summarize the history based on the table in application form.

Declarations: Summarize the declarations appended to the application form:

- Manufacture of the substance in accordance with International Conference for Harmonisation (ICH) Q7A GMP rules
- Commitment by the manufacturer to keep the proposed holder informed of any changes to the documentation
- If applicable: manufacturer's authorization for X to act as representative
- Willingness to be inspected (holder, manufacturers)
- Nonuse/use of materials of human or animal origin in the process

1.2.3.S.1.1 Nomenclature

(a) Recommended international nonproprietary name (INN)
(b) Chemical name(s)
(c) Company or laboratory code
(d) Other nonproprietary name(s) (e.g., national name, United States Adopted Name [USAN], British Approved Name [BAN])
(e) CAS No.: Molecular Formula, MW

1.2.3.S.1.2 General Properties

Give summarized data on

(a) Physical description (e.g., appearance, color, physical state …)
(b) Physical form (e.g., polymorphic form, solvate, hydrate): to be commented especially if requested as grade
(c) Solubility and other properties as necessary
(d) Particle size: for example, nonmicronized, micronized, or any grade claimed as subtitle

2.3.S.2 MANUFACTURE

2.3.S.2.1 Manufacturer(s) (Name, Manufacturer) and Sites Involved in the Entire Process

Give the name, address, and responsibility of each manufacturer, including contractors and manufacturer, and each proposed production site or facility involved in manufacture.

2.3.S.2.2 Description of Manufacturing Process and Process Controls

(a) Give a brief narrative step-by-step description of the manufacturing process(es), and provide reference to detailed description in the documentation. Confirm the maximum batch size.
(b) If applicable, summarize alternate processes and give a short explanation of their use.
(c) Comment briefly on recovery of materials (solvents, reagents, and mother liquor) together with reprocessing steps, and give a brief justification.

2.3.S.2.3 Control of Materials

(I) Starting material(s)
  (a) Give summarized specifications (including impurities profile) including their justification based on studies of carryover.
    NB: If starting material is obtained by fermentation or is of herbal origin, summarize the information related to the nature of this material.

(II) Reagents and solvents
  Summarize the quality and controls of the materials (e.g., raw materials, solvents pure and/or recovered, reagents, and catalysts) used in the manufacture of the drug substance.

2.3.S.2.4 Controls of Critical Steps and Intermediates

Summary of the controls performed at critical steps of the manufacturing process and on intermediates; compare analytical procedures used for intermediates and final substance.

2.3.S.2.5 Process Validation and/or Evaluation

For aseptic processing and sterilization, only give the summary of process validation and/or evaluation studies.

2.3.S.3 CHARACTERIZATION

2.3.S.3.1 Impurities

(I) Related substances
  (a) Fill in the following table identifying related substances, their origin, and distinguishing between potential and actual impurities and comparing with impurity section of the monograph.

Chemical Name	Ph.Eur. Impurity	Applicant's Specifications	Ph.Eur. Specifications	Origin	Levels Found	LOD of the Method	LOQ of the Method

(b) *Justify these specifications based on* data observed for impurities in relevant batches.
(c) Discuss briefly the *suitability of the monograph* to control the potential impurities present in the substance (residual starting materials, reactants, reagents, etc.).
(d) *Specific discussion on possible genotoxic impurities:* Give a brief discussion on impurities with potential genotoxicity based on the requirements of the guideline.

(II) Residual solvent(s)/reagent(s)/catalyst(s)
(a) Fill in the following table.

Solvent/ Reagent/ Catalyst	Used in Step X/Y	Applicant's Limit	ICH Class/ Limit	Levels (PPM)	LOD of the Method	LOQ of the Method

(b) Discuss briefly the basis for setting the specification.

2.3.S.4 CONTROL OF THE DRUG SUBSTANCE

2.3.S.4.1 Specification

Give a table summarizing the proposed specifications.

2.3.S.4.2 Analytical Procedures

(a) Summarize the analytical procedures.

2.3.S.4.3 Validation of Analytical Procedures

Give the summary of the validation information for any in-house tests, and compare briefly with the method(s) described in the monograph (cross-validation).

2.3.S.4.4 Batch Analyses

(a) Give a short description of the batches: batch number, batch size, date, and site of production.
(b) Summarize the results for relevant batches (according to specifications and showing equivalence of any alternative supplier, process, etc.).

2.3.S.4.5 Justification of Specification

Justify the drug substance specification.

2.3.S.5 REFERENCE STANDARDS OR MATERIALS

(a) Give the source of primary reference standards or reference materials (e.g., Ph.Eur.) for final substance and its impurities where relevant.
(b) Summarize characterization and evaluation of in-house standards.

2.3.S.6 CONTAINER CLOSURE SYSTEM

(a) Describe briefly the container closure system(s) for the storage and shipment of the drug substance, as it has to be mentioned on the CEP in case a retest period is requested (i.e.. in a clear and understandable manner).
(b) Summarize the specifications (description + identification).

2.3.S.7 STABILITY

State retest period claimed for the substance and storage recommendations, if any.

2.3.S.7.1 Stability Summary and Conclusions

(a) Summarize accelerated and long-term testing (e.g., studies conducted, protocols used, and results obtained).
(b) Justify the retest period claimed based on data available.

2.3.S.7.2 Postapproval Stability Protocol and Stability Commitment

Give the stability protocol for commitment batches.

2 Solid Oral Dosage Forms Validation

I. INTRODUCTION

The *Validation Guidelines* issued by the Food and Drug Administration (FDA) in 1987 defines process validation as establishing documented evidence that provides a high degree of assurance that a specific process will consistently produce a product meeting its predetermined specifications and quality attributes. The three components of this definition are

- Documented evidence
- Consistency
- Predetermined specifications

Documented evidence includes the experiments, data, and analytical results that support the master formula, the in-process and finished product specifications, and the filed manufacturing process.

With regard to consistency, several batches would have to be manufactured, using the full-scale batch size, to demonstrate that a process meets the consistency test. At least three batches are needed to demonstrate consistency.

The development of a product and its manufacturing process and specifications, the design of the validation protocol, and the demonstration (validation) runs of the full-scale manufacturing process require scientific judgment based on good scientific data. The FDA expects that in-process control and product specifications will be established during the product development process, with the test batch serving as the critical batch used for the establishment of specifications.

Specifications, such as hardness and particle size, should be established prior to validation of the process; these specifications should be included in the validation protocol. Problems often arise when the product development runs of the process are used both to establish specifications and to demonstrate that the system is validated. In these cases, more in-depth inspection and evaluation will be required; some of these process runs often produce failing product because the product specifications have not been fully established and tested.

II. BACKGROUND

Two common complaints regarding validation issues have frequently been raised. The first concerns the misconception that the 1987 *Validation Guidelines* represents a new requirement. The second concerns the lack of specificity in the FDA's guides. In 1978, however, the current good manufacturing practice regulations (cGMPRs) were revised and provided for process validation, so this guideline does not represent a new requirement.

Both the FDA and the industry have recognized the need to establish general guidance for the validation of manufacturing processes, and the FDA published a draft guideline in 1983. However, this draft guideline was a very general document that addressed general principles and was applicable to both sterile and nonsterile drugs and devices. In 1984, the guideline was reissued as a draft guideline, and it was finalized in 1987. The 1987 *Validation Guidelines* merely points out the need to adequately develop and control manufacturing processes. It discusses microbiological issues and provides few specific and practical applications for the validation of manufacturing processes for a marketed solid oral dosage form.

The issue of retrospective validation and its application to marketed products is frequently encountered. This concept of using historical data (test results) along with process control and process specificity was of value until more scientific methods for demonstrating process validation evolved. It should be pointed out that retrospective validation is not merely the review of test results. It also requires that the manufacturing process be specific and the same each time a batch is manufactured. Thus, specific raw material specifications (including particle size when necessary), in-process specifications (tablet hardness, etc.), and specific manufacturing directions are required. Obviously, any failing batches attributed to the process would necessitate the conclusion that the process is not validated and is inadequate.

Prospective process validation is required, particularly for those products introduced in the last 7 to 8 years or those for which manufacturing changes have been made; however, in some cases where older products have been on the market without sufficient premarket process validation, it may be possible to validate, in some measure, the adequacy of the process by examination of accumulated test data on the product and records of the manufacturing procedures used.

III. PRODUCT DEVELOPMENT

A. Product Development Reports

No statute or regulation specifically requires a product development report, although companies are required to produce scientific data that justify the formulation and the manufacturing and control processes. Most companies use product development reports, technology transfer reports, and others to summarize the scientific data that justify the product and process. The product development report should satisfy the needs of the company. No specific format is required for the contents of the report.

It is suggested that a company develop a product development standard operating procedure (SOP) that describes the development process, the documentation requirements, and the individuals responsible for approving the filed process. This SOP can be brief, and again, no legal requirement exists

stating that companies must produce such an SOP. Failure to have a formal development report is not a GMP deficiency, nor is it a filing requirement to have a formal development report; however, where such reports *are* written, the development data found in these reports should include the following.

1. Drug Substance Characterization

Characterization of the chemical and physical properties of the drug substance is one of the most critical steps in the development of a solid dosage form. Chemical properties, especially the identification of impurities, are very important. In addition, the physical properties of the active pharmaceutical ingredient (API), such as solubility, polymorphism, hygroscopicity, particle size, density, etc., must be addressed. The literature and actual experience demonstrate that the physical quality (e.g., particle size of raw materials) can sometimes have a significant impact on the availability and clinical effect of a dosage form drug; therefore, it is appropriate that the physical characteristics of a drug substance be characterized, that the impact of the physical characteristics be determined, and that a specification for the bulk drug product be established, if necessary.

Development data will vary between new drugs and generics (e.g., characterization and establishment of specifications for the drug substance). In most cases, the manufacturing process for a new drug substance (new chemical entity) is developed and scaled up before the dosage form. In early development stages, very little information is available regarding polymorphic forms, solubility, etc. Consequently, changes to the manufacturing process for the drug substance may change the purity profile or physical characteristics and thus, cause problems with the finished dosage form. Although these types of problems are expected, the firm must investigate and document batch failures for the API and dosage form product.

On the other hand, generic manufacturers usually purchase drug substances from API manufacturers who may not be willing to supply information regarding the synthesis or analysis of the drug substance; therefore, the manufacturer of the finished dosage form must perform the appropriate tests to characterize the drug substance chemically and physically and establish appropriate specifications. This may require developing analytical methods to identify impurities. In some cases, this information can be obtained from literature searches.

In either case, it is important that each firm compare the drug substance used to manufacture the biobatch or clinical batch(es) and the drug substances used for the commercial batches, including specifications, analytical methods, and test results for the lots of each drug substance. Remember that the safety of the drug may be based upon the type and level of impurities, and different physical characteristics may affect dissolution or content uniformity. This is particularly important for those drug substances that are poorly soluble in water.

For those products on which biostudies have been conducted, the physical characteristics of the drug substance used for the study should serve as the basis for the physical specifications.

It is widely recognized that when discussing in vivo release rates and drug absorption rates, fast and immediate release is not always best. For some "immediate"-release drug products, such as carbamazepine tablets, a slower release is desired; therefore, it is frequently desirable to have minimum and maximum particle size specifications to control the release rate. For example, micronizing or milling a drug substance to provide a greater surface area of the substance may also result in faster dissolution and possibly, faster absorption and higher blood levels. Such changes to improve the dissolution may not always be desired.

In addition to release or dissolution, variation in particle size, particle shape, and/or bulk density can also have an effect on the uniformity of dosage forms, particularly those manufactured by direct compression or direct encapsulation.

Particulate solids, once mixed, have a tendency to segregate by virtue of differences in the shape, size, and density (other variables are also important) of the particles of which they are composed. This process of separation occurs during mixing as well as during subsequent handling of the completed mix. Generally, large differences in particle size, density, or shape within the mixture result in instability in the mixture. The segregation process normally requires energy input and can be reduced following mixing by careful handling.

Some manufacturers establish wide ranges for specifications. These must be established based on a GMP and validation perspective. Even though a wide range for a physical specification, such as particle size or surface area, may be established in a filing, it is expected that such ranges will be verified during validation of the process. In a recent court decision, the judge ruled that companies cannot hide behind approval of processes listed in an application when these processes do not work. In other words, the approval of a filing has no impact on processes that do not perform consistently. For example, in a particular filed process, it was determined that particle size would have no effect on drug absorption and dissolution, and a wide-range particle size specification was established; however, during the GMP review, it was found that variation in particle size did have a major effect on content uniformity. Therefore, a tighter particle size specification had to be established.

Control of the physical characteristics of the excipient is also important, because variations in such characteristics may also affect the performance of the dosage form. Changes in particle size of some excipients, for example, may affect content uniformity. In other cases, a change in the supplier of an excipient or lubricant may affect dissolution or bioavailability. In fact, the release of the active ingredients in some products is timed by varying lubricant blending time and concentration. The literature contains many examples of lubricant processing causing major changes. Such changes in excipients illustrate deficiencies in the utilization of retrospective validation; for such validation to be satisfactory, control of all parameters and key steps in the process is necessary.

The control of mixing times and physical characteristics of all ingredients is critical to successful validation of all formulations and processes. A major question that must be addressed is the need for testing physical characteristics (particle size) for each batch of excipient. For many single-source excipients, particle size is a supplier specification and is usually tightly controlled. Having established a specification and not testing each lot of excipient upon receipt may be satisfactory in such cases; however, for some multisource excipients, and where the dosage formulator expects to shift sources of supply, some resulting differences in physical characteristics (particle size) may have an effect on dose uniformity and dissolution. A definite justification should exist for not testing lots of excipients for physical characteristics.

2. Manufacturing Procedures

Procedures used to manufacture development batches must be specific and well documented. This is necessary for scale-up and subsequent comparison with the commercial process. This is another area where differences between new drug application (NDA)/new animal drug application (NADA) and abbreviated new drug application (ANDA)/abbreviated new animal drug application (ANADA) products arise. In the case of the NDA/NADA, there will be several clinical and/or test batches manufactured over a period of time showing changes in the process as more is learned about the drug and the process. The level of documentation should increase as the process becomes more defined and the firm begins phase II and III studies.

The generic product focus is on the biobatch. Again, the process used to manufacture the biobatch must be well defined and well documented; test batches must be manufactured to establish that biobatch manufacture is reproducible.

3. In-Process Testing

Specific specifications required to control the manufacturing process must be established and justified. Doing so will require granulation studies, including blend uniformity, sieve analysis, and moisture.

4. Finished Product Testing

Testing for standards given in FDA monographs, such as content uniformity (when a specification applies), assay, hardness, friability, dissolution, and others, is essential.

5. Dissolution Profile

The dissolution profiles for the biobatch or pivotal clinical batches should be evaluated in the product development report. A good correlation should exist between the dissolution specifications and test results for the biobatch/clinical test batches and the full-scale commercial process.

6. Stability

The Center for Drug Evaluation and Research (CDER) conducts an evaluation of stability data and approves proposed expiration dates. The product development report should contain an evaluation of the stability data that have been obtained. During postapproval inspections, stability data are reviewed by the field. An FDA inspection, therefore, inevitably includes an audit of underlying raw data and analytical worksheets to ensure the accuracy and authenticity of stability data contained in summary reports.

B. Preapproval Inspections

Validation of three full-size commercial lots is not required for approval of the marketing application; however, the firm must have data that justify the full-scale commercial process filed in the NDA/ANDA or NADA/ANADA application. In other words, the firm should have sufficient research on the test batches to establish specifications for the manufacturing and control procedures listed in the application. These data and specifications form the basis for the validation protocol that may be developed following approval of the application. The final step in the process is demonstration (validation) runs to prove that the process will perform consistently. Firms should validate the process using the specifications listed in the filing. To evaluate the proposed manufacturing process, the following areas must be covered during the preapproval inspection.

1. Master Formula

This document must include specific manufacturing directions for the full-scale commercial process, including in-process and finished product specifications. Make sure that the process filed in the application complies with the process used to manufacture the bio/clinical batch. In some cases, the process may be different after scale-up. This is acceptable if the firm has data showing that the product produced by this process will be equivalent. Data such as granulation studies, finished product test results, and dissolution profiles are used to document that the two processes are equivalent.

2. History Section of the Application

This section of the application is used to identify the biobatch or batches used for pivotal clinical studies. Any batches in which in vivo studies were carried out, particularly those for which in vivo studies showed a lack of equivalency, are subject to review.

3. Development Data (Product Development Report)

The firm cannot logically proceed to the validation step without some prior evaluation of the process. During the development phase, the critical process parameters must be identified and specifications established. These predetermined specifications must be established during the development of the process, with the biobatch or pivotal clinical batch serving as the reference batch.

The development of a solid dosage form will vary from firm to firm and will be dependent upon the specific product and process; however, the formula ranges, physical and chemical specifications of the drug substance and excipients,

in-process variables, and interaction effects of the dosage form ingredients under normal and stress aging conditions should be confirmed by limited challenge in pilot-scale and production-size batches.

Such development data serve as the foundation for the manufacturing procedures, specifications, and validation of the commercial process. In some cases, manufacturers establish specifications such as hardness and particle size during validation; however, as the validation definition states, specifications must be determined prior to validation of the process.

When a manufacturer files a manufacturing process in an application, the FDA expects that the process will yield a product that is equivalent to the product on which the bio study or pivotal clinical study was conducted; therefore, it is important that the development and scale-up of the process be well documented, so that a link between the bio/clinical batches and the commercial process can be established. The firm should have data such as granulation studies, finished product test results, and dissolution profiles that may be used to document that the two processes are equivalent.

In most cases, in vitro data alone will not be sufficient to document equivalency. The bioequivalency evaluation must be made by qualified individuals, and the firm should have a signed statement documenting that the processes are equivalent.

4. Inspection of the Facilities

The FDA inspectors physically inspect the facility to ensure that the area and ancillary equipment such as air handling and water systems are suitable for the proposed manufacturing process. Construction of new walls, installation of new equipment, and other significant changes must be evaluated for their impact on the overall compliance with GMP requirements. These inspections include facilities used for development batches and to be used for full-scale production batches.

5. Raw Materials

The FDA inspectors review the information contained in the raw materials section of the product development report. Inventory records are a good source for identification of batches used for product development and bio studies.

6. Laboratory

The regulatory inspection of a laboratory involves observations of the laboratory in operation and of the raw laboratory data to evaluate compliance with GMPs and to specifically carry out the commitments in an application or Drug Master File (DMF). The raw laboratory data, laboratory procedures and methods, laboratory equipment, and methods validation data must be periodically reviewed to ensure overall quality of the laboratory operation and the ability to comply with GMP regulations.

It is not uncommon for the FDA inspecting team to identify foreign peaks and impurities not filed or discussed in applications. Also, many inspections reveal laboratory test methods that are not validated. The transfer of laboratory methods and technology from the research and development department to the quality control department should be firmly established. Be aware that FDA inspectors are not bound by any rules to restrict their investigation to particular product files. They can and often do pick up data files, charts, and recordings that are lying around in the area and will raise queries. It is a good idea to keep these records properly secured to avoid unnecessary distractions in the inspection process.

7. Equipment

At the time of the preapproval inspection, the FDA expects that the equipment will be in place and qualified. New products, particularly potent drug products, can present cleaning problems for existing equipment. Manufacturers must validate their cleaning processes for the new drug/dosage form.

IV. VALIDATION PROTOCOLS

Validation protocols are developed from the information obtained during product development research. These protocols list the specific manufacturing process and specifications that will be tested during the demonstration runs. Validation protocols are not required for the preapproval inspection but are required for postapproval inspections. Key processes and control specifications should have been established during product development research and should be carefully listed in the validation protocol.

V. DEMONSTRATION RUNS (VALIDATION OF THE PROCESS)

A. Test Batch Relationships

A validated process should produce a dosage form that is directly related to the dosage form on which equivalency and/or efficacy and safety data were determined. This is usually the test batch; therefore, ensure that the process used to make the test batch has been used for routine full-scale production batches. These processes and specifications must be equivalent, and the importance and need for good control of the manufacturing process used to produce the test and clinical batches cannot be overemphasized. Typically, the control of test batches includes, among other components, drug substance characterization, granulation analyses, and dose uniformity and dissolution profiles. The validation report should compare the manufacturing processes and specifications for the test batches with those for the full-scale batches; however, such findings may be contained in other documents, such as bioequivalency reports, and should be readily available.

B. Postapproval Prospective Validation Inspections

In the postapproval, premarketing phase, the FDA reviews the validation protocol and validation report. Obviously, a validation protocol that lists all the variables and parameters that should be controlled when the process is validated cannot be written until the variables are identified in the development phase. In many of the FDA's postapproval, premarketing inspections, validations

(and consistency) are often not well established. Failures of production-size batches include dissolution, lack of content uniformity, and variable potency. Validation reports on batch scale-ups may also reflect selective reporting of data. Several parameters must be considered when ensuring validation of the manufacturing process for an oral solid dosage form. For example, at least eight major areas must be evaluated:

- Biobatch relationship
- Raw materials
- Manufacturing procedures and equipment
- Granulation/mix analysis
- In-process controls
- Test results with validated methods
- Investigations/product failures
- Site review

1. Raw Materials

Physical characteristics of raw materials can vary among manufacturers of drug substances and on occasion, have varied from lot to lot from the same manufacturer. The examination of retained samples of the lots of raw materials can reveal physical differences between the two lots and thus should become a routine measure. Quantitative compliance must be present for the raw material inventory records to evaluate the use of the drug substance in biobatch, clinical, and/or test batches. Make sure to account for the quantities and sources of materials used and the testing performed. Physical specifications for drug substances should be well established. If no such specifications, or only a very vague specification, are available, support data should exist to demonstrate that dissolution profiles and content uniformity will be satisfactory over a wide range of particle sizes. For example, a manufacturer may establish a specification that 90% of the particles must be less than 300 microns. For validation of this process, one would expect the use of micronized as well as nonmicronized material with particles close to 300 microns in size.

2. Manufacturing Procedures and Equipment

Regardless of the nature of the specificity of the manufacturing directions contained in the application, a detailed master formula with specific manufacturing directions and specifications must have been developed before any validation protocol is prepared and before the validation process begins. The basic premise of validation of a process is that a detailed process already exists that, it is hoped, will be shown to perform consistently and produces products in compliance with predetermined specifications; therefore, detailed manufacturing directions specifying equipment and operating parameters must be specified in the master formula.

The importance of specific written directions and specifications cannot be overemphasized. For example, problem areas include

- Failure to specify the amount of granulating solution, resulting in overwetting and dissolution failures of aged batches
- Failure to specify the encapsulation machine and operating parameters, such as dosing discs, resulting in weight variation failures
- Failure to specify the compression machine(s) and operating parameters, resulting in content uniformity failures

In addition to the concern about specific manufacturing directions, equipment presents its own set of unique problems that have to be considered in the control of the manufacturing and the validation processes. The following is a brief description of some issues associated with equipment.

a. Blenders

Many solid oral dosage forms are made by direct compression. The two types of mixers are low energy and high energy. The low-energy mixers represent the classical type of slow mixers, such as ribbon blenders, tumblers, and planetary pony pan; the high-energy mixers include some basic features of the low-energy mixers but also contain some type of high-speed blade, commonly termed an *intensifier bar* or *chopper.* The various types of mixers can be described as follows.

1. *Pony pan type*. This mixer has historically been used for the manufacture of wet granulations. Because of its open pan or pot, granulating agents such as starch paste can be added while mixing. Because the pan is open at the top to allow the mixing blades to penetrate the powder, mixing operations are usually dusty and can lead to potential cross-contamination problems. The usefulness of these mixers is limited to wet granulating. This type of mixer provides good horizontal (side-to-side) blending; however, vertical (top-to-bottom) mixing does not occur. Powder placed in the mixer first will be poorly mixed. Segregation or unmixing is also a recognized problem. To minimize this problem, some manufacturers have emptied the pan contents halfway through the mixing cycle in an attempt to turn the powder over at the bottom of the mixer. To alleviate the problem of the lack of mixing along the sides or walls of the pan, manufacturers have used a hand-held steel paddle at various times during mixing. This type of mixing is difficult to control and reproduce; thus, it would be difficult to validate.

   The potential for segregation and poor mixing along the sides and particularly the bottom of the pony blender makes this type of blender less desirable for the dry blending of granulations of drug products; consequently, whenever such dry blending is encountered, investigators will look for potential problems with blending validation and content uniformity. Whenever in-process samples of the granulation are collected as part of an investigation or inspection, the formula card and the weight of the dosage unit to be manufactured are needed for the calculations.

2. *Ribbon blender.* In the ribbon blender, powder is mixed both horizontally and vertically. Loading operations can be dusty, but during the actual blending the unit is enclosed, thereby limiting the amount of dust released to the environment. The major and potentially the most serious problem with the ribbon blender is the "dead spot" or zone at the discharge valve in some of these blenders. To compensate for this dead spot, manufacturers have to recycle the powder from this area at some point during the mixing process. Obviously, adequate and very specific directions and procedures should be available to ensure that this critical step is performed. Another concern with this mixer is the poor mixing at the ends of the center horizontal mixing bar and at the shell wall because of blade clearance. The level of powder placed in this mixer is normally at the top of the outer ribbon blade, and as with other mixers, care must be taken not to overfill the mixer. Cleaning problems, particularly at the ends of the ribbon blender where the horizontal bar enters the blender, have been identified. Manufacturers who do not disassemble and clean the seals/packing between batches should have data to demonstrate the absence of foreign contaminants between batches of different products processed in the blender.
3. *Tumbler blender.* Common mixers of this type include the twin shell and double cone. These mixers exert a gentle mixing action; because of this mild action, lumps of powder will not be broken up and mixed. Powders may also clump due to static charges, and segregation can occur. Low humidity can contribute to this problem. Blending under very dry conditions has been found to lead to charge buildup and segregation, while blending of some products under humid conditions has led to lumping. More so than with other mixers, powder charge levels should not exceed 60% to 65% of the total volume of the mixer. Fabricators of tumbler-type blenders identify the volume as the actual working capacity and not the actual volume of the blender. It is important to correlate the bulk density of the granulation with the working capacity of the blender.
4. *High-shear (high-energy) mixers.* The fabricators of these mixers include GRAL, Diosna, and Littleford/Lodige. These mixers are highly efficient and ideally suited for wet granulations. End points of wet granulations can be determined by measurements on a gauge of the work required to agitate the blend. The mixing vessel is enclosed, and dust only enters the environment when loading. One of the problems associated with these mixers is the transfer or conversion of products blended in the older types of mixers to these blenders. Mixing times are going to be different, and the physical characteristics of the blend may also be different. These mixers are very efficient. For wet granulations, it is important to control the rate and amount of addition of the solvent. Because of their efficiency, drug substance may partially dissolve and recrystallize upon drying as a different physical form. An intensifier bar in the center of the blender rotates at very high speeds to break down the smaller, harder agglomerates. A major disadvantage of this type of blender is that the extremely high speed of the intensifier bar generates considerable heat, which can sometimes result in charring of some sugar-based granulations. It should be pointed out that these same comments are applicable to other high-energy mixers that also rely on high-speed choppers to disperse powders. Also, cleaning of the blender requires disassembly of the intensifier bar between products.
5. *Plastic bag.* Any discussion of mixers would not be complete without addressing the plastic bag. Firms have resorted to the blending or manufacture of a trituration in a plastic bag. Obviously, it is very difficult to reproduce such a process, and there is the potential for loss of powder as a result of breakage or handling. The use of a plastic bag cannot be justified in the manufacture of a pharmaceutical product. When the plastic bag has been used, directions are usually not specific, and one would not know by reading the directions that a plastic bag was employed. Some companies have been known to hide the use of plastic bags by indicating in the manufacturing records that a blender was used; these bags are easy to spot during an inspection, and the practice is highly discouraged.

b. Dryers

The two basic types of dryers are the oven dryer, in which the wet granulation is spread on trays and dried in an oven, and the fluid-bed dryer, in which the wet granulation is "fluidized" or suspended in air. Generally, the fluid-bed dryer yields a more uniform granulation with spherical particles; however, this may result in compression problems that may require additional compression force. It is not unusual to see manufacturers change from an oven dryer to the fluid-bed dryer; however, such a change should be examined for equivalency with in vitro testing such as hardness, disintegration, and comparative dissolution and stability testing.

Other issues of concern with drying include moisture uniformity and cross-contamination. Tray dryers present more moisture uniformity problems than fluid-bed dryers. Obviously, a dryer should be qualified for heat uniformity and a program developed to ensure moisture uniformity in granulations at the end point of drying. With respect to fluid-bed dryers, moisture problems can occur if the granulation is not completely fluidized.

In regard to cross-contamination, oven dryers, particularly those in which air is recirculated, present cross-contamination problems, because air recirculates through a common filter and duct. For fluid-bed dryers, the bag filters present cross-contamination problems. In order to minimize such problems, manufacturers should use product-dedicated bags.

c. Tablet and Capsule Equipment

Another important variable in the manufacturing process is the tablet press or encapsulating machine. The newer dosage form equipment requires granulations with good flow characteristics and good uniformity. The newer tablet presses control weight variation by compression force and require a uniform granulation to function correctly. The setup of the microprocessor-controlled tablet press usually includes some type of challenge to the system. For example, a short punch is sometimes placed among the other punches. If the press is operating correctly, it will alarm when a lower- or higher-weight tablet is compressed.

Different tablet compression equipment can cause dose uniformity, weight uniformity, and hardness problems. For example, vibrations during tablet compression can cause segregation of the granulation in the feed hopper. The speed of the machine can affect the fill of the die and tablet weight; therefore, as previously noted, it is important to have specific operating directions.

Many unit operations now provide for blending in totes with direct discharge of the tote into the tablet compression equipment. Because of segregation problems at the end of the discharge, tablets from the end of the compression should be tested for content uniformity. The use of inserts in totes has been shown to minimize segregation.

With regard to the newer computer-controlled tablet compression equipment, buckets of tablets are often rejected because of potential weight variation problems. The disposition of these tablets, as well as the granulation and tablets used to set up the press, should be documented, and reworking processes must be validated.

With regard to encapsulation operations, the hygroscopic nature of gelatin capsules and some of the granulations require humidity controls for storage of the empty capsules and their subsequent filling. The scale-up of capsule products has also presented some problems because of the different types of encapsulation equipment. Older equipment that operated on gravity fill, such as Lilly and Parke-Davis machines, was commonly used for manufacturing capsules in clinical manufacturing areas. When formulations were scaled up to high-speed encapsulation equipment, flow problems and weight variation resulted. Additionally, some of the newer equipment provides for the formation of a slug, which could have an impact on dissolution.

Many firms, in order to recondition (rework) batches, pass those particular batches through a sorter, such as the MOCON VERICAP®. This machine works on the principle of current (dielectric constant), and moisture variation in the filled capsules can cause inaccurate results. Manufacturers should qualify equipment and examine equipment logs for these sorting machines to identify batches with weight problems. Data supporting the accuracy of equipment in regard to rejecting low- or high-weight capsules should be available during an FDA inspection.

d. Coating Equipment

Many tablets are now coated with an aqueous film coat, which is usually very soluble. Current technology provides for fixed sprays of the coating solution. The volume of coating solution, rate, and temperature can be controlled by some of the more highly automated operations; however, for many sugar-coated, enteric-coated, and delayed-release products, some components of the coating are not highly soluble, and that part of the process is performed manually. Generally, the shellac undercoat used for sugar-coated tablets has presented disintegration/dissolution problems, particularly in aged samples.

With respect to poor disintegration, the example of ferrous sulfate tablets probably represents the classical example. Over the years, many different manufacturers have issued recalls for poor disintegration of coated ferrous sulfate tablets; likewise, problems with poor dissolution have been attributed to the coating process. Again, the shellac undercoat hardens and even sometimes cracks, resulting in poor dissolution.

On many occasions, the coating process has not been validated. The number of applications of coats, volume of coating solution in a specific application, and temperature of the solution during application are all parameters that must be addressed. For example, the temperature of application and even heat during drying have been found to cause dissolution failures in aged tablets.

Another problem associated with the coating process concerns heat applied to products that are sensitive to heat. For example, it has been shown that estrogen tablets are heat sensitive and have exhibited stability problems; thus, it is important to control this phase of the process.

For a few products, such as some of the antihistamine tablets or multivitamin tablets containing folic acid or cyanocobalamin, the drug substance is applied during the coating process. Some products require the active drug substance to be applied as a dust on tacky tablets as part of the coating process; for these products, it is particularly important to apply the drug in the coating solution through controlled applications. Again, it is important as part of the validation of these processes to demonstrate dose uniformity and dissolution and to control the parameters of the coating process.

3. Granulation/Mix Analysis

A critical step in the manufacture of an oral solid dosage form is the blending of the final granulation. If uniformity is not achieved at this stage, then one could assume that some dosage units would not comply with uniformity requirements. The major advantage of blend analysis (from a uniformity perspective) is that specific areas of the blender that have the greatest potential to be nonuniform can be sampled. This is particularly true of the ribbon-type blender and planetary or pony-type mixers.

In some cases, such as for large or tumbler-type blenders, it is impractical to sample from the blender directly. In such cases, granulations or blends could be sampled at the time of blender discharge or directly from drums. If sampling from drums, samples from the top, middle, and bottom of each drum should be collected.

In most cases, sampling thieves are readily available for sampling the small quantities that need to be taken from key areas of the blender or the drums. If samples larger than one

dosage unit must be collected, however, adequate provisions must be made to prevent excessive handling manipulation between the time of sampling and the time of analysis.

Good science and logic would seem to dictate that sample sizes of the approximate equivalent weight of the dosage unit should be sampled in order to test for uniformity. Many industrial pharmacy and engineering texts confirm this approach. Large granulation sample sizes (e.g., 1 oz) will provide little information with respect to uniformity. Generally, further mixing after sampling and prior to analysis can yield misleading results.

The acceptance criteria for granulation dose uniformity testing must be established. Although many firms evaluate dose uniformity using the compendial dose uniformity specifications (85% to 115% with a relative standard deviation [RSD] of 6 to 7.8), such specifications should be tighter where supported by the firm's historical data on the level of blend uniformity with its equipment for a given product. In many cases, compendial assay limits for the finished product (90% to 110% of label claim) are broad enough for this purpose, and most firms should be able to demonstrate blend assay results well within these limits. If larger sample sizes are taken for assay to evaluate total composite assay, then the specific U.S. Pharmacopeia (USP) or filed criteria for assay should be used.

In addition to analysis of blends for dose uniformity and potency, blends are tested for physical characteristics. A major physical parameter used to demonstrate equivalence between batches is the particle size profile. This is particularly important for comparison of the biobatch with production batches and also when processes are modified or changed. The particle size profile will provide useful information for demonstrating comparability.

Particle size profiles are particularly important for tablets made by a wet granulation process. The size and even the type of granule can affect the pore size in a tablet and have an effect on dissolution. For example, a recent dissolution failure was attributed to a change in the milling screen size, yielding a granulation with larger granules. It was a coated tablet, and the larger pores permitted increased penetration of the coating solution into the tablet, resulting in slower dissolution.

Another test that is typically performed in regard to granulation, particularly when the wet granulation process is used, is loss on drying (LOD) and/or moisture content. If organic solvents are employed, then residual solvent residues are also tested. To validate a drying process, LOD levels are determined prior to, during, and after drying in order to demonstrate times and levels. As with processing variables, levels (specifications) are established in the development phase, with the validation phase being used to confirm the adequacy of the process.

4. In-Process Testing

In-process testing is testing performed on dosage forms during their compression/encapsulation stages to ensure consistency throughout these operations. For tablets, individual tablet weight, moisture, hardness (compression force), and disintegration tests are performed. For capsules, individual weight and moisture tests are performed. In many of the validation reports, it has been found that manufacturers have neglected to supply results of individual (not composite) dosage unit weight tests that should be performed throughout compression/encapsulation. Such testing is particularly important for capsule products, which may exhibit weight variation problems. If not part of the validation reports, the individual dosage unit weights should be recorded and be available for FDA inspectors to review.

With regard to individual capsule weights, a major question that arises concerns acceptable levels. Because most USP assay limits are 90% to 110%, it would seem reasonable that each unit manufactured complies with these specifications. It should be pointed out that 85% to 115% limits are established by the USP for variability in both blending and compression or encapsulation operations.

Because hardness and disintegration specifications are established during development and biobatch production, testing is performed to demonstrate both equivalency (comparability) and consistency.

With regard to moisture, some tablets set up upon aging as a result of poor moisture control and inadequate specifications. For example, this has been shown to be a major problem with carbamazepine tablets and often for ferrous sulfate tablets.

5. Test Results

Finished product testing, particularly assay, content uniformity, and dissolution, should be carefully recorded. With regard to dissolution, it is important to establish dissolution profiles. Validation batches with dissolution profiles not comparable to biobatches indicate nonequivalency of the manufacturing process. Depending on the discriminating nature of the dissolution test, it may also indicate lack of equivalence of the dosage forms made during validation with the biobatch. In the review of dissolution test results, it is important to eventually see results very close to 100% dissolution. In some cases, manufacturers will profile the dissolution results only to the specification; however, if lower but still acceptable results are obtained (such as 85%), it is important to continue the test by increasing the speed of the apparatus. If a product completely dissolves, yet only results in a value of 85%, it may indicate some problem with the test. Likewise, high dissolution results (115%) also indicate some problem with the test. Obviously, unusual or atypical results should be explained in the validation report.

6. Investigations and Product Failures

In any process validation exercise, a basic objective is to prove that a process is satisfactory; unfortunately, some processes are unsatisfactory and may sometimes yield unacceptable results. It is important, therefore, that when the final validation report is reviewed, all results, including failing results, are discussed and evaluated. Historically, reviews of

manufacturing processes typically show that one out of every eight batches manufactured has failed content uniformity testing. Manufacturers often recognize that the process is unsatisfactory and not validated but fail to draw this conclusion in the written validation report. This is a dangerous procedure and is often easily identified during FDA inspections.

7. Site Review

A major aspect and possibly the most critical phase of process validation is the review of data to ensure that failing batches were not omitted without justification. Additionally, manufacturers must ensure that the raw data, including analytical raw data, are accurate.

3 Current Regulatory Status of Over-the-Counter Products

BACKGROUND

Over-the-Counter (OTC) drug products are those drugs that are available to consumers without a prescription. There are more than 80 classes (therapeutic categories) of OTC drugs, ranging from acne drug products to weight control drug products. As with prescription drugs, the Center for Drug Evaluation and Research (CDER) oversees OTC drugs to ensure that they are properly labeled and that their benefits outweigh their risks.

OTC drugs play an increasingly vital role in America's health-care system by providing easy access to certain drugs that can be used safely without the help of a health-care practitioner. This enables consumers to take control of their own health care in many situations. There are more than 100,000 OTC drug products marketed, encompassing about 800 significant active ingredients. Most OTC drug products have been marketed for many years, prior to the laws that require proof of safety and effectiveness before marketing. For this reason, the Food and Drug Administration (FDA) has been evaluating the ingredients and labeling of these products as part of "The OTC Drug Review Program." The goal of this program is to establish OTC drug monographs for each class of products. OTC drug monographs are a kind of "recipe book" covering acceptable ingredients, doses, formulations, and labeling. Monographs will continually be updated adding additional ingredients and labeling as needed. Products that conform to a monograph may be marketed without further FDA clearance, while those that do not must undergo separate review and approval through the "new drug approval system." The new drug application (NDA) system—and not the monograph system—is also used for new ingredients entering the OTC marketplace for the first time. For example, the newer OTC products (previously available only by prescription) are first approved through the NDA system, and their "switch" to OTC status is approved via the NDA system.

FDA's review of OTC drugs is primarily handled by CDER's Division of Over-the-Counter Drug Products in the Office of Drug Evaluation V. However, scientists and regulators throughout CDER, the Office of General Counsel, and other centers within FDA are routinely asked to assist in this massive effort. There is also an advisory committee, "The Nonprescription Drug Advisory Committee," which meets regularly to assist the agency in evaluating issues surrounding these products.

REGULATORY DEFINITIONS

An OTC drug product is a drug product marketed for use by the consumer without the intervention of a health-care professional in order to obtain the product. Two post-1938 regulatory pathways exist for the legal marketing of such products: (a) marketing in compliance with an OTC drug monograph and (b) marketing under the authority of an approved product-specific NDA or an abbreviated new drug application (aNDA). The OTC drug review was established to evaluate the safety and effectiveness of OTC drug products marketed in the United States before May 11, 1972. It is a three-phase public rulemaking process (each phase requiring a *Federal Register* publication) resulting in the establishment of standards (monographs or nonmonographs) for an OTC therapeutic drug category. The first phase was accomplished by advisory review panels. The panels were charged with reviewing the ingredients in nonprescription drug products to determine whether these ingredients could be generally recognized as safe and effective for use in self-treatment. They were also charged with reviewing claims and recommending appropriate labeling, including therapeutic indications, dosage instructions, and warnings about side effects and preventing misuse. According to the terms of the review, the panels classified ingredients into three categories as follows:

Category I: generally recognized as safe and effective for the claimed therapeutic indication
Category II: not generally recognized as safe and effective or unacceptable indications
Category III: insufficient data available to permit final classification

The second phase of the OTC drug review was the agency's review of ingredients in each class of drugs based on the panel's findings, on public comment, and on new data that may have become available. The agency, in turn, publishes its conclusions in the *Federal Register* in the form of a tentative final monograph. After publication of the tentative final monograph, a period of time is allotted for objections to the

agency's proposal or for requests to be submitted for a hearing before the Commissioner of FDA.

The publication of final regulations in the form of drug monographs is the third and last phase of the review process. The monographs establish conditions under which certain OTC drug products are generally recognized as safe and effective.

The term *human drug application* means an application for approval of a new drug submitted under section 505(b)(1) of the Federal Food, Drug, and Cosmetic Act (FD&C Act) or approval of a new drug submitted under section 505(b)(2) of the FD&C Act or approval of an abbreviated new drug application under section 505(j) of the FD&C Act or licensure of certain biological products under section 351 of the Public Health Service Act. A 505(b)(1) application is an application that contains full reports of investigations of safety and effectiveness. The investigations the applicant relied on for approval were conducted by, or for, the applicant, or the applicant has obtained a right of reference or use for the investigations.

Appendix I to this chapter is a listing of OTC ingredients and their respective recommended uses and classification.

The U.S. FDA has recently issued guidance on unproven safety of OTC drug components (current as of April 2008) (CITE: 21CFR310.545). A number of active ingredients have been present in OTC drug products for various uses, as described later. However, based on evidence currently available, there are inadequate data to establish general recognition of the safety and effectiveness of these ingredients for the specified uses. These ingredients are listed as Appendix II to this chapter.

APPENDIX I OTC INGREDIENT LIST

Review Panel	Report	Drug Category	Advance Notice Proposed Rulemaking (ANPR)	Proposed Rule (PR)	Federal Register (FR) Listing
		2-Ethylhexyl-4-phenylbenzophenone-2-carboxylic acid			
Topical analgesic	Sunscreen	Sunscreen	IISE	IISE	Pending

APPENDIX II UNPROVEN SAFETY OF OTC INGREDIENTS

(1) Topical acne drug products.
Alcloxa
Alkyl isoquinolinium bromide
Aluminum chlorohydrex
Aluminum hydroxide
Benzocaine
Benzoic acid
Boric acid
Calcium polysulfide
Calcium thiosulfate
Camphor
Chloroxylenol
Cloxyquin
Coal tar
Dibenzothiophene
Estrone
Magnesium aluminum silicate
Magnesium sulfate
Phenol
Phenolate sodium
Phenyl salicylate
Povidone–iodine
Pyrilamine maleate
Resorcinol (as single ingredient)
Resorcinol monoacetate (as single ingredient)
Salicylic acid (over 2% up to 5%)
Sodium borate
Sodium thiosulfate
Tetracaine hydrochloride
Thymol
Vitamin E
Zinc oxide
Zinc stearate
Zinc sulfide

(2) Anticaries drug products
(i) Approved as of May 7, 1991.
Hydrogen fluoride
Sodium carbonate
Sodium monofluorophosphate (6% rinse)
Sodium phosphate
(ii) Approved as of October 7, 1996.
Calcium sucrose phosphate
Dicalcium phosphate dihydrate
Disodium hydrogen phosphate[1]
Phosphoric acid
Sodium dihydrogen phosphate
Sodium dihydrogen phosphate monohydrate
Sodium phosphate, dibasic anhydrous reagent

(3) Antidiarrheal drug products
(i) Approved as of May 7, 1991.
Aluminum hydroxide
Atropine sulfate
Calcium carbonate
Carboxymethylcellulose sodium
Glycine
Homatropine methylbromide
Hyoscyamine sulfate
Lactobacillus acidophilus
Lactobacillus bulgaricus
Opium, powdered
Opium tincture
Paregoric
Phenyl salicylate
Scopolamine hydrobromide
Zinc phenolsulfonate
(ii) Approved as of April 19, 2004; April 18, 2005, for products with annual sales less than $25,000.
Attapulgite, activated
Bismuth subnitrate
Calcium hydroxide
Calcium polycarbophil
Charcoal (activated)
Pectin
Polycarbophil
Potassium carbonate
Rhubarb fluid extract

(4) Antiperspirant drug products
(i) Ingredients
Approved as of May 7, 1991.
Alum, potassium
Aluminum bromohydrate
Aluminum chloride (alcoholic solutions)
Aluminum chloride (aqueous solution) (aerosol only)
Aluminum sulfate
Aluminum sulfate, buffered (aerosol only)
Sodium aluminum chlorohydroxy lactate
(ii) Approved as of December 9, 2004; June 9, 2005, for products with annual sales less than $25,000.
Aluminum sulfate buffered with sodium aluminum lactate

(5) [Reserved]

(6) Cold, cough, allergy, bronchodilator, and antiasthmatic drug products
(i) Antihistamine drug products
(A) Ingredients.
Methapyrilene hydrochloride
Methapyrilene fumarate
Thenyldiamine hydrochloride
(B) Ingredients.
Phenyltoloxamine dihydrogen citrate
Methapyrilene hydrochloride
Methapyrilene fumarate
Thenyldiamine hydrochloride
(ii) Nasal decongestant drug products
(A) Approved as of May 7, 1991.
Allyl isothiocyanate
Camphor (lozenge)
Creosote, beechwood (oral)
Eucalyptol (lozenge)
Eucalyptol (mouthwash)

Eucalyptus oil (lozenge)
Eucalyptus oil (mouthwash)
Menthol (mouthwash)
Peppermint oil (mouthwash)
Thenyldiamine hydrochloride
Thymol
Thymol (lozenge)
Thymol (mouthwash)
Turpentine oil

(B) Approved as of August 23, 1995.
Bornyl acetate (topical)
Cedar leaf oil (topical)
Creosote, beechwood (topical)
Ephedrine (oral)
Ephedrine hydrochloride (oral)
Ephedrine sulfate (oral)
Racephedrine hydrochloride (oral/topical)

(C) Approved as of April 11, 2007; October 11, 2007, for products with annual sales less than $25,000. Any ingredient(s) labeled with claims or directions for use for sinusitis or for relief of nasal congestion associated with sinusitis.

(iii) Expectorant drug products.
Ammonium chloride
Antimony potassium tartrate
Beechwood creosote
Benzoin preparations (compound tincture of benzoin, tincture of benzoin)
Camphor
Chloroform
Eucalyptol/eucalyptus oil
Horehound
Iodides (calcium iodide anhydrous, hydriodic acid syrup, iodized lime, potassium iodide)
Ipecac
Ipecac fluid extract
Ipecac syrup
Menthol/peppermint oil
Pine tar preparations (extract white pine compound, pine tar, syrup of pine tar, compound white pine syrup, white pine)
Potassium guaiacolsulfonate
Sodium citrate
Squill preparations (squill, squill extract)
Terpin hydrate preparations (terpin hydrate, terpin hydrate elixir)
Tolu preparations (tolu, tolu balsam, tolu balsam tincture)
Turpentine oil (spirits of turpentine)

(iv) Bronchodilator drug products

(A) Approved as of October 2, 1987.
Aminophylline
Belladonna alkaloids
Euphorbia pilulifera
Metaproterenol sulfate
Methoxyphenamine hydrochloride
Pseudoephedrine hydrochloride
Pseudoephedrine sulfate
Theophylline, anhydrous
Theophylline calcium salicylate
Theophylline sodium glycinate

(B) Approved as of January 29, 1996. Any combination drug product containing theophylline (e.g., theophylline and ephedrine, or theophylline and ephedrine and phenobarbital).

(C) Approved as of June 19, 1996. Any ingredient(s) in a pressurized metered-dose inhaler container.

(D) Approved as of October 29, 2001. Any oral bronchodilator active ingredient (e.g., ephedrine, ephedrine hydrochloride, ephedrine sulfate, racephedrine hydrochloride, or any other ephedrine salt) in combination with any analgesic(s) or analgesic-antipyretic(s), anticholinergic, antihistamine, oral antitussive, or stimulant active ingredient.

(7) Dandruff/seborrheic dermatitis/psoriasis drug products.
Alkyl isoquinolinium bromide
Allantoin
Benzalkonium chloride
Benzethonium chloride
Boric acid
Calcium undecylenate
Captan
Chloroxylenol
Colloidal oatmeal
Cresol, saponated
Ethohexadiol
Eucalyptol
Juniper tar
Lauryl isoquinolinium bromide
Menthol
Mercury oleate
Methylbenzethonium chloride
Methyl salicylate
Phenol
Phenolate sodium
Pine tar
Povidone–iodine
Resorcinol
Sodium borate
Sodium salicylate
Thymol
Undecylenic acid

(8) Digestive aid drug products

(i) Approved as of May 7, 1991.
Bismuth sodium tartrate
Calcium carbonate
Cellulase
Dehydrocholic acid

Dihydroxyaluminum sodium carbonate
Duodenal substance
Garlic, dehydrated
Glutamic acid hydrochloride
Hemicellulase
Homatropine methylbromide
Magnesium hydroxide
Magnesium trisilicate
Ox bile extract
Pancreatin
Pancrelipase
Papain
Peppermint oil
Pepsin
Sodium bicarbonate
Sodium citrate
Sorbitol

(ii) Approved as of November 10, 1993.
Alcohol
Aluminum hydroxide
Amylase
Anise seed
Aromatic powder
Asafetida
Aspergillus oryzae enzymes (except lactase enzyme derived from *Aspergillus oryzae*)
Bacillus acidophilus
Bean
Belladonna alkaloids
Belladonna leaves, powdered extract
Betaine hydrochloride
Bismuth subcarbonate
Bismuth subgallate
Black radish powder
Blessed thistle (*Cnicus benedictus*)
Buckthorn
Calcium gluconate
Capsicum
Capsicum, fluid extract of
Carbon
Cascara sagrada extract
Catechu, tincture
Catnip
Chamomile flowers
Charcoal, wood
Chloroform
Cinnamon oil
Cinnamon tincture
Citrus pectin
Diastase
Diastase malt
Dog grass
Elecampane
Ether
Fennel acid
Galega
Ginger
Glycine
Hydrastis canadensis (golden seal)
Hectorite
Horsetail
Huckleberry
Hydrastis fluid extract
Hydrochloric acid
Iodine
Iron ox bile
Johnswort
Juniper
Kaolin, colloidal
Knotgrass
Lactic acid
Lactose
Lavender compound, tincture of
Linden
Lipase
Lysine hydrochloride
Mannitol
Mycozyme
Myrrh, fluid extract of
Nettle
Nickel–pectin
Nux vomica extract
Orthophosphoric acid
Papaya, natural
Pectin
Peppermint
Peppermint spirit
Phenacetin
Potassium bicarbonate
Potassium carbonate
Protease
Prolase
Rhubarb fluid extract
Senna
Sodium chloride
Sodium salicylate
Stem bromelain
Strawberry
Strychnine
Tannic acid
Trillium
Woodruff

(iii) Charcoal, activated

(9) [Reserved]

(10) External analgesic drug products

(i) Analgesic and anesthetic drug products.
Aspirin
Chloral hydrate
Chlorobutanol
Cyclomethycaine sulfate
Eugenol
Hexylresorcinol
Methapyrilene hydrochloride
Salicylamide

Thymol

(ii) Counterirritant drug products.
Chloral hydrate
Eucalyptus oil

(iii) Male genital desensitizer drug products.
Benzyl alcohol
Camphorated metacresol
Ephedrine hydrochloride

(iv) Diaper rash drug products. Any ingredient(s) labeled with claims or directions for use in the treatment and/or prevention of diaper rash.

(v) Fever blister and cold sore treatment drug products.
Allyl isothiocyanate
Aspirin
Bismuth sodium tartrate
Camphor (exceeding 3%)
Capsaicin
Capsicum
Capsicum oleoresin
Chloral hydrate
Chlorobutanol
Cyclomethycaine sulfate
Eucalyptus oil
Eugenol
Glycol salicylate
Hexylresorcinol
Histamine dihydrochloride
Menthol (exceeding 1%)
Methapyrilene hydrochloride
Methyl nicotinate
Methyl salicylate
Pectin
Salicylamide
Strong ammonia solution
Tannic acid
Thymol
Tripelennamine hydrochloride
Trolamine salicylate
Turpentine oil
Zinc sulfate

(vi) Insect bite and sting drug products.
Alcohol
Alcohol, ethoxylated alkyl
Benzalkonium chloride
Calamine
Ergot fluid extract
Ferric chloride
Panthenol
Peppermint oil
Pyrilamine maleate
Sodium borate
Trolamine salicylate
Turpentine oil
Zinc oxide
Zirconium oxide

(vii) Poison ivy, poison oak, and poison sumac drug products.
Alcohol
Aspirin
Benzethonium chloride
Benzocaine (0.5%–1.25%)
Bithionol
Calamine
Cetalkonium chloride
Chloral hydrate
Chlorobutanol
Chlorpheniramine maleate
Creosote, beechwood
Cyclomethycaine sulfate
Dexpanthenol
Diperodon hydrochloride
Eucalyptus oil
Eugenol
Glycerin
Glycol salicylate
Hectorite
Hexylresorcinol
Hydrogen peroxide
Impatiens biflora tincture
Iron oxide
Isopropyl alcohol
Lanolin
Lead acetate
Merbromin
Mercuric chloride
Methapyrilene hydrochloride
Panthenol
Parethoxycaine hydrochloride
Phenyltoloxamine dihydrogen citrate
Povidone–vinylacetate copolymers
Pyrilamine maleate
Salicylamide
Salicylic acid
Simethicone
Sulfur
Tannic acid
Thymol
Trolamine salicylate
Turpentine oil
Zirconium oxide
Zyloxin

(11) [Reserved]

(12) Laxative drug products

(i) (A) Bulk laxatives.
Agar
Carrageenan (degraded)
Carrageenan (native)
Guar gum

(i) (B) Bulk laxatives—Approved as of March 29, 2007. Granular dosage forms containing psyllium (hemicellulose), psyllium hydrophilic mucilloid, psyllium seed,

psyllium seed (blond), psyllium seed husks, plantago husks, or plantago seed including, but not limited to, any granules that are
(1) swallowed dry prior to drinking liquid
(2) dispersed, suspended, or partially dissolved in liquid prior to swallowing;
(3) chewed, partially chewed, or unchewed, and then washed down (or swallowed) with liquid
(4) sprinkled over food

(ii) Saline laxative.
Tartaric acid

(iii) Stool softener.
Poloxamer 188

(iv) (A) Stimulant laxatives—Approved as of May 7, 1991.
Aloin
Bile salts/acids
Calcium pantothenate
Calomel
Colocynth
Elaterin resin
Frangula
Gamboge
Ipomea
Jalap
Ox bile
Podophyllum resin
Prune concentrate dehydrate
Prune powder
Rhubarb, Chinese
Sodium oleate

(B) Stimulant laxatives—Approved as of January 29,1999.
Danthron
Phenolphthalein

(C) Stimulant laxatives—Approved as of November 5, 2002.
Aloe ingredients (aloe, aloe extract, aloe flower extract)
Cascara sagrada ingredients (casanthranol, cascara fluid extract aromatic, cascara sagrada bark, cascara sagrada extract, cascara sagrada fluid extract).

(13) [Reserved]

(14) Oral health-care drug products (nonantimicrobial).
Antipyrine
Camphor
Cresol
Dibucaine
Dibucaine hydrochloride
Eucalyptol
Lidocaine
Lidocaine hydrochloride
Methyl salicylate
Myrrh tincture
Pyrilamine maleate
Sorbitol
Sugars
Tetracaine
Tetracaine hydrochloride
Thymol

(15) Topical otic drug products
(i) For the prevention of swimmer's ear and for the drying of water-clogged ears, approved as of May 7, 1991.
Acetic acid

(ii) For the prevention of swimmer's ear, approved as of August 15, 1995.
Glycerin and anhydrous glycerin
Isopropyl alcohol

(16) Poison treatment drug products.
Ipecac fluid extract
Ipecac tincture
Zinc sulfate

(17) Skin bleaching drug products.
Mercury, ammoniated

(18) Skin protectant drug products
(i) (A) Ingredients—Approved as of May 7, 1991.
Allantoin (wound healing claims only)
Sulfur
Tannic acid
Zinc acetate (wound healing claims only)

(B) Ingredients—Approved as of June 4, 2004; June 6, 2005, for products with annual sales less than $25,000.
Beeswax
Bismuth subnitrate
Boric acid
Cetyl alcohol
Glyceryl stearate
Isopropyl palmitate
Live yeast cell derivative
Shark liver oil
Stearyl alcohol

(ii) Astringent drug products.
Acetone
Alcohol
Alum, ammonium
Alum, potassium
Aluminum chlorhydroxy complex
Aromatics
Benzalkonium chloride
Benzethonium chloride
Benzocaine
Benzoic acid
Boric acid
Calcium acetate
Camphor gum
Clove oil
Colloidal oatmeal
Cresol
Cupric sulfate

Eucalyptus oil
Eugenol
Ferric subsulfate (Monsel's Solution)
Honey
Isopropyl alcohol
Menthol
Methyl salicylate
Oxyquinoline sulfate
p-t-Butyl-*m*-cresol
Peppermint oil
Phenol
Polyoxeythylene laurate
Potassium ferrocyanide
Sage oil
Silver nitrate
Sodium borate
Sodium diacetate
Talc
Tannic acid glycerite
Thymol
Topical starch
Zinc chloride
Zinc oxide
Zinc phenolsulfonate
Zinc stearate
Zinc sulfate

(iii) Diaper rash drug products.
Aluminum hydroxide
Cocoa butter
Cysteine hydrochloride
Glycerin
Protein hydrolysate
Racemethionine
Sulfur
Tannic acid
Zinc acetate
Zinc carbonate

(iv) Fever blister and cold sore treatment drug products.
Bismuth subnitrate
Boric acid
Pyridoxine hydrochloride
Sulfur
Tannic acid
Topical starch
Trolamine
Zinc sulfate

(v) Insect bite and sting drug products
(A) Ingredients—Approved as of November 10, 1993.
Alcohol
Alcohol, ethoxylated alkyl
Ammonia solution, strong
Ammonium hydroxide
Benzalkonium chloride
Camphor
Ergot fluid extract
Ferric chloride
Menthol
Peppermint oil
Phenol
Pyrilamine maleate
Sodium borate
Trolamine
Turpentine oil
Zirconium oxide
(B) Ingredients—Approved as of June 4, 2004; June 6, 2005, for products with annual sales less than $25,000.
Beeswax
Bismuth subnitrate
Boric acid
Cetyl alcohol
Glyceryl stearate
Isopropyl palmitate
Live yeast cell derivative
Shark liver oil
Stearyl alcohol

(vi) Poison ivy, poison oak, and poison sumac drug products
(A) Ingredients—Approved as of November 10, 1993.
Alcohol
Anion and cation exchange resins buffered
Benzethonium chloride
Benzocaine
Benzyl alcohol
Bismuth subnitrate
Bithionol
Boric acid
Camphor
Cetalkonium chloride
Chloral hydrate
Chlorpheniramine maleate
Creosote
Diperodon hydrochloride
Diphenhydramine hydrochloride
Eucalyptus oil
Ferric chloride
Glycerin
Hectorite
Hydrogen peroxide
Impatiens biflora tincture
Iron oxide
Isopropyl alcohol
Lanolin
Lead acetate
Lidocaine
Menthol
Merbromin
Mercuric chloride
Panthenol
Parethoxycaine hydrochloride
Phenol

Phenyltoloxamine dihydrogen citrate
Povidone–vinylacetate copolymers
Salicylic acid
Simethicone
Tannic acid
Topical starch
Trolamine
Turpentine oil
Zirconium oxide
Zyloxin

(B) Ingredients—Approved as of June 4, 2004; June 6, 2005, for products with annual sales less than $25,000.

Beeswax
Bismuth subnitrate
Boric acid
Cetyl alcohol
Glyceryl stearate
Isopropyl palmitate
Live yeast cell derivative
Shark liver oil
Stearyl alcohol

(19) [Reserved]

(20) Weight control drug products.

Alcohol
Alfalfa
Alginic acid
Anise oil
Arginine
Ascorbic acid
Bearberry
Biotin
Bone marrow, red
Buchu
Buchu, potassium extract
Caffeine
Caffeine citrate
Calcium
Calcium carbonate
Calcium caseinate
Calcium lactate
Calcium pantothenate
Carboxymethylcellulose sodium
Carrageenan
Cholecalciferol
Choline
Chondrus
Citric acid
Cnicus benedictus
Copper
Copper gluconate
Corn oil
Corn syrup
Corn silk, potassium extract
Cupric sulfate
Cyanocobalamin (vitamin B12)
Cystine
Dextrose
Docusate sodium
Ergocalciferol
Ferric ammonium citrate
Ferric pyrophosphate
Ferrous fumarate
Ferrous gluconate
Ferrous sulfate (iron)
Flax seed
Folic acid
Fructose
Guar gum
Histidine
Hydrastis canadensis
Inositol
Iodine
Isoleucine
Juniper, potassium extract
Karaya gum
Kelp
Lactose
Lecithin
Leucine
Liver concentrate
Lysine
Lysine hydrochloride
Magnesium
Magnesium oxide
Malt
Maltodextrin
Manganese citrate
Mannitol
Methionine
Methylcellulose
Mono- and diglycerides
Niacinamide
Organic vegetables
Pancreatin
Pantothenic acid
Papain
Papaya enzymes
Pepsin
Phenacetin
Phenylalanine
Phosphorus
Phytolacca
Pineapple enzymes
Plantago seed
Potassium citrate
Pyridoxine hydrochloride (vitamin B6)
Riboflavin
Rice polishings
Saccharin
Sea minerals
Sesame seed
Sodium
Sodium bicarbonate

Sodium caseinate
Sodium chloride (salt)
Soybean protein
Soy meal
Sucrose
Thiamine hydrochloride (vitamin B1)
Thiamine mononitrate (vitamin B1 mononitrate)
Threonine
Tricalcium phosphate
Tryptophan
Tyrosine
Uva ursi, potassium extract
Valine
Vegetable
Vitamin A
Vitamin A acetate
Vitamin A palmitate
Vitamin E
Wheat germ
Xanthan gum
Yeast

(21) Ophthalmic drug products.

(i) Ophthalmic anesthetic drug products.
Antipyrine
Piperocaine hydrochloride

(ii) Ophthalmic anti-infective drug products.
Boric acid
Mild silver protein
Yellow mercuric oxide

(iii) Ophthalmic astringent drug products.
Infusion of rose petals

(iv) Ophthalmic demulcent drug products.
Polyethylene glycol 6000

(v) Ophthalmic vasoconstrictor drug products.
Phenylephrine hydrochloride (less than 0.08%)

(22) Topical antifungal drug products.

(i) Diaper rash drug products. Any ingredient(s) labeled with claims or directions for use in the treatment and/or prevention of diaper rash.

(ii) Ingredients.
Alcloxa
Alum, potassium
Aluminum sulfate
Amyltricresols, secondary
Basic fuchsin
Benzethonium chloride
Benzoic acid
Benzoxiquine
Boric acid
Camphor
Candicidin
Chlorothymol
Coal tar
Dichlorophen
Menthol
Methylparaben
Oxyquinoline
Oxyquinoline sulfate
Phenol
Phenolate sodium
Phenyl salicylate
Propionic acid
Propylparaben
Resorcinol
Salicylic acid
Sodium borate
Sodium caprylate
Sodium propionate
Sulfur
Tannic acid
Thymol
Tolindate
Triacetin
Zinc caprylate
Zinc propionate

(iii) Any ingredient(s) labeled with claims or directions for use on the scalp or on the nails.

(iv) Ingredients.
Camphorated metacresol
Chloroxylenol
m-Cresol
Nystatin

(23) Internal analgesic drug products

(i) Approved as of November 10, 1993.
Aminobenzoic acid
Antipyrine
Aspirin, aluminum
Calcium salicylate
Codeine
Codeine phosphate
Codeine sulfate
Iodoantipyrine
Lysine aspirin
Methapyrilene fumarate
Phenacetin
Pheniramine maleate
Pyrilamine maleate
Quinine
Salsalate
Sodium aminobenzoate

(ii) Approved as of February 22, 1999.
Any atropine ingredient
Any ephedrine ingredient

(24) Orally administered menstrual drug products

(i) Approved as of November 10, 1993.
Alcohol
Alfalfa leaves
Aloes
Asclepias tuberosa
Asparagus
Barosma
Bearberry (extract of *Uva ursi*)
Bearberry fluid extract (extract of bearberry)
Blessed thistle (*Cnicus benedictus*)

Buchu powdered extract (extract of buchu)
Calcium lactate
Calcium pantothenate
Capsicum oleoresin
Cascara fluid extract, aromatic (extract of cascara)
Chlorprophenpyridamine maleate
Cimicifuga racemosa
Codeine
Collinsonia (extract stone root)
Corn silk
Couch grass
Dog grass extract
Ethyl nitrite
Ferric chloride
Ferrous sulfate
Gentiana lutea (gentian)
Glycyrrhiza (licorice)
Homatropine methylbromide
Hydrangea, powdered extract (extract of hydrangea)
Hydrastis canadensis (golden seal)
Hyoscyamine sulfate
Juniper oil (oil of juniper)
Magnesium sulfate
Methapyrilene hydrochloride
Methenamine
Methylene blue
Natural estrogenic hormone
Niacinamide
Nutmeg oil (oil of nutmeg)
Oil of erigeron
Parsley
Peppermint spirit
Pepsin, essence
Phenacetin
Phenindamine tartrate
Phenyl salicylate
Piscidia erythrina
Pipsissewa
Potassium acetate
Potassium nitrate
Riboflavin
Saw palmetto
Senecio aureus
Sodium benzoate
Sodium nitrate
Sucrose
Sulfurated oils of turpentine
Taraxacum officinale
Theobromine sodium salicylate
Theophylline
Thiamine hydrochloride
Triticum
Turpentine, Venice (Venice turpentine)
Urea

(ii) Approved as of February 22, 1999.
Any atropine ingredient
Any ephedrine ingredient

(25) Pediculicide drug products

(i) Approved as of November 10, 1993.
Benzocaine
Benzyl alcohol
Benzyl benzoate
Chlorophenothane (dichlorodiphenyl trichloroethane)
Coconut oil soap, aqueous
Copper oleate
Docusate sodium
Formic acid
Isobornyl thiocyanoacetate
Picrotoxin
Propylene glycol
Sabadilla alkaloids
Sulfur, sublimed
Thiocyanoacetate

(ii) Approved as of June 14, 1994. The combination of pyrethrum extract (formerly named pyrethrins) and piperonyl butoxide in an aerosol dosage formulation.

(26) Anorectal drug products

(i) Anticholinergic drug products.
Atropine
Belladonna extract

(ii) Antiseptic drug products.
Boric acid
Boroglycerin
Hydrastis
Phenol
Resorcinol
Sodium salicylic acid phenolate

(iii) Astringent drug products.
Tannic acid

(iv) Counterirritant drug products.
Camphor (greater than 3%–11%)
Hydrastis
Menthol (1.25%–16%)
Turpentine oil (rectified) (6%–50%)

(v) Keratolytic drug products.
Precipitated sulfur
Sublimed sulfur

(vi) Local anesthetic drug products.
Diperodon
Phenacaine hydrochloride

(vii) Other drug products.
Collinsonia extract
Escherichia coli vaccines
Lappa extract
Leptandra extract
Live yeast cell derivative
Mullein

(viii) Protectant drug products.
Bismuth oxide
Bismuth subcarbonate

Bismuth subgallate
Bismuth subnitrate
Lanolin alcohols

(ix) Vasoconstrictor drug products.
Epinephrine undecylenate

(x) Wound-healing drug products.
Cholecalciferol
Cod liver oil
Live yeast cell derivative
Peruvian balsam
Shark liver oil
Vitamin A

(xi) Combination drug products. Any combination drug product containing hydrocortisone and pramoxine hydrochloride.

(27) Topical antimicrobial drug products

(i) First aid antiseptic drug products.
Ammoniated mercury
Calomel (mercurous chloride)
Merbromin (mercurochrome)
Mercufenol chloride (ortho-chloromercuriphenol, ortho-hydroxyphenylmercuric chloride)
Mercuric chloride (bichloride of mercury, mercury chloride)
Mercuric oxide, yellow
Mercuric salicylate
Mercuric sulfide, red
Mercury
Mercury oleate
Mercury sulfide
Nitromersol
Para-chloromercuriphenol
Phenylmercuric nitrate
Thimerosal
Vitromersol
Zyloxin

(ii) Diaper rash drug products.
Para-chloromercuriphenol
Any other ingredient containing mercury

(28) Vaginal contraceptive drug products

(i) Approved as of October 22, 1998.
Dodecaethylene glycol monolaurate (polyethylene glycol 600 monolaurate)
Laureth 10S
Methoxypolyoxyethyleneglycol 550 laurate
Phenylmercuric acetate
Phenylmercuric nitrate
Any other ingredient containing mercury

(ii) Approved as of November 5, 2002.
Octoxynol 9

(29) Sunscreen drug products.
Diethanolamine methoxycinnamate
Digalloyl trioleate
Ethyl 4-[bis(hydroxypropyl)] aminobenzoate
Glyceryl aminobenzoate
Lawsone with dihydroxyacetone
Red petrolatum

4 Bioequivalence of Complementary and Alternative Medicines

BACKGROUND

The history of legislation described previously in the United States demonstrates that the U.S. agencies have been proactive in creating pathways that will lead to affordable medicines. Whereas the United States remains the largest market of pharmaceutical products, with over $700 billion of market, it has not ignored the emerging need to recognize other systems of medicines, such as herbal therapies and other nonconventional methods; in summary, any modality that is not clearly connected with a chemical structure and activity can be labeled as nontraditional in the modern understanding of pharmacology. In the United States, the Food and Drug Administration (FDA) chose a designation of Complementary and Alternative Medicine to encompass all herbal and nontraditional medicinal systems. This was a giant step for the U.S. FDA, which had long been a promoter of a clean connection between chemistry and pharmacology. Such is not the case in the use of the broad range of drugs that fall into this category of treatment modalities.

The term "complementary and alternative medicine" (CAM) encompasses a wide array of health-care practices, products, and therapies that are distinct from practices, products, and therapies used in "conventional" or "allopathic" medicine. Some forms of CAM, such as traditional Chinese medicine and the Indian Ayurvedic medicine, have been practiced for centuries, whereas others, such as electrotherapy, are more recent in origin. In the United States, the practice of CAM has risen dramatically in recent years. In 1992, Congress established the Office of Unconventional Therapies, which later became the Office of Alternative Medicine (OAM), to explore "unconventional medical practices." In 1998, OAM became the National Center for Complementary and Alternative Medicine (NCCAM). NCCAM is a center within the National Institutes of Health. The Institute of Medicine, in its book entitled *Complementary and Alternative Medicine in the United States*, stated that more than one-third of American adults reported using some form of CAM and that visits to CAM providers each year exceed those to primary care physicians. As the practice of CAM has increased in the United States, FDA observed increased confusion as to whether certain products used in CAM products are subject to regulation under the Federal Food, Drug, and Cosmetic Act (FD&C Act) or Public Health Service Act (PHS Act); this is further compounded by the importation of a large number of CAM products, since these are widely used not just in the developing countries but also in many developed markets, such as Germany and Japan. The FDA guidance regarding CAM products makes two fundamental points:

- First, depending on the CAM therapy or practice, a product used in a CAM therapy or practice *may* be subject to regulation as a biological product, cosmetic, drug, device, or food (including food additives and dietary supplements) under the Act or the PHS Act. For example, the PHS Act defines "biological product," and the Act defines (among other things) Cosmetic, Device, Dietary supplement, and Drug, as well as "new drug" and "new animal drug," "Food," and Food additive.
- Second, neither the Act nor the PHS Act exempts CAM products from regulation. This means, for example, that if a person decides to produce and sell raw vegetable juice for use in juice therapy to promote optimal health, that product is a food subject to the requirements for foods in the Act and FDA regulations, including the hazard analysis and critical control point (HACCP) system requirements for juices in 21 CFR Part 120. If the juice therapy *is* intended for use as part of a disease treatment regimen instead of for general wellness, the vegetable juice would also be subject to regulation as a drug under the Act.

The NCCAM defines CAM as "a group of diverse medical and health care systems, practices, and products that are not presently considered to be part of conventional medicine." It interprets "complementary" medicine as being used together with conventional medicine, whereas "alternative" medicine is used in place of conventional medicine. NCCAM classifies CAM therapies into four categories or "domains." These are biologically based practices; energy therapies; manipulative and body-based methods; and mind-body medicine.

NCCAM once had a fifth domain, "Alternative medical systems," but now considers "alternative medical systems" (now known as "whole medical systems") to be a separate category rather than another domain, because alternative medical systems use practices from the four domains listed earlier. For purposes of this guidance, FDA adopts the same domains and "whole medical systems" category that NCCAM uses.

According to NCCAM, the domain called "biologically based practices" includes, but is not limited to, botanicals, animal-derived extracts, vitamins, minerals, fatty acids, amino acids, proteins, prebiotics and probiotics, whole diets,

and "functional foods." Many biologically based products within this domain are subject to statutory and regulatory requirements under the Act or the PHS Act. The intended use of a product plays a central role in how it is regulated. For example:

- Botanical products, depending on the circumstances, may be regulated as drugs, cosmetics, dietary supplements, or foods. All four types of products are subject to the Act. For example, a botanical product intended for use in treating a disease would generally be regulated as a drug; a botanical product taken by mouth, labeled as a dietary supplement, and intended for use to affect the structure or function of the body would generally be regulated as a dietary supplement; a raw or dried botanical intended for use as an ingredient to flavor food would generally be regulated as a food or as a food additive, depending on whether the botanical was generally recognized as safe for its intended use in food; and a lotion containing botanical ingredients and intended for use in moisturizing the skin would generally be regulated as a cosmetic.
- Probiotics may be regulated as dietary supplements, foods, or drugs under the Act, depending on the product's intended use. Other factors may also affect the classification of the product: for example, whether the product contains a "dietary ingredient" as defined in section 201(ff)(1) of the Act (21 U.S.C. 321(ff)(1)), whether it is represented as a conventional food or as a meal replacement (see section 201(ff)(2)(B) of the Act), and for probiotics used as ingredients in a conventional food, whether the ingredient is generally recognized as safe for its intended use (see section 201(s) of the Act (21 U.S.C. 321(s)). In addition to any requirements that apply based on the product's classification under the Act, probiotics may also be subject to the PHS Act's provisions concerning the prevention of communicable disease, due to potential disease-causing microorganisms that might be contained in such products. Finally, if a probiotic is a drug under the Act, it may be subject to regulation as a biological product under the PHS Act as well.
- Products that NCCAM would consider to be "functional foods" may be subject to FDA regulation as foods, dietary supplements, or drugs under the Act. As with botanicals and probiotics, the classification of a "functional food" under the Act is based primarily on the product's intended use and may also involve other factors depending on the elements of the statutory definition of a particular product category.

NCCAM considers energy medicine to involve energy fields of two types:

- Veritable energy fields, which can be measured and use either mechanical vibrations (such as sound) or electromagnetic forces, including visible light, magnetism, monochromatic radiation (such as laser light), and other light rays.
- Putative energy fields (or biofields) that have defied measurement to date by reproducible methods. According to NCCAM, therapies involving putative energy fields "are based on the concept that human beings are infused with a subtle form of energy," and therapists "claim that they work with this subtle energy, see it with their own eyes, and use it to effect changes in the physical body and influence health."

In a sense, "conventional" medicine already uses various forms of "energy" medicine. For example, a magnetic resonance imaging (MRI) device uses electromagnetic waves to create images of internal body organs and tissues. As another example, an ultrasound machine uses sound waves to create images of body organs, tissues, and fetuses. Given their intended uses, we regulate these products as medical devices under the Act. The CAM products that use veritable energy fields in the diagnosis of disease or other conditions or in the cure, mitigation, treatment, or prevention of disease in man or animals or to affect the structure or any function of the body of man or animals may be medical devices under the Act. Additionally, if the product is electronic and emits radiation, it may be subject to additional requirements to ensure that there is no unnecessary exposure of people to radiation. CAM products that use putative energy fields in the diagnosis of disease or other conditions or in the cure, mitigation, treatment, or prevention of disease in man or animals may be medical devices under the Act. For example, FDA regulates acupuncture needles as "class II" medical devices.

Under the umbrella of manipulative and body-based practices is a heterogeneous group of CAM interventions and therapies. These include chiropractic and osteopathic manipulation, massage therapy, Tui Na, reflexology, rolfing, Brown technique, Trager bodywork, Alexander technique, Feldenkrais method, and a host of others. Manipulative and body-based practices focus primarily on the structures and systems of the body, including the bones and joints, the soft tissues, and the circulatory and lymphatic systems. To the extent that manipulative and body-based practices involve practitioners physically manipulating a patient's body without using tools or machines, FDA does not consider that such practices are subject to regulation under the Act or the PHS Act. If, however, the manipulative and body-based practices involve the use of equipment (such as massage devices) or the application of a product (such as a lotion, cream, or oil) to the skin or other parts of the body, those products may be subject to regulation under the Act, depending on the nature of the product and its intended use.

NCCAM describes mind-body medicine as focusing on "the interactions among the brain, mind, body, and behavior, and the powerful ways in which emotional, mental, social, spiritual, and behavioral factors can directly affect health." It states that mind-body medicine "typically focuses on intervention strategies that are thought to promote health, such as relaxation, hypnosis, visual imagery, meditation, yoga,

biofeedback, tai chi, qi gong, cognitive-behavioral therapies, group support, autogenic training, and spirituality." In general, CAM practices in this domain would *not* be subject to FDA jurisdiction under the Act or the PHS Act. As with the manipulative and body-based practices domain, however, any equipment or other products used as part of the practice of mind-body medicine may be subject to FDA regulation, depending on the nature of the product and its intended use. For example, biofeedback machines intended to help a patient learn to affect body functions, such as muscle activity, are regulated as class II devices.

NCCAM describes "whole medical systems" as involving "complete systems of theory and practice that have evolved independently from or parallel to allopathic (conventional) medicine." These may reflect individual cultural systems, such as traditional Chinese medicine and Ayurvedic medicine. Some elements common to whole medical systems are a belief that the body has the power to heal itself and that healing may involve techniques that use the mind, body, and spirit. Although it is unlikely that a whole medical system itself would be subject to regulation under the Act or the PHS Act, products used as *components* of whole medical systems may be subject to FDA regulation for the reasons described earlier.

To understand how the Act or the PHS Act might apply to CAM products, it is important to understand the Act's statutory definitions or, in the case of the PHS Act, our authority regarding biological products.

To illustrate how the definitions of drug or new drug might apply, consider an herbal product that is intended to treat arthritis in humans. The herbal product, which would be a "biologically based practice" insofar as CAM domains are concerned, would be a "drug" under section 201(g)(1)(B) of the Act, because it is intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease (arthritis) in man. The same herbal product would also be a "new drug" under section 201(p)(1) of the Act unless it is generally recognized, among experts qualified by scientific training and experience to evaluate the safety and effectiveness of drugs, as safe and effective for use under the conditions prescribed, recommended, or suggested in the labeling. "New drug" status triggers the Act's requirements for premarket review and approval by FDA.

To illustrate how a CAM product might be a "device" under the Act, acupuncture is a CAM therapy that seeks to stimulate energy pathways ("meridians") by puncturing, pressing, heating, using electrical current, or using herbal medicines. Fine needles are often used, and these acupuncture needles are "devices" under section 201(h) of the Act, because they are intended for use in the cure, mitigation, treatment, or prevention of disease in man or are intended to affect the structure or function of the body of man. We regulate acupuncture needles (see 21 CFR 880.5580) but not the practice of acupuncture itself. A detailed discussion of the Act's device provisions is beyond the scope of this guidance document. Note, however, that the Act establishes classifications for devices (class I, II, or III) that affect how they are regulated. The Act also imposes certain requirements on those who manufacture devices (including requirements pertaining to establishment registration and product listing, premarket review, labeling, postmarket reporting, and good manufacturing practices). Certain requirements also apply to device distributors.

To illustrate how a CAM practice might involve "foods," juice therapy uses juice made from vegetables and fruits. Absent any claims that would make the juice subject to the drug definition, the juice would be a "food" under section 201(f) of the Act, because it is an article used for food or drink for man. A detailed discussion of the Act's food provisions is beyond the scope of this guidance document. However, anyone who intends to market CAM products that might be subject to regulation under these provisions should familiarize himself/herself with the Act's requirements for foods, particularly with respect to safety and labeling. The Act and our food regulations can be found at www.fda.gov/opacom/laws.

To illustrate how a CAM product might involve "food additives" under section 201(s) of the Act, some CAM practices involve dietary modifications whereby substances such as botanicals or enzymes are added to foods in the diet. If a manufacturer adds such a substance to a food, the substance may fall within the "food additive" definition at section 201(s) of the Act. A food additive is subject to premarket approval by FDA under section 409 of the Act (21 U.S.C. 348). Food additives that we have not approved or that do not comply with applicable FDA regulations prescribing safe conditions of use are deemed to be unsafe under section 409(a) of the Act, and foods that contain such additives are adulterated under section 402(a)(2)(C) of the Act (21 U.S.C. 342(a)(2)(C)). The Act provides that a substance is exempt from the definition of a food additive and thus, from premarket approval if, among other reasons, it is generally recognized as safe (GRAS) by qualified experts under the conditions of intended use. Whether a substance added to a food is considered to be a food additive or is GRAS, any claims associating the substance with the reduction of a disease risk are "health claims" (defined in 21 CFR 101.14(a)(1)) that require premarket review by FDA. A detailed discussion of the Act's food additive provisions is beyond the scope of this guidance document. However, anyone intending to market CAM products that are or contain substances that might be subject to regulation as food additives should consult with the Act's food additive requirements.

> Except for purposes of section 201(g) [of the Act], a dietary supplement shall be deemed to be a food within the meaning of this Act.

To illustrate how a CAM product might be a "dietary supplement" under section 201(ff) of the Act, consider botanical products used in naturopathy.

Naturopathy is a CAM whole medical system that views disease as a manifestation of alterations in the processes by which the body heals itself. For example, naturopathic cranberry tablets might be labeled for use to maintain the health of the urinary tract. In this example, the cranberry tablets generally would be regulated as "dietary supplements" under section 201(ff)(1) of the Act if they were labeled for use to "maintain the health of the urinary tract" rather than "prevent urinary tract infections." The cranberry tablets would be

regulated as "drugs" under section 201(g) of the Act if they were labeled for use to "treat urinary tract infections" even if they were labeled as dietary supplements. A detailed discussion of the Act's dietary supplement provisions is beyond the scope of this guidance document.

It is possible that certain products used in conjunction with CAM practices may be "cosmetics" under the Act. For example, if a CAM practice involves massage with a moisturizer, the moisturizer could be a "cosmetic" to the extent that it is "rubbed, poured, sprinkled, or sprayed on" the body for beautification or appearance-altering purposes. However, if the moisturizer's intended use is also for the diagnosis, cure, mitigation, treatment, or prevention of disease, or to affect the structure or any function of the body, then it may also be subject to regulation as a drug. Other examples of drug/cosmetic combinations are deodorants that are also antiperspirants, moisturizers and makeup marketed with sun-protection claims, and shampoos that also treat dandruff. The Act does not require premarket approval for cosmetics, but it does prohibit the marketing of adulterated or misbranded cosmetics in interstate commerce. Anyone intending to market CAM products that might be subject to regulation as cosmetics should familiarize himself/herself with the safety and labeling requirements for these products in the Act and our regulations.

If a CAM product manufacturer attempted to use a live, disease-causing virus as a component of a CAM product, FDA could exercise its authority under section 361 of the PHS Act and 21 CFR 1240.30 to take action against the product, in addition to considering the applicability of section 351 of the PHS Act.

As the practice of CAM has increased in the United States, FDA saw increased confusion as to whether certain products used in CAM (which, for convenience, we will refer to as "CAM products") are subject to regulation under the Act or the PHS Act. FDA also saw an increase in the number of CAM products imported into the United States.

Therefore, the draft guidance discusses when a CAM product is subject to the Act or the PHS Act. (When the draft guidance mentions a particular CAM therapy, practice, or product, it does so in order to provide background information or to serve as an example or illustration; any mention of a particular CAM therapy, practice, or product should not be construed as expressing FDA's support for or endorsement of that particular CAM therapy, practice, or product or, unless specified otherwise, as an agency determination that a particular product is safe and effective for its intended uses or is safe for use.) The draft guidance makes the following two fundamental points:

First, depending on the CAM therapy or practice, a product used in a CAM therapy or practice may be subject to regulation as a biological product, cosmetic, drug, device, or food (including food additives and dietary supplements) under the Act or the PHS Act.

Second, neither the Act nor the PHS Act exempts CAM products from regulation.

As the practice of CAM has increased in the United States, the Food and Drug Administration ("FDA," "we") has seen increased confusion as to whether certain products used in CAM (which, for convenience, we will refer to as "CAM products") are subject to regulation under the Federal Food, Drug, and Cosmetic Act ("the Act") or the Public Health Service Act ("PHS Act"). There is also an increase in the number of CAM products imported into the United States.

The FDA Guidance makes two fundamental points:

- First, depending on the CAM therapy or practice, a product used in a CAM therapy or practice *may* be subject to regulation as a biological product, cosmetic, drug, device, or food (including food additives and dietary supplements) under the Act or the PHS Act. For example, the PHS Act defines "biological product," and the Act defines (among other things)
  - Cosmetic
  - Device
  - Dietary supplement
  - Drug, as well as "new drug" and "new animal drug"
  - Food
  - Food additive
- Second, neither the Act nor the PHS Act exempts CAM products from regulation. This means, for example, that if a person decides to produce and sell raw vegetable juice for use in juice therapy to promote optimal health, that product is a food subject to the requirements for foods in the Act and FDA regulations, including the hazard analysis and critical control point (HACCP) system requirements for juices in 21 CFR part 120. If the juice therapy is intended for use as part of a disease treatment regimen instead of for general wellness, the vegetable juice would also be subject to regulation as a drug under the Act.

7.20	Regular checks of all control devices (code reader, counter, etc.)?	☐☐☐		5.52
7.21	Printings clear and durable?	☐☐☐		5.53
7.22	Balancing of printed packaging materials and bulk?	☐☐☐		5.56
7.23	Destruction of excessive coded packaging material after completion of an order?	☐☐☐		5.57
7.24	Are the finished products kept in quarantine until final release?	☐☐☐		5.58
7.25	Appropriate storage after release?	☐☐☐		5.60
	IPC			
7.26	Checks on identity of bulk and packaging materials?	☐☐☐		5.47
	Regular line checks on			
7.27	• Aspect of the packages?	☐☐☐		5.54a
7.28	• Completeness?	☐☐☐		5.54b
7.29	• Conformity of quantity and quality of materials with packaging order?	☐☐☐		5.54c
7.30	• Correct imprint?	☐☐☐		5.54d
7.31	• Correct function of control devices?	☐☐☐		5.54d
	Are the following IPC checks performed?			
7.32	• Leaking	☐☐☐		
7.33	• Release torque of screw caps	☐☐☐		
7.34	• pH, density, drop weight, viscosity, and sedimentation	☐☐☐		
8	**DOCUMENTATION**			
	Specifications			
8.1	Specifications for raw/packaging materials available?	☐☐☐		4.10
	Do they include			
8.2	• internal name and code?	☐☐☐		4.11
8.3	• Name of supplier and/or manufacturer?	☐☐☐		4.11
8.4	• Reference sample (printed packaging material)?	☐☐☐		4.11
8.5	• Sampling procedure?	☐☐☐		4.11
8.6	• Qualitative/quantitative specifications with limits?	☐☐☐		4.11
8.7	• Storage conditions?	☐☐☐		4.11
8.8	• Maximum storage period?	☐☐☐		4.11
	Goods Receiving			
8.9	Written procedures for the reception of deliveries?	☐☐☐		4.19
	Do the records of receipt include			
8.10	• Product name on labels and delivery note?	☐☐☐		4.20
8.11	• Internal name and code?	☐☐☐		4.20
8.12	• Receiving date?	☐☐☐		4.20
8.13	• Name of supplier and/or manufacturer?	☐☐☐		4.20
8.14	• Batch number of supplier?	☐☐☐		4.20
8.15	• Total quantity and number of containers?	☐☐☐		4.20
8.16	• Allocated internal batch number?	☐☐☐		4.20
8.17	SOPs for labeling, quarantine, and storage conditions of all incoming goods available?	☐☐☐		4.21
	SOPs include			
8.18	• authorized sampling personnel?	☐☐☐		4.22
8.19	• methods, equipment, and quantities?	☐☐☐		4.22
8.20	• safety measures?	☐☐☐		4.22

	Master Formulae			
8.21	Are master formulae for each product and batch size available?	☐☐☐		4.3
8.22	Is the master formula approved and signed by the authorized persons?	☐☐☐		4.3
	The master formula includes			
8.23	• Product name and code?	☐☐☐		4.14a
8.24	• Description of galenical form, dosage, and batch size?	☐☐☐		4.14b
8.25	• All active ingredients with name, code, and weight?	☐☐☐		4.14c
8.26	• All excipients used during manufacture with name, code, and weight?	☐☐☐		4.14c
8.27	• Yields with limits?	☐☐☐		4.14d
	Does the working procedure include			
8.28	• The production line?	☐☐☐		4.15a
8.29	• Equipment to be used?	☐☐☐		4.15a
8.30	• Reference to methods for cleaning, assembling, and calibration of machines?	☐☐☐		4.15b
8.31	• Detailed stepwise manufacturing prescription?	☐☐☐		4.15c
8.32	• IPCs to be performed with limits?	☐☐☐		4.15d
8.33	• Precautions to be followed?	☐☐☐		4.15e
8.34	Are batch records kept for each batch processed?	☐☐☐		4.17
	Do batch records include			
8.35	• Protocol of line clearance?	☐☐☐		4.17
8.36	• Name of the product and batch no.?	☐☐☐		4.17a
8.37	• Date and time of start and end of production?	☐☐☐		4.17b
8.38	• Name and initials of responsible workers for each step?	☐☐☐		4.17c, d
8.39	• Batch and analytical no. and actual weight of all starting materials?	☐☐☐		4.17e
8.40	• Equipment used?	☐☐☐		4.17f
8.41	• Results of IPCs with initials of person who carries them out?	☐☐☐		4.17g
8.42	• Yields of the relevant manufacturing steps?	☐☐☐		4.17h
8.43	• Detailed notes on problems and process deviations?	☐☐☐		4.17i
8.44	Records on reprocessing of batches?	☐☐☐		
	Packaging Instructions			
8.45	Packaging instructions for each product, package size, and presentation?	☐☐☐		4.16
	Do they include			
8.46	• Product name?	☐☐☐		4.16a
8.47	• Description of galenical form and strength?	☐☐☐		4.16b
8.48	• Package size?	☐☐☐		4.17c
8.49	• List of all packaging materials with code for a standard batch size?	☐☐☐		4.17d
8.50	• Samples of printed packaging materials?	☐☐☐		4.17e
8.51	• Special precautions?	☐☐☐		4.17f
8.52	• Description of the process and equipment?	☐☐☐		4.17g
8.53	• IPCs to be performed with sampling instruction?	☐☐☐		4.17h

12.12	If a third party is involved, it must have the necessary manufacturing and analytical information.	☐☐☐		7.8
	The Contract			
12.13	Does the written contract specify the responsibilities?	☐☐☐		7.10
12.14	Have technical aspects been drawn up by competent persons?	☐☐☐		7.10
12.15	Release of material and check for compliance with the marketing authorization defined?	☐☐☐		7.11
12.16	Is it defined who is responsible for			7.12
	• Purchasing of materials?	☐☐☐		
	• IPC controls?	☐☐☐		
	• Testing and release of materials?	☐☐☐		
	• Manufacturing and quality control?	☐☐☐		
	• Sampling?	☐☐☐		
	• Storage of batch documentation?	☐☐☐		
12.17	Are manufacturing, analytical, and distribution records available to the contract giver?	☐☐☐		7.13
12.18	Does the contract permit the giver to visit the facilities of the acceptor?	☐☐☐		7.14
12.19	In the case of contract analysis: Does the contract acceptor understand that he or she is subject to inspection by the competent authorities?	☐☐☐		7.15
13	**AUDIT OF SUPPLIERS**			**2.7**
13.1	Supplier audits performed for	☐☐☐		
	• Excipients?			
	• Active substances?	☐☐☐		
	• Packaging material?	☐☐☐		

[a] 1. Fulfilled or available; 2. partially fulfilled; 3. not fulfilled or not available.

GLOSSARY

Acceptance Criteria: Numerical limits, ranges, or other suitable measures for acceptance of test results.

Active Pharmaceutical Ingredient (API) (or Drug Substance): Any substance or mixture of substances intended to be used in the manufacture of a drug (medicinal) product and that, when used in the production of a drug, becomes an active ingredient of the drug product. Such substances are intended to furnish pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease or to affect the structure and function of the body.

Air Lock: An enclosed space with two or more doors, which is interposed between two or more rooms, for example, of differing classes of cleanliness, for the purpose of controlling the airflow between those rooms when they need to be entered. An air lock is designed for use either by people or for goods and/or equipment.

API Starting Material: A raw material, intermediate, or API that is used in the production of an API and that is incorporated as a significant structural fragment into the structure of the API. An API Starting Material can be an article of commerce, a material purchased from one or more suppliers under contract or commercial agreement, or produced in house. API Starting Materials are normally of defined chemical properties and structure.

Authorized Person: The person recognized by the national regulatory authority as having the responsibility for ensuring that each batch of finished product has been manufactured, tested, and approved for release in compliance with the laws and regulations in force in that country.

Batch (or Lot): A specific quantity of material produced in a process or series of processes so that it is expected to be homogeneous within specified limits. In the case of continuous production, a batch may correspond to a defined fraction of the production. The batch size can be defined either by a fixed quantity or by the amount produced in a fixed time interval.

Batch Number (or Lot Number): A unique combination of numbers, letters, and/or symbols that identifies a batch (or lot) and from which the production and distribution history can be determined.

Batch Records: All documents associated with the manufacture of a batch of bulk product or finished product. They provide a history of each batch of product and of all circumstances pertinent to the quality of the final product.

Bioburden: The level and type (e.g., objectionable or not) of microorganisms that can be present in raw materials, API starting materials, intermediates, or APIs. Bioburden should not be considered contamination unless the levels have been exceeded or defined objectionable organisms have been detected.

Bulk Product: Any product that has completed all processing stages up to, but not including, final packaging.

Calibration: The demonstration that a particular instrument or device produces results within specified limits by comparison with those produced by a reference or traceable standard over an appropriate range of measurements. The set of operations that establish, under specified conditions, the relationship between values indicated by an instrument or system for measuring (especially weighing), recording, and controlling, or the values represented by a material measure, and the corresponding known values of a reference standard. Limits for acceptance of the results of measuring should be established.

Clean Area: An area with defined environmental control of particulate and microbial contamination, constructed and used in such a way as to reduce the introduction, generation, and retention of contaminants within the area.

Computer System: A group of hardware components and associated software designed and assembled to perform a specific function or group of functions. A process or operation integrated with a computer system.

Consignment (or Delivery): The quantity of a pharmaceutical(s) made by one manufacturer and supplied at one time in response to a particular request or order. A consignment may comprise one or more packages or containers and may include material belonging to more than one batch.

Contamination: The undesired introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or on to a starting material or intermediate during production, sampling, packaging or repackaging, and storage or transport.

Contract Manufacturer: A manufacturer performing some aspect of manufacturing on behalf of the original manufacturer.

Critical: Describes a process step, process condition, test requirement, or other relevant parameter or item that must be controlled within predetermined criteria to ensure that the API meets its specification.

Critical Operation: An operation in the manufacturing process that may cause variation in the quality of the pharmaceutical product.

Cross-Contamination: Contamination of a material or product with another material or product. Contamination of a starting material, intermediate product, or finished product with another starting material or product during production.

Deviation: Departure from an approved instruction or established standard.

Drug (Medicinal) Product: The dosage form in the final immediate packaging intended for marketing. (See ICH Guidance Q1A.)

Drug Substance: See Active Pharmaceutical Ingredient.

Expiry Date (or Expiration Date): The date placed on the container/labels of an API designating the time during which the API is expected to remain within established shelf-life specifications if stored under defined conditions, and after which it should not be used.

Finished Product: A finished dosage form that has undergone all stages of manufacture, including packaging in its final container and labeling.

Impurity: Any component present in the intermediate or API that is not the desired entity.

Impurity Profile: A description of the identified and unidentified impurities present in an API.

In-Process Control: Checks performed during production in order to monitor and if necessary, to adjust the process to ensure that the product conforms to its specifications. The control of the environment or equipment may also be regarded as a part of in-process control.

Intermediate: A material produced during steps of the processing of an API that undergoes further molecular change or purification before it becomes an API. Intermediates may or may not be isolated. Partly processed product that must undergo further manufacturing steps before it becomes a bulk product.

Large-Volume Parenterals: Sterile solutions intended for parenteral application with a volume of 100 mL or more in one container of the finished dosage form.

Lot: See Batch.

Lot Number: See Batch Number.

Manufacture: All operations of receipt of materials, production, packaging, repackaging, labeling, relabeling, quality control, release, storage, and distribution of APIs and related controls.

Manufacturer: A company that carries out operations such as production, packaging, repackaging, labeling, and relabeling of pharmaceuticals.

Marketing Authorization (Product License, Registration Certificate): A legal document issued by the competent drug regulatory authority that establishes the detailed composition and formulation of the product and the pharmacopoeial or other recognized specifications of its ingredients and of the final product itself, and includes details of packaging, labeling, and shelf life.

Master Formula: A document or set of documents specifying the starting materials with their quantities and the packaging materials, together with a description of the procedures and precautions required to produce a specified quantity of a finished product as well as the processing instructions, including the in-process controls.

Master Record: A document or set of documents that serve as a basis for the batch documentation (blank batch record).

Material: A general term used to denote raw materials (starting materials, reagents, and solvents), process aids, intermediates, APIs, and packaging and labeling materials.

Mother Liquor: The residual liquid that remains after the crystallization or isolation processes. A mother liquor may contain unreacted materials, intermediates, levels of the API, and/or impurities. It may be used for further processing.

Packaging: All operations, including filling and labeling, that a bulk product has to undergo in order to become a finished product. Filling of a sterile product under aseptic conditions, or a product intended to be terminally sterilized, would not normally be regarded as part of packaging.

Packaging Material: Any material intended to protect an intermediate or API during storage and transport. Any material, including printed material, employed in the packaging of a pharmaceutical, but excluding any outer packaging used for transportation or shipment. Packaging materials are referred to as primary or secondary according to whether or not they are intended to be in direct contact with the product.

Pharmaceutical Product: Any material or product intended for human or veterinary use presented in its finished dosage form, or as a starting material for use in such a dosage form, that is subject to control by pharmaceutical legislation in the exporting state and/or the importing state.

Procedure: A documented description of the operations to be performed, the precautions to be taken, and measures to be applied directly or indirectly related to the manufacture of an intermediate or API.

Process Aids: Materials, excluding solvents, used as an aid in the manufacture of an intermediate or API that do not themselves participate in a chemical or biological reaction (e.g., filter aid, activated carbon, and so on).

Process Control: See In-Process Control.

Production: All operations involved in the preparation of a pharmaceutical product, from receipt of materials, through processing, packaging and repackaging, and labeling and relabeling, to completion of the finished product.

Qualification: Action of proving and documenting that equipment or ancillary systems are properly installed, work correctly, and actually lead to the expected results. Qualification is part of validation, but the individual qualification steps alone do not constitute process validation.

Quality Assurance (QA): The sum total of the organized arrangements made with the object of ensuring that all APIs are of the quality required for their intended use and that quality systems are maintained.

Quality Control (QC): Checking or testing that specifications are met.

Quality Unit(s): An organizational unit independent of production that fulfills both Quality Assurance and Quality Control responsibilities. This can be in the form of separate QA and QC units or a single individual or group, depending upon the size and structure of the organization.

Quarantine: The status of starting or packaging materials, intermediates, or bulk or finished products isolated physically or by other effective means while a decision is awaited on their release, rejection, or reprocessing.

Raw Material: A general term used to denote starting materials, reagents, and solvents intended for use in the production of intermediates or APIs.

Reconciliation: A comparison between the theoretical quantity and the actual quantity.

Recovery: The introduction of all or part of previous batches (or of redistilled solvents and similar products) of the required quality into another batch at a defined stage of manufacture. It includes the removal of impurities from waste to obtain a pure substance or the recovery of used materials for a separate use.

Reference Standard, Primary: A substance that has been shown by an extensive set of analytical tests to be authentic material that should be of high purity.

Reference Standard, Secondary: A substance of established quality and purity, as shown by comparison to a primary reference standard, used as a reference standard for routine laboratory analysis.

Reprocessing: Subjecting all or part of a batch or lot of an in-process drug, bulk process intermediate (final biological bulk intermediate), or bulk product of a single batch/lot to a previous step in the validated manufacturing process due to failure to meet predetermined specifications. Reprocessing procedures are foreseen as occasionally necessary for biological

drugs and in such cases, are validated and preapproved as part of the marketing authorization.

Retest Date: The date when a material should be reexamined to ensure that it is still suitable for use.

Reworking: Subjecting an in-process or bulk process intermediate (final biological bulk intermediate) or final product of a single batch to an alternate manufacturing process due to a failure to meet predetermined specifications. Reworking is an unexpected occurrence and is not preapproved as part of the marketing authorization.

Self-Contained Area: Premises that provide complete and total separation of all aspects of an operation, including personnel and equipment movement, with well-established procedures, controls, and monitoring. This includes physical barriers as well as separate air-handling systems but does not necessarily imply two distinct and separate buildings.

Signature (Signed): See definition for signed.

Signed (Signature): The record of the individual who performed a particular action or review. This record can be initials, a full handwritten signature, a personal seal, or an authenticated and secure electronic signature.

Solvent: An inorganic or organic liquid used as a vehicle for the preparation of solutions or suspensions in the manufacture of an intermediate or API.

Specification: A list of detailed requirements with which the products or materials used or obtained during manufacture have to conform. They serve as a basis for quality evaluation.

Standard Operating Procedure (SOP): An authorized written procedure giving instructions for performing operations not necessarily specific to a given product or material (e.g., equipment operation, maintenance, and cleaning; validation; cleaning of premises and environmental control; sampling and inspection). Certain SOPs may be used to supplement product-specific master and batch production documentation.

Starting Material: Any substance of a defined quality used in the production of a pharmaceutical product, but excluding packaging materials.

Validation: A documented program that provides a high degree of assurance that a specific process, method, or system will consistently produce a result meeting predetermined acceptance criteria. Action of proving, in accordance with the principles of GMP, that any procedure, process, equipment, material, activity, or system actually leads to the expected results (see also Qualification).

Validation Protocol: A written plan stating how validation will be conducted and defining acceptance criteria. For example, the protocol for a manufacturing process identifies processing equipment, critical process parameters/operating ranges, product characteristics, sampling, test data to be collected, number of validation runs, and acceptable test results.

Yield, Expected: The quantity of material or the percentage of theoretical yield anticipated at any appropriate phase of production based on previous laboratory, pilot-scale, or manufacturing data.

Yield, Theoretical: The quantity that would be produced at any appropriate phase of production, based upon the quantity of material to be used, in the absence of any loss or error in actual production.

Appendix B: OTC Process and Ingredients

The Over-the-Counter (OTC) Drug Review was established to evaluate the safety and effectiveness of OTC drug products marketed in the United States before May 11, 1972. It is a three-phase public rulemaking process (each phase requiring a *Federal Register* publication) resulting in the establishment of standards (drug monographs) for an OTC therapeutic drug class.

The first phase was accomplished by advisory review panels. The panels were charged with reviewing the active ingredients in OTC drug products to determine whether these ingredients could be generally recognized as safe and effective for use in self-treatment. They were also charged with reviewing claims and recommending appropriate labeling, including therapeutic indications, dosage instructions, and warnings about side effects and preventing misuse.

The FDA published the panel's conclusions in the *Federal Register* in the form of an advanced notice of proposed rulemaking (ANPR). After publication of the ANPR, a period of time was allotted for interested parties to submit comments or data in response to the proposal.

According to the terms of the review, the panels classified ingredients into three categories as follows:

- Category I: generally recognized as safe and effective for the claimed therapeutic indication
- Category II: not generally recognized as safe and effective or unacceptable indications
- Category III: insufficient data available to permit final classification

The second phase of the OTC Drug Review is the FDA's review of active ingredients in each class of drugs, based on the panel's review of ingredients, on public comment, and on new data that may have become available. The FDA, in turn, publishes its conclusions in the *Federal Register* in the form of a tentative final monograph (TFM). After the publication of the TFM, a period of time is allotted for interested parties to submit comments or data in response to the FDA's proposal.

The publication of final regulations in the form of drug monographs is the third and last phase of the review process. The monographs establish conditions under which certain OTC drug products are generally recognized as safe and effective. Products containing active ingredients or indications that are nonmonograph require an approved New Drug Application for marketing.

After publication, a final monograph may be amended, either on the Commissioner's own initiative or upon the petition of any interested person. OTC drug monographs are continually updated to add, change, or remove ingredients, labeling, or other pertinent information as needed.

The OTC drug category Web site contains Federal Register notices organized by therapeutic category subtopics. Each Web page also links to therapeutic category pages organized chronologically.

This rulemaking history site is intended as a research aid and is not an official Food and Drug Administration (FDA record). We have tried to make these histories accurate and complete. Should you find an error, however, please let us know so that we can correct it (Table 1).

OTC drugs can be brought to the market following the new drug application (NDA) process as described earlier or under an OTC monograph. Each OTC drug monograph is a kind of "recipe book" covering acceptable ingredients, doses, formulations, labeling, and in some cases, testing parameters. OTC drug monographs are continually updated to add additional ingredients and labeling as needed. Products conforming to a monograph may be marketed without FDA preapproval. The NDA and monograph processes can be used to introduce new ingredients into the OTC marketplace. For example, OTC drug products previously available only by prescription are first approved through the NDA process, and their "switch" to OTC status is approved via the NDA process. OTC ingredients marketed overseas can be introduced into the U.S. market via a monograph under a Time and Extent Application (TEA) as described in 21 CFR 330.14. For a more thorough discussion of how OTC drug products are regulated, visit FDA laws, regulations, and guidances that affect small business. Information is also provided on financial assistance and incentives that are available for drug development. Table 2 shows a comparison of the NDA and the OTC monograph process for approval (Table 3).

TABLE 1
Categories of OTC Products with Monographs (www.fda.gov/drugs/over-counter-otc-drugs/status-otc-rulemakings)

Acne	Alcohol	Allergy
Analgesic, External	Analgesic, Internal	Anorectal
Antacid	Anthelmintic	Antibiotic, First Aid
Anticaries	Anticholinergic	Antidiarrheal
Antiemetic	Antiflatulent	Antifungal
Antihistamine	Antimalarial	Antimicrobial
Antiperspirant	Antipyretic	Antirheumatic
Antitussive	Aphrodisiac	Astringent
Benign Prostatic Hypertrophy	Boil Treatment	Bronchodilator
Callus Remover	Camphorated Oil	Category 2/3 Active Ingredients
Cholecystokinetic	Cold and Cough	Colloidal Silver
Corn Remover	Dandruff	Daytime Sedative
Decongestant, Nasal	Dental Care	Deodorant, Internal
Diaper Rash	Digestive Aid	Drink Overindulgence
Exocrine Pancreatic Insufficiency	Expectorant	External Analgesic
Fever Blister	First Aid Antibiotic	Food Overindulgence
General Procedures and Policies	Hair Growth and Loss	Hormone
Hypophosphatemia/Hyperphosphatemia	Ingrown Toenail	Insect Bite and Sting
Insect Repellent, Oral	Internal Analgesic	Internal Deodorant
Labeling	Laxative	Leg Muscle Cramps
Male Genital Desensitizers	Menstrual	Nailbiting
Nasal Decongestant	Nighttime Sleep Aid	Ophthalmic
Oral Health Care	Oral Wound Healing	Otic
Overindulgence, Food and Drink	Pancreatic Insufficiency	Pediatric Dosing Information
Pediculicide	Poison Oak/Ivy	Poison Treatment
Prostatic Hypertrophy	Psoriasis	Seborrheic Dermatitis
Sedative, Daytime	Silver	Skin Bleaching
Skin Protectant	Sleep Aid, Nighttime	Smoking Deterrent
Stimulant	Stomach Acidifier	Sunscreen
Sweet Spirits of Nitre	Thumbsucking	Time and Extent Applications
Topical Analgesic	Vaginal Contraceptive	Vaginal Drug Products
Vitamins and Minerals	Wart Remover	Weight Control

TABLE 2
NDA versus OTC approval of drugs

NDA Approval process	OTC Monograph Process
Premarket approval—FDA reviews and approves formulation and labeling prior to marketing.	No premarket approval – FDA sets forth specific conditions for generally regarded as safe and effective (GRASE) or in the case of a developing monograph, sets forth conditions that allow continued marketing pending a final monograph. Oversight occurs on a postmarketing basis.
Confidential filing	Public process
Drug product specific	Active ingredient specific and evaluated by OTC drug category
May require a user fee	No user fees
Potential for marketing exclusivity	No marketing exclusivity
FDA review timelines	Manufacturers responsible for ensuring compliant product with no FDA-mandated review (either pre or post market)
May require clinical studies, including studies on label comprehension and actual use	Generally, does not require clinical studies. Label comprehension and actual use studies are not required for ingredients already covered by a final or tentative final monograph.
Approved labeling is unique to the drug.	Labeling is defined by the monograph. Once marketed, FDA can review the complete labeling at any time to determine whether it is truthful or misleading.
Approved NDA is your "license" to market.	Final monograph is open to anyone.
Trade name reviewed prior to marketing	No review of trade name prior to marketing. Once marketed, FDA can review the trade name at any time.

Over-the-Counter Formulations

ACETAMINOPHEN AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (fine powder)	500.00
65.00	2	Anhydrous caffeine	65.00
15.00	3	Maize starch	15.00
10.00	4	Povidone (PVP K-30)	10.00
5.00	5	Croscarmellose sodium (Ac-Di-Sol)	5.00
33.00	6	Maize starch	33.00
8.00	7	Povidone (PVP K-90)	8.00
1.00	8	Polysorbate 80 (Tween 80)	1.00
10.00	9	Microcrystalline cellulose (Avicel™ PH102)	10.00
7.00	10	Sodium starch glycolate (Primojel®)	7.00
5.00	11	Croscarmellose sodium (Ac-Di-Sol)	5.00
2.00	12	Stearic acid (fine powder)	2.00
4.00	13	Talc (fine powder)	4.00
–	14	Purified water	155.00

Manufacturing Directions

1. Sift items 1 to 5 through a stainless steel 630 µm sieve. Load into mixer. Mix for 5 minutes at low speed.
2. Dissolve items 7 and 8 in 115 g of purified water (80–90°C) in a vessel.
3. Prepare slurry of item 6 in 40 g of purified water (25–30°C).
4. Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C.
5. Add the binder (item 4) to the paste.
6. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes.
7. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules into stainless steel trays for drying.
8. Dry the wet granules at 55°C for 8 hours. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying. Check the loss on drying (LOD limit: 1.5–2.0%). If required, dry further at 55°C for 1 hour.
9. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed. Collect in stainless steel drums.
10. Load the granules into blender. Sift items 9, 10, and 11 through a 500 µm sieve using a suitable sifter, and add to the blender. Mix for 2 minutes.
11. Sift items 12 and 13 through a 500 µm sieve.
12. Add 5 to 10 g granules from bulk. Mix in.
13. Check temperature and humidity before start of compression (recommended: relative humidity [RH] 55–60% at a temperature not exceeding 27°C).
14. Compress the granules using a rotary tableting machine. Average weight of tablet is 665 mg.

ACETAMINOPHEN AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (crystalline)	500
50.00	2	Caffeine (Knoll)	50
90.00	3	Avicel™ PH101	90
10.00	4	Kollidon® 30	10
20.00	5	Kollidon® CL	20
10.00	6	Polyethylene glycol (PEG-6000) (powder)	10

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compression force.
2. Compress into 683 mg tablets using 12 mm biplanar punches.
3. If the flowability of the powder mixture for tableting is not high enough, some Aerosil® 200 should be added.

ACETAMINOPHEN AND DIPHENHYDRAMINE HYDROCHLORIDE HOT THERAPY SACHETS

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
1650.00	1	Acetaminophen (micronized)	1650.00
250.00	2	Diphenhydramine hydrochloride	250.00
0.90	3	FD&C Yellow No. 10 Lake	0.90
0.0005	4	FD&C Red No. 40	0.0005
18,081.10	5	Castor sugar	18,081.10
200.00	6	Aspartame	200.00
250.00	7	Maize starch (dried)	250.00
180.00	8	Citric acid	180.00
38.00	9	Sodium citrate	38.00
200.00	10	Sodium chloride	200.00
240.00	11	Honey flavor (dry)	240.00
100.00	12	Lemon flavor (dry)	100.00
QS	13	Purified water	QS

Manufacturing Directions

1. Mix items 1 and 2 well; then, pass through 0.8 mm sieves.
2. Mix items 3, 5, and 13 to make a clear solution.
3. Add mixture of items 1 and 2 to second step mixture, and mix well.
4. Add this mixture to item 4, and mix. Take care to avoid lump formation.
5. Dry in an oven, maintaining a constant temperature.
6. Sieve and add items 6 to 12. Mix well. Make sure all the solids added are in fine powder form.
7. Fill 20 g of powder into sachets, and seal.

ACETAMINOPHEN AND PSEUDOEPHEDRINE HYDROCHLORIDE HOT THERAPY SACHETS

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
650.00	1	Acetaminophen (micronized)	650.00
260.00	2	Pseudoephedrine hydrochloride	260.00
0.90	3	FD&C Yellow No. 10 Lake	0.90
18,081.10	4	Castor sugar	18,081.10
200.00	5	Aspartame	200.00
250.00	6	Maize starch (dried)	250.00
180.00	7	Citric acid	180.00
38.00	8	Sodium citrate	38.00
200.00	9	Sodium chloride	200.00
240.00	10	Apple flavor (dry)	240.00
100.00	11	Cinnamon flavor (dry)	100.00
QS	12	Purified water	QS

Manufacturing Directions

1. Mix item 1 and 2 well, pass through a 0.8 mm sieve, and add to items 3 and 12, which have been mixed together.
2. Make into a clear solution. Take care to avoid lump formation.
3. Dry in an oven, maintaining constant moisture.
4. Using a 500 mm sieve, add items 6 to 11. Mix well. Make sure all the solids added are in fine powder form.
5. Fill 20 g of powder into sachets, and seal.

ACETAMINOPHEN AND DIPHENHYDRAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
325.00	1	Acetaminophen (fine powder)	325.00
26.00	2	Diphenhydramine HCl	26.00
50.00	3	Maize starch	50.00
07.00	4	Povidone (PVP K-30)	7.00
50.00	5	Microcrystalline cellulose (Avicel™ PH101)	50.00
42.00	6	Cornstarch	42.00
10.00	7	Povidone (PVP K-30)	10.00
09.50	8	Cellulose (powdered)	9.50
65.50	9	Cellulose (microcrystalline) (Avicel™ PH102)	65.50
20.00	10	Sodium starch glycolate (Primojel®)	20.00
08.00	11	Stearic acid (fine powder)	8.00
05.00	12	Talc (fine powder)	5.00
02.00	13	Magnesium stearate	2.00
–	14	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 5 through a 630 µm stainless steel sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 7 in 135 g of purified water (80–90°C) in a vessel.
4. Prepare a slurry of item 6 in 45 g of purified water (25–30°C).
5. Add the slurry to the vessel to make a translucent paste.
6. Cool to 45°C to 50°C.
7. Add the binder (item 4).
8. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.)

9. Unload the wet granules into stainless steel trays for drying.
10. Dry the wet granules in an oven at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying. Check the LOD (limit: 1–2%). If required, dry further at 55°C for 1 hour.
11. Grind the dried granules through a 1.25 mm sieve at medium speed.
12. Collect in stainless steel drums. Load the granules into blender.
13. Sift items 8, 9, and 10 through a 500 µm sieve using a suitable sifter, and add mixture to blender. Mix for 2 minutes.
14. Sift items 11, 12, and 13 through a 500 µm sieve. Add 5 to 10 g of granules from bulk.
15. Mix in polyethylene bag for 1 minute. Add to blender. Blend for 1 minute.
16. Check temperature and humidity before start of compression (limit: temperature not exceeding 27°C, RH 55–65%).
17. Compress the granules using a rotary tableting machine. Compress average tablet weight of 620 mg.
18. Disintegration time is not more than (NMT) 15 minutes; friability NMT is 1%.
19. Coating: Use one of the HPMC aqueous formulations in part III, such as yellow Opadry.

ACETAMINOPHEN SUSTAINED-RELEASE TABLETS

Manufacturing Directions

1. 300 g acetaminophen and 60 g hydroxypropylmethylcellulose were dissolved in a mixture of 720 g methanol and 720 g dichloromethane.
2. 300 g Celphere 102 (mean particle diameter of approximately 127 µm, particle diameter of approximately 50–150 µm) was introduced to a fluidized-bed granulator and coated with the solution by the side-spraying method (spraying liquid volume 14 g/min, spraying air pressure 3 kg/cm^2, product temperature 32°C, inlet temperature 45°C) to obtain acetaminophen particles.
3. Separately, 48 g ethyl cellulose and 12 g hydroxypropylmethylcellulose were dissolved in a mixture of 57 g purified water and 1083 g methanol.
4. 300 g acetaminophen particles were introduced to a fluidized-bed granulator and coated with this solution by side spraying (spraying liquid volume 8 g/min, spraying air pressure 3 kg/cm^2, product temperature 38°C, inlet temperature 67°C) to obtain sustained-release fine particles.
5. 66.00 g of these sustained-release fine particles and 314.25 g mannitol that had been pulverized by a pin-mill pulverizing device were granulated (spraying liquid volume 15 g/min, spraying air pressure 1.1 kg/cm^2, product temperature 30°C, inlet temperature 38°C, spraying cycle 30 seconds spraying/30 seconds drying) with an aqueous 30% w/w solution containing 67.5 g maltose in a fluidized bed granulator to obtain the final composition.
6. After further mixing 2.25 g magnesium stearate with the composition that was obtained, 450 mg tablets containing 25 mg acetaminophen per tablet were made under a tableting pressure of 25 kg/punch and an initial hardness of 2 kp using a rotary tableting machine.
7. Next, these tablets were kept for 24 hours while heating and humidifying at 25°C and 75% RH using a thermostatic chamber at constant humidity. Then, they were dried for 3 hours at 30°C and 40% RH.
8. The tablets that were obtained showed a hardness of 3.5 kp and disintegration time in the buccal cavity of 12 seconds.

ACETAMINOPHEN AND PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/caplet)	Item	Material Name	Qty/1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
50.00	3	Cornstarch	50.00
7.00	4	Povidone (PVP K-30)	7.00
50.00	5	Microcrystalline cellulose (Avicel™ PH101)	50.00
42.00	6	Cornstarch	42.00
10.00	7	Povidone (PVP K-30)	10.00
9.50	8	Cellulose (powdered)	9.50
60.00	9	Cellulose (microcrystalline) (Avicel™ PH102)	60.00
20.00	10	Sodium starch glycolate (Primojel®)	20.00
8.00	11	Stearic acid (fine powder)	8.00
5.00	12	Talc (fine powder)	5.00
2.00	13	Magnesium stearate	2.00
–	14	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 5 through a stainless steel 630 µm sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 7 in 135 g of purified water (80–90°C) in a vessel.
4. Prepare a slurry of item 6 in 45 g of purified water (25–30°C).
5. Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C. Add the binder (item 4).

6. Mix at low speed over a period of 3 minutes. Scrape sides and blades. Mix and chop at low speed for 1 to 2 minutes. Check the end point of granulation. If required, add additional purified water to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules into stainless steel trays for drying.
7. Dry the wet granules in oven at 55°C for 10 hours.
8. After 2 hours of drying, scrape the semidried granules to break up the lumps for uniform drying.
9. Check the LOD (limit: 1–2%). If required, dry further at 55°C for 1 hour.
10. Transfer the dried granules to stainless steel drums.
11. Grind the dried granules through a 1.25 mm sieve using granulator at medium speed. Collect in stainless steel drums. Load the granules into blender.
12. Sift items 8, 9, and 10 through a 500 µm sieve using a suitable sifter, and add to blender. Mix for 2 minutes.
13. Sift items 11, 12, and 13 through a 500 µm sieve.
14. Add 5 to 10 g of granules.
15. Mix in polyethylene bag for 1 minute. Add to blender. Blend for 1 minute. Unload in stainless steel drums.
16. Compress 620 mg in 6 mm capsule-shaped punches.
17. Coat. The formula for the coating solution is determined to obtain a weight gain of 10 mg per caplet considering evaporation and loss during the coating operation.

ACETAMINOPHEN CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Acetaminophen, milled (Hoechst)	300.00
600.00	2	Sucrose, milled	600.00
550.00	3	Kollidon® CL-M	550.00
30.00	4	Orange flavor (FDO)	30.00
30.00	5	Strawberry flavor (FDO)	30.00
60.00	6	Kollidon® 30	60.00
QS	7	Ethanol (96%)	~425.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 and 7, pass through a sieve, and press with medium compression force.
2. Average weight of tablet is 1620 mg using a 20 mm biplanar punch.
3. Taste is sweet, fruity, and only slightly bitter.

ACETAMINOPHEN, CHLORPHENIRAMINE, AND PSEUDOEPHEDRINE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
24.00	1	Acetaminophen (fine powder)	24.00
3.00	2	Pseudoephedrine HCl	3.00
0.44	3	Chlorpheniramine maleate (10% excess)	0.44
14.00	4	Ascorbic acid	14.00
2.40	5	Sodium hydroxide	2.40
1.00	6	Edetate disodium (sodium EDTA)	1.00
0.50	7	Saccharin sodium	0.50
2.00	8	Sodium metabisulfite (sodium disulfite)	2.00
80.00	9	Alcohol (ethanol, 95%)	80.00
100.00	10	Propylene glycol	100.00
100.00	11	Sorbitol (70% solution)	100.00
250.00	12	Glycerin (glycerol)	250.00
300.00	13	Sucrose	300.00
0.04	14	Quinoline yellow	0.04
0.25	15	Pineapple flavor	0.25
QS	16	Purified water	QS to 1 L

Manufacturing Directions

1. Add 200 g of item 16 to the manufacturing vessel, and heat to 90°C to 95°C.
2. Add item 13 while mixing at slow speed at a temperature of 90°C to 95°C.
3. Mix for 1 hour at high speed.
4. Add items 10, 11, and 12 to the manufacturing vessel while mixing at high speed. Mix for 10 minutes.
5. Cool the temperature to 50°C while mixing at slow speed.
6. Add 70 g of item 9 to the syrup solution while mixing at slow speed.
7. Load item 1 into the manufacturing vessel while mixing at high speed.
8. Mix for 30 minutes to obtain a clear solution. Check the clarity of the solution.
9. Flush the solution with nitrogen gas for 5 minutes at 1 bar.
10. Add items 2, 4, 6, and 8 to the manufacturing vessel while mixing at slow speed.
11. Dissolve item 3 in 2 g of item 16 (25°C), and check that the solution is complete.
12. Add the solution to the manufacturing vessel while mixing at slow speed.

13. Dissolve item 15 in 10 g of item 9 in a stainless steel container, and add to the manufacturing vessel while mixing at slow speed.
14. Dissolve items 5 and 7 in 20 g of item 16 (25°C), and add to the manufacturing vessel while mixing at slow speed.
15. Dissolve item 14 in 2 g of item 16 (25°C).
16. Transfer the color solution to the manufacturing vessel while mixing at slow speed.
17. Rinse the container of color solution with 2 g of item 16 (25°C); then, transfer the rinsings to the manufacturing vessel, and mix for 5 minutes at high speed.
18. Bring the volume up to 1 L with item 16, and finally, mix for 15 to 20 minutes at high speed.
19. Check and record the pH (limit: 5.1–5.2). If required, adjust pH with 10% citric acid or 10% sodium citrate solution.
20. Assemble the filter press with 13.1 T 1000 12 sheets (K 800 14 sheets). Use changeover plate. Wash the filters using purified water (25°C) by passing through filters at 0.2 bar. Discard the washings. Filter the syrup at 1.5 bar. Recirculate approximately 20 to 30 mL syrup.
21. Connect the hose to the manufacturing vessel, and transfer the filtered syrup to the storage vessel.

ACETAMINOPHEN, CHLORPHENIRAMINE MALEATE, AND PSEUDOEPHEDRINE CAPLETS

Bill of Materials

Scale (mg/caplet)	Item	Material Name	Qty/1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
2.10	3	Chlorpheniramine maleate	2.10
50.00	4	Cornstarch	50.00
7.00	5	Povidone (PVP K-30)	7.00
50.00	6	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
42.00	7	Cornstarch	42.00
10.00	8	Povidone (PVP K-30)	10.00
9.50	9	Powdered cellulose	9.50
77.90	10	Cellulose (microcrystalline) (Avicel™ PH102)	77.90
20.00	11	Sodium starch glycolate (Primojel®)	20.00
8.00	12	Stearic acid (fine powder)	8.00
5.00	13	Talc (fine powder)	5.00
2.00	14	Magnesium stearate	2.00
–	15	Purified water	180.00

Manufacturing Directions

1. Sift items 1 to 6 through a 630 µm stainless steel sieve.
2. Load into mixer. Mix for 5 minutes at low speed.
3. Dissolve item 8 in 135 g of item 15 (80–90°C) in a vessel.
4. Prepare a slurry of item 7 in 45 g of item 15 (25–30°C). Add the slurry to the vessel to make a translucent paste. Cool to 45°C to 50°C.
5. Add the binder (item 5) to preceding step.
6. Mix at low speed over a period of 3 minutes. Scrape sides and blades.
7. Mix and chop at low speed for 1 to 2 minutes. Check the end point of granulation. If required, add additional item 15 to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Unload the wet granules in stainless steel trays for drying.
8. Dry the wet granules at 55°C for 10 hours. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying. Check the LOD (limit: 1.0–2.0%). If required, dry further at 55°C for 1 hour.
9. Grind the dried granules through a 1.25 mm sieve at medium speed. Collect in stainless steel drums.
10. Load the granules into blender.
11. Sift items 9, 10, and 11 through a 500 µm sieve using suitable sifter, and add mixture to blender. Mix for 2 minutes.
12. Sift items 12, 13, and 14 through a 500 µm sieve.
13. Add 5 to 10 g of granules from bulk. Mix in polyethylene bag for 1 minute.
14. Add to blender. Blend for 1 minute.
15. Check temperature and humidity before start of compression. Temperature should not exceed 27°C, and recommended RH is 55% to 65%.
16. Compress the granules using rotary tableting machine. Tablet weight is 640 mg.
17. Coating: Select an appropriate coating, such as Opadry HPMC. The formula for the coating solution is determined to obtain a weight gain of 10 mg per caplet considering evaporation and loss during coating operation.

ACETAMINOPHEN, DEXTROMETHORPHAN, AND PSEUDOEPHEDRINE CAPLETS

Bill of Materials

Scale (mg/caplet)	Item	Material Name	Qty/1000 Caplets (g)
325.00	1	Acetaminophen (fine powder)	325.00
31.50	2	Pseudoephedrine HCl	31.50
15.50	3	Dextromethorphan HBr	15.50
50.00	4	Cornstarch	50.00
7.00	5	Povidone (PVP K-30)	7.00
50.00	6	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
42.00	7	Cornstarch	42.00
10.00	8	Povidone (PVP K-30)	10.00
9.50	9	Cellulose (powdered)	9.50
64.50	10	Cellulose (microcrystalline) (Avicel™ PH102)	64.50
20.00	11	Sodium starch glycolate (Primojel®)	20.00
8.00	12	Stearic acid (fine powder)	8.00
5.00	13	Talc (fine powder)	5.00
2.00	14	Magnesium stearate	2.00
–	15	Purified water	180.00

Manufacturing Directions

Follow manufacturing directions provided for acetaminophen, chlorpheniramine, and pseudoephedrine caplets.

ACETAMINOPHEN, DOXYLAMINE, AND CAFFEINE EFFERVESCENT GRANULES

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
500.00	1	Acetaminophen (powder)	500.00
5.00	2	Doxylamine succinate	5.00
33.00	3	Caffeine (Knoll)	33.00
391.00	4	Tartaric acid	391.00
417.00	5	Sodium hydrogen carbonate	417.00
6.00	6	Kollidon® 30	6.00
–	7	Isopropanol (or ethanol)	QS
30.00	8	Sodium citrate	30.00
707.00	9	Sugar	707.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 and 7, dry at 60°C under vacuum conditions through 0.8 mm sieve, and mix with items 8 and 9.
2. Fill 2.1 g in sachets at maximum relative atmospheric humidity of 30%.
3. Granules are free flowing.
4. If the solvent isopropanol is replaced by water, the granulation should be done in a fluidized bed.

ACETAMINOPHEN DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
739.00	1	Propylene glycol	739.00
90.00	2	Acetaminophen	90.00
17.50	3	Saccharin sodium	17.50
8.75	4	Sodium chloride	8.75
0.05	5	FD&C Red No. 40[a]	0.05
2.50	6	Purified water, USP	2.50
2.00	7	Wild cherry artificial flavor	2.00
65.00	8	Alcohol (ethanol, 190 proof, nonbeverage), USP	65.00
QS	9	Deionized purified water, USP	QS to 1 L

[a] Check for local regulatory allowance to use red dyes.

Manufacturing Directions

Caution: Ensure that solution in tank never exceeds 65°C.

1. Add 739 g of propylene glycol to jacketed mixing tank, and start heating with slow mixing.
2. Dissolve dye in 2.5 mL of purified water, and add to tank while mixing.
3. Rinse container with small amount of purified water, and add to tank.
4. While mixing, add acetaminophen, saccharin sodium, and sodium chloride.
5. Hold at 60°C to 65°C with continued moderate mixing until all are in solution.
6. Force cool to less than 30°C with slow mixing.
7. Blend flavor with alcohol, and add to tank with slow mixing.
8. Add purified water with mixing QS to make 1 L.
9. Mix well with moderate agitation until uniform.
10. Filter through an 8 µm Millipore membrane (or equivalent).

ACETAMINOPHEN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (powder <300 μm)	500.00
500.00	2	Sodium bicarbonate	500.00
430.00	3	Tartaric acid (powder)	430.00
200.00	4	Dextrose	200.00
QS	5	Flavoring	QS
20.00	6	Kollidon® 30	20.00
–	7	Isopropanol	100.00 mL
60.00	8	PEG-6000 (powder)	60.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 5 with solution of items 6 and 7.
2. Pass through a 0.8 mm sieve, add item 8, and mix.
3. Press to tablets (average weight, 1700 mg; 16 mm diameter biplanar tablet).

ACETAMINOPHEN FAST-DISSOLVING TABLETS

Manufacturing Directions

1. To the vortex of a rapidly stirred vessel containing 2.85 kg of deionized water is added 300 g of croscarmellose sodium, forming slurry. This slurry is mixed for 10 minutes.
2. Concurrently, 5 kg of powdered acetaminophen is placed in the bowl of a mixer.
3. At the conclusion of the mixing time for the slurry of croscarmellose sodium, the slurry is added slowly to the acetaminophen in the mixer bowl, forming a granulation, which is then placed in trays and dried in a 70°C oven for 3 hours.
4. The dry granulation is then passed through a U.S. standard 14 mesh screen (1410 μm).
5. Dry granulation (4796 g) is then placed in a twin shell blender, and to it is added 1584 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of calcium, sodium alginate complex, and 1584 g of microcrystalline cellulose [Avicel™ PH-302]).
6. This is thoroughly blended for 10 to 15 minutes, after which 36.24 g of magnesium stearate is added and mixed for an additional 5 minutes.
7. Prior to being added to the blender, magnesium stearate had been passed through a U.S. standard 30 mesh screen.
8. The resulting blend is compressed into caplet-shaped tablets with average weight of 0.884 g and an average thickness of 7.869 mm (0.3098 in).
9. The hardness of these tablets averaged 11.98 kp. Friability of these tablets is measured at 0.433% after 10 minutes and 0.847% after 19 minutes.
10. The average disintegration time is 26 seconds in 10 mL of deionized water, forming a suspension with minimal shaking.

ACETAMINOPHEN, IBUPROFEN, AND ORPHENADRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetaminophen (powder <300 μm)	250.00
200.00	2	Ibuprofen	200.00
100.00	3	Orphenadrine hydrochloride	100.00
200.00	4	Ludipress®	200.00
5.00	5	Magnesium stearate	5.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve. Mix.
2. Press with high compression force.
3. Tablet weight is 761 mg for each 12 mm biplanar tablet.

ACETAMINOPHEN INSTANT GRANULES

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
166.66	1	Acetaminophen (fine powder)	166.66
426.64	2	Sucrose (fine powder)	426.64
300.00	3	Kollidon® CL-M	300.00
23.33	4	Aspartame	23.33
16.66	5	Orange flavor	16.66
16.66	6	Strawberry flavor	16.66
40.00	7	Kollidon® 30	40.00
250.00	8	Ethanol (96%)	250.00

Manufacturing Directions

1. Granulate items 1 to 6 with solution made from items 7 and 8, and pass through a 0.8 mm sieve.
2. Fill 1.5 or 3.0 g in sachets (for 250 or 500 mg strength, respectively).
3. The free-flowing granules disperse well in cold water.
4. Suspend 1.5 or 3.0 g of the granules (=250 or 500 mg acetaminophen) in a glass of water.

ACETAMINOPHEN INSTANT GRANULES

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
192.30	1	Acetaminophen (fine powder)	192.30
500.00	2	Sorbitol (instant) (Merck)	500.00
192.30	3	Kollidon® CL-M	192.30
27.00	4	Aspartame	27.00
19.23	5	Orange flavor	19.23
19.23	6	Strawberry flavor	19.23
11.53	7	Sodium citrate	11.53
11.53	8	Citric acid	11.53
30.76	9	Kollidon® 90 F	30.76
192.30	10	Ethanol (96%)	192.30

Manufacturing Directions

1. Granulate items 1 to 8 with solution made from items 9 and 10, and pass through a 0.8 mm sieve.
2. Fill 1.3 or 2.6 g in sachets (for 250 or 500 mg strength, respectively).
3. The free-flowing granules disperse well in cold water.
4. Suspend 1.2 or 2.6 g of the granules (=250 or 500 mg acetaminophen) in a glass of water.

ACETAMINOPHEN INSTANT GRANULES

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
500.00	1	Acetaminophen fine powder	500.00
1300.00	2	Sorbitol instant (Merck)	1300.00
500.00	3	Lutrol F 127	500.00
30.00	4	Citric acid (powder)	30.00
30.00	5	Sodium citrate	30.00
80.00	6	Kollidon® 90 F	80.00
500.00	7	Ethanol (96%)	500.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 in solution of item 6 in item 7.
2. Fill 2.44 g in sachets (=500 mg acetaminophen).
3. The free-flowing granules disperse well in cold water.
4. The taste of the suspension is only slightly bitter (2.44 g in a glass of water).

ACETAMINOPHEN MICROSPHERE TABLETS

Manufacturing Directions

1. Formulation: Acetaminophen (APAP) powder (melting point 169–170.5°C), 85%; carnauba wax, 7.5%; Pluronic F68, 7.5%.
2. Mill the Pluronic through a Fitz mill using a 40 mesh screen.
3. Blend all of the ingredients at 60 Hz slow speed with chopper for 10 minutes.
4. Subject the blend to liquiflash processing at 60 Hz and 37% nominal power using the 5 in V-groove heater head.
5. Sieve the collected microspheres.
6. Coat the fraction passing through a 40 mesh and retained on 120 mesh sieve.
7. Coat the microspheres selected in a fluid-bed coater for taste masking at a 30% coating level with a coating solution containing a 1:1 ethylcellulose/hydroxypropylcellulose blend in acetone:isopropyl alcohol solvent.
8. Prepare a preblend of 78.25% sucrose, 11.00% sorbitol, 10.00% xylitol, and 0.75% Tween (polysorbate) 80.
9. Process the floss preblend using the 5 in. crown head at a temperature of 250°C and rotational speed of 60 Hz (3600 rpm).
10. Chop the floss collected with 2% lactose (2% w/w of the floss) for 2 minutes at 100 rpm with the choppers on, and spray 200 proof ethanol (0.5% based on weight of the floss) on the chopped floss and mix.
11. Dry the floss at 45°C for 90 minutes with intermittent mixing.
12. Screen the dried floss through a 20 mesh screen.
13. Process APAP taste-masked microspheres (step 5), 47.97; floss (step 6), 48.88; grape flavor, 0.70; citric acid, 1.50; acesulfame potassium, 0.20; silicon dioxide, 0.25; and sodium stearyl fumarate, 0.50.
14. Blend the coated APAP microspheres with the sieved floss for 5 minutes in a mixer, followed by the addition of flavors, sweeteners, and citric acid for another 3 minutes.
15. Thereafter, add silicon dioxide and blend the mix for another 2 minutes. After the final addition, sodium stearyl fumarate, blend for an additional 2 minutes.

16. Tablet the blend using flat-faced bevel edge punches (tablet weights are 255 mg for 9-mm punch tooling, equivalent to 80 mg APAP, and 510 mg for 12-mm tooling, equivalent to 160 mg APAP dose).
17. The hardness values should range from 0.5 to 2.0 lb.

ACETAMINOPHEN, NOREPHEDRINE, AND PHENYLTOLOXAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Acetaminophen (crystalline) (Merck)	300.00
25.00	2	Norephedrine hydrochloride (Knoll)	25.00
22.00	3	Phenyltoloxamine	22.00
200.00	4	Cornstarch	200.00
25.00	5	Kollidon® 30	25.00
–	6	Ethanol (96%)	QS
25.00	7	Kollidon® CL	25.00
5.00	8	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 5 and 6.
2. Dry, pass through a 0.8 mm sieve, and add items 7 and 8.
3. Press with high compression force.
4. Tablet weight is 601 mg for 12 mm biplanar tablet.

ACETAMINOPHEN ORAL SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
250.00	1	Acetaminophen (micronized) (2% excess)	51.00
2500.00	2	Sucrose	500.00
5.00	3	Methylparaben	1.00
1.50	4	Propylparaben	0.30
0.30	5	Sodium citrate	0.06
35.00	6	Glycerin (glycerol)	7.00
400.00	7	Glycerin (glycerol)	80.00
2000.00	8	Sorbitol (70%)	400.00
10.00	9	Xanthan gum (Keltrol® F)	2.00
0.50	10	Dye	0.10
22.50	11	Flavor	4.50
3.50	12	Strawberry flavor	0.70
–	13	Purified water	QS to 1 L

Manufacturing Directions

Note: Acetaminophen dispersion should be uniformly mixed. If acetaminophen dispersion is either added to hot syrup base or homogenized for a long time, flocculation may appear. While handling the syrup or mucilage or drug dispersion, the handling loss should not be more than 1%. If it exceeds 1%, a poor suspension may result.

1. Add 180 g of purified water to the mixer, and heat to 90°C.
2. Dissolve item 3 and item 4 while mixing.
3. Add and dissolve item 2 while mixing.
4. Cool down to approximately 50°C to 55°C.
5. Add and dissolve item 5 while mixing.
6. Filter the syrup through T-1500 filters washed with purified water.
7. Collect the syrup in a clean stainless steel tank.
8. Disperse item 9 in item 6 in a separate stainless steel container.
9. Add 40 g of hot purified water (90°C) at once while mixing.
10. Mix for 20 minutes to make a homogeneous smooth mucilage.
11. Mix item 7 in 10 g of purified water (25°C) in a separate stainless steel container.
12. Add item 1 while mixing with stirrer.
13. Mix for 25 minutes to make uniform suspension.
14. Add sugar syrup and mucilage to the mixer.
15. Rinse the container of mucilage with 15 g of purified water, and add the rinsings to the mixer.
16. Cool to 25°C while mixing.
17. Add item 1 dispersion to the mixer.
18. Rinse the container of dispersion with 15 g of purified water, and add rinsings to the mixer.
19. Check the suspension for uniformity of dispersion.
20. Mix for additional 5 minutes at 18 rpm and a vacuum of 0.5 bar, if required.
21. Add item 8 to the mixer, and mix for 10 minutes.
22. Dissolve item 10 in 7 g of purified water, and add to the mixer.
23. Disperse item 11 in 7 g of purified water, and add to the mixer.
24. Add item 12 to the mixer.
25. Add cold purified water (25°C) to bring the volume up to 1 L.
26. Homogenize for 5 minutes at low speed under a vacuum of 0.5 bar, 18 rpm, and temperature of 25°C.
27. Check the dispersion for uniformity.
28. Check the pH (limit: 5.7 ± 0.5 at 25°C). If required, adjust the pH with a 20% solution of citric acid or sodium citrate.
29. Transfer the suspension through a 630 µm sieve to the stainless steel storage tank after mixing for 5 minutes at 18 to 20 rpm at room temperature.

ACETAMINOPHEN, PHENYLPROPANOLAMINE, DEXTROMETHORPHAN, AND CHLORPHENIRAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Acetaminophen	200.00
12.50	2	Phenylpropanolamine hydrochloride (10% excess)	13.75
10.00	3	Dextromethorphan hydrobromide (10% excess)	11.00
1.00	4	Chlorpheniramine maleate (10% excess)	1.10
64.65	5	Cellulose (microcrystalline) (Avicel™ PH101)	121.72
28.00	6	Sodium starch glycolate (pH 5.5–7.5)	28.00
17.00	7	Povidone (PVP K-29–32)	17.5
–	8	Distilled purified water	~80.0 mL
2.00	9	Magnesium stearate	2.00
125.00	10	Acetaminophen	125.00
50.00	11	Ascorbic acid; use item 12	–
56.25	12	Sodium ascorbate (special grade) (20% excess)	67.50
24.00	13	Sodium starch glycolate (pH 5.5–7.5)	24.00
15.00	14	Povidone (PVP K-29–32)	~ 15.00
–	15	Alcohol SD 3A (200 proof)	75.0 mL

Manufacturing Directions

1. Dissolve chlorpheniramine and povidone (item 7) in the purified water.
2. Pass phenylpropanolamine, dextromethorphan, and an equal portion of Avicel™ (item 5) through a 790 µm screen to break up any agglomerates.
3. Blend the screened items in a suitable mixer for 5 minutes.
4. Load the acetaminophen (item 1), sodium starch glycolate (item 6), remaining Avicel™ (item 5), and blended items from previous step into a suitable planetary mixer.
5. Blend for 10 minutes.
6. Granulate the blend from the preceding solution.
7. Add the granulating solution in three equal portions, massing for 5 minutes after each addition.
8. Pass the wet mass through a 4.2 mm screen onto paper-lined trays.
9. Dry at 50°C until the granule loss on drying (LOD) is 1% to 1.5%.
10. Pass the dried granules through an oscillating granulator fitted with a 790 µm screen.
11. Load the dried granules into a suitable blender.
12. Pass the magnesium stearate through a 600 µm screen and add to the blender.
13. Blend for 5 minutes.
14. Compress to the following specifications: tablet weight 291 mg and tablet thickness 4.2 to 4.4 mm.

ACETAMINOPHEN, PROPOXYPHENAZONE, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetaminophen powder	250.00
150.00	2	Propoxyphenazone (isopropyl antipyrine)	150.00
50.00	3	Anhydrous caffeine	50.00
120.00	4	Avicel™ PH102	120.00
5.00	5	Pharmacoat® 603	5.00
3.25	6	Magnesium stearate	3.25
9.75	7	Talcum	9.75
1.30	8	Silicic acid	1.30
7.00	9	Methocel™ E-15	7.00
32.50	10	Esmaspreng fine	32.50
21.20	11	Maize starch	21.20
–	12	Water purified	QS

Manufacturing Directions

1. Place into a suitable vessel 5 g of Pharmacoat® and 74 g of purified water. Stir until homogeneous aqueous mucilage is obtained.
2. Mix in another vessel 250 g acetaminophen powder and 17.50 g Esmaspreng fine. Add the above granulating solution, and knead for approximately 10 minutes until an evenly moist mass of soft lumps is obtained.
3. Granulate by means of centrifugal granulator with 10 mm screen. Dry the moist granulate overnight on trays in drying oven at 45°C (RH: 20–30%).
4. Crush the dried cake through an oscillator with a 1.5 mm perforated plate.
5. In a suitable container, add 65 g deionized water and 7 g Methocel™.
6. Stir until homogeneous aqueous mucilage is obtained.
7. Mix into another vessel 150 g isopropyl antipyrine, 50 g caffeine, 15 g Esmespreng fine, and 5 g maize starch.
8. Pass through a centrifugal granulator with 1 mm screen. Place mixture into another vessel, and knead for approximately 10 minutes until an evenly moist mass of small lumps is obtained.
9. Granulate through centrifugal granulator with 10 mm perforated screen.

10. Dry moist granulate overnight on trays in drying oven at 45°C (RH: 10–20%).
11. Crush the dried granules through oscillator with a 1.5 mm perforated plate. Store in airtight container.
12. Mix into a tumbling mixer 4.875 g talc, 1.625 g magnesium stearate, 0.65 kg silicic acid, and 60.00 g Avicel™ PH102.
13. Pass through a 0.5 mm round sieve, and load acetaminophen granulate and isopropyl antipyrine/caffeine granulate. Add premixture of talc into blender.
14. Mix the mixture well for 30 minutes (RH: 30–35%).
15. Store mix in airtight container.
16. Compress 650 mg tablet to 12.8 to 13.2 mm, hardness 6 to 20, disintegration time 5 minutes.

ACETAMINOPHEN, PSEUDOEPHEDRINE HYDROCHLORIDE, AND CHLORPHENIRAMINE HOT THERAPY SACHET

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
650.00	1	Acetaminophen (micronized)	650.00
60.00	2	Pseudoephedrine hydrochloride	60.00
4.00	3	Chlorpheniramine maleate	4.00
1.20	4	Dispersed orange	1.20
18,081.10	5	Castor sugar	18,081.10
200.00	6	Aspartame	200.00
250.00	7	Maize starch (dried)	250.00
180.00	8	Citric acid	180.00
38.00	9	Sodium citrate	38.00
200.00	10	Sodium chloride	200.00
400.00	11	Blood orange flavor (dry)	400.00
QS	12	Purified water	QS

Manufacturing Directions

1. See manufacturing directions for acetaminophen and pseudoephedrine hydrochloride hot therapy sachets.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
80.00	1	Acetaminophen (micronized)	80.00
836.80	2	Hard fat (Suppocire AM)	836.80
3.20	3	Sorbitan monostearate (Crill-3)	3.20

Manufacturing Directions

1. Fill weight is 920 mg per suppository. The molten suppository mass must be stirred throughout the storage period and during manufacturing and filling to avoid sedimentation of the active drug.
2. Load items 2 and 3 into the fat-melting vessel and heat to 50°C ± 3°C.
3. Transfer the molten mass to a mixer through filter sieves.
4. Set the temperature at 45°C ± 2°C.
5. Load item 1 into the mixer containing molten item 2.
6. Carefully mix the powder with molten item 2 for 20 minutes at 10 rpm, at a temperature of 45°C ± 2°C, and at a vacuum of 0.4 to 0.5 bar; then, homogenize for 10 minutes at low speed.
7. Continue mixing at 10 rpm.
8. Heat the storage vessel, and set the temperature at 45°C ± 2°C.
9. Transfer the molten mass from the mixer to the storage vessel.
10. Hold the mass at 45°C ± 2°C with continuous mixing at low speed.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
125.00	1	Acetaminophen (micronized) (5% excess)	131.25
785.54	2	Hard fat (Suppocire AM)	785.54
3.21	3	Sorbitan monostearate (Crill-3)	3.21

Manufacturing Directions

Fill weight is 920 mg per suppository. See manufacturing directions for acetaminophen suppositories.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
250.00	1	Acetaminophen (micronized)	250.00
1140.00	2	Hard fat (Suppocire AM)	1140.00

Manufacturing Directions

Fill weight is 1390 mg per suppository. See manufacturing directions for acetaminophen suppositories.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
150.00	1	Acetaminophen (fine powder), excess	150.00
20.00	2	Aerosil® 200	20.00
1290.00	3	Lutrol E 1500	1290.00
554.00	4	Lutrol E 4000	554.00

Manufacturing Directions

1. Melt the mixture of items 1 and 2 in a mixture of items 3 and 4.
2. Fill the molten mass in suppository molds.
3. Average weight is 2 g.

ACETAMINOPHEN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
500.00	1	Acetaminophen (fine powder)	500.00
100.00	2	Lutrol E 400	100.00
600.00	3	Lutrol E 1500	600.00
800.00	4	Lutrol E 4000	800.00

Manufacturing Directions

1. Fill weight is 2.09 g. Melt items 2 through 4, and add and dispense item 1.
2. Fill the molten mass in suppository molds.

ACETAMINOPHEN SUSPENSION

Bill of Materials

Scale (mg/10 mL)	Item	Material Name	Qty/L (g)
500.00	1	Acetaminophen (powder)	50.00
50.00	2	Citric acid (powder)	5.00
50.00	3	Sodium citrate	5.00
500.00	4	Kollidon® CL-M	50.00
10.00	5	Orange flavor	1.00
3000.00	6	Dextrose	300.00
QS	7	Water	589.00

Manufacturing Directions

1. Prepare the solution of dextrose in water, and add the other solid ingredients with stirring in the following sequence: citric acid, sodium citrate, orange flavor, Kollidon® CL-M, and acetaminophen.
2. A white, homogeneous suspension is obtained that is a practically tasteless, stable suspension showing almost no sedimentation over 24 hours and good redispersibility (easily homogenized by shaking two to three times).

ACETAMINOPHEN SYRUP

Bill of Materials

Scale (mg/ mL)	Item	Material Name	Qty/L (g)
569.00	1	Sucrose (granulated sugar), NF	569.00
2.00	2	Sodium citrate (dihydrate powder), USP	2.00
1.00	3	Citric acid (anhydrous powder), USP	1.00
1.00	4	Saccharin sodium (powder), USP	1.00
1.00	5	Sodium chloride (powder), USP	1.00
204.00	6	Propylene glycol, USP	204.00
35.00	7	Acetaminophen, USP	35.00
77.11	8	Alcohol (ethanol, 190 proof), USP	77.112
0.12	9	Cherry flavor (artificial), N59456/A	0.12
0.12	10	FD&C Red No. 40	0.10
QS	11	Deionized purified water, USP	400.00
–	12	HyFlo filter aid	QS

Manufacturing Directions

1. Add 300 mL of purified water to a jacketed stainless steel mixing tank. Start heating.
2. Add sugar with mixing.
3. Heat to 60°C to 65°C, and hold. Mix for complete solution.
4. Add, while mixing, sodium citrate, citric acid, saccharin sodium, and sodium chloride. Mix for complete solution.
5. Add propylene glycol with mixing.
6. Add acetaminophen powder with moderate mixing.
7. Continue mixing at 60°C to 65°C for complete solution.
8. Force cool to 25°C to 30°C with slow mixing.
9. Blend cherry flavor with approximately twice its volume of alcohol, and add with mixing.
10. Rinse the container with several portions of alcohol, and add. Mix until uniform.
11. Dissolve red dye in approximately 4 g of slightly warmed (50–60°C) purified water, and add with mixing.

12. Rinse the container twice with approximately 1.5 g purified water, and add. Mix until uniform.
13. Adjust volume to 1 L with purified water. Mix well.
14. Add a small amount of HyFlo filter aid to the mixing tank, and continue to mix slowly while filtering.
15. Filter through press until sparkling clear.
16. Use clarifying pad backed by lint-free filter paper.

ACETAMINOPHEN SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
50.00	1	Acetaminophen (Merck)	50.00
50.00	2	Sorbitol (crystalline)	50.00
40.00	3	Cyclamate sodium	40.00
1.00	4	Strawberry flavor	1.00
200.00	5	Kollidon® 25	200.00
150.00	6	Glycerol	150.00
200.00	7	1, 2-Propylene glycol	200.00
310.00	8	Water	310.00

Manufacturing Directions

1. First dissolve Kollidon® 25 and then the other solid components in the solvent mixture of glycerol, propylene glycol, and water.
2. The clear solution has a slightly bitter taste.
3. The solution remains clear for more than 1 week at 6°C and for more than 3 months at 25°C and 40°C.
4. The color of the solution changes only a little during 3 months at 25°C and 40°C.
5. To prevent discoloration during storage, 0.2% to 0.5% of cysteine could be added as antioxidant.

ACETAMINOPHEN SYRUP FOR CHILDREN

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
25.00	1	Acetaminophen (crystalline)	25.00
300.00	2	Kollidon® 25 or Kollidon® 30	300.00
60.00	3	Glycerol	600.00
40.00	4	Sodium cyclamate	40.00
QS	5	Orange flavor	<01.0
QS	6	Raspberry flavor	2.00
QS	7	Water	575.00

Manufacturing Directions

1. Dissolve Kollidon® in water, add acetaminophen and cyclamate, heat to 50°C, and stir to obtain a clear solution.
2. Dissolve the flavors, and mix with glycerol.
3. The obtained syrup is a viscous, clear, sweet, and only slightly bitter liquid.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (fine powder)	500.00
44.15	2	Maize starch	44.15
0.84	3	Potassium sorbate	0.84
18.00	4	Povidone (PVP K-30)	18.00
4.00	5	Aerosil® 200	4.00
12.00	6	Gelatin (powder)	12.00
4.00	7	Glycerol	4.00
30.00	8	Cellulose (powder)	30.00
12.00	9	Primojel®	12.00
8.00	10	Stearic acid (fine powder)	8.00
2.00	11	Magnesium stearate	2.00
5.00	12	Talc (fine powder)	5.00
QS	13	Purified water	QS

Manufacturing Directions

1. Binder solution: Prepare in several batches. Add items 3 to 5 with approximately 50% quantity of water, dissolve item 1 in water, add item 4, and dissolve at medium speed. Avoid foaming.
2. Add item 5, and mix for 3 minutes.
3. Dissolve item 6 in 70°C to 80°C purified water, and mix until clear. Avoid foaming.
4. Add item 7, and mix gently. Add to mixture from previous step.
5. Mix items 1 and 2 for 5 minutes.
6. Add binding solution, and mix at slow speed until granules form. Add extra water if necessary.
7. Dry in fluid-bed dryer at 55°C for 30 minutes. After 15 minutes, scrape granules to break up lumps to promote uniform drying. Dry to LOD 1% to 1.5%.
8. Grind through a 3 mm sieve and then through a 1 mm sieve. Load into double-cone blender.
9. Pass cellulose powder, Primojel®, and stearic acid through a 500 µm sieve; bag-mix magnesium stearate and fine talc powder, and pass through a 250 µm sieve; add portion of granules from the bulk to the bag, and mix for 1 minute.
10. Add both of these parts to the granules.
11. Compress 17.6 mm × 7.2 mm caplet punches to 10 to 14 kp hardness and 5.8 to 6.0 mm thickness.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (crystalline)	500.00
137.00	2	Avicel™ PH102	137.00
35.00	3	Kollidon® VA 64	35.00
21.00	4	Kollidon® CL	21.00
3.00	5	Magnesium stearate	3.00
4.00	6	Aerosil® 200	4.00

Manufacturing Directions

1. Pass the lubricant through a 200 mm sieve. Mix all other components.
2. Pass through 0.8 mm sieve, add the lubricant, and press with a high compression force of 25 to 30 KN.
3. Fill 699 mg.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (g/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500	1	Acetaminophen (crystalline)	500
150	2	Avicel™ PH102	150
20	3	Kollidon® VA 64	20
15	4	Kollidon® CL	15
15	5	PEG-6000 (powder)	15
2	6	Aerosil® 200	2

Manufacturing Directions

1. Pass the lubricant through a 200 μm sieve. Mix all other components.
2. Pass through a 0.8 mm sieve, add the lubricant, and press with a high compression force of 25 to 30 kN.
3. Weight should be 703 mg.

ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetaminophen (powder)	500.00
30.00	2	Dicalcium phosphate	30.00
12.00	3	Kollidon® CL	12.00
20.00	4	Kollidon® VA 64	20.00
10.00	5	Kollidon® 90 F	10.00
–	6	Ethanol (96%)	70 mL (max.)
12.00	7	Kollidon® CL	12.00
10.00	8	Polyethylene glycol (powder)	10.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of item 5 and 6.
2. Dry, sieve, and mix with items 7 and 8.
3. Press with high compression force of 25 to 30 kN.
4. Tablet weight is 587 mg for an 11 mm biconvex tablet.

ACETAMINOPHEN TABLETS FOR CHILDREN

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
210.00	1	Acetaminophen (Merck)	210.00
168.00	2	Avicel™ PH101	168.00
13.00	3	Kollidon® VA 64	13.00
6.00	4	Kollidon® CL	6.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Tablet weight is 401 mg for each 12 mm biplanar tablet.

ACETYLCYSTEINE SACHETS

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
66.66	1	Acetylcysteine BP (200 mg/sachet)	66.66
914.16	2	Sugar (18–60 mesh)	914.16
3.33	3	Saccharin sodium	3.33
0.66	4	Silicon dioxide (colloidal)	0.66
0.16	5	FD&C Yellow No. 6	0.16
QS	6	Mandarin flavor (e.g., Naarden)	~13.0 mL

Manufacturing Directions

1. Load the acetylcysteine and half the amount of sugar and saccharin sodium into a suitable blender, and premix for 30 minutes.
2. Sift the premix through a 0.8 mm screen.
3. Load again into the blender.
4. Add the remaining amount of sugar and colloidal silicon dioxide, and blend until uniform (typically, this is achieved on the PK processor by heating the envelope to 40°C and mixing until the product cools to 30–35°C).
5. Dissolve the dye in 13 mL of distilled water.
6. Continue mixing the blended powders, and slowly add the solution from preceding step.
7. When addition of the solution is complete, continue massing until the granulation is evenly wetted and colored. If necessary, complete massing by adding additional quantities of distilled water (in approximately 1 mL increments).
8. Verify that massing is adequate, and note the total quantity of added water. Record the total quantity of water added. Do not overmass.
9. Spread the wet granules on trays, and dry at 50°C until LOD is NMT 1% (3 hours at 60°C at 5 mmHg).
10. Allow the granules to cool; then, sift on an oscillating granulator fitted with 1.18 mm aperture screen.
11. Load the granules from preceding step into a suitable blender, add the flavor, and blend until uniform (15 minutes), passing it through a 1.18 mm screen if necessary.
12. Fill into suitable approved sachets at a theoretical fill weight of 3 g per sachet.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLETS (250 MG + 250 MG + 50 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetaminophen (Merck)	250.00
50.00	2	Caffeine powder	50.00
250.00	3	Acetylsalicylic acid	250.00
60.00	4	Kollidon® VA 64	60.00
20.00	5	Kollidon® CL	20.00
3.00	6	Aerosil® 200	3.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. The active ingredients and Kollidon® VA 64 are granulated in a roller compactor.
2. Pass the granules together with magnesium stearate, Aerosil® 200, and Kollidon® CL through an 800 µm sieve.
3. Blend for 10 minutes in a mixer.
4. Compress into tablets with a force of approximately 12 kN.

ACETYLSALICYLIC ACID + PARACETAMOL (=ACETAMINOPHEN) TABLETS (250 MG + 250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetylsalicylic acid	250.00
250.00	2	Acetaminophen	250.00
60.00	3	Avicel™ PH101	60.00
15.00	4	Kollidon® VA 64	15.00
3.00	5	Macrogol 6000 powder	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.

ACETYLSALICYLIC ACID + VITAMIN C TABLETS (400 MG + 250 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Acetylsalicylic acid crystalline	400.00
250.00	2	Ascorbic acid	250.00
100.00	3	Ludipress®	100.00
20.00	4	Kollidon® CL	20.00
3.00	5	Macrogol 6000 powder	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.

ACETYLSALICYLIC ACID TABLETS (500 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Acetylsalicylic acid crystalline	500.00
200.00	2	Avicel™ PH101	200.00
15.00	3	Kollidon® 30	15.00
25.00	4	Kollidon® CL	25.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compression force.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetylsalicylic acid (crystalline)	250.00
250.00	2	Acetaminophen (crystalline)	250.00
50.00	3	Caffeine	50.00
50.00	4	Kollidon® 90 F	50.00
–	5	Isopropanol	QS
5.00	6	Magnesium stearate	5.00
16.00	7	Kollidon® CL	16.00

Manufacturing Directions

1. Granulate items 1 to 3 with solution of items 4 and 5. Dry, and sieve through a 0.8 mm screen.
2. Add items 5 and 6, and press with low compression force (hardness 45 N). Each 12 mm biplanar tablet has an average weight of 670 mg.

ACETYLSALICYLIC ACID, ACETAMINOPHEN, AND CAFFEINE TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (crystalline)	400.00
100.00	2	Acetaminophen (crystalline)	100.00
30.00	3	Caffeine	30.00
100.00	4	Ludipress®	100.00
20.00	5	Kollidon® CL	20.00
30.00	6	PEG-6000 (powder)	30.00
5.00	7	Stearic acid	5.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press with compression force of 116 N. Each 12 mm biplanar tablet has an average weight of 683 mg.

ACETYLSALICYLIC ACID AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetylsalicylic acid (crystalline)	250.00
250.00	2	Acetaminophen (crystalline)	250.00
60.00	3	Avicel™ PH101	60.00
15.00	4	Kollidon® 30 (or Kollidon® VA 64)	15.00
25.00	5	Kollidon® CL	25.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium compression force.
3. Tablet weight is 605 mg for each 12 mm biplanar tablet.

ACETYLSALICYLIC ACID AND ACETAMINOPHEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Acetylsalicylic acid (40 mesh)	250.00
250.00	2	Acetaminophen (40 mesh)	250.00
15.00	3	Avicel™ PH102	15.00
7.20	4	Croscarmellose sodium (Ac-Di-Sol)	7.20
7.20	5	Stearic acid	7.20
4.00	6	Fumed silica	4.00

Manufacturing Directions

1. Screen all ingredients through a 0.8 mm sieve.
2. Blend all ingredients in a V-blender, and mix for 10 minutes.
3. Compress to 670 mg tablet weight using appropriate tooling.

ACETYLSALICYLIC ACID AND ASCORBIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
325.00	1	Acetylsalicylic acid (crystalline) (Merck)	325.00
250.00	2	Ascorbic acid (powder) (BASF)	250.00
120.00	3	Sorbitol (crystalline)	120.00
40.00	4	Avicel™ PH101	40.00
25.00	5	Kollidon® VA 64	25.00
20.00	6	Kollidon® CL	20.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium to high compression force (hardness 92 N). Each 12 mm biplanar tablet has an average weight of 790 mg.

ACETYLSALICYLIC ACID AND ASCORBIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
325.00	1	Acetylsalicylic acid (crystalline) (Merck)	325.00
250.00	2	Ascorbic acid (powder) (BASF)	250.00
100.00	3	Avicel™ PH101	100.00
12.00	4	Kollidon® VA 64	12.00
30.00	5	Kollidon® CL	30.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium to high compression force (hardness 100 N). Each 12 mm biplanar tablet has an average weight of 726 mg.

ACETYLSALICYLIC ACID SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
100.00	1	Acetylsalicylic acid	100.00
400.00	2	Suppocire AM	400.00

Manufacturing Directions

1. Heat item 2 to 50°C. Allow to cool to 40°C.
2. Add item 1 while stirring with a turbine mixer. Cool molds to –5°C to 0°C.
3. Continue mixing and cooling, and pour into molds at 35°C.
4. Remove suppositories from molds after 7 minutes.
5. Fill to appropriate weight for strength desired.

ACETYLSALICYLIC ACID TABLETS (BUFFERED)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (40 mesh)	400.00
40.00	2	Magnesium hydroxide	40.00
40.00	3	Aluminum hydroxide	40.00
135.00	4	Cellulose (microcrystalline) (Avicel™ PH101)	135.00
15.30	5	Stearic acid	15.30
15.30	6	Croscarmellose sodium (Ac-Di-Sol)	15.30
18.50	7	Hydroxy coatings	18.50

Manufacturing Directions

1. Screen all ingredients except item 7 through a 40 mesh sieve.
2. Blend items 2 and 3 in a V-blender for 10 minutes.
3. Coat items 2 and 3 using Aquacoat® (FMC) aqueous polymer dispersion in a fluid-bed column using a 10% by weight formula.
4. Blend 50% of item 1 with items 4 and 5 for 10 minutes in a V-blender.
5. Add remaining item 1, and blend again for 10 minutes.
6. Blend item 7 with the mixture from the previous step for 10 minutes.
7. Add item 6, and blend for 7 minutes.
8. Compress 625 mg to the desired hardness using appropriate tooling.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (crystalline) (Merck)	400.00
99.00	2	Ludipress®	99.00
1.00	3	Stearic acid	1.00
15.00	4	Kollidon® CL	15.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press with low compression force (hardness 90 N). Each 12 mm biplanar tablet has an average weight of 516 mg.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Acetylsalicylic acid (40 mesh)	400.00
55.60	2	Cellulose (microcrystalline) (Avicel™ PH101)	55.60
21.40	3	Starch (pregelatinized)	21.40
2.20	4	Stearic acid	2.20
10.00	5	Croscarmellose sodium (Ac-Di-Sol)	10.00
3.20	6	Fumed silica	3.20

Manufacturing Directions

1. Screen approximately half of item 1 through a mill using 12 mesh screen with knives forward.
2. Preblend items 2 to 6 with 25% of item 1, and pass the mixture through the mill.
3. Pass the balance of item 1 through the mill.
4. Mix all the ingredients in a V-blender for 10 minutes, and compress using 13/32 in. tooling.
5. For enteric coating, coat with Aquateric (FMC) dispersion.

ACETYLSALICYLIC ACID TABLETS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Avicel™ PH101	200.00
15.00	2	Kollidon® 30	15.00
25.00	3	Kollidon® CL	25.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with low compression force of (hardness 61 N). Each 12 mm biplanar tablet has an average weight of 707 mg.

ACNE COVER CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
37.00	1	Glyceryl stearate S/E	37.00
46.00	2	Mineral oil/Lanolin alcohol (liquid base CB3939)	46.00
9.00	3	Polawax GP2000	9.00
18.00	4	Stearic acid	18.00
QS	5	Deionized water	QS
36.00	6	Propylene glycol	36.00
2.00	7	Carboxymethyl cellulose (CMC-7HF)	2.00
9.00	8	Magnesium aluminum silicate (regular) (Veegum®)	9.00
9.00	9	Triethanolamine (99%)	9.00
120.00	10	Titanium dioxide	120.00
QS	11	Iron oxides	QS
50.00	12	Actives	50.00
QS	13	Perfume, preservative	QS

Manufacturing Directions

1. Disperse CMC in propylene glycol and triethanolamine, and add warm water (60–65°C) while stirring until the gum is hydrated.
2. Add Veegum®, and stir until hydrated.
3. Heat oil phase to 60°C to 65°C.
4. Add water phase to oil phase while stirring.
5. Add pigments, and stir to cool, adding the actives at 30°C.
6. Homogenize using suitable equipment.
7. Fill. (Note that active ingredients may be added as required to this base formula.)

ACNE SCRUB

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Magnesium aluminum silicate magnabrite HV	20.00
582.00	2	Water	582.00
100.00	3	Propylene glycol	100.00
150.00	4	Mineral oil and acetylated lanolin alcohol	150.00
30.00	5	Glyceryl stearate and PEG-100 stearate	30.00
14.00	6	Myristyl propionate	14.00
100.00	7	PEG-600	100.00
4.00	8	Eucalyptus oil	4.00
QS	9	Preservatives	QS

Manufacturing Directions

1. Slowly sift item 1 into water, mixing until smooth.
2. Heat to 75°C.
3. Heat items 3 to 6 separately. Mix, and heat to 70°C.
4. Add this portion to item 1 dispersion, and mix well until smooth.
5. Add item 7 to mixture, and mix.
6. Finally, add items 8 and 9, and mix until cool.
7. *Note*: If using parabens, prepare a solution in a portion of water, and add before adding item 8 and after allowing parabens to cool to 50°C.

ACNE TREATMENT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Polychol 10 (Laneth-10)	20.00
5.00	2	Lanolin alcohols (Super Hartolan)	5.00
55.00	3	Cetyl alcohol C90	55.00
60.00	4	Polawax, NF	60.00
14.00	5	Sulfur	14.00
QS	6	Deionized water	QS
40.00	7	Veegum® (regular)	40.00
20.00	8	Propylene glycol	20.00
20.00	9	Resorcinol	20.00
QS	10	Perfume, preservative	QS

Manufacturing Directions

1. Hydrate Veegum® in water.
2. Add rest of the water-phase ingredients, and heat to 70°C.
3. Heat oil phase to 70°C.
4. Disperse sulfur in the oil phase.
5. Add oil phase to water phase while stirring.
6. Stir to cool. Fill.

ALGINIC ACID + ALUMINUM HYDROXIDE + MAGNESIUM SILICATE TABLETS (500 MG+100 MG+25 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Alginic acid	500.00
100.00	2	Aluminum hydroxide dried gel (Giulini)	100.00
25.00	3	Magnesium trisilicate	25.00
170.00	4	Sodium bicarbonate	170.00
160.00	5	Sorbitol crystalline	160.00
627.00	6	Sucrose crystalline	627.00
900.00	7	Ludipress®	900.00
70.00	8	Kollidon® VA 64	70.00
50.00	9	Magnesium stearate	50.00
5.00	10	Vanillin	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.

ALOE VERA GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
4.00	1	Aloe vera extract (200-fold)	4.00
50.00	2	Propylene glycol	50.00
QS	3	Preservative	QS
736.00	4	Water	736.00
11.00	5	Cremophor RH 40	11.00
QS	6	Perfume	QS
200.00	7	Lutrol F 127	200.00

Manufacturing Directions

1. Prepare solutions I (items 1–4) and II (items 5 and 6) separately, and add I into II.
2. Cool this mixture to <10°C (or heat to 70–80°C), and dissolve item 7.
3. Maintain the temperature until air bubbles escape.
4. Appearance is clear, viscosity is approximately 60 Pa, and pH is approximately 5.5.

ALPHA-BISABOLOL AQUEOUS MOUTHWASH SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
2.00	1	Alpha-bisabolol, natural (BASF)	2.00
QS	2	Flavor	QS
25.00	3	Cremophor RH 40	25.00
50.00	4	Glycerol	50.00
1.00	5	Saccharin sodium	1.00
QS	6	Preservative	QS
922.00	7	Water	922.00

Manufacturing Directions

1. Heat mixture of items 1 to 3 to approximately 60°C, and slowly add the warm solution of items 4 to 7 (60°C).
2. The clear, colorless liquid has a low viscosity.

ALPHA-BISABOLOL BUCCAL OR TOPICAL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
1.20	1	Alpha-bisabolol (racemic) (BASF)	1.20
10.00	2	Cremophor RH 40	10.00
0.10	3	Butylhydroxytoluene (BHT)	0.10
QS	4	Preservative	QS
990.00	5	Water	990.00

Manufacturing Directions

1. Heat mixture of items 1 to 3 to approximately 60°C, stir well, and slowly add the warm solution of items 4 in 5 to obtain a clear solution.

ALPHA-BISABOLOL ETHANOLIC MOUTHWASH SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.00	1	Alpha-bisabolol, racemic (BASF)	10.00
100.00	2	Flavor	100.00
60.00	3	Cremophor RH 40	60.00
10.00	4	Glycerol	10.00
2.00	5	Saccharin sodium	2.00
818.00	6	Ethanol (96%)	818.00

Manufacturing Directions

1. Heat mixture of items 1 to 3 to approximately 60°C, and slowly add the warm solution of items 4 to 6.
2. The clear, colorless liquid can be diluted with water.

ALPHA-BISABOLOL MOUTHWASH SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
5.00	1	(–)Alpha-bisabolol, natural (BASF)	5.00
50.00	2	Lutrol F 127	50.00
QS	3	Flavor	QS
100.00	4	Propylene glycol (pharma)	100.00
300.00	5	Ethanol (96%)	300.00
545.00	6	Water	545.00

Manufacturing Directions

1. Prepare solution of items 1 to 5, and slowly add the water.
2. The clear, colorless solution has pH 8.

ALUMINUM ACETYLSALICYLATE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Aluminum acetylsalicylate, excess	255.00
213.00	2	Mannitol	213.00
28.00	3	Cornstarch	28.00
10.00	4	Kollidon® 90 F	10.00
5.00	5	Lutrol E 6000	5.00
–	6	Isopropanol, QS	50.00 mL
23.00	7	Kollidon® CL	23.00
5.00	8	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 to 6.
2. Dry, pass through a 0.8 mm sieve, and mix with items 7 and 8.
3. Compress with medium compression force. Each 12 mm biplanar tablet has an average weight of 540 mg.

ALUMINUM HYDROXIDE + MAGNESIUM SILICATE CHEWABLE TABLETS (120 MG+250 MG)

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
120.00	1	Aluminum hydroxide dried gel (Giulini)	120.00
250.00	2	Magnesium trisilicate	250.00
232.00	3	Ludipress®	232.00
6.00	4	Aerosil® 200	6.00
6.00	5	Magnesium stearate	6.00
12.00	6	Cyclamate sodium	12.00
1.50	7	Menthol	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with a compression force of 20 kN at 640 mg.

ALUMINUM HYDROXIDE AND MAGNESIUM CARBONATE DRY SYRUP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
200.00	1	Aluminum hydroxide dry gel (Giulini)	200.00
200.00	2	Basic magnesium carbonate	200.00
240.00	3	Kollidon® CL-M	240.00
211.50	4	Sorbitol (crystalline)	211.50
41.30	5	Orange flavor	41.30
82.60	6	Kollidon® 30	82.60
3.30	7	Coconut flavor	3.30
4.13	8	Banana flavor	4.13
4.13	9	Saccharin sodium	4.13
8.26	10	Water	8.26

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 to 10, pass through a sieve, and dry.
2. Shake 58 g of the granules with 100 mL of water.
3. Product remains homogeneous and without sedimentation for more than 24 hours.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Aluminum hydroxide (Rorer)	200.00
200.00	2	Magnesium hydroxide (Rorer)	200.00
100.00	3	Lactose monohydrate	100.00
30.00	4	Kollidon® VA 64	30.00
QS	5	Water	260.00 mL
315.00	6	Sucrose (crystalline)	315.00
100.00	7	Sorbitol (crystalline) (Merck)	100.00
60.00	8	PEG-6000 (powder)	60.00
12.00	9	Aerosil® 200	12.00
6.00	10	Talc	6.00
6.00	11	Magnesium stearate	6.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 4 to 5.
2. Dry and pass through a 0.8 mm sieve, add items 6 to 11, and press with high compression force (20 kN).
3. Each 16 mm biplanar tablet has an average weight of 1013 mg.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
320.00	1	Aluminum hydroxide (dried gel)	320.00
320.00	2	Magnesium hydroxide powder	320.00
32.00	3	Sucrose	32.00
288.40	4	Mannitol	288.40
QS	5	Povidone (Plasdone®) (10% solution in equal parts water and alcohol)	QS
12.90	6	Glycerin	12.90
19.20	7	Magnesium stearate	19.20
6.40	8	Fumed silica	6.40
0.30	9	Oil of peppermint	0.30

Manufacturing Directions

1. Mix items 1 to 4 in a suitable blender, add item 6 to item 5, and use this combination to moisten the mix of items 1 to 4.
2. Granulate by passing through a 20 mesh screen.
3. Add and thoroughly mix items 7 to 9, and compress using 0.5 in. flat-face, beveled-edge punches.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE ANTACID SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
5.00	1	Purified bentonite (Veegum® HS)	5.00
2.00	2	Xanthan gum (Rhodigel)	2.00
401.00	3	Water	401.00
200.00	4	Sorbitol (70%)	200.00
360.00	5	Aluminum hydroxide gel	360.00
320.00	6	Magnesium hydroxide, USP	320.00
QS	7	Preservative, flavor	QS

Manufacturing Directions

1. Slowly add a dry blend of item 1 and 2 to item 3, agitating with maximum available shear until a smooth and uniform mix is obtained.
2. Mix items 4 to 6 together in another vessel until uniform, and then add to previous mix.
3. Agitate until uniform.
4. Add item 7, and mix until uniform.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE ANTACID SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
200.00	1	Magnesium aluminum silicate (Magnabrite S) (5% suspension)	200.00
2.00	2	Methylparaben	2.00
1.00	3	Propylparaben	1.00
0.50	4	Saccharin sodium	0.50
500.00	5	Aluminum hydroxide/Magnesium hydroxide fluid gel	500.00
3.00	6	Polysorbate 80	3.00
2.00	7	Flavor	2.00
291.50	8	Deionized water	291.50

Manufacturing Directions

1. Add the parabens and saccharin to item 1 with stirring until dissolved (may heat to 80°C to dissolve).
2. Add item 5 with mixing.
3. Finally, add items 6 and 7. Mix well.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
405.00	1	Aluminum hydroxide gel	290.00
100.00	2	Magnesium hydroxide paste (30%)	67.00
0.21	3	Ammonia solution (25%)	0.04
0.05	4	Ammonia solution (25%)	0.01
10.00	5	Methylparaben	2.00
0.25	6	Menthol	0.05
3.00	7	Propylparaben	0.60
1.00	8	Peppermint oil	0.20
50.00	9	Propylene glycol	10.00
1.25	10	Saccharin sodium	0.25
150.00	11	Sorbitol (70% solution)	30.00
4.50	12	Sodium hypochlorite (5%)	0.90
1.25	13	Sodium hypochlorite (5%)	0.25
15.00	14	Magnesium aluminum silicate (Veegum® HV)	3.00
QS	15	Purified water	QS to 1 L

Note: The quantity of the sodium hypochlorite solution should be adjusted according to the assay.

Manufacturing Directions

1. Disperse item 14 in 60 g of hot purified water (70–80°C) in stainless steel vessel, using stirrer. Continue stirring for 30 minutes.
2. Transfer the dispersion into mixer (e.g., Krieger) vessel by vacuum, and mix for 30 minutes at 16/32 mixer speed.
3. Cool down to 30°C.
4. Add 200 g of hot purified water (70–80°C) to the mixer.
5. Mix and homogenize at 1420 rpm, mixer speed 16/32, and vacuum 0.5 bar for 30 minutes.
6. Cool down to 30°C.
7. Add 1 kg of purified water (70°C) to a suitable vessel, and heat to 85°C to 90°C for 1 hour.
8. Cool to 20°C to 25°C.
9. Mix items 13 and 4, and immediately add to purified water (20–25°C) in the storage vessel.
10. Mix for 2 minutes. Store in a previously cleaned storage vessel.
11. Load item 2 and 100 g of purified water (25–30°C) in a stainless steel mixing vessel with lid and stirrer.
12. Mix for 5 minutes at medium speed.
13. Transfer by vacuum into mixer.
14. Load 80 g of item 1 and 80 g of purified water (25–30°C) from preceding step in a stainless steel mixing vessel with lid and stirrer. Mix for 5 minutes at medium speed. Transfer by vacuum into mixer.
15. Load 50 g of item 1 and 50 g of purified water (25–30°C) from preceding step in a stainless steel mixing vessel with lid and stirrer.
16. Mix for 5 minutes at medium speed. Transfer by vacuum into mixer.
17. Transfer item 11 into mixer by vacuum.
18. Dissolve item 10 in 2 g of purified water (25–30°C) and transfer to mixer.
19. Mix and homogenize for 30 minutes at 1420 rpm under vacuum 0.5 bar.
20. Dissolve items 5 and 7 in item 9 (50–60°C) by stirring in stainless steel container in a water bath.
21. Dissolve items 6 and 8, and add to parabens/glycol solution. Mix well. Add to mixer.
22. Mix, and homogenize for 10 minutes under vacuum 0.5 bar.
23. Mix items 3 and 12 and 2 g of purified water, and immediately add to the mixer.
24. Mix for 10 minutes without vacuum.
25. Add cold purified water to bring the volume up to 1 L. Mix for 15 minutes.
26. Transfer the suspension through 630 µm sieve to the stainless steel storage tank. (Final pH is 7.5–8.0, and density is 1.04–1.06.)

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
200.00	1	Aluminum hydroxide gel	2004.00
80.00	2	Magnesium hydroxide paste (30%)	800.00
150.00	3	Sorbitol (70% solution)	30.00
10.00	4	Methyl paraben	2.00
1.00	5	Propyl paraben	0.20
2.00	6	Saccharin sodium	0.40
15.00	7	Magnesium aluminum silicate (Veegum® HV)	3.00
0.20	8	Ammonia solution (25%)	0.04
4.50	9	Sodium hypochlorite (5%)	0.90
100.00	10	Propylene glycol	20.00
0.75	11	Lemon mint flavor	0.15
QS	12	Purified water	QS to 1 L

Manufacturing Directions

1. See manufacturing directions for aluminum hydroxide and magnesium hydroxide suspension.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
40.00	1	Aluminum hydroxide	40.00
40.00	2	Magnesium hydroxide	40.00
50.00 g	3	Cremophor RH 40	50.00
1.00	4	Silicon oil DC 200 (Serva)	1.00
100.00	5	Kollidon® CL-M	100.00
QS	6	Water	76.90

Manufacturing Directions

1. Mix Cremophor RH 40 well with the silicon oil, add the water, and suspend the solid substances.

ALUMINUM HYDROXIDE AND MAGNESIUM HYDROXIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
405.00	1	Aluminum hydroxide gel (dried)	405.00
100.00	2	Magnesium hydroxide powder	100.00
108.00	3	Mannitol	108.00
38.80	4	Sorbitol powder	38.80
2.50	5	Saccharin sodium	2.50
16.70	6	Povidone (PVP K-30)	16.70
7.00	7	Magnesium stearate	7.00
2.00	8	Mint flavor (dry)	2.00
299.00	9	Purified water	299.00

Manufacturing Directions

1. Dissolve items 4 and 5 in 59 g of purified water by using stirrer.
2. Add item 6 while mixing until clear solution is obtained.
3. Add items 1, 2, and 3 into mixer, and mix for 5 minutes using mixer and chopper at high speed.
4. Dilute concentrate-binding solution with 240 g of purified water.
5. Add binding solution at a rate of 9 to 11 g/min to the dry powders in mixer while mixing at low speed. Mix for 2 to 3 minutes. Scrape the sides, blade, and lid of the mixer. Mix and chop at low speed for an additional 2 to 3 minutes or until the granules stop flying around the chopper. Add extra-purified water, if required, and continue mixing until a satisfactory mass is obtained. Record extra quantity of purified water added.
6. Unload the wet mass into a clean Aeromatic bowl for drying. Avoid big lump formation, as this leads to nonuniform drying.
7. Dry the wet mass in an Aeromatic fluid-bed dryer at 60°C for 120 minutes. After 30 minutes of drying, scrape the semidried granules to break the lumps for uniform drying. Check the LOD (limit: NMT 5.5%).
8. Pass the dried granules through 1.5 mm sieve using granulator at medium speed. Collect in stainless steel drums. Set aside 7 to 9 g granules for later step.
9. Load the rest of the granules into blender. Pass items 8 and 7 through a sifter using a 250 µm sieve. Collect in a polyethylene bag.
10. Add approximately 7 to 9 g of granules, and mix gently.
11. Load into blender, and blend for 3 minutes.
12. Check temperature and humidity of the room before beginning compression (humidity limit: NMT 60%, temperature 25°C ± 1°C).
13. Compress the granules using a rotary tableting machine. Compress 680 mg tablets using 12.7 mm flat, beveled- edge punches.

ALUMINUM HYDROXIDE AND MAGNESIUM SILICATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
120.00	1	Aluminum hydroxide dried gel (Giulini)	120.00
250.00	2	Magnesium trisilicate	250.00
232.00	3	Ludipress®	232.00
6.00	4	Aerosil® 200	6.00
6.00	5	Magnesium stearate	6.00
12.00	6	Cyclamate sodium	12.00
1.50	7	Menthol	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with a compression force of 20 kN.
2. Because of the poor flowability of the powder, the tableting machine should be equipped with a special technical device to provide a continuous and homogeneous filling of the dies.
3. Each 16 mm biplanar tablet has an average weight of 640 mg.

ALUMINUM HYDROXIDE, MAGNESIUM CARBONATE (OR OXIDE), AND SIMETHICONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
576.00	1	Sucrose	576.00
157.00	2	Aluminum hydroxide	157.00
160.00	3	Magnesium carbonate (or oxide)	160.00
97.00	4	Magnesium oxide	97.00
45.00	5	Kollidon® 90 F	45.00
22.00	6	Aerosil® 200	22.00
300.00	7	Simethicone suspension (30%)	300.00
9.00	8	Menthol	9.00
1.00	9	Saccharin sodium	1.00
49.00	10	Talc	49.00
13.00	11	Magnesium stearate	13.00

Manufacturing Directions

1. Granulate mixture of items 1 to 6 with the simethicone suspension, dry, sieve through a 0.8 mm screen, add items 8 to 11, and press with high compression force.
2. Tablet has an average weight of 1295 mg.

ALUMINUM HYDROXIDE, MAGNESIUM HYDROXIDE, AND SIMETHICONE SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
27.00	1	Simethicone 30%	27.00
30.00	2	Cremophor RH 40	30.00
70.00	3	Water	70.00
80.00	4	Aluminum hydroxide dry gel (Giulini)	80.00
80.00	5	Magnesium hydroxide	80.00
90.00	6	Kollidon® CL-M	90.00
100.00	7	Sorbitol (crystalline)	100.00
4.00	8	Banana flavor	4.00
5.00	9	Coconut flavor	5.00
1.00	10	Saccharin sodium	1.00
QS	11	Water	QS to 1 L
QS	12	Citric acid (to adjust pH)	QS

Manufacturing Directions

1. Mix Cremophor RH 40 with simethicone, and heat to approximately 50°C, stirring well.
2. Add warm water.
3. Dissolve the flavors and saccharin in water, and suspend aluminum hydroxide, magnesium hydroxide, and Kollidon® CL-M.
4. Add emulsion of items 1 to 3 to the stirred suspension of items 4 to 11, and adjust the pH to approximately 9 with item 12, if needed.

ALUMINUM HYDROXIDE, MAGNESIUM HYDROXIDE, AND SIMETHICONE SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
215.00	1	Aluminum hydroxide gel	435.00
80.00	2	Magnesium hydroxide paste (30%)	16.00
25.00	3	Simethicone emulsion (Simethicone Antifoam M30)	5.50
150.00	4	Sorbitol (70% solution)	30.00
0.20	5	Ammonia solution 25%	0.04
10.00	6	Methylparaben	2.00
1.00	7	Propylparaben	0.20
28.00	8	Methylcellulose 4000 (Methocel™ A4M)	5.60
2.00	9	Saccharin sodium	0.40
4.50	10	Sodium hypochlorite (5%)	0.90
1.00	11	Lemon mint flavor	0.20
QS	12	Purified water	QS to 1 L

Manufacturing Directions

1. See manufacturing directions for aluminum and magnesium hydroxide suspension.

ALUMINUM HYDROXIDE, MAGNESIUM HYDROXIDE, AND SIMETHICONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Aluminum hydroxide gel (dried)	200.00
200.00	2	Magnesium hydroxide powder	200.00
200.00	3	Mannitol	200.00
45.00	4	Sorbitol powder	45.00
65.00	5	Dextrose (glucose) monohydrate	65.00
16.50	6	Povidone (PVP K-30)	16.50
2.50	7	Saccharin sodium	2.50
1.00	8	FD&C Yellow No.10 lake	1.00
2.50	9	Mint flavor (dry)	2.50
1.50	10	Lemon flavor (dry)	1.50
25.00	11	Simethicone GS granules	25.00
315.00	12	Dextrates (Emdex®)	315.00
1.00	13	Colloidal silicon dioxide (Aerosil® 200)	1.00
6.00	14	Magnesium stearate	6.00
–	15	Purified water	160.00

Manufacturing Directions

1. Processing should be done at RH 50% ± 5% and temperature of 26°C ± 1°C.
2. Dissolve items 4, 5, and 7 in cold purified water (25–30°C) by using stirrer; then, add item 6 while mixing.
3. Add item 8, and disperse the color completely.
4. Check final weight; if required, adjust with purified water.
5. Load items 1, 2, and 3 into mixer, and mix for 5 minutes using mixer and chopper at high speed.
6. Add binding solution at a rate of 16 to 20 g/min to the dry powders in mixer while mixing at low speed. Mix for 2 to 3 minutes. Scrape the sides, blade, and lid of the mixer.
7. Mix and chop at low speed for an additional 2 to 3 minutes or until the granules stop flying around the chopper. Add extra-purified water, if required, and continue mixing until a satisfactory mass is obtained. Record extra quantity of purified water added.
8. Unload the wet mass into clean Aeromatic bowl for drying.
9. Avoid big lump formation, as this leads to nonuniform drying.
10. Dry the wet mass in an Aeromatic fluid-bed dryer at 60°C for 90 minutes.

11. After 30 minutes of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
12. Pass the dried granules through a 1.5 mm sieve using a granulator at medium speed. Collect in stainless steel drums.
13. Load the granules into blender.
14. Add items 11 and 12 to stainless steel drum, and mix for 2 minutes using drum mixer; then, load into the blender, and mix along with the granules for 2 minutes.
15. Pass items 9, 10, 13, and 14 through sifter using 250 µm sieve.
16. Load the sieved material into blender, and mix for 2 minutes. Unload into stainless steel drums.
17. Check temperature and humidity of the room before beginning compression.
18. Compress 1.2 g per tablet using 15.8 mm flat punch at RH 50% ± 5% at a temperature of 26°C ± 1°C.

ANALGESIC CLEAR GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
25.00	1	Hydroxypropyl cellulose	25.00
QS	2	Deionized water	QS to 1 kg
400.00	3	Ethanol DEB 100	400.00
100.00	4	Menthol	100.00
150.00	5	Methyl salicylate	150.00
25.00	6	DEA-oleath-3-phosphate	25.00

Manufacturing Directions

1. Hydrate hydroxypropyl cellulose in water at 60°C to 65°C.
2. Stir to cool.
3. Add ethanol.
4. Add remaining ingredients and stir until homogeneous.

ANALGESIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
130.00	1	Methyl salicylate	130.00
60.00	2	Menthol	60.00
20.00	3	Eucalyptus oil	20.00
5.00	4	Lanolin	5.00
1.00	5	Chloroxylenol	1.00
150.00	6	Glyceryl stearate and PEG-100 stearate	150.00
73.00	7	Cetearyl alcohol	73.00
70.00	8	Glyceryl stearate	70.00
QS	9	Deionized water	QS to 1 kg
QS	10	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 30°C.

ANALGESIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Methyl salicylate	150.00
70.00	2	Menthol	70.00
10.00	3	Lanolin oil	10.00
30.00	4	PEG-40 stearate	30.00
20.00	5	Glyceryl stearate	20.00
QS	6	Deionized water	QS
1.50	7	Carbopol® 980	1.50
10.00	8	Potassium hydroxide (10% aqueous solution)	10.00
QS	9	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases (except potassium hydroxide) separately to 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add potassium hydroxide solution to neutralize.
4. Stir to cool.
5. Fill at 30°C.

ANISE OIL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.00	1	Anise oil	10.00
17.00	2	Cremophor RH 40	17.00
340.00	3	Ethanol	340.00
QS	4	Preservatives	QS
633.00	5	Water	633.00

Manufacturing Directions

1. Mix the anise oil with Cremophor RH 40, heat to approximately 65°C, and stir strongly.
2. Slowly add the hot solution of items 3 to 5 to produce a clear or slightly opalescent, colorless liquid.

ANTAZOLINE AND XYLOMETAZOLINE EYE DROPS

Bill of Materials

Scale (mg/100 mL)	Item	Material Name	Qty/L (g)
500.00 g	1	Antazoline sulfate	5.00
50.00 g	2	Xylometazoline hydrochloride	0.50
0.15	3	Hydroxypropylmethylcellulose (4000 cps)	1.50
0.10	4	Benzalkonium chloride; use benzalkonium chloride solution (17%) (7% excess)	0.63 mL
0.10	5	Edetate disodium	1.00
0.843	6	Sodium chloride	8.43
QS	7	Water purified	QS to 1 L

Manufacturing Directions

Equipment used should be thoroughly cleaned and rinsed before proceeding. Use steam-jacketed, glass-lined, or stainless steel (No. 304 or better) tanks. The tank must be equipped with an agitator (preferably with speed control) and a cover to protect against air at all times during the manufacturing process, except when ingredients are being added or samples are being taken. Benzalkonium chloride markedly lowers the surface tension. During severe agitation or turbulent flow, substantial foaming will occur. This condition often exists in the processing equipment and in the overflow system of vacuum-filling machines. Benzalkonium chloride tends to concentrate in the foam. If the foam is not dissipated quickly, and if it is allowed to accumulate, a substantial excess of benzalkonium chloride may result near the surface of the liquid after the foam condenses; therefore, it is advisable to design the processing and filling systems in such a way as to minimize foaming and ensure rapid dissipation of any unavoidable foaming.

1. Fill mixing tank to 90% of final volume with purified water.
2. Heat water to 90°C, and while agitating, add and dissolve the hydroxypropylmethylcellulose by slowly sprinkling onto the surface of the water.
3. Methyl cellulose must be dispersed evenly over a period of time to ensure complete wetting and dispersion.
4. The agitation rate should be adjusted to avoid excessive foaming.
5. Allow 15 minutes for hydration of the hydroxypropylmethylcellulose before cooling.
6. Discontinue heating, and cool solution to approximately 40°C.
7. While agitating, add and dissolve antazoline sulfate, xylometazoline hydrochloride, benzalkonium chloride, edetate disodium, and sodium chloride.
8. Continue cooling to 25°C.
9. Turn off agitator, and QS to final volume. Mix well.
10. *Note:* Methylcellulose solutions filter at a slow rate. Recirculate the solution through filter assembly until clear.
11. Sterile filter, and fill.

ANTIACNE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
422.00	1	Witch hazel (distilled, 14% alcohol)	422.00
5.00	2	Salicylic acid	5.00
5.00	3	Aloe vera gel	5.00
10.00	4	Sorbitol	10.00
500.00	5	Polyglycerylmethacrylate	500.00
10.00	6	Propylene glycol	10.00
0.80	7	Methylparaben	0.80
0.20	8	Propylparaben	0.20

Manufacturing Directions

1. Premix items 1 to 4.
2. Add item 5 with low-shear mixing until homogeneous.
3. Mix together items 6 to 8, and add them to the formulation.

ANTIFUNGAL FOOT POWDER

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Dichlorobenzyl alcohol (Myacide SF)	5.00
5.00	2	Allantoin	5.00
200.00	3	Cornstarch	200.00
790.00	4	Talc	790.00

Manufacturing Directions

1. Mix all ingredients using geometric dilution technique.

ANTISEPTIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Polawax GP200	50.00
10.00	2	Lanolin	10.00
150.00	3	Mineral oil (70 cS)	150.00
70.00	4	Cetearyl alcohol	70.00
30.00	5	Dimethicone	30.00
QS	6	Deionized water	QS to 1 kg
5.00	7	Cetrimonium bromide	5.00
0.50	8	Chlorhexidine gluconate	0.50
QS	9	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases to 65°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill.

ANTISEPTIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Cetearyl alcohol and ceteareth-20	30.00
50.00	2	Mineral oil (70 cS)	50.00
2.00	3	Lanolin alcohol	2.00
QS	4	Deionized water	QS to 1 kg
5.00	5	Cetrimonium bromide (as 40% cetrimide solution BP)	5.00
20.00	6	Glycerin	20.00
QS	7	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill at 30°C.

ANTISEPTIC LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Cetearyl alcohol and ceteareth-20	30.00
45.00	2	Mineral oil (70 cS)	45.00
25.00	3	Stearyl alcohol	25.00
10.00	4	Lanolin	10.00
5.00	5	Polysorbate 60	5.00
15.00	6	Laneth-15	15.00
QS	7	Deionized water	QS to 1 kg
5.00	8	Cetrimonium bromide (as 40% cetrimide solution BP)	5.00
20.00	9	Glycerin	20.00
QS	10	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill at 30°C.

ANTISEPTIC WET WIPES

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
3.75	1	Cetrimonium bromide	3.75
0.15	2	Chlorhexidine gluconate	0.15
10.0–20.0	3	Polysorbate 20	10.0–20.0
10.0–20.0	4	Glycerin	10.0–20.0
QS	5	Deionized water	QS to 1 L
QS	6	Perfume	QS

Manufacturing Directions

1. Preblend Polysorbate 20 and perfume.
2. Combine remaining components with stirring. Add perfume/Polysorbate 20 blend.
3. Stir until clear.
4. Package in wipes.

ASPARAGUS EXTRACT + PARSLEY EXTRACT TABLETS (200 MG+200 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Asparagus extract powder	200.00
200.00	2	Parsley extract powder	200.00
200.00	3	Sorbitol crystalline	200.00
20.00	4	Kollidon® VA 64	20.00
10.00	5	Kollidon® CL	10.00
4.00	6	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with low compression force at 636 mg.

ASPARTAME EFFERVESCENT TABLETS (20 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
20.00	1	Aspartame	20.00
10.40	2	Sorbitol crystalline	10.40
14.30	3	Tartaric acid powder	14.30
18.70	4	Sodium carbonate	18.70
1.70	5	Kollidon® 25	1.70
1.10	6	PEG-6000 powder	1.10

Manufacturing Directions

1. Mix and pass through a 0.5 mm sieve.
2. Press to tablets at 66 mg.

ASPARTAME GRANULES IN SACHETS

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
30.00	1	Aspartame	30.00
2.00	2	Silicon dioxide (colloidal)	2.00
968.00	3	Cerelose powder N60[a]	1052.00

[a] Standard quantity of cerelose powder allows for LOD.

Manufacturing Directions

1. Protect from moisture. Maintain RH 40% and temperature 25°C.
2. Oven dry cerelose powder at 50°C overnight until LOD is NMT 3% (3 hours, vacuum at 60°C).
3. Pass dried cerelose powder through 595 µm aperture screen in oscillating granulator.
4. Charge the following ingredients into suitable blender: aspartame, half of the amount of dried cerelose powder (milled), and colloidal silicon dioxide.
5. Add the balance of the dried cerelose powder (for a total amount of dried powder of 968 g/kg), and blend for 15 minutes.
6. Pass blended powders through an 840 µm screen using an oscillating granulator, and discharge into polyethylene-lined drums.
7. Fill weight is 1 g per sachet.

ASPARTAME POWDER IN SACHETS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
47.50	1	Aspartame	47.50
2.50	2	Silicon dioxide (colloidal)	2.50
950.00	3	Mannitol granules	950.00

Manufacturing Directions

1. Protect from humidity. Maintain RH 40% and temperature 25°C.
2. Pass mannitol granules and colloidal silicon dioxide through an 840 µm screen in oscillating granulator.
3. Charge the following ingredients into suitable blender: aspartame, half of the amount of mannitol granules, and colloidal silicon dioxide.
4. Add balance of mannitol granules, and blend for 15 minutes.
5. Pass blended powders through an 840 µm screen using an oscillating granulator, and discharge into polyethylene-lined drums.
6. Fill weight is 0.8 g per sachet.

ASPARTAME TABLETS (25 MG), DC

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
27.00	1	Aspartame	27.00
76.00	2	Ludipress®	76.00
12.00	3	Kollidon® CL	12.00
1.00	4	Magnesium stearate	1.00
3.00	5	Lutrol F68	3.00

Manufacturing Directions

1. Mix all components, and pass through a 0.8 mm sieve.
2. Press to tablets with low compression force at 120 mg.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
20.00	1	Aspartame	20.00
4.00	2	Cellulose (microcrystalline) (Avicel™ PH101), NF	4.00
4.00	3	Sodium starch glycolate (pH 5.5–7.5), NF International	4.00
0.50	4	Silicon dioxide (colloidal)	0.50
0.50	5	Povidone (PVP K-29–32), USP	0.50
14.00	6	Anhydrous alcohol (isopropyl, refined) USP	~14.00
34.00	7	Lactose (granulated)	34.00
4.00	8	Leucine, USP	4.00
3.00	9	Sodium benzoate (powder), NF	3.00

Manufacturing Directions

1. Charge aspartame, cellulose microcrystalline, sodium starch glycolate, silicon dioxide, and povidone in a suitable mixer.
2. Blend for 20 minutes or until uniform.
3. While mixing, slowly add isopropyl alcohol to blended powders until a suitable granulating mass is obtained. Avoid overwetting.
4. Pass wet mass through a 2.38 mm screen on an oscillating granulator, and spread onto paper-lined trays.
5. Oven dry at 45°C to 50°C until LOD is NMT 1.2%.
6. Pass dried granulation through an 840 µm screen on an oscillating granulator.
7. Load dried granulation into a suitable mixer.
8. Add granulated lactose, leucine, and sodium benzoate, and blend for approximately 10 minutes.
9. Discharge into polyethylene-lined drums.
10. Compress tablets in a low-humidity area not to exceed 40% RH at 23°C.
11. Compress, using 7/32 in. concave punches, to the following specifications: weight of 10 tablets is 0.7 g; thickness of a tablet is 2.9 to 3.3 mm.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25	1	Aspartame	25
25	2	Dibasic calcium phosphate	25
3	3	Kollidon® VA 64	3
10	4	Water	10
3	5	Kollidon® CL	3
3	6	PEG-6000 (powder)	3

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with items 4 and 5.
2. Pass through a 0.8 mm sieve. Mix with item 6.
3. Press to tablets 60 mg in weight with a 5 mm biplanar shape.

ASPARTAME TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Aspartame	25.00
76.00	2	Ludipress®	76.00
12.00	3	Kollidon® CL	12.00
1.00	4	Magnesium stearate	1.00
3.00	5	Lutrol F 68	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with low compression force.
2. Each 8 mm biplanar tablet has an average weight of 120 mg.

ASPARTAME TABLETS, EFFERVESCENT

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
20.00	1	Aspartame	20.00
10.40	2	Sorbitol (crystalline)	10.40
14.30	3	Tartaric acid (powder)	14.30
18.70	4	Sodium bicarbonate	18.70
1.70	5	Kollidon® 25	1.70
1.10	6	PEG-6000 (powder)	1.10

Manufacturing Directions

1. Mix, pass through a 0.5 mm sieve, and press to tablets.
2. Each 6 mm biplanar tablet has an average weight of 66 mg.

ASPIRIN, ACETAMINOPHEN, AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
225.00	1	Aspirin (40 mesh)	225.00
250.00	2	Acetaminophen (20 mesh)	250.00
30.00	3	Caffeine (granular)	30.00
100.00	4	Cellulose (microcrystalline) (Avicel™ PH102)	100.00
45.00	5	Anhydrous lactose	45.00
10.00	6	Croscarmellose sodium (Ac-Di-Sol)	10.00
5.00	7	Fumed silica	5.00
10.00	8	Stearic acid	10.00

Manufacturing Directions

1. Mix items 1 to 6 in a suitable blender.
2. Pass the mixture through a mill using a 12 mesh screen with knives forward.
3. Add items 7 and 8, and blend the milled mixture for 20 minutes in a V-blender.
4. Compress to tablet weight of 675 mg.

ASPIRIN, ACETAMINOPHEN, CAFFEINE, AND SALICYLAMIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Aspirin (40 mesh)	200.00
100.00	2	Salicylamide	100.00
100.00	3	Acetaminophen (40 mesh)	100.00
60.00	4	Caffeine (Granular)	60.00
150.00	5	Cellulose (microcrystalline) (Avicel™ PH101)	150.00
13.00	6	Stearic acid, USP	13.00
3.00	7	Fumed silica	3.00

Manufacturing Directions

1. Screen all ingredients through a 20 mesh sieve.
2. Blend all the ingredients in a V-blender for 20 minutes.
3. Compress 615 mg tablets using 5/8 in. tooling.

ASPIRIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
325.00	1	Aspirin	325.00
25.52	2	Starch 1500®	25.52
21.33	3	Microcrystalline cellulose (50 μm)	21.33
6.33	4	Powdered cellulose	6.33

Manufacturing Directions

1. Blend in a twin-shell blender.
2. Compress 378.00 mg tablets.

ASPIRIN-COATED CRYSTALS

Formulation

Aqueous-based polymeric coating solution: Hydroxypropylmethylcellulose (HPMC E5), 6.0%; propylene glycol, 1.0%; FD&C Red No. 3, 0.01%; and distilled water, QS to 100.

Manufacturing Directions

1. A standard coating pan and an air suspension 6 in. column are used to coat aspirin crystals of 100 to 200 mesh using top-spray, bottom-spray, and tangential spray fluid-bed coating processes.
2. Aspirin crystal load is placed in the product container.
3. The crystals are fluidized in an expansion chamber.
4. The spray nozzle is located low in the expansion chamber so that liquid is applied when the crystals are moving at a higher velocity.
5. This serves to minimize surface wetting and to inhibit agglomeration.
6. A filter is used to separate entrained crystals from the exiting process air stream.
7. The pump is calibrated with coating solution prior to start-up of the coating process.
8. The turbine is activated, and the process air is heated to 55°C.
9. The spray and shake cycle is started and run continually until the coating solution is completely depleted.
10. The coated aspirin crystal bed is dried for 10 minutes, and the product is cooled to 35°C.
11. The product is removed, weighed, and passed through a 20 mesh screen to remove any agglomerates.

12. Tablets are prepared containing five components: 50% by weight aspirin crystals (100–200 mesh) coated previously with 3% to 6% polyvinylpyrrolidone (PVP); 25% calcium carbonate buffer, 5% to 15% hydroxypropylmethylcellulose (K100LV) as the gel-forming hydrophilic matrix material; 14.5% to 19.5% microcrystalline cellulose (Avicel™ PH101) as the excipient/binder; and 0.5% stearic acid as the hydrophobic lubricant.
13. The components of the tablet formulation are weighed and mixed.
14. 650 mg samples are compressed using 1/2 in. punches.

ATTAPULGITE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
475.00	1	Attapulgite (regular)	475.00
275.00	2	Attapulgite (colloidal)	275.00
12.00	3	PVP K 30	12.00
7.00	4	Ac-Di-Sol	7.00
15.00	5	Kollidon® CL	15.00
30.00	6	Sucrose	30.00
50.00	7	Klucel® EF	50.00
40.00	8	Sucrose	40.00
35.00	9	Ac-Di-Sol	35.00
25.00	10	Kollidon® CL	25.00
14.00	11	Talc (fine powder)	14.00
5.00	12	Pectin	5.00
7.00	13	Glyceryl behenate	7.00
5.00	14	Aerosil® 200	5.00
5.00	15	Magnesium stearate	5.00
–	16	Purified water	32.00
–	17	Ethanol (95%)	23.00

Manufacturing Directions

Use face mask, hand gloves, and clean uniform. Avoid dust and inhalation of powder.

1. Dissolve sucrose (item 6) in purified water by using an appropriate stirrer at slow speed in a stainless steel container.
2. Dissolve Klucel® EF in the ethanol by using an appropriate stirrer at slow speed in stainless steel container.
3. Mix the two steps in a stainless steel drum by using an appropriate stirrer at slow speed.
4. Take item 8 (sucrose), and pass through a Fitz mill using sieve No. 24250 (impact forward, high speed). Collect in a stainless steel drum.
5. Add items 1 to 5, and sift the material through a 500 µm sieve using a Russell sifter.
6. Mix for 3 minutes.
7. Add the binding solution prepared earlier at a speed of 6 to 8 kg/min to the dry powder in an appropriate mixer at slow speed. After addition, scrape sides and blades; then, mix and chop further for 1 minute at slow speed. Check for satisfactory wet mass. Add additional purified water, if required, to obtain satisfactory wet mass.
8. Spread the granules onto stainless steel trays to a thickness of one-fourth of the tray thickness, and load the trays on the trolley.
9. Load the trolleys into the oven, and dry the granules at 55°C for 16 hours.
10. After 4 hours of drying, stir the granules on the trays, and change the position of the trays for uniform drying.
11. Check the LOD of dried granules (limit: 2.5–3.5%).
12. The LOD should be strictly maintained; otherwise, tablet hardness and friability are affected. If required, dry further to obtain the desired LOD.
13. Grind the dried granules using first a 2.5 mm sieve and then a 1.25 mm sieve.
14. Load the ground material into a double-cone blender.
15. Sift items 9, 10, 12, and 14 through a 500 µm sieve, and add mixture to the double-cone blender.
16. Mix for 5 minutes.
17. Sift items 11, 13, and 15 through a 250 µm sieve, and collect in a polyethylene bag.
18. Add approximately 2 to 3 kg bulk granules from earlier step, mix, and add to the double-cone blender.
19. Mix for 1 minute.
20. Compress the granules using an 18 mm × 8 mm oblong, capsule-shaped, parallel, concave plain punch for a 1 g tablet weight of hardness 12 to 18 kp.
21. Coat the tablets using one of the HPMC coating solutions (see Appendix).

AZULENE SOLUTION (1%)

Manufacturing Directions

1. Mix 1 g azulene with 3 g Cremophor RH 40, and heat to approximately 60°C.
2. Slowly add water (60°C) to 100 mL, and cool to room temperature.

BABY CREAM, BENZALKONIUM CHLORIDE AND ZINC OXIDE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.002 mL	1	Benzalkonium chloride solution	2.30 mL
85.00 mg	2	Zinc oxide (powder)	85.00
100.00 mg	3	Polawax (emulsifying, nonionic wax)	100.00
16.00 mg	4	Alcohol cetostearyl	16.00
4.00 mg	5	Lanolin (acetylated/anhydrous, regular)	4.00
80.00 mg	6	Glycerin (96%)	80.00
10.00 mg	7	Oil (neutral, vegetable triglycerides mixture; Miglyol®)	10.00
0.50 mg	8	Propylparaben (Aseptoform™ P)	0.50
1.00 mg	9	Methylparaben (Aseptoform™ M)	1.00
0.80 mL	10	Purified water	QS to 800.00 mL
0.24 mg	11	Perfume (Diabolo 110.388/B)	0.24

Manufacturing Directions

Avoid mixing air into emulsion. Emulsify under vacuum to minimize air entrapment. Use jacketed tank with vacuum with high-speed agitator (adjustable, slow-speed, anchor type with Teflon sweep blades).

1. If necessary, mill zinc oxide in a Fitz mill or similar device (impact forward, maximum speed), fitted with a 250 µm screen.
2. Repeat three times.
3. Heat 800 mL of water to 75°C in a steam-jacketed mixing tank, and dissolve methylparaben.
4. Maintain temperature at 75°C.
5. Disperse milled zinc oxide in solution of previous step.
6. Maintain temperature at 75°C.
7. Dissolve benzalkonium chloride and glycerin in solution, and maintain temperature at 75°C.
8. In a separate steam-jacketed tank, add Polawax, cetostearyl alcohol, acetylated lanolin, oil, and propylparaben. Carefully melt at 70°C.
9. Adjust the turbomixer of the steam-jacketed tank containing the aqueous phase to maximum speed, keeping the temperature at 75°C.
10. Slowly add the oil phase to the aqueous phase.
11. Generate as much vacuum as possible, and maintain it for the rest of the process.
12. Circulate cold water to allow a slow temperature decrease (down to 60°C).
13. Stop the turbomixer, and set the anchor-type agitator at minimum speed until 40°C to 45°C is reached.
14. The temperature decrease must be very slow.
15. Break the vacuum, and add perfume to cream with anchor-type agitator set at slow speed.
16. Continue to mix until the perfume is completely dispersed.

BABY LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
50.00	1	Alcohol (ethanol; natural cosmetic grade)	50.00
50.00	2	Propylene glycol	50.00
0.80	3	Ethoxylated nonyl phenol	0.80
0.005	4	FD&C Red dye No. 40	5.70 mg
0.41	5	FD&C Blue dye No. 1	0.41
0.70	6	FD&C Yellow dye No. 5	0.70
0.40	7	Perfume essence (Nelandia)	0.40
QS	8	Hydrochloric acid (reagent-grade bottles)	~0.01
QS	9	Purified water	QS to 1 L

Manufacturing Directions

Use 316 or more resistant-grade stainless steel tank.

1. Charge approximately 800 mL of purified water in main mixing tank.
2. Add alcohol and propylene glycol, and mix for 5 minutes.
3. Separately dissolve each dye in sufficient water to obtain 0.5% dye solutions.
4. Add color solutions to main tank, and mix.
5. Rinse containers with small portions of purified water, and add rinsings.
6. Dissolve perfume essence in ethoxylated nonyl phenol.
7. Add solution from previous step to main tank, and mix for 5 minutes.
8. Determine pH of solution, and adjust if necessary with 5% hydrochloric acid solution.
9. Mix well. pH should be 5.7 to 5.9.
10. QS to 1 L with purified water.

BABY SHAMPOO

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
250.00	1	Sodium alkyl ether sulfate/ sulfonate	250.00
30.00	2	Monateric CAB surfactant	30.00
30.00	3	Cocamide DEA surfactant (Synotol CN 90)	30.00
1.00	4	Methylparaben	1.00
0.52	5	Anhydrous citric acid	0.52
0.003	6	FD&C Yellow dye No. 6	3.50 mg
0.01	7	FD&C Yellow dye No. 5	15.00 mg
4.00	8	Ethoxylated nonyl phenol	4.00
3.00	9	Perfume I	3.00
1.00	10	Perfume II	1.00
8.50	11	Sodium chloride	8.50
QS	12	Purified water	QS to 1 kg

Manufacturing Directions

Use 315 or more resistant-grade stainless steel tank.

1. Add approximately 270 g of purified water to the main mixing tank.
2. With slow agitation, add cocamide DEA surfactant.
3. Add and dissolve methylparaben, and mix for approximately 10 minutes.
4. Add the following ingredients to tank: sodium alkyl sulfate/sodium alkyl ether sulfate/sulfonite, monateric CAB surfactant, and approximately 280 g of purified water.
5. Mix for 15 minutes until complete solution is obtained.
6. With constant stirring, slowly add citric acid (10% solution) until a pH of 6.9 to 7.1 is maintained constantly for 5 minutes after the last addition of the citric acid solution.
7. Separately dissolve FD&C Yellow No. 5 and 6 (if used) in sufficient purified water.
8. Add dye solution from preceding step to main tank, and mix.
9. Rinse containers with a small portion of purified water, and add rinsings.
10. Separately mix ethoxylated nonyl phenol with perfumes (perfume available from Firmenich; Plainsboro, NJ), and add to main mixing tank.
11. Rinse container with purified water, and add rinsings.
12. Mix until completely dissolved.
13. Slowly add in small portions sodium chloride to adjust the viscosity to between 1500 and 3500 cps.
14. Mix for 15 minutes.
15. If necessary, QS to 1 kg with purified water.

BARIUM SULFATE ORAL SUSPENSION (23%)

Formulation

Barium sulfate, 100.0 g; Kollidon® 90 F, 5.0 g; carboxymethyl cellulose sodium, 0.4 g; sodium bisulfite, <0.5 g; preservatives, QS; water, 320.0 g.

Manufacturing Directions

1. Dissolve the preservatives and the carboxymethyl cellulose sodium in the hot water.
2. Add Kollidon® 90 F and sodium bisulfite.
3. In the obtained clear solution, suspend barium sulfate.

BASIC CREAM FOR VARIOUS ACTIVE INGREDIENTS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
70.00	1	Cetylstearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
120.00	4	Liquid paraffin	120.00
2.00	5	Paraben(s)	2.00
680.00	6	Water	680.00
80.00	7	Propylene glycol	80.00
1.00–20.00	8	Active ingredient	1.00–20.00

Manufacturing Directions

1. Separately heat a mixture of items 1 to 5 and the water to approximately 80 ˚C.
2. Add the water to the obtained solution with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved, mix with aqueous solution, and continue to stir during cooling to room temperature.
4. This white basic cream can be readily used for active ingredients soluble in 1, 2-propylene glycol.

BENZALKONIUM CHLORIDE CONTRACEPTIVE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PEG-6, PEG-32, and glycol stearate (Tefose® 63)	50.00
30.00	2	Apricot kernel oil PEG-6 esters (Labrafil® M 1944 CS)	30.00
816.00	3	Deionized water	816.00
80.00	4	Hydroxyethylcellulose	80.00
24.00	5	Benzalkonium chloride (50 wt% in water)	24.00

Manufacturing Directions

1. Mix items 3 and 4 at room temperature.
2. Heat to 75°C, and add items 1 and 2 while stirring.
3. Cool with gentle stirring to 30°C; then, add item 5 and stir.

BENZOYL PEROXIDE AND ALPHA-BISABOLOL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
2.00	1	Alpha-Bisabolol, natural (BASF)	2.00
60.00	2	Propylene glycol	60.00
100.00	3	Triethanolamine	100.00
30.00	4	Cremophor RH 40	30.00
30.00	5	Kollidon® 30	30.00
408.00	6	Water	408.00
10/00	7	Carbopol® 940	10.00
400.00	8	Water	400.00
50.00	9	Benzoyl peroxide	50.00

Manufacturing Directions

1. Prepare suspension of items 7 and 8. Let swell for 1 hour.
2. Add this suspension to the well-stirred solution of items 1 to 5.
3. Add item 9 to produce a colorless, transparent gel.

BENZOYL PEROXIDE ANTIACNE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
460.50	1	Deionized water	460.50
5.00	2	Carbomer 940	5.00
10.00	3	Hydroxypropylmethylcellulose (HPMC, medium viscosity)	10.00
137.50	4	Deionized water	137.50
70.00	5	Purified bentonite (Polargel®, NF)	70.00
2.00	6	Methylparaben	2.00
1.00	7	Propylparaben	1.00
20.00	8	Glyceryl stearate	20.00
60.00	9	Propylene glycol	60.00
20.00	10	PEG-600	20.00
20.00	11	Myristyl propionate	20.00
50.00	12	Dimethicone	50.00
70.00	13	Purified bentonite (Polargel, NF)	70.00
10.00	14	Titanium dioxide	10.00
100.00	15	Benzoyl peroxide (70%)	100.00

Manufacturing Directions

1. Sift Carbomer 940 into vortex in water. When completely dispersed, sift in the HPMC.
2. Add parabens with stirring, and heat to at least 80°C until dissolved.
3. Add glyceryl stearate.
4. Blend in propylene glycol and items 10 to 13 in order, and mix well.
5. After addition of the Polargel®, allow 15 minutes of mixing to complete hydration.
6. Blend propylene glycol portion into the first part.
7. Add benzoyl peroxide and titanium dioxide to the mixture, and mill.

BENZOYL PEROXIDE ANTIACNE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
2.50	1	Acrylates/C10-30 alkyl acrylate cross-polymer (Permulen TR1)	2.50
4.00	2	Carbopol 980	4.00
QS	3	Deionized water	QS to 1 kg
40.00	4	Isopropyl myristate	40.00
10.00	5	Cetyl alcohol	10.00
20.00	6	Glyceryl stearate	20.00
50.00	7	Sodium hydroxide (0.5 M)	50.00
15.00	8	Deionized water	15.00
50.00	9	Benzoyl peroxide	50.00
50.00	10	PEG-600	50.00
QS	11	Perfume, preservative	QS

Manufacturing Directions

1. Hydrate Carbopol and permulen in warm water at 60°C.
2. When fully hydrated, heat to 70°C.
3. Heat oil phase to 70°C.
4. Add water phase to oil phase while stirring.
5. Add sodium hydroxide, and continue stirring.
6. Combine benzoyl peroxide, PEG-600, and deionized water, and add to the emulsion.
7. Homogenize at 35°C with caution, using suitable equipment.

BENZOYL PEROXIDE ANTIACNE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Purified bentonite (Polargel®, NF)	40.00
10.00	2	Hydroxypropylmethylcellulose (HPMC)	10.00
522.20	3	Water	522.20
190.00	4	Water	190.00
2.00	5	Methylparaben	2.00
2.00	6	Propylparaben	2.00
20.00	7	Glyceryl stearate	20.00
60.00	8	Propylene glycol	60.00
20.00	9	Myristyl propionate	20.00
5.00	10	Dimethicone	5.00
QS	11	Iron oxides	QS
10.00	12	Titanium dioxide	10.00
100.00	13	Benzoyl peroxide (77%)	100.00

Manufacturing Directions

1. Sift the Polargel® into water with rapid mixing.
2. Allow to hydrate for 15 minutes.
3. Pass HPMC through a coarse sieve, add to the Polargel® solution, and mix until all lumps are removed.
4. Add parabens to the water with stirring, and heat to 90°C to dissolve the parabens.
5. Add items 4 to 10, and mix well; then, add these to the HPMC mixture.
6. Mix well again.
7. Finally, add items 11 to 13, and mix.

BENZOYL PEROXIDE ANTIACNE MICROEMULSION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
470.00	1	Ethoxydiglycol (Transcutol®)	470.00
250.00	2	PEG-8 caprylic/Capric glycerides (Labrasol®)	250.00
150.00	3	Dipelargonate propylene glycol (DPPG)	150.00
80.00	4	Benzoyl peroxide	80.00
50.00	5	Propylene glycol laurate (Lauroglycol®)	50.00

Manufacturing Directions

1. Mix items 1 to 3.
2. Dissolve item 4 in this mixture with mixing for 1.5 to 2.0 hours.
3. Add item 5 to mixture, and mix until uniform emulsion is obtained.

BENZYL BENZOATE SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
100.00	1	Benzyl benzoate	100.00
220.00	2	Cremophor RH 40	220.00
410.00	3	Ethanol (96%)	410.00
270.00	4	Water	270.00

Manufacturing Directions

1. Heat the mixture of benzyl benzoate and Cremophor RH 40 to approximately 60°C.
2. Stir strongly, and slowly add the water.
3. Finally, add the ethanol to produce a clear, colorless liquid.

BERBERINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Berberine sulfate, with excess	5.70
54.10	2	Lactose monohydrate	54.10
54.10	3	Ludipress®	54.10
1.20	4	Magnesium stearate	1.20

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compression force.
2. Each 6 mm biplanar tablet has an average weight of 115 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E CHEWABLE TABLETS (10 MG + 500 MG + 250 MG)

Formulation

Beta-carotene dry powder 10%, 100 g; ascorbic acid, crystalline (BASF), 250 g; sodium ascorbate, crystalline, 280 g; vitamin E acetate dry powder SD, 50, 500 g; (BASF) sorbitol, crystalline, 600 g; Ludipress®, 500 g; fructose, 350 g; polyethylene glycol 6000, powder, 50 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with high compression force at 2600 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E EFFERVESCENT TABLETS (12 MG + 150 MG + 25 MG)

Formulation

Lucarotene dry powder 10% CWD G/Y (BASF), 120 g; ascorbic acid, crystalline (BASF), 150 g; dry vitamin E acetate 50% DC (BASF), 50 g; Ludipress® LCE [1], 705 g; Kollidon® VA64, 50 g; citric acid, anhydrous, 450 g; sodium bicarbonate, 320 g; polyethylene glycol 6000, powder, 75\g; orange flavor (Dragoco), 50\g; aspartame (Searle), 30\g.

Manufacturing Directions

1. Mix all components. Pass through a sieve.
2. Press with high compression force at a maximum of 30% of relative atmospheric humidity at 2.045 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E TABLETS (7 MG + 60 MG + 25 MG)

Formulation

Betavit® dry powder 10% (BASF), 75 g; ascorbic acid, powder (BASF), 60 g; vitamin E acetate dry powder 50%, 50 g; sorbitol, crystalline, 240 g; Kollidon® CL, 30 g; magnesium stearate, 5 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compression force at 497 mg.

BETA-CAROTENE + VITAMIN C + VITAMIN E TABLETS (12 MG + 250 MG + 125 MG)

Formulation

Beta-carotene dry powder 10%, 125 g; ascorbic acid, crystalline (BASF), 125 g; sodium ascorbate, crystalline (BASF), 141 g; vitamin E acetate dry powder SD 50, 250 g; (BASF) Ludipress® or sorbitol, crystalline, 119 g; polyethylene glycol 6000, powder, 5 g; orange flavor (FDO), 15 g; sodium cyclamate, 10 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with medium compression force at 790 mg.

BETA-CAROTENE EFFERVESCENT TABLETS (7 MG)

Formulation

Lucarotin® dry powder 10% CWD (BASF), 70 g; Ludipress®, 113 g; citric acid, anhydrous, 200 g; sodium bicarbonate, 120 g; sodium carbonate, 12 g; sodium cyclamate, 20 g; aspartame, 15 g; orange flavor, 20 g; polyethylene glycol 6000, powder, 30 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium or high compression force at maximum 30% of relative atmospheric humidity.

BETA-CAROTENE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
7.00	1	Beta-carotene; use Lucarotin® CWD (dry powder, 10%) (BASF)	70.00
113.00	2	Ludipress®	113.00
200.00	3	Anhydrous citric acid	200.00
120.00	4	Sodium bicarbonate	120.00
12.00	5	Sodium carbonate	12.00
20.00	6	Sodium cyclamate	20.00
15.00	7	Aspartame	15.00
20.00	8	Orange flavor	20.00
30.00	9	PEG-6000 (powder)	30.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium or high compression force at maximum RH 30%.
3. Use 12 mm biplanar punches for 602 mg tablets.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Beta-carotene (dry powder, 10% with excess)	160.00
240.00	2	Ludipress®	240.00
175.00	3	Dicalcium phosphate, granulated with 5% Kollidon® 30	175.00
6.00	4	Kollidon® CL	6.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compression force.
2. Compress 400 mg in 12 mm biplanar punches.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Beta-carotene (dry powder, 10%)	150.00
175.00	2	Dicalcium phosphate, granulated with 5% Kollidon® 30	175.00
100.00	3	Avicel™ PH101	100.00
5.00	4	Kollidon® CL	5.00
2.50	5	Aerosil® 200	2.50
20.00	6	Talc	20.00
2.50	7	Calcium arachinate	2.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with a medium compression force.
2. Compress 502 mg in 12 mm biplanar punches.

BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
20.00	1	Beta-carotene (dry powder, 10%)	220.00
250.00	2	Avicel™ PH101	250.00
20.00	3	Kollidon® CL	20.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, and press with a low compression force.
2. Compress 518 mg in 12 mm biplanar punches.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Beta-carotene (dry powder, 10%)	100.00
250.00	2	Ascorbic acid (crystalline) (BASF)	250.00
280.00	3	Sodium ascorbate (crystalline)	280.00
500.00	4	Vitamin E acetate (dry powder, SD 50)	500.00
600.00	5	Sorbitol (crystalline)	600.00
500.00	6	Ludipress®	500.00
350.00	7	Fructose	350.00
50.00	8	PEG-6000 (powder)	50.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with high compression force.
2. Each 20 mm biplanar tablet has an average weight of 2.6 g.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
12.00	1	Beta-carotene (dry powder, 10% with excess)	125.00
125.00	2	Ascorbic acid (crystalline) (BASF)	125.00
141.00	3	Sodium ascorbate (crystalline) (BASF)	141.00
250.00	4	Vitamin E acetate (dry powder, SD 50)	250.00
119.00	5	Ludipress® or sorbitol (crystalline)	119.00
5.00	6	PEG-6000 (powder)	5.00
15.00	7	Orange flavor (FDO)	15.00
10.00	8	Sodium cyclamate	10.00

Manufacturing Directions

1. Mix all components. Pass through a sieve.
2. Press with medium compression force.
3. Compress 790 mg into 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
6.00	1	Beta-carotene; use Betavit (dry powder, 10% with excess) (BASF)	65.00
100.00	2	Ascorbic acid (powder) (BASF)	100.00
60.00	3	Vitamin E acetate (dry powder, 50%)	60.00
369.00	4	Ludipress®	369.00
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium or high compression force.
3. Compress 599 mg into 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
6.00	1	Beta-carotene; use Betavit (dry powder, 10% with excess) (BASF)	65.00
100.00	2	Ascorbic acid (powder) (BASF)	100.00
60.00	3	Vitamin E acetate (dry powder, 50%)	60.00
233.00	4	Sorbitol (crystalline) (Merck)	233.00
30.00	5	Kollidon® VA 64	30.00
8.00	6	Kollidon® CL	8.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium or high compression force.
3. Compress 502 mg into 12 mm biplanar tablets.

BETA-CAROTENE, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
7.00	1	Beta-carotene; use Betavit (dry powder, 10% with excess) (BASF)	75.00
60.00	2	Ascorbic acid (powder) (BASF)	60.00
50.00	3	Vitamin E acetate (dry powder, 50%)	50.00
240.00	4	Sorbitol (crystalline)	240.00
30.00	5	Kollidon® CL	30.00
5.00	6	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with low compression force.
3. A colorant pigment should be added to obtain a homogeneous appearance of tablets.
4. Use 12 mm biplanar punches for 497 mg tablets.

BETAMETHASONE AND NEOMYCIN GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/kg (g)
1.30	1	Betamethasone valerate	0.13
6.50	2	Neomycin sulfate	0.65
150.00	3	Lutrol E 400	15.00
100.00	4	Miglyol® 812	10.00
200.00	5	Lutrol F 127	20.00
QS	6	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve betamethasone valerate in a mixture of Lutrol E 400 and Miglyol® 812.
2. Dissolve Lutrol F127 and neomycin sulfate in water at 5°C to 10°C.
3. Mix both solutions.
4. Maintain cool temperature until the air bubbles disappear. A milky white, soft gel cream is obtained.

BETAMETHASONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/kg (g)
70.00	1	Cetylstearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
12.00	4	Liquid paraffin	12.00
2.00	5	Paraben(s)	2.00
697.00	6	Water	697.00
80.00	7	Propylene glycol	80.00
1.00	8	Betamethasone	1.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and item 6 separately to approximately 80°C.
2. Add together with rigorous stirring.
3. Heat items 7 and 8 until the active ingredient is dissolved.
4. Mix with the previous mixture, and continue to stir to cool to room temperature to produce white cream.

BETAMETHASONE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
1.00	1	Betamethasone valerate	1.00
100.00	2	Ethanol (96%)	100.00
200.00	3	Propylene glycol	200.00
220.00	4	Lutrol F 127	220.00
QS	5	Water QS	470.00

Manufacturing Directions

1. Prepare a solution of items 1 to 3 at room temperature and a solution of items 4 and 5 at approximately 6°C (or >70 °C).
2. Mix both solutions.
3. Maintain the temperature until the air bubbles disappear.
4. A certain amount of propylene glycol could be substituted by water. The obtained gel is clear and colorless.

BETAMETHASONE VALERATE CREAM

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Betamethasone valerate (34% excess)	1.34
2.00	2	Poloxyl 20 cetostearyl ether (Cetomacrogol 1000)	20.00
8.00	3	Cetostearyl alcohol	80.00
0.10	4	Methylparaben	1.00
0.034	5	Propylparaben	0.34
0.10	6	Chlorocresol	1.00
6.00	7	Mineral oil (liquid paraffin)	60.00
0.29	8	Monobasic sodium phosphate	2.90
17.80	9	Petrolatum (soft white paraffin)	178.00
66.00	10	Purified water	660.00

Manufacturing Directions

1. Heat item 10 to 90°C in mixer.
2. Dissolve items 4 and 5 (parabens) to a clear solution by stirring.
3. Dissolve 3 g of item 2 in the parabens solution while stirring.
4. Dissolve items 6 and 8 in the parabens solution while stirring.
5. Set the mixer at a temperature of 65°C to 70°C and speed at 8 rpm. Use manual mode.
6. Load 17 g of items 2, 3, and 9 and 45 g of item 7 in a fat-melting vessel.
7. Heat to 70°C to 75°C while stirring. Maintain temperature at 65°C to 7°C.
8. Mix item 1 in 10 g of item 7 in a stainless steel container.
9. Homogenize for 10 minutes to make a smooth slurry.
10. Check the temperature of the aqueous phase in the mixer (should be 65–70°C).
11. Check the temperature of the fatty phase in the fat-melting vessel (should be 65–70 °C).
12. Set the mixer speed at 8 rpm and vacuum at 0.4 to 0.6 bar.
13. Transfer the fatty phase to the aqueous phase in mixer vessel through filter under vacuum while mixing.
14. Start the homogenizer at high speed. Homogenize for 10 minutes.
15. Check and record the pH of cream (limit 4.5–5.2 at 30°C).
16. Cool the temperature to 50°C while mixing. Release the vacuum.
17. Take out 400 g of the cream into the stainless steel vessel, and set aside.
18. Add slurry from earlier step to the remaining cream base in mixer.
19. Rinse the container of slurry using 5 g of item 7, and transfer the rinsings to the mixer.
20. Homogenize for 10 minutes at high speed (mixer speed 8 rpm).
21. Load 400 g cream from preceding step to the mixer.
22. Set the mixer in manual mode at 8 rpm and a vacuum of 0.4 to 0.6 bar.
23. Homogenize at high speed with recirculation, temperature 25°C. Homogenize for 10 minutes with recirculation, stop the homogenizer, and continue mixing to produce a white, homogeneous cream of pH 4.5 to 5.2 at 30°C.

BETAMETHASONE VALERATE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
0.10	1	Betamethasone; use betamethasone valerate	1.30
84.87	2	Petrolatum (soft white paraffin)	848.70
15.00	3	Mineral oil (liquid paraffin)	150.00

Manufacturing Directions

1. Melt item 2 in a fat-melting vessel at 75°C while mixing (do not overheat item 2). Maintain temperature of the molten mass in the melting vessel at 60°C to 65°C.

2. Start the steam on the mixer vessel, and set the temperature at 60°C.
3. Transfer 160 g of the molten mass at 60°C to the mixer vessel.
4. Retain the rest of the quantity in the fat-melting vessel.
5. Start mixing in the mixer vessel at medium speed with a vacuum between 0.4 and 0.6 bar until obtaining actual temperature of 40°C to 45°C. Maintain the temperature of mixer vessel at 40°C to 45°C.
6. Add item 1 in 80 g of item 3, and homogenize for 3 minutes using a homogenizer.
7. Keep the slurry aside.
8. Rinse the homogenizer and container with 70 g of item 3.
9. Transfer item 1 slurry from step 7 and the rinsings from the previous step to the mixer vessel.
10. Start mixing under a vacuum of 0.4 to 0.6 bar for 15 minutes.
11. The temperature should be maintained at 40°C to 45°C.
12. Slowly transfer the rest of the quantity of molten mass (temperature 60°C) into mixer vessel. Continue mixing for 5 minutes after each addition.
13. At the end of addition, mix an additional 10 minutes under a vacuum of 0.4 to 0.6 bar.
14. Homogenize for 5 minutes at high speed under a vacuum of 0.4 to 0.6 bar.
15. Cool the ointment to 30°C to 35°C with stirring under a vacuum of 0.4 to 0.6 bar.

BISACODYL DELAYED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
05.00	1	Bisacodyl	5.00
20.00	2	Cellulose (microcrystalline) (Avicel™ PH102)	20.00
45.27	3	Lactose (spray dried)[a]	45.27
04.00	4	Maize starch (dried)[b]	4.00
00.73	5	Magnesium stearate	0.73

[a] Particle size distribution: minimum: 98%, 250 µm, 30% to 60%, 100 µm; maximum: 15%, 45 µm.

[b] LOD NMT 4.5%, when dried at 120°C for 4 hours.

Manufacturing Directions

Handle bisacodyl carefully; it can cause itching if it comes into contact with skin. Overmixing of lubricants reduces the hardness. Check the temperature and RH of the room before beginning processing. Limit RH to 50% to 60% and temperature to 27°C to 30°C.

1. Mix items 1 and 2 in a stainless steel drum for 2 to 3 minutes.
2. Pass the mixed powder through a 500 µm sieve using sifter.
3. Collect in stainless steel drum.
4. Pass item 3 through a 500 µm sieve using sifter.
5. Collect in stainless steel drum.
6. Load the sieved material into the drum mixer, and mix for 5 minutes.
7. Mix items 4 and 5 in a polyethylene bag for 1 minute.
8. Pass the mix through a 250 µm sieve.
9. Collect in a polyethylene bag.
10. Add 3 to 5 g powder to it, and mix for 1 minute.
11. Add this mixture, and mix for 1 minute in a drum blender.
12. Check the moisture content (limit: 1.0–1.5%).
13. Compress the granules using a rotary tableting machine; 6 mm biconvex tablets have an average weight of 750 mg and hardness of 4 to 5 kp.
14. Apply enteric coating.

BISACODYL SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
5.00	1	Bisacodyl (micronized) (2% excess)[a]	5.10
447.50	2	Hard fat (Witepsol E 76)	447.50
447.50	3	Hard fat (Witepsol W 45)	447.50

[a] 100% particles should be less than 70 µm; fill weight is 1800 mg per suppository.

Manufacturing Directions

The molten suppository mass must be kept stirred throughout the storage period and during manufacturing and filling to avoid sedimentation of the active drug. The active ingredient causes skin irritation, which vanishes after some time without aftereffects. Avoid dust formation during processing. In particular, protect eyes and mucous membranes.

1. Load items 2 and 3 into the fat-melting vessel, and heat to 50°C ± 3°C.
2. Transfer the molten mass to a mixer through a 0.8 mm sieve.
3. Set the temperature at 40°C ± 2°C.
4. Load item 1 to the mixer containing molten mass. Carefully mix the powder with the molten mass.
5. Set the mixer at a temperature of 40°C ± 2°C and speed of 10 rpm (manual mode), and mix for 20 minutes.

6. Set the mixer at a temperature of 40°C ± 2°C, speed of 10 rpm (manual mode), and vacuum of 0.6 bar.
7. Homogenize at low speed while mixing for 10 minutes. Homogenize at high speed while mixing for 3 minutes.
8. Continue mixing of the mass under vacuum in mixer.
9. Heat the storage vessel, and set the temperature at 40°C ± 2°C.
10. Transfer the molten mass from the mixer to the storage vessel.
11. Hold the mass at 40°C ± 2°C, continuously mixing at low speed.
12. Fill weight is 900 mg per suppository. Use a fill weight of 1.8 g for 10 mg suppositories.

BISMUTH CARBONATE SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
266.66	1	Light kaolin	266.66
8.30	2	Pectin	8.30
6.70	3	Bismuth carbonate	6.70
9.40	4	Cellulose (microcrystalline; Avicel™ RC-591)	9.40
1.40	5	Methylparaben	1.40
0.20	6	Saccharin sodium	0.20
0.40	7	Aspartame	0.40
40.00 mL	8	Sorbitol	40.00 mL
5.00 mL	9	Ethanol	5.00 mL
QS	10	Deionized water	QS to 1 L

Manufacturing Directions

1. Dissolve item 2 in hot water.
2. Disperse item 1 in 75 mL of item 10 at room temperature.
3. With constant agitation, add item 3, and continue stirring.
4. Mix, and cool to room temperature.
5. Disperse item 4 in item 10, and add it to the batch.
6. Dissolve item 2 in item 1 dispersion, and add to the batch.
7. Dissolve items 6 and 7 in water, and add to the batch.
8. Add flavor, color, and water to volume.
9. Pass through homogenizer or colloid mill if necessary.

BISMUTH SUBSALICYLATE AND CALCIUM CARBONATE TABLET

Formulation

Bismuth subsalicylate, 262.5 mg; microcrystalline cellulose NF, 213.3 mg; calcium carbonate, 67.5 mg; mannitol, 67.5 mg; sodium starch glycolate, 40.5 mg; polyvinyl pyrrolidone, 13.5 mg; magnesium stearate, 5.4 mg; polysorbate 80, 3.4 mg; silica, 0.7 mg; dye, 0.7 mg; total, 675.0 mg.

Manufacturing Directions

1. The ingredients are added to a mixer or granulator in the following order: part of microcrystalline cellulose, calcium carbonate, part of sodium starch glycolate, Polysorbate 80, dye, and bismuth subsalicylate.
2. After the addition of the bismuth subsalicylate and mixing at high shear, the mixture is dried at 86°C to less than 2% moisture.
3. Additional powders (microcrystalline cellulose, sodium starch glycolate, mannitol, and polyvinylpyrrolidone) are added, and granules are formed by spraying water (approximately 10% by weight of the composition) onto the mixture under high shear.
4. After additional drying to less than 3% moisture, silica (glidant) and magnesium stearate (lubricant) are added and mixed for approximately 1 minute.
5. Caplets are then formed on a rotary tablet press.

BISMUTH SUBSALICYLATE SUSPENSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
15.00	1	Magnesium aluminum silicate (Magnabrite K)	15.00
1.50	2	Methyl cellulose	1.50
910.00	3	Deionized water	910.00
0.50	4	Saccharin sodium	0.50
30.00	5	Bismuth subsalicylate	30.00
4.00	6	Salicylic acid	4.00
10.00	7	Sodium salicylate	10.00
29.00	8	Ethanol	29.00
QS	9	Preservatives	QS
QS	10	Colorings	QS

Manufacturing Directions

1. Dry blend items 1 and 2, and slowly add them to item 3, agitating until smooth.
2. Add items 4 to 7 to this dispersion, gradually mixing well each time.
3. Finally, add items 8 to 10 to smooth mix.

BISMUTH SUBSALICYLATE SWALLOW TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
262.50	1	Bismuth subsalicylate	262.50
213.30	2	Microcrystalline cellulose	213.30
67.50	3	Calcium carbonate	67.50
67.50	4	Mannitol	67.50
40.50	5	Sodium starch glycolate	40.50
13.50	6	Polyvinylpyrrolidone (PVP)	13.50
5.40	7	Magnesium stearate	5.40
3.40	8	Polysorbate 80	3.40
0.70	9	Silica	0.70
0.70	10	Dye	0.70

Manufacturing Directions

1. Mix the ingredients in a mixer in the following order: part of microcrystalline cellulose, calcium carbonate, part of sodium starch glycolate, Polysorbate 80, dye, and bismuth subsalicylate.
2. After the addition of bismuth subsalicylate and mixing at high shear, the mixture is dried at 86°C to less than 2% moisture.
3. Additional powders (microcrystalline cellulose, sodium starch glycolate, mannitol, and PVP) are added, and granules are formed by spraying water (approximately 10% by weight of the composition) onto the mixture under high shear.
4. After additional drying to less than 3% moisture, silica (glidant) and magnesium stearate (lubricant) are added and mixed for approximately 1 minute.
5. Caplets are then formed on a rotary tablet press.

BLEACHING AND ANTIMICROBIAL DENTIFRICE

Manufacturing Directions

1. Weight percentage: hydrogen peroxide (50%), 10.00; carbamide peroxide, 14.00; sodium fluoride, 0.38; Pecogel S-2120 (VP/dimethicolylacrylate is an inclusion complex polymer to retard the solubility of emulsified bleaching actives. It is obtained from Phoenix Chemical, Inc.), 0.50; hydroxyethyl cellulose, 0.50; triethanolamine, 0.30.
2. Water, purified, 10.00; glycerin, 10.75; tetrafluoroethylene (Teflon), 50.58; sodium lauryl sulfate, 1.25; sodium saccharin, 0.18; sodium citrate, 0.20; citric acid, 0.20; triclosan, 0.06; flavor, 1.10.

BRAN–SUCROSE–GELATIN–CALCIUM CARBONATE TABLET

Manufacturing Directions

1. Prepare gelatin–sucrose syrup by placing the following ingredients in a mixing kettle equipped with a heater and agitator: distilled water, 24,000 g; gelatin, 3000 g; sucrose granular, 31,995 g.
2. Heat the mixture to approximately 65.5°C with agitation until solution is affected and then slowly stir the gelatin–sucrose syrup and hold at a temperature of approximately 65.5°C until needed.
3. Comminute wheat bran in a Schutz-O'Neill Airswept Pulverizer to provide a particle size whereby a minimum of 94% passes through a U.S. standard No. 20 mesh screen and a maximum of 60% passes through a U.S. standard No. 80 mesh screen.)The required amount of bran for the batch is calculated by the formula: 44,250 g × 100/(100% moisture in bran)).
4. After pulverizing, transfer the bran to a heavy-duty double-sigma arm mixer and mix with 1500 g of calcium carbonate, and rapidly add the previously prepared gelatin–sucrose syrup thereto with stirring.
5. When the bran appears to be damp, stir the mixture for a 30 minute period and then stop.
6. Add powdered sucrose (16,600 g) and agitate the mixture for an additional 2 to 5 minutes.
7. Discharge the wet mix through an Ambrette screw extruder and spread the extrudate on drying trays and dry in an oven at 107.2°C to 3% moisture content.
8. Granulate the dried extrudate employing a Fitz mill (2A plate) and then press into 1 g tablets by a conventional tableting machine.

BRAN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Bran wheat (milled <1 mm)	250.00
200.00	2	Ludipress®	200.00
5.00	3	Kollidon® 30	5.00
4.00	4	Aerosil® 200	4.00
4.00	5	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, pass through a sieve, and press with medium compression force.
2. If the bran is not milled, the hardness of the tablet is higher, but the content uniformity is lower.
3. Compress 477 mg tablets using 12 mm punches.

BREAST CARE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/kg (g)
20.00	1	Polysorbate 60	20.00
70.00	2	Cetyl alcohol	70.00
60.00	3	Mineral oil (70 cS)	60.00
40.00	4	Glyceryl stearate	40.00
QS	5	Deionized water	QS
QS	6	Preservative	QS

Manufacturing Directions

1. Heat oil and water phases separately at 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Fill at 20°C.
5. Only food-grade materials should be used.

BROMHEXINE HYDROCHLORIDE SYRUP

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
4.00	1	Bromhexine HCl	0.80
1000.00	2	Glycerin (glycerol)	200.00
10.00	3	Benzoic acid	2.00
1.70	4	All fruits flavor	0.34
5.00	5	Tartaric acid	1.00
151.58	6	Alcohol (ethanol, 95%)	30.31
2857.00	7	Sorbitol (70% solution)	571.40
10.00	8	Sodium carboxymethyl cellulose (sodium CMC)	2.00
0.72	9	Sodium hydroxide pellets	0.14
QS	10	Purified water	QS to 1 L

Manufacturing Directions

1. Add 250 g of item 10 to the manufacturing vessel, and heat to 65°C to 70°C.
2. Add 20 g of item 2 in a separate stainless steel container, and mix item 8 using an Ekato stirrer, carefully avoiding lump formation.
3. Transfer the slurry to the manufacturing vessel, and continue mixing to make a clear mucilage. Avoid air entrapment.
4. Cool to 30°C while mixing at slow speed. Transfer the mucilage to container.
5. Load 100 g of item 2 to the manufacturing vessel.
6. Add item 6 in a separate stainless steel container, and dissolve item 3 using stirrer.
7. Add 60 g of item 2 to the container while mixing at slow speed.
8. Add and dissolve item 1 to the container while mixing at slow speed. Avoid splashing of the solution. Be sure bromhexine is dissolved completely.
9. Add item 4 to the container, and mix well.
10. Transfer the solution to the manufacturing vessel while mixing at high speed.
11. Rinse the container with 20 g of item 2, and transfer the rinsings to the manufacturing vessel while mixing.
12. Rinse the container with 20 g of item 10, and transfer the rinsing to the manufacturing vessel while mixing.
13. Add 15 g of item 10 in a separate stainless steel container.
14. Dissolve item 5 using a stirrer, and transfer it to the manufacturing vessel while mixing. Check for clarity of the solution in the manufacturing vessel. The solution must be clear without any undissolved particles of the drug.
15. Add item 7 to the manufacturing vessel while mixing at high speed.
16. Transfer the cooled mucilage of item 8 to the manufacturing vessel used in the preceding step while mixing at slow speed.
17. Check and record the pH of the solution (limit: 3.3–3.6).
18. Dissolve item 9 in 5 g of cooled item 10 (30°C) in a separate stainless steel container.
19. Adjust the pH of the syrup in the manufacturing vessel using the sodium hydroxide solution.
20. Add sodium hydroxide solution, small portions at a time. Mix well, and check the pH after every addition. Adjust the pH to 3.5 (limit: 3.3–3.6).
21. Bring the volume up to 1 L with item 10, and finally, mix for 15 to 20 minutes at high speed.
22. Check and record the pH (limit: 3.3–3.6).
23. Filter the syrup at 1.5 bar.
24. Recirculate.

BROMHEXINE HYDROCHLORIDE SYRUP (ALCOHOL FREE)

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
4.00	1	Bromhexine HCl	0.80
1000.00	2	Glycerin (glycerol)	200.00
12.00	3	Sodium benzoate	2.40
1.70	4	All fruit flavors	0.34
17.00	5	Tartaric acid	3.40
2250.00	6	Sorbitol (70% solution)	450.00
10.00	7	Sodium carboxymethyl cellulose (sodium CMC)	2.00
QS	8	Purified water	QS to 1 L

Manufacturing Directions

1. Add 240 g of item 8 (25°C) to the manufacturing vessel.
2. Add item 5, and mix for 20 minutes at high speed.
3. Load 180 g of item 2 into the manufacturing vessel, and mix for 3 minutes.
4. Add item 1 to the manufacturing vessel, and mix for 30 minutes at high speed.
5. Add 20 g of item 2 in a suitable vessel, and levigate item 7 using stirrer, carefully avoiding lump formation.
6. Add 40 g of item 8 (70°C) to the stainless steel container while mixing to make a clear mucilage. Mix for 15 minutes. Avoid air entrapment.
7. Cool down to 25°C to 30°C while mixing at slow speed.
8. Transfer the mucilage to the manufacturing vessel.
9. Rinse the vessel with 10 g of item 8, and transfer to the manufacturing vessel.
10. Mix at slow speed for 20 minutes.
11. Transfer item 6 to the manufacturing vessel while mixing. Mix at low speed for 5 minutes.
12. Add 20 g of item 8 (25°C) in a separate stainless steel container, and dissolve item 3 using an Ekato stirrer until a clear solution is obtained.
13. Transfer this solution to the manufacturing vessel, and mix at low speed for 3 minutes.
14. Add item 4 to the manufacturing vessel, and mix at low speed for 3 minutes.
15. Record the pH of the solution (limit: 3.3–3.7). Adjust the pH of the solution with a 10% solution of sodium hydroxide, if required.
16. Make the volume up to 1 L with item 8 (25°C), and finally, mix for 15 to 20 minutes at high speed.
17. Filter the syrup at 1.5 bar.
18. Recirculate.

BROMHEXINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
8.00	1	Bromhexine HCl	8.00
78.00	2	Lactose monohydrate	78.00
30.40	3	Cornstarch	30.40
3.00	4	Gelatin (powder)	3.00
QS	5	Purified water	12.00
0.60	6	Magnesium stearate	0.60

Manufacturing Directions

The binding solution is susceptible to microbiological growth; hence, prepare the solution directly before the granulation process. Protect bromhexine HCl from light.

1. Make slurry in a separate container by dissolving item 4 in hot item 5 (70–80°C).
2. Mix for 10 minutes using stirrer at medium speed.
3. Pass items 1, 2, and 3 through a 630 µm sieve using a sifter.
4. Charge the sieved material into the mixer.
5. Mix, using mixer and chopper, for 5 minutes at high speed. Add binding solution to the dry powders in the mixer while mixing at low speed.
6. After the addition is complete, mix for an additional 4 minutes at low speed or until a satisfactory mass is obtained.
7. Spread the wet granules onto the trays.
8. Load the trolleys into the drying oven.
9. Dry the granules at 60°C for 10 hours.
10. Turn the granules after 4 hours of drying in order to obtain uniform drying.
11. Transfer the dried granules in stainless steel drums.
12. Check moisture content (limit: NMT 2%).
13. Pass the dried granules through first a 1.5 mm and then a 1.0 mm sieve using a granulator. Collect in stainless steel drums.
14. Load the granules into the blender.
15. Pass item 6 through a 250 µm sieve using a sifter, and add to the granules in blender. Blend for 2 minutes.
16. Compress the granules using a rotary tableting machine.
17. Use a 7 mm flat, beveled-edge punch to compress 1.2 g per tablet at a hardness of NLT 3 kp.

BURN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
120.00	1	Glyceryl stearate SE (Monthybase)	120.00
80.00	2	Myristate octyldodecyl (MOD)	80.00
20.00	3	Apricot kernel oil PEG-6 esters (Labrafil® M 1944 CS)	20.00
0.50	4	Sodium methylparaben	0.50
0.50	5	Sodium propylparaben	0.50
0.50	6	Sorbic acid	0.50
767.50	7	Deionized water	767.50
10.00	8	Avocado oil	10.00
1.00	9	Fragrance	1.00

Manufacturing Directions

1. Mix and heat items 1 to 7 to 75°C.
2. Cool slowly with stirring.
3. At 30°C, add item 8 and then item 9.

BURN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate (Veegum®)	15.00
568.00	2	Deionized water	568.00
30.00	3	Propylene glycol	30.00
2.00	4	Dimethicone emulsion	2.00
100.00	5	Mineral oil, light	100.00
170.00	6	Acetylated lanolin alcohol	170.00
50.00	7	Benzocaine, USP	50.00
30.00	8	C18–C36 acid	30.00
120.00	9	Glyceryl stearate and PEG-100 stearate	120.00
5.00	10	Polysorbate 60	5.00
QS	11	Preservatives	QS

Manufacturing Directions

1. Slowly add item 1 to water, agitating with extensive shear force until smooth.
2. Add items 3 and 4, and heat to 75°C to 80°C.
3. Mix and heat items 5 to 11, keeping item 7 suspended, to 75°C to 80°C. Mix the two parts while cooling. Pour and fill at 40°C.

CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
150.00	1	Caffeine powder	150.00
36.00	2	Cellulose (microcrystalline) (Avicel™ PH102)	36.00
46.00	3	Anhydrous lactose	46.00
48.50	4	Di-Pac granular	48.50
3.00	5	Croscarmellose sodium (Ac-Di-Sol SD-711)	3.00
1.50	6	Fumed silica	1.50
0.75	7	Stearic acid	0.75
0.75	8	Magnesium stearate	0.75
1.20	9	Flavor	1.20

Manufacturing Directions

1. Screen items 1,7, and 8 separately through a 40 mesh sieve.
2. Blend items 1 to 6 and 9 in a V-blender, and mix for 3 minutes.
3. Add item 8 to the blender, and mix for another 5 minutes.
4. Compress, using 7 kg pressure and 3/8 in. flat, beveled-edge punches to produce tablets with an average weight of 311 mg.

CALAMINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
80.00	1	Polawax GP200	80.00
10.00	2	Polysorbate 60	10.00
50.00	3	Caprylic/Capric triglyceride	50.00
QS	4	Deionized water	QS to 1 kg
100.00	5	Witch hazel distillate	100.00
50.00	6	Glycerin	50.00
20.00	7	Zinc oxide	20.00
20.00	8	Calamine	20.00
QS	9	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add zinc oxide and calamine under high shear.
4. Stir to cool.

CALAMINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/ kg (g)
20.00	1	Cellulose (microcrystalline) (Avicel™ RC-591)	20.00
100.00	2	Glycerin	100.00
1.80	3	Methylparaben	1.80
0.20	4	Propylparaben	0.20
100.00	5	Glyceryl stearate and PEG-100 stearate	100.00
25.00	6	Cetyl alcohol	25.00
50.00	7	Zinc oxide	50.00
50.00	8	Calamine	50.00
653.00	9	Distilled water	653.00

Manufacturing Directions

1. Mix item 2 with item 9, 5 and 6 and heat to 75°C.
2. Add items 3 and 4. Mix until dissolved using a shearing mixer.
3. Maintain temperature at 75°C, and gradually add item 1. Continue mixing at 75°C for 15 minutes or until item 1 is homogeneously dispersed. Mix well.
4. When temperature drops to 60°C to 65°C, gradually add items 7 and 8. Mix well until powders are homogeneously dispersed.
5. Pass through homogenizer if necessary. Adjust theoretical weight with warm distilled water, and continue mixing until the cream congeals.

CALAMINE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
78.30	1	Calamine	78.30
78.30	2	Zinc oxide	78.30
19.60	3	Glycerin	19.60
230.80	4	Deionized water	230.80
558.00	5	Calcium hydroxide solution	558.00
34.40	6	Purified bentonite (Polargel®, NF)	34.40
0.60	7	Carboxymethyl cellulose	0.60

Manufacturing Directions

1. Prepare a saturated solution of item 5 by putting 3 g of item 5 in 1000 mL of purified water. Mix vigorously for 1 hour.
2. Decant the clear, supernatant liquid for use in the formula.
3. Add the balance of water.
4. Add items 6 and 7 to this solution with rapid mixing. Continue mixing for 15 minutes.
5. In a separate vessel, blend items 1 and 2.
6. Add item 3, and mix until uniform.
7. Begin adding the aqueous solution with mixing until it is blended into a lotion.

CALCIUM AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Anhydrous calcium phosphate (dibasic)	500.00
133 IU	2	Vitamin D (as vitamin D3) (3.33 µg/tablet)	3.33 mg
15.00	3	Starch (pregelatinized, NF)	15.00
55.00	4	Cellulose (microcrystalline, NF)	55.00
6.00	5	Magnesium stearate, NF	6.00
5.00	6	Talc (powder), USP	5.00
12.00	7	Wax (hydrogenated vegetable oil) (Sterotex K)	12.00
15.50	8	Sodium starch glycolate, NF	15.50

Manufacturing Directions

1. Pass one-half of dibasic calcium phosphate through a mesh screen into a blender.
2. Premix by hand the pregelatinized starch with vitamin D_3 beadlets in a suitable container, and sift through a mesh screen into the blender.
3. Charge the microcrystalline cellulose and the remaining calcium phosphate through a mesh screen into the blender.
4. Mix for 20 minutes.
5. Discharge approximately one-third of the granulation into polyethylene-lined drums.
6. Mix the magnesium stearate, talc, hydrogenated vegetable oil wax, and sodium starch glycolate.
7. Mill through a No. 40 mesh screen into the blender.
8. Return granulation from previous step to the blender. Blend together.
9. Compress.

CALCIUM CARBONATE AND GLYCINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Calcium carbonate (precipitated)	400.00
200.00	2	Glycine (aminoacetic acid)	200.00
QS	3	Starch	QS
6.50	4	Mineral oil (light)	6.50
QS	5	Purified water	QS

Manufacturing Directions

1. Add starch to a planetary mixer, and add 10 times the quantity of purified water.
2. Heat to boil with constant stirring until a thick, translucent white paste is formed. Use this paste in granulation.
3. Charge calcium carbonate and glycine in a sigma-blade or a planetary mixer and mix for 10 minutes.
4. Granulate this powder with the starch paste until a suitable mass is obtained.
5. Force the wet mass through a No.12 mesh screen onto dryer trays.
6. Dry in an air-forced oven at 54.4°C to 60°C or in a fluid- bed dryer.
7. Pass the dried granules through a No.12 mesh screen and then through a No.18 mesh screen.
8. Pass the granules through a 30 mesh screen, remove the portion passing through the screen, and regranulate.
9. Charge the particles retained on 30 mesh screen in a tumble mixer, add mineral oil, and mix for 8 minutes.
10. Compress 640 mg tablets using 7/16 in. punches.

CALCIUM CARBONATE AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
600.00	1	Calcium (elemental); use calcium carbonate (90%) for direct compression	1665.00
0.235	2	Vitamin D_3 (200 IU); use vitamin D_3 beadlets	0.282
4.16	3	Magnesium stearate	4.16
83.25	4	Sodium starch glycolate	83.25

Manufacturing Directions

1. Make a premix of vitamin D_3 successively in three portions of calcium carbonate (total amount equivalent to approximately 3% of total calcium carbonate) using geometric dilution.
2. Mix for 10 minutes each time (total: 30 minutes).
3. Add the premix to the sodium starch glycolate. Mix for 10 minutes.
4. Set the blend aside, protected from light, until the next step.
5. Pass the magnesium stearate through a 420 µm aperture screen, if required, and blend it with another portion of calcium carbonate (approximately 10% of total calcium carbonate).
6. Mix for 5 minutes. Set aside.
7. Add the blended material to the balance of the calcium carbonate. Mix for 10 minutes.
8. Add the premix to blend from step 7. Mix for 5 minutes.
9. Compress on specially shaped 0.8100 in. × 0.3700 in. ovaloid bisected punches with a monogram on one side.
10. Theoretical weight of 10 tablets = 17.527\g.
11. Coat using one of the HPMC formulae (see Appendix).

CALCIUM CARBONATE CHEWABLE TABLETS

Manufacturing Directions

1. Granulated calcium carbonate (93.3% calcium carbonate, 6.3% glucose, and 0.4% gelatin), 42.87%; magnesium stearate, 2.50%; colored speckles, 0.75%; flavorants, 0.78%; MPD (31-menthoxy propane 1,2-diol), 0.07%; WS-3 (N-ethyl-*P*-menthane-3-carboxamide), 0.05%; aspartame, 0.198%; sodium saccharin, 0.102%; mannitol, QS.
2. Dry blend the ingredients in a mixer until homogeneous and then direct compress in a tableting machine to approximately 8.5 Strong Cobb units of hardness to produce chewable antacid tablets each weighing 1.25 g (500 mg calcium carbonate per tablet).
3. These tablets may also be prepared by utilizing granulated calcium carbonate, which is a 50/50 coblend of calcium carbonate/mannitol.

CALCIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Calcium carbonate (precipitated)	500.00
65.00	2	Kollidon® 30	65.00
97.00	3	Water	97.00
32.00	4	Kollidon® CL	32.00
53.00	5	Ludipress®	53.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with the water (item 3).
2. Pass through a 0.8 mm sieve, mix the dry granules with items 4 and 5, and press with low compression force.
3. Fill 656 mg in 12 mm planar punches.

CALCIUM CHEWABLE TABLETS (200 MG CA)

Formulation

Calcium gluconate (Merck), 845.0 g; calcium citrate (Merck), 500.0 g; Ludipress® LCE, 297.5 g; citric acid anhydrous, fine granular, 100.0 g; polyethylene glycol 6000, powder, 80.0 g; orange flavor (Dragoco), 30.0 g; Aerosil® 200, 17.0 g; aspartame, potassium (Searle), 5.0 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force at 2417 mg.

CALCIUM D-PANTOTHENATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
600.00	1	Calcium D-pantothenate (BASF), with excess	610.00
150.00	2	Sorbitol (crystalline)	150.00
140.00	3	Avicel™ PH101	140.00
30.00	4	Kollidon® CL	30.00
50.00	5	PEG-6000 (powder)	50.00
QS	6	Flavors	QS

Note: Kollidon® CL may be omitted and the tablet weight adjusted.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compression force.
2. Compress 987 mg tablets in 12 mm biplanar punches.

CALCIUM D-PANTOTHENATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
100.00	1	Calcium D-pantothenate (BASF)	100.00
150.00	2	Ludipress®	150.00
10.00	3	Kollidon®	10.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press into 252 mg tablets using medium compression force and biplanar 8 mm punches.

CALCIUM D-PANTOTHENATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
280.00	1	Calcium D-pantothenate (BASF), with excess	285.00
50.00	2	Avicel™ PH101	50.00
150.00	3	Dibasic calcium phosphate	150.00
20.00	4	Kollidon® CL	20.00
3.00	5	Stearic acid	3.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press into 518 mg tablets using medium compression force and 12 mm biplanar punches.

CALCIUM EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
634.00	1	Calcium lactate	634.00
610.00	2	Calcium gluconate	610.00
185.21	3	Calcium carbonate	185.21
400.00	4	Sodium bicarbonate	400.00
468.25	5	Tartaric acid	468.25
46.25	6	Povidone (Kollidon® 30)	46.25
11.75	7	Povidone (Kollidon® 30)	11.75
QS	8	Isopropyl or ethyl alcohol (96%)	QS
97.50	9	Crospovidone (Kollidon® CL)	97.50
46.25	10	PEG-6000	46.25
QS	11	Flavor	QS

Manufacturing Directions

1. Granulate items 1 to 6 in a solution of items 7 and 8.
2. Dry, sieve, and mix well with items 9 to 11.
3. Compress at low pressure to form 2.5 g tablets, 20 mm in diameter.

CALCIUM GLUCONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
350.00	1	Calcium gluconate (powder), with excess	360.00
117.00	2	Lactose monohydrate	117.00
11.00	3	Kollidon® 30	11.00
QS	4	Isopropanol	90.00
25.00	5	Kollidon® CL	25.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with item 4.
2. Dry, pass through a 0.8 mm sieve, and mix with items 5 and 6.
3. Press into 500 mg tablets using high compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Calcium glycerophosphate	500.00
117.50	2	Cornstarch	117.50
15.00	3	Kollidon® 90 F	15.00
60.00	4	Water	60.00
15.00	5	Kollidon® CL	15.00
2.50	6	Magnesium stearate	2.50

Manufacturing Directions

1. Granulate items 1 to 3 with item 4, dry, sieve, and mix with items 5 and 6.
2. Press into 650 mg tablets using medium to high compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Calcium glycerophosphate	200.00
297.50	2	Ludipress®	297.50
2.50	3	Magnesium stearate	2.50
QS	4	Aerosil® 200	QS

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Press into 470 mg tablets using high compression force and 12 mm biplanar punches.

CALCIUM GLYCEROPHOSPHATE TABLETS (200 MG)

Formulation

Calcium glycerophosphate, 200.0 g; Ludipress®, 297.5 g; magnesium stearate, 2.5 g; Aerosil® 200, QS.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force at 470 mg.

CALCIUM IODIDE AND ASCORBIC ACID SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
311.60	1	Glucose liquid (corn syrup)	311.60
53.90	2	Glycerin (96%)	53.90
30.00	3	Anhydrous calcium iodide; use calcium iodide solution 27% w/w	111.11
1.00	4	Ascorbic acid (white powder)	1.00
485.30	5	Sucrose (granulated sugar)	485.30
0.80	6	Saccharin sodium (powder)[a]	0.80
8.00	7	Sodium cyclamate (XIII powder)	8.00
1.31	8	Honey artificial flavor, AU-73	1.31
0.33	9	Floral mint artificial flavor	0.33
51.53	10	Alcohol (ethanol, 190 proof)	51.53
0.60	11	Isoproterenol sulfate (powder)	0.60
0.05	12	FD&C Yellow dye No. 5	0.05
0.25	13	Caramel (acid proof)	0.25
QS	14	Water purified	~344.0 mL

[a] Use 1.2 g of saccharin to replace cyclamate; adjust balance with sucrose.

Manufacturing Directions

Isoproterenol is toxic; wear a dust mask, and avoid contact. The product is sensitive to oxidation. Manufacture under N_2 protection, and protect product from light and heat; all water must be boiled, cooled, and gassed with nitrogen.

1. Load glucose and glycerin into a suitable mixing tank.
2. Add 187 mL purified water to tank with mixing.
3. Begin bubbling N_2 protection for the balance of the process.

4. Add and dissolve saccharin sodium and sodium cyclamate, if used, with mixing.
5. Add calcium iodide to the tank with good mixing.
6. Add and dissolve ascorbic acid and sugar.
7. Dissolve the flavors in alcohol, and add with mixing to the main batch.
8. Dissolve isoproterenol in 10 to 13 mL of water, and add with mixing to the main batch.
9. Dissolve dye in 3.5 mL purified water, and add solution to tank with mixing. (*Note*: Dye may be deleted.) Add caramel with mixing to main batch.
10. Move N_2 source from the bottom to the top of the tank.
11. Turn off mixer.
12. Allow to stand overnight under N_2 protection to let entrapped gases escape.
13. QS to 1 L. Mix for 1 hour.
14. Filter and circulate product through a suitable filter press until sparkling clear.

CALCIUM PHOSPHATE TABLETS FOR CATS AND DOGS (DIRECT COMPRESSION)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Dicalcium phosphate	400.00
100.00	2	Wheaten flour	100.00
1.00	3	Citric acid crystalline	1.00
272.00	4	Lactose monohydrate	272.00
QS	5	Flavors	QS
20.00	6	Kollidon® 90 F	20.00
4.00	7	Magnesium stearate	4.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve. Mix.
2. Press with medium to high compression force (20 kN).
3. Compress into 800 mg tablets using 12 mm biplanar punches.

CALCIUM PHOSPHATE TABLETS FOR CATS AND DOGS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Dicalcium phosphate	400.00
100.00	2	Wheaten flour	100.00
1.00	3	Citric acid crystalline	1.00
262.00	4	Lactose monohydrate	262.00
QS	5	Flavors	QS
30.00	6	Kollidon® 30 F	30.00
150.00	7	Water	150.00 mL
4.00	8	Magnesium stearate	4.00

Manufacturing Directions

1. Granulate items 1 to 6 in item 7, dry, add item 8, and pass through a 0.8 mm sieve.
2. Compress 800 mg tablets using 12 mm biplanar punches.

CARBAMIDE PEROXIDE CHEWING GUM

Formulation

Gum base, 26.25 g; calcium carbonate, 3.75 g; sorbitol, 28.05 g; mannitol, 7.50 g; maltitol, 21.62 g; glycerin, 1.00 g; flavorant, 3.15 g; gum arabic, 1.16 g; titanium dioxide, 0.17 g; wax candelilla, 0.03 g; sodium stearate/sodium palmitate, 50% each, 3.00 g; tripolyphosphate sweetener, 0.82 g; Imwitor 370, 1.00 g; carbamide peroxide, 3.00 g.

Manufacturing Directions

1. Heat the gum base to sufficiently soften the base without adversely affecting the physical and chemical make-up of the base.
2. Add the molten gum base and the filler to a mixing kettle.
3. Last, add the sugar alcohols, glycerin, flavor, high-intensity sweetener, and stain-removing agent carbamide peroxide with mixing to obtain a homogeneous mixture.
4. Discharge the mixture from the mixing kettle and rolled and score into the desired piece size by conventional techniques.

CARBAMIDE PEROXIDE AND HYDROGEN PEROXIDE BLEACHING ORAL DENTIFRICE

Manufacturing Directions

1. Gel composition as weight percent contains sodium fluoride, 0.32 (0.14 w/v fluoride ion); Carbopol 974 P-NF, 1.25; sorbitol (70% solution), 10.00; glycerin, 10.00; carbamide peroxide, 14.00; sodium lauryl sulfate, 1.50; sodium saccharin, 0.20; flavor, 1.25; FD&C Yellow No. 5, 0.15; FD&C Red No. 40, 0.05; water purified, 29.60.
2. Paste composition in weight percent contains sodium fluoride, 0.32; hydrogen peroxide (50% solution), 10.00; Carbopol 943, 0.51; sorbitol (70% solution), 5.18; glycerin, 5.18; sodium lauryl sulfate, 1.50; sodium saccharin, 0.20; flavor, 1.25; polytetrafluoroethylene (Teflon), 52.00; water, purified, 29.86.
3. Neutralize both phases (steps 1 and 2) to a pH of approximately 5.5 and 6.5 with freshly prepared 10% sodium hydroxide. The ratio of the stripe composition to the main composition should be approximately 15:100.
4. This hydrogen peroxide/carbamide peroxide blend composition is effective and stable when used topically for bleaching tooth surfaces.

5. When extruded from the tube container, the gel composition will be in the form of one or more stripes enclosed in the periphery of the toothpaste surrounded by the paste composition.
6. The gel and the paste composition must be of sufficiently heavy viscosities to prevent migration (bleeding) of the colored gel into the white paste composition.

CARBINOXAMINE MALEATE, PHENYLPROPANOLAMINE, AND ACETAMINOPHEN SUSTAINED-RELEASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Carbinoxamine maleate	5.00
75.00	2	Phenylpropanolamine hydrochloride	75.00
50.00	3	Acetaminophen	50.00
143.35	4	Sucrose and maize starch microgranules	143.35
6.34	5	Polyvidone (PVP)	6.34
0.01	6	Dye	0.01
0.075	7	Dye	0.075
0.025	8	Dye	0.025
23.99	9	Talc	23.99

Manufacturing Directions

This product requires separate preparation of microgranules for each active ingredient. This preparation requires a coating pan equipped with air suction and hot air heating system, mixer, automatic airless pump with a spray gun, vibrating sieve, and capsule-filling machine with triple-feed microgranular system.

1. Place the neutral microgranules in the coating pan. Prepare a 20% solution of PVP.
2. Maintain the temperature of microgranules at 20°C ± 2°C.
3. Using the pump, apply the solution of PVP; then, project the active ingredient onto the microgranules with a plastic scoop until they are dry.
4. Repeat these operations until all the active ingredients have been incorporated.
5. Sieve the microgranules with a 1.11 mm sieve.
6. Dry the microgranules at 30°C ± 5°C for 3 hours.
7. Prepare a 40% solution of shellac in alcohol and the required quantity of talc.
8. Apply the shellac solution, maintaining a microgranule temperature of 20°C ± 2°C, and add the talc simultaneously.
9. Sieve the microgranules through a 1.18 mm sieve.
10. Dry the microgranules at 18°C to 23°C for 8 hours. Store until used.
11. Test for dissolution, and rework if necessary.

CARBONYL IRON, COPPER SULFATE, AND MANGANESE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
24.00	1	Carbonyl iron (BASF)	24.00
0.16	2	Copper sulfate	0.16
3.50	3	Manganese sulfate	3.50
100.00	4	Ludipress®	100.00
2.00	5	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve. Mix.
2. Press into 131 mg tablets using medium compression force and 8 mm biplanar punches.

CARNITINE AND COENZYME Q SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
1.00	1	Coenzyme Q 10	1.00
1.00	2	Lutrol E 400	1.00
4.00	3	Cremophor RH 40	4.00
QS	4	Preservative	QS
QS	5	Water	QS to 1 L
40.00	6	Carnitine	40.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 to 60°C. Stir well.
2. Cool to room temperature, and add and dissolve item 6.

CETIRIZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
15.00	1	Cetirizine hydrochloride	15.00
3.00	2	PVP	3.00
1.50	3	Silicon dioxide	1.50
135.00	4	Lactose	135.00
1.50	5	Glyceryl behenate	1.50
QS	6	Water	QS

Manufacturing Directions

1. Place cetirizine and lactose in a fluidized-bed apparatus.
2. Spray an aqueous PVP solution (in 85 g of water) to get granules.
3. Dry the granules thus obtained and pass through a sieve (1 mm mesh), and weigh, add, and blend glyceryl behenate in a drum mixer.
4. Press the resulting mixture into 156 mg tablets.
5. Coat these tablet cores with the following formulation: ethyl cellulose, 10 g; hydroxypropyl cellulose, 10 g; stearic acid, 2 g; alcohol, 188 g.
6. First dissolve ethyl cellulose, povidone, and stearic acid in denatured alcohol (188 g).
7. Spray the coating solution is then sprayed onto the tablet cores in a coating pan.

CETRIMIDE ANTISEPTIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Cetearyl alcohol and cetrimonium bromide	50.00
75.00	2	White petroleum jelly	75.00
60.00	3	Mineral oil (70 cS)	60.00
QS	4	Deionized water	QS to1 kg
QS	5	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 60°C to 65°C.
2. Add the water phase to the oil phase while stirring.
3. Stir to cool.

CETYLPYRIDINIUM LOZENGES (2.5 MG)

Formulation

Cetylpyridinium chloride (Merck), 2.5 g; Ludipress® LCE, 370.0 g; polyethylene glycol 6000, powder, 20.0 g; menthol, crystalline, 6.0 g; aspartame, potassium (Searle), 1.5 g.

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press with low compression force at 402 mg.

CHARCOAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Activated charcoal	250.00
150.00	2	Bolus alba (Merck)	150.00
28.00	3	Kollidon® 25	28.00
38.00	4	Acacia gum	38.00
QS	5	Water + isopropanol (10 + 3)	575.00 mL
15.00	6	Cremophor EL	15.00
QS	7	Isopropanol	300.00 mL

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with item 5, and pass through a 1 mm sieve.
2. Dry until a relative powder humidity of 90% is reached.
3. Add solution of items 6 and 7, and pass again through a 0.8 mm sieve.
4. Dry the granules, and press into 481 mg tablets using low compression force and 12 mm planar punches.
5. Dry the obtained tablets.

CHLOPHEDIANOL, IPECAC, EPHEDRINE, AMMONIUM CHLORIDE, CARBINOXAMINE, AND BALSAM TOLU SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
0.001 mL	1	Ipecac fluid extract	1.00 mL
5.00	2	Chlophedianol hydrochloride	5.00
1.32	3	Ephedrine hydrochloride (powder)	1.32
8.80	4	Ammonium chloride (reagent-grade granules)	8.80
0.80	5	Carbinoxamine maleate	0.80
0.90	6	Methylparaben	0.90
0.10	7	Propylparaben	0.10
6.25	8	Balsam of tolu (eq. aqueous extract)	6.25
2.66	9	Saccharin sodium (dihydrate powder)	2.66
319.22	10	Sucrose (granulated sugar)	319.22
238.33	11	Glucose liquid (corn syrup)	238.33
83.93	12	Sorbitol solution (calculate as 70% sorbitol crystals)	83.93
40.00	13	Alcohol	40.00
166.67	14	FD&C Red dye (Amaranth E123)	166.67 mg
0.80	15	Raspberry flavor	0.80
100.00	16	Propylene glycol	100.00
QS	17	HyFlo filter aid	0.50
QS	18	Water purified	~450.00 mL

Manufacturing Directions

1. Place balsam of tolu and 25 mL of water in a steam bath.
2. Raise the temperature, stirring continuously in order to mix water with the balsam.
3. Boil for half an hour, and allow to decant while cooling.
4. Discard extracted balsam of tolu.
5. Filter the supernatant liquid through filter paper, and store apart.
6. Place 150 mL water in a jacketed mixing tank, and heat to boiling.
7. Add and dissolve parabens with mixing.
8. Add and dissolve sugar with constant mixing.
9. Heat to 70°C to 75°C.
10. Once sugar is dissolved, add glucose, sorbitol, and saccharin sodium. Mix well until dissolved.
11. Dissolve ammonium chloride in 28 mL water.
12. Add to mixing tank.
13. Add extract balsam of tolu from first step with mixing. Mix well, and cool to 25°C to 30° C.
14. Add and dissolve ephedrine and carbinoxamine in 20 mL water, and add to mixing tank. Mix well.
15. Add and dissolve chlophedianol in 50 g of propylene glycol, and add to mixing tank.
16. Add balance of propylene glycol to mixing tank.
17. Add and dissolve ipecac fluid extract and raspberry flavor in alcohol.
18. Add to mixing tank.
19. Dissolve dye in 5 mL water, and add to tank with continuous mixing.
20. Rinse container with 5 mL of water, and add rinsings.
21. Adjust to volume with purified water.
22. Add HyFlo filter aid to syrup, and mix well.
23. Recirculate through filter press or equivalent until sparkling clear.

CHLORHEXIDINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Chlorhexidine diacetate	20.00
300.00	2	1,2-Propylene glycol (pharma)	300.00
220.00	3	Lutrol F 127	220.00
460.00	4	Water	460.00

Manufacturing Directions

1. Dissolve chlorhexidine diacetate in propylene glycol at >70°C.
2. Stir well, and slowly add Lutrol F 127 and water.
3. Maintain the temperature until the air bubbles escape.
4. A clear, colorless gel is obtained.

CHLORHEXIDINE LOZENGES

Bill of Materials

Scale (mg/lozenge)	Item	Material Name	Qty/1000 lozenges (g)
5.00	1	Chlorhexidine	5.00
150.00	2	Sorbitol (crystalline)	150.00
5.00	3	Kollidon® VA 64	5.00
5.00	4	Menthol (crystalline)	5.00
5.00	5	Eucalyptol (crystalline)	5.00
1.00	6	Aspartame, potassium	1.00
0.10	7	Saccharin sodium	0.10
2.00	8	Aerosil® 200	2.00
1.00	9	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compression force.
2. Compress into 175 mg lozenge using 8 mm biplanar punches.

CHLORPHENIRAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
4.00	1	Chlorpheniramine maleate	4.00
75.00	2	Starch 1500	75.00
65.62	3	Microcrystalline cellulose (50 μm)	65.62
2.96	4	Stearic acid	2.96
1.11	5	Fumed silica	1.11
0.37	6	Magnesium stearate	0.37

Manufacturing Directions

1. Blend half of the Starch 1500 with the fumed silica and chlorpheniramine for 5 minutes.
2. Pass this mixture through a 40 mesh screen, and return to blender.
3. Add the remaining Starch 1500 to the material in step 1, and blend for 5 additional minutes.
4. Add the microcrystalline cellulose and stearic acid to the material from step 2, and blend for an additional 10 minutes.
5. Add the magnesium stearate to the material from step 3, and blend for an additional 5 minutes.

CHLORPHENIRAMINE MALEATE SYRUP

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
2.00	1	Chlorpheniramine maleate	0.40
3000.00	2	Sucrose	600.00
4.50	3	Methylparaben	0.90
1.50	4	Propylparaben	0.30
1.00	5	Citric acid (monohydrate)	0.20
2.40	6	Sodium citrate	0.48
2.00	7	Green banana flavor	0.40
–	8	Purified water	QS to 1 L

Manufacturing Directions

1. Add 500 g of purified water to the manufacturing vessel, and heat to 95°C to 98°C.
2. Add items 3 and 4 while mixing to dissolve at high speed.
3. Mix for 5 minutes.
4. Add item 2 while mixing at slow speed.
5. Maintain a temperature of 95°C to 98°C.
6. Mix for 1 hour at high speed.
7. Cool down to 30°C while mixing at slow speed.
8. Dissolve items 5 and 6 in 20 g of cooled purified water (25°C).
9. Transfer the solution to the manufacturing vessel while mixing at high speed.
10. Mix for 2 minutes.
11. Add 8 g of cold purified water (25–30°C) in a separate container, and dissolve item 1 by using stirrer.
12. Mix for 10 minutes, and transfer to the manufacturing vessel.
13. Rinse the container with 2 g of cooled purified water (25°C), and transfer the rinsings to the manufacturing vessel while mixing at high speed.
14. Add item 7 to the manufacturing vessel while mixing.
15. Mix for 10 minutes at high speed.
16. Bring the volume up to 1 L with purified water, and finally, mix for 15 to 20 minutes at high speed.
17. Check and record the pH (limit: 5.0–5.2 at 25°C).
18. If required, adjust pH with 10% citric acid or 10% sodium citrate solution.
19. Filter the syrup at 1.5 bar.
20. Bubble the syrup with nitrogen gas.

CHLORPHENIRAMINE AND PSEUDOEPHEDRINE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
3.35	1	Chlorpheniramine maleate	3.35
100.00	2	Pseudoephedrine hydrochloride	100.00
396.65	3	Cab-o-Sil M5	396.65
200.00	4	Water	200.00

Manufacturing Directions

1. Chlorpheniramine maleate and pseudoephedrine hydrochloride are mixed in the water until thoroughly dissolved.
2. Cab-o-Sil M5 (silicon dioxide) is poured into a planetary mixer, to which the dissolved drug solution is added and mixed at slow speed.
3. This is continued for 5 minutes until the solution and Cabo-Sil are completely mixed.
4. The mixture is dried in a forced hot air oven for 5 hours to an LOD of less than 2%.
5. Magnesium stearate is then added as a lubricant, and tartaric acid is added as an acidulant.
6. The excipients are then thoroughly mixed, and the entire composition is compressed into 1 g tablets, each one possessing a potency of 4 mg chlorpheniramine maleate and 120 mg pseudoephedrine hydrochloride.

CHLORPHENIRAMINE, PSEUDOEPHEDRINE, AND DEXTROMETHORPHAN CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
8.00	1	Chlorpheniramine maleate	8.00
120.00	2	Pseudoephedrine hydrochloride	120.00
60.00	3	Dextromethorphan hydrobromide	60.00
812.00	4	Cab-o-Sil M5	812.00
200.00	5	Water	200.00

Manufacturing Directions

1. Chlorpheniramine maleate, dextromethorphan HBr, and pseudoephedrine hydrochloride are mixed in the water until thoroughly dissolved.
2. Cab-o-Sil M5 (silicon dioxide) is poured into a planetary mixer, to which the dissolved drug solution is added and mixed at slow speed.

3. This is continued for 5 minutes until the solution and Cab-o-Sil are completely mixed.
4. The entire composition is dried in a forced hot air oven for 7 hours at 50°C.
5. The composition is dried to an LOD of 1.25%.
6. The dried material is then screened through a No. 30 U.S. standard mesh screen.
7. The excipients are added as mentioned before, and the blend is compressed into 1 g tablets, each one possessing a potency of 4 mg chlorpheniramine maleate, 60 mg pseudoephedrine hydrochloride, and 30 mg dextromethorphan HBr.

CHYMOTRYPSIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
27.00	1	Chymotrypsin, with excess	27.50
71.50	2	Ludipress®	71.50
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm screen.
2. Press with low compression force.
3. Compress into 100 mg tablets using 8 mm biplanar punches.

CIMETIDINE TABLETS (200 MG)

Formulation

Cimetidine, 200 g; Ludipress®, 295 g; magnesium stearate, 5 g.

Manufacturing Directions

1. Pass the mixture through a 0.8 mm screen.
2. Press with low compression force at 510 mg at low humidity (30%).

CIMETIDINE CHEWABLE TABLETS

Manufacturing Directions

1. Cimetidine premix granules: cimetidine, 200 mg; Eudragit E100, 20 mg; antacid (Al/Mg) granules sorbitol, direct compression grade, 590 mg; lactose, direct compression grade spray dried, 325 mg; lactose crystalline, 325 mg; dried aluminum hydroxide gel, 250 mg; magnesium hydroxide, 200 mg; croscarmellose sodium type A, 30 mg; magnesium stearate, 15 mg; total, 1735 mg.
2. Tableting mix for compression: cimetidine, 220 mg; premix granules antacid (Al/Mg), 1735 mg; granules microcrystalline cellulose (Avicel™ PH102), 200 mg; aspartame, 10 mg; aniseed, 20 mg; butterscotch, 20 mg; magnesium stearate, 15.0 mg; total, 2220 mg.
3. Add a 40% (w/w) solution of the Eudragit E100 in methylene chloride with mixing to the cimetidine and blend until granules are formed.
4. Dry the resulting granules and then sieve through a 16 mesh screen.
5. Sieve aluminum hydroxide, magnesium hydroxide, and other ingredients for the antacid granules through a 12 mesh (1.4 mm) screen and mix together.
6. Compress the resulting mix on a rotary tablet press, and mill the resulting compacts using a 12 mesh screen.
7. Place cimetidine granules, antacid granules, and extragranular excipients into a cone blender and mix thoroughly.
8. Discharge the resulting mix from the blender and compress on a suitable rotary tablet press fitted with the appropriate punches.

CITRATE EFFERVESCENT POWDER

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/kg (g)
0.50	1	Oil lemon terpeneless	0.50
10.00	2	Lemon flavor (natural microseal)	10.00
QS	3	Alcohol dehydrated (absolute, doubly rectified)	6.50
440.33	4	Sodium bicarbonate	440.33
0.35	5	Saccharin sodium	0.35
157.50	6	Anhydrous sodium citrate	157.50
178.82	7	Anhydrous citric acid (powder)	178.82
222.50	8	Acid tartaric	222.50

Manufacturing Directions

1. All processing should be done in controlled humidity at a maximum RH of 40% at 25°C.
2. Sodium citrate and citric acid are anhydrous.
3. Dissolve lemon oil in dehydrated alcohol with stirring in a suitable container (delete this step if using powdered lemon flavor).
4. Sift sodium bicarbonate, if necessary, through a 595 μm screen.
5. Load into a suitable mixer and mix for 10 minutes.
6. Very slowly add solution from first step to the mixer while mixing. Continue mixing for at least 10 minutes and up to a total of 30 minutes, depending on equipment.
7. Screen the massed granulation mixture through a 595 μm screen and divide approximately in half.

8. Premix saccharin sodium into sodium citrate (and lemon powder, if used), and sift through a 595 µm screen or mill fitted with a 595 µm screen (knives forward, medium speed).
9. Sift both citric acid and tartaric acid separately through a 595 µm screen, or mill separately using a comminuting mill with a 595 µm aperture (knives forward, medium speed).
10. Load materials into a suitable blender, preferably in the following order: milled tartaric acid, milled citric acid, half of granulation mixture, milled saccharin sodium, sodium citrate, and remaining granulation mixture.
11. Blend for 20 minutes, and pack into double plastic bags inside fiber drums.
12. Provide silica gel protection to maintain low humidity in drums.
13. If blended material is lumpy, pass through a 1.2 mm screen before bagging.

CROSPOVIDONE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1000.00	1	Crospovidone (micronized)	1000.00
150.00	2	Citric acid	150.00
25.00	3	Aerosil® 200	25.00
100.00	4	Sucrose (crystalline)	100.00
1.00	5	Saccharin sodium	1.00
QS	6	Water	QS
5.00	7	Magnesium stearate	5.00
125.00	8	Sodium bicarbonate	125.00
65.00	9	Flavor mixture	65.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with item 6, dry, and pass through a sieve.
2. Mix the dry granules with items 7 to 9, and press with medium compression force.
3. The dosage may be increased to 2000 mg crospovidone by increasing the tablet weight to 3200 mg.
4. Compress 1590 mg tablets using 20 mm diameter biplanar punches.

CROSPOVIDONE ORAL SUSPENSION (2000 MG/10 ML)

Formulation

Kollidon® CL-M, 20.0 g; sorbitol, crystalline, 10.0 g; Kollidon® 90F, 2.0 g; preservatives, QS; flavor, QS; water, 100 mL.

Manufacturing Directions

1. Dissolve sorbitol, Kollidon® 90F, preservatives and flavors in the water. Add Kollidon® CL-M, and homogenize by shaking.,

CROSPOVIDONE WATER-DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1000.00	1	Crospovidone M (BASF)	1000.00
50.00	2	Aerosil® 200	50.00
250.00	3	Sucrose (crystalline)	250.00
5.00	4	Saccharin sodium	5.00
2.00–3.00	5	Flavors	2.00–3.00
380.00	6	Water	380.00
5.00	7	Magnesium stearate	5.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with item 6, dry, and pass through a sieve.
2. Mix the dry granules with item 7 and press with low compression force.
3. The dosage may be increased to 2000 mg crospovidone by increasing the tablet weight to 2600 mg.
4. Compress 1280 mg tablets using 20 mm biplanar punches.

CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00 µg	1	Cyanocobalamin; use gelatin-coated cyanocobalamin (0.1%)	50.00
150.00	2	Ludipress®	150.00
1.50	3	Magnesium stearate	1.50
2.00	4	Sicovit Quinoline lake, yellow	2.00
3.00	5	Sicovit Yellow lake, orange	3.00

Manufacturing Directions

1. Prepare a premix of item 1 and 2 and add to items 3 to 5.
2. Pass through a 0.5 mm sieve and press with low compression force.
3. Compress into 209 mg tablets using 8 mm biplanar punches.

DEXPANTHENOL GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Dexpanthenol (BASF)	50.00
100.00	2	Liquid paraffin	100.00
150.00	3	Lutrol E 400	150.00
180.00	4	Lutrol F 127	180.00
QS	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve dexpanthenol and Lutrol E 400 in water, add liquid paraffin, and stir, heating to 60°C to 70°C.
2. Slowly add Lutrol F 127, and stir until dissolved.
3. Cool to room temperature, stirring continuously until the air bubbles disappear.

DEXTROMETHORPHAN, PSEUDOEPHEDRINE, AND CHLORPHENIRAMINE MALEATE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
2.00	1	Dextromethorphan hydrobromide	2.00
4.00	2	D-Pseudoephedrine hydrochloride	4.00
0.40	3	Chlorpheniramine maleate	0.40
25.00	4	Sorbitol syrup	25.00
0.20	5	Saccharin sodium	0.20
3.00	6	Hydroxyethyl cellulose (Natrosol™)	3.00
2.50	7	Sodium benzoate	2.50
1.05	8	Banana flavor	1.05
1.10	9	Custard flavor	1.10
1.20	10	Trisodium citrate dihydrate (powder)	1.20
QS	11	Deionized water	QS to 1 L

Manufacturing Directions

1. In a suitable stainless steel vessel, combine sorbitol syrup, hydroxyethyl cellulose, and deionized water. Mix well.
2. Add sodium benzoate and stir again for 5 minutes.
3. After obtaining a clear solution, stir the hydroxyethyl cellulose suspension, rinse the container with deionized water, and transfer the rinsings to the vessel.
4. Heat the vessel to 40°C to 50°C and stir the mix for 1 hour.
5. After 1 hour, a clear gel without lumps is obtained.
6. Dilute the gel with sorbitol syrup, and cool to 30°C.
7. In a separate vessel, add deionized water, and heat while stirring to 50°C.
8. After this temperature is reached, dissolve, in this order, dextromethorphan hydrobromide, chlorpheniramine maleate, and pseudoephedrine hydrochloride and saccharin sodium.
9. Cool the solution to 25°C.
10. In a suitable stainless steel container, add deionized water, and while stirring, dissolve trisodium citrate under 0.6 bar vacuum and high speed.
11. Transfer the active substance solution to the syrup vehicle.
12. Rinse the vessel twice with deionized water.
13. Add while stirring (low) the custard and banana flavors.
14. Mix for 10 minutes.
15. Then, while stirring, add the solution from the preceding step. Keep stirring for 15 minutes at moderate speed.
16. Stop stirring, and check pH (limit: 5.9–6.2). Adjust with 10% trisodium citrate solution. After each addition, where necessary, stir for 5 minutes before recording pH again.
17. Finally, make up the volume with deionized water, and stir once more for 15 minutes under vacuum (0.6 bar) at moderate speed.
18. Stop stirring, and remove vacuum. Check final volume once more.
19. Filter the clear syrup under compressed air pressure, first through a filter of 330 µm and then through a 20 µm filter of propylene type.

DIHYDROXYALUMINUM SODIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
31.00	1	Dihydroxyaluminum sodium carbonate (Giulini A 265)	31.00
61.50	2	Sugar	61.50
2.00	3	Magnesium stearate	2.00
15.00	4	Starch	15.00
QS	5	Flavor, sweetener	0.50

Manufacturing Directions

1. Blend to mix and compress 110 mg in 6 mm punch.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Dimenhydrinate	50.00
245.00	2	Ludipress®	245.00
5.00	3	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components, sieve, and press with low compression force.
2. Compress into 300 mg tablets using 8 mm biplanar punches.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Dimenhydrinate	50.00
50.00	2	Cellulose (microcrystalline) (Avicel™ PH101)	50.00
125.00	3	Lactose	125.00
2.29	4	Croscarmellose sodium (Ac-Di-Sol, SD-711)	2.29
1.00	5	Fumed silicon dioxide	1.00
0.50	6	Stearic acid	0.50
0.50	7	Magnesium stearate	0.50

Manufacturing Directions

1. Screen items 1,5, and 6 separately through a 40 mesh sieve.
2. Blend items 1, 2, 4, and 5 in a V-blender for 3 minutes.
3. Add item 3 in the blender and mix for 17 minutes.
4. Add item 6, and blend for 3 minutes.
5. Add item 7 to the blender and mix for 5 minutes.
6. Compress using 3/8 in. flat, beveled-edge punches to a hardness of 6 kp and average tablet weight of 228 mg.

DIMENHYDRINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Dimenhydrinate	100.00
40.00	2	Lactose monohydrate	40.00
40.00	3	Cornstarch	40.00
6.00	4	Kollidon® 90 F	6.00
30.00	5	Isopropanol	30.00
14.00	6	Kollidon® CL	14.00
16.00	7	Talc	16.00
2.00	8	Aerosil® 200	2.00
2.00	9	Calcium arachinate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with item 5, dry, pass through a 0.8 mm sieve, mix with items 6 to 9, and press with low compression force.
2. Compress into 210 mg tablets using 9 mm biconvex punches.

DIMENHYDRINATE TABLETS (50 MG), DC

Formulation

Dimenhydrinate, 50.0 g; Aerosil® 200, 4.0 g; Ludipress®, 140.0 g; Kollidon® CL, 2.0 g; magnesium stearate, 1.5 g.

Manufacturing Directions

1. Mix dimenhydrinate with Aerosil® 200, add the other components, and sieve.
2. Press with low compression force at 202 mg.

DIPHENHYDRAMINE AND PSEUDOEPHEDRINE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Diphenhydramine hydrochloride	25.00
60.00	2	Pseudoephedrine hydrochloride	60.00
415.00	3	Cab-o-Sil	415.00
200.00	4	Water	200.00

1. Mix diphenhydramine hydrochloride and pseudoephedrine hydrochloride in the water until thoroughly dissolved.
2. Pour Cab-o-Sil M5 (silicon dioxide) into a planetary mixer, to which add the dissolved drug solution and mix at slow speed.
3. Continued for 5 minutes until the solution and Cab-o-Sil are completely mixed.
4. Dry the entire composition in a forced hot air oven for 7 hours at 50° C.
5. Dry the composition to LOD 1%.
6. Screen the dried material through a No. 30 U.S. standard mesh screen and compress to give average weight of 1 g containing 50 mg diphenhydramine hydrochloride and 120 mg pseudoephedrine hydrochloride.

DIPHENHYDRAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Diphenhydramine hydrochloride	25.00
150.00	2	Calcium phosphate (dibasic)	150.00
20.00	3	Starch (StaRX 1500)	20.00
QS	4	PVP	QS
QS	5	Alcohol, USP	QS
75.00	6	Stearic acid (fine powder)	75.00
25.00	7	Cellulose (microcrystalline)	25.00
QS	8	Purified water, USP	QS

Manufacturing Directions

1. In a planetary mixer, place diphenhydramine hydrochloride, calcium phosphate dibasic, and starch.
2. Mix for 5 to 10 minutes.
3. In a separate mixer, charge PVP, alcohol, and water in the ratio 1:50:40.
4. Moisten this mixture with solution from the previous step to granulate.
5. Record the volume used.
6. Pass the wet mass through a No. 14 mesh screen on dryer trays.
7. Dry the granulation at 48.8°C to 54.4°C, or use a fluid-bed dryer.
8. Pass the dried granules through a No. 20 mesh screen.
9. Charge dried granules to twin-shell blender and add stearic acid (previously passed through No. 30 mesh screen) and microcrystalline cellulose.
10. Mix for 5 to 7 minutes.
11. Compress to 300 mg tablets using a rotary press with 5/16 in. standard concave punches.

ECONAZOLE NITRATE AND BENZOYL PEROXIDE ANTIACNE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
200.00	1	PEG-6 and PEG-32 and glyceryl stearate (Tefose® 63)	200.00
30.00	2	Mineral oil	30.00
30.00	3	Apricot kernel oil PEG-6 esters (Labrafil® M 1944)	30.00
0.50	4	Sorbic acid	0.50
0.50	5	Sodium methylparaben	0.50
724.00	6	Deionized water	724.00
5.00	7	Benzoyl peroxide	5.00
10.00	8	Econazole nitrate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 6 together, and bring temperature to 75°C.
2. Allow to cool while stirring.
3. Add items 7 and 8 at 30°C, and mix well until uniform.

ECONAZOLE NITRATE AND BENZOYL PEROXIDE ANTIACNE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PEG-6 stearate, cetech-20, and steareth-20 (Tefose® 2000)	50.00
30.00	2	Mineral oil	30.00
20.00	3	Cetyl alcohol	20.00
0.70	4	Sodium methylparaben	0.70
0.30	5	Sorbic acid	0.30
884.00	6	Deionized water	884.00
5.00	7	Benzoyl peroxide	5.00
10.00	8	Econazole nitrate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 3 together, and bring temperature to 75°C.
2. Allow to cool while stirring.
3. Mix items 4 to 6 and add to previous step while stirring.
4. Cool with stirring.
5. Add items 7 and 8 at 30°C while stirring.

EUCALYPTOL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
80.00	1	Eucalyptol	80.00
40.00	2	Cremophor RH 40	40.00
QS	3	Preservative	QS
QS	4	Water	QS to 1 L

Manufacturing Directions

1. Mix eucalyptol and cremophor at 65°C, stir well, and slowly add the warm solution of item 3 to produce a clear or slightly opalescent, colorless liquid.

EUCALYPTOL SOLUTION (8%)

Formulation

1. Eucalyptol, 8.0 g; Cremophor RH 40 [1], 4.0 g.
2. Preservative, QS; Water, 100 mL.

Manufacturing Directions

1. Mix eucalyptol and Cremophor at 65°C, stir well, and slowly add the warm solution 2.

EUCALYPTUS AND MINT EMULSION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
427.50	1	Distilled water	427.50
375.00	2	Eucalyptamint	375.00
70.00	3	Sodium stearoyl lactylate (Pationic® SSL)	70.00
35.00	4	PEG-20 hydrogenated lanolin (Supersat ANS4)	35.00
17.50	5	Ritasynt IP	17.50
80.00	6	Cetearyl alcohol, polysorbate 60, PEG-15 stearate, and steareth-20 (Ritachol 1000)	80.00

Manufacturing Directions

1. Heat item 1 to 71°C.
2. Combine rest of the ingredients in another container, and heat to 71°C.
3. Slowly add water at 71°C, and mix for 1 hour.
4. Cool the mixture to 35°C to 45°C, and fill.

EUCALYPTUS AND MINT OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
160.00	1	Menthol	160.00
40.00	2	Eucalyptus	40.00
800.00	3	Anhydrous lanolin, USP	800.00

Manufacturing Directions

1. Mix lanolin until melted (approximately at 50°C), add remaining ingredients, and mix for 1 hour.
2. Fill hot.

FERROUS FUMARATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Ferrous fumarate	200.00
295.00	2	Ludipress®	295.00
5.00	3	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components. Pass through a 0.8 mm sieve.
2. Press with low compression force.
3. Compress into 509 mg tablets using 12 mm biplanar punches.

FERROUS SULFATE, MANGANESE SULFATE, AND COPPER SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
65.00	1	Anhydrous ferrous sulfate	65.00
3.50	2	Manganese sulfate	3.50
0.16	3	Copper sulfate	0.16
70.00	4	Ludipress®	70.00
10.00	5	Kollidon® 30	10.00
2.00	6	Magnesium stearate	2.00
3.00	7	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high compression force.
2. Compress into 149 mg tablets using 8 mm biplanar punches.

FERROUS SULFATE ORAL SOLUTION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Quantity/ L (g)
75.00	1	Ferrous sulfate[a]	125.00
294.00	2	Sucrose	490.00
147.00	3	Maltitol solution (Lycasin® 80/55)	245.00
0.30	4	Citric acid (monohydrate)	0.50
0.90	5	Citric acid (monohydrate)	1.50
0.06	6	FD&C Yellow No. 6 (sunset yellow FCF)	1.00
3.12	7	Guarana flavor 12144-33	5.20
0.33	8	Potassium sorbate	0.55
0.30	9	Saccharin sodium	0.50
–	10	Purified water	QS to 1 L

[a] Equivalent to 15 mg iron (Fe).

Manufacturing Directions

1. Bubble nitrogen throughout the process.
2. Check and record pH of the purified water (limit: 5.0–6.5).
3. Collect 166.67 g of purified water in mixer.
4. Heat to 90°C to 95°C for 10 minutes.
5. Add item 8. Stir to dissolve to a clear solution.
6. Add item 2. Stir to dissolve to a clear solution.
7. Add item 3. Stir for 10 minutes, and cool to 30°C to 35°C.
8. Dissolve item 4 in 10 g of purified water (30–35°C), and add to first step.
9. Dissolve item 9 in 10 g of purified water (30–35°C), and add to first step.
10. Dissolve item 5 in 273.33 g of purified water (30–35°C).
11. Then, add item 1 to the clear solution, and dissolve slowly without aeration.
12. Add to mixer.
13. Dissolve item 6 in 10 g of purified water (25–30°C), and add to first step.
14. Add item 7 to first step.
15. Mix at low speed for 10 minutes.
16. Bring volume up to 1 L with purified water.
17. Check and record pH (target: 2.20, limit: 1.95–5.15).
18. Filter the drops with recirculation.
19. Transfer the filtered drops to a storage vessel under an N_2 blanket.
20. Use the nitrogen blanket in the tank throughout the storage and filling period.

FERROUS SULFATE ORAL SYRUP

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
200.00	1	Ferrous sulfate[a]	40.00
3350.00	2	Sucrose	670.00
750.00	3	Maltitol solution (Lycasin® 80/55)	150.00
4.16	4	Citric acid (monohydrate)	833.20
8.33	5	Citric acid (monohydrate)	1.66
0.50	6	Color	0.10
15.50	7	Flavor	3.10
–	8	Purified water	QS to 1 L

[a] Equivalent to 40 mg elemental iron.

Manufacturing Directions

1. Bubble nitrogen throughout the process.
2. Heat 300 g of purified water to 95°C.
3. Add item 2 while stirring at low speed.
4. Dissolve to clear solution by stirring at 95°C.
5. Add item 3.
6. Stir at low speed, and cool to 25°C to 30°C.
7. Dissolve item 4 in 17 g of item 8, and add to the first step.
8. Dissolve item 5 in 180 g of purified water in a separate stainless steel container.
9. Then, add item 1 to the clear solution, and dissolve slowly without aeration.
10. Add to first step.
11. Dissolve item 6 in 16 g of purified water, and add to the first step.
12. Add item 7 to the first step.
13. Mix at low speed for 10 minutes.
14. Bring volume up to 1 L with purified water.
15. Check and record pH (limit: 2–5).
16. Filter the syrup at 1.5 bar.
17. Recirculate approximately 100 to 150 mL of syrup.
18. Use a nitrogen blanket in the tank throughout the storage period.

FERROUS SULFATE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Anhydrous ferrous sulfate, with excess	203.00
185.00	2	Ludipress®	185.00
15.00	3	Kollidon® VA 64	15.00
4.00	4	Magnesium stearate	4.00
4.00	5	Talc	4.00
3.00	6	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with medium compression force.
2. Compress into 413 mg tablets using 8 mm biplanar punches.

FIR NEEDLE OIL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
30.00	1	Fir needle oil (Frey & Lau)	30.00
50.00	2	Camphora	50.00
60.00	3	Cremophor RH 40	60.00
403.00	4	Ethanol (96%)	403.00
457.00	5	Water	457.00

Manufacturing Directions

1. Mix the active ingredients with Cremophor RH 40, and heat to 50°C to 60°C.
2. Add the ethanol to the well-stirred solution; then, slowly add the warm water to produce a clear or slightly opalescent liquid.
3. The amount of Cremophor RH 40 required depends on the type of fir needle oil.

FOLIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Folic acid[a]	5.24
12.00	2	Maize starch (dried)[b]	12.00
5.26	3	Cellulose (microcrystalline) (Avicel™ PH102)	5.26
20.00	4	Cellulose (microcrystalline) (Avicel™ PH102)	20.00
1.50	5	Colloidal silicon dioxide (Aerosil® 200)	1.50
66.00	6	Lactose (spray-dried)[c]	66.00
2.50	7	Talc (fine powder)	2.50
2.50	8	Stearic acid (fine powder)	2.50

[a] Extra folic acid is added (0.08 mg/tablet) to compensate water (water NMT 8.0%).

[b] LOD: NMT 4.5% when dried at 120°C for 4 hours.

[c] Meets the USP NF, except particle size distribution, as follows: minimum 98%, 250 µm; 30% to 60%, 100 µm; maximum 15%, 45 µm.

Manufacturing Directions

1. Folic acid must be protected from exposure to direct light.
2. Sift items 1, 2, and 3 through a Fitz mill (impact forward, high speed), and collect in a stainless steel drum.
3. Load the material into a blender, and mix for 3 minutes.
4. Sift items 4 to 8 through a 500 µm sieve using a sifter, and collect in a stainless steel drum.
5. Load this sieved material into a blender.
6. Mix for 5 minutes.
7. Unload the lubricated powder into a stainless steel drum. Check for small lumps or globules in the powder mix.
8. If required, pass the entire mass through a 500 µm sieve using a sifter, and mix for 1 minute in a blender.
9. Compress into 1.15 g tablets (hardness: 3–7 kp) using 7 mm round flat punches.
10. For 1 mg tablets, compensate with lactose, and compress as in step 9.

FOLIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Folic acid	5.00
195.00	2	Ludipress®	195.00
1.50	3	Magnesium stearate	1.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press into tablets using medium compression force.
   If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.
2. Compress into 213 mg tablets using 8 mm biplanar punches.

FOOT BATH

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
200.00	1	Polysorbate 20	200.00
2.50	2	Menthol	2.50
10.00	3	Alpha-bisabolol	10.00
20.00	4	Disodium undecylenamido MEA-sulfosuccinate	20.00
20.00	5	Perfume (menthol compatible)	20.00
QS	6	Deionized water	QS to 1 L
QS	7	Preservative, color	QS

Manufacturing Directions

1. Predissolve menthol, alpha-bisabolol, and perfume in Polysorbate 20.
2. Add mixture to the water phase while stirring.
3. Stir until homogeneous, and then fill.

FOOT FRESHENER CREAM

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/L (g)
30.00	1	Alcohol and ceteareth-20 (Cosmowax® EM5483)	30.00
30.00	2	Isopropyl myristate (Crodamol® IPM)	30.00
5.00	3	Cetyl esters (Crodamol® SS)	5.00
20.00	4	Oleyl alcohol	20.00
5.00	5	Propylene glycol	5.00
5.00	6	Carbopol 980	5.00
QS	7	Deionized water	QS to 1 L
300.00	8	Ethanol (DEB100)	300.00
2.00	9	Triclosan (Irgasan® DP300)	2.00
0.50	10	Menthol	0.50
4.00	11	Triethanolamine 99 (to give pH 6–7)	~4.00

Manufacturing Directions

1. Preblend ethanol, irgasan, and menthol, and warm to 50°C.
2. Heat water and oil phases separately to 70°C.
3. Add the water phase to the oil phase while stirring.
4. Stir to cool, adding the preblend at 60°C. Adjust pH.

FOOT MOUSSE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
300.00	1	Ethanol (DEB100)	300.00
1.00	2	Menthol	1.00
QS	3	Deionized water	QS
20.00	4	Undecyleneamide DEA and diethanolamine	20.00
5.00	5	Cetrimonium bromide	5.00
10.00	6	PEG-75 and water	10.00
QS	7	Perfume, preservative, color	QS

Manufacturing Directions

1. Dissolve menthol in ethanol.
2. Add remaining ingredients.
3. Pack into mechanical mousse applicator, such as the Kunststoff AG Supermatic foamer system, Airspray International BV jet foamers, or Calmar foamers.

GARLIC EXTRACT + THYME EXTRACT + VITAMIN C (300 MG + 25 MG + 100 MG)

Formulation

Garlic extract, granulated (Aflopa), 300 g; thyme extract, 25 mg; powder (Aflopa), 25 g; ascorbic acid, crystalline (BASF), 100 g; Kollidon® CL, 14 g; Ludipress®, 268 g; magnesium stearate, 7 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press to tablets with medium compression force at 714 mg.

GARLIC TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
95.00	1	Calcium phosphate, dibasic	95.00
94.00	2	Lactose monohydrate	94.00
9.00	3	Kollidon® 30	9.00
25.00	4	Water	25.00
100.00	5	Dried garlic powder	100.00
2.00	6	Magnesium stearate	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, pass through a 0.8 mm sieve, add items 5 and 6, and press with low compression force.
2. Compress 312 mg using 9 mm biconvex punches.

GINKGO EXTRACT TABLETS (40 MG)

Formulation

Ginkgo biloba extract, dry powder, 240 g; Aerosil® (Biogen) 200, 1 g; Kollidon® CL, 4 g; Ludipress®, 203 g; magnesium stearate, 2 g.

Manufacturing Directions

1. Mix the ginkgo extract with Aerosil 200, add the other components, pass through a 0.8 mm sieve, and press to tablets with low compression force at 254 mg.

GLYCERIN SUPPOSITORIES

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
1800.00	1	Glycerin (glycerol)	1800.00
0178.00	2	Sodium stearate	178.00
0099.00	3	Purified water	99.00

Manufacturing Directions

1. The suppository mass is manufactured at a temperature of 120°C.
2. Care must be taken to see that molten suppository mass does not accidentally spill on the person.
3. The inside of the vessel should not be touched with the bare hand, as it is at a temperature of 120°C.
4. Sodium stearate powder is light and fluffy; avoid inhaling the dust.
5. Load item 1 into the mixer, and heat to 120°C ± 2°C while stirring at low speed.
6. Load item 2 into the mixer containing item 1.
7. Mix until complete solubilization is achieved.
8. Cool to 105°C ± 2°C.
9. Add item 3 slowly to the mixer containing the mass while stirring.
10. Mix for 20 minutes.
11. Immediately transfer the hot mass to the heated storage vessel or heated vessel of a Sarong SAAS suppository-filling machine.
12. Check the temperature; it should be 105°C ± 2°C.
13. Fill weight: 2077 mg per suppository.

GLYCERIN SUPPOSITORIES FOR CHILDREN

Bill of Materials

Scale (mg/ suppository)	Item	Material Name	Qty/1000 Suppositories (g)
900.00	1	Glycerin (glycerol) (0.06% excess)	900.50
089.00	2	Sodium stearate	89.00
049.50	3	Purified water	49.50

Manufacturing Directions

1. Fill weight: 1039 mg per suppository.
2. See manufacturing directions for glycerin suppositories.

GLYCOL FOAM (NONAQUEOUS)

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Polawax A31	40.00
710.00	2	Propylene glycol	710.00
150.00	3	Ethanol DEB100	150.00

Manufacturing Directions

1. Dissolve Polawax in propylene glycol/ethanol.
2. Pack into containers, and pressurize.
3. Ethanol may be omitted if desired.
4. In aerosol pack, 90% concentrate and 10% propellant 12/114 may be used.
5. Propylene glycol is a suitable vehicle for glycol-soluble medicaments.
6. This formulation provides a mousse for such a system.

GUAIFENESIN, PSEUDOEPHEDRINE, CARBINOXAMINE, AND CHLOPHEDIANOL DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Quantity/L (g)
20.00	1	Guaifenesin	20.00
400.00	2	Sucrose	400.00
240.00	3	Glucose liquid	240.00
120.00	4	Sorbitol solution	120.00
3.00	5	Saccharin sodium	3.00
2.50	6	Sodium benzoate (powder)	2.50
30.00	7	Pseudoephedrine hydrochloride	30.00
1.00	8	Carbinoxamine maleate	1.00
6.60	9	Chlophedianol hydrochloride	6.60
105.00	10	Red E123 (Amaranth)	0.105
3.75	11	FD&C Blue No. 1	3.75 mg
QS	12	Acid, hydrochloric	QS
50.00	13	Menthol crystals	50.00 mg
2.75	14	Flavors	2.75
65.00	15	Orange oil terpeneless	65.00 mg
5.66	16	Alcohol (190 proof)	5.66
QS	17	HyFlo filter aid	0.526
QS	18	Purified water	~420.00

Manufacturing Directions

1. Charge 260 mL purified water into a suitable tank.
2. Begin heating water to 70°C to 80°C while adding guaifenesin and sucrose with stirring.
3. Continue stirring to dissolve ingredients.
4. Remove heat. Add glucose liquid and sorbitol to solution from preceding step with stirring.
5. Add saccharin sodium, sodium benzoate, pseudoephedrine hydrochloride, carbinoxamine maleate, and chlophedianol hydrochloride to solution from preceding step.
6. Stir well to dissolve all ingredients.
7. Dissolve Red E123 and FD&C Blue No. 1 in 10 mL warm purified water.
8. Add dye solution to solution from preceding step with stirring.
9. Cool solution to 30°C to 35°C.
10. QS to 975 mL using purified water. Mix well.
11. Adjust to pH 4.25 (range: 4.0–4.5) with hydrochloric acid (approximately 0.65 g/L of drops).
12. Stir well after each addition of acid.
13. Dissolve menthol, flavors, and orange oil in alcohol. Add mixture to solution from previous step with good stirring.
14. Stir the solution slowly for 2 hours.
15. Allow to stand overnight to cool and remove entrapped air.
16. QS to 1 L with purified water. Stir well.
17. Add HyFlo filter aid to solution, and mix well.
18. Recirculate through filter press or equivalent until sparkling clean.

GUAIFENESIN TABLETS

Manufacturing Directions

1. Inner tablet: guaifenesin, 175.0 mg; microcrystalline cellulose, 35.1 mg; crospovidone, 35.0 mg; PVP, 7.3 mg; talc, 2.3 mg; zinc stearate, 2.3 mg; total, 257 mg.
2. Outer tablet: guaifenesin, 425.0 mg; hydroxypropylmethylcellulose K4M, 139.9 mg; stearic acid, 30.0 mg; zinc stearate, 5.4 mg; total, 600.3 mg.
3. Make the inner tablet by oscillating guaifenesin and half of the PVP through a 30 mesh screen.
4. Transfer the blend to a pharmaceutical-grade blender and mix until it is of uniform consistency.
5. Granulate tt with PVP that had been previously dissolved in a sufficient amount of purified water to make a solution of approximately 8% to 12% of PVP.
6. Discharge this mixture and dry in a forced air oven at 40°C until the water content is less than 1%.
7. Oscillate the dried granulation through a 12 mesh screen and return to the blender.
8. Add the remaining PVP, microcrystalline cellulose, and talc to this dried granulation and mix until it is of uniform consistency.
9. Finally, add zinc stearate, and mix the mixture until it is of uniform consistency.
10. Compress this mixture into inner tablets using a standard tableting press.
11. Make the outer tablet by first passing guaifenesin through an oscillator equipped with a 30 mesh screen.
12. After this step, transfer guaifenesin to a blender, and hydroxypropylmethylcellulose K4M and stearic acid are added to it. It is mixed until uniform.
13. Add zinc stearate and blend the mixture until uniform.
14. Compress the mixture of ingredients that comprise the outer tablet around the already formed inner tablet on a standard compression coating tablet press.

GUAIFENESIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g) Percent (w/w)
69.77	1	Guaifenesin USP	69.77
16.00	2	Starch 1500	16.00
9.48	3	Microcrystalline cellulose NF	9.48
4.00	4	Starch 1500	4.00
0.50	5	Stearic acid NF	0.50
0.25	6	Magnesium stearate	0.25
100.00	7	Total	100.00

Manufacturing Directions

1. Granulation: Preblend items 1 and 2 for 2 minutes prior to granulating with water to appropriate moisture.
2. Wet mass for 3 minutes.
3. Size the granulation.
4. Pass lubricant through a 60 mesh screen prior to blending.
5. Pass colloidal silicon dioxide through a 30 mesh screen along with the MCC.
6. Blend all the ingredients, except the lubricant, for 10 minutes.

HEMORRHOID CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Lanolin alcohol (Ivarlan 3310)	20.00
448.00	2	Petrolatum	448.00
450.00	3	Petrolatum amber	450.00
30.00	4	Shark liver oil	30.00
10.00	5	Live yeast cell derivative (Biodyne's TRF)	10.00
10.00	6	Deionized water	10.00
20.90	7	Lanolin	20.90
1.00	8	Thyme oil	1.00
0.10	9	Phenyl mercuric nitrate	0.10

Manufacturing Directions

1. Mix and heat items 1 to 4 to 70°C. Cool to 50°C, and hold.
2. Separately combine items 5 to 7, heat to 40°C, and mix until homogeneous dispersion is achieved. With rapid mixing, add this mixture to previous mixture. Mix again, and cool to 40°C. Add items 8 and 9.
3. Continue mixing while cooling to 35°C.

HERBAL HEMORRHOID TABLETS

Manufacturing Directions

1. Initially, wash genera *Glycyrrhizae radix*, *Rhei rhizoma*, *Ephedrae herba*, *Moutan radicis cortex*, *Menthae herba*, *Pinelliae rhizoma*, *Pasoniae radix*, *Aconiti tuber*, *Corni fructus,* gypsum, *Ginseng radix,* and *Pelladendri radix*, respectively, with water to remove sand, clay, dust, and the like.
2. Clean and dry these natural substances to a moisture content of approximately 5%.
3. Cut 168 g of *G. radix*, 104 g of *R. rhizoma*, 104 g of *E. herba*, 168 g of *M. radicis cortex*, 104 g of *M. herba*, 168 g of *P. rhizoma*, 56 g of *P. radix*, 56 g of *A. tuber*, 56 g of *C. fructus*, 168 g of *G. radix*, and 104 g of *P. radix* into a particle size of approximately 1 cm and mix together.
4. To this mixture add 104 g of *Testudinis carapax*, 56 g of *Natrii sulfas*, 168 g of gypsum, 56 g of cinnabaris, and 256 g of talcum.
5. Thereafter, place this mixture in an extractor with an aromatic vapor collector.
6. Add 12 L of water to approximately 2 kg of the mixture in the extractor.
7. Heat the mixture in the extractor to approximately 80°C for 1 hour and then extract.
8. Filter the aqueous mixture first in a centrifugal separator and then again in a microfilter.
9. Condense the aromatic vapor distilled from the aqueous mixture and add as an aromatic liquid to the filtrate.
10. Evaporate the filtrate through an automatic vacuum evaporator to a moisture content of approximately 30% to produce an extract, which is useful as an antihemorrhoidal composition in extract form.
11. At this time, dry the concentrated liquid through a dry sprayer to produce a granulated formulation, a tablet formulation, a pill formulation, an ointment formulation, or the like, for use as an antihemorrhoid medicine.

HORSETAIL EXTRACT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
450.00	1	Horsetail extract (powder), with excess	456.00
14.00	2	Kollidon® VA 64	14.00
5.00	3	Lutrol F 68	5.00
QS	4	Isopropanol	~120.00
14.00g	5	Kollidon® CL	14.00
QS	6	Magnesium stearate	QS

Manufacturing Directions

1. Granulate the extract (item 1) with solution of items 2 to 4, dry, pass through a 0.8 mm sieve, mix with items 5 and 6, and press with high compression force.
2. Compress 489 mg using 12 mm biplanar punches.

HYDROCORTISONE AQUEOUS GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	Hydrocortisone acetate	10.00
100.00	2	Lutrol E 400	100.00
50.00	3	Cremophor RH 40	50.00
5.00	4	Carbopol 940 (Goodrich)	5.00
495.00	5	Water	495.00
QS	6	Preservative	QS
260.00	7	Water	260.00
8.00	8	Triethanolamine	8.00
–	9	Water	7.20

Manufacturing Directions

1. Heat item 6 in item 7 to 80°C, prepare a solution of items 3 and 4 in item 5, and add to the solution of preservative.
2. Add and suspend item, and mix.
3. Prepare a solution of item 8 in item 9, add to the previous solution at 70°C, and cool to form gel.

HYDROCORTISONE AQUEOUS GEL

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Hydrocortisone acetate	10.00
150.00	2	Cremophor A 25	150.00
20.00	3	Cremophor RH 40	20.00
QS	4	Preservative	QS
640.00	5	Water	640.0000

Manufacturing Directions

1. Suspend item 1 in a mixture of items 2 and 3 at 70°C.
2. Prepare solution of item 4 by heating item 5 to 70°C, and add it slowly to the hot item 4.
3. Continue to stir until the gel is cool to form clear, colorless gels.

HYDROCORTISONE CREAM

Bill of Materials

Scale (g/ 100 g)	Item	Material Name	Qty/kg (g)
1.00	1	Hydrocortisone, micronized (3% excess)	10.30
6.00	2	Propylene glycol	60.00
0.10	3	Chlorocresol	1.00
5.00	4	Mineral oil (liquid paraffin)	50.00
2.00	5	Poloxyl 20 cetostearyl ether (Cetomacrogol 1000)	20.00
8.00	6	Cetostearyl alcohol	80.00
18.00	7	Petrolatum (white soft paraffin)	180.00
0.29	8	Monobasic sodium phosphate	2.90
0.035	9	Propylparaben	0.35
0.10	10	Methylparaben	1.00
59.60	11	Purified water	596.00

Manufacturing Directions

1. Load 10 g of item 5 and items 4, 6, and 7 in fat-melting vessel.
2. Heat to 70°C to 75°C while stirring.
3. Cool down the temperature to 65°C.
4. Maintain temperature at 65°C to 70°C.
5. Heat item 11 to 90 °C in mixer.
6. Dissolve items 9 and 10 to a clear solution by stirring.
7. Cool down the temperature to 65°C.
8. Maintain temperature to 65°C to 70°C.
9. Add 10 g of item 5 and items 3 and 8 to the parabens solution to dissolve.
10. Mix for 15 minutes.
11. Maintain temperature at 65°C to 70°C.
12. Transfer oil phase to the aqueous phase in mixer vessel through mesh under vacuum while stirring at manual mode (10 rpm) at a temperature of 60°C.
13. Homogenize at high speed.
14. Maintain temperature of 60°C.
15. Vacuum at 0.4 bar for 10 minutes.
16. Cool temperature to 45°C.
17. Mix item 1 in 48 g of item 2 in a separate container at 45°C using homogenizer to make slurry.
18. Add to the dispersed phase while mixing at 10 rpm, and keep temperature at 45°C.
19. Rinse the container with 12 g of item 2, and add to the dispersed phase.
20. Mix and homogenize under vacuum at 0.4 bar for 10 minutes, low speed (10 rpm), at a temperature of 45°C.
21. Cool the temperature to 30°C while mixing at 10 rpm in automode under a vacuum of 0.4 bar.

HYDROCORTISONE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
70.00	1	Cetylstearyl alcohol	70.00
15.00	2	Cremophor A 6	15.00
15.00	3	Cremophor A 25	15.00
120.00	4	Liquid paraffin	120.00
2.00	5	Paraben	2.00
688.00	6	Water	688.00
80.00	7	Propylene glycol	80.00
10.00	8	Hydrocortisone	10.00

Manufacturing Directions

1. Heat the mixture of items 1 to 5 and the water separately to approximately 80°C.
2. Add the water to the obtained solution of items 1 to 5 with vigorous stirring.
3. Heat items 7 to 8 until the active ingredient is dissolved, mix with step 2, and continue to stir while cooling to room temperature to produce a white cream.

HYDROCORTISONE ETHANOLIC GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Hydrocortisone acetate	5.00
60.00	2	Cremophor RH 40	60.00
9.00	3	Triethanolamine	9.00
76.00	4	Water	76.00
600.00	5	Ethanol, 96%	600.00
5.00	6	Carbopol 940 (Goodrich)	5.00
245.00	7	Water	245.00

Manufacturing Directions

1. Prepare solution of items 6 and 7, and mix slowly with solution of items 1 to 5 to produce a clear, colorless gel.

HYDROCORTISONE OINTMENT

Bill of Materials

Scale g / 100 g	Item	Material Name	Qty/kg (g)
1.00	1	Hydrocortisone, micronized (6% excess)	10.60
91.50	2	Petrolatum (white soft paraffin)	915.00
7.00	3	Mineral oil (liquid paraffin)	70.00
0.50	4	Sorbitan sesquioleate (Arlacel 83)	5.00

Manufacturing Directions

1. Melt items 2 and 4 at 75°C in fat-melting vessel.
2. Start heating mixer vessel to 75°C.
3. Transfer molten items from first step to mixer through stainless steel mesh under vacuum at 0.4 to 0.6 bar.
4. Start mixer at 10 rpm in manual mode.
5. Cool down to 50°C.
6. Disperse item 1 in 60 g of item 3 using a spatula in a water bath at 60°C.
7. Homogenize for 6 minutes using homogenizer.
8. Add this to mixer while mixing.
9. Rinse the homogenizer and container with 10 g of item 3, and transfer the rinsings to the mixer.
10. Homogenize the dispersion under vacuum at 0.4 to 0.6 bar while stirring at 10 rpm in homogenizer at high speed for 10 minutes.
11. Cool the temperature to 30°C using a mixer speed 10 rpm and vacuum of 0.4 to 0.6 bar in automode.
12. Transfer the ointment to stainless steel container.

HYDROGEN PEROXIDE BLEACHING DENTIFRICE PASTE

Manufacturing Directions

1. Add to 50 g purified water, 1.5 g of emulsifier Carbopol 934/PVP in 75:25 ratio, and dissolve with gradual stirring.
2. To the mixture, 20 mL of hydrogen peroxide (50%) add and mix for an additional 5 to 10 minutes.
3. Adjust the acid composition to between pH 5.5 and 6.5 with 10% NaOH.
4. The composition thickens to a gel; set aside.
5. In a separate vessel, add 210 g of methyl methacrylate crosspolymer GMX-0610 obtained from Perspere Corp.
6. In another separate vessel, prepare the continuous phase of the invention, comprising the following ingredients: weight%, sodium fluoride, 1.05; propylene glycol, 24.10; sodium lauryl sulfate, 5.04; water, 43.40; vinyl pyrrolidone/acrylic acid,[a] 1.02; hydroxyethyl cellulose, 2.01; glycerin, 18.85; sodium saccharin, 0.47; flavor, 2.76; sodium benzoate, 0.55; benzoic acid, 0.06; sodium EDTA, 0.14; sodium hydroxide (10% solution), 0.55. [a]Dry blend copolymer containing 25% vinyl pyrrolidone and 75% Carbopol.
7. The vinyl pyrrolidone in the mixture delays the solubility of the emulsion further than Carbopol alone.
8. After the bleaching composition (step 1) has been prepared to the desired consistency, add 50 g of this composition to 50 g of the water-insoluble abrasive suspension (step 2). Disperse the two immiscible phases in each other in an intimate mixture and then, with the aid of the colloidal mill, agitate until an extremely fine homogeneous dispersion is obtained.

9. Add 100 g of the dispersion so obtained to 50 g of the continuous phase (step 3), mix the two phases in a colloidal mill. The resultant composition comprises the discontinuous phases (step 1) dispersed homogeneously throughout the continuous phase (step 2) and (step 3) of the present invention.
10. The final formulation is expressed as weight in percentage as follows: water, purified, 15.75; methyl methacrylate crosspolymer GMX-0610, 53.71; hydrogen peroxide, 10.00; Carbopol 934, 0.37; hydroxyethyl cellulose, 0.73; sodium fluoride, 0.38 (0.17% F ions); sodium lauryl sulfate, 1.83; propylene glycol, 8.75; glycerin, 6.84; sodium saccharin, 0.17; sodium benzoate, 0.20; benzoic acid, 0.02; sodium EDTA, 0.05; flavor, 1.00; sodium hydroxide (10%), QS (pH 6.5), 0.20.
11. Carbopol in this composition sufficiently retards the dissolution of the emulsified hydrogen peroxide to allow the abrasive agent methyl methacrylate crosspolymer GMX-0610 to remove the dental plaque and pellicles from the enamel surface and thus allow the bleaching active hydrogen peroxide to diffuse through the plaque-free enamel with ease.

IBUPROFEN FAST-DISSOLVE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ibuprofen coated (equivalent of ibuprofen)	121.90
11.00	2	Citric acid	11.00
3.90	3	Magnasweet 135	3.90
6.50	4	Aspartame	6.50
7.80	5	Cherry flavor	7.80
39.00	6	Croscarmellose sodium	39.00
1.95	7	Silicon dioxide	1.95
3.25	8	Magnesium stearate	3.25
457.90	9	Fast-dissolving granulation (see manufacturing directions)	457.90

Manufacturing Directions

1. Make a fast-dissolving granulation by combining 400 g of melted PEG-900 with fructose powder (100 g) in a planetary mixer (low shear mixer) and mixing until the granules form.
2. Allow the granulations to cool and then screen.
3. Screen ingredients are screened and then mix in a V-blender.
4. Compress tablets (653.7 mg) at 600 lb (approximately 2.7 kN).
5. The tablets should have hardness of 0.2 to 0.5 kp and disintegrate in less than 15 seconds.

IBUPROFEN-COATED FAST-CRUMBLING GRANULE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
16.00	2	Sodium croscarmellose (AGG)	16.00
27.50	3	Aspartame	27.50
12.20	4	Precipitated silica	12.20
35.00	5	Ethylcellulose	35.00
8.00	6	Hypromellose	8.00
1.33	7	Sodium (AGM) croscarmellose	1.33
	8	Pharmacoat® 606	

Manufacturing Directions

1. Obtain a suspension by mixing ethylcellulose, 80% precipitated silica, and 30% aspartame in ethyl alcohol until a homogeneous suspension is obtained.
2. Fluidize the powder mixture consisting of ibuprofen, item 7, 70% aspartame, and 20% precipitated silica.
3. Start the granulation by spraying the mixture for approximately 15 to 20 minutes at a spraying rate of 25 g/min and a suspension atomization pressure of 0.8 bar.
4. Perform the actual coating by spraying the remainder of the mixture over approximately 1 hour 30 minutes at a spraying rate of 15 to 20 g/min and a suspension atomization pressure of 1.5 bar.
5. Spray 15% of the mixture during the granulation step, and spray the remainder to 100% during the coating step.
6. Formulate the granules obtained as fast-crumbling multiparticulate tablets, the composition of which is as follows: coated granules, 300 mg; mannitol, 344 mg; sodium croscarmellose, 21 mg; precipitated silica, 7 mg; aspartame, 20 mg; mint flavoring, 4 mg; magnesium stearate, 4 mg.

IBUPROFEN PEDIATRIC SUSPENSION

Bill of Materials

Scale (mg/ 5 mL)	Item	Material Name	Qty/L (g)
100.00	1	Ibuprofen, low-density[a]	20.00
3000.00	2	Sucrose	600.00
10.00	3	Sodium benzoate	2.00
5.00	4	Saccharin sodium	1.00
5.00	5	Edetate disodium (sodium EDTA)	1.00
500.00	6	Glycerin (glycerol)	100.00
500.00	7	Sorbitol (70% solution)	100.00
10.00	8	Xanthan gum (Keltrol®-F)	2.00
20.00	9	Microcrystalline cellulose (Avicel™ RC-591)	4.00
5.00	10	Polysorbate 80 (Tween 80)	1.00
8.50	11	Citric acid	1.70
1.35	12	FD&C Red No. 40	0.27
7.50	13	Mixed fruits flavor	1.50
5.00	14	Strawberry flavor	1.00
QS	15	Purified water	QS to 1 L

[a] Meets USP criteria with the following additional requirements: 100% particle size less than 50 µm and tapped density of 0.3 to 0.4 g/mL.

Manufacturing Directions

1. Heat 302 g of item 15 to 90°C, and dissolve item 2 while mixing in mixer.
2. Cool to approximately 50°C.
3. Add items 3, 4, 5, 7, and 11 to mixer while mixing, and dissolve.
4. Filter the syrup through Seitz Supra 2600 filters in clean stainless steel tank.
5. In a clean stainless steel vessel, dissolve item 10 in 35 g of item 15 (40°C).
6. Add item 1 slowly while mixing with stirrer.
7. Mix for 30 minutes to make uniform dispersion. *Caution*: Avoid excessive foaming.
8. Disperse items 8 and 9 in item 6 in a clean and dry stainless steel container using stirrer.
9. Add 75 g of hot item 15 (70–90°C) at once while mixing.
10. Mix for 20 minutes to make a homogeneous smooth mucilage.
11. Add approximately 500 g syrup, ibuprofen dispersion, and mucilage to the mixer.
12. Rinse the containers of ibuprofen dispersion and mucilage with 50 g of item 15 (40°C).
13. Add the rinsings to the mixer.
14. Set the mixer: temperature, 25°C; speed, 18 rpm; and manual mode vacuum, 0.5 bar.
15. Mix for 3 minutes at low homogenizer speed.
16. Mix for 2 minutes at high homogenizer speed. Check the suspension for uniformity of dispersion.
17. Homogenize for additional 3 minutes at high speed, if required.
18. Add the balance of the syrup (approximately 507.6 g) from previous step to the mixer.
19. In a separate container, dissolve item 12 in 6 g of cooled item 15 (40°C), and transfer to the mixer.
20. Add items 13 and 14 to the mixer.
21. Set the mixer: temperature, 25°C; speed, 18 rpm; manual mode vacuum, 0.5 bar.
22. Mix for 15 minutes.
23. Mix for 5 minutes at low homogenizer speed.
24. Mix for 5 minutes at high homogenizer speed.
25. Check the suspension for uniformity.
26. Adjust the final volume to 1 L by using purified water.

IBUPROFEN CHEWABLE TABLETS

Manufacturing Directions

1. Dissolve PVAP and PVP-K90, equivalent to a 2:1 weight ratio, in minimum volumes of an aqueous ammonium hydroxide solution (28% v/v) and water, respectively, and then mix.
2. In the resulting mixture, dissolve ibuprofen, equal to the amount of PVAP used, and then add 0.1 N HCl solution dropwise until the pH of the solution is 1.
3. Filter the white solid precipitate, wash with water, and then vacuum dry.
4. Use the entrapped granules containing 39.06% ibuprofen in the preparation of tablets.
5. Accurately weigh appropriate amounts of the granules and the cherry vehicle, corresponding to 200 mg of ibuprofen per 668 mg of tablet, and then mix and compress tablets.

IBUPROFEN SUSTAINED-RELEASE BILAYER TABLETS

Manufacturing Directions

1. Immediate-Release Layer Composition
    1. Part I: Ibuprofen USP, 160.0 mg; microcrystalline cellulose NF, 32.0 mg (Avicel™ PH 101); starch NF, 32.0 mg; pregelatinized starch NF (Starch 1500), 16.0 mg; sodium starch glycolate NF, 6.4 mg.
    2. Part II: Hydroxypropylmethylcellulose 2910 USP (Methocel™ E-5), 1.6 mg; purified water USP, QS.
    3. Part III: Sodium starch glycolate NF, 1.6 mg; (Explotab) colloidal silicon dioxide NF, 0.8 mg; total, 250.4 mg.
    4. Weigh the components of part I, and preblend them in a high-shear mixer (Fielder: impeller speed of approximately 118 rpm for 3 minutes).

5. Prepare the granulating agent (part II) by dissolving the hydroxypropylmethylcellulose 2910 USP into the purified water USP (a ratio of 3.2 g of hydroxypropylmethylcellulose to 200 g water).
6. Deliver the granulating agent to the powders of part I in the high shear mixer.
7. Granulate the mixture for 20 minutes (Fielder: impeller speed of approximately 118 rpm).
8. Remove the completed wet granulation from the high-shear mixer, and load into the product bowl of a fluid-bed apparatus (e.g., Aeromatic or Glatt).
9. With an inlet air temperature of approximately 60°C, dry the granulation to a moisture level of 0.5% to 1.1% as determined by LOD (e.g., Computrac). The wet granulation can also be dried on trays in drying ovens.
10. Sieve the dried granulation (e.g., Glatt Quick Sieve: Stator No. 3, Screen No. 1, 5 mm, 1000 rpm). Other machines, such as a Fitzpatrick Communition Mill, can be used.
11. Blend the sieved and dried granulation with the powders of part III using a suitable mixer, such as a twin-shell, ribbon, or planetary mixer.

2. Sustained-Release Layer
   1. Povidone USP (Plasdone K 29/32), 14.7 mg; alcohol USP and purified water USP (QS); 1:1 mixture.
   2. Pregelatinized starch NF (Starch 1500 LM), 0.8 mg; microcrystalline cellulose NF (Avicel™ PH101), 7.3 mg; magnesium stearate NF, 5.0 mg; colloidal silicon dioxide NF (Cab-O-Sil), 5.0 mg. total, 523.3 mg; total tablet weight, 773.7 mg.
   3. Weigh the components of part I, and preblend them in a high-shear mixer (Fielder: impeller speed of approximately 250 rpm for 1 minute).
   4. Prepare the granulating agent (part II) by dissolving Povidone USP in a 1:1 mixture of alcohol USP and purified water USP (a ratio of 12.25 g of povidone to 100 g of alcohol/water).
   5. Spray the granulating agent at a rate of 600 mL/min onto part I in the high-shear mixer.
   6. Granulate the mixture for 1 minute after the addition of part II (Fielder: impeller speed of approximately 250 rpm).
   7. Remove the completed wet granulation from the high-shear mixer, and load it into the product bowl of a fluid-bed apparatus (e.g. Aeromatic or Glatt).
   8. With an inlet air temperature of approximately 60°C, dry the granulation to a moisture level of 0.3% to 0.8% as determined by LOD (e.g., Computrac).
   9. The wet granulation can also be dried on trays in drying ovens.
   10. Sieve the dried granulation (Fitzpatrick Communition Mill, Model D6: medium speed, knives forward, 0.093 screen). Other machines, such as Glatt Quick Sieve, can also be used.
   11. Blend the sieved and dried granulation with the powders of part III using a suitable mixer such as a twin-shell, ribbon, or planetary mixer.

3. Compression of Tablets or Caplets
   1. Load the granulation of the immediate-release layer into one hopper and the granulation of the sustained-release layer into the second hopper of a bilayer tableting machine (e.g., Stokes Versapress).
   2. Compress tablets using 0.749 × 0.281 × 0.060 extra deep concave capsule-shaped tooling. (Tablet tooling of other shapes, such as oval or round, can also be used.)
   3. The sustained-release layer has a target weight of 523.3 mg, and the immediate-release layer has a target weight of 250.4 mg. Ideal tablet hardness immediately after compression is 11 to 12 kp.

IBUPROFEN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Ibuprofen	200.00
88.00	2	Maize starch	88.00
30.00	3	Maize starch	30.00
12.80	4	Maize starch (dried)[a]	12.80
1.60	5	Stearic acid (fine powder)	1.60
–	6	Purified water	144.00

[a] LOD: NMT 4.5% when dried at 120°C for 4 hours.

Manufacturing Directions

1. Pass item 3 through a 250 µm sieve using a sifter.
2. Prepare a slurry of item 3 with 10.67 g of cold item 6 (25–30°C) in a stainless steel container.
3. Pour the slurry into a vessel containing 37.33 g of hot item 6 (70–90°C).
4. Heat to 80°C to 90°C, and mix until mixture swells and becomes translucent.
5. Cool to 50°C.
6. Check weight (theoretical weight, 58.00 g). If required, adjust with hot purified water. Record the quantity of extra water added.
7. Pass items 1 and 2 through sifter using 250 µm sieve.
8. Load it into a mixer (if required, grind item 1 through a 1 mm sieve).
9. Mix the powder for 15 minutes at high speed.

10. Add binding solution to the dry powder in the mixer, and mix for 15 minutes at high speed. Check for satisfactory wet mass.
11. Pass the wet mass through a Fitz mill using sieve 24207, knives forward, medium speed.
12. Collect and spread the granules onto the trays, one-third the thickness of the tray.
13. Load the trolleys into the oven, and dry the granules at 55°C for 36 hours.
14. After 12 hours of drying, stir the granules in the trays, and change the position of the trays for uniform drying.
15. Check the moisture of the dried granules. The limit NMT is 2.5%. Dry further if required to obtain moisture content of 2.5%.
16. Check the weight of dried granules (theoretical weight = 318.00 g).
17. Pass the dried granules through a 1.5 mm sieve using a granulator. Collect in a stainless steel drum, and add to the blender.
18. Pass items 4 and 5 through a 250 µm sieve using a sifter.
19. Add the sieved material to the granules in a blender, and mix for 5 minutes.
20. Compress 330 mg in 10 mm convex punches at 4 to 9 kp.
21. Coat the tablets using one of the PVP coating solutions provided in the Appendix, or use the sugar-coating formulation given here.

Bill of Materials: Sugar Coating

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
7.06	1	Sandrac varnish (WMR)	7.06
3.33	2	Povidone (PVP K-25)	3.33
1.86	3	Povidone (PVP K-25)	1.86
175.85	4	Sucrose	175.85
0.16	5	Titanium dioxide	0.16
1.20	6	Polishing emulsion	1.20
1.33	7	Talc (fine powder)	1.33
–	8	Purified water	87.10

22. Load the tablets into the pan.
23. Start the tablets rolling with the exhaust on and air supply off.
24. Pour the item 1 solution onto the rolling tablets, and allow the tablets to roll, using hand agitation if required, permitting the solution to spread well over the tablet bed.
25. Permit the tablets to roll until tack develops, at which point item 7 should be quickly sprinkled over the tablets.
26. Allow to roll freely for 2 minutes at 45°C.
27. Do not roll too long, as the seal may be worn from the tablet edges.
28. After 2 minutes of rolling, jog the tablets every 1 minute over a period of 15 minutes with exhaust and drying air on at 45°C.
29. Continue jogging for a further 15 minutes. Jog every 3 minutes with exhaust and drying air temperature on at 45°C.
30. Dissolve 2.40 g of item 2 in 28.80 g of item 8.
31. Apply a half quantity of it to the tablets over 5 minutes. Allow to dry, and apply the remainder over a 15 minute period.
32. Heat 11.52 g of item 8 to boiling, dissolve 26.88 g of item 4, and cool down to 25°C.
33. Check weight (theoretical weight, 38.40 g). If lower, adjust weight to 38.40 g with purified water.
34. Apply sugar coat over a 30 minute period.
35. Dry the tablets in the coating pan at 30°C, jogging every 1 hour for 6 hours.
36. Heat 72 g of item 8 in mixer to boiling.
37. Dissolve 168 g of item 4, and then cool to 25°C.
38. Filter the syrup through a 180 µm stainless steel sieve.
39. Dissolve item 3 in 3.68 g of item 8.
40. Dissolve 4.53 g of item 4 in item 6.
41. Disperse item 5 in approximately 10.67 g of sugar syrup from the previous step, and homogenize.
42. Mix these steps with sugar syrup. Check for evenness of the dispersion.
43. Apply sugar coating.

Bill of Materials: Polishing Coat

Scale (mg/g	Item	Material Name	Qty/kg (g)
28.75	1	Beeswax, bleached (white beeswax)	28.75
70.00	2	Polyethylene glycol (PEG-6000)	70.00
57.50	3	Carnauba wax	57.50
125.00	4	Talc (fine powder)	125.00
718.75	5	Ethanol, 95%	718.75

44. Melt items 1, 2, and 3 in a steam-heated vessel by gentle heating to 70°C or in a stainless steel container on a hotplate heater.
45. Add item 4 to the vessel or stainless steel container, and stir manually.
46. Add item 5 to the vessel or stainless steel container, and stir manually.
47. Pass the mixture through a homogenizer.
48. Store the polishing emulsion in a closed container at room temperature.
49. Apply gloss solution.
50. Add item 6 without air to the tablet bed carefully to get a uniform distribution while rolling.
51. After 5 minutes of distribution, turn on the cold air, and roll further until a shine appears.
52. Once the desired polish appears, stop rolling the pan.
53. Dry the tablets in the pan at 30°C for 30 minutes. Final tablet weight should be 480 mg.

INOSIN TABLETS

Bill of Materials

Scale (g/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Inosin (Ribaxin, Russia)	200.00
51.00	2	Lactose monohydrate	51.00
6.00	3	Kollidon® 90 F	6.00
QS	4	Isopropanol	60.00 mL
10.00	5	Kollidon® CL	10.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with the solvent mixture of item 4.
2. Dry and pass through a 0.8 mm sieve, add items 5 and 6, and press with low compression force.
3. Compress 270 mg in 9 mm biconvex punches.

INSECT BITE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
180.00	1	Trilaneth-4 phosphate, glyceryl stearate, and PEG-2 stearate	180.00
20.00	2	Hydrogenated palm/kernel oil PEG-6 esters	20.00
80.00	3	Mineral oil	80.00
0.30	4	Sodium methylparaben	0.30
0.70	5	Sorbic acid	0.70
646.70	6	Deionized water	646.70
10.00	7	Benzocaine	10.00
10.00	8	Butamben	10.00
2.00	9	Menthol	2.00
0.30	10	Resorcinol	0.30
50.00	11	Ethoxydiglycol	50.00

Manufacturing Directions

1. Dissolve items 7 to 10 in item 11.
2. Mix and heat items 1 to 6 to 75°C.
3. Allow to cool slowly with constant stirring.
4. At 35°C, add this to previous mixture.
5. Homogenize if necessary.

IRON INFANT DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
0.18	1	Propylparaben	0.18
0.022	2	Methylparaben	0.02
1000.00	3	Sorbitol solution	1.00 kg
4.00	4	Citric acid (hydrous powder)	4.00
125.00	5	Iron sulfate	125.00
0.106	6	Sodium metabisulfite	0.10
0.50	7	Guarana flavor (artificial)	0.50
20.00	8	Alcohol (ethanol)	20.00
0.14	9	Dye	0.14
QS	10	Sodium hydroxide	QS
QS	11	Citric acid (powder)	QS
QS	12	Purified water	QS to 1 L
QS	13	HyFlo filter aid	1.00
QS	14	Liquid nitrogen	QS
QS	15	Carbon dioxide gas	QS

Manufacturing Directions

The product is susceptible to oxidation. No effort should be spared to protect it from atmospheric air. Maintain carbon dioxide (CO_2) or nitrogen atmosphere where indicated. The product must be manufactured and held in a glass-lined or stainless steel tank. Product waiting to be filled should be either in a closed tank with a CO_2 atmosphere or in an open tank covered with polyethylene sheeting taped tightly with a constant slow stream of CO_2 gas flowing into the tank headspace. Avoid vortex formation throughout processing.

1. Place 144 mL of purified water into a mixing tank.
2. Heat to 95°C to 100°C, and add parabens with strong agitation.
3. Add sorbitol solution and citric acid (item 4) while mixing.
4. Bring solution to 90°C while mixing.
5. Cool the solution while mixing to 60 °C to 65 °C, and hold at this temperature with CO_2 or nitrogen gas bubbling into it.
6. CO_2 gas protection is continued for the remainder of the manufacturing process.
7. Add ferrous sulfate and dissolve while mixing, holding at 60°C to 65°C.
8. Cool to 25°C with mixing.
9. Add sodium metabisulfite, and dissolve while mixing.
10. Avoid vortex formation.
11. Dissolve dye in 2 mL of freshly boiled purified water, and add to the tank. Mix.

12. Dissolve the guarana flavor in alcohol, add to the tank, and mix.
13. Check pH (range: 1.8–2.2). Adjust if necessary with a solution of 10% sodium hydroxide or a solution of 10% citric acid.
14. Make up to volume with freshly boiled purified water, and mix.
15. Readjust to volume if necessary with freshly boiled purified water, and mix.
16. Add HyFlo filter aid, and mix. Filter through press until clear.
17. Bubble CO_2 or nitrogen gas into the clear filtrate for 5 minutes; then, seal tank, and hold product under CO_2 or nitrogen protection.

IRON (POLYMER-COATED PARTICLE) TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Elemental iron; use ferrous sulfate polymer-coated particles (233 mg iron per gram ferrous sulfate)	450.60
200.00	2	Cellulose microcrystalline	200.00
254.40	3	Lactose monohydrate	254.40
36.00	4	Sodium starch glycolate	36.00
9.00	5	Magnesium stearate	9.00

Note: Factor in potency of ferrous sulfate polymer-coated particles. Adjust with item 3. Item 1 is prepared by first granulating ferrous sulfate using alcohol and water, drying, and sieving particles over 1200 µm in size. Regranulate smaller particles. Apply enteric (HPMC) coating to the granules in a fluid-bed dryer.

Manufacturing Directions

1. Load a suitable mixer/blender with microcrystalline cellulose, and disperse the ferrous sulfate polymer-coated powder.
2. To this mix, add about half the lactose (item 3), and blend for 5 minutes.
3. Pass the sodium starch glycolate through a 500 µm sieve followed by about half of the remaining lactose.
4. Add to the mix.
5. Blend for further 5 minutes.
6. Pass the magnesium stearate (item 5) through a 500 µm sieve followed by the remaining lactose.
7. Add to the previous mix.
8. Blend for further 5 minutes.
9. Compress 950 mg per tablet at 8 to 14 kpi using 8 mm × 16 mm punches. Do not rework tablets.
10. Coat the tablets using a HPMC coating solution (see Appendix).

IRON POLYSTYRENE AND VITAMIN C SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
125.00	1	Glycerin	125.00
1.40	2	Methylparaben	1.40
0.16	3	Propylparaben	0.16
79.61	4	Sorbitol; use sorbitol solution	364.33
3.30	5	Xanthan gum	3.30
10.00	6	Sucrose (granulated)	10.00
0.20	7	Saccharin (insoluble)	0.200
105.00	8	Elemental iron; use iron polystyrene sulfonate	530.31
50.00	9	Ascorbic acid, USP (35% excess)	61.95
0.10	10	Flavor	1.00 mL
0.10	11	Flavor (artificial guarana)	1.00 mL
QS	12	Sodium hydroxide	12.00
QS	13	Dye	2.00
9.50	14	Distilled purified water	~95.00 mL
10.00	15	Sorbitol solution	~10.00

Manufacturing Directions

1. Add glycerin (item 1) to the tank.
2. Commence heating with agitation.
3. Add and disperse parabens.
4. Continue heating to 70°C to 80°C, and mix until solution is complete.
5. Force cool to 30°C; then, add and disperse xanthan gum (item 5).
6. Add sorbitol solution (item 4) and 80 mL of purified water (item 14), and heat with mixing to 60°C to 70°C until the xanthan gum is fully dissolved.
7. Add and disperse saccharin and sugar (items 6 and 7).
8. Mix at 60°C to 70°C until dispersion is complete.
9. Force cool to 25°C to 30°C with continuous mixing.
10. Commence N_2 gas protection, and maintain for the remainder of the manufacturing process.
11. Add and disperse ascorbic acid.
12. Continue mixing for 30 minutes at 25°C to 30°C.
13. *Note:* Use suitable stainless steel high-powered stirrer.
14. Mix the iron polystyrene sulfonate milled slurry in the original epoxy-lined drums under N_2 gas protection until uniform.
15. Add the slurry to the main batch, and mix for 30 minutes at 25°C to 30°C.
16. *Note:* Avoid scraping the epoxy lining of the steel drum while mixing, and use a plastic or rubber scraper to assist in complete transfer of the mixed slurry.) Add and disperse the flavors. Mix well.
17. Check and record pH. Adjust pH using a 20% sodium hydroxide solution (1 g in 5 mL water) to a value of 3 (range: 2.8–3.2).

18. Dissolve the dye in 5 to 7 mL of water at 40°C to 45°C by stirring for 10 minutes.
19. Add this solution to the main batch through a 420 µm screen with mixing.
20. Rinse container with 2 to 3 mL water at 40°C to 45°C, and add to bulk through a 420 µm screen.
21. Continue to mix under vacuum until mixture is uniform.
22. Pass the suspension through the colloid mill at a gap setting of 100 to 150 µm.
23. Adjust the flow rate such that the temperature rise of the suspension does not exceed 10°C.
24. Collect the milled suspension in a stainless steel jacketed tank with vacuum.
25. Mix at 25°C to 30°C under vacuum until a uniform suspension is achieved.
26. Flush the bulk suspension with nitrogen, and seal.
27. Hold at 25°C to 30°C.

KAOLIN-PECTIN SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
5.40	1	Sodium methylparaben	4.92
0.6	2	Sodium propylparaben	1.08
36.00	3	Magnesium aluminum silicate type IA	0.11
5832.00	4	Kaolin (powder)	194.40
130.00	5	Pectin	4.33
120.00	6	Sodium CMC (premium, low-viscosity)	4.00
210.00	7	Cyclamate calcium	7.00
21.00	8	Saccharin calcium (powder)	0.70
15.375	9	Flavor	0.51
1.234	10	Flavor	41.13
QS	11	Distilled purified water (approx.)	QS
QS	12	Citric acid (anhydrous powder)	QS

Manufacturing Directions

1. Charge 600 mL of water into a suitable jacketed mixing tank.
2. Add the methylparaben and propylparaben to the tank, and heat to 90°C to 95°C.
3. Cool to 70 °C, add the magnesium aluminum silicate, and mix for 30 minutes or until evenly dispersed.
4. Hold temperature at 70°C.
5. Add kaolin with constant mixing at 70°C until evenly dispersed.
6. Add pectin and mix for 2 hours, maintaining a temperature of 70°C.
7. Add the premium, low-viscosity sodium CMC, and mix for at least 30 minutes, maintaining a temperature of 70°C.
8. Cool to 60°C, and hold at this temperature.
9. Add, in order, the cyclamate calcium and saccharin calcium, and mix thoroughly for 20 minutes.
10. While mixing, cool to room temperature, and allow to stand overnight to hydrate.
11. After overnight standing (minimum 12 hours), mix for 30 minutes.
12. Add flavors while mixing.
13. Check and record pH (range: 4.5–7.5). If pH is more than 7.5, adjust with a 60% solution of citric acid to the desired pH.
14. Add water to 1 L, and mix thoroughly for 3 hours.
15. Strain product through muslin cloth into holding tanks, and cover.

KAOLIN-PECTIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
QS	1	Distilled purified water	300 mL
50.00	2	Cornstarch	50.00
50.00	3	Povidone (K-29-32)	50.00
QS	4	Distilled purified water	0.50 L
630.00	5	Hydrated aluminum–magnesium silicate	630.00
100.00	6	Kaolin (powder)	100.00
50.00	7	Pectin	50.00
80.00	8	Cornstarch	80.00
80.00	9	Sodium lauryl sulfate	80.00
10.00	10	Magnesium stearate	10.00

Manufacturing Directions

1. Heat purified water (item 1) to 75°C to 80°C, and add cornstarch (item 2) with continuous stirring until a translucent paste is formed. Use this paste within 1 hour.
2. Dissolve povidone in purified water (item 4) in a separate container. Ensure that dissolution is complete.
3. Charge the following into a suitable planetary mixer: hydrated aluminum–magnesium silicate, kaolin, and pectin.
4. Mix for 5 minutes.
5. Add freshly prepared starch paste from the first step and the povidone solution to the powder blend from the third step. Mix until a mass of suitable consistency is obtained.
6. Add extra-purified water, if needed.
7. Spread the wet mass on paper-lined trays, and dry in the oven at 50°C for 2 hours.
8. Pass the semidried mass through a 4.8 mm (4 mesh) screen by hand or by using a suitable granulator, and load the granule mass onto paper-lined trays.

9. Dry in the oven at 50°C until the moisture content is between 10% and 15%.
10. Pass the dried granules through a 1 mm (18 mesh) screen on a comminuting mill at medium speed, knives forward, into clean, tared, polyethylene-lined drums. Seal and weigh.
11. Transfer the dried granules to a suitable blender.
12. Screen the following items through a 595 µm (30 mesh) screen, and add to the blender: cornstarch (item 8), sodium lauryl sulfate, and magnesium stearate.
13. Blend for 5 to 10 minutes.
14. Compress on a suitable compression machine using 1/2 in. round standard concave punches, upper punch with logo, and lower punch with a bisect line.
15. Compress 977 mg at 10 to 18 kpi.
16. Coat using an aqueous Methocel™ coating, and polish as desired.

KERATOLYTIC CREAM

Bill of Materials

Scale (mg/10 g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax (self-emulsifying wax)	15.00
150.00	2	PPG-2 myristyl ether propionate (Crodamol PMP)	15.00
50.00	3	Sorbitol isostearate	5.00
35.00	4	Safflower oil, super-refined	3.50
20.00	5	Avocado oil, super-refined	2.00
20.00	6	Cetyl palmitate	2.00
50.00	7	Salicylic acid	5.00
1.50	8	Propylparaben	0.15
1.00	9	Butylated hydroxyl anisole	0.10
487.50	10	Deionized water	48.75
10.00	11	Sodium borate	1.00
3.00	12	Methylparaben	0.30
2.00	13	Imidazolidinyl urea	0.20
20.00	14	Hydrolyzed collagen + hyaluronic acid (Cromoist HTA)	2.00

Manufacturing Directions

1. Dissolve item 7 in item 2 with mixing and heating to 70°C.
2. Add balance of items 1 to 9, and mix with heat to 80°C. Add items 10 to 13 together in a separate container , and heat to 80°C.
3. Add this mixture to the first mixture with mixing, and cool to 40°C.
4. Add item 14 with mixing, and cool to the desired fill temperature.
5. Adjust pH if necessary to 3 to 4 with 10% triethanolamine solution.

KHELLIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Khellin	25.00
124.00	2	Ludipress®	124.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press.
2. Compress 150 mg in 8 mm biplanar punches.

LIDOCAINE GEL

Bill of Materials

Scale (mg/10 g)	Item	Material Name	Qty/kg (g)
20.00	1	Lidocaine hydrochloride	2.00
560.00	2	Water	56.00
200.00	3	Propylene glycol (pharma)	20.00
220.00	4	Lutrol F 127	22.00

Manufacturing Directions

1. Prepare solution of items 1 to 3 at room temperature, heat to 70°C or cool to 6°C, and slowly add item 4 to the well. Stir solution until it is dissolved.
2. Maintain the temperature until the air bubbles escape to obtain a clear, colorless gel.

LIDOCAINE GEL CREAM

Bill of Materials

Scale (mg/10 g)	Item	Material Name	Qty/kg (g)
50.00	1	Lidocaine hydrochloride	5.00
500.00	2	Water	50.00
150.00	3	Propylene glycol (pharma)	15.00
100.00	4	Liquid paraffin	10.00
200.00	5	Lutrol F 127	20.00

Manufacturing Directions

1. Prepare solution of items 1 to 3 at room temperature, and mix with item 4.
2. Heat to 70°C or cool to 6°C, and slowly add item 5 to the well. Stir solution until it is dissolved.
3. Maintain the temperature until the air bubbles escape.

LIDOCAINE OINTMENT

Bill of Materials

Scale (g/100 g)	Item	Material Name	Qty/kg (g)
5.00	1	Lidocaine base	50.00
28.00	2	PEG-3350	280.00
40.00	3	PEG-400	400.00
25.00	4	Propylene glycol	250.00
2.00	5	Purified water	20.00

Manufacturing Directions

1. Load items 2 and 3 into a fat-melting vessel.
2. Heat to 70°C.
3. Cool to 40°C while stirring at slow speed (10–12 rpm).
4. Maintain the temperature between 40°C and 45°C under continuous stirring.
5. Heat 200 g of item 4 to 40°C to 45°C in a stainless steel container.
6. Dissolve item 1 by stirring with stirrer.
7. Add item 5 under continuous stirring.
8. Maintain the temperature between 40°C and 45°C under continuous stirring.
9. Filter through cloth filter.
10. Transfer the drug solution into a mixer previously set with a temperature of 40°C to 45°C.
11. Rinse the stainless steel container with 50 g of item 4.
12. Add the rinsings into the mixer.
13. Transfer the molten mass from the fat-melting vessel at 40 °C through a stainless steel filter to the mixer containing the drug solution while mixing at 10 to 12 rpm.
14. When the transfer is over, start the homogenizer at low speed with a vacuum of 0.6 bar and stirrer speed of 10 rpm (manual mode).
15. Mix and homogenize for 10 minutes with recirculation.
16. Maintain temperature at 40°C to 45°C.
17. Stop the homogenizer, and set the mixer at temperature 25°C and stirrer speed at 10 rpm (manual mode).
18. Cool the cream to 25°C.
19. When the ointment is cooled to 25°C, unload the ointment into a stainless steel container.

LIDOCAINE, EUGENOL, AND MENTHOL DENTAL OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
55.20	1	Beeswax (white, slabs)	55.20
150.00	2	Anhydrous lanolin (regular)	150.00
723.70	3	Petrolatum (white, regular)	723.70
40.00	4	Lidocaine base	40.00
1.20	5	Saccharin sodium (powder)	1.20
QS	6	Deionized, purified water	3.00 mL
1.00	7	Eugenol	1.00
5.00	8	Menthol (crystals)	5.00
0.80	9	Peppermint oil	0.80
20.16	10	Metaphen ointment base	20.16

Manufacturing Directions

1. Melt beeswax, lanolin, and petrolatum together at 70°C to 80°C, and strain into a suitable container.
2. Do not heat above 70°C to 80°C.
3. Mix together.
4. Melt lidocaine base, and strain into the container while mixing.
5. Dissolve the sodium saccharin in purified water heated to 70°C.
6. Add to the container while mixing.
7. Cool down to 45°C to 50°C while mixing.
8. Mix the eugenol, menthol, and peppermint oil together, and liquefy.
9. Warm gently to 35°C to 40°C if necessary.
10. Strain into the container while mixing.
11. Gently melt metaphen ointment base, and strain into the container while mixing.
12. Mix thoroughly until congealed.

LOPERAMIDE HYDROCHLORIDE FAST-MELT TABLET

Manufacturing Directions

1. Prepare granules by using loperamide hydrochloride, 5%; sodium bicarbonate, 27%; citric acid anhydrous, 27%; tartaric acid, 3%; microcrystalline cellulose, 15%; anhydrous lactose, 8%; xylitol, 12%; and Crodesta F160, 3%.
2. Dry the ingredients at elevated temperature in the presence of a desiccant to significantly reduce the moisture content of each material.

3. Blend the ingredients for 10 minutes and extrude in a hot melt extruder at 70°C to 100°C to soften and melt the thermal binders (sucrose stearate and xylitol) to form granules containing the effervescent ingredients.
4. Pass the granules through a screen and then blend with the following ingredients: LH-EFG (30–80 mesh), 50%; microcrystalline cellulose, 31%; mannitol, 8%; Ac-Di-Sol, 5%; L-HPC LH-11, 2%; aspartame, 3%; redberry flavor, 0.4%; magnesium stearate, 0.5%; Cab-o-Sil M5P, 0.1%. These are mixed for 5 minutes prior to compression.
5. Compress loperamide FICI tablets to a hardness of approximately 1 to 3 kg and tablets disintegrate in purified water in approximately 15 to 35 seconds.

LORATADINE AND PSEUDOEPHEDRINE SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Loratadine	25.00
180.00	2	Pseudoephedrine sulfate	180.00
5.00	3	PVP	5.00
75.00	4	Low-substituted hydroxypropyl cellulose	75.00
75.00	5	Crospovidone	75.00
1.50	6	Colloidal silicon dioxide	1.50
25.00	7	Microcrystalline cellulose	25.00
250.00	8	Crystalline sugar seeds	250.00
120.00	9	Purified water	120.00

Manufacturing Directions

1. Prepare a binder solution by dissolving 5 g of PVP in 120 g of water.
2. Mix and screen 25 g of loratadine, 180 g of pseudoephedrine sulfate, 25 g of microcrystalline cellulose, 75 g of low-substituted hydroxypropyl cellulose, 75 g of crospovidone, and 1.5 g of colloidal silicon dioxide through a 20 mesh sieve to give a mixed powder.
3. Spray the binder solution of step 1 onto 250 g of crystalline sugar seeds in a centrifugal granulator, and dust the mixed powder onto the crystalline sugar seeds in the centrifugal granulator to afford pellets using the rotation panel rate of 140 to 200 rpm, the spraying rate of the binder solution of 2 to 20 mL/min, air spraying pressure of 1 to 2 kg/cm^2, air spraying volume of 5 to 300 L/min, and powder (step 2) spraying rate of 5 to 30 g/min.

LORATADINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Loratadine	10.00
69.93	2	Pregelatinized starch	69.93
69.63	3	Microcrystalline cellulose	69.63
0.37	4	Colloidal silicon dioxide	0.37
0.25	5	Magnesium stearate	0.25

Manufacturing Directions

1. Use a multistep blending process to ensure proper distribution of the active. Initially, combine half of the pregelatinized starch with the drug and colloidal silicon dioxide.
2. Blend this mixture in a twin-shell V-blender for 5 minutes.
3. Discharge the mixture and pass through a 40 mesh screen by hand.
4. This step not only breaks up the silicon dioxide but also helps to distribute the active.
5. Return the screened mixture to the blender, and add the remainder of the Starch 1500 and blend for an additional 5 minutes.
6. Add the MCC and blend for 10 minutes.
7. Add the magnesium stearate last and blend for 5 minutes.
8. Pass the magnesium stearate through a 60 mesh screen prior to weighing.
9. Compress tablets at 100 mg or proportionally for different strengths.

LORATADINE FASTAB

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Loratadine (micronized)	10.00
180.60	2	Pharmaburst	180.60
2.70	3	Acesulfame K	2.70
2.00	4	Magnesium stearate	2.00
2.00	5	Talc (fine powder)	2.00
2.70	6	Dry anise flavor	2.70

Manufacturing Directions

1. Sift and mix items 1, 2, 3, and 6.
2. Lubricate with magnesium stearate and fine talc powder.
3. Compress 200 mg in 6 mm punches.

LORATADINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Loratadine	10.00
67.30	2	Lactose monohydrate	67.30
22.00	3	Maize starch	22.00
10.00	4	Maize starch	10.00
5.00	5	Maize starch, dried	5.00
0.70	6	Magnesium stearate	0.70
QS	7	Purified water	QS

Manufacturing Directions

1. Sift items 1 to 3 through a 630 μm stainless steel sieve, load in mixer, and mix for 5 minutes.
2. In a separate container, prepare binder solution by mixing item 4 using purified water at 30°C to 40°C, heat translucent slurry to 90°C to 95°C, and cool to 45°C to 50°C.
3. Mix the binder solution with the first step and granulate, dry on trays at 55 °C for 8 hours, and dry to LOD of 2% to 3% (2 hours after beginning drying, crush mixture for uniform drying).
4. Heat additional 1 hour at 55°C if LOD is not within limits.
5. Add magnesium stearate, tumble mix, and compress using 7 mm round punches to 10-tablet weight of 1.15 (within 3%) to achieve thickness of 2.3 ± 0.3 mm and hardness of 4 to 7 kp.

LYCOPENE TABLET CORES (6 MG)

Formulation

LycoVit 10% dry powder, 60 g; Ludipress®, 330 g; Kollidon® CL, 6 g; magnesium stearate, 4 g.

Manufacturing Directions

1. Mix the LycoVit dry powder with the other components.
2. Sieve through a 0.8 mm screen, and press with medium to high compression force at 400 mg.

MAGALDRATE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Magaldrate, USP	500.00
400.00	2	Lactose monohydrate	400.00
50.00	3	Orange flavor (FDO)	50.00
20.00	4	Kollidon® 90 F	20.00
6.00	5	Banana flavor (FDO)	6.00
6.00	6	Cocoa flavor (FDO)	6.00
1.00	7	Saccharin sodium	1.00
180.00	8	Water	180.00
5.00	9	Aerosil® 200	5.00
3.00	10	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 to 8, pass through a 0.8 mm sieve, dry, mix with items 9 and 10, and press with low compression force.
2. Compress 1 g in 16 mm biplanar punches.

MAGALDRATE CHEWABLE TABLETS (500 MG)

Formulation

1. Magaldrate USP, 500 g; lactose monohydrate, 400 g; orange flavor (FDO), 50 g.
2. Kollidon® 90 F, 20 g; banana flavor (FDO), 6 g; cocoa flavor (FDO), 6 g; saccharin sodium, 1 g; water, 180 g.
3. Aerosil® 200, 5 g; magnesium stearate, 3 g.

Manufacturing Directions

1. Wet granulation: Granulate mixture 1 with solution 2, pass through a 0.8 mm sieve, dry, mix with 3, and press with low compression force at 1000 mg.

MAGALDRATE CHEWABLE TABLETS (1000 MG)

Formulation

Magaldrate (Reheis), 1000 g; Ludipress® LCE, 930 g; Lutrol E4000F, 60 g; aspartame, potassium (Searle), 10 g; peppermint flavor, QS.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force at 2 g.

MAGALDRATE DISPERSIBLE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
700.00	1	Magaldrate	700.00
435.00	2	Lactose monohydrate	435.00
10.00	3	Kollidon® 90 F	10.00
50.00	4	Kollidon® CL	50.00
5.00	5	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8-mm sieve, mix, and press with low compression force (4–6 kN).
2. Compress 1.2 g in 16 mm biplanar punches.

MAGALDRATE INSTANT POWDER OR DRY SYRUP

Bill of Materials

Scale (mg/ Sachet)	Item	Material Name	Qty/1000 Sachets (g)
800.00	1	Magaldrate, USP	800.00
640.00	2	Kollidon® CL-M	640.00
200.00	3	Sorbitol (crystalline)	200.00
40.00	4	Orange flavor	40.00
40.00	5	Kollidon® 90 F	40.00
4.00	6	Coconut flavor	4.00
4.00	7	Banana flavor	4.00
0.80	8	Saccharin sodium	0.80
QS	9	Water	~280.00 mL

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of items 5 to 9, and pass through a 0.8 mm sieve to obtain free-flowing granules.
2. Fill 2 g in sachets or 20 g in a 100 mL flask.
3. Instant granules in sachets: suspend 2 g (= one sachet) in a glass of water (= 800 mg magaldrate).

MAGALDRATE SUSPENSION

Bill of Materials

Scale (mg/ mL)	Item	Material Name	Qty/L (g)
100.00	1	Magaldrate USP	100.00
80.00	2	Kollidon® CL-M	80.00
20.00	3	Kollidon® 90 F	20.00
10.00	4	Orange flavor	10.00
0.50	5	Coconut flavor	0.50
0.80	6	Banana flavor	0.80
0.20	7	Saccharin sodium	0.20
QS	8	Preservatives	QS
QS	9	Water	QS to 1 L

Manufacturing Directions

1. Dissolve or suspend all the solids in water under aseptic conditions; pH should be approximately 9.

MAGALDRATE TABLETS

Bill of Materials

Scale (mg/ tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Magaldrate (powder, 100 mesh)	400.00
325.00	2	Sucrose	325.00
60.00	3	Cellulose (microcrystalline) (Avicel™ PH101)	60.00
30.00	4	Cornstarch	30.00
8.84	5	Guar gum	8.84
0.50	6	Saccharin sodium	0.50
–	7	Purified water	100.00 mL
–	8	Alcohol SD 3A (200 proof)	100.00 mL
QS	9	Flavor	0.60 mL
QS	10	Flavor	1.00 mL
0.06	11	Ethyl vanillin	0.06
8.00	12	Talc	8.00
16.00	13	Magnesium stearate	16.00

Manufacturing Directions

1. Pass granulated sugar (take approximately 10% excess) through 500 µm stainless steel screen on comminuting mill (impact forward, high speed).
2. Screen the milled sugar through 250 µm aperture on sieve shaker.
3. Weigh the required quantity, and charge into a suitable mixer.
4. Discard remaining sugar.
5. Screen magaldrate powder (take approximately 5% excess) through 150 µm stainless steel screen on sieve shaker.

6. Weigh the required quantity, and add to the previous blend.
7. Mix well.
8. Screen, if necessary, microcrystalline cellulose, cornstarch, and guar gum through 500 µm aperture on sieve shaker.
9. Add to the first step, and mix well.
10. Dissolve saccharin sodium in water.
11. To this, add alcohol, and mix well.
12. Add this hydroalcoholic solution to magaldrate blend, and knead well.
13. Add more water, if necessary, and QS to mass.
14. Pass wet mass through 2.8 mm aperture on sieve shaker or oscillating granulator, and spread uniformly on stainless steel trays.
15. Tray dry granules at 70°C to 75°C.
16. After 3 to 4 hours of drying, screen semidried granules through 1.4 mm aperture on sieve shaker, and reload for further drying.
17. (This step helps in drying granules faster and more uniformly.) Dry to LOD of 1% to 1.5%.
18. Screen dry granules through 1 mm aperture on sieve shaker and store in drums doubly lined with polyethylene bags.
19. Charge half of the granulation into a suitable blender.
20. From the balance of the granules, take out the fines (approximately 40 g of fines for a batch of 1000 tablets) through 250 µm aperture on sieve shaker.
21. Retain coarse particles for later use.
22. Mix together the flavors in a suitable vessel.
23. Add and dissolve the ethyl vanillin.
24. Check that the solution is clear before proceeding.
25. Charge a suitable mixer with the fines from step 20.
26. While mixing, disperse the flavor solution.
27. Add magnesium stearate and talc, and mix thoroughly.
28. Pass the blend through a 250 µm aperture on sieve shaker.
29. Add the dispersed flavor blend to the granules.
30. Add remaining granules, and blend for 8 to 10 minutes.
31. Discharge blended granules into suitable airtight containers doubly lined with polyethylene bags.
32. Compress on a suitable machine fitted with 14.4 mm diameter round punches with beveled edges.
33. Weight: 8.5 g/10 tablets, thickness: approximately 3.6 to 3.8 mm, hardness: 8 to 10 kPa.

MAGALDRATE WITH SIMETHICONE SUSPENSION

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
QS	1	Distilled purified water	285.00 mL
9.00	2	Methylparaben	1.80
1.00	3	Propylparaben	0.20
5.00	4	Benzoic acid	1.00
3.75	5	Saccharin sodium (dehydrate powder)	0.75
400.00	6	Magaldrate (wet cake; 18–20%)	400.00
1.00 g	7	Sorbitol solution (70%)	260.00
12.50	8	Silicon dioxide (colloidal) (international)	2.50
QS	9	Citric acid (hydrous powder)	QS
200.00	10	Dimethyl polysiloxane emulsion (30%)	40.00
0.005 mL	11	Flavor	1.00 mL
1.26 g	12	Glycerin	252.00
25.00 g	13	Potassium citrate monohydrate	5.00
13.30	14	Xanthan gum	2.66

Manufacturing Directions

This product is highly prone to microbial contamination. All equipment coming into contact with the product should be treated with a freshly prepared sodium hypochlorite solution (100 ppm) made with freshly boiled and cooled-down water on the day of use. Bottles and caps should also be so treated. Freshly boiled and cooled deionized water should be used for rinsing.

1. Place 285 mL purified water into a suitable jacketed tank, and heat to 90°C to 95°C.
2. Add and dissolve parabens, benzoic acid, saccharin sodium, and potassium citrate.
3. While maintaining temperature at 85°C to 90°C, add, in small quantities, half the quantity of magaldrate cake or powder, if used, and disperse well.
4. (Adjust speed of the agitator and homogenizer to ensure effective mixing and to maintain free mobility of the suspension.) Add sorbitol solution, and mix well.
5. Raise the temperature, if necessary, maintaining temperature at 85°C to 90°C.
6. Add, in small quantities, the remaining half of the magaldrate cake or powder, and disperse well.
7. Mix for 1 hour, and then remove heat. (Adjust speed of the agitator and homogenizer to maintain the mobility of suspension.) Separately blend colloidal silicon dioxide with xanthan gum, and disperse the blend in glycerin with constant mixing.

8. While maintaining temperature at 85°C to 95°C, add and disperse the suspension from the previous step to the main tank, and mix well.
9. Avoid lump formation at any stage.
10. Cool to room temperature.
11. Add dimethyl polysiloxane emulsion, and mix well.
12. Add flavor, and mix well.
13. Dissolve citric acid in twice the quantity of purified water, and adjust pH if necessary.
14. Check and record pH (range: 7.5–8.0). Add purified water to volume, and mix well for a minimum of 30 minutes.
15. Filter through a 180 µm aperture nylon cloth, and store in a suitable tank.

MAGALDRATE WITH SIMETHICONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
525.00	1	Sucrose, NF	525.00
15.00	2	Lactose monohydrate, NF	15.00
60.00	3	Simethicone, USP	60.00
60.00	4	Cellulose microcrystalline (Avicel™ PH101), NF	60.00
12.00	5	Silicon dioxide colloidal (International)	12.00
400.00	6	Magaldrate, USP	400.00
40.00	7	Acacia (special grade), NF	40.00
0.05	8	Dye	0.05
–	9	Distilled purified water, USP	100.00 mL
–	10	Alcohol SD 3A (200 proof)	100.00 mL
1.50	11	Flavor	1.50
0.15	12	Ethyl vanillin, NF	0.15
5.00	13	Silicon dioxide (colloidal)	5.00
30.00	14	Starch monohydrate	30.00
10.00	15	Lactose monohydrate	10.00
80.00	16	Talc powder, USP	80.00
5.30	17	Magnesium stearate	5.30

Manufacturing Directions

1. Pass the granulated sucrose (with approximately 10% excess) through a 500 µm aperture stainless steel screen on comminuting mill (impact forward, high speed).
2. Screen the milled sugar through a 250 µm screen on sieve shaker.
3. Weigh the required quantity, and charge into a suitable mixer (planetary mixer or dough mixer). Discard the remainder.
4. Screen lactose (item 2) through a 250 µm aperture screen on sieve shaker, and add to powdered sugar from preceding step. Mix well.
5. While mixing vigorously, add and disperse simethicone (add slowly in a fine stream of flow to avoid lump formation). Mix well.
6. Rough blend colloidal silicon dioxide (item 5) and microcrystalline cellulose, and add to the simethicone dispersed mass from previous step.
7. Mix initially at low speed for 4 to 5 minutes, and thereafter, mix vigorously for 5 to 10 minutes.
8. Either screen simethicone dispersed mass through a 1.0 mm aperture on sieve shaker or pass through a comminuting mill using a 1.4 mm aperture screen (impact forward, medium speed).
9. Load into a mass mixer, and continue mixing.
10. Screen magaldrate powder (with approximately 7% excess) through a 150 µm aperture screen on sieve shaker, and weigh the required quantity.
11. To this quantity, add acacia, and rough blend.
12. Add this blend in the dough mixer, dispersing in small quantities, and mix well for 30 to 40 minutes until simethicone is well absorbed in the dry blend. Discard remaining magaldrate powder.
13. Dissolve dye in water; then, add alcohol, and mix well.
14. Wet down mass with colored hydroalcoholic solution, and knead well.
15. Add more hydroalcoholic solution, if necessary (water : alcohol, 1:1), to mass.
16. Screen wet mass through a 2.8 mm aperture screen on sieve shaker or oscillating granulator, and spread uniformly on trays.
17. Tray dry granules at 71°C to 74°C until LOD is within 1% to 1.5% (test at 105°C for 1 hour).
18. After approximately 3 to 4 hours of drying, screen semidried granules through a 1.4 mm aperture on sieve shaker, and reload for further drying.
19. (*Note:* This step helps in drying granules faster and more uniformly and avoids color mottling on final product.) Screen dried granules through a 1.0 mm aperture screen on sieve shaker, and store in drums lined with double polyethylene bags. Alternatively, drying can be done in a fluid-bed dryer.
20. Pass dried granules through a 1 mm aperture screen on sieve shaker.
21. Pass coarse granules through a comminuting mill using a 1.4 mm aperture screen (knives forward, slow speed) and then through 1.0 mm aperture on sieve shaker.
22. Store granules in drums lined with double polyethylene bags.
23. Charge half of the base granulation into a suitable blender.
24. From the balance of the granules, take out fines (approximately 50 g of fines for a batch of 1000 tablets) through a 250 µm aperture on sieve shaker, and hold in a suitable vessel.
25. Add and dissolve ethyl vanillin in liquid flavor.
26. Check for clarity, and only then disperse over dried starch.
27. Rough blend colloidal silicon dioxide (item 13) with lactose monohydrate (item 15), talc, and magnesium stearate, and add to the flavored starch.

28. To this mixture, add fines from step 24 and mix well by hand or in a suitable mixer.,
29. Screen through a 250 µm aperture on sieve shaker.
30. Add this flavored, dispersed blend to the base granulation (first step) in a blender.
31. Add the remaining bulk granules from the second step to the base granulation, and blend well for 8 to 10 minutes. (*Caution*: Do not mix for too long, as the granules may crumble to a finer size, which may adversely affect hardness during compression.) Discharge blended granules into suitable airtight containers lined with double polyethylene bags until ready for compressing.
32. Compress on a suitable machine fitted with 14.4 mm diameter round punches with beveled edges. Compress 1244 mg per tablet.

MAGNESIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
260.00	1	Magnesium carbonate, USP	262.00
238.00	2	Ludipress®	238.00
4.00	3	Magnesium stearate	4.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compression force.
2. Compress 500 mg in 12 mm biplanar punches.

MEDICATED FOOT CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Lanolin	5.00
90.00	2	Stearic acid	90.00
5.00	3	Cetyl alcohol	5.00
40.00	4	Isopropyl palmitate	40.00
10.00	5	Oleyl alcohol	10.00
20.00	6	Mineral oil and lanolin alcohol (liquid base CB3929)	20.00
7.50	7	Oil of wintergreen	7.50
3.00	8	Oil of thyme	3.00
5.00	9	Oil of pine	5.00
5.00	10	Menthol	5.00
5.00	11	Camphor	5.00
QS	12	Deionized water	QS to 1 kg
80.00	13	Glycerin	80.00
18.00	14	Triethanolamine 99%	18.00
QS	15	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately at 65°C to 70°C.
2. Add water phase to oil phase while stirring.
3. Add the triethanolamine dropwise.
4. Stir to cool.
5. This product can be used as a disinfecting and soothing cream for the feet.

MENTHOL MOUTHWASH

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.00	1	Menthol	10.00
10.00	2	Eucalyptus oil	10.00
40.00	3	Cremophor RH 40	40.00
4.50	4	Saccharin sodium	4.50
2.00	5	Sodium citrate	2.00
5.00	6	Citric acid	5.00
50.00	7	Lutrol F 127	50.00
67.00	8	Ethanol 96%	67.00
QS	9	Sicovit colorant	QS
QS	10	Water	801.00

Manufacturing Directions

1. Mix items 1 to 3, and heat to approximately 60°C.
2. Prepare solution of items 4 to 10, heat it to approximately 60°C, and add it slowly to the well-stirred mixture of items 1 to 3.
3. Clear, colored liquid has a fresh mint taste.

METHYL SALICYLATE ANALGESIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
30.00	1	Tromethamine magnesium aluminum silicate (Veegum® PRO)	30.00
30.00	2	Hydroxypropylcellulose	30.00
350.00	3	Deionized water	350.00
350.00	4	Ethanol	350.00
40.00	5	Cocoyl sarcosine (Vanseal CS)	40.00
25.00	6	Oleath-10	25.00
25.00	7	PEG-25 hydrogenated castor oil	25.00
50.00	8	Isopropyl myristate	50.00
20.00	9	Triethanolamine	20.00
5.00	10	Camphor	5.00
5.00	11	Menthol	5.00
2.00	12	Eucalyptus oil	2.00
65.00	13	Methyl salicylate	65.00
QS	14	Preservatives	QS

Manufacturing Directions

1. Dry blend item 1 and item 2, and slowly add them to items 3 and 4, agitating to ensure homogenous dispersion.
2. Combine items 5 to 9 separately and items 10 to 14 separately; then, mix them together.
3. Finally, add this mixture to the first mixture, and mix until uniform.

METHYL SALICYLATE ANALGESIC CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate (Veegum®)	15.00
547.00	2	Deionized water	547.0
2.00	3	Simethicone emulsion	2.00
30.00	4	Propylene glycol	30.00
150.00	5	Methyl salicylate	150.00
50.00	6	Menthol	50.00
6.00	7	Polysorbate	6.00
50.00	8	C18-C36 acid	50.00
150.00	9	Glyceryl stearate and PEG-100 stearate	150.00
QS	10	Preservatives	QS

Manufacturing Directions

1. Add item 1 to water slowly, and mix vigorously to smooth dispersion.
2. Add items 3 and 4, mixing one at a time. Heat to 75°C to 80°C.
3. Separately mix and heat items 5 to 9 to 75°C to 80°C, and combine the two parts while mixing.
4. Cool while mixing, and add item 10 at 40°C.

METHYL SALICYLATE AND MENTHOL GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
110.00	1	Methyl salicylate	110.00
50.00	2	Menthol	50.00
200.00	3	Lutrol E 400	200.00
60.00	4	Cremophor RH 40	60.00
70.00	5	Propylene glycol (pharma)	70.00
320.00	6	Lutrol F 127	320.00
QS	7	Water	190.00

Manufacturing Directions

1. Dissolve item 6 in solution of items 1 to 5, and mix with item 7.
2. The clear gel can be diluted with water.
3. Because of the high concentration of the active ingredients and of Lutrol F 127, the consistency of the colorless clear gel is extremely hard.
4. By reducing the concentration of the active ingredients, the amount of Lutrol F 127 can also be reduced, and the consistency of the gel will be normal.

METHYL SALICYLATE HEAT RUB LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
25.00	1	PPG-5-cetech-10-phosphate (Crodafos SG)	25.00
40.00	2	Emulsifying wax, NF (Polawax)	40.00
45.00	3	PPG-1 cetyl ether (Procetyl 10)	45.00
10.00	4	Menthol	10.00
10.00	5	Camphor	10.00
75.00	6	Methyl salicylate	75.00
30.00	7	Glycerin	30.00
10.00	8	Gelatin, NF (Crodyne BY-19)	10.00
3.00	9	Diethanolamine	3.00
742.00	10	Deionized water	742.00
10.00	11	Propylene glycol, diazolidinyl urea, methylparaben, and propylparaben	10.00

Manufacturing Directions

1. Premix items 4, 5, and 6 with item 3.
2. When completely dissolved, add items 1 and 2, and heat to 75°C to 80°C.
3. Dissolve item 8 in water, and add items 7 and 9.
4. Heat to 80°C; slowly add this part to previous part using good mechanical mixing.
5. Allow to cool while mixing to 40°C, and then add item 11.
6. Cool to 30°C, and fill.

METOCLOPRAMIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Anhydrous metoclopramide hydrochloride; use metoclopramide hydrochloride	10.54
7.00	2	Maize starch (dried)	7.00
1.00	3	Silicon dioxide (colloidal)	1.00
0.76	4	Magnesium stearate	0.76
5.00	5	Starch (pregelatinized)	5.00
101.24	6	Lactose	101.24
QS	7	Purified water	~ 15.00 mL

Manufacturing Directions

1. Dried maize starch must be used for lubrication.
2. Dry the starch at 80 °C for 36 hours prior to its use in manufacturing.
3. Check LOD of starch; the LOD must be less than 2%.
4. Pass the lactose, pregelatinized starch, and metoclopramide hydrochloride through a 1.25 mm aperture screen, and transfer to a suitable mass mixer. Mix for 5 minutes.
5. Add the water slowly to the mixer, and mix for 30 minutes or until a suitable consistency is obtained. Add extra water if required.
6. Pass the mass through a 4.8 mm aperture screen or an oscillating granulator (or by hand), and dry in a tray dryer or fluid-bed dryer at 50 °C until the moisture content is less than 5.5%.
7. Pass the granules through an 875 µm aperture screen on an oscillating granulator (or comminuting mill at medium speed, knives forward) into tared, polyethylene-lined drums. Seal and weigh.
8. Carry out remaining steps at an RH less than 50% and temperature less than 26°C.
9. Transfer the dried granulation to a suitable blender.
10. Screen the starch (item 2), magnesium stearate, and silicon dioxide through a 250 µm aperture screen on a sieve shaker, and add to the blender.
11. Blend for 10 minutes.
12. Discharge the granules into polyethylene-lined drums. Seal, and weigh for yield.
13. Compress 1.255 g per 10 tablets in 6.35 or 7.14 mm standard concave punches.

MICONAZOLE NITRATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
21.00	1	Miconazole nitrate (5% excess)	21.00
200.0	2	Tefose® 63	200.0
30.00	3	Labrafil®® M[a]	30.00
30.00	4	Mineral oil (liquid paraffin)	30.00
0.05	5	Butylated hydroxyanisole	0.05
2.00	6	Benzoic acid	2.00
720.00	7	Purified water	720.00

[a] Synonyms: Labrafil® M 1944 CS, oleoyl macrogolglycerides, apricot kernel oil PEG-6 complex.

Manufacturing Directions

1. Melt items 2, 3, and 4 (fatty phase) in fat-melting vessel.
2. Heat to 65°C to 70°C.
3. Disperse items 1 and 5 in the fatty phase while mixing at high speed for 20 minutes.
4. Add item 7 to the mixer, and heat to 80°C to 90°C.
5. Dissolve item 6, and cool down to 65°C to 70°C.
6. Transfer the fatty phase to the mixer with vacuum at 0.2 to 0.3 bar.
7. Start cooling down while mixing at 10 rpm, and homogenize at high speed for 20 minutes; then, cool down to 25°C to 28°C while mixing at a vacuum of 0.2 to 0.3 bar (65–45°C) or 0.5 to 0.7 bar (45–25°C).

MINERAL AND MULTIVITAMIN SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
6.65	1	Hypophosphorous acid	6.65
16.47	2	Calcium hypophosphite	16.47
31.68	3	Calcium lactate (powder)	31.68
1.00	4	Methylparaben	1.00
0.20	5	Propylparaben	0.20
1.00	6	Benzoic acid	1.00
150.00	7	Sucrose (granular)	150.00
5.20	8	Ferrous gluconate	5.20
2.00	9	Niacinamide (5% excess)	2.10
0.33	10	Riboflavin-5-phosphate sodium	0.33
1.00	11	D-pantothenyl alcohol (dexpanthenol; 20% excess)	1.20
0.60 µg	12	Vitamin B_{12} (cyanocobalamin) (35% excess)	0.81 mg
0.20	13	Pyridoxine hydrochloride	0.20
0.30	14	Thiamine hydrochloride (regular powder) (55% excess)	0.46
4.782	15	Flavor, raspberry blend	4.78
1.945	16	Flavor, chocolate	1.945
0.64	17	Orange oil (terpeneless, No. 54125)	0.64
0.21	18	Lime oil, distilled	0.21
4.28	19	Alcohol	4.28
2.50	20	Saccharin sodium	2.50
10.00	21	Ascorbic acid (white powder/EP) (45% excess)	14.50
3.00	22	Caramel (acid proof)	3.00
2.00	23	Anhydrous citric acid	2.00
10.0 µg	24	Butylated hydroxyanisole (BHA)	10.0 mg
3.39	25	Corn oil	3.39
0.40	26	Vitamin A palmitate (1.5 million U/g) (40% excess)	0.56
0.08	27	Viosterol in corn oil (syn. oleovitamin D; 1000 mg/g) (40% excess)	0.112
1.5 g	28	Acacia (special grade)	1.50
0.127	29	Sodium lauryl sulfate (acetone-washed)	0.127
171.00	30	Deionized, purified water	~171.00
QS	31	Glucose liquid (corn syrup)	QS to 1 L

Manufacturing Directions

Do not expose this preparation during manufacturing to direct sunlight. Riboflavin is sensitive to light.

1. Add 83.7 mL purified water to a stainless steel jacketed tank.
2. Add calcium hypophosphite, calcium lactate, the parabens, and benzoic acid.
3. Heat mixture to 60°C with agitation.
4. Shut off mixer, and wash tank until free of all powders with 25.9 mL purified water.
5. Heat to and maintain a maximum temperature of 100°C until solution is complete. Do not agitate. Avoid loss of water through evaporation. Cover opening of tank.
6. After solution occurs, take sample from bottom of tank and examine for clarity. Solution must be clear.
7. Add hypophosphorous acid (if used) with mixing.
8. Turn off heat, add 222 g glucose, and start agitator. (*Caution:* Use CO_2 cover throughout. Wherever water is used, it should be CO_2-saturated water.) Dissolve ferrous gluconate in 7.4 mL water CO_2-saturated by heating.
9. Add 278 g glucose with mixing. Add and dissolve sugar.
10. Allow solution to cool to 35°C, and mix well.
11. To 29.6 mL water, add and dissolve nicotinamide, riboflavin, D-pantothenyl alcohol, vitamin B_{12}, pyridoxine, and thiamine. Mix until solution is complete, and add to tank. Dissolve by heat if necessary.
12. Charge raspberry blend flavor and chocolate flavor into tank. Charge saccharin into tank, and mix until dissolved.
13. Charge ascorbic acid into tank. Mix well.
14. Charge caramel into tank, and mix well.
15. Dissolve citric acid in 3 mL water, and add.
16. Heat corn oil to 50°C to 60°C, and add and dissolve BHA. Be sure the BHA is completely dissolved before continuing.
17. Cool to room temperature. While cooling oil mixture, saturate with CO_2, and maintain heavy CO_2 coverage for balance of operation.
18. Set aside a small amount of this mixture as a rinse for the vitamin A and viosterol containers in preceding step.
19. Add vitamin A palmitate and viosterol to the cool corn oil mixture, rinsing the containers with the reserved oil.
20. Add the rinse to the bulk. Mix well.
21. Add the acacia to the oil mixture with good mixing.
22. Dissolve sodium lauryl sulfate in 3 mL CO_2-saturated purified water. To avoid excessive foaming, do not bubble CO_2 gas through the water/sodium lauryl sulfate solution.
23. Add the sodium lauryl sulfate solution to the oil mixture, and stir to a thick creamy emulsion.
24. Add 7.56 g glucose to the emulsion with mixing.
25. Blend 13.33 mL CO_2-saturated purified water with 77.04 g glucose, and add emulsion with stirring.
26. Recycle primary emulsion back into holding tank while setting mill.
27. Homogenize until all oil globules are less than 8 µm in diameter using colloid mill with a fine setting. Do not change mill setting after removing sample unless samples are unacceptable.

28. Add primary emulsion to syrup solution with mixing. Add glucose QS to 965 mL, and mix well. Allow to stand overnight to vent entrapped air.
29. Adjust the volume to 1 L using glucose or glucose and CO_2-saturated water.
30. Strain through 149 µm aperture or similar screen into clean reserve tank, and recheck volume.

MINT-MENTHOL MOUTHWASH

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
20.00	1	Mint oil	20.00
0.40	2	Menthol	0.40
0.90	3	Eucalyptus oil	0.90
10.00	4	Alpha-bisabolol (BASF)	10.00
0.60	5	Thymian oil	0.60
40.00	6	Cremophor RH 40	40.00
4.50	7	Saccharin sodium	4.50
2.00	8	Sodium citrate	2.00
5.00	9	Citric acid	5.00
0.20	10	Sodium fluoride	0.20
50.00	11	Glycerol	50.00
50.00	12	Lutrol F 127	50.00
0.60	13	Salicylic acid	0.60
1.00	14	Benzoic acid	1.00
175.00	15	Sorbitol, crystalline	175.00
216.00	16	Ethanol 96%	216.00
QS	17	Sicovit colorant	QS
QS	18	Water	48.40

Manufacturing Directions

1. Mix items 1 to 6, and heat to approximately 60°C.
2. Prepare solution of items 7 to 18, heat it to approximately 60 °C, and add it slowly to the well-stirred mixture of items 1 to 6.
3. Clear, colored liquids have a fresh mint taste.

MINT OIL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
35.00	1	Peppermint oil	35.00
138.00	2	Cremophor RH 40	138.00
520.00	3	Ethanol 96%	520.00
QS	4	Water	307.00

Manufacturing Directions

1. Mix the peppermint oil with Cremophor RH 40, stir well, and slowly add ethanol and water.
2. Clear, colorless liquid is of low viscosity.

MULTIVITAMIN AND BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
7.00	1	Beta-carotene; use beta-carotene dry powder (10%, Pharma)	70.00
2.20	2	Thiamine mononitrate	2.20
2.20	3	Riboflavin	2.20
6.50	4	Nicotinamide	6.50
11.50	5	Calcium D-pantothenate	11.50
2.20	6	Pyridoxine hydrochloride	2.20
0.06	7	Cyanocobalamin; use cyanocobalamin dry powder (0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
32.00	9	Vitamin E acetate (dry powder; SD 50)	32.00
210.00	10	Ludipress®	210.00
7.00	11	Kollidon® VA 64	7.00
3.00	12	Magnesium stearate	3.00
7.00	13	Orange flavor	7.00
2.50	14	Saccharin sodium	2.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 448 mg using 12 mm planar punches.

MULTIVITAMIN AND CALCIUM SYRUP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/100 g (mg)
0.10	1	Vitamin A palmitate	10.00
0.50 µg	2	Vitamin D 40 mio IU/g	0.05
1.00	3	Vitamin E acetate, BASF	100.00
0.02	4	BHT	2.00
45.00	5	Cremophor RH 40	4.50 g
100.00	6	Water	10.00 g
450.00	7	Saccharose	45.00 g
2.00	8	Methyl paraben	200.00
0.80	9	Citric acid	80.00
96.00	10	Glycerol	9.60 g
0.70	11	Calcium gluconate	70.00
250.00	12	Water	25.00 g
0.15	13	Thiamine hydrochloride, BASF	15.00
0.15	14	Riboflavin 5′-phosphate sodium	15.00
0.55	15	Nicotinamide	55.00
0.15	16	Pyridoxine hydrochloride	15.00
3.00	17	Ascorbic acid, crystalline	300.00
1.00	18	Sorbic acid	100.00
50.00	19	Propylene glycol (pharma)	5.00 g

Manufacturing Directions

1. Heat items 1 to 5 and item 6 separately to approximately 60 °C, and mix slowly, stirring well to obtain a clear solution.
2. Dissolve items 7 to 9 in the hot solution of items 10 to 12 to obtain a clear solution.
3. Mix all the solutions upon cooling, and add solutions of items 13 to 19. Adjust the pH value to 4.0 to 4.1.
4. Pass nitrogen through the solution for 10 minutes, and fill in bottles under nitrogen cover.

MULTIVITAMIN AND CARBONYL IRON TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5000 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	10.00
2.20	2	Thiamine mononitrate, BASF	2.20
2.20	3	Riboflavin	2.20
16.50	4	Nicotinamide	16.50
11.50	5	Calcium D-pantothenate	11.50
2.20	6	Pyridoxine hydrochloride	2.20
6.00	7	Cyanocobalamin (dry powder; 0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
311.00	10	Ludipress®	311.00
10.00	11	Carbonyl iron (powder OF)	10.00
3.00	12	Magnesium stearate	3.00
7.20	13	Orange flavor	7.20
2.50	14	Saccharin sodium	2.50

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, mix, and press with high compression force (20 kN).
2. Compress 500 mg in 12 mm biplanar punches.

MULTIVITAMIN AND FLUORIDE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1.20	1	Riboflavin; use coated riboflavin (25% excess)	5.28
0.30	2	Folic acid (powder)	0.31
1.00	3	Fluoride; use sodium fluoride (powder)	2.21
19.50	4	Starch (bright yellow 2 LA)	19.50
1.05	5	Pyridoxine; use pyridoxine hydrochloride (6% excess)	4.02
1.05	6	Thiamine HCl; use coated thiamine mononitrate (5% excess)	3.21
13.50	7	Niacin; use nicotinamide	40.20
4.50 µg	8	Vitamin B_{12}; use cyanocobalamin oral powder in starch (10% excess)	5.17
20.00	9	Ascorbic acid; use surface-coated ascorbic acid	21.00
40.00	10	Sodium ascorbate; use surface-coated sodium ascorbate (5% excess)	47.25
7.49	11	Anhydrous citric acid	7.49
15 IU	12	Vitamin E; use vitamin E (D,L-alpha-tocopherol) (5% excess)	31.50
400 IU (10 µg)	13	Vitamin D; use vitamin D_3 beadlets (25% excess)	0.65
9.36	14	Flavor	9.36
2500 IU or 0.75 mg	15	Vitamin A; use vitamin A palmitate beadlets (500 mU/g), USP (60% excess)	8.25
500.60	16	Sugar (compressible)	500.60

Manufacturing Directions

Manufacture this product at less than 40% RH and a temperature less than 26.7°C.

1. If lumpy, hand screen riboflavin through an 8 mesh screen, and mix with folic acid, sodium fluoride powder, and approximately 3.5 g of bright yellow starch in a suitable blender until the yellow color of premix is uniform.

2. Cross-feed the premixed items, pyridoxine hydrochloride, thiamine mononitrate, nicotinamide, cyanocobalamin oral powder in starch, ascorbic acid, citric acid, and vitamin E through an 846 µm screen on a comminuting mill (knives forward, medium speed).
3. Transfer the powders to a suitable blender.
4. Clear mill with a part of the compressible sugar, and transfer to the blender.
5. Charge vitamin D_3 beadlets, sodium ascorbate, flavor, and vitamin A palmitate into the blender.
6. Blend for 10 minutes.
7. Discharge the contents of the blender into polyethylene-lined drums.
8. Pass the remaining compressible sugar through an 846 µm screen on a comminuting mill (knives forward, medium speed).
9. Transfer to the blender.
10. Screen the material from previous step, the magnesium stearate, and the remaining bright yellow starch through an 846 µm screen, and transfer to the blender. (*Note:* Mill material not passing through the screen through an 846 µm screen on a comminuting mill at medium speed with knives forward.) Blend for 20 minutes.
11. Discharge blender into polyethylene-lined drums, and weigh for yield.
12. Use precompression, if available, to obtain a tablet with adequate friability.
13. Coat as needed (see Appendix).

MULTIVITAMIN AND MINERAL SYRUP

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/L (g)
6.65	1	Hypophosphorous acid (50% pure)	6.655
16.47	2	Calcium hypophosphite	16.47
31.68	3	Calcium lactate (powder)	31.68
1.00	4	Methylparaben	1.00
0.20	5	Propylparaben	200 00 mg
1.00	6	Acid benzoic	1.00
150.00	7	Sucrose	150.00
5.20	8	Ferrous gluconate	5.20
2.00	9	Niacinamide (white powder) (5% excess)	2.10
0.32	10	Riboflavin-5-phosphate sodium	328.77 mg
1.00	11	D-Pantothenyl alcohol (dexpanthenol; 20% excess)	1.20
0.00060	12	Vitamin B_{12} (cyanocobalamin; 35% excess)	810.00 µg
0.20	13	Pyridoxine hydrochloride	200.00 mg
0.30	14	Thiamine hydrochloride (powder, regular) (55% excess)	465.00 mg
4.78	15	Flavor, raspberry blend	4.782
1.94	16	Flavor, chocolate	1.945
0.64	17	Orange oil, terpeneless No. 54125	642.00 mg
0.21	18	Lime oil (distilled)	214.975 mg
4.28	19	Alcohol (ethanol, 190 proof)	4.28
2.50	20	Saccharin sodium	2.50
10.00	21	Acid ascorbic (45% excess)	14.50
3.00	22	Caramel (acid proof)	3.00
2.00	23	Anhydrous citric acid	2.00
0.0010	24	Butylated hydroxyanisole (BHA)	10.0 mg
3.39	25	Corn oil	3.39
0.56	26	Vitamin A palmitate (1.5 million UA/g, 40% excess)	560.00 mg
0.08	27	Viosterol in corn oil (syn. oleovitamin D; 1000 mD/g; D3 in arachis oil) (40% excess)	112.00 mg
1.50	28	Acacia	1.50
0.12	29	Sodium lauryl sulfate (acetone washed)	127.41 mg
171.00	30	Purified water	~171.00
QS	31	Glucose liquid	QS to 1 L

Manufacturing Directions

Do not expose this preparation during manufacturing to direct sunlight. Riboflavin is sensitive to light.

1. Add 83.7 mL of purified water to a stainless steel jacketed tank.
2. Add calcium hypophosphite, calcium lactate, parabens, and benzoic acid.
3. Heat mixture to 60°C with agitation.

4. Shut off mixer, and wash tank free of all powders with 25.9 mL purified water.
5. Heat to and maintain a maximum temperature of 100°C until solution is complete. Do not agitate. Avoid loss of water through evaporation. Cover opening of tank. After solution occurs, take sample from bottom of tank and examine for clarity. Solution must be clear.
6. Add acid hypophosphorous (if used) with mixing.
7. Turn off heat, add 222 g glucose, and start agitator. (*Caution:* Use CO_2 cover throughout. Wherever water is used, it should be CO_2-saturated water.) Dissolve ferrous gluconate in 7.4 mL water CO_2 saturated by heating.
8. Add 278 g glucose with mixing. Add and dissolve sugar.
9. Allow solution to cool to 35°C, and mix well.
10. To 29.6 mL water, add and dissolve nicotinamide, riboflavin, D-pantothenyl alcohol, vitamin B_{12}, pyridoxine, and thiamine.
11. Mix until solution is complete, and add to tank. Dissolve by heat if necessary.
12. Charge raspberry blend flavor and chocolate flavor into tank.
13. Charge saccharin into tank, and mix until dissolved.
14. Charge ascorbic acid into tank, and mix well.
15. Charge caramel into tank, and mix well.
16. Dissolve citric acid in 3 mL water, and add this solution to the mixture.
17. Heat corn oil to 50°C to 60°C, and add and dissolve BHA. Be sure the BHA is completely dissolved before continuing.
18. Cool to room temperature. While cooling oil mixture, saturate with CO_2, and maintain heavy CO_2 coverage for balance of operation.
19. Set aside a small amount of this mixture as a rinse for the vitamin A and viosterol containers in previous step.
20. Add vitamin A palmitate and viosterol to the cool corn oil mixture, rinsing the containers with the oil reserved earlier.
21. Add the rinse to the bulk, and mix well.
22. Add the acacia to the oil mixture with good mixing.
23. Dissolve sodium lauryl sulfate in 3 mL CO_2-saturated purified water. To avoid excessive foaming, do not bubble CO_2 gas through the water/sodium lauryl sulfate solution.
24. Add the sodium lauryl sulfate solution to the oil mixture, and stir to a thick creamy emulsion.
25. Add 7.56 g glucose to the emulsion with mixing.
26. Blend 13.33 mL CO_2-saturated purified water with 77.04 g glucose, and add emulsion with stirring.
27. Recycle primary emulsion back into the holding tank while setting mill.
28. Homogenize until all oil globules are less than 8 µm in diameter using colloid mill with a fine setting. After setting mill, sample. Do not change mill setting after removing sample unless samples are unacceptable.
29. Add primary emulsion to syrup solution with mixing. Add glucose QS to 965 mL, and mix well.
30. Allow to stand overnight to vent entrapped air. Adjust the volume to 1 L using glucose or glucose and CO_2-saturated water.
31. Strain through 149 µm aperture or similar screen into clean reserve tank, and recheck volume.

MULTIVITAMIN AND MINERAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
4000 IU/400 IU	1	Vitamin A/vitamin D crystallets (500,000 A/50,000 D/g) (25% excess)	10.00
40.00	2	Vitamin A acetate (powder; 500 MA) (20% excess)	50.00
10.00	3	Thiamine hydrochloride (10% excess)	11.00
5.00	4	Riboflavin	5.00
100.00	5	Nicotinamide niacinamide (white powder)	100.00
200.00	6	Ascorbic acid (white powder) (10% excess)	220.00
20.00	7	Calcium pantothenate (dextro) (30% excess)	26.00
5.00	8	Pyridoxine hydrochloride	5.00
7.33	9	Povidone (K-29-32)[a]	7.33
29.16	10	Anhydrous refined alcohol isopropyl	29.16
24.20	11	Talc powder	24.20
6.07	12	Magnesium stearate (impalpable powder)	6.07
4.75	13	Stearic acid (fine powder)	4.75
10.0	14	Iron; use iron sulfate (dried)	31.26
1.00	15	Copper[a]	1.00
0.15	16	Iodine[a]	0.15
1.00	17	Manganese[a]	1.00
5.00	18	Magnesium[a]	5.00
1.50	19	Zinc[a]	1.50
0.10	20	Cobalt; use cobalt sulfate	0.47
5.00	21	Potassium; use potassium sulfate	11.14
0.20	22	Molybdenum; use sodium molybdate (dihydrate)	0.50
6.00 µg	23	Vitamin B_{12}; use cyanocobalamin (1000 µg/g oral powder in gelatin; 5% excess)	6.30

[a] Provided as mineral mix (includes 3% excess).

Bill of Materials for Mineral Mix

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
13.85	1	Copper sulfate	14.28
0.01175	2	Calcium iodate monohydrate	0.01212
0.1228	3	Manganese sulfate monohydrate	0.1267
0.1480	4	Zinc sulfate (pure dry powder)	0.1526

Manufacturing Directions

Mineral mix processing:

1. Grind copper sulfate, calcium iodate, manganese sulfate, and zinc sulfate through Fitz mill screen 0 band (high speed, impact forward).
2. *Note:* Vitamin A is susceptible to destruction by oxidation and excessive exposure to actinic light and moisture. Compression of this tablet should be done where RH is less than 40%. Protect granulation with CO_2 if material is not to be compressed soon after granulation.
3. Hand screen vitamins A and D crystallets and vitamin A acetate through 1.2 mm aperture screen.
4. Load into mass mixer (screen using 1.2 mm aperture screen if necessary) thiamine HCl, riboflavin, nicotinamide, ascorbic acid, calcium pantothenate, pyridoxine HCl, and the vitamins A and D mix.
5. Blend for 10 minutes.
6. Dissolve povidone in alcohol (approximately 26 mL).
7. Add povidone solution to blended materials, and mix for 5 minutes.
8. Scrape mixer; then, add alcohol to mass (approximately 11 mL).
9. Pass wet mass through a 15.88 mm aperture (or similar) band-fitted to rotary granulator. (*Note:* Wet mass can set hard; therefore, granules should be spread quickly onto trays.) Dry the granulation at 49°C until LOD is less than 1.0%.
10. Pass the dried granulation through a 1.2 mm aperture screen fitted to an oscillating granulator.
11. Mill the talc (item 11), magnesium stearate, stearic acid, iron sulfate, mineral mix, cobalt sulfate, potassium sulfate, and sodium molybdate through a 595 μm aperture screen at high speed, impact forward.
12. Load half the granulation into a suitable blender. Add mineral mix and cyanocobalamin oral powder.
13. Add balance of granulation, and blend for 30 minutes.
14. Compress and coat using a sealing subcoating of PVP (see Appendix) followed by HPMC coating solution and clear Methocel™ gloss.

MULTIVITAMIN AND MINERAL TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
150.00	1	Beta-carotene (dry powder; 10%)	150.00
2.50	2	Thiamine mononitrate	2.50
2.90	3	Riboflavin	2.90
2.00	4	Pyridoxine hydrochloride	2.00
22.00	5	Nicotinamide	22.00
12.00	6	Calcium D-pantothenate	12.00
110.00	7	Ascorbic acid for direct compression	110.00
550.00	8	Calcium phosphate (dibasic)	550.00
82.00	9	Ferrous fumarate	82.00
166.00	10	Magnesium oxide	166.00
2.50	11	Cupric sulfate	2.50
13.80	12	Manganese sulfate	13.80
57.20	13	Potassium chloride	57.20
37.00	14	Zinc sulfate	37.00
57.00	15	Avicel™ PH102	57.00
50.00	16	Kollidon® CL	50.00
5.70	17	Stearic acid	5.70
5.00	18	Magnesium stearate	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compression force.
2. Compress 1300 mg per tablet using 16 mm biplanar punches.

MULTIVITAMIN, CALCIUM, AND IRON TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Vitamin A acetate (dry powder)	5.00
2.00	2	Vitamin D (dry powder; 500,000 IU/g)	2.00
1.20	3	Thiamine mononitrate (100,000 IU/g)	1.20
1.80	4	Riboflavin, BASF	1.80
12.00	5	Nicotinamide	12.00
4.00	6	Vitamin E acetate (dry powder, SD 50)	4.00
50.00	7	Ascorbic acid (powder), BASF	50.00
60.00	8	Ferrous fumarate	60.00
200.00	9	Dibasic calcium phosphate granulated with 5% Kollidon® 30	200.00
125.00	10	Calcium carbonate	125.00
45.00	11	Avicel™ PH101	45.00
1.50	12	Aerosil® 200	1.50

Manufacturing Directions

1. Mix all components, pass through a sieve, and press to tablets.
2. Compress 500 mg in 11 mm biplanar punches.

MULTIVITAMIN + CALCIUM + IRON TABLETS (1 RDA OF VITAMINS)

Formulation

Vitamin A acetate dry powder, 500,000 IU/g (BASF), 5.0 g; vitamin D dry powder, 100,000 IU/g, 2.0 g; thiamine mononitrate,1.2 g; riboflavin, 1.8 g; nicotinamide, 12.0 g; vitamin E acetate dry powder SD 50, 4.0 g; ascorbic acid, powder, 50.0 g; ferrous fumarate, 60.0 g; dibasic calcium phosphate, 200.0 g, granulated with 5% Kollidon® 30; calcium carbonate, 125.0 g; Avicel™ PH 101, 45.0 g; Aerosil® 200,1.5 g.

Manufacturing Directions

1. Mix all components, pass through a sieve, and press to tablets at 500 mg.

MULTIVITAMIN + CARBONYL IRON TABLETS (1–2 RDA OF VITAMINS)

Formulation

Vitamin A acetate dry powder, 500,000 IU/g, 10.0 g; thiamine mononitrate, 2.2 g; riboflavin, 2.2 g; nicotinamide, 16.5 g; calcium D-pantothenate, 11.5 g; pyridoxine hydrochloride, 2.2 g; cyanocobalamin, dry powder 0.1%, 6.0 g; ascorbic acid, powder, 85.0 g; vitamin E acetate dry powder SD 50, 31.0 g; Ludipress®, 311.0 g; carbonyl iron powder OF, 10.0 g; magnesium stearate, 3.0 g; orange flavor, 7.2 g; saccharin sodium, 2.5 g.

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, mix, and press with high compression force (20 kN) at 500 mg.

MULTIVITAMIN CHEWABLE TABLETS FOR CHILDREN

Formulation

Vitamin A acetate dry powder, 500,000 IU/g, 7.0 g; thiamine mononitrate, 1.2 g; riboflavin, 1.2 g; nicotinamide, 20.0 g; pyridoxine hydrochloride, 1.8 g; cyanocobalamin, 0.1% dry powder, 6.5 g; ascorbic acid, powder, 60.0 g; vitamin D_3 acetate dry powder, 100,000 IU/g, 5.0 g; vitamin E acetate, 31.0 g, dry powder SD 50; sorbitol, crystalline [10], 200.0 g; sucrose, crystalline, 200.0 g; Kollidon® VA 64, 20.0 g; Aerosil® 200, 1.0 g; orange flavor, dry powder, 30.0 g; raspberry flavor, dry powder, 6.0 g; passion fruit flavor, dry powder, 3.0 g; cyclamate sodium, 2.0 g.

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and press with medium to high compression force (20 kN) at 575 mg.

MULTIVITAMIN CHEWABLE TABLETS FOR CHILDREN

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
3500 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	7.00
1.20	2	Thiamine mononitrate	1.20
1.20	3	Riboflavin	1.20
20.00	4	Nicotinamide	20.00
1.80	5	Pyridoxine hydrochloride	1.80
6.50	6	Cyanocobalamin (dry powder; 0.1%), BASF	6.50
60.00	7	Ascorbic acid (powder)	60.00
5.00	8	Vitamin D_3 acetate (dry powder; 100,000 IU/g)	5.00
31.00	9	Vitamin E acetate (dry powder, SD 50)	31.00
200.00	10	Sorbitol (crystalline)	200.00
200.00	11	Sucrose (crystalline)	200.00
20.00	12	Kollidon® VA 64	20.00
1.00	13	Aerosil® 200	1.00
30.00	14	Orange flavor (dry powder)	30.00
6.00	15	Raspberry flavor (dry powder)	6.00
3.00	16	Passion fruit flavor (dry powder)	3.00
2.00	17	Cyclamate sodium	2.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and press with medium to high compression force (20 kN).
2. Compress 575 mg using 12 mm biplanar punches.

MULTIVITAMIN DROPS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
13,600 IU	1	Vitamin A palmitate (1.7 MM IU/g)	8.00
5200 IU	2	Vitamin D_3 (40 MM IU/g)	0.13
5.00	3	Vitamin E acetate	5.00
150.0	4	Cremophor EL (or Cremophor RH 40)	150.00
2.00	5	Parabens (methyl and propyl)	2.00
525.00	6	Water purified	525.00
4.00	7	Thiamine hydrochloride	4.00
2.00	8	Riboflavin 5-phosphate sodium	2.00
2.00	9	Pyridoxine hydrochloride	2.00
2.00	10	Nicotinamide	2.00
0.20	11	Sodium bisulfite	0.20
200.00	12	Propylene glycol	200.00
QS	13	Water purified	10.00
QS	14	Hydrochloric acid	QS

Manufacturing Directions

1. Heat mixture of items 1 to 4 to approximately 60°C, stir strongly, and slowly add solution of items 5 and 6 (60°C).
2. To the obtained clear solution, add solution of items 7 to 13.
3. Adjust the pH with item 14 to approximately 4, and QS to volume.

MULTIVITAMIN EFFERVESCENT GRANULES

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/1000 Sachets (g)
2.60	1	Thiamine hydrochloride	0.26
3.00	2	Riboflavin	0.30
11.00	3	Nicotinamide	1.10
2.50	4	Pyridoxine hydrochloride	0.25
15.00	5	Calcium D-pantothenate	1.50

350.00	15	Isopropanol	35.00
5000 IU	16	Vitamin A acetate (dry powder; 325,000 IU/g cold water dispersible [CWD])	1.50
800 IU	17	Vitamin D_3 (dry powder; 100,000 IU/g CWD)	0.80
21.00	18	Vitamin E acetate (dry powder; 50%)	2.10
0.0660	19	Cyanocobalamin (gelatin-coated; 0.1%)	0.66
400.00	20	Sodium bicarbonate	40.00

Manufacturing Directions

1. Granulate mixture of items 1 to 13 with solution of items 14 and 15.
2. Pass through a 0.8 mm sieve, dry well, and mix with items 16 to 20.
3. Fill 4 g in sachets.

MULTIVITAMIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
13.00	1	Thiamine mononitrate	13.00
4.00	2	Riboflavin	4.00
11.00	3	Pyridoxine hydrochloride	11.00
66.00	4	Nicotinamide	66.00
17.00	5	Calcium D-pantothenate	17.00

35.00	10	Kollidon® 30	35.00
5.00	11	Kollidon® 30	5.00
QS	12	Isopropanol	~80.00
6.00	13	Riboflavin	6.00
550.00	14	Ascorbic acid (powder)	550.00
20.00	15	Cyanocobalamin (dry powder, 0.1%)	20.00
12.00	16	Vitamin A palmitate (250,000 IU/g dry powder CWD)	12.00
60.00	17	Vitamin E acetate (dry powder; 50%)	60.00
80.00	18	PEG-6000 (powder)	80.00
100.00	19	Kollidon® CL	100.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 10 with solution of items 11 and 12. Dry at 60°C with vacuum.
2. Mix with items 13 to 19, and press with high compression force at maximum 30% of relative atmospheric humidity.
3. Compress 2.5 g per tablet using 20 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.50	1	Thiamine mononitrate	5.50
5.50	2	Riboflavin	5.50
6.50	3	Pyridoxine hydrochloride	6.50
60.00	4	Nicotinamide	60.00
30.00	5	Calcium D-pantothenate	30.00
200.00	6	Ascorbic acid (powder)	200.00

200.00	17	Sucrose, crystalline	200.00
200.00	18	Fructose	200.00
100.00	19	Flavors (Firmenich)	100.00

Manufacturing Directions

1. Mix all components, and sieve through a 0.8 mm screen.
2. Press with high compression force at maximum 30% relative atmospheric humidity.
3. Compress 3 g in 20 mm biplanar punches.

MULTIVITAMIN EFFERVESCENT TABLETS I, DC (1–2 RDA OF VITAMINS)

Formulation

Lucarotene dry powder 10%, 23.0 g; CWD G/Y, dry vitamin E acetate 50% DC, 40.0 g; thiamine mononitrate, 2.0 g; riboflavin C, 2.0 g; nicotinamide, 22.0 g; calcium D-pantothenate, 11.0 g; pyridoxine hydrochloride, 2.0 g; cyanocobalamin 0.1% dry powder, 6.0 g; ascorbic acid, powder, 85.0 g; Ludipress® LCE, 477.0 g; sodium bicarbonate, 600.0 g; tartaric acid, 400.0 g; polyethylene glycol 6000, powder, 90.0 g; orange flavor (Dragoco), 60.0 g; aspartame (Searle), 30.0 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with high compression force at a maximum of 30% of relative atmospheric humidity at 1850 mg.

MULTIVITAMIN EFFERVESCENT TABLETS II, DC (3–4 RDA OF VITAMINS)

Formulation

Thiamine mononitrate, 5.5 g; riboflavin, 5.5 g; pyridoxine hydrochloride, 6.5 g; nicotinamide, 60.0 g; calcium D-pantothenate, 30.0 g; ascorbic acid, powder, 200.0 g; cyanocobalamin 0.1% dry powder, 20.0 g; vitamin A palmitate dry powder, 325,000 IU/g CWD, 30.0 g; vitamin E acetate dry powder 50%, 110.0 g; tartaric acid, powder, 400.0 g; sodium bicarbonate, 500.0 g; Ludipress®, 600.0 g; polyethylene glycol 6000, powder, 70.0 g; saccharin sodium, 0.5 g; cyclamate sodium, 40.0 g; sucrose, crystalline, 200.0 g; fructose, 200.0 g; flavors (Firmenich), 100.0 g.

Manufacturing Directions

1. Mix all components, sieve through a 0.8 mm screen, and press with high compression force at maximum 30% relative atmospheric humidity.

MULTIVITAMIN EFFERVESCENT TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.00	1	Thiamine mononitrate	2.00
2.00	2	Riboflavin	2.00
2.00	3	Pyridoxine hydrochloride	2.00
22.00	4	Nicotinamide	22.00
11.00	5	Calcium D-pantothenate	11.00
400.00	6	Tartaric acid (powder)	400.00
300.00	7	Lactose monohydrate	300.00
100.00	8	Cornstarch	100.00
3.00	9	Cornstarch	3.00
50.00	10	Water	50.00
23.00	11	Beta-carotene (dry powder; 10% CWD; food grade)	23.00
6.00	12	Cyanocobalamin (powder; 0.1%)	6.00
85.00	13	Ascorbic acid (powder)	85.00
40.00	14	Vitamin E acetate (dry powder; 50%)	40.00
600.00	15	Sodium bicarbonate	600.00
80.00	16	Flavors	80.00
QS	17	Saccharin sodium	QS

Manufacturing Directions

1. Granulate mixture of items 1 to 6 with solution of items 9 and 10 prepared at 70°C.
2. Dry and sieve, add items 11 to 17, pass through a 0.4 mm sieve, and press with high compression force at maximum 30% of relative atmospheric humidity.
3. Compress 1.63 g using 16 mm biplanar punches.

MULTIVITAMIN INFANT DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
1125 IU	1	Vitamin A palmitate (1.7 MM IU/g, 50% excess)	1.324
416 IU	2	Vitamin D (40 MM lU/g, cholecalciferol, 25% excess)	0.013
5.00	3	Vitamin E (oily; alpha-tocopheryl acetate)	5.00
52.50	4	Ascorbic acid (50% excess)	78.75
0.375	5	Thiamine hydrochloride (50% excess)	0.75
0.40	6	Pyridoxine hydrochloride	0.40
8.00	7	Nicotinamide	8.00
0.00125	8	Cyanocobalamin (50% excess)	0.001875
0.82	9	Riboflavin sodium phosphate (5% excess as riboflavin)	0.865
2.50	10	Polyoxyl 20 cetostearyl ether (Cetomacrogol 1000)	2.50
12.50	11	Polysorbate 80 (Tween 80)	12.50
0.50	12	Edetate disodium (sodium EDTA)	0.50
3.75	13	Sodium hydroxide	3.75
0.25	14	Saccharin sodium	0.25
300.00	15	Glycerin (glycerol)	300.00
500.00	16	Sorbitol (70% solution)	500.00
50.00	17	Propylene glycol	50.00
1.50	18	Flavor	1.50
3.00	19	Flavor	3.00
1.50	20	Flavor	1.50
–	21	Purified water	QS to 1 L

Manufacturing Directions

The product is a microemulsion and thermolabile. The temperature of solution must not exceed 25°C at the time of processing. Store bulk at temperature 15°C to 20°C under nitrogen protection to avoid discoloration and precipitation. Period of storage should not exceed 48 hours prior to filling in the bottle.

1. Check and record pH of item 21 (limit: 5.0–6.5), and collect 250 g of it in manufacturing vessel. Heat to 90°C to 95°C for 10 minutes; then, cool to 20°C to 25°C.
2. Bubble nitrogen gas into cooled item 21 for 20 minutes.
3. Load 200 g of item 21 from first step to the manufacturing vessel.

4. Bubble nitrogen gas during all stages of the process.
5. Add items 4 to 9 and 12 to 14 one by one to the manufacturing vessel while mixing.
6. Check that all materials are dissolved completely. Solution should be clear.
7. Add item 11 in a separate stainless steel container, and heat to 45°C.
8. Mix items 1, 2, 3, and 10 one by one.
9. Mix for 1 hour at slow speed.
10. Add oil phase preparation to the aqueous phase at a rate of 2 mL/min while mixing. Keep on bubbling nitrogen gas throughout the process.
11. Add items 15 and 16 to the manufacturing vessel one by one while mixing.
12. Keep on bubbling nitrogen gas throughout the process.
13. Add items 18, 19, and 20 in item 17, and add to the manufacturing vessel while mixing.
14. Adjust the volume to 1 L using nitrogen-bubbled item 21.
15. Mix for 10 minutes at slow speed without aeration.
16. Check pH (limit: 3.7–4.5).
17. Filter the product at 1.5 bar.
18. Recirculate approximately 100 to 150 mL of product.
19. Transfer the filtered product to the storage vessel under a nitrogen blanket.

MULTIVITAMIN INFANT DROPS

Bill of Materials

Scale (mg/0. mL)	Item	Material Name	Qty/L (g)
675.00	1	Glycerin, USP (96%)	675.00
10.00	2	Nicotinamide niacinamide (white powder) (5% excess)	17.50
2.74	3	Riboflavin-5′-phosphate sodium (0% excess)	2.74
0.50	4	Methyl paraben (powder)	500.00 mg
1.00	5	Benzoic acid	1.00
2.10	6	Saccharin sodium (powder)	2.10
1.50	7	Thiamine HCl (45% excess)	3.625
0.60	8	Pyridoxine HCl	833.34 mg
50.00	9	Ascorbic acid (white powder) (20% excess)	100.00
0.257	10	Orange oil terpeneless No. 54125	257.789 mg
0.095	11	Alcohol (ethanol)	95.50 mg
80.00	12	Polysorbate 80	80.00
0.186	13	Butylated hydroxyanisole	186.92 mg
400 IU	14	Vitamin D viosterol in corn oil (oleovitamin D) (25% excess)	833.34 mg
5000 IU	15	Vitamin A; use vitamin A palmitate (1,500,000 AU/g) (50% excess[a])	16.66
QS	16	Purified water	329
QS	17	Carbon dioxide gas	QS

[a] Excess includes 20% manufacturing loss and 30% stability excess.

Manufacturing Directions

Use carbon dioxide cover at all times, and use stainless steel 316 or higher resistant equipment.

1. Add 300 mL of purified water and the glycerin into a suitable jacketed tank. Start mixing.
2. Add, in this order, nicotinamide, riboflavin-5′-phosphate sodium, Aspetoform M (paraben), benzoic acid, and saccharin sodium.
3. Continue mixing for balance of process.
4. Heat to 90°C to 100°C to dissolve ingredients.
5. In a separate tank, boil at least 15 mL of purified water for at least 15 minutes.
6. Cool while bubbling CO_2 gas into it, and hold at 30°C or lower for use later for making up the volume.
7. Start cooling the main tank. When the temperature reaches 50°C to 60°C, start bubbling CO_2 gas through the solution from the bottom of the tank.
8. Continue cooling to 25°C. Continue the CO_2 gas protection for the balance of the process.
9. Add and dissolve thiamine HCl, pyridoxine HCl, and ascorbic acid.
10. Dissolve orange oil in alcohol, and add.
11. Load approximately 5.25 g of Polysorbate 80 into a separate stainless steel container.
12. Heat to 50°C to 60°C. Add the butylated hydroxyanisole and dissolve with mixing. Remove heat.
13. Add remaining Polysorbate 80 into the container, setting aside a sufficient quantity for rinsing the vitamin containers.
14. Bubble in CO_2 gas while mixing slowly. Stop mixing.
15. Add viosterol and vitamin A palmitate.
16. Rinse bottles with remaining Polysorbate 80, and drain.
17. Mix slowly for at least 30 minutes or longer, if necessary, to provide a clear solution. Continue to bubble CO_2 gas for the entire mixing period.
18. Change CO_2 gas protection on main mixing tank to the top to prevent excessive foaming upon addition of Polysorbate 80 solution.
19. Add Polysorbate 80 solution to the main tank from the bottom of the tank to the top to prevent excessive foaming. Stop mixing.
20. If the volume is less than 1000 mL, adjust the volume with CO_2-saturated purified water made previously to 1000 mL. Mix for at least 1 hour.
21. In a separate tank, boil at least 115 mL of purified water for at least 15 minutes.
22. Cool while bubbling CO_2 gas into it, and hold at 30°C or lower for use later. Stop mixing.
23. Allow to stand for at least 4 hours to eliminate entrapped CO_2 gas.
24. Readjust volume to 1000 mL with CO_2-saturated purified water. Mix for at least 1 hour. Stop mixing.
25. Filter through lint-free paper; do not use filter aids.
26. Recirculate product back to mixing tank until clear.
27. Flush storage tank with CO_2 gas, and continue CO_2 gas protection until product has been filled.
28. Average intake dose is 0.60 mL.

MULTIVITAMIN INSTANT GRANULES

Bill of Materials

Scale (mg/sachet)	Item	Material Name	Qty/30 kg (g)
40.00	1	Vitamin A and vitamin D (dry powder + 50,000 IU/g CWD)	200.00
5.00	2	Thiamine mononitrate, with excess	26.00
6.00	3	Riboflavin, with excess	33.00
22.00	4	Nicotinamide	110.00
4.50	5	Pyridoxine hydrochloride	22.00
30.00	6	Calcium D-pantothenate	150.00
0.013	7	Cyanocobalamin; use cyanocobalamin (gelatin-coated, 0.1%)	66.00
230	8	Ascorbic acid powder	1150.00
–	9	Vitamin E acetate dry powder	210.00
4000	10	Sucrose (finely ground)	20,000.00
1000	11	Kollidon® CL-M	5000.00
200	12	Orange flavor	1000.00
400	13	Kollidon® VA 64	2000.00
–	14	Ethanol or isopropanol	~7.00 L

Manufacturing Directions

1. Pass mixture through a 0.8 mm sieve, and granulate with solution of items 13 and 14 in the fluidized bed.
2. Fill 6 to 12 g of the granules in sachets.
3. If the technology of a fluidized bed is not available, the dry powders of vitamins A, B_{12}, and E should be added after granulation of the other components.
4. Suspend 6 to 12 g (= 1 sachet) in a glass of water (corresponds to 2 to 4 RDA of vitamins).

MULTIVITAMIN MINERAL SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
6.65	1	Acid hypophosphorous (50% pure)	6.65
16.47	2	Calcium hypophosphite	16.47
31.68	3	Calcium lactate (powder)	31.68
1.00	4	Methylparaben	1.00
0.20	5	Propylparaben	200.00 mg
1.00	6	Benzoic acid	1.00
150.00	7	Sucrose (granular)	150.00
5.20	8	Ferrous gluconate	5.20
2.00	9	Niacinamide (5% excess)	2.10
0.32	10	Riboflavin-5-phosphate sodium	328.77 mg
1.00	11	D-Pantothenyl alcohol (dexpanthenol) (20% excess)	1.20
0.60	12	Vitamin B_{12} (cyanocobalamin) (35% excess)	810.00 µg
0.20	13	Pyridoxine hydrochloride	200.00 mg
0.30	14	Thiamine hydrochloride (regular powder) (55% excess)	465.00 mg
4.78	15	Flavor	4.78
1.94	16	Flavor	1.94
0.64	17	Orange oil, terpeneless	642.00 mg
0.21	18	Lime oil, distilled	214.97 mg
4.28	19	Alcohol (190 proof)	4.28
2.50	20	Saccharin sodium	2.50
14.50	21	Acid ascorbic (white powder/EP) (45% excess)	14.50
3.00	22	Caramel (acid proof)	3.00
2.00	23	Anhydrous citric acid (powder/EP)	2.00
0.01	24	Butylated hydroxyanisole (BHA)	10.00 mg
3.39	25	Corn oil	3.39
0.40	26	Vitamin A palmitate (TN, 1.5 MM UA/g) (40% excess)	560.00 mg
0.08	27	Viosterol in corn oil (syn. oleovitamin D; 1000 mD/g; D_3 in arachis oil) (40% excess)	112.00 mg
1.50	28	Acacia	1.50
0.12	29	Sodium lauryl sulfate (acetone washed)	127.41 mg
171.00	30	Deionized, purified water	171.00
QS	31	Glucose liquid	QS to 1 L

Manufacturing Directions

Do not expose this preparation during manufacturing to direct sunlight. Riboflavin is sensitive to light.

1. Add 83.7 mL of purified water to a stainless steel jacketed tank.
2. Add calcium hypophosphite, calcium lactate, parabens, and benzoic acid.
3. Heat mixture to 60 °C with agitation.

4. Shut off mixer, and wash tank free of all powders with 25.9 mL purified water.
5. Heat mixture to and maintain a maximum temperature of 100°C until solution is complete. Do not agitate. Avoid loss of water through evaporation. Cover opening of tank.
6. After solution occurs, take sample from bottom of tank and examine for clarity. Solution must be clear.
7. Add acid hypophosphorous (if used) with mixing.
8. Turn off heat, add 222 g glucose, and start agitator. (*Caution:* Use CO_2 cover throughout. Wherever water is used, it should be CO_2-saturated water.) Dissolve ferrous gluconate in 7.4 mL water CO_2 saturated by heating.
9. Add 278 g glucose with mixing. Add and dissolve sugar.
10. Allow solution to cool to 35°C, and mix well.
11. To 29.6 mL water, add and dissolve nicotinamide, riboflavin, D-pantothenyl alcohol, vitamin B_{12}, pyridoxine, and thiamine. Mix until solution is complete, and add to tank. Dissolve by heat if necessary.
12. Charge flavors into tank.
13. Charge saccharin into tank, and mix until dissolved.
14. Charge ascorbic acid into tank, and mix well.
15. Charge caramel into tank, and mix well. Dissolve citric acid in 3 mL water, and add to mixture.
16. Heat corn oil to 50°C to 60°C, and add and dissolve BHA. Be sure the BHA is completely dissolved before continuing.
17. Cool to room temperature. While cooling oil mixture, saturate with CO_2, and maintain heavy CO_2 coverage for balance of operation.
18. Set aside a small amount of this mixture as a rinse for the vitamin A and viosterol containers.
19. Add vitamin A palmitate TN and viosterol to the cool corn oil mixture, rinsing the containers with the reserved oil.
20. Add the rinse to the bulk. Mix well.
21. Add the acacia to the oil mixture with good mixing.
22. Dissolve sodium lauryl sulfate in 3 mL CO_2-saturated purified water.
23. To avoid excessive foaming, do not bubble CO_2 gas through the water/sodium lauryl sulfate solution.
24. Add the sodium lauryl sulfate solution to the oil mixture, and stir to a thick creamy emulsion.
25. Add 7.56 g glucose to the emulsion with mixing.
26. Blend 13.33 mL CO_2-saturated purified water with 77.04 g glucose, and add emulsion with stirring.
27. Recycle primary emulsion back into holding tank while setting mill.
28. Homogenize until all oil globules are less than 8 µm in diameter using colloid mill with a fine setting.
29. Add primary emulsion to syrup solution with mixing. Add glucose QS to 965 mL, and mix well.
30. Allow to stand overnight to vent entrapped air.
31. Adjust the volume to 1 L using glucose or glucose and CO_2-saturated water.
32. Strain through 149 µm aperture or similar screen into clean reserve tank, and recheck volume.
33. Seal tank under heavy CO_2 until filled.

MULTIVITAMIN + MINERALS TABLETS WITH BETA-CAROTENE (1 RDA OF VITAMINS)

Formulation

Beta-carotene dry powder, Betavit 20%, 16.5 g; thiamine mononitrate, 1.7 g; riboflavin, 1.9 g; nicotinamide (Degussa), 22.0 g; calcium D-pantothenate, 12.0 g; pyridoxine hydrochloride, 2.2 g; ascorbic acid, crystalline, 72.0 g; vitamin E acetate dry powder 50%, 66.0 g; ferrous fumarate, 54.7 g; magnesium oxide, high-density type, 165.8 g; copper II oxide, powder, 2.5 g; manganese sulfate, 6.9 g; zinc oxide, 18.7 g; potassium chloride (Baker), 76.3 g; dicalcium phosphate, DI-TAB, 550.0 g; Avicel™ PH 102, 60.0 g; croscarmellose, 32.0 g; Syloid® 244 FP (Grace), 6.0 g; stearic acid. 6.0 g; magnesium stearate. 6.0 g.

Manufacturing Directions

1. Pass all ingredients through a 0.8 mm sieve, blend in a mixer, and then compress with medium to high compression force at 1193 mg.

MULTIVITAMIN ORAL GEL

Formulation

I. Vitamin A palmitate, 1.7 million IU/g, 110 mg; vitamin E acetate, 1060 mg; butylated hydroxytoluene (BHT), 500 mg; Cremophor RH 40, 20 g.
II. Water, 725 g.
III. Thiamine hydrochloride, 355 mg; riboflavin, 35 mg; pyridoxine hydrochloride, 177 mg; cyanocobalamin gelatin coated 1%, 35 mg; nicotinamide, 353 mg; folic acid, 35 mg; dexpanthenol, 353 mg; EDTA sodium, 300 mg; ferrous sulfate ($7H_2O$), 438 mg; manganese chloride ($4H_2O$), 638 mg; potassium iodide, 115 mg.
IV. Kollidon® 90 F, 50 g; Lutrol F 127, 100 g; Lutrol F 127 [1], 100 g; Total amount: approximately 1000 g.

Manufacturing Directions

1. Heat mixture I to approximately 60°C to obtain a clear solution.
2. Slowly add the water II to the well-stirred solution I.
3. Dissolve III and IV in this mixed solution (step 2) at room temperature, cool to approximately 6°C, add IV, and stir until all Lutrol F 127 is dissolved.
4. Maintain the cool temperature until the air bubbles escape.

MULTIVITAMIN ORAL GEL VETERINARY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (mg)
18,700 IU	1	Vitamin A palmitate (1.7 MM IU/g)	110.00
1.06	2	Vitamin E acetate	1060.00
0.50	3	BHT	500.00
20.00	4	Cremophor RH 40	20.00 g
725.00 g	5	Water	725.00 g
0.355	6	Thiamine hydrochloride	355.00
0.035	7	Riboflavin	35.00
0.177	8	Pyridoxine hydrochloride	177.00
0.035	9	Cyanocobalamin (gelatin coated, 1%)	35.00
0.353	10	Nicotinamide	353.00
0.035	11	Folic acid	35.00
0.353	12	Dexpanthenol	353.00
0.30	13	EDTA sodium	300.00
0.438	14	Ferrous sulfate ($7H_2O$)	438.00
0.638	15	Manganese chloride ($4H_2O$)	638.00
0.115	16	Potassium iodide	115.00
50.00	17	Kollidon® 90 F	50.00 g
100.00	18	Lutrol F 127	100.00 g
100.00	19	Lutrol F 127	100.00 g

Manufacturing Directions

1. Heat mixture of items 1 to 4 to approximately 60°C to obtain a solution.
2. Slowly add the water (item 5) to the well-mixed solution.
3. Dissolve items 6 to 16 and item 17 separately in this mixed solution at room temperature, cool to approximately 6°C, add item 19, and stir until all Lutrol F127 clear is dissolved.
4. Maintain the cool temperature until the air bubbles escape.

MULTIVITAMIN ORAL GEL WITH LINOLEIC AND LINOLENIC ACID

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/100 mL (mg)
0.05	1	Evening primrose oil (Epopure®, Prima Rosa/SA)	5.00 mL
0.30	2	Vitamin A palmitate (1.7 million IU/g)	30.00
0.19	3	Vitamin E acetate	19.00
0.00150	4	Vitamin D_3 (40 million IU/g)	150.00 µg
200.00	5	Cremophor RH 40	20.00 g
550.00	6	Water	55.00 g
0.03	7	Thiamine hydrochloride	3.00
0.03	8	Riboflavin	3.00
0.15	9	Pyridoxine hydrochloride	15.00
0.001	10	Cyanocobalamin (crystalline)	10.00 µg
0.001	11	Calcium D-pantothenate	10.00
0.005	12	Nicotinamide	50.00
10.00	13	Ascorbic acid (crystalline)	1.00 g
140.00	14	Lutrol F 127	14.00 g
50.00	15	Lutrol F 127	5.00 g

Manufacturing Directions

1. Prepare mixture of items 1 to 5, and heat to approximately 65°C.
2. Slowly add the warm water (item 6) (65°C) to the well-stirred mixture as before.
3. Dissolve items 7 to 14 at 20°C to 25°C in this clear solution.
4. Cool the obtained solution to approximately 5°C, and dissolve the rest of the Lutrol F 127 (item 15).
5. Maintain the cool temperature until the air bubbles escape.
6. A clear yellow gel is obtained. 5 mL of evening primrose oil Epopure® contains 3.5 g linoleic acid and 0.45 g gamma-linolenic acid.

MULTIVITAMIN SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/100 mL (mg)
170 IU	1	Vitamin A palmitate (1.7 million IU/g)	10.00
2.00 IU	2	Vitamin D (40 million IU/g)	0.05
1.00	3	Vitamin E acetate	100.00
0.02	4	BHT	2.00
45.00	5	Cremophor RH 40	4.50 g
100.00	6	Water	10.00 g
450.00	7	Saccharose	45.00 g
2.00	8	Methylparaben	200.00
0.08	9	Citric acid	80.00
9.60	10	Glycerol	9.60 g
250.00	11	Water	25.00 g
0.15	12	Thiamine hydrochloride	15.00
0.15	13	Riboflavin 5′-phosphate sodium	15.00
0.55	14	Nicotinamide	55.00
0.15	15	Pyridoxine hydrochloride	15.00
3.00	16	Ascorbic acid (crystalline)	300.00
1.00	17	Sorbic acid	100.00
5.00	18	Propylene glycol (Pharma)	5.00 g

Manufacturing Directions

1. Mix items 1 through 5 and heat to 60°C.
2. Separately heat item 2 to approximately 60°C.
3. Mix these two solutions slowly, stirring well to obtain a clear solution.
4. Dissolve items 7 to 9 in the hot solution of items 10 and 11 to obtain a clear solution.
5. Add to previous solution.
6. Add items 12 to 18, and adjust the pH to 4.0 to 4.2.
7. Pass nitrogen through the solution for 10 minutes, and fill under nitrogen cover.
8. Provides 1 to 2 RDA/20 mL.

MULTIVITAMIN SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/100 mL (mg)
0.17	1	Vitamin A palmitate (1.7 MM IU/g)	17.00
0.001	2	Vitamin D_3 (40 MM IU/g)	0.10
0.01	3	BHT	1.00
30.00	4	Cremophor RH 40	3.00 g
1.00	5	Parabens	100.00
170.00	6	Water	17.00 g
0.50	7	Thiamine hydrochloride	50.00
0.20	8	Riboflavin phosphate sodium	20.00
0.20	9	Pyridoxine hydrochloride	20.00
2.50	10	Ascorbic acid (crystalline)	250.00
50.00	11	Water	5.00 g
–	12	Sugar syrup	Add 100 mL

Manufacturing Directions

1. Heat mixture of items 1 to 4 to approximately 65°C.
2. Stir well, and very slowly add item 6 to warm solution (65°C).
3. Mix with solution of items 7 to 11, and add item 12 to make up the volume.
4. *Note:* Parabens are generally a 1:10 ratio of methyl and propyl parabens.

MULTIVITAMIN TABLET CORES WITH BETA-CAROTENE (1–2 RDA OF VITAMINS)

Formulation

Vitamin A acetate dry powder, 500,000 IU/g, 1.27%; beta-carotene dry powder Betavit 10%, 11.50%; thiamine mononitrate, 1.24%; riboflavin, 0.96%; nicotinamide, 11.50%; calcium D-pantothenate, 1.91%; pyridoxine hydrochloride, 1.15%; cyanocobalamin gelatin coated 1%, 2.86%; D-biotin, 1% trituration, 1.91%; folic acid, 0.09%; ascorbic acid, 38.20%; vitamin D_3 dry powder, 100,000 IU/g, 0.76%; vitamin E acetate dry powder 50 DC, 28.40%; phytomenadione dry powder 5% GFP, 0.19%, 270.2 g; Ludipress®, 69.1 g; magnesium stearate, 3.3 g.

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force at 459 mg.

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
10.00	1	Thiamine mononitrate (powder), USP (5% excess; 5–10%)	10.50
5.00	2	Riboflavin, USP	5.00
100.00	3	Nicotinamide niacinamide (white powder), USP	100.00
200.00	4	Ascorbic acid; use sodium ascorbate (microcrystalline) (2% excess)	229.47
40.00	5	Calcium pantothenate; use calcium pantothenate racemic (20% excess)	48.00
5.00	6	Pyridoxine hydrochloride, USP	5.00
6.10	7	Povidone (PVP K-25), USP	6.10
–	8	Alcohol dehydrated (200 proof), USP	25.00 mL
21.90	9	PEG-8000, NF	21.90
25,000 IU	10	Vitamin A (275,000 IU[a]) (20% excess)	7.50 mg
400 IU	11	Vitamin D as D_2 powder (850 mD[a])	1.77
6.00	12	Vitamin B_{12} oral powder in gelatin (5% excess)	6.30
16.00	13	PEG-8000 (milled), NF	16.00
5.30	14	Magnesium stearate	5.30
23.20	15	Talc	23.20

[a] Adjust quantities according to regulatory allowance for OTC label.

Manufacturing Directions

Vitamin A is susceptible to destruction by oxidation and also excessive exposure to actinic light and moisture. Oxidation and destruction are catalyzed by traces of copper and other heavy metals. Dry granulation and compression of this tablet should be done where RH is less than 40%. Protect with CO_2 at blending and storage stages.

1. Load the following into a suitable mixer (screen if necessary): thiamine mononitrate, riboflavin, nicotinamide, sodium ascorbate, calcium pantothenate, and pyridoxine HCl.
2. Dissolve the PVP (item 7) in approximately 16 mL alcohol.
3. Add PVP solution to the powders from first step, and QS with alcohol to mass.
4. Granulate the mass through a 4 mesh (4.76 mm aperture or similar) screen.
5. Dry at 50°C until the LOD is less than 1%.
6. Grind to 16 mesh (1.2 mm or similar).
7. Melt the PEG-8000 (item 10), and incorporate vitamins A and D with thorough agitation.
8. Mix until mass cools and becomes granular.
9. Screen through a 16 mesh (1.2 mm aperture or similar) screen, and grind coarse material through a Fitz mill or similar No. 2 band (1.59 mm aperture or similar) at slow speed or a 16 mesh (1.2 mm aperture or similar).
10. Reserve for lubrication.
11. Mix milled PEG-8000 (item 13) with talc and magnesium stearate, and pass through a Fitz mill using a 60 mesh (250 µm aperture or similar) screen (impact forward, high speed).
12. If a Fitz mill is unavailable, pass the mixture through a 30 mesh (595 µm aperture or similar) screen.
13. Load base granulation into a mixer along with vitamin B_{12}, the preceding mixture, and the PEG-coated vitamins A and D mixture from the first step. Blend thoroughly.
14. Store dry mixed granulation with CO_2 protection.
15. Compress.
16. Apply a PVP subcoat, a CAP-carbowax, or other aqueous coating, and finish with a polish coat (see Appendix).

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Riboflavin	10.00
100.00	2	Niacinamide (white powder)	100.00
5.00	3	Pyridoxine hydrochloride (15% excess)	5.75
15.00	4	Thiamine mononitrate (powder) (5% excess)	15.75
500.00	5	Ascorbic acid, EP	500.00
100.00	6	Lactose	100.00
40.00	7	Povidone (K-29-32)	40.00
100.00	8	Cellulose microcrystalline (Avicel™ PH101)	100.00
–	9	Alcohol SD 3A (200 proof)	QS
20.00	10	Calcium pantothenate; use racemic calcium pantothenate, USP (80 mesh; 15% excess)	46.00
11.50	11	Magnesium oxide (light powder calcined)	11.50
500.00	12	Ascorbic acid	500.00
3.83	13	Povidone (K-29-32)	3.83
–	14	Alcohol SD 3A (200 proof)	QS
4.00 µg	15	Vitamin B_{12}; use vitamin B_{12} oral powder in gelatin (15% excess)	4.60
28.00	16	Acid stearic	28.00
9.60	17	Magnesium stearate	9.60

Manufacturing Directions

1. Dry blend the riboflavin, niacinamide, pyridoxine hydrochloride, thiamine mononitrate, ascorbic acid (item 5), and lactose for 10 minutes.
2. Dissolve the povidone (item 7) in 75 mL of alcohol (item 9).
3. While mixing in mass mixer, add the povidone solution to mass, and continue mixing for 10 minutes or until a satisfactory granule mass is obtained.
4. Additional alcohol may be added if required.
5. Granulate the mass through a 15.9 mm screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on an oscillating granulator.
6. Dry the granules between 41°C and 49°C in a hot air oven (for approximately 8 hours) or fluid-bed dryer until moisture content is less than 1.5%.
7. Dry screen the granule through a 1 mm screen on an oscillating granulator.
8. Dry blend the calcium pantothenate and magnesium oxide in a suitable mixer for 10 minutes.
9. Dissolve the povidone (item 13) in 20 mL alcohol (item 14).
10. While mixing, add the povidone solution, and mix to produce a suitable mass.
11. Additional alcohol may be added if required.
12. Granulate the mass through a 15.9 mm aperture screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on an oscillating granulator.
13. Dry the granule at 45 ° C in a hot air oven until moisture content is less than 1.5%.
14. Dry screen granule through a 1.0 mm screen on an oscillating granulator.
15. Mix the two granules made separately in a suitable mixer.
16. Add vitamin B_{12} powder, and blend for 10 minutes. If necessary, screen the stearic acid and magnesium stearate through a 250 μm screen.
17. Add the remainder of the granule together with the magnesium stearate and stearic acid to the mixer, and blend for 10 minutes.
18. Compress and coat (see Appendix).

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Riboflavin	10.00
100.00	2	Niacinamide (white powder)	100.00
5.00	3	Pyridoxine hydrochloride (15% excess)	5.75
15.00	4	Thiamine mononitrate (powder) (5% excess)	15.75
40.00	5	Povidone (K-29-32)	40.00
25.00	6	Povidone (K-29-32)	25.00
–	7	Alcohol SD 3A (200 proof)	QS
13.50	8	Stearic acid (fine powder)	13.50
2.70	9	Magnesium stearate	2.70

Manufacturing Directions

1. Mill the niacinamide, riboflavin, pyridoxine hydrochloride, and thiamine mononitrate through a 500 μm screen on a comminuting mill (impact forward, slow speed).
2. Load screened material from previous step into a mass mixer, add the povidone (item 5) and the cellulose microcrystalline, and dry blend for 5 to 15 minutes.
3. While mixing in the mass mixer, add alcohol (item 7) to mass, and continue mixing for 10 minutes or until a satisfactory granule mass is obtained.
4. If necessary, granulate the mass through a 15.9 mm screen using a comminuting mill (knives forward, slow speed) or a 4 mm screen on an oscillating granulator.
5. Dry the granule between 41°C and 49°C in a hot air oven (for approximately 8 hours) or fluid-bed dryer until moisture content is less than 1.5%.
6. Dry screen the granules through a 1 mm screen on an oscillating granulator.
7. Load ascorbic acid and povidone (item 6) into the mixer, and dry-blend for 10 minutes.
8. While mixing, add 15 mL of alcohol (item 7), and mix until a satisfactory mass is formed, adding more alcohol if necessary. If necessary, screen through a 4.00 mm screen, and load onto trays.
9. Dry at 49°C for 8 hours.
10. Dry screen the granules through a 1 mm aperture screen on an oscillating granulator.
11. Screen the magnesium stearate and stearic acid through a 500 μm aperture screen.
12. Mix the two granules, add the screened lubricants, and blend for 20 minutes.
13. Coat with a protective subcoat, a color coat, and a polish coat (see Appendix).

MULTIVITAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Vitamin A acetate (dry powder; 500,000 IU/g)	10.00
2.20	2	Thiamine mononitrate	2.20
2.20	3	Riboflavin	2.20
16.50	4	Nicotinamide	16.50
11.50	5	Calcium D-pantothenate	11.50
2.20	6	Pyridoxine hydrochloride	2.20
6.00	7	Cyanocobalamin (dry powder, 0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
321.00	10	Ludipress®[a]	321.00
21.00	11	Kollidon® VA 64	21.00
3.00	12	Magnesium stearate	3.00
7.20	13	Orange flavor	7.20
2.50	14	Saccharin sodium	2.50

[a] Can be replaced with 300 g of microcrystalline cellulose (Vitacel®).

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium compression force (15 kN).
2. Compress 500 mg in 12 mm biplanar punches.

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.00	1	Thiamine hydrochloride	2.20
2.20	2	Riboflavin	2.20
11.00	3	Calcium D-pantothenate	11.00
2.20	4	Pyridoxine hydrochloride	2.20
300.00	5	Mannitol	300.00
20.00	6	Kollidon® 30 or Kollidon® VA 64	20.00
–	7	Isopropanol	~80
5000 IU vitamin A, 500 IU vitamin D	8	Vitamins A and D; use crystallets of vitamin A acetate + vitamin D_3 dry powder (500,000 + 50,000 IU/g) (10% excess)	11.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
0.06	10	Cyanocobalamin; use gelatin-coated cyanocobalamin (0.1%)	6.00
80.00	11	Ascorbic acid (crystalline)	80.00
20.00	12	Nicotinamide	20.00
65.00	13	Avicel™ PH101	65.00
7.00	14	Orange flavor	7.00
2.00	15	Saccharin sodium	2.00
3.00	16	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 5 with solution of items 6 and 9.
2. Pass through a 0.8 mm sieve, mix with items 8 to 16, and press with medium compression force.
3. Compress 560 mg in 12 mm biplanar punches.

MULTIVITAMIN TABLETS, DC (1–2 RDA OF VITAMINS)

Formulation

Vitamin A acetate dry powder, 500,000 IU/g, 10.0 g; thiamine mononitrate, 2.2 g; riboflavin, 2.2 g; nicotinamide, 16.5 g; calcium D-pantothenate, 11.5 g; pyridoxine hydrochloride, 2.2 g; cyanocobalamin, 0.1% dry powder, 6.0 g; ascorbic acid, powder, 85.0 g; vitamin E acetate dry powder SD 50, 31.0 g; Ludipress®, 321.0 g; magnesium stearate, 3.0 g; orange flavor, 7.2 g; saccharin sodium, 2.5 g.

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium compression force (15 kN).

MULTIVITAMIN TABLETS FOR DOGS

Formulation

Vitamins A and D_3 dry powder, 500,000 and 50,000 IU/g, 4.0 g; thiamine mononitrate, 0.5 g; riboflavin, 0.7 g; nicotinamide, 5.0 g; calcium D-pantothenate, 1.0 g; pyridoxine hydrochloride, 0.5 g; cyanocobalamin gelatin coated 1%, 0.5 g; folic acid, 0.05 g; choline bitartrate, 20.0 g; vitamin E acetate dry powder SD 50, 20.0 g; Ludipress®, 196.0 g; magnesium stearate, 2.0 g.

Manufacturing Directions

Pass all components through a 0.8 mm sieve, mix, and press with low compression force at 250 mg.

MULTIVITAMIN TABLETS FOR DOGS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2000 IU Vitamin A, 200 IU Vitamin D	1	Vitamin A + vitamin D_3 (dry powder; 500,000 + 50,000 IU/g)	4.00
0.50	2	Thiamine mononitrate	0.50
0.70	3	Riboflavin	0.70
5.00	4	Nicotinamide	5.00
1.00	5	Calcium D-pantothenate	1.00
0.50	6	Pyridoxine hydrochloride	0.50
0.50	7	Cyanocobalamin (gelatin coated, 1%)	0.50
0.05	8	Folic acid	0.05
20.00	9	Choline bitartrate	20.00
20.00	10	Vitamin E acetate (dry powder, SD 50)	20.00
196.00	11	Ludipress®	196.00
2.00	12	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compression force.
2. Compress 250 mg using 8 mm biplanar punches.

MULTIVITAMIN TABLETS WITH BETA-CAROTENE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1.00	1	Beta-carotene; use beta-carotene dry powder (Betavit, 10%)	10.00
2.00	2	Thiamine mononitrate	2.00
2.00	3	Riboflavin	2.00
16.00	4	Nicotinamide	16.00
11.00	5	Calcium D-pantothenate	11.00
2.00	6	Pyridoxine hydrochloride	2.00
0.06	7	Cyanocobalamin; use cyanocobalamin dry powder (0.1%)	6.00
85.00	8	Ascorbic acid (powder)	85.00
31.00	9	Vitamin E acetate (dry powder; SD 50)	31.00
321.00	10	Ludipress®	321.00
7.00	11	Kollidon® VA 64	7.00
3.00	12	Magnesium stearate	3.00
7.00	13	Orange flavor	7.00
2.00	14	Saccharin sodium	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 508 mg using 12 mm planar punches.

MULTIVITAMIN TABLETS WITH COPPER AND ZINC

Formulation

Vitamin mixture (thiamine mononitrate), 3.9%; riboflavin 100, 0.4%; nicotinamide 10.1%; calcium D-pantothenate, 2.9%; pyridoxine hydrochloride, 1.2%; cyanocobalamin gelatin coated 0.1%, 2.6%; folic acid, 0.1%; ascorbic acid fine powder, 63.4%; vitamin E acetate dry powder 500 SD, 9.1%; copper oxide, 0.3%; zinc sulfate, 6.0%, 1000 g; Aerosil®, 200, 5 g; Ludipress®, 150 g; Avicel™ PH102, 120 g; Kollidon® VA64, 25 g; magnesium stearate, 10 g; talc, 10 g.

Manufacturing Directions

Pass all components through a 0.8 mm sieve, mix, and press with high compression force at 1350 mg.

MULTIVITAMIN WITH BETA-CAROTENE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.85 IU	1	Vitamin A acetate (dry powder; 500,000 IU/g)	5.47
5.00	2	Beta-carotene; use beta-carotene dry powder (Betavit, 10%)	50.00
15.34	3	Thiamine mononitrate	15.34
4.13	4	Riboflavin	4.13
50.00	5	Nicotinamide	50.00
8.23	6	Calcium D-pantothenate	8.23
5.00	7	Pyridoxine hydrochloride	5.00
0.04	8	Cyanocobalamin; use gelatin-coated cyanocobalamin (1%)	4.00
0.04	9	D-Biotin; use 1% trituration	4.00
0.38	10	Folic acid	0.38
165.00	11	Ascorbic acid	165.00
327.00	12	Vitamin D_3 (dry powder; 100,000 IU/g)	3.27
122.00	13	Vitamin E acetate (dry powder; SD 50)	122.00
0.41	14	Phytomenadione; use phytomenadione dry powder (5% GFP)	0.82

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 432 mg in 12 mm biplanar punches.

MULTIVITAMIN WITH FLUORIDE INFANT DROPS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
8.00	1	Niacin; use niacinamide (5% excess)	0.82
0.80	2	Riboflavin, USP; use riboflavin-5-phosphate sodium (2% excess)	
0.50	3	Methylparaben	0.50
1.00	4	Benzoic acid	1.00
5000 IU	5	Vitamin E; use D-alpha-tocopheryl PEG-1000 succinate (20% excess)	13.826
400 IU	6	Vitamin D; use viosterol in corn oil (syn. oleovitamin D) (25% excess)	0.522
1500 IU (0.45)	7	Vitamin A palmitate (synthetic A palmitate, 1 MM U/g), USP	1.44
35.00	8	Ascorbic acid (white powder), USP (33% excess)	46.55
0.50	9	Thiamine hydrochloride (44% excess)	0.72
0.40	10	Pyridoxine; use pyridoxine hydrochloride	0.486
0.25	11	Fluoride; use sodium fluoride (powder)	0.5526
4.013	12	Caramel (acid proof)	4.013
0.257	13	Orange oil terpeneless	0.257
QS	14	Alcohol (ethanol; 190 proof)	10.00 mL
QS	15	Distilled purified water	QS
QS	16	Hydrochloric acid	QS
QS	17	Sodium hydroxide	QS
QS	18	Carbon dioxide gas	QS

Manufacturing Directions

Use only stainless steel tanks, and minimize vortex formation to prevent aeration. Product attacks glass, so avoid contact with glass.

1. Place 350 mL of purified water into the stainless steel jacketed main tank.
2. Start mixing.
3. Add, in this order, niacinamide, riboflavin, sodium fluoride, methyl paraben, and benzoic acid.
4. Rinse the interior walls of the tank with approximately 16 mL purified water.
5. Continue mixing for the balance of the process.
6. Heat the main tank to 95°C to dissolve ingredients.
7. When the solution is complete, cool to less than 85°C (range: 80–90 °C).
8. The main tank will have to be heated to 85°C for this step.
9. Add vitamin E to another tank, if necessary, by heating vitamin E container.
10. Melt vitamin E in the tank.
11. Add viosterol and vitamin A, and heat to 60°C to 65°C with mixing.
12. Start bubbling in CO_2.
13. Mix slowly for 10 minutes or longer to produce a clear solution.
14. Start CO_2 gas protection on the main mixing tank, and continue for the balance of the process.
15. With the main batch at 85°C to 90°C, add the solution of vitamins A, D, and E at 60°C to 65°C, with mixing.
16. The addition may cause the temperature of the main batch to drop below the specified range, so readjust to 85°C to 90°C.
17. Mix and maintain at this temperature until solution is complete, after which cool to less than 30°C.
18. Add the glycerin with mixing.
19. Adjust the temperature to 25°C ± 5°C, and maintain at this temperature before proceeding.
20. Add and dissolve with mixing, in this order, ascorbic acid, thiamine, pyridoxine, and caramel.
21. Rinse the caramel container with approximately 3 mL of water, and add the rinsings.
22. Rinse the tank inner walls and mixer shaft with approximately 3 mL water.
23. Dissolve the orange oil with mixing in the alcohol, and add to the solution.
24. Continue mixing for at least 30 minutes to ensure a homogeneous product.
25. Stop mixing, and take pH (range: 3.1–3.3). If necessary, adjust with 10% sodium hydroxide or 10% hydrochloric acid, prepared by adding 1 mL hydrochloric acid (reagent-grade) with 3.3 mL purified water. Mix.
26. Stop mixing, and allow to stand for at least 4 hours to eliminate entrapped CO_2 gas.
27. In a properly cleaned separate tank, boil at least 65 mL of purified water for at least 15 minutes.
28. Cool while bubbling CO_2 into it, and hold at 30°C.
29. Adjust pH to the range of 3.1 to 3.3.
30. Filter using a lint-free paper. Do not use filter aids.
31. Recirculate product back to main mixing tank until clear.
32. Flush a storage tank with CO_2 for at least 10 minutes with the CO_2 valve completely open.
33. Filter product into this storage tank.
34. Fill under CO_2 cover.

MULTIVITAMIN WITH ZINC TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Niacin; use niacinamide (white powder)	100.00
750.00	2	Ascorbic acid; use microcrystalline sodium ascorbate[a]	843.68
20.00	3	Vitamin B_6; use pyridoxine hydrochloride	34.03
QS	4	Povidone	40.00
15.00	5	Thiamine hydrochloride; use thiamine mononitrate (powder)	17.47
15.00	6	Riboflavin	16.50
20.00	7	Pantothenic acid; use calcium pantothenate	32.60
0.49	8	Folic acid (powder)	0.52
12.00 µg	9	Vitamin B_{12}; use cyanocobalamin oral powder in gelatin 1:1000	15.00
60.00	10	Vitamin E (D,L-alpha-tocopherol acetate)	60.00
–	11	Alcohol SD 3A (200 proof)	138 mL
22.50	12	Elemental zinc (pure zinc sulfate powder)	55.61
4.00	13	Povidone	4.00
–	14	Alcohol SD 3A (200 proof)	4 mL
–	15	Alcohol SD 3A (200 proof)	9 mL
10.80	16	Magnesium stearate	10.80
40.00	17	Cellulose microcrystalline	40.00
3.20	18	Silicon dioxide colloidal	3.20
6.00	19	Colloidal silicon dioxide	6.00

[a] May use ascorbic acid (750.00 g) instead. The quantity of povidone is reduced to 6.34 g, and the amount of alcohol SD used is adjusted.

Manufacturing Directions

1. Mill niacinamide, sodium ascorbate, pyridoxine, povidone (item 4), and thiamine through a comminuting mill with hammers (impact forward) at high speed and fitted with a 0 band (686 µm aperture or similar) screen.
2. Place millings into mass mixer.
3. Screen riboflavin, calcium pantothenate, folic acid, and vitamins B_{12} and E through an 840 µm screen.
4. Place into mass mixer, and dry mix for 5 to 10 minutes.
5. Add 89 mL alcohol to powder while mixing.
6. Add additional alcohol if required (approximately 49 mL) to achieve satisfactory granulation.
7. Pass wet mass through 5/8 in. band (15.88 mm aperture or similar) screen, and spread out on paper-lined trays.
8. Dry granulation at 49°C, and dry until LOD is NMT 1.5%.
9. Sift dry granule through 1.19 mm screen, and coarse grind granule through a No. 2 band (1.59 mm aperture or similar) screen fitted on a comminuting mill (knives forward, medium speed) to polyethylene-lined drums.
10. Mill zinc sulfate and povidone through a comminuting mill fitted with a 0 band (686 µm aperture or similar) screen at high speed with impact (hammers) forward.
11. Charge millings into mass mixer for 5 to 10 minutes.
12. Add 3.3 mL alcohol (item 14) to powders from first step while mixing.
13. If necessary, use additional alcohol (up to 0.83 mL) to achieve satisfactory granulation.
14. Granulate wet mass through 5/8 in. band (15.88 mm aperture or similar) screen, and spread out on paper-lined trays.
15. Dry granule at 49°C, and dry until LOD is NMT 1.5%.
16. Sift dry granule through 1.19 mm screen and coarse grind granule through a No. 2 band (1.59 mm aperture or similar) screen fitted on a comminuting mill (knives forward, medium speed), and transfer to polyethylene-lined drums.
17. Charge approximately one-tenth of vitamin granulation into blender.
18. Premix magnesium stearate, microcrystalline cellulose, and silicon dioxide in a bowl, and sift through 840 µm screen into blender.
19. Charge another one-tenth of vitamin granulation into blender, and blend for 5 minutes.
20. Discharge a portion of granulation from the blender, and check for white lumps.
21. If lumps are present, discharge entire granulation through a 1.68 mm aperture screen to break lumps; then, return it to blender.
22. Charge zinc granulation into the blender.
23. Charge remaining vitamin granulation into blender, and blend for 15 minutes.
24. Discharge blender into polyethylene-lined drums, tie liners, close and seal drums, and deliver to storage area.
25. Compress and coat (see Appendix).

NAPHAZOLINE EYE DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
17.71	1	Acid boric	17.71
1.50	2	Hydroxypropylmethylcellulose 2910 (400 cps)	1.50
0.36	3	Borax (sodium borate)	0.36
1.00	4	Disodium edetate	1.00
0.12	5	Naphazoline hydrochloride	0.12
0.17 mL	6	Benzalkonium chloride; use benzalkonium chloride solution (17%)	0.63 mL
QS	7	Water for injection	QS to 1 L

Manufacturing Directions

Use thoroughly cleaned and rinsed, steam-jacketed glass-lined or stainless steel tank equipped with a speed-controlled agitator. The tank should have a cover. Foaming occurs because of benzalkonium chloride, which concentrates in foam. Processing and filling systems should be designed to minimize foaming and allow rapid dissipation of foaming.

1. Place 80% of final volume of water into mixing tank. Heat deionized water to 90°C.
2. While agitating, add and disperse hydroxypropylmethylcellulose by slowly sprinkling it on the surface of solution. Mix to avoid excessive foaming.
3. Allow 15 minutes for hydration of hydroxypropylmethylcellulose before discontinuing heating and allowing cooling to 40°C.
4. While agitating, add and dissolve disodium edetate, benzalkonium chloride, boric acid, and sodium borate.
5. Continue cooling to 30°C (25–30°C). Discontinue agitation, and QS to 950 mL with deionized water.
6. Start agitator, and mix for at least 15 minutes at 30°C. Discontinue agitation and cooling.
7. Naphazoline hydrochloride concentrate solution: dissolve naphazoline hydrochloride in 50 mL of deionized water, and sterile-filter solution through a previously sterilized Millipore filter unit containing 0.22 µm membrane.
8. Hold naphazoline solution under aseptic conditions for addition to bulk solution (after it has been autoclaved and cooled).
9. Prefiltration: Methylcellulose solutions filter at a slow rate, so use an appropriate filter.
10. Recirculate solution until clear, and transfer to holding or sterilization.
11. Sterilization and filling: Use either heat sterilization or sterile filtration.
12. Heat sterilization: Sterilize at 112°C to 115°C for 60 minutes, cool solution to 25°C to 30°C, and aseptically add the sterile naphazoline solution. Mix well.
13. Set up a previously sterilized filter and transfer line with 10 µm stainless steel FulFlo filter or equivalent.
14. Aseptically fill sterile solution into sterilized containers, and apply sterile closure components.
15. Sterile filtration: Use Pall cartridge AB 1 NR 7p (pr 8P) with Sartorius Cartridge 526-07 H 1. Prepare and steam sterilize the recommended filter units.
16. Aseptically fill the sterilized solution to which the naphazoline solution has been added into each sterilized container, and apply sterile closure.

NEOMYCIN GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.50	1	Neomycin sulfate	0.50
50.00	2	Propylene glycol	50.00
5.00	3	Parabens	5.00
200.00	4	Lutrol F 127	200.00
745.00	5	Water	745.00

Manufacturing Directions

1. Dissolve the parabens and Lutrol F 127 in water heated to approximately 80 ˚C.
2. Add the propylene glycol, and dissolve neomycin sulfate.
3. Cool to room temperature when the air bubbles escape.
4. Alternative: Dissolve parabens in hot water, cool to 5°C to 10°C, dissolve Lutrol F 127, add propylene glycol, and dissolve neomycin sulfate.
5. Maintain the cool temperature until the air bubbles escape.

NIACIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1000.00	1	Niacin	1000.00
40.00	2	PVP	40.00
10.00	3	Silicon dioxide	10.00
15.00	4	Sodium stearyl fumarate	15.00
400.00	5	Water	400.00

Manufacturing Directions

1. Niacin is placed in a fluidized-bed apparatus.
2. An aqueous PVP solution (in 85 g of water) is sprayed to get granules.
3. The granules thus obtained are subsequently dried and passed through a sieve (1 mm mesh), and sodium stearyl fumarate is weighed, added, and blended in a drum mixer.
4. The resulting mixture is pressed into tablets 1065 mg.
5. These tablet cores are then coated with the following formulation: ethylcellulose (Ethocel™), 10mL; PVP (povidone), 5.50 mg; stearic acid, 2.40 mg.
6. Ethocel™, povidone, and stearic acid are first dissolved in denatured alcohol (180 g).
7. The coating solution is then sprayed onto the tablet cores in a coating pan.

NICOTINAMIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Nicotinamide (Degussa)	320.00
160.00	2	Avicel™ PH101	160.00
16.00	3	Kollidon® VA 64	16.00
3.00	4	Magnesium stearate	3.00
3.00	5	Aerosil® 200	3.00

Manufacturing Directions

1. With medium compression force, compress 506 mg using 12 mm biplanar punches.

NICOTINIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
375.00	1	Nicotinic acid	375.00
188.70	2	Hydroxypropylmethylcellulose E10 M premium	188.70
12.90	3	Povidone K90	12.90
5.80	4	Stearic acid (Hystrene 5016)	5.80

Manufacturing Directions

1. Combine one-half of the quantity of items 1 to 3, and dry mix the powder bed mixed in a Littleford granulator, with choppers on, for approximately 1 minute.
2. At the completion of the 1 minute premix cycle, slowly spray an appropriate quantity, approximately three times the quantity of item 3, for a period of 5 minutes.
3. Discharge the granulated unit into double polyethylene-lined containers and then manually load into a Glatt bowl while passing through a No. 4 mesh screen. Load the Glatt bowl into a Glatt fluid-bed drier with an inlet air temperature setting of approximately 70°C ± 5°C.
4. Dry the unit until a moisture level of approximately 1% is obtained as determined using a Computrac® Moisture Analyzer.
5. Discharge the dried granulation into appropriately labeled, double polyethylene-lined drums and reconciled.
6. Pass the dried and reconciled granulation through a Kemutec BetaGrind mill equipped with a l.5 mm screen and running at approximately 1500 rpm.
7. Collect the milled granulation into appropriately labeled, double polyethylene-lined drums and reconciled.
8. Sample and test the milled granulation by quality control and release prior to further processing.
9. Add the released granulation units to a Patterson-Kelley 20 ft^3 V-blender, after which blend together for approximately 10 ± 1 minutes and then discharge to appropriately labeled, double polyethylene-lined containers.
10. Add item 4, blend, and compress at 582.40 mg in caplet shaped punches. Compress 727.50 mg for 500 mg strength and 990.50 mg for 750 mg strength.

NICOTINIC ACID (NIACIN) TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Nicotinic acid	200.00
200.00	2	Ludipress®	200.00
5.00	3	Kollidon® CL	5.00
1.50	4	Magnesium stearate	1.50
3.00	5	Aerosil® 200	3.00
10.00	6	PEG-6000	10.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve.
2. Mix, and press with very low compression force.
3. Compress 410 mg using 12 mm biplanar punches.

NICOTINIC ACID (NIACIN) TABLETS (200 MG)

Formulation

Nicotinic acid (Lonza), 200.0 g; Ludipress®, 200.0 g; Kollidon® CL, 5.0 g; magnesium stearate, 1.5 g; Aerosil® 200, 3.0 g; polyethylene glycol 6000, powder, 10.0 g.

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with very low compression force at 419 mg.

NONDETERGENT NEUTRAL DRY SKIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
60.00	1	Stearic acid	60.00
145.00	2	White petrolatum jelly	145.00
116.00	3	Mineral oil (25 cS)	116.00
10.00	4	Lanolin	10.00
20.00	5	Cetearyl alcohol	20.00
QS	6	Deionized water	QS to 1 kg
14.00	7	Triethanolamine (99%)	14.00
QS	8	Perfume, preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool, adding triethanolamine at 60°C and perfuming at 40°C to 50°C.
4. This cream serves as a base for drugs as well.
5. Triethanolamine may be omitted, as it gives a higher pH.

NOREPHEDRINE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
40.00	1	DL-norephedrine hydrochloride	40.00
4.00	2	Parabens	4.00
5.00	3	Saccharin sodium	5.00
3.00	4	Kollidon® 90 F	3.00
500.00	5	Sorbitol solution	500.00
460.00	6	Water	460.00

Manufacturing Directions

1. Dissolve the parabens in the hot water, add the sorbitol, cool to room temperature, and dissolve the other components.
2. To prevent discoloration of Kollidon® in the solution during storage, 0.1% to 0.5% cysteine could be added as an antioxidant.
3. Flavors should be added to adjust the taste as needed.

NYSTATIN CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
80.00	1	Cetostearyl alcohol	80.00
20.00	2	Polyoxyl 20 cetostearyl ether (Cetomacrogol 1000)	20.00
80.00	3	Mineral oil (liquid paraffin)	80.00
2.00	4	Methyl paraben	2.00
100,000 IU	5	Nystatin microfine[a] (30% excess) 5420 IU/mg	24.00
1.00	6	Propylparaben	1.00
100.00	7	Propylene glycol	100.00
4.86	8	Dibasic sodium phosphate	4.86
2.36	9	Monobasic sodium phosphate	2.36
180.00	10	Petrolatum (soft white paraffin)	180.00
506.00	11	Purified water	506.00

[a] Particle size NLT 90% less than 45 μm and 100% less than 80 μm.

Manufacturing Directions

1. Charge item 3 to the fat-melting vessel.
2. Heat to 70°C while stirring.
3. Charge items 1, 2, and 10 to the fat-melting vessel while stirring.
4. Mix well, and maintain the temperature at 65°C to 70°C.
5. Load 466 g of item 11 and item 7 into mixer, and heat to 90°C.
6. Add items 4 and 6 to dissolve while stirring on manual mode.
7. Mix for 15 minutes at 10 rpm.
8. Cool to 65°C to 70°C.
9. Add items 8 and 7 to the parabens solution (step 6) to dissolve.
10. Mix for 5 to 10 minutes at 10 rpm.
11. Maintain temperature at 65°C to 70°C.
12. Take a sample of approximately 0.40 mL from mixer, and cool to 25°C.
13. Check the pH (6.3–7.0).
14. Withdraw 80 g of preservative/buffer solution from mixer at 65°C to 70°C in a stainless steel container.
15. Cool the solution in stainless steel container to 30°C to 35°C.
16. Disperse item 5 carefully using a spatula.
17. Homogenize using homogenizer to make a smooth dispersion.
18. Transfer the molten fat to the mixer containing the preservative/buffer solution through a stainless steel

sieve by vacuum at 0.6 bar while mixing at 10 rpm in manual mode at a temperature of 65°C.
19. Homogenize, and mix the cream for 10 minutes at low speed (10 rpm, manual mode) and vacuum of 0.6 bar.
20. Cool to 40°C ± 5°C.
21. Transfer 104 g of drug phase (35°C ± 5°C) to the mixer while mixing.
22. Rinse the stainless steel container of the drug phase with 40 g of item 11 (25–35°C), and transfer to the mixer while mixing.
23. Rinse the homogenizer and the container with item 11, and transfer the rinsings to the mixer.
24. Mix for 5 minutes.
25. Set the mixer at a mixing speed of 10 rpm (manual mode) and the homogenizer at low speed with a vacuum of 0.6 bar.
26. Mix and homogenize for 15 minutes.
27. Cool to 30°C with mixer speed of 10 rpm and vacuum of 0.6 bar.
28. Transfer the cream to a stainless steel drum.

NYSTATIN OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100,000 IU	1	Nystatin microfine[a], 5420 IU/mg, 15% excess	21.05
22.00	2	Cetostearyl alcohol	22.00
8.00	3	Paraffin (hard paraffin)	8.00
100.00	4	Mineral oil (liquid paraffin)	100.00
848.95	5	Petrolatum (soft white paraffin)	848.95

[a] Particle size NLT 90% less than 45 µm and 100% less than 80 µm.

Manufacturing Directions

1. Melt items 2, 3, and 5 at 70°C in fat-melting vessel.
2. Disperse item 1 in 80 g of item 4 in a separate stainless steel container by using a spatula.
3. Pass the dispersion through a homogenizer twice; then, transfer the dispersion to the mixer.
4. Rinse the homogenizer and container with 20 g of item 4, and transfer the rinsings to the mixer.
5. Homogenize the dispersion at high speed for 15 minutes.
6. Set the mixer at a temperature of 40°C to 45°C.
7. Transfer the molten mass from the fat-melting vessel to the mixer at a temperature of 45°C to 50°C.
8. Mix for 10 minutes in manual mode and 10 minutes in automode at 12 rpm and vacuum 0.4 to 0.6 bar.
9. Homogenize at high speed for 10 minutes with recirculation.
10. Mix until the temperature of ointment reaches 28°C to 30°C.
11. Transfer the ointment to a stainless steel drum.
12. Keep drum tightly closed.

NYSTATIN, NEOMYCIN SULFATE, GRAMICIDIN, AND TRIAMCINOLONE ACETONIDE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100,000 IU	1	Nystatin microfine,[a] 5420 IU/mg 20% excess	22.96
4.43	2	Neomycin sulfate[b]	4.43
0.28	3	Gramicidin[c]	0.28
1.00	4	Triamcinolone acetonide micronized	1.00
80.00	5	Cetostearyl alcohol	80.00
20.00	6	Poloxyl 20 cetostearyl ether (Cetomacrogol 1000)	20.00
80.00	7	Mineral oil (liquid paraffin)	80.00
2.00	8	Methylparaben	2.00
1.00	9	Propylparaben	1.00
60.00	10	Propylene glycol	60.00
4.86	11	Dibasic sodium phosphate	4.86
2.36	12	Monobasic sodium phosphate	2.36
180.00	13	Petrolatum (soft white paraffin)	180.00
531.86	14	Purified water	531.86

For items 1–3, actual quantity to be calculated per actual potency.
Difference in quantity is to be adjusted by purified water.

[a] Particle size NLT 90% less than 45 µm and 100% less than 80 µm.
[b] Particle size NLT 99% less than 20 µm and 75% less than 10 µm.
[c] Particle size NLT 98% less than 50 µm.

Manufacturing Directions

1. Load items 5, 6, 7, and 13 in fat-melting vessel.
2. Heat to 70°C. Stir to melt.
3. Maintain temperature at 70°C to 75°C.
4. Heat 420 g of item 14 to 90°C in mixer.
5. Dissolve items 8 and 9 by stirring.
6. Mix for 15 minutes at 10 to 12 rpm.
7. Cool to 65°C to 70°C.
8. Dissolve items 11 and 12 in 71.86 g of item 14 at 40°C to 45°C in a stainless steel drum.
9. Check the pH (limit: 6.3–7.0 at 25°C).
10. Dissolve item 2 into 79.08 g of phosphate solution. The solution should be clear.
11. Disperse item 1 in the neomycin/phosphate solution.
12. Homogenize two times with homogenizer (gap setting 1) to make smooth dispersion.
13. Dispersion should be smooth with no lumps.
14. Add 50 g of item 10 in a separate stainless steel container, and heat to 40°C to 45°C; then, dissolve item 3 by using a homogenizer. The solution should be clear.
15. Disperse item 4 in the clear solution of gramicidin/propylene glycol by using a homogenizer.

16. Homogenize until no lumps are present.
17. Maintain temperature at 40°C to 45°C.
18. Transfer the melt from previous step to the mixer through a stainless steel sieve while mixing at 1012 rpm (manual mode) at a temperature of 65°C.
19. Homogenize at high speed for 10 to 12 minutes at a temperature of 60°C to 65°C and a vacuum of 0.6 bar. Scrape the sides and blade.
20. Cool down to 50°C.
21. Transfer the homogenized dispersion to the mixer.
22. Rinse the container with 10 g of item 10.
23. Add the rinsings to the mixer, and mix for 10 minutes.
24. Transfer the dispersion to the mixer.
25. Rinse the container with 40 g of item 14.
26. Add to the mixer, and mix for 10 minutes.
27. Homogenize at high speed for 20 minutes at a temperature of 45°C, mixer speed of 10 to 12 rpm, and vacuum of 0.6 bar.
28. Cool down to 25°C to 30°C while mixing.
29. Transfer the cream to a stainless steel drum.

NYSTATIN, NEOMYCIN SULFATE, GRAMICIDIN, AND TRIAMCINOLONE ACETONIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
22.96	1	Nystatin microfine[a]	22.96
4.43	2	Neomycin sulfate[a]	4.43
0.28	3	Gramicidin[a]	0.28
1.00	4	Triamcinolone acetonide (micronized)	1.00
100.00	5	Mineral oil (liquid paraffin)	100.00
10.00	6	Syncrowax	10.00
861.33	7	Petrolatum (soft white paraffin)	861.33

[a] Actual quantity to be calculated per actual potency. Difference in quantity to be adjusted by use of soft white paraffin.

Manufacturing Directions

1. Melt item 7 at 70°C in fat-melting vessel.
2. Add item 6 to the melt while mixing.
3. Transfer the melt to the mixer through filters, and cool to 40°C while mixing.
4. Add 60 g of item 5 in a stainless steel container, and disperse item 1 manually by using a spatula.
5. Homogenize two times with homogenizer (gap setting 1) to make a smooth dispersion, and then transfer to the mixer.
6. Add 20 g of item 5 in a stainless steel container, and disperse items 2, 3, and 4 by using the homogenizer to make a smooth dispersion.
7. Homogenize until no lumps are present.
8. Transfer the dispersion to the mixer.
9. Rinse the homogenizer and stainless steel container with 20 g of item 5, and transfer the rinsings to the mixer.
10. Mix for 10 minutes at a mixer speed of 10 rpm and vacuum of 0.4 to 0.6 bar.
11. Set thermostat at 28°C to 30°C.
12. Homogenize at high speed for 20 minutes with recirculation.
13. Mix until the temperature of ointment reaches 28°C to 30°C.
14. Transfer the ointment to a stainless steel drum.
15. Keep drum tightly closed.

OMEGA FATTY ACIDS TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
140.00	1	Omega fatty acids dry N-3	140.00
140.00	2	Avicel™ PH101	140.00
8.40	3	Kollidon® VA 64	8.40
2.00	4	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 289 mg in 9 mm biconvex punches.
3. The dry powder omega fatty acids dry N-3 contains 25% fish oil; this fish oil consists of approximately 30% eicosapentaenoic acid (EPA) + docosahexaenoic acid (DHA).
4. These tablet cores could be coated with an enteric coating of Kollicoat MAE 30 D.
5. See Appendix for more choices.

ORAL REHYDRATION SALT (45 MEQ)

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
811.90	1	Cerelose powder	811.90
66.57	2	Sodium chloride	66.57
31.82	3	Sodium citrate dihydrate, USP	31.82
70.14	4	Potassium citrate monohydrate (food grade)	70.14
19.57	5	Povidone (PVP K-29-32), USP/BP	19.57
–	6	Alcohol SD 3A (200 proof/190 proof), USP	500.00 mL
–	7	Purified water, USP	50.00 mL

Manufacturing Directions

1. Mill the dextrose through a 1.2 mm aperture screen or similar on a comminuting mill (knives forward, medium speed).
2. Individually mill the sodium chloride, sodium citrate, and potassium citrate through a 1.2 mm aperture screen on a comminuting mill (knives forward, medium speed).
3. *Note:* Do not mix the milled items until ready to add them to the dextrose.
4. Charge the powders from steps 1 and 2 into a suitable mass mixer, and mix for 10 minutes.
5. Screen the povidone through a 1.2 mm aperture screen, and transfer to the mixer.
6. Mix all the powders for 5 minutes.
7. Mix 500 mL of alcohol with 50 mL of water, and slowly add to the mixer while mixing.
8. Continue to mix for 5 to 10 minutes. Do not overwet the mass.
9. Granulate the wet mass through a 4.76 mm screen using an oscillating granulator, and spread on stainless steel trays.
10. Dry the granules at 45°C for approximately 16 hours, or until LOD is less than 0.8%.
11. Turn the granules over after 3 to 4 hours of drying.
12. Screen dry granules through an 840 µm screen.
13. Transfer the fines to a suitable blender.
14. Pass coarse granules through 840 µm screen using an oscillating granulator, and transfer to the blender.
15. Blend for 5 to 10 minutes.
16. Discharge into polyethylene-lined drums.
17. Fill 3.08 g for 100 mL, 7.70 g for 250 mL, and 30.80 g for 1000 mL of reconstituted solution. Prorate weights for different volumes.

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Melt orlistat (60 g) and myristic acid (30 g) together at 50°C.
2. Add mannitol (400 g) and lactose (400 g), and cool the mixture to room temperature under continuous stirring.
3. Add talcum (10 g) and homogeneously distribute.
4. Press the powder into tablets of 960 mg weight (= orlistat content of 120 mg).

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Melt rlistat (120 g) and myristic acid (30 g) together at 50°C.
2. Add sucrose palmitate (PEG-40 stearate, 12 g) and lactose (15 g), and cool the mixture to room temperature under continuous stirring.
3. Press the powder into tablets of 960 mg weight (= orlistat content of 120 mg).

ORLISTAT CHEWABLE TABLETS

Manufacturing Directions

1. Mix together orlistat, 120 g; sodium laurate, 30 g; mannitol, 80 g; and HPMC 3 cp, 60 g, with stepwise addition of a (50:50% m/m) ethanol/water mixture (0.2 mL/g).
2. The formed granules are dried in vacuum at 30° C to constant weight and pressed into tablets (each containing 120 mg orlistat).

PANCREATIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
30.00	1	Pancreatin	30.00
308.00	2	Ludipress®	308.00
10.00	3	Kollidon® CL	10.00
2.00	4	Magnesium stearate	2.00

Manufacturing Directions

1. Mix the components, pass through a 0.8 mm sieve, and press with low compression force.
2. Compress 355 mg using 8 mm biconvex punches.
3. Coat by enteric coating. (See Appendix in Volume 1.)

PANCREATIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Pancreatin	300.00
290.00	2	Ludipress®	290.00
25.00	3	Kollidon® CL	25.00
3.00	4	Magnesium stearate	3.00

Manufacturing Directions

1. Mix the components, pass through a 0.8 mm sieve, and press to tablets with low compression force.
2. Compress 615 mg in 11 mm biconvex punches.
3. Coat by enteric coating. (See Volume 1.)

PANCREATIN AND CHOLIC ACID TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
130.00	1	Pancreatin	130.00
2.00	2	Cholic acid	2.00
127.00	3	Avicel™ PH101	127.00
56.00	4	Lactose monohydrate	56.00
2.00	5	Magnesium stearate	2.00
3.00	6	Aerosil® 200	3.00

Manufacturing Directions

1. Mix the components, and press with high compression force.
2. Compress 324 mg in 9 mm biconvex punches.
3. Coat by enteric coating. (See Volume 1.)

PANTHENOL LOTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L Tablets (g)
26.25	1	D-Panthenol (2.5%)[a]	26.25
2.50	2	DL-Lactone (pure)	2.50
1.00	3	Sequestrene disodium	1.00
3.00	4	Chlorhexidine hydrochloride (micropowder)	3.00
5.00	5	POEG 300-stearate[b]	5.00
50.00	6	Paraffin oil (low viscosity)	50.00
5.00	7	Polydimethylsiloxane M 350	5.00
3.00	8	Perfume PCV 1155/8	3.00
–	9	Purified water	QS to 1 L

[a] Based on 100% content; adjust for assay.

[b] POEG 300 is a mixture of monoesters and diesters of polyoxyethylene glycol 300 with palmitic and stearic acids and free polyoxyethylene glycol 300.

Manufacturing Directions

1. Aqueous phase: Prepare a solution of DL-lactone (previously liquefied at approximately 100 °C) in water.
2. Add the DL-lactone solution to the main part of water at 70°C.
3. Incorporate the D-panthenol (previously liquefied at approximately 45°C).
4. Admix and dissolve sequestrene disodium.
5. Fatty phase: Melt at approximately 65°C under stirring POEG 300-stearate, paraffin oil, and polydimethylsiloxane M 350.
6. Emulsion: Add the fatty phase at 65°C to the aqueous phase at approximately 45°C.
7. Cool to approximately 36°C while stirring and homogenizing.
8. Chlorhexidine suspension: Suspend chlorhexidine in water.
9. Lotion: Add the chlorhexidine suspension to the emulsion at approximately 36°C.
10. Stir, homogenize, and deaerate.
11. Finally, add the perfume, homogenize again, and filter.

PANTHENOL OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Protegin X	50.00
18.00	2	Cetyl alcohol	18.00
12.00	3	Stearyl alcohol	12.00
40.00	4	Wax (white)	40.00
250.00	5	Wool fat (deodorized)	250.00
130.00	6	Vaseline® (white)	130.00
50.00	7	Almond oil	50.00
150.00	8	Paraffin oil	150.00
50.00	9	D-Panthenol	50.00
250.00	10	Deionized water	250.00

Manufacturing Directions

1. Place in a heating vessel wool fat, Vaseline, almond oil, and paraffin.
2. Heat and melt the fats together at 80°C with stirring to keep the fatty phase at this temperature until further processing.
3. In a separate container, add Protegin X, cetyl alcohol, stearyl alcohol, and white wax. Melt these fats with stirring at 80°C.
4. Add to step 2.
5. The final temperature in the melt should be approximately 70°C.
6. Keep this temperature until further processing.
7. Transfer D-panthenol into a 10 L container by pouring; then, rinse it with hot deionized water.
8. Continue to mix for another 5 minutes, check the final weight, and make up for evaporated water (5.67 kg).
9. Place in kettle, and heat to 70°C while stirring. Transfer the melted fatty mass under vacuum (−0.3 atm) through the inline sieve (0.150 mm mesh).
10. After the addition, evacuate again to −0.3 atm.

11. Then, stir for another 15 minutes, and homogenize for 5 minutes under the same conditions.
12. Cool to 30°C (the cooling should occur within 4 hours).
13. When this temperature is reached, continue stirring until the ointment has reached 24°C to 26°C.
14. Stop cooling; then, evacuate quickly to −0.3 atm, and stir for 5 minutes.
15. Transfer the ointment in a storage vessel, and mix for 5 minutes with electric mixer.
16. Fill the ointment.

PAPAIN CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1.00	1	Papain	1.00
150.00	2	Lycasin	150.00
17.40	3	Hydrogenated vegetable oil	17.40
9.60	4	Water	9.60
5.80	5	Gelatin (40% solution)	5.80
17.40	6	Starch coated dicalcium phosphate	17.40
1.60	7	Mono- and diglyceride mixture	1.60
0.60	8	Lecithin	0.60
0.10	9	Aspartame	0.10
0.10	10	Vanillin	0.10
0.20	11	Glycerin	0.20
0.20	12	Sodium bicarbonate	0.20
0.38	13	Mint flavor	0.38

Manufacturing Directions

1. Boil lycasin, water, fat, mono- and diglyceride mixture, glycerin, and lecithin to 131°C.
2. Glycerin is added to the mixture and cooled to 60°C.
3. Thereafter, sodium bicarbonate, papain, dicalcium phosphate, and the remaining ingredients are added.
4. Thereafter, the mixture cooled to room temperature is ground into powder and compressed into 205 mg tablets using a tablet press.

PAPAIN CHEWING GUM

Formulation

Gum base, 31.20%; sorbitol, 28.08%; mannitol, 5.23%; papain, 1.00%; acesulfame K, 0.16%; aspartame, 0.16%; menthol powder, 1.00%; liquid flavor, 0.47%; isomalt PF, 11.70%; isomalt DC, 16.00%; anticaking agents (magnesium stearate, talc, or silica gel), 4.00%; flavor, 2.00%.

PEPPERMINT RUB CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
25.00	1	Sorbitol stearate	25.00
15.00	2	Polysorbate 60	15.00
300.00	3	Peppermint oil	300.00
20.00	4	Cetyl alcohol	20.00
40.00	5	Stearic acid	40.00
10.00	6	Triethanolamine (99%)	10.00
2.00	7	Carbopol 980	2.00
QS	8	Deionized water	QS
QS	9	Preservative, color	QS

Manufacturing Directions

1. Hydrate Carbopol in water at 60°C to 65°C.
2. Add remaining water-phase ingredients.
3. Heat oil and water phases separately to 70°C to 75°C.
4. Add water phase to oil phase while stirring.
5. Stir to cool, neutralizing at 65°C with triethanolamine.

PEPTIDE SUBLINGUAL TABLET

Formulation

The individual component peptides, each having a molecular weight of less than 20,000 Da. Thymosin fraction, 5%; water, 5.0%; sucrose/lactose, 69.5%; propylene glycol, 0.5%; silicon dioxide, 15.0%; methyl nicotinate, 0.5%.

Manufacturing Directions

1. Form the wetted mixture into tablets of the desired weight, and dry the tablets at 30°C for 36 hours.

PEPTIDE TOPICAL LIQUID

Formulation

Peptide such as thymic fraction, 5; glycerin, 44.5; propylene glycol, 44.9; methyl nicotinate, 0.1; water, 50; polysorbate 80, 0.5% by weight.

PHENINDIONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Phenindione	50.00
165.00	2	Ludipress®	165.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compression force.
2. Compress 230 mg in 8 mm biplanar punches.

PHENOLPHTHALEIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Phenolphthalein	200.00
150.00	2	Dibasic calcium phosphate	150.00
11.00	3	Kollidon® 30	11.00
–	4	Isopropanol or ethanol (96%)	QS
19.00	5	Kollidon® CL	19.00
3.00	6	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, mix with items 5 and 6, pass through a 0.8 mm sieve, and press with low compression force.
2. Compress 385 mg using 9 mm biconvex punches.

PHENOLPHTHALEIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
90.00	1	Yellow phenolphthalein	90.00
64.80	2	Microcrystalline cellulose	64.80
187.20	3	Dicalcium phosphate	187.20
3.60	4	Croscarmellose sodium	3.60
3.60	5	Fumed silica	3.60
7.20	6	Stearic acid	7.20
3.60	7	Magnesium stearate	3.60

Manufacturing Directions

1. Screen items 6 and 7 through a 40 mesh sieve.
2. Blend items 1 and 5 in a V-blender for 3 minutes.
3. Add items 2 and 4 to the blender, and mix for 5 minutes.
4. Add item 3 to the blender, and mix for 12 minutes.
5. Add item 6, and blend for 3 minutes.
6. Add item 7, and mix for another 5 minutes.
7. Compress using 3/8 in, flat, bevel-edged punches to hardness of 10 kg; average tablet weight is 360 mg.

PHENYLPROPANOLAMINE AND BROMPHENIRAMINE FAST-DISSOLVING TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
6.25	1	Phenylpropanolamine hydrochloride	6.25
1.00	2	Brompheniramine maleate	1.00
6.00	3	Citric acid	6.00
1.80	4	Magnasweet 135	1.80
4.50	5	Aspartame	4.50
3.60	6	Cherry flavor	3.60
21.00	7	Croscarmellose sodium	21.00
3.00	8	Lecithin	3.00
30.00	9	Cornstarch	30.00
3.00	10	Silicon dioxide	3.00
2.10	11	Magnesium stearate	2.10
219.25	12	Fast-dissolving granulation (see following)	219.25

Manufacturing Directions

1. Make a fast-dissolving granulation by combining 400 g of melted PEG-900 with fructose powder (100 g) in a planetary mixer (low-shear mixer) and mixing until the granules form.
2. Allow the granulations to cool, and then screen.
3. Mix all ingredients in a V-blender.
4. Compress tablets (301.5 mg) at approximately 3 kN.
5. Tablet hardness should be 0.2 to 0.5 kp, and disintegration time is 10 seconds.

PHENYLPROPANOLAMINE, CHLORPHENIRAMINE, DEXTROMETHORPHAN, VITAMIN C SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
150.00	1	PEG-400 (low color), NF	150.00
21.66	2	Acetaminophen, USP	21.66
0.075 mL	3	Glycerin, USP (96%)	75.00 mL
0.35 mL	4	Sorbitol; use sorbitol solution, USP	350.00 mL
1.00	5	Benzoic acid, USP	1.00
1.75	6	Saccharin sodium (dihydrate powder), USP	1.75
0.91	7	Phenylpropanolamine hydrochloride, USP	916.70 mg
0.06	8	Chlorpheniramine maleate, USP (plus 10% manufacturing)	73.30 mg
0.66	9	Dextromethorphan hydrobromide, USP	667.00 mg
20.00	10	Sodium CMC (premium low viscosity)	20.00
70.00 mcg	11	Dye	70.00 mg
6.00 mcg	12	Dye	6.00 mg
5.00	13	Ascorbic acid; use sodium ascorbate (fine powder)	5.62
0.50	14	Flavor, orange	500.00 mg
0.25	15	Flavor, orange	250.00 mg
QS	16	Carbon dioxide gas	QS
QS	17	Purified water, USP	QS to 1 L

Manufacturing Directions

Manufacture under complete CO_2 protection. Bubble the CO_2 gas through the solution from the bottom of the tank.

If excessive foaming occurs, change CO_2 gas protection from the bottom to the top of the tank. Minimize vortex formation while mixing to prevent aeration of the product.

1. In a covered stainless steel container, heat 500 mL of water to boiling. Boil for 30 minutes.
2. Turn off the heat. While keeping the container covered, cool the water to 30°C while purging the water with CO_2.
3. Keep this water in a covered container blanketed with CO_2 gas, and use where indicated.
4. Transfer the PEG-400 to the main stainless steel mixing tank, and cover.
5. Start bubbling CO_2 gas. While mixing, slowly heat to 60°C to 65°C. Maintain at this temperature.
6. While mixing, add and dissolve the acetaminophen. Maintain the temperature and CO_2 protection.
7. When all the acetaminophen has dissolved, add, while mixing, the glycerin and sorbitol.
8. Continue mixing while maintaining the temperature and CO_2 gas protection until mixture is used later.
9. Do not allow the temperature to go to more than 65°C.
10. During this mixing period, remove samples through the bottom valve of the mixing tank, and inspect for clarity. Return samples to the mixing tank. Continue mixing and sampling until absolutely clear.
11. In a separate stainless steel mixing tank, heat 300 mL of water covered to 90°C.
12. While maintaining at this temperature, start bubbling CO_2 gas.
13. While mixing, add and dissolve successively the benzoic acid, saccharin sodium, and phenylpropanolamine hydrochloride. Continue mixing until all have dissolved.
14. Reduce the temperature to 60°C to 65°C while mixing. Do not force cool.
15. Add the solution from previous step to the solution in the main mixing tank while mixing and bubbling CO_2 gas.
16. Rinse the container with two lots of 5 mL of CO_2-saturated water, and add the rinsings to the batch while mixing.
17. Continue mixing for 15 minutes while maintaining the temperature at 60°C to 65°C and under CO_2 gas protection.
18. While mixing the batch, sprinkle on the sodium CMC.
19. Continue mixing until all the sodium CMC has been dispersed.
20. Check on the absence of any undissolved lumps.
21. Add CO_2-saturated water from step 3 to 900 mL, and mix while cooling the batch to 30°C.
22. Dissolve the dyes in 10 mL of CO_2-saturated water; then, add to the batch with mixing.
23. Rinse the container with two lots of 5 mL of the same water, and add the rinsings to the batch.
24. Mix until a homogeneously colored batch is formed.
25. Stop bubbling in CO_2 gas, but maintain CO_2 protection of the tank headspace.
26. In a stainless steel container, dissolve the sodium ascorbate in 25 mL of CO_2-saturated water, taking care to minimize exposure of the solution to air or light.
27. Mix all solutions, add rinsings where necessary, and continue mixing for 15 minutes.
28. Add the flavors, complete the batch to 1 L with CO_2-saturated water, and mix well for 1 hour.
29. Stop mixing, saturate the headspace with CO_2, and leave overnight to release any entrapped air.

PHENYLPROPANOLAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
60.00	1	Phenylpropanolamine hydrochloride, USP	60.00
180.00	2	Calcium sulfate dihydrate	180.00
–	3	Starch paste 10%	QS
12.00	4	Starch 1500 (StarX)	12.00
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Add starch to cold water in 1:10 ratio. Heat to boil with constant stirring until a thick, translucent white paste is formed.
2. Keep it for use in following granulation.
3. Mix the phenylpropanolamine hydrochloride with the calcium sulfate in a Sigma blade mixer for 15 minutes.
4. Add starch paste in sufficient quantity to form a suitable wet mass of desirable consistency.
5. Allow to mix for 30 minutes.
6. Pass the wet mass through a No.14 screen, and distribute on drying trays.
7. Dry in a forced-air oven at 49 °C to 54 °C or in a fluid-bed dryer.
8. Pass the dried granules through a No. 18 mesh screen.
9. Transfer granules to a twin-shell blender, add items 4 and 5, and blend for 6 to 8 minutes.
10. Compress the granulation in a rotary press using 3/8 in. standard punches. Tablet weight is 260 mg.

PLACEBO TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
299.70	1	Ludipress®	299.70
0.30	2	Magnesium stearate	0.30

Manufacturing Directions

1. Mix the components, sieve, and press.
2. For this formulation, compress 300 mg.
3. The compression force determines hardness and friability.
4. At 7 kN, the hardness is 45 N; at 22 kN, the hardness is 160 N.
5. The disintegration time increases from 1 minute to 4 minutes.

POLIDOCANOL WOUND SPRAY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Polidocanol	5.00
50.00	2	Kollidon® VA 64	50.00
50.00	3	Ethocel™ 20	50.00
20.00	4	Lutrol E 400	20.00
675.00	5	Ethyl acetate	675.00
200.00	6	Isopropanol	200.00

Manufacturing Directions

1. Dissolve items 1 to 4 in the solvent mixture of items 5 and 6.
2. Fill the solution into spray cans with the necessary quantity of propellant (e.g., propane/butane) or in a mechanical pump bottle.

POTASSIUM BICARBONATE–COATED TABLET

Manufacturing Directions

1. Preparation of the potassium bicarbonate crystals: U.S. Patent 5,445,805 describes how to prepare crystals of size within the range of 800 to 900 μm, a Brunauer–Emmett–Teller (BET) surface area of 0.004 to 0.01 m^2/g, and particle distributions such that greater than 90% by weight of the crystals are within the range of 700 to 1000 μm. (At least 90% of the crystals are retained on a 25 mesh screen [707 μm], and fewer than 10% are retained on an 18 mesh screen (1000 μm]).
2. Preparation and application of controlled-release coating lacquers: Coating lacquer composition: Cutina HR, 23.45 g; Ethocel™, 163.45 g; acetyl tributyl citrate, 8.75 g; isopropyl alcohol, 3304.35 g; total, 3500.00 g.
3. Coating conditions: process air flow (m^3/h), 100–171; spray period (minutes), 135; spray temperature, 60.1°C to 68.1°C; spray pressure (bar), 2; liquid flow rate, 26–28 g/min; product temperature, 46°C to 52°C; coated crystals: theoretical yield (g), 3191.1; actual yield approximately 98% giving w/w dry matter of 6.37% (coated/uncoated crystals).
4. Dissolve hydrogenated castor oil (Cutina HR), ethyl cellulose (Ethocel™ Standard 100 premium), and acetyl tributyl citrate in isopropyl alcohol to provide the controlled-release coating lacquers.
5. Dissolve Cutina HR, Ethocel™, and acetyl tributyl citrate in the isopropyl alcohol solvent by heating in a mixer equipped with a heating jacket set at 60°C to 70°C with vigorous agitation. Continue the agitation for approximately 1 hour. When dissolved, the mixture should be clear to translucent.

6. Maintain the coating lacquer composition at temperatures of 60°C to 70°C.
7. Coat the lacquers on the potassium bicarbonate particles by cocurrent flow through a fluidized bed in which the moisture content is controlled. Spray the coating lacquer from a spray nozzle positioned at the bottom of a Glatt fluidized-bed apparatus equipped with a Wurster tube.
8. Fluidize the potassium bicarbonate crystals, and spray the warm coating lacquer on the crystals in multiple coating cycles.
9. Adjust the process air-flow rate as necessary to provide adequate movement of the crystals through the fluidized bed as they are coated. During the coating process, flash evaporate the isopropyl alcohol solvent from the crystals as they cycle through the fluidized bed.
10. After completing the application of the coating lacquer to the crystals, remove any trace residual solvent remaining on the coated crystals by cycling in the fluidized bed without lacquer spray for 10 minutes.
11. Following the residual solvent removal, cool the coated crystals in the bed.
12. The amount of coating lacquer applied on the crystals is calculated as the % w/w of the dry matter of the respective coatings relative to the uncoated potassium bicarbonate crystals.
13. Compression: potassium, 85.00%; bicarbonate-coated crystals, Cutina HR, 1.50%; Avicel™ PH, 7.68%; cornstarch, 5.12%; Syloid, 0.40%; Lubritab, 0.30%. Compress tablets of 1500 mg of potassium bicarbonate.

POVIDONE–IODINE AND LIDOCAINE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Lidocaine hydrochloride	10.00
10.00	3	Sodium chloride	10.00
200.00	4	Lutrol F 127	200.00
79.00	5	Sodium hydroxide (1 M solution)	79.00
61.10	6	Water	61.10

Manufacturing Directions

1. Dissolve items 1 to 3 in item 6, cool to approximately 6°C, dissolve item 4, and adjust the pH to a value of 4.5 to 5.0 with item 5.
2. Maintain the cool temperature until the air bubbles escape.
3. Viscosity (Brookfield, 23°C) is 54,000 mPa.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP-iodine 30/06	50.00
10.00	2	Fragrance	10.00
75.00	3	Water	75.00
940.00	4	Syndet base	940.00

Manufacturing Directions

1. Dissolve PVP–iodine in water, and mix the solution with the fragrance and the syndet base.
2. Pass the blend four times through a three-roller mill.
3. Blend three times through a plodder with a narrow-sieve hole disk.
4. Pass the blended material through a wide-sieve hole disk combined with a mouth hole disk.
5. Heat the area of the two disks to 50°C using a heating collar.
6. Cut the bar in pieces on a laboratory stamper.
7. Composition of the syndet base (in sequence of concentration): disodium lauryl sulfosuccinate, sodium lauryl sulfate, cetyl stearyl alcohol, paraffin, glycerol stearate, water, titanium dioxide.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP–iodine 30/06	50.00
75.00	2	Water	75.00
241.5	3	Texapon® K 12	241.5
241.5	4	Setacin® F special paste	241.5
241.5	5	Emcol® 4400.1	241.5
145.00	6	Cetylstearyl alcohol	145.00
96.50	7	Paraffin	96.50
226.00	8	Glycerol monostearate	226.00

Manufacturing Directions

1. Heat mixture of items 3 to 8 to 75°C to 80°C, and cool to approximately 50°C, stirring well.
2. Add solution of items 1 and 2, and let cool to room temperature, stirring continuously.
3. Pass the blend four times through a three-roller mill, and let dry overnight at room temperature.
4. Cut the bar into pieces on a laboratory stamper.

POVIDONE–IODINE BAR SOAP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	PVP-iodine 30/06	50.00
75.00	2	Water	75.00
241.50	3	Texapon® K 12	241.50
145.00	4	Cetylstearyl alcohol	145.00
96.50	5	Paraffin	96.50
226.00	6	Glycerol monostearate	226.00

Manufacturing Directions

1. Heat mixture of items 3 to 6 to 75°C to 80°C, and cool to approximately 50°C, stirring well.
2. Add solution of item 1, and let cool to room temperature, stirring continuously.
3. Pass the blend four times through a three-roller mill, and let dry overnight at room temperature.
4. Cut the bar into pieces on a laboratory stamper.

POVIDONE–IODINE CONCENTRATES FOR BROILERS AND CATTLE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
200.00	1	PVP–iodine 30/06	200.00
50.00	2	Texapon® K 12	50.00
50.00	3	Cremophor NP 14	50.00
73.00	4	Tartaric acid	73.00
43.00	5	Sulfuric acid, diluted	43.00
100.00	6	Ethanol 96%	100.00
QS	7	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve surfactant items 2 and 3 in solution of items 4 to 7, and slowly add PVP–iodine.
2. Brown transparent liquid having a pH of approximately 1 is obtained.
3. Dilute approximately 3 mL of the concentrate with 1 L of water prior to use.

POVIDONE–IODINE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
241.00	2	Citric acid (0.1 M solution)	241.00
369.00	3	Na_2HPO_4 (0.2 M solution)	369.00
20.00	4	Cremophor A 6	20.00
20.00	5	Cremophor A 25	20.00
100.00	6	Cetylstearyl alcohol	100.00
100.00	7	Liquid paraffin	100.00
50.00	8	Glycerol	50.00

Manufacturing Directions

1. Prepare a basic cream from the emulsifying agents and the fatty substances (items 4–8).
2. Stir in the PVP–iodine dissolved in the buffer solutions made from items 2 and 3.
3. A brown cream having a pH of 4.5 should be obtained.

POVIDONE–IODINE EFFERVESCENT VAGINAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
350.00	1	PVP–iodine 30/06, with excess	360.00
1450.00	2	Ludipress®	1450.00
360.00	3	Tartaric acid	360.00
265.00	4	Sodium bicarbonate	265.00
19.00	5	Talc	19.00
2.00	6	Calcium arachinate	2.00
2.00	7	Aerosil® 200	2.00

Manufacturing Directions

1. Dry the mixture of items 2 to 4 for 4 hours at 60°C, mix with item 1 and items 5 to 7, and press to tablets.
2. Compress 2.5 g in 20 mm biplanar punches.
3. The tablet can be dissolved in water to obtain a vaginal douche solution.

POVIDONE–IODINE FOAM SPRAY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
0.10	2	Cremophor A 25	0.10
QS	3	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve PVP–iodine in the solution of Cremophor A 25 in water.
2. Fill the aerosol cans with 90 parts of this solution and 10 parts propane:1 part butane.

POVIDONE–IODINE GARGLE

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.00	1	Polyvinylpyrrolidone–iodine (powder) (35% excess)	13.50
10.00	2	Glycerin, USP (96%)	10.00
–	3	Purified water, USP	QS to 1 L

Manufacturing Directions

Wear gloves and mask during all phases of manufacturing and filling. Do not keep the lid of the manufacturing or storage tank open unless necessary, as iodine may be liberated.

1. Add 600 mL purified water to a suitable stainless steel manufacturing tank.
2. Slowly add povidone–iodine powder to the water (with continuous stirring).
3. Stir for 30 minutes or until a clear, brown solution is obtained.
4. Add glycerin to the manufacturing tank.
5. Stir until uniform solution is obtained.
6. Make up volume to 1 L with purified water, and mix well for 5 minutes.
7. Check pH (range: 2–4).
8. Filter the solution through a 100 mesh nylon cloth, and transfer to a stainless steel storage tank.
9. Keep the storage tank tightly closed.

POVIDONE–IODINE GARGLE SOLUTION CONCENTRATE

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Propylene glycol	10.00
90.00	3	Ethanol (96%)	90.00
800.00	4	Water	800.00

Manufacturing Directions

1. Dissolve the PVP–iodine in the solvent mixture to produce a brown transparent liquid.
2. Dilute 10 mL of the concentrate with approximately 100 mL of water prior to use.

POVIDONE–IODINE GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
359.00	2	Citric acid (0.1 M solution)	359.00
181.00	3	$NA_2HPO_4 \cdot 12H_2O$ (0.2 M solution)	181.00
50.00	4	Lutrol E 400	50.00
100.00	5	Liquid paraffin	100.00
150.00	6	Lutrol F 127	150.00
70.00	7	Lutrol F 127	70.00

Manufacturing Directions

1. Dissolve item 1 in solution of items 2 to 4, mix with item 5, and dissolve item 6 at approximately 20°C.
2. Cool to 5°C to 8°C, and dissolve item 7.
3. Maintain cool temperature until all air bubbles have disappeared.
4. A brown, turbid gel should be obtained.

POVIDONE–IODINE GELS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Sodium chloride	10.00
200.00	3	Lutrol F 127	200.00
79.00	4	Sodium hydroxide (1 M solution)	79.00
610.00	5	Water	610.00

Manufacturing Directions

1. Dissolve items 1 and 2 in item 5, and cool to approximately 6°C.
2. Dissolve Lutrol F 127 and item 2, and adjust the pH value with item 4.
3. Maintain cool until all air bubbles escape.
4. Viscosity (Brookfield, 23°C) is 61,000 to 54,000 mPa; pH value (20% in water) is 2.2 to 4.6.

POVIDONE–IODINE GLUCOSE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	PVP–iodine 30/06, with excess	26.00
45.00	2	Ethanol (96%)	45.00
849.00	3	Glucose	849.00
34.00	4	Lutrol E 4000	34.00
6.00	5	Glycerol	6.00
6.00	6	Water	6.00

Manufacturing Directions

1. Dissolve Lutrol E 4000 in the hot mixture of glycerol and water, and add the glucose warmed to 60°C to 80°C.
2. Incorporate item 4 to obtain a brown, viscous, and turbid paste.

POVIDONE–IODINE LIQUID SPRAY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
150.00	2	Kollidon® VA 64	150.00
750.00	3	*N*-Propanol	750.00
750.00	4	Ethanol	750.00

Manufacturing Directions

1. Dissolve Kollidon® VA 64 in the mixture of solvents, and slowly add PVP–iodine to the well-stirred solution.
2. Fill in aerosol cans with propellants such as propane and butane or with manual valves.

POVIDONE–IODINE LOZENGES

Bill of Materials

Scale (mg/lozenge)	Item	Material Name	Qty/1000 Lozenges (g)
5.00	1	PVP–iodine 30/06	5.00
150.00	2	Sorbitol (crystallized)	150.00
4.00–5.00	3	Menthol (crystalline)	4.00–5.00
4.00–5.00	4	Eucalyptol (crystalline)	4.00–5.00
1.00	5	Aspartame, potassium	1.00
0.10	6	Saccharin sodium	0.10
1.00	7	Aerosil® 200	1.00
1.00	8	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compression force.
2. Compress 176 mg in 8 mm biplanar punches.

POVIDONE–IODINE MASTITIS CREAM FOR CATTLE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
100.00	2	Liquid paraffin	100.00
100.00	3	Vaseline®	100.00
50.00–80.00	4	Cetylstearyl alcohol	50–80
20.00	5	Cremophor A 6	20.00
20.00	6	Cremophor A 25	20.00
50.00	7	Propylene glycol	50.00
QS	8	Water	530.00–560.00

Manufacturing Directions

1. Dissolve PVP–iodine in the solvents (items 7 and 8).
2. Mix items 2 to 6 by heating, stir the solution in the previous mixture, and cool by stirring.

POVIDONE–IODINE MOUTHWASH AND GARGLE SOLUTION CONCENTRATE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
75.00	1	PVP–iodine 30/06	75.00
5.00	2	Saccharin sodium	5.00
150.00	3	Water	150.00
2.00	4	Menthol	2.00
1.00	5	Anise oil + eucalyptus oil (1+1)	1.00
150.00	6	Lutrol E 400	150.00
500.00	7	Ethanol (96%)	500.00

Manufacturing Directions

1. Dissolve PVP–iodine and saccharin in water, and mix with solution of items 4 to 7.
2. Brown transparent liquid has a fresh odor.
3. Dilute 10 to 20 mL with a glass of water.
4. A brown liquid with a fresh taste should be obtained.

POVIDONE–IODINE POWDER SPRAY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
250.00	1	PVP–iodine 30/06	250.00
250.00	2	Maize PO_4 aerosol	250.00
15.00	3	Isopropyl myristate	15.00
100.00	4	Dow Corning® 344 fluid	100.00
500.00	5	Pentane	500.00
220.00	6	Propane + butane (1+3)	220.00

Manufacturing Directions

1. Suspend PVP–iodine and maize PO_4 aerosol in the liquid mixture of items 3 to 5.
2. Fill in aerosol cans with the propellants.

POVIDONE–IODINE PUMP SPRAY

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	PVP–iodine 30/06	10.00
100.00	2	Water	100.00
1.00	3	Potassium iodide	1.00
100.00	4	Xylitol	100.00
787.50	5	Propylene glycol	787.50
1.00	6	Menthol (crystalline)	1.00
0.50	7	Peppermint oil (double rectified)	0.50

Manufacturing Directions

1. Dissolve potassium iodide in water, warm up to 40°C, and dissolve xylitol.
2. At room temperature, dilute with propylene glycol, dissolve PVP–iodine, and add flavors to produce a clear, brown liquid with a sweet, refreshing taste.

POVIDONE–IODINE SHAMPOO

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
75.00	1	PVP–iodine 30/06	75.00
250.00	2	Neutronyx® S 60	250.00
40.00	3	Super Amide® L 9	40.00
5.00–7.00	4	Natrosol™ HR 250	5.00–7.00
–	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve Super Amide® and Natrosol™ in hot water (approximately 60°C); then, dissolve PVP–iodine.
2. After cooling, incorporate Neutronyx®.
3. A brown, clear solution should be obtained.
4. The viscosity can be changed by modification of the amount of Natrosol™ 250 HR.

POVIDONE–IODINE SOFT GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	PVP–iodine 30/06	10.00
25.00	2	Natrosol™ HR 250	25.00
QS	3	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve PVP–iodine and Natrosol™ HR 250 in the water, and stir well to produce a clear, brown gel.
2. Viscosity (Brookfield, 23°C) is 31,500 mPa.

POVIDONE–IODINE SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
100.00	1	Povidone–iodine powder (35% excess)	135.00
9.318	2	Anhydrous citric acid (powder)	9.318
14.62	3	Anhydrous sodium phosphate (dibasic)	14.62
QS	4	Purified water	QS to 1 L

Manufacturing Directions

Wear gloves and mask during all phases of manufacturing and filling. Do not keep the lid of the manufacturing or storage tank open unless necessary, as iodine may be liberated.

1. Citric acid–phosphate buffer solution (pH 5): Add 600 mL purified water to a suitable stainless steel manufacturing tank.
2. With gentle stirring, add citric acid to the purified water in the manufacturing tank.
3. Stir for 10 minutes or until completely dissolved.
4. During this mixing period, remove samples from the bottom valve of the manufacturing tank, and inspect for clarity.
5. Return samples to the manufacturing tank.
6. Continue mixing and sampling until the solution is completely clear.
7. With gentle stirring, add dibasic sodium phosphate to the solution.
8. Stir for 10 minutes or until completely dissolved.
9. During this mixing period, remove samples from the bottom valve of the manufacturing tank, and inspect for clarity.
10. Return samples to the manufacturing tank.
11. Continue mixing and sampling until the solution is completely clear.
12. Make up volume to 1 L with purified water, and mix well for 5 minutes.
13. Check and record pH (range: 4.8–5.2).
14. Filter the solution through a 100 mesh nylon cloth.
15. Transfer into a suitable stainless steel storage tank, and keep tightly closed.
16. This solution should be freshly prepared, and should not be stored for more than 24 hours.
17. Preparation of solution: Dissolve povidone–iodine in approximately 600 mL of citric acid/phosphate buffer (pH 5) solution in a suitable stainless steel mixing tank.
18. Stir evenly for 10 minutes or until a clear, brown solution is obtained.
19. Make up volume to 1 L with citric acid/phosphate buffer solution.
20. Mix well for 10 minutes.
21. Check and record pH (range: 3.0–4.5).
22. Filter the solution through a 100 mesh nylon cloth.
23. Transfer into a suitable stainless steel storage tank, and keep it tightly closed.

POVIDONE–IODINE SCRUB

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
75.00	1	PVP–iodine (powder) (40% excess)	105.00
250.00	2	Sodium lauryl sulfate	250.00
35.00	3	Lauric diethanolamide	35.00
–	4	Distilled purified water, USP	QS to 1 L

Manufacturing Directions

1. Add 600 mL purified water to a suitable stainless steel manufacturing tank.
2. Add, by sprinkling, the sodium lauryl sulfate to the manufacturing tank.
3. Continue to mix slowly under vacuum, and begin to heat until product temperature is 70°C.
4. Continue to mix vigorously under vacuum at 65°C to 70°C for 15 minutes or until completely dissolved.
5. (*Note:* Do not add detergent quickly, as a gel may form that is difficult to dissolve.) Stop mixer, release vacuum, and open tank.
6. Add and disperse the previously broken lauric diethanolamide in the warmed solution from the previous step.
7. Maintain vacuum, and mix vigorously for 30 minutes at 65°C to 70°C or until completely dissolved.
8. Slowly cool under vacuum to room temperature with slow mixing. (*Note:* Do not force cool with cold water; otherwise the mixture will adhere to the walls of the manufacturing tank.) When temperature reaches 30°C, release vacuum, and open tank.
9. While mixing slowly, add povidone–iodine in small portions.
10. Rinse the container of povidone–iodine with 150 mL purified water, and add to the main tank. (*Note:* Do not keep the lid of the manufacturing or storage tank open unless necessary, as iodine may be liberated.) Mix under vacuum until a clear reddish-brown solution is obtained.
11. Make volume up to 1 L with purified water, and mix well under vacuum for at least 15 minutes to ensure product uniformity and to deaerate the product.
12. Stop mixing, release the vacuum, and then open the tank.
13. Check and record pH (range: 3–6).
14. Filter the solution through 100 mesh nylon cloth.

POVIDONE–IODINE SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
3.00	2	Lutrol F 127	3.00
5.00	3	Lutrol E 400	5.00
432.00	4	Citric acid (0.1 M solution)	432.00
460.00	5	$Na_2HPO_4 \cdot 12H_2O$ (0.2 M solution)	460.00

Manufacturing Directions

1. Dissolve the PVP–iodine (and Lutrol F 127) in the mixture of buffer solutions (and Lutrol E 400).
2. Brown clear solutions having a low viscosity and pH of approximately 4.5.
3. Items 2 and 3 can be deleted and compensated with item 5.

POVIDONE–IODINE SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
0.23	2	Texapon® K 12	0.23
1.40	3	Sodium biphosphate	1.40
0.30	4	Sodium citrate	0.30
20.80	5	Sodium hydroxide (1 M solution)	20.80
10.00	6	Glycerol	10.00
QS	7	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve Texapon® K 12 in solution of items 3 to 7, and slowly add PVP–iodine to the well-stirred solution.
2. The brown transparent liquid has a pH of 4.5.

POVIDONE–IODINE SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
10.00	2	Natrosol™ HR 250	10.00
2.00	3	Lutrol F 127	2.00
32.00	4	Sodium hydroxide (1 M solution)	32.00
QS	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve Lutrol F 127 and then Natrosol™ in the water.
2. As soon as both are dissolved, slowly add the PVP–iodine to the well-stirred solution.
3. Adjust the pH with the sodium hydroxide solution to approximately 3.5.

POVIDONE–IODINE SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
20.00	1	Tylose® M 300	20.00
2.00	2	Texapon® K 12	2.00
595.00	3	Citric acid (0.1 M solution)	595.00
283.00	4	Sodium biphosphate (0.2 M solution)	283.00

Manufacturing Directions

1. Dissolve Tylose® M 300 in the mixture of the citric acid and sodium biphosphate solutions.
2. Add Texapon®, and slowly dissolve the PVP–iodine.
3. The brown, clear solution will have a pH of 3 to 4.

POVIDONE–IODINE SURGICAL SCRUB

Bill of Materials

Scale (mg/g) Item	Item	Material Name	Qty/kg (g)
75.00	1	PVP–iodine 30/06	75.00
250.00	2	Neutronyx® S 60	250.00
40.00	3	Super Amide L 9	40.00
QS	4	Floral bouquet	QS
QS	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve Super Amide in hot water, cool, dissolve PVP–iodine, and add Neutronyx® to produce a brown, clear viscous solution with pH of approximately 3.4.

POVIDONE–IODINE SURGICAL SCRUB

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
75.00	1	PVP–iodine 30/06	75.00
250.00	2	Lutensit® AES	250.00
40.00	3	Monoamide® 150 MAW	40.00
QS	4	Floral bouquet	QS
QS	5	Water	QS to 1 kg

Manufacturing Directions

1. Dissolve monoamide in hot water, cool, dissolve PVP–iodine, and add Lutensit to produce a brown, clear, viscous solution.

POVIDONE–IODINE TRANSPARENT OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP-iodine 30/06	100.00
600.00	2	Lutrol E 400	600.00
46.00	3	Sodium hydroxide (1 M solution)	46.00
4.00	4	Water	4.00
250.00	5	Lutrol E 4000	250.00

Manufacturing Directions

1. Prepare solution of items 1 to 4, heat to approximately 60°C, incorporate item 5 (stirring well), and cool to room temperature.
2. The transparent ointment, similar to a gel, will have a pH of 4 and be miscible and washable with water.

POVIDONE–IODINE VAGINAL DOUCHE CONCENTRATE

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine 30/06	100.00
5.00	2	Lutrol E 400	5.00
3.00	3	Lutrol F 127	3.00
432.00	4	Citric acid (0.1 M solution)	432.00
460.00	5	$Na_2HPO_4 \cdot 12H_2O$ (0.2 M solution)	460.00

Manufacturing Directions

1. Dissolve PVP–iodine and Lutrol F 127 in the mixture of buffer solutions with Lutrol E 400.
2. The brown, clear solution will have a low viscosity and pH of approximately 4.3.

POVIDONE–IODINE VAGINAL OVULE

Bill of Materials

Scale (mg/Ovule)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	PVP–iodine 30/06	5.00
200.00	2	Lutrol E 400	10.00
170.00	3	Lutrol E 4000	85.00

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating.
2. Stir in the micronized PVP–iodine product in small portions into the melt.
3. After a uniform suspension has been obtained, pour it into polyethylene molds.
4. The homogeneous, brown-colored ovule has a weight of 2 g.

POVIDONE–IODINE VAGINAL OVULE

Bill of Materials

Scale (mg/Ovule)	Item	Material Name	Qty/kg (g)
200.00	1	PVP–iodine 30/06	200.00
100.00	2	Lutrol E 400	100.00
100.00	3	Lutrol E 1500	100.00
700.00	4	Lutrol E 4000	700.00

Manufacturing Directions

1. Melt the Lutrol E grades by gentle heating.
2. Stir in the micronized PVP–iodine product in small portions into the melt.
3. After a uniform suspension has been obtained, pour it into polyethylene molds.
4. The homogeneous, brown-colored ovule has a weight of 2 g.

POVIDONE–IODINE VISCOUS SOLUTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
10.00	1	PVP–iodine 30/06	10.00
15.00	2	Natrosol™ HR 250	15.00
QS	3	Buffer	QS
QS	4	Water	975.00

Manufacturing Directions

1. Dissolve PVP–iodine and Natrosol™ in the well-stirred buffered solution in water to produce a clear, brown, viscous liquid.
2. Viscosity (Brookfield) should be 7500 mPa.

PROMETHAZINE HYDROCHLORIDE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
1.00	1	Promethazine HCl (5% excess)	1.05
675.00	2	Sucrose	675.00
1.00	3	Citric acid (monohydrate)	1.00
2.40	4	Sodium citrate	2.40
0.50	5	Ascorbic acid	0.50
0.25	6	Sodium metabisulfite (sodium disulfite)	0.25
0.25	7	Anhydrous sodium sulfite	0.25
50.00	8	Alcohol (ethanol, 95%)	50.00
0.15	9	Flavor	0.15
0.30	10	Flavor	0.30
0.50	11	Polysorbate 80 (Tween 80)	0.50
0.15	12	Caramel color	0.15
QS	13	Purified water	QS to 1 L

Manufacturing Directions

Promethazine HCl undergoes thermal and photochemical oxidation. Protect from light, heat, and oxygen as practicable. Avoid vortex or overmixing to avoid air entrapment. Use nitrogen gas whenever necessary to expel air.

1. Add 400 g of item 13 to the manufacturing vessel, and heat to 90°C to 95°C.
2. Add item 2 while mixing at slow speed.
3. After addition of item 2, mix for 30 minutes at high speed and a temperature of 90°C to 95°C.
4. Cool down to 30°C to 35°C while mixing at low speed.
5. Add items 3 and 4 to the manufacturing vessel while mixing, and mix until dissolved.
6. Add items 6 and 7 to the manufacturing vessel while mixing, and mix until dissolved.
7. Add item 5 to the manufacturing vessel while mixing, and mix until dissolved.
8. Mix items 9 and 10 with items 8 and 11 in a separate container by using stirrer.
9. Mix for 10 minutes, and add to the manufacturing vessel while mixing.
10. Add 8 g of cold purified water (25–30°C) to a separate container, and dissolve item 12 by using stirrer.
11. Mix for 10 minutes, and add to the manufacturing vessel while mixing.
12. Start flushing the syrup with nitrogen gas pressure at 20 to 40 psi.
13. Add 10 g of cold purified water (cooled and flushed with N_2 gas) in a separate container with lid.
14. Pass nitrogen gas at 20 to 40 psi pressure for 15 minutes.
15. Dissolve item 1 in nitrogen-flushed, cold purified water (25–30°C) by using stirrer.
16. Mix for 10 minutes and add to the manufacturing vessel while mixing. Do not produce vortex.
17. Bring volume up to 1 L with nitrogen-flushed purified water.
18. Continue flushing nitrogen gas at 20 to 40 psi pressure for 30 minutes while mixing at slow speed.
19. Check and record the pH (limit: 4.5–5.5). If required, adjust pH with 10% citric acid or 10% sodium citrate solution.
20. Filter the syrup at 1.5 bar.
21. Recirculate approximately 20 to 30 mL syrup.
22. Transfer the filtered syrup to the storage vessel.
23. Flush with nitrogen gas and seal the tank.

PROMETHAZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Promethazine HCl, with excess	10.50
41.95	2	Lactose monohydrate	41.95
20.00	3	Maize starch	20.00
0.05	4	Sodium metabisulfite (sodium disulfite)	0.05
2.00	5	Povidone (PVP K-30)	2.00
5.00	6	Maize starch (dried)	5.00
0.50	7	Magnesium stearate	0.50
–	8	Alcohol (ethanol, 95%)	6.07
–	9	Purified water	8.67

Manufacturing Directions

Avoid overmixing of lubricants; otherwise, hardness will be reduced.

1. Mix items 8 and 9 in a stainless steel container.
2. Dissolve items 4 and 5 by slow stirring with stirrer until mixture becomes clear.
3. Sift items 1,2, and 3 through a stainless steel 500 µm sieve in sifter.
4. Load into mixer, and mix for 5 minutes at low speed.
5. Add binding solution at a rate of 5 to 7 g/min to the dry powders while mixing at low speed.
6. After addition is complete, scrape sides and blades.
7. Mix further for 2 minutes using a mixer and chopper at low speed.
8. Scrape sides and blades.

9. Check for the end point of granulation, which is the point where the granulation consists of few or no lumps.
10. If required, add purified water.
11. Dry the wet granules with the air circulation heater to expel alcohol for 2 hours.
12. Then, dry at 55°C for 14 hours.
13. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
14. Check the LOD (limit: 1.0–1.5%).
15. If required, dry further at 55°C for 2 hours.
16. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed.
17. Collect in stainless steel drums.
18. Load granules into the blender.
19. Sift item 6 material through a 500 µm sieve using a sifter, and add it into blender.
20. Mix for 3 minutes.
21. Sift item 7 through a 500 µm sieve, and add 1 to 2 g of granules.
22. Mix in polyethylene bag for 1 minute.
23. Add to blender.
24. Mix for 30 seconds.
25. Compress 0.80 g.
26. Coat using one of the HPMC coatings in the Appendix.

PROMETHAZINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Promethazine HCl, with excess	26.00
103.75	2	Lactose monohydrate	103.75
50.00	3	Maize starch	52.50
1.50	4	Sodium metabisulfite (sodium disulfite)	1.50
5.00	5	Povidone (PVP K-30)	5.00
12.50	6	Maize starch (dried)	12.50
1.25	7	Magnesium stearate	1.25
–	8	Alcohol (ethanol, 95%)	15.00
–	9	Purified water	21.67

Manufacturing Directions

Avoid overmixing of lubricants; otherwise, hardness will be reduced.

1. Mix items 8 and 9 in a stainless steel container.
2. Dissolve items 4 and 5 by slow stirring with stirrer until mixture becomes clear.
3. Sift items 1,2, and 3 through a stainless steel 500 µm sieve in sifter.
4. Load into mixer, and mix for 5 minutes at low speed.
5. Add binding solution at a rate of 5 to 7 g/min to the dry powders while mixing at low speed.
6. After addition is complete, scrape sides and blades.
7. Mix further for 2 minutes using a mixer and chopper at low speed.
8. Scrape sides and blades.
9. Check for the end point of granulation, which is the point where the granulation consists of few or no lumps.
10. If required, add purified water.
11. Dry the wet granules with the air circulation heater to expel alcohol for 2 hours.
12. Then, dry at 55°C for 14 hours.
13. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
14. Check the LOD (limit: 1.0–1.5%).
15. If required, dry further at 55°C for 2 hours.
16. Grind the dried granules through a 1.25 mm sieve using a granulator at medium speed.
17. Collect in stainless steel drums.
18. Load granules into the blender.
19. Sift item 6 material through a 500 µm sieve using a sifter, and add it into blender.
20. Mix for 3 minutes.
21. Sift item 7 through a 500 µm sieve, and add 1 to 2 g of granules.
22. Mix in polyethylene bag for 1 minute.
23. Add to blender.
24. Mix for 30 seconds.
25. Compress 0.80 g.
26. Coat using one of the HPMC coatings in the Appendix.

PSEUDOEPHEDRINE HYDROCHLORIDE CAPSULES

Bill of Materials

Scale (mg/capsule)	Item	Material Name	Qty/1000 Capsules (g)
24.00	1	Pseudoephedrine hydrochloride	24.00
15.00	2	Hydroxyethylcellulose, NF	15.00
60.00	3	Anhydrous lactose	60.00
1.00	4	Magnesium stearate	1.00

Manufacturing Directions

1. Blend all the ingredients in a twin-shell blender for 10 minutes.
2. Fill No. 0 capsules with fill weight of 500 mg using a tamping force of 200 N.

PSEUDOEPHEDRINE HYDROCHLORIDE, CARBINOXAMINE MALEATE ORAL DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
500.00	1	Sucrose	500.00
300.00	2	Glucose liquid	300.00
150.00	3	Glycerin (96%)	150.00
30.00	4	D-Pseudoephedrine hydrochloride	30.00
1.00	5	Carbinoxamine maleate	1.00
4.00	6	Saccharin sodium (powder)	4.00
2.50	7	Sodium benzoate (powder)	2.50
1.25	8	Flavor	1.25
0.03	9	Dye	0.03
0.03	10	Dye	0.03
QS	11	Hydrochloric acid reagent-grade bottles	QS
QS	12	HyFlo filter aid	1.32
QS	13	Purified water	455.00
QS	14	Sodium hydroxide for pH adjustment	QS

Manufacturing Directions

1. Charge 315 mL of deionized water into a suitable tank.
2. Begin heating water to 60°C to 70°C while adding sucrose with stirring.
3. Stir until sugar is dissolved.
4. Remove heat.
5. Add glucose liquid and 125 g of glycerin in this step.
6. Add and dissolve D-pseudoephedrine HCl, carbinoxamine maleate, saccharin sodium, and sodium benzoate with mixing.
7. Cool solution to 30°C to 35°C.
8. Mix flavor with 25 g of glycerin.
9. (*Note:* Temperature of syrup must not be higher than 35°C.) Dissolve dyes, if used, in 5 mL of deionized water, and add to syrup with mixing.
10. Adjust to pH 4.25 (range: 4.0–4.5), if necessary, with hydrochloric acid or sodium hydroxide.
11. QS to 1 L with deionized water, and mix well.
12. Allow product to stand overnight to let entrapped air escape.
13. Readjust volume to 1 L with deionized water.
14. Add and mix 1.320 g of HyFlo filter aid to the product.
15. Circulate through a press.
16. Filter into tank for filling.

PSEUDOEPHEDRINE HYDROCHLORIDE FAST–DISINTEGRATING TABLETS

1. To the vortex of a rapidly stirred vessel containing 345 g of deionized water add 30 g of croscarmellose sodium.
2. Mix this slurry for 10 minutes.
3. Concurrently, place 300 g of pseudoephedrine hydrochloride and 300 g of microcrystalline cellulose (Avicel™ PH-101) in the bowl of a mixer.
4. Stir this mixture for 10 minutes.
5. At the conclusion of the mixing time, slowly add the slurry to the contents of the mixing bowl, forming a granulation; place this in trays and dry in a 65°C oven for 3 hours.
6. Pass the dried granulation through a U.S. standard 16 mesh screen (1190 μm).
7. Place the dried granulation in a twin-shell blender, and to it add 300 g of Avicel™ AC-815 (85% microcrystalline cellulose coprocessed with 15% of a calcium, sodium alginate complex) and 300 g of microcrystalline cellulose (Avicel™ PH-102).
8. Thoroughly blend for 10 minutes, after which add 10.05 g of magnesium stearate and mix for an additional 5 minutes.
9. Prior to being added to the blender, pass the magnesium stearate through a U.S. standard 30 mesh screen.
10. Compress the resulting blend into tablets using 6.35 mm (0.25 in.) round standard concave tooling to give average weight of 0.1299 g and an average thickness of 4.864 mm (0.1915 in.).
11. The hardness of these tablets should average 1.38 kp.
12. Friability should measure at 0.077% after 4 minutes.
13. The average disintegration time should be 15 seconds in 10 mL of deionized water, forming a suspension with minimal shaking.

PSEUDOEPHEDRINE HYDROCHLORIDE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
6.00	1	Pseudoephedrine HCl (3% excess)	6.18
600.00	2	Sucrose	600.00
100.00	3	Glycerin (glycerol)	100.00
100.00	4	Sorbitol (70% solution)	100.00
15.00	5	Propylene glycol	15.00
1.00	6	Methylparaben	1.00
0.30	7	Propylparaben	0.30
0.50	8	Saccharin sodium	0.50
0.02	9	Dye (if needed)	0.02
0.05	10	Menthol	0.05
0.13	11	Citric acid	0.13
1.15	12	Sodium citrate	1.15
QS	13	Purified water	QS to 1 L

Manufacturing Directions

1. Add 390 g of purified water to the manufacturing vessel, and heat to 90°C to 95°C.

2. Add items 6 and 7 while mixing to dissolve at high speed.
3. Add item 2 while mixing at slow speed at a temperature of 90°C to 95°C.
4. Mix for 1 hour at high speed.
5. Cool down to 50°C while mixing at slow speed.
6. Dissolve items 8 and 12 in 10 g of item 13, and add to the manufacturing vessel while mixing at high speed.
7. Dissolve item 11 in 10 g of purified water, and add to the manufacturing vessel while mixing at high speed.
8. Load items 4 and 3 into the manufacturing vessel using a transfer pump while mixing at high speed.
9. Mix for 5 minutes.
10. Cool down to 30°C while mixing at slow speed.
11. Add 20 g of item 13 (30°C) in a separate container, and dissolve item 1 by using stirrer.
12. Mix for 10 minutes, and add to the manufacturing vessel while mixing at high speed.
13. Add 6 g of item 13 in a separate container, and dissolve item 9 manually.
14. Add color to the manufacturing vessel while mixing at high speed.
15. Dissolve item 10 in item 5.
16. Add this flavor mixture to the manufacturing vessel while mixing at high speed.
17. Bring the volume up to 1 L with item 13, and finally, mix for 15 to 20 minutes at high speed.
18. Check and record the pH (limit: 5.5–6.5 at 25°C).
19. If required, adjust pH with 20% citric acid or 20% sodium citrate solution.
20. Filter the syrup at 1.5 bar.
21. Recirculate approximately 100 to 150 mL syrup.

PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
60.00	1	Pseudoephedrine HCl[a]	63.00
120.20	2	Lactose monohydrate	120.20
25.00	3	Maize starch	25.00
1.00	4	Povidone (PVP K-30)	1.00
4.00	5	Povidone (PVP K-30)	4.00
1.80	6	Magnesium stearate	1.80
–	7	Alcohol (ethanol, 95%)	29.00

[a] Pseudoephedrine HCl 3 mg/tablet can be added in excess to compensate for moisture and handling loss.

Manufacturing Directions

Avoid overmixing of lubricants; otherwise, hardness is reduced.

1. Dissolve item 5 in item 7 while mixing at slow speed using a stirrer.
2. Sift items 1 to 4 through a 500 μm sieve.
3. Load into mixer, and mix for 5 minutes at low speed.
4. Add binding solution to the dry powders while mixing at low speed for 2 minutes.
5. After addition is complete, mix further for 1 minute using mixer and chopper at low speed.
6. Scrape sides and blade.
7. Check for the end point of granulation, which is when the granulation consists of wet granules with few or no lumps.
8. If required, add ethanol 95% to achieve desired granules.
9. Record extra quantity of ethanol 95% used.
10. Dry the wet mass at 55°C for 7 hours.
11. After 4 hours of drying, scrape the semidried granules to break the lumps to promote uniform drying.
12. Check the moisture content (limit: 1.5–2.5%).
13. Sift the dried granules through a 1.25 mm sieve using a granulator at medium speed.
14. Collect in stainless steel drums.
15. Load granules into the drum blender.
16. Sift item 6 through a stainless steel 250 μm sieve in sifter.
17. Add 8 to 12 g granules in mixer to sieved item 6.
18. Mix manually for 1 minute.
19. Add to drum blender, and blend for 1 minute.
20. Compress 215 mg in 8 mm round punches.

PSEUDOEPHEDRINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
60.00	1	(+) Pseudoephedrine hydrochloride	60.00
95.00	2	Dicalcium phosphate (Di-Tab)	95.00
5.00	3	Kollidon® 30	5.00
–	4	Water	QS
20.00	5	PEG-6000 (powder)	20.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate dicalcium phosphate with solution of items 3 and 4, dry, pass through a 0.8 mm sieve, and mix with item 1.
2. Add items 5 and 6, and press with low compression force.
3. Compress 192 mg using 8 mm biplanar punches.

PSORIASIS CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
40.00	1	Lanolin alcohol	40.00
50.00	2	White petroleum jelly	50.00
120.00	3	Paraffin wax 140F	120.00
300.00	4	Mineral oil (70 cS)	300.00
20.00	5	Coal tar	20.00
2.50	6	Allantoin	2.50
QS	7	Deionized water	QS to 1 kg
QS	8	Preservative	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Slowly add water phase in increments to the oil phase.
3. Allow each addition time to be fully incorporated.
4. Stir to cool.
5. Fill just above melting point.
6. Further homogenization may improve stability prior to filling.

PSORIASIS CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
16,000	1	Stearic acid	1600
6.00	2	Oleyl alcohol	6.00
2.00	3	Lanolin	2.00
2.00	4	Coal tar	2.00
0.600	5	Triethanolamine (99%)	0.60
0.250	6	Allantoin	0.25
QS	7	Deionized water	QS to 1 kg
–	8	Preservative	QS

Manufacturing Directions

1. Heat water and oil phases separately to 80°C.
2. Add water phase to oil phase while stirring.
3. Stir to cool.
4. Pass through homogenizer.
5. Fill at 40°C.

PSYLLIUM AND DIOCTYL SODIUM SULFOSUCCINATE POWDER

Manufacturing Directions

1. Psyllium husk, 5.1 g; dioctyl sodium sulfosuccinate, 240 mg.
2. The psyllium husk is milled to a small particle size: NMT 4% on 100 mesh and between 25% and 50% through 200 mesh.
3. These psyllium particles are then agglomerated with maltodextrin, and citric acid is sprayed on.
4. Dioctyl calcium sulfosuccinate or dioctyl potassium sulfosuccinate, can be substituted for the dioctyl sodium sulfosuccinate, or two or three of these can be combined.
5. Methyl cellulose, polycarbophil, calcium polycarbophil, bran, malt soup extract, karaya, guar gum, or mixtures of these can be substituted for the psyllium.
6. The amounts of psyllium and/or dioctyl sulfosuccinate can be varied within the ranges specified herein.

PSYLLIUM AND DOCUSATE SODIUM TABLETS

Formulation

Psyllium, 71.0%; ethylcellulose, 4.8%; isopropyl alcohol, QS; microcrystalline cellulose, 16.7%; PVP cross-linked, 1.9%; carnauba wax, 2.3%; docusate sodium, 3.3%.

Manufacturing Directions

1. Soak ethylcellulose in isopropyl alcohol overnight.
2. Granulate psyllium with isopropyl/ethylcellulose mixture in mixer.
3. Dry at 49°C for 3 hours.
4. Mill through 12 mesh screen.
5. Mix in a mixer the following: psyllium, microcrystalline cellulose, and carnauba wax.
6. Compress the tablet per granulation specifications using a tableting press.
7. Coat the core tablets.

Methylcellulose, polycarbophil, calcium polycarbophil, bran, malt soup extract, karaya, guar gum, or mixtures of these can be substituted for the psyllium. The amounts of psyllium and/or dioctyl sulfosuccinate can be varied. Dioctyl calcium sulfosuccinate or dioctyl potassium sulfosuccinate can be substituted for the dioctyl sodium sulfosuccinate, or two or three of these can be combined.

PSYLLIUM AND DOCUSATE SODIUM WAFER

Formulation

Ascorbic acid, 0.15%; natural and artificial flavors, 1.54%; corn oil, 14.80%; cornstarch, 1.97%; fructose crystalline, 6.82%; lecithin oil, 0.99%; molasses granular light, 0.39%; oat hull fiber, 6.42%; psyllium husk, 13.32%; sodium bicarbonate, 0.20%; sucrose white granulated, 17.40%; table oats, 8.89%; water purified USP, QS; wheat flour, 19.21%; docusate sodium, 0.63%; sorbitan tristearin, 0.20%.

Manufacturing Directions

1. In an appropriate mixer, add corn oil and lecithin, and mix for 1 minute using low speed.
2. *Note:* Preheat (microwave) lecithin, if necessary.
3. Add psyllium and docusate (which has been coated with the sorbitan tristearin), and mix for 1 minute using low speed.
4. Into a separate bowl, add part of the sucrose, fructose, molasses, and half of the water.
5. Mix for 1 minute using low speed.
6. Add psyllium/oil/lecithin premix and oat fiber.
7. Mix for 1 minute. Add rest of water, soda, flavors, ascorbic acid, and starch.
8. Mix for 1 minute at low speed.
9. Add flour to the mixer, and mix for 1 minute at low speed.
10. Roll dough into sheets approximately 0.1 in. thick.
11. Cut dough into rectangles of approximately 2.5 in. × 1.6 in.
12. Place bars on baking trays, and bake at 375°C for 10 to 12 minutes.
13. Ethylcellulose, polycarbophil, calcium polycarbophil, bran, malt soup extract, karaya, guar gum, or mixtures of these can be substituted for the psyllium. The amounts of psyllium and/or dioctyl sulfosuccinate can be varied within the ranges specified herein. Dioctyl calcium sulfosuccinate or dioctyl potassium sulfosuccinate can be substituted for the dioctyl sodium sulfosuccinate, or two or three of these can be combined.

PSYLLIUM HUSK GRANULES

1. Stir raw, unmilled psyllium seed husk (2 g) with 0.2 N sodium hydroxide (400 mL) containing sodium borohydride (400 mg) in a nitrogen atmosphere at ambient temperature for 90 minutes.
2. The pH of the solution should be from 10 to 11.
3. Pass the solution through a pasteurizer at a temperature of 100°C for a period of 50 seconds.
4. Once pasteurized, centrifuge the mixture for 20 minutes at 23,500 g.
5. Decant the supernatant from an insoluble fraction that settles out in the centrifuge bottle.
6. Mix the insoluble fraction with fresh sodium hydroxide/sodium borohydride solution (100 mL) and recentrifuge for 15 minutes to increase yield of the soluble fraction.
7. Adjust the pH of the supernatant to 5.5 by the addition of acetic acid at ambient temperature with stirring, forming a gel.
8. Desiccate the gel with isopropanol added with high-shear mixing.
9. Decant the isopropanol solution from the gel.
10. The solids content of the gel should be 30%.
11. Pass the gel material through an extruder and extrude into individual particles with an average particle size of 500 μm.
12. Introduce the extruded particles to a fluidized-bed dryer fitted with a cyclonic airflow screen, such as a Conidur screen.
13. Maintain the air temperature at 80°C.
14. The gel temperature should remain below 70°C throughout the drying process.
15. Dry the particles to a powder, with 90% of the water being removed.
16. The yield of the gel-forming polysaccharide will be 85%.
17. The final compositions comprise the following components by weight: gel-forming, 50.0%; polysaccharide sorbitol Neosorb P20, 48.16%; magnesium stearate, 0.5%; flavorant, 0.4%; colorant, 0.14%; citric acid, 0.8%.
18. The granules can be coated using the coating formulation: isopropanol, 94.5%; Eudragit® RD100, 5%; polyethylene glycol, 0.5%.
19. Dry and combine the coated gel-forming polysaccharide particles with the excipients as described previously.

PSYLLIUM HUSK TABLETS

Manufacturing Directions

1. Stir raw, unmilled psyllium seed husk (2 g) with 0.2 N sodium hydroxide (400 mL) containing sodium borohydride (400 mg) in a nitrogen atmosphere at ambient temperature for 90 minutes.
2. The pH of the solution should be from 10 to 11.
3. Pass the solution through a pasteurizer at a temperature of 100°C for a period of 50 seconds.
4. Once pasteurized, centrifuge the mixture for 20 minutes at 23,500 g.
5. Decant the supernatant from an insoluble fraction that settles out in the centrifuge bottle.
6. Mix the insoluble fraction with fresh sodium hydroxide/sodium borohydride solution (100 mL) and recentrifuge for 15 minutes to increase yield of the soluble fraction.
7. Adjust the pH of the supernatant to 5.5 by the addition of acetic acid at ambient temperature with stirring, forming a gel.
8. Desiccate the gel with isopropanol added with high-shear mixing.
9. Decant the isopropanol solution from the gel.
10. The solids content of the gel should be 30%.
11. Pass the gel material through an extruder and extruded into individual particles with an average particle size of 500 μm.
12. Introduce the extruded particles to a fluidized-bed dryer fitted with a cyclonic airflow screen, such as a Conidur screen.

13. Maintain the air temperature at 80°C.
14. The gel temperature should remain below 70°C throughout the drying process.
15. Dry the particles to a powder with 90% of the water being removed.
16. The yield of the gel-forming polysaccharide will be 85%.
17. Manufacture chewable tablets, total weight 2.5 g, while dry blending step 8 with sorbitol for 10 minutes, each component having an average particle size of approximately 500 μm.
18. Add the premix, if desired, and blend the mixture for an additional 10 minutes.
19. Add magnesium stearate, and blend the composition for another 5 minutes.
20. Directly compress the mixture into tablets using pressure from 2000 to 4000 psi.
21. The final compositions comprise the following components by weight: gel-forming, 50.0%; polysaccharide sorbitol Neosorb P20, 48.16%; magnesium stearate, 0.5%; flavorant, 0.4%; colorant, 0.14%; citric acid, 0.8%.
22. Optionally, the coating can be applied directly to a chewable tablet containing the gel-forming polysaccharide.
23. Additionally, it may be desired to include a flavorant within the coating composition: ethanol, 94%; polyethylene glycol, 5%; flavorant, 1%.

PVP–IODINE MOUTHWASH

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	PVP–iodine	100.00
5.00	2	Saccharin sodium	5.00
2.00	3	Menthol	2.00
0.50	4	Aniseed oil	0.50
0.50	5	Eucalyptus oil	0.50
160.00	6	PEG-400	160.00
300.00	7	Ethanol	300.00
QS	8	Purified water	QS to 1 kg

Manufacturing Directions

1. Dissolve PVP–iodine powder and saccharin sodium in 440 g of water to obtain a clear solution.
2. In a separate container, add alcohol.
3. Mix and dissolve aniseed oil, eucalyptus oil, menthol, and PEG-400 to obtain a clear solution.
4. QS with water.
5. Add solution from previous step and mix with stirring.
6. Package in HDPE plastic bottles.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
40.00	1	Pyridoxine hydrochloride	40.00
150.00	2	Lactose monohydrate	150.00
150.00	3	Avicel™ PH101	150.00
15.00	4	Kollidon® VA 64	15.00
10.00	5	Kollidon® CL	10.00
1.00	6	Magnesium stearate	1.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high compression force.
2. Compress 361 mg in 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
40.00	1	Pyridoxine hydrochloride	40.00
300.00	2	Cornstarch	300.00
15.00	3	Kollidon® 30	15.00
80.00	4	Water + isopropanol	80.00
1.00	5	Magnesium stearate	1.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, dry, pass through a 0.8 mm sieve, mix with items 5 and 6, and press with high compression force.
2. Compress 354 mg in 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Pyridoxine hydrochloride	100.00
200.00	2	Tablettose®	200.00
10.00	3	Kollidon® VA 64	10.00
3.00	4	Kollidon® CL	3.00
1.00	5	Magnesium stearate	1.00
1.00	6	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 363 mg in 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Pyridoxine hydrochloride	100.00
150.00	2	Lactose monohydrate	150.00
83.00	3	Avicel™ PH101	83.00
10.00	4	Kollidon® VA 64	10.00
3.00	5	Kollidon® CL	3.00
1.00	6	Magnesium stearate	1.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 360 mg in 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Pyridoxine hydrochloride	250.00
100.00	2	Avicel™ PH101	100.00
12.00	3	Kollidon® VA 64	12.00
5.00	4	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 361 mg in 12 mm biplanar punches.

PYRIDOXINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Pyridoxine hydrochloride	300.00
100.00	2	Lactose monohydrate D 20	100.00
20.00	3	Kollidon® 30	20.00
QS	4	Isopropanol + water (1+1)	60.00
10.00	5	Kollidon® CL	10.00
2.00	6	Aerosil® 200	2.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 to 6, dry, and sieve through a 0.8 mm screen.
2. Press with medium compression force.
3. Compress 440 mg using 12 mm biplanar punches.

RANITIDINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
75.00	1	Ranitidine; use Ranitidine HCl	88.88
65.00	2	Microcrystalline cellulose, NF	65.00
1.12	3	Magnesium stearate, NF	1.12

Manufacturing Directions

1. Pass ranitidine and microcrystalline cellulose through a 595 μm screen, and transfer to a suitable mixer.
2. Mix for 10 minutes.
3. Screen the magnesium stearate through a 400 μm screen, and add to the blender.
4. Blend for 2 minutes.
5. Compress using slightly convex round punches at hardness 8 ppi and disintegration time NMT 15 minutes in water.
6. Coat using a Methocel™–Ethocel™ coating solution (see Appendix).

RANITIDINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Quantity/1000 Tablets (g)
167.39	1	Ranitidine HCl USP (Orchev Pharma)	167.39
78.28	2	Microcrystalline cellulose NF (Avicel™ PH-102, FMC)	78.28
62.00	3	Pregelatinized starch NF (Starch 1500, Colorcon)	62.00
1.55	4	Fumed silica NF (Aerosil® 200, Degussa AG)	1.55
0.78	5	Magnesium stearate NF (Peter Greven)	0.78

Manufacturing Directions

1. Blend all materials, with the exception of magnesium stearate, for 10 minutes in a blender.
2. Add magnesium stearate and blend for an additional 2 minutes.
3. Compress tablets at 310 mg.

RANITIDINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
75.00	1	Ranitidine; use Ranitidine HCl[a]	85.00
95.00	2	Microcrystalline cellulose (Avicel™ PH102)	95.00
7.00	3	Croscarmellose sodium (Ac-Di-Sol)	7.00
6.60	4	Microcrystalline cellulose (Avicel™ PH102)	6.60
1.40	5	Magnesium stearate	1.40

[a] Ranitidine HCl (1.5%) is added to compensate LOD and process loss.

Manufacturing Directions

1. Process the product in an area where the RH is 40% to 45% and temperature does not exceed 25°C.
2. Store the bulk tablets in polyethylene-lined stainless steel containers at a controlled RH of 45% to 50% and temperature not exceeding 25°C.
3. Pass items 1, 2, and 3 through a sifter using a 900 µm sieve.
4. Load into a blender, and mix for 3 minutes.
5. Manually mix items 4 and 5 in a polyethylene bag for 1 minute.
6. Pass through a sifter using a 500 µm sieve.
7. Collect in a polyethylene bag.
8. Add to blender, and blend for 1 minute.
9. Check temperature and humidity before start of slugging (at a temperature not exceeding 25°C and a RH of 40–45%).
10. Slug 240 g of mixed powder in a rotary tableting machine.
11. Grind the slugs in a granulator using a 3 mm sieve followed by a 1 mm sieve.
12. Compress 195 mg using oblong biconvex punches.
13. Check temperature and humidity before start of compression (limit: temperature not exceeding 25°C and RH of 40–45%).
14. Coat using a hydroalcoholic HPMC coating.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
3.00	1	Riboflavin	3.00
195.00	2	Ludipress®	195.00
2.00	3	Magnesium stearate	2.00
1.00	4	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with very low compression force (4 kN).
2. Compress 202 mg using 8 mm biplanar punches.
3. This is a very low–active ingredient formulation (3 mg).
4. If content uniformity is a problem, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Riboflavin	10.00
75.00	2	Lactose monohydrate	75.00
20.00	3	Cornstarch	20.00
15.00	4	Avicel™ PH101	15.00
5.00	5	Kollidon® 30	5.00
25.00	6	Water	25.00
0.80	7	Aerosil® 200	0.80
2.50	8	Talc	2.50
1.70	9	Hydrogenated castor oil	1.70

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of items 5 and 6, dry, pass through a 0.8 mm sieve, mix with items 7 to 9, and press with low compressive force.
2. Compress 134 mg in 8 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
75.00	1	Riboflavin	75.00
375.00	2	Sorbitol (crystalline)	375.00
23.00	3	Kollidon® VA 64	23.00
4.00	4	Magnesium stearate	4.00
12.00	5	Aerosil® 200	12.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress 493 mg using 12 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Riboflavin	100.00
250.00	2	Sorbitol (crystalline)	250.00
19.00	3	Kollidon® VA 64	19.00
5.00	4	Magnesium stearate	5.00
10.00	5	Aerosil® 200	10.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 384 mg using 12 mm biplanar punches.

RIBOFLAVIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
150.00	1	Riboflavin, with excess	156.00
150.00	2	Ludipress®	150.00
4.00	3	Magnesium stearate	4.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 308 mg using 8 mm biplanar punches.

RUBEFACIENT ANALGESIC OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax, NF	150.00
100.00	2	Methyl salicylate	100.00
50.00	3	Menthol	50.00
100.00	4	Mineral oil (70 cS)	100.00
QS	5	Deionized water	QS to 1 kg
QS	6	Preservative, color	QS

Manufacturing Directions

1. Heat oil and water phases separately to 70°C.
2. Add water phase to oil phase while stirring. Stir to cool.
3. Fill at 30°C.

SACCHARIN EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Saccharin sodium	15.00
10.00	2	Tartaric acid	10.00
14.00	3	Sodium bicarbonate	14.00
2.00	4	Kollidon® VA 64	2.00
2.00	5	PEG-6000 (powder)	2.00

Manufacturing Directions

1. Dry saccharin sodium and tartaric acid for 1 hour at 100°C.
2. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
3. Compress 42 mg in 5 mm biplanar punches.

SACCHARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
37.50	1	Sodium cyclamate	37.50
17.00	2	Mannitol	17.00
6.35	3	Soda ash (light-milled powder, 58% Na_2O)	6.35
3.75	4	Saccharin sodium (dehydrated powder)	3.75
1.40	5	Povidone (PVP K-29-32)	1.40
8.00	6	Purified water	8.00
11.00	7	Tartaric acid	11.00
0.80	8	Soda ash (light-milled powder, 58% Na_2O)	0.80
1.00	9	Anhydrous sodium citrate	1.00
1.00	10	Sodium benzoate	1.00
0.20	11	PEG-8000	0.20

Manufacturing Directions

1. This product is hygroscopic and should be processed in a low-humidity area not exceeding 50% RH at 24°C.
2. Maintain at 35 to 40% RH at 24°C if possible.
3. If necessary, pass sodium cyclamate and mannitol (if used) through a Fitz mill or similar type using a 420 µm or similar screen, and then charge into a suitable mixer.
4. To this mixture, add soda ash (item 3) and blend for 30 minutes or until uniform.
5. Dissolve povidone in 4 mL of warm purified water.
6. Dissolve saccharin sodium in 3 mL of warm purified water.

7. Add solutions from previous steps together plus sufficient purified water.
8. Mass with blended powders.
9. Blend for 1 hour or until uniform.
10. Pass the wet mass through a 4.76 mm or similar screen in an oscillating granulator, and spread onto trays.
11. Oven dry at 50°C to 55°C for 16 to 24 hours using a full oven load of trays (LOD NMT 0.9%).
12. Pass dried granulation through a 1.19 mm or similar screen in an oscillating granulator or through a 1.68 mm or similar screen using a comminuting mill (knives forward, slow speed).
13. Lubricants must meet LOD/moisture content before proceeding.
14. If lubricants fail, dry them at 80°C for 8 hours.
15. Use 60°C for tartaric acid.
16. Mill lubricants (except tartaric acid and granulated lactose, if used) through a 600 μm or similar screen in a comminuting mill (hammers forward, medium speed).
17. Load dried granulation, coated tartaric acid, lactose (if used), and milled lubricants into a suitable mixer, and blend for 30 to 40 minutes.
18. Compress 80 mg per tablet in 7/32 in. punches.

SACCHARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Saccharin sodium	15.00
31.00	2	Ludipress®	31.00
2.00	3	Kollidon® CL	2.00
0.30	4	Magnesium stearate	0.30
2.00	5	PEG-6000 (powder)	2.00
2.00	6	Lutrol F 68	2.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compression force.
2. Compress 51 mg (or 50 mg if items 5 and 6 are omitted) using 5 mm punches.

SALICYLIC ACID CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Glyceryl stearate and PEG-75 stearate	150.00
5.00	2	Stearic acid	5.00
80.00	3	Mineral oil	80.00
665.00	4	Deionized water	665.00
100.00	5	Salicylic acid	100.00

Manufacturing Directions

1. Mix and heat items 1 to 4 to 75°C.
2. Allow to cool with gentle stirring.
3. At 30°C, add item 5. Homogenize if necessary.

SCOPOLAMINE TABLETS

Manufacturing Directions

1. To 0.2 g of scopolamine hydrobromide, add 29.4 g of calcium hydrogen phosphate (anhydrous) in small portions and mix well in a mortar to form a triturate.
2. Mix the triturate (29.6 g) well with fumaric acid (60 g) and calcium stearate (0.4 g) in a polyethylene bag to form a mixed powder A.
3. Mix 25 g of fumaric acid, 9.8 g of potassium hydrogen phosphate (anhydrous), and 0.2 g of calcium stearate in a polyethylene bag to make a mixed powder B.
4. To 0.1 g of scopolamine hydrobromide, add 10 g of crystalline cellulose in small portions and mix well in a mortar to make a triturate.
5. Mix this triturate (10.1 g) well with 24.7 g of lactose and 0.2 g of calcium stearate in a polyethylene bag to make a mixed powder C.
6. Perform multilayer tableting on a single-punch machine equipped with a die (8 mm) and flat-faced punches: First, place 90 mg of the mixed powder A in the die and precompress lightly; place 35 mg of the mixed powder B on the first fill and lightly precompress; thereafter, place 35 mg of the mixed powder C on the second fill and compress with a total pressure of approximately 1.2 tonnes.

SELEGILINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Selegiline	5.00
94.00	2	Ludipress®	94.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components intensively, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 99 mg in 6 mm biplanar punches.

SELENIUM SULFIDE SHAMPOO WITH CONDITIONER

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
10.00	1	Selenium sulfide	10.00
2.00	2	Methylparaben	2.00
10.00	3	Magnesium aluminum silicate type IIA	10.00
20.00	4	Titanium	20.00
0.17	5	Dye	0.17
230.00	6	Sodium alkyl ether sulfate/sulfonate	230.00
30.00	7	Cocamide DEA surfactant	30.00
40.00	8	Cocoamphocarboxyglycinate	40.00
10.00	9	Hydrolyzed protein	10.00
4.00	10	Perfume	4.00
QS	11	Citric acid	QS
QS	12	Sodium chloride	QS
QS	13	Deionized purified water	QS to 1 L

Note: Item 11 is used for pH adjustment, if necessary, and item 12 is used for viscosity adjustment, if necessary.

Manufacturing Directions

1. Selenium sulfide is toxic. Handle carefully, and use approved respiratory protection.
2. Add 7 mL of purified water to an appropriate mill containing full-charge alumina grinding cylinder media.
3. Add selenium sulfide.
4. Seal the mill, and agitate for approximately 10 minutes to wet down the powdered material.
5. Recycle for approximately 5 minutes with the pump set at 1040 mmHg.
6. Stop agitation.
7. If necessary, add purified water (25–30°C) to nearly cover the grinding media.
8. Seal the mill, and recirculate the slurry for 1 to 2 hours with the pump set to obtain the required particle size specifications for the selenium sulfide.
9. Load 250 mL of purified water into a suitable jacketed mixing tank, and heat to 60°C to 70°C.
10. With good stirring, add and dissolve methylparaben.
11. Slowly add and disperse the magnesium aluminum silicate. Continue mixing until fairly smooth.
12. Stop mixing, and allow to hydrate for 1 hour.
13. Add and disperse titanium dioxide.
14. Mix for 30 minutes.
15. With good stirring, add the selenium sulfide slurry, and rinse the mill with purified water.
16. Mix for 30 minutes.
17. Stop mixing, and add sodium lauryl ether sulfate/sulfonate.
18. Mix slowly for 5 minutes.
19. Add cocamide DEA.
20. Mix slowly for approximately 3 minutes.
21. Add cocoamphocarboxyglycinate.
22. Mix slowly for 30 minutes.
23. Separately dissolve hydrolyzed protein (hydrogel) in 4 mL of purified water, and mix until uniform.
24. Add solution to the tank, and mix until uniform.
25. Add perfume, and mix for 1 minute.
26. Dissolve dye in 2 mL of warm purified water (50–60°C), and add to mixing tank.
27. Mix until uniform.
28. Check and record pH. Adjust to 4.5 to 5.0, if necessary, using citric acid. Record amount of citric acid used and the adjusted pH.
29. Add purified water QS to 980 mL, and mix for 30 minutes.
30. Check and record viscosity.
31. If necessary, adjust by adding sodium chloride.
32. Deaerate by slow stirring under vacuum or use of a suitable deaerator.
33. Mix for 1 hour.

SERRATIOPEPTIDASE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
10.00	1	Serratiopeptidase	10.00
228.00	2	Ludipress®	228.00
2.00	3	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix intensively, and press with low compressive force (6 kN).
2. Compress 238 mg in 8 mm biplanar punches.

SERTRALINE L-LACTATE OSMOTIC TABLETS

Manufacturing Directions

1. Blend tablet cores comprising sertraline L-lactate (13.8 wt%), L-aspartic acid (11 wt%), calcium acetate (5 wt%), microcrystalline cellulose (29.5 wt%), and fructose (38.2 wt%) and then run through a roller compactor and mill.
2. Blend this milled material with 2.5 wt% magnesium stearate to form the final blended material; use this to make tablets having a total weight of 470 mg on a conventional tablet press.
3. Semipermeable asymmetric membrane coatings comprise 10 wt% cellulose acetate 398-10, 2.5 wt% polyethylene glycol 3350, 15 wt% water, and 72.5 wt% acetone.
4. The coating solution is spray-coated onto the tablets at a rate of 20 g/min until a 10 wt% coating level on the tablets has been achieved.

SILICONE PROTECTIVE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Polawax, NF	150.00
40.00	2	Oleyl alcohol	40.00
50.00	3	PEG-75 lanolin	50.00
150.00	4	Mineral oil (70 cS)	150.00
50.00–100.00	5	Dimethicone	50.00–100.00
QS	6	Deionized water	QS to 1 kg

Manufacturing Directions

1. Heat water and oil phase separately to 60°C to 65°C.
2. Add the water phase to the oil phase while stirring.
3. Stir to cool to 30°C.
4. May add perfume or color as desired.

SILYMARIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
35.50	1	Silymarin	35.50
410.50	2	Ludipress®	410.50
4.50	3	Magnesium stearate	4.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force (approximately 10 kN).
2. Compress 458 mg in 12 mm biplanar punches.

SIMETHICONE AND MAGNESIUM CARBONATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
16.00	1	Dextrose monohydrate, USP 25.0 kg	16.00
0.16	2	D&C Yellow No.10 Lake 250 g	0.16
0.06	3	FD&C Blue No.1 Lake 90.0 g	0.06
80.00	4	Simethicone powder GS (30%) 417 kg	266.40
64.00	5	Magnesium carbonate 100 kg	64.00
128.00	6	Microcrystalline cellulose 200 kg	128.00
175.68	7	Dextrates 275 kg	175.68
5.00	8	Stearic acid 8.00 kg	5.00

Manufacturing Directions

1. Process the simethicone mix by preblending magnesium carbonate and simethicone powder GS 30% in a V-blender.
2. Dry granulate this preblended mix and place in a V-shell blender.
3. Add dextrates and microcrystalline cellulose to the preblended mix in the V-shell blender, and blend the preblended mix, dextrates, and microcrystalline cellulose for approximately 10 minutes.
4. Combine FD&C Blue No. 1 Lake, D&C Yellow No. 10 Lake, and dextrose in a drum roller, dry granulate, and then place in the V-shell blender with the preblended mix, dextrates, and microcrystalline cellulose.
5. Dry granulate an additional amount of dextrose in the same granulator that the colorants are granulated in for the purpose of rinsing the granulator after the dry granulation of the colorants.
6. Add this amount of dextrose to the V-shell blender.
7. Pass an amount of stearic acid through a 30 mesh screen and add to the V-shell blender.
8. Blend the preblended mix, dextrates, microcrystalline cellulose, colorants, dextrose, and stearic acid in the V-shell blender for 3 minutes.
9. Measure a sample of the V-shell blender mix to test blend uniformity.
10. Upon meeting satisfactory blend uniformity requirements, transfer the simethicone layer mix to tote bins and then compress into 650 mg tablets.

SIMETHICONE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
70.00	1	Simethicone dry powder 25%	280.00
158.00	2	Sucrose, powder	158.00
7.00	3	Kollidon® 90 F	7.00
3.50	4	Kollidon® 90 F	3.50
QS	5	Isopropanol	QS
2.80	6	Aerosil® 200	2.80

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 and 5, dry, pass through a 0.8 mm sieve, add item 6, mix thoroughly, and press with high compressive force.
2. Compress 442 mg in 12 mm biplanar punches.

SIMETHICONE CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
80.00	1	Simethicone (Wacker silicon oil, S184)	80.00
400.00	2	Sorbitol (crystalline)	400.00
20.00	3	Aerosil® 200	20.00
390.00	4	Ludipress®	390.00
2.00	5	Menthol (powder)	2.00
8.00	6	Magnesium stearate	8.00

Manufacturing Directions

1. Mix items 2 and 3 with item 1, pass through a 0.8 mm sieve, add mixture of items 4 to 6, mix thoroughly, pass again through a 0.8 mm sieve, and press with high compressive force.
2. Compress 870 mg using 16 mm biplanar punches.

SIMETHICONE INSTANT GRANULES (60 MG AND 120 MG)

Formulation

I. Simethicone (Abil® 200, Goldschmidt), 10.0 g; Cremophor RH 40, 5.0 g.
II. Kollidon® VA 64, 3.0 g; ethanol, 40.0 g.
III. Sorbitol, crystalline, 50.0 g; fructose, 50.0 g; Kollidon® CL-M, 50.0 g; orange flavor (Dragoco), 0.5 g.

Manufacturing Directions

1. Introduce solution II into mixture I.
2. Granulate the powder mixture III with the well-stirred mixture I/II, dry, and pass through a 1 mm sieve.
3. Fill 1 or 2 g in sachets.

SIMETHICONE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
70.00	1	Simethicone	70.00
71.40	2	Microcrystalline cellulose	71.40
71.40	3	Magnesium hydroxide	71.40
265.00	4	Mannitol	265.00
100.00	5	Lactose	100.00
395.10	6	Granular sugar	395.10
0.70	7	Menthol	0.70
10.00	8	Fumed silica	10.00
5.00	9	Fumed silica	5.00
10.00	10	Magnesium stearate	10.00

Manufacturing Directions

1. Blend item 2 and item 3 in a V-blender for 10 minutes.
2. Transfer to planetary mixer.
3. Slowly add weighted amount of item 1 to the mix, and mix slowly using a "B" flat beater blade. After thorough mixing, pass through a No. 20 mesh screen.
4. Add the balance of the ingredients, mix, and compress.

SODIUM FLUORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
0.50	1	Sodium fluoride	0.55
56.25	2	Sorbitol, crystalline	56.25
56.25	3	Dicalcium phosphate	56.25
2.20	4	Kollidon® VA 64	2.20
0.50	5	Magnesium stearate	0.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compressive force.
2. Compress 116 mg using 6 mm biplanar punches.
3. If the content uniformity is not sufficient, a premix of sodium fluoride and sorbitol or dicalcium phosphate should be prepared separately before mixing with the rest of the excipients.

SODIUM FLUORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1.30	1	Sodium fluoride	1.30
76.70	2	Ludipress®	76.70
0.40	3	Magnesium stearate	0.40

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 78 mg using 5 mm biplanar punches.
3. If the content uniformity does not meet the requirements, prepare a premix of the active ingredient with a small part of the Ludipress® or with lactose monohydrate before mixing with the other components of the formulation.

SPIRULINA EXTRACT CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Spirulina extract (powder)	250.00
245.00	2	Ludipress®	245.00
25.00	3	PEG-6000 (powder)	25.00
5.00	4	Aerosil® 200	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compressive force.
2. Compress 495 mg using 12 mm biplanar punches.

SUCRALFATE AND SODIUM ALGINATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Sucralfate	500.00
20.00	2	Sodium alginate	20.00
70.00	3	Cornstarch	70.00
20.00	4	Kollidon® 30	20.00
–	5	Ethanol (95%)	80.00 mL
30.00	6	Kollidon® CL	30.00
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with solution of items 4 and 5, pass through a sieve, mix the dry granules with items 6 and 7, and press with low compressive force.
2. Compress 660 mg using 12 mm biplanar punches.

SULFUR ANTISEPTIC OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Sulfur (precipitated)	15.00
85.00	2	Kaolin	85.00
QS	3	White petroleum jelly	QS to 1 kg
60.00	4	Isopropyl palmitate	60.00
13.00	5	Camphor	13.00
13.00	6	Methyl salicylate	13.00
20.00	7	Lanolin	20.00
50.00	8	Tribehenin	50.00
50.00	9	Ozokerite	50.00
35.00	10	Sorbitan oleate	35.00
15.00	11	Deionized water	15.00
4.00	12	Salicylic acid	4.00
24.00	13	Glycerin	24.00
QS	14	Preservative	QS

Manufacturing Directions

1. Heat oils, except sulfur and lanolin, to 70°C.
2. Disperse sulfur and kaolin in the oil phase.
3. Heat water, glycerin, and salicylic acid gently.
4. Add to oil phase while stirring.
5. Stir to 55°C.
6. Mill to disperse sulfur.

TANNIN–CROSPOVIDONE COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
55.00	1	Tannic acid	55.00
230.00	2	Water	230.00
230.00	3	Kollidon® CL	230.00
33.00	4	Avicel™ PH101	33.00
2.60	5	Talc	2.60
0.30	6	Aerosil® 200	0.30
0.30	7	Calcium arachinate	0.30

Manufacturing Directions

1. Prepare solution of items 1 and 2, suspend item 3, and filter the formed insoluble tannin–crospovidone complex.
2. Wash with water until the water is clear, pass the solids through a 0.8 mm sieve, and dry.
3. Add items 4 to 7, and press with low compressive force.
4. Compress 323 mg using 12 mm biplanar punches.

TETRAHYDROZOLINE EYE DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
17.20	1	Acid boric	17.20
1.50	2	Hydroxypropylmethylcellulose 2910 (4000 cps)	1.50
0.40	3	Borax	0.40
1.00	4	Disodium edetate	1.00
0.50	5	Tetrahydrozoline hydrochloride	0.50
0.63 mL	6	Benzalkonium chloride solution (17%)	0.63 mL
QS	7	Water purified	QS to 1 L

Manufacturing Directions

1. Use thoroughly cleaned and rinsed steam-jacketed, glass-lined, or stainless steel tank (No. 304 or better) equipped with a speed-controlled agitator. The tank should have a cover. Foaming occurs because of the benzalkonium chloride, which concentrates in the foam. Processing and filling systems should be designed to minimize foaming and allow rapid dissipation of foaming.
2. Place 80% of the final volume of water into the mixing tank.
3. If using methyl cellulose, heat deionized water to 90°C.
4. While agitating, add and disperse methylcellulose by slowly sprinkling it on the surface of solution. Mix to avoid excessive foaming.
5. Allow 15 minutes for hydration of the methylcellulose before discontinuing heating, and allow to cool to 40°C.
6. While agitating, add and dissolve disodium edetate, benzalkonium chloride, boric acid, sodium borate, and tetrahydrozoline. Continue cooling to 25°C.
7. Discontinue agitation, and QS to 1 L with deionized water. (*Note:* Methylcellulose solutions filter at a slow rate.) Use inline Pall and Sartorius cartridges, and recirculate solution until clear. Transfer to holding or sterilization.
8. Use either heat sterilization or sterile filtration.
9. Heat sterilization: Sterilize at 112°C to 115°C for 60 minutes, cool solution to 25°C to 30°C, and aseptically add the sterile tetrahydrozoline solution. Mix well.
10. Set up a previously sterilized filter and transfer line with 10 µm stainless steel FulFlo filter or equivalent.
11. Aseptically fill sterile solution into sterilized containers, and apply sterile closure components.
12. Sterile filtration: Use Pall cartridge with Sartorius cartridge. Prepare and steam-sterilize the recommended filter units.
13. Aseptically fill the sterilize solution into each sterilized container, and apply sterile closure.

THIAMINE AND CAFFEINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Thiamine hydrochloride	500.00
100.00	2	Caffeine	100.00
30.00	3	Cornstarch	30.00
20.00	4	Kollidon® VA 64	20.00
15.00	5	Kollidon® VA 64	15.00
QS	6	Ethanol (96%)	QS
35.00	7	PEG-6000 (powder)	35.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with solution of item 5 and 6, dry, sieve, mix with item 7, and press with low compressive force.
2. Compress 698 mg using 16 mm biplanar punches

THIAMINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine HCl with excess	110.00
43.50	2	Lactose monohydrate	43.50
4.00	3	Crospovidone (Kollidon® CL)	4.00
5.50	4	Povidone (PVP K-90)	5.50
5.50	5	Crospovidone (Kollidon® CL)	5.50
32.00	6	Microcrystalline cellulose (Avicel™ PH112)	32.00
5.60	7	Talc (fine powder)	5.60
3.70	8	Glyceryl behenate (glyceryl monostearate)	3.70
0.20	9	Magnesium stearate	0.20
–	10	Alcohol (ethanol, 95%)	50.67

Manufacturing Directions

1. Sift items 1, 2, and 3 through a stainless steel 630 µm sieve.
2. Load into mixer.
3. Mix for 5 minutes at high speed.
4. Dissolve item 4 in item 10 under slow stirring by stirrer.
5. Add the binding solution while mixing at high speed over a period of 2 minutes. Scrape sides and blades.
6. Mix and chop at high speed for 2 minutes.
7. Check the end point of granulation.
8. If required, add additional item 10 to obtain the end point. (The end point of granulation occurs when the wet mass consists of few or no lumps.) Dry wet granules in oven at 55°C for 8 hours.

9. After 2 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
10. Check the LOD (limit: 1.0–1.5%).
11. If required, dry at 55°C for an additional hour.
12. Check the LOD again.
13. Grind the dried granules through a 1.25 mm sieve with the granulator set at medium speed.
14. Collect in stainless steel drums.
15. Load the granules into blender.
16. Sift items 5 and 6 through a 500 µm sieve and add to blender.
17. Mix for 2 minutes (do not overmix).
18. Sift items 8 and 9 through a 500 µm sieve.
19. Add 1.33 g to 2.67 g of granules.
20. Mix in a polyethylene bag for 1 minute.
21. Add to blender.
22. Blend for 1 minute.
23. Check temperature and humidity before start of compression (limit: temperature should not exceed 25°C; RH, 45–50%).
24. Compress using 8 mm round, beveled, concave punches.

THIAMINE HYDROCHLORIDE TABLETS (SUGAR-COATED)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine hydrochloride monohydrate (with excess)	110.00
110.00	2	Lactose	110.00
5.00	3	Luviskol® K-98	5.00
1.00	4	Magnesium stearate	1.00
40.00	5	Ethyl alcohol (denatured)	40.00
251.44	6	Sugar (crystalline)	251.44
1.40	7	Sugar powder	1.40
14.50	8	Maize starch	14.50
14.81	9	Talcum	14.81
21.00	10	Copolymer lacquer	21.00
0.40	11	Paraffin (solid)	0.40
0.16	12	Gum acacia	0.16
0.228	13	Ethyl alcohol (denatured)	0.228
0.01	14	Paraffin (liquid)	0.01
QS	15	Purified water	QS

Manufacturing Directions

1. In a suitable stainless steel vessel, add denatured ethyl alcohol and Luviskol®. Mix until homogeneous mixture is obtained. Set aside.
2. Pass lactose through a No. 2 mesh sieve, add thiamine, and mix for 10 minutes in an appropriate mixer.
3. Slowly add to this mixture the solution made earlier, and stir until slightly lumpy mass is obtained.
4. If required, add ethyl alcohol to the mixture.
5. Pass the wet mass through an oscillating granulator with a 7 mm perforated sieve.
6. Spread the granules over paper-lined trays, and dry at 40°C for 5 hours in a drying oven.
7. The RH of the granules should be 15% to 25%.
8. Pass magnesium stearate and talcum through a 1 mm hand sieve.
9. Compress on a rotary tablet machine at approximately 4 to 5 tonnes of pressure. The weight of each tablet should be approximately 230 mg.
10. In a suitable container, add purified water and acacia gum. Pass the resulting solution through a 0.8 mm sieve.
11. Charge the compressed tablets into a coating pan, and apply the copolymer lacquer in 10 portions. After the last application, apply neutral spray (crystalline sugar in demineralized water).
12. Dry the insulated tablets in a drying oven overnight at 45°C (minimum 14 hours). The tablet weight should be approximately 236 mg each.
13. In an electric-jacketed kettle, put demineralized water, crystalline sugar, maize starch, and talcum. Mix by stirring until homogeneous.
14. Pass through a sieve of mesh size 0.8 mm (pH: 6–8, density: 1.335–1.356).
15. Coat the tablets to 400 mg weight using the coating solution and a sugar-coating pan. Set pans at slow speed, open air inlets, and set air inflow at 80°C and maximum contact temperature at 42°C.
16. Roll tablets to reach this temperature.
17. Turn pan to fast speed, close the inlet air flap, and make first application of syrup.
18. When all tablets are wet, and distribution of syrup is uniform, open the air inlet flap, and allow 80°C air to blow (tablet temperature falls 1–2°C for a short time and then slowly rises to 42°C).
19. The next application of the syrup cycle begins.
20. Coat the tablets with color solution as described earlier to 495 mg weight.
21. Set the air inflow temperature at 25°C, and reduce the size of application with the falling temperature, whereby tablets are evenly and lightly moistened after each application. The temperature drops from 42°C to 32°C.
22. Turn the coating pans slowly during the drying phase. For the last three applications, keep the pan lids closed, as well as the air intake and outflow during this phase.
23. Drying only with outlet air may be extended for the last three applications up to 10 to 15 minutes.
24. Immediately after the last application of syrup has dried slightly, begin the polishing step.

25. The polishing paste is prepared in a suitable boiling vessel by adding stock gum solution, crystalline sugar, and demineralized water.
26. Boil until temperature reaches 106°C with stirring.
27. In a steam kettle, melt solid and liquid paraffin, and pour melted paraffins into the mixture of gum. Make up the weight with demineralized water.
28. Polishing paste ready for use contains 0.75 kg of paste and 0.113 kg of ethyl alcohol.
29. Tablet temperature is 28°C to 32°C.
30. Shut off the inlet flaps and outlet flaps, set the pans at the fast speed, and add polishing paste (approximately 0.3% of tablet weight).
31. Close the pans with inner lids, and allow them to rotate at fast speed for 90 seconds for even distribution.
32. Remove the inner lid of the pan, and set it on slow speed.
33. Open the outlet air for 3 minutes, and blow the inlet air at 40°C for 6 to 8 minutes until a good sheen appears.
34. Set the pans on automatic system for overnight with intermission time of 5 minutes off and 10 seconds on.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
110.00	1	Thiamine mononitrate	110.00
210.00	2	Pyridoxine hydrochloride	210.00
76.82	3	Lactose monohydrate	76.82
10.00	4	Crospovidone (Kollidon® CL)	10.00
18.50	5	Povidone (PVP K-90)	18.50
0.30	6	Cyanocobalamin	0.30
85.00	7	Microcrystalline cellulose (Avicel™ PH102)	85.00
14.00	8	Crospovidone (Kollidon® CL)	14.00
10.00	9	Glyceryl behenate (glyceryl monostearate)	10.00
0.49	10	Magnesium stearate	0.49
15.00	11	Talc (fine powder)	15.00
–	12	Alcohol (ethanol, 95%)	88.90

Manufacturing Directions

1. Dissolve item 5 in item 12 by using a stirrer to make a clear solution.
2. Dissolve item 6 carefully in the solution.
3. Sift items 1 to 4 through a 630 µm sieve.
4. Load the material into a mixer.
5. Mix and chop at high speed for 5 minutes.
6. Add binding solution from previous step to the dry powder in the mixer while mixing and chopping at high speed for 2 minutes.
7. Check for satisfactory wet mass.
8. Add additional item 12, if required, to obtain a satisfactory wet mass.
9. Do not allow big lumps.
10. Record the additional quantity of ethanol 95%.
11. Spread the granules onto stainless steel trays to a thickness of one-fourth of the tray thickness, and load the trays onto a trolley.
12. Load the trolley into an oven.
13. Keep the door open and switch on the oven with air circulation and heater turned off for 2 hours.
14. Dry the granules at 55°C for 12 hours.
15. Check the LOD of dried granules (limit: NMT 0.7%).
16. Grind the dried granules through a 1.25 mm sieve using a granulator.
17. Collect in a stainless steel drum.
18. Load into the blender.
19. Sift items 7, 8, and 9 through a 500 µm sieve.
20. Collect in stainless steel container.
21. Load the sieved powder into the blender.
22. Blend for 3 minutes.
23. Sift items 11 and 10 through a 500 µm sieve.
24. Collect in a polyethylene bag.
25. Add 4.44 g to 6.67 g of granules from earlier step, and mix manually for 1 minute.
26. Add this mixture to the blender, and mix for 1 minute.
27. Compress the granules using a rotary tableting machine.
28. Compress 550 mg using round, biconvex punches at 9 to 16 kp.
29. Coat tablets using an HPMC coating (see Appendix).

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine mononitrate (powder), with excess	115.00
50.00	2	Pyridoxine hydrochloride	50.00
9.75	3	Anhydrous citric acid (powder)	9.75
20.10	4	Monohydrate lactose (powder, regular)	20.10
1.67	5	Saccharin sodium	1.67
0.24	6	Dye	0.24
0.009	7	Dye	0.009
0.02	8	Dye	0.02
2.00	9	Cornstarch	2.00
QS	10	Purified water	18.00 mL
50.00 µg	11	Vitamin B_{12}; use vitamin B_{12} oral powder cobalamin conc.	62.50
12.50	12	Monohydrate lactose (powder, regular)	12.50
1.50	13	Oil orange terpeneless	1.50
3.50	14	Magnesium stearate	3.50
1.50	15	Talc (powder)	1.50
17.70	16	Cornstarch, light coral red 6 LA	17.70

Manufacturing Directions

1. Pass thiamine mononitrate, pyridoxine HCl, citric acid, lactose (item 4), and saccharin sodium through a No. 30-mesh (595 µm or similar) screen.
2. Charge into mixer, and dry mix.
3. Dissolve the dyes in purified water.
4. Add the starch (item 9) to this dye solution with stirring.
5. Heat, and continue stirring until a thick paste is formed.
6. Cool to room temperature before using.
7. (*Note:* Use 7.5 g of colored starch paste for the vitamins B_1 and B_6 blend and 12.5 g of colored starch paste for the vitamin B_{12} blend.) Add 7.5 g of colored starch paste to powder blend, and mix until mass is formed.
8. Pass through a No. 6 mesh (3.36 mm or similar) screen, and air dry for 3 to 4 hours.
9. Screen vitamin B_{12} oral powder and lactose (item 12) through a No. 30 mesh (595 µm or similar) screen.
10. Charge into mixer, and dry mix.
11. Add 12.5 g colored starch paste to powder blend, and mix until mass is formed.
12. Pass through No. 6 mesh (3.36 mm or similar) screen, and air dry for 3 to 4 hours.
13. Dry granulations from the two steps separately at 49°C overnight or until LOD is less than 1%.
14. Mill the two dried granulations through a No. 16 mesh (1.2 mm or similar) screen (knives forward, medium speed), and combine.
15. Sift a small quantity of granulation from the previous steps over a No. 30 mesh (595 µm or similar) screen, and add the orange oil to the fines.
16. Add magnesium stearate, talc powder, and light coral red starch to mixture, and pass through a No. 30 mesh (595 µm or similar) screen.
17. Charge base granulation and lubricants into a blender, and blend thoroughly.
18. Compress using 11/32 in. concave punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine hydrochloride	100.00
10.00	2	Pyridoxine hydrochloride	10.00
0.10	3	Cyanocobalamin (gelatin-coated, 1%)	10.00
277.00	4	Ludipress®	277.00
3.00	5	Magnesium stearate	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress 394 mg in 12 mm biplanar punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine mononitrate	100.00
200.00	2	Pyridoxine hydrochloride	200.00
0.10	3	Cyanocobalamin (gelatin-coated, 1%)	10.00
250.00	4	Ludipress®	250.00
45.00	5	PEG-6000 (powder)	45.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 609 mg using 12 mm biplanar punches.

THIAMINE, PYRIDOXINE, AND CYANOCOBALAMIN TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
250.00	1	Thiamine mononitrate	250.00
250.00	2	Pyridoxine hydrochloride	250.00
75.00	3	Lactose monohydrate	75.00
25.00	4	Kollidon® 30	25.00
QS	5	Isopropanol	QS
1.00	6	Cyanocobalamin (gelatin-coated, 1%)	100.00
25.00	7	Kollidon® CL	25.00
2.00	8	Magnesium stearate	2.00
2.00	9	Talc	5.00

Manufacturing Directions

1. Granulate mixture items 1 to 3 with solution of items 4 and 5, dry, pass through a 0.8 mm sieve, mix with items 6 to 9, and press with low compressive force, applying a vibrating hopper.
2. Compress 730 mg using 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Thiamine hydrochloride or thiamine mononitrate	50.00
293.00	2	Ludipress®	293.00
5.00	3	Magnesium stearate	5.00
2.00	4	Aerosil® 200	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with medium compressive force.
2. Compress 357 mg, if hydrochloride salt is used, or 347 mg, if mononitrate salt is used, with 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Thiamine hydrochloride or thiamine mononitrate	50.00
150.00	2	Lactose monohydrate	150.00
150.00	3	Avicel™ PH101	150.00
15.00	4	Kollidon® CL	15.00
2.00	5	Aerosil® 200	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high compressive force.
2. Compress 344 mg, if hydrochloride salt is used, or 373 mg, if mononitrate salt is used, with 12 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine hydrochloride or thiamine mononitrate	110.00 (or 100.00)
190.00	2	Ludipress®	190.00
100.00	3	Lactose monohydrate	100.00
100.00	4	Avicel™ PH101	100.00
9.00	5	Kollidon® CL	9.00
3.00	6	Aerosil® 200	3.00
2.00	7	Magnesium stearate	2.00

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with medium compressive force.
2. Compress 302 mg, if hydrochloride salt is used, or 320 mg, if mononitrate salt is used, with 8 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Thiamine hydrochloride	100.00
200.00	2	Lactose monohydrate	200.00
10.00	3	Kollidon® 30	10.00
60.00	4	Isopropanol	60.00
10.00	5	Kollidon® CL	10.00
2.00	6	Magnesium stearate	2.00
1.00	7	Aerosil® 200	1.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, dry, sieve through a 0.8 mm screen, mix with items 5 to 7, and press to tablets.
2. Compress 330 mg using 8 mm biplanar punches.

THIAMINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Thiamine mononitrate	300.00
100.00	2	Dicalcium phosphate (Di-Tab)	100.00
15.00	3	Kollidon® 30	15.00
QS	4	Isopropanol	~50.00
10.00	5	Kollidon® CL	10.00
4.00	6	Magnesium stearate	4.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 3 and 4, dry, and sieve through a 0.8 mm screen.
2. Mix with items 5 and 6, and compress 430 mg into tablets using 12 mm biplanar punches.

TOLNAFTATE AND UNDECYLENATE FOOT CARE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
150.00	1	Glyceryl stearate and PEG-75 stearate	150.00
20.00	2	Hydrogenated palm/Palm kernel oil PEG-6 esters	20.00
60.00	3	Mineral oil	60.00
0.50	4	Sorbic acid	0.50
0.50	5	Sodium methylparaben	0.50
509.00	6	Deionized water	509.00
50.00	7	Undecylenic acid	50.00
200.00	8	Zinc undecylenate	200.00
10.00	9	Tolnaftate	10.00

Manufacturing Directions

1. Mix and heat items 1 to 7 to 75°C.
2. Allow to cool with gentle stirring.
3. At 30°C, add items 8 and 9.
4. Homogenize if necessary.

TOLNAFTATE FOOT CARE MICROEMULSION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
155.00	1	Ethoxydiglycol	155.00
130.00	2	Polyglyceryl-6-dioleate	130.00
450.00	3	PEG-8 caprylic/capric glycerides	450.00
10.00	4	Tolnaftate	10.00
100.00	5	Deionized water	100.00
50.00	6	Apricot kernel oil PEG-6 esters	50.00
100.00	7	Caprylic/Capric triglycerides	100.00
5.00	8	Chlorocresol	5.00

Manufacturing Directions

1. Mix items 1 to 3, and dissolve item 4 in this mixture.
2. Add items 5 to 8, and mix until uniform.

TOLU BALSAM COUGH SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
11.03	1	Tolu balsam tincture	11.03
2.50	2	Magnesium carbonate (powder)	2.50
15.00	3	Sucrose (granulated sugar)	15.00
QS	4	Purified water	90.00 mL
0.77	5	Methylparaben	0.77
0.086	6	Propylparaben	0.86
514.36	7	Sucrose (granulated sugar)	514.36
129.24	8	Glycerin (96%)	129.24
2.00	9	Dextromethorphan hydrobromide	2.00
1.00	10	Ephedrine HCl (powder)	1.00
8.00	11	Ammonium chloride	8.00
0.40	12	Chlorpheniramine maleate	0.40
1.00	13	Phenylephrine HCl	1.00
333.32	14	Glucose (liquid)	333.32
0.35	15	Flavor	0.35
0.15	16	Flavor	0.15
1.01	17	Ipecac (fluid extract)	1.01
8.57	18	Alcohol (ethanol, 190 proof)	8.57
0.037	19	Dye	0.037
QS	20	Hydrochloric acid (reagent-grade bottles)	QS
QS	21	Purified water	212.00 mL

Manufacturing Directions

1. Load tolu balsam tincture into mixing tank, and add magnesium carbonate.
2. Mix well to suspend.
3. Add sugar (item 3) with mixing.
4. Add 90 mL purified water (item 4), and mix thoroughly.

5. Allow to set for 1 hour.
6. Mix periodically while circulating through Shriver filter (or equivalent).
7. Solution must be brilliantly clear.
8. Filter, and save for next part.
9. Place 210.5 mL purified water (item 21) into suitable tank.
10. Add and dissolve parabens with heat (90–95°C) and mixing.
11. Add and dissolve sugar (item 7) with mixing; heat if necessary.
12. Add glycerin, continue agitation, and cool to room temperature.
13. To cooled syrup, add filtrate from previous step.
14. Add and dissolve the following ingredients with mixing: dextromethorphan hydrobromide, ephedrine HCl, ammonium chloride, chlorpheniramine maleate, and phenylephrine HCl.
15. Add glucose. Mix well.
16. Add and dissolve flavors and Ipecac fluid extract in 190 proof alcohol.
17. To the tank or in a separate container, add flavors and Ipecac extract to 10 mL of glucose liquid, and mix.
18. Add this mixture to the main mixture.
19. Rinse the container with a further 5 mL of liquid glucose, and add the rinsings to the mixture.
20. Add the remaining liquid glucose. Mix well.
21. Dissolve in 1.75 mL purified water, and add.
22. Check pH (range: 4–5).
23. Use hydrochloric acid to adjust pH to 4 to 5, with 4.5 being optimum (approximately 0.3 mL HCl per liter of syrup).
24. QS to 1 L with purified water.
25. Filter until sparkling clear.
26. Add a suitable filter aid, and mix until uniform.
27. Filter into tank for filling.

TRICLOSAN AND ZINC FOOT DEODORANT POWDER

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
3.00	1	Triclosan (Irgasan® DP300)	3.00
2.00	2	Zinc undecylenate, USP	2.00
0.20	3	Menthol (crystals), USP	0.20
926.80	4	Talc (powder), USP	926.80
30.00	5	Magnesium stearate	30.00
30.00	6	Cornstarch, NF	30.00
8.00	7	Perfume	8.00

Manufacturing Directions

1. Pass the following ingredients through a 250 µm screen or similar: Irgasan® DP300, zinc undecylenate, magnesium stearate, cornstarch, menthol, and approximately 10% of the total amount of talc.
2. Place materials from first step into a suitable mixer.
3. Mix until uniform.
4. Discharge powder from second step into another suitable mixer.
5. Add and disperse perfume.
6. Mix until uniform.
7. Pass mixture from previous step through a 250 µm screen or similar.
8. Place mixture from previous step into a V-mixer or similar, and add balance of talc powder.
9. Mix for 30 minutes or until homogeneous.

TRICLOSAN FOOT CARE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
50.00	1	Glyceryl stearate (Gelol)	50.00
50.00	2	Propylene glycol stearate	50.00
100.00	3	Octyldodecyl myristate	100.00
50.00	4	Isostearyl isostearate	50.00
20.00	5	Dimethicone (100 cS)	20.00
651.00	6	Deionized water	651.00
50.00	7	Sucrose distearate	50.00
4.00	8	Phenoxyethanol, methylparaben, ethylparaben, and propylparaben	4.00
20.00	9	Propylene glycol	20.00
3.00	10	Triclosan	3.00
2.00	11	Fragrance	2.00

Manufacturing Directions

1. Heat items 1 to 5 and items 6 to 7 separately to 75°C. Mix the two parts with turbine mixing for 1 minute.
2. Cool with gentle stirring.
3. Add items 9 and 10 and then item 11 with mixing at 30°C to 35°C.

TRIPROLIDINE AND PSEUDOEPHEDRINE HYDROCHLORIDE SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
0.25	1	Triprolidine HCl (4.8% excess)	0.26
6.00	2	Pseudoephedrine HCl (3.0% excess)	6.18
600.00	3	Sucrose	600.00
100.00	4	Glycerin (glycerol)	100.00
100.00	5	Sorbitol (70% solution)	100.00
15.00	6	Propylene glycol	15.00
1.00	7	Methylparaben	1.00
0.30	8	Propylparaben	0.30
0.50	9	Saccharin sodium	0.50
0.04	10	Quinoline yellow	0.04
0.05	11	Menthol	0.05
0.25	12	Raspberry flavor	0.25
1.15	13	Sodium citrate	1.15
QS	14	Purified water	QS to 1 L

Manufacturing Directions

1. Add 400 g of purified water to the manufacturing vessel and heat to 90°C to 95°C.
2. Add items 7 and 8 while mixing to dissolve at high speed.
3. Add item 3 while mixing at slow speed (temperature: 90–95°C).
4. Mix for 1 hour at high speed.
5. Cool down to 50°C while mixing at slow speed.
6. Add items 9 and 13 to the manufacturing vessel while mixing at high speed.
7. Load items 4 and 5 into the manufacturing vessel using a transfer pump while mixing at high speed.
8. Add 20 g of cold purified water (30°C) in a separate container, and dissolve items 1 and 2 by using stirrer.
9. Mix for 10 minutes, and add to the manufacturing vessel while mixing at high speed.
10. Add 1 g of purified water in a separate container, and manually dissolve item 10.
11. Add color to the manufacturing vessel while mixing at high speed.
12. Dissolve item 11 in item 12; then, add item 6.
13. Add this flavor mixture to the manufacturing vessel while mixing at high speed.
14. Bring the volume up to 1 L with item 14, and finally, mix for 15 to 20 minutes at high speed.
15. Check and record the pH (limit: 5.8–6.8 at 25°C).
16. If required, adjust pH with 20% citric acid or 20% sodium citrate solution.
17. Filter the syrup at 1.5 bar.
18. Recirculate approximately 20 to 30 mL syrup.

TRIPROLIDINE AND PSEUDOEPHEDRINE HYDROCHLORIDE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.60	1	Triprolidine HCl (4% excess)	2.70
60.00	2	Pseudoephedrine HCl (5% excess)	63.00
122.40	3	Lactose monohydrate	122.40
25.50	4	Maize starch	25.5.00
1.00	5	Povidone (PVP K-30)	1.00
4.00	6	Povidone (PVP K-30)	4.00
–	7	Alcohol (ethanol, 95%)	28.00
1.50	8	Magnesium stearate	1.50

Manufacturing Directions

1. Dissolve item 6 in item 7 using a stirrer.
2. Avoid loss of ethanol by evaporation.
3. Pass items 1 to 5 through a 630 µm sieve using sifter.
4. Collect in a stainless steel drum.
5. Load the sieved powders into a mixer.
6. Mix and chop for 5 minutes at low speed.
7. Add PVP solution to the mixer at medium rate while mixing.
8. Start the chopper at low speed when half of the solution is added.
9. Mix and chop at low speed until the satisfactory mass is obtained.
10. Spread the wet granules onto the trays.
11. Keep the trolleys in the open air for approximately 1 hour.
12. Load the trolleys into the oven, and start the air circulation at room temperature for 2 hours.
13. Dry the granules at 55°C with air circulation for 5 hours.
14. Scoop the granules after 2 hours of drying. Move the upper trays down and the lower trays up for uniform drying.
15. Check the moisture content (limit: NMT 1.5%).
16. Pass the dried granules through a 1 mm sieve using a granulator.
17. Collect in a stainless steel drum, and load into the blender.
18. Pass item 8 through a 250 µm sieve using a sifter.
19. Collect in a polyethylene bag.
20. Mix 2 g of granules with this mixture, and add to the blender.
21. Mix for 1 minute.
22. Unload the lubricated granules in a stainless steel drum.
23. Compress 220 mg in 8.5 mm round, concave punches.

TROLAMINE SALICYLATE CREAM

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/kg (g)
50.00	1	Glyceryl stearate	5.00
25.00	2	Cetyl alcohol	2.50
30.00	3	Cetyl phosphate and DEA cetyl phosphate	3.00
40.00	4	Stearyl stearoyl stearate	4.00
40.00	5	Cococaprylate/Caprate	4.00
40.00	6	Cetyl palmitate	4.00
5.00	7	Dimethicone	0.50
502.00	8	Deionized water	50.20
10.00	9	Propylene glycol, diazolidinyl urea, methylparaben, and propylparaben	1.00
5.50	10	Magnesium aluminum silicate	0.55
2.50	11	Xanthan gum	0.25
100.00	12	Deionized water	10.00
100.00	13	Trolamine salicylate (TEA salicylate)	10.00
50.00	14	Propylene glycol	5.00

Manufacturing Directions

1. Heat items 8 and 9 to 85°C, and add items 10 and 11.
2. Mix until well dispersed.
3. Add items 1 to 7, and mix well at 80°C to 85°C.
4. Continue mixing. While cooling to 65°C, add items 12 to 14, and continue mixing and cooling to 35°C.
5. The pH should be 5.5 to 5.6.

ULTRASONIC ADHESIVE GEL

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
5.00	1	Preservative (e.g., parabens)	5.00
754.00	2	Water	754.00
6.00	3	Carbopol 940 (Goodrich)	6.00
20.00	4	Sodium hydroxide solution 10%	20.00
15.00	5	Kollidon® 30	15.00
200.00	6	Water	200.00

Manufacturing Directions

1. Prepare solution of item 1 in item 2 by heating to 70°C, and add item 3 slowly to obtain a homogeneous suspension.
2. Add items 4 to 6.
3. A clear, colorless adhesive gel is obtained.
4. Addition of sodium chloride changes consistency.

UREA PEROXIDE EAR DROPS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
65.00	1	Urea peroxide (40% excess)	91.00
15.00	2	Sodium citrate (dihydrate, powder)	15.00
5.00	3	Polysorbate 20 (Tween 20)	5.00
2.50	4	Tartaric acid (12663)	2.50
QS	5	Anhydrous glycerin	QS
QS	6	Nitrogen	QS

Manufacturing Directions

1. Add 500 mL of glycerin into a suitable tank.
2. Start mixing at slow speed, and heat the contents to 70°C to 75°C.
3. Flood tank with nitrogen, increase mixing speed, and slowly add sodium citrate.
4. Add tartaric acid.
5. Mix for at least 30 minutes or until dissolved.
6. Maintain the temperature at 70°C to 75°C.
7. When sodium citrate is completely dissolved, cool to 25°C to 30°C with constant mixing.
8. Prepare urea peroxide by breaking up lumps and screening to remove large particles.
9. Wear gloves.
10. Add an additional 250 to 300 mL of glycerin into tank.
11. Add urea peroxide slowly to prevent lumping while mixing constantly.
12. Mix at high speed after addition.
13. Add Polysorbate 20 with constant mixing, and QS to final volume with glycerin.
14. Mix for at least 30 minutes and until solution is clear.
15. Pass solution through an approximately No. 100 mesh (150 μm or similar) screen, and collect in clean, dry carboys. (The filter support screen in a Millipore holder may be used for filtering. The solution is too viscous to flow through a membrane or any cellulosic filter.)

VALERIANA AND PASSIFLORA EXTRACT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
44.00	1	Valeriana extract, powder	44.00
33.00	2	Passiflora extract, powder (with excess)	36.00
120.00	3	Avicel™ PH101	120.00
11.00	4	Kollidon® CL	11.00
3.60	5	Aerosil® 200	3.60
7.30	6	Magnesium stearate	7.30

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress 231 mg using 9 mm biconvex punches.

VITAMIN A AND VITAMIN D INFANT DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
1500 IU	1	Vitamin A palmitate (1.7 MM IU/g) (50% excess)	1.323
400 IU	2	Vitamin D (40 MM IU/g) (Cholecalciferol) (25% excess)	0.012
10.00	3	Polysorbate 80 (Tween 80)	10.00
0.88	4	Vitamin E (oily; alpha-tocopheryl acetate)	0.88
0.50	5	Edetate disodium (sodium EDTA)	0.50
1.00	6	Ascorbic acid	1.00
0.10	7	Saccharin sodium	0.10
600.00	8	Glycerin (glycerol)	600.00
100.00	9	Sorbitol (70% solution)	100.00
50.00	10	Propylene glycol	50.00
1.00	11	Flavor	1.00
1.50	12	Flavor	1.50
QS	13	Dye	QS
QS	14	Dye	QS
–	15	Purified water	QS to 1 L

Manufacturing Directions

1. This product is a microemulsion and thermolabile preparation. The temperature of solution must not exceed 25°C at the time of processing. Store bulk at a temperature of 15°C to 20°C under nitrogen protection. Period of storage should not exceed 48 hours prior to filling in the bottle.
2. Collect 200 g of purified water in a melting vessel.
3. Heat to 90°C to 95°C for 10 minutes, and then cool to 20°C to 25°C.
4. Bubble nitrogen gas into purified water for 20 minutes.
5. Load 100 g of purified water into the manufacturing vessel.
6. Bubble nitrogen gas during all stages of the processing.
7. Add items 5, 6, and 7 one by one to the manufacturing vessel while mixing.
8. Check that all materials are dissolved completely.
9. Add items 8 and 9 and 20 g of item 10 one by one to the manufacturing vessel while mixing at slow speed.
10. Mix for 5 minutes.
11. Avoid aeration.
12. Add item 3 in a stainless steel container.
13. Mix items 1, 2, and 4 one by one using a stirrer.
14. Mix for 1 hour at slow speed.
15. Avoid aeration.
16. Add the oil phase to the aqueous phase in the manufacturing vessel at a rate of 4 mL/min while mixing. Keep on bubbling nitrogen gas throughout the process.
17. Dissolve items 11 and 12 in 30 g of item 10 in a stainless steel container by slow stirring.
18. Add to manufacturing vessel while mixing.
19. Dissolve items 14 and 13 in 40 g of purified water (25–30°C) in a stainless steel container with slow stirring.
20. Add to manufacturing vessel while mixing.
21. Adjust the volume to 1 L with cooled purified water.
22. Check and record the volume and pH (limit: 2.5–4.8).
23. Filter the solution through a prefilter and 0.2 µm membrane filter into the receiving tank.
24. Bubble with nitrogen gas for 15 minutes.
25. Store the solution with a nitrogen blanket.

VITAMIN A AND VITAMIN D_3 DROPS

Bill of Materials

Scale (mg/g)	Item	Material Name	Quantity/L (g)
30,000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	1.90
3000 IU	2	Vitamin D_3 (40 MM IU/g)	7.50 mg
12.00	3	Cremophor (RH, 40%)	12.00
0.30	4	BHT	0.30
10.00	5	Lutrol E 400	10.00
0.80	6	Paraben	0.80
0.20	7	Sorbic acid	0.20
QS	8	Water	QS to 1 L

Manufacturing Directions

1. Heat mixture of items 1 to 5 and solution of items 6 to 8 to approximately 65°C, and add this slowly to the well-stirred mixture of items 1 to 5.
2. Clear or slightly opalescent yellow liquid is obtained.

VITAMIN A AND VITAMIN D_3 ORAL SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (mg)
1000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	60.00
100 IU	2	Vitamin D_3 (40 MM IU/g)	0.30
0.002	3	BHT	0.20
3.00	4	Cremophor EL or Cremophor (RH, 40%)	3.00 g
QS	5	Preservative	QS
QS	6	Flavor	QS
QS	7	Water	QS to 1 L

Manufacturing Directions

1. Heat mixture of items 1 to 4 to approximately 65°C, stir well, and slowly add the hot solution of item 5 (65°C).
2. Cool to room temperature, and add item 6 to obtain a clear, yellow liquid.

VITAMIN A AND VITAMIN D_3 SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
30,000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	19.00
10,000 IU	2	Vitamin D_3 (40 MM IU/g)	0.25
70.00 mg	3	Cremophor (RH, 40%)	7.00
QS	4	Sugar syrup (50%)	QS to 1 L

Manufacturing Directions

1. Heat mixture of items 1 to 3 to approximately 45°C, stir well, and slowly add item 4 to obtain a clear, yellow liquid (pH 6.2).

VITAMIN A AND VITAMIN E DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
5000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	3.33
50.00	2	Vitamin E acetate, with excess	60.00
150.00	3	Cremophor (RH, 40%)	150.00
150.00	4	Ethanol (96%)	150.00
QS	5	Water	QS to 1 L

Manufacturing Directions

1. Heat mixture of items 1 to 3 to approximately 65°C, stir well, and slowly add the mixture of items 4 and 5.
2. Color is yellow. Clarity is clear (turbidity units, 25 FTU).
3. It must be determined whether or not the ethanol concentration has a sufficient preservative efficiency.
4. The addition of BHT as an antioxidant is recommended.

VITAMIN A AND VITAMIN E DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L
25,000 IU	1	Vitamin A palmitate (1.7 MIU/g)	1.50
50.00	2	Vitamin E acetate	5.00
210.00	3	Cremophor (RH, 40%)[a]	21.00
QS	4	Preservative	QS
QS	5	Water	71.50

[a] The quantity is reduced by 1 g if 1 g of D,L-alpha-tocopherol is also added in the formulation.

Manufacturing Directions

1. Mix the vitamins with Cremophor (and D,L-alpha-tocopherol, if used) at 60°C.
2. Add solution of preservatives (at 37°C) slowly, with stirring, to produce clear, yellow, viscous liquids.

VITAMIN A AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
33,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	69.00
70.00	2	Vitamin E acetate (dry powder)	70.00
146.00	3	Mannitol (granulated) with 10% of Kollidon® 30	146.00
17.00	4	Kollidon® CL	17.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with high compressive force.
2. Compress 300 mg in 12 mm biplanar punches.

VITAMIN A CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100,000 IU	1	Vitamin A acetate (dry powder, 325,000 IU/g)	350.00
350.00	2	Mannitol	350.00
25.00	3	Kollidon® VA 64	25.00
5.00	4	Magnesium stearate	5.00
3.00	5	Aerosil® 200	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with medium compressive force.
2. Compress 750 mg in 12 mm biplanar punches.

VITAMIN A CONCENTRATE (WATER-MISCIBLE)

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
100,000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	6.50
0.200	2	BHT	0.20
21.00	3	Cremophor (RH, 40%)	21.00
QS	4	Preservative	QS
QS	5	Water	QS to 1 L

Manufacturing Directions

1. Heat the mixture of items 1 to 3 to approximately 65°C. Stir well.
2. Add slowly the warm solution of items 4 and 5 (65°C) to obtain a clear, yellow liquid that is miscible with water.

VITAMIN A DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/1000 Tablets (g)
50,000 IU	1	Vitamin A palmitate (1.7 Mio IU/g)	3.00
110.00	2	Cremophor (RH, 40%)	11.00
1.00	3	BHT	0.10
QS	4	Water	85.90

Manufacturing Directions

1. Heat the mixture of items 1 to 3 to approximately 65°C. Stir well.
2. Slowly add the hot water (65°C) to obtain a clear or slightly opalescent yellow solution of low viscosity.
3. Lutrol E 400 can be added at a level of 5% (compensated for by item 4).

VITAMIN A SUPPOSITORIES

Bill of Materials

Scale (mg/suppository)	Item	Material Name	Qty/1000 Suppositories (g)
150,000 IU	1	Vitamin A palmitate (1.7 MM IU/g)	88.23
1.00	2	BHT	10.00
400.00	3	Cremophor (RH, 40%)	400.00
800.00	4	Lutrol E 1500	800.00
500.00	5	Lutrol E 4000	505000

Manufacturing Directions

1. Dissolve BHT in warm vitamin A.
2. Add Cremophor, and mix with the molten Lutrol E grades.
3. Fill into molds of suppositories to obtain a weight of 2 g.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
100.00	2	Avicel™ PH102	100.00
10.00	3	Kollidon® VA 64	10.00
5.00	4	Kollidon® CL	5.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with low compressive force.
2. Compress 231 mg using 9 mm biconvex punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
189.00	2	Ludipress®	189.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 306 mg in 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50,000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	120.00
120.00	2	Ludipress®	120.00
10.00	3	Avicel™ PH101	10.00
1.00	4	Magnesium stearate	1.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 277 mg in 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50,000	1	Vitamin A acetate (dry powder, 500,000 IU/g)	110.00
154.00	2	Avicel™ PH101	154.00
10.00	3	Kollidon® VA 64	10.00
4.00	4	Kollidon® CL	4.00
1.00	5	Aerosil® 200	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press with low compressive force.
2. Compress 250 mg in 8 mm punches.

VITAMIN A TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	55.00
572.00	2	Dicalcium phosphate (granulated) (Di-Tab) with 3% of Kollidon® 30	572.00
28.00	3	Polyethylene glycol, powder	28.00
19.40	4	Kollidon® CL	19.40
5.60	5	Aerosil® 200	5.60

Manufacturing Directions

1. Granulate the dicalcium phosphate with Kollidon® 30, dissolved in isopropanol or water, and pass through a 0.5 to 12 mm screen sieve using a vibrating hopper.
2. Mix the obtained dried granules with the other components, sieve, and press with high compressive force.
3. Compress 680 mg in biplanar punches.

VITAMIN A, VITAMIN B_6, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
40,000 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	80.00
40.00	2	Pyridoxine hydrochloride	40.00
35.00	3	Vitamin E acetate (dry powder, SD 50)	75.00
395.00	4	Ludipress®	395.00
4.00	5	Magnesium stearate	4.00
5.00	6	Aerosil® 200	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compressive force.
2. Compress 583 mg in 12 mm biplanar punches.

VITAMIN A, VITAMIN C, AND VITAMIN D_3 CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2000/200 IU	1	Vitamin A and vitamin D_3 (dry powder, 500,000 and 50,000 IU/g, respectively)	4.00
30.00	2	Ascorbic acid (powder),with excess	33.00
300.00	3	Sucrose (crystalline)	300.00
300.00	4	Sorbitol (crystalline)	300.00
300.00	5	Mannitol	300.00
300.00	6	Ludipress®	300.00
5.00	7	Stearic acid	5.00
0.10	8	Saccharin sodium	0.10
30.00	9	Cyclamate sodium	30.00
30.00	10	Flavor mixture (Firmenich)	30.00
20.00	11	PEG-6000, powder	20.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compressive force.
2. Compress 1290 mg in 16 mm biplanar punches.

VITAMIN A, VITAMIN C, AND VITAMIN E TABLETS (1200 IU, 60 MG, 30 MG)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1200 IU	1	Vitamin A acetate (dry powder, 500,000 IU/g)	2.40
60.00	2	Ascorbic acid (powder)	60.00
30.00	3	Vitamin E acetate (dry powder, 50%)	60.00
105.00	4	Lactose monohydrate	105.00
30.00	5	Avicel™ PH101	30.00
20.00	6	Kollidon® 25	20.00
5.00	7	Talc	5.00
1.00	8	Aerosil® 200	1.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 285 mg in 8 mm biplanar punches.

VITAMIN B COMPLEX, AMINO ACIDS, AND MAGNESIUM EFFERVESCENT GRANULES (SUGAR-FREE)

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.00	1	Thiamine hydrochloride	2.00
2.00	2	Pyridoxine hydrochloride	2.00
5.00	3	Cyanocobalamin (dry powder, 0.1%)	5.00
20.00	4	L-Glutamine	20.00
10.00	5	Inositol	10.00
10.00	6	Potassium L-aspartate	10.00
500.00	7	D,L-Carnitine hydrochloride	500.00
350.00	8	Magnesium L-aspartate	350.00
600.00	9	Anhydrous citric acid	600.00
500.00	10	Sodium bicarbonate	500.00
QS	11	Flavors	QS
50.00	12	Kollidon® VA 64	50.00
80.00	13	Isopropanol	80.00

Manufacturing Directions

1. Mix items 1 to 6, add the mixture of items 7 to 12, granulate the mixture of these two combinations with item 13, pass through a 0.8 mm sieve, dry well, and mix.
2. Fill 2.1 g of the granules into sachets.

VITAMIN B COMPLEX + AMINO ACID + MAGNESIUM EFFERVESCENT GRANULES (SUGAR-FREE, 1 RDA OF VITAMINS + 500 MG CARNITINE + 20 MG GLUTAMINE)

Formulation

I. Thiamine hydrochloride, 2 g; pyridoxine hydrochloride, 2 g; cyanocobalamin dry powder 0.1%, 5 g; L-glutamine, 20 g; inositol, 10 g; potassium L-aspartate, 10 g.
II. DL-Carnitine hydrochloride, 500 g; magnesium L-aspartate, 350 g; citric acid, anhydrous, 600 g; sodium bicarbonate, 500 g; flavors, QS; Kollidon® VA 64, 50 g.
III. Isopropanol, 80 g.

Manufacturing Directions

1. Mix the components I, add the mixture II, granulate mixture I + II with the liquid III, pass through a 0.8 mm sieve, dry well, and mix with III.
2. Fill 2.1 g of the granules in sachets.

VITAMIN B COMPLEX AND CARNITINE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
95.00	1	Thiamine mononitrate	95.00
20.00	2	Riboflavin	20.00
100.00	3	Nicotinamide	100.00
50.00	4	Calcium D-pantothenate	50.00
2.00	5	Folic acid	2.00
0.20	6	Biotin	0.20
0.5	7	Cyanocobalamin (gelatin coated, 1%)	0.50
50.00	8	Carnitine hydrochloride	50.00
100.00	9	Inositol	100.00
2.00	10	Adenosine phosphate	2.00
15.70	11	Kollidon® 30	15.70
70.00	12	Isopropanol	70.00
26.00	13	Kollidon® CL	26.00
122.00	14	Lactose monohydrate	122.00
14.00	15	PEG-6000, powder	14.00

Manufacturing Directions

1. Granulate mixture of items 1 to 10 with solution of items 11 and 12.
2. Dry, pass through a 0.8 mm sieve, mix with items 13 and 15, and press with low compressive force.
3. Compress 708 mg using 13 mm biplanar punches.

VITAMIN B COMPLEX AND FOLIC ACID DRAGÉES

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
4.35	1	Calcium D-pantothenate (granulate, 67%)	6.50
2.60	2	Thiamine mononitrate (10.4%)	25.00
20.00	3	Magnesium oxide (light)	20.00
45.75	4	D-Mannitol (powder)	45.75
100.00	5	DL-Methionine	100.00
2.30	6	Riboflavin	2.30
6.30	7	Nicotinamide	6.30
2.40	8	Pyridoxine HCl	2.40
4.00	9	Magnesium stearate	4.00
0.1150	10	D-Biotin	0.1150
0.46	11	Folic acid	0.46
100.00	12	Choline tartrate	100.00
28.00	13	Silicic acid (precipitated)	28.00
0.87 µg	14	Vitamin B_{12} (as 0.1% water soluble form)	0.871
3.15	15	Vitamin E (50%)	6.30
30.00	16	Sodium carboxymethyl starch	30.00
116.66	17	Isopropyl alcohol	116.66
22.00	18	Povidone (PVK K-90) (Luviskol®)	22.00

Manufacturing Directions

1. Incorporate in mixer PVP K-90 and isopropyl alcohol, and make a solution with continuous stirring.
2. Place in mixer choline tartrate, DL-methionine, D-mannitol powder, magnesium oxide (previously sieved), silicic acid, and sodium carboxymethyl starch, and mix for 15 minutes.
3. Add the solution of isopropyl alcohol and alcohol in first step for 10 minutes until moist mass is obtained.
4. Granulate the moist mass through a centrifugal granulator with a 10 mm screen.
5. Spread the granules on paper-lined trays, and dry overnight in a drying oven at 50°C.
6. Crush the granules through a 1.5 mm sieve.
7. Vitamin granulate: Tumble D-biotin, vitamin B_{12}, folic acid, riboflavin, and pyridoxine hydrochloride in mixer for 5 minutes.
8. Combine in the mixer the nicotinamide, vitamin E, thiamine mononitrate/gelatin/mannitol granulate, D-mannitol powder, and sodium carboxymethyl starch; then, add the vitamin mixture, and mix for 10 minutes.
9. Pass through a 1 mm sieve if lumpy.
10. In a mixer, make a separate solution of PVP K-90 and isopropyl alcohol.

11. Place in the mixer the solution of isopropyl alcohol and PVP; then, knead until an evenly moist homogeneous mass is obtained.
12. Add calcium D-pantothenate granules, and mix for 3 to 5 minutes.
13. Pass the granules through a centrifugal granulator with a 10 mm screen, and spread on paper-lined trays.
14. Keep overnight in a drying oven at 50°C. The RH of the granules should be 10% to 20%.
15. Crush the dried granules through an oscillator with a 1.5 mm sieve.
16. Put the granulate mixture in the mixing drum—the choline tartrate and the two lots of vitamin granules.
17. Mix, and then add the magnesium stearate.
18. Check to be sure that the RH of the mixture is 10% to 20%.
19. Compress and apply a sealer coat (lacquer), sugar coat, and finishing coating.

VITAMIN B COMPLEX AND IRON SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
910.00	1	Sorbitol solution	910.00
0.019	2	Propylparaben	0.019
0.17	3	Methylparaben	0.17
1.50	4	Niacinamide (white powder)	1.50
0.30	5	Riboflavin	0.30
103.60	6	Propylene glycol	103.60
126.40	7	Glycerin	126.40
26.13	8	Iron sulfate (granular)	26.132
0.037	9	Dye	37.50 mg
0.25	10	Pyridoxine hydrochloride	0.25
1.20	11	Saccharin sodium (dihydrate powder)	1.20
22.00	12	Sodium cyclamate (powder)	22.00
30.00	13	Ascorbic acid (white powder)	30.00
0.80	14	Sodium bicarbonate (powder)	0.80
0.36	15	Thiamine hydrochloride (powder, regular)	0.36
0.625	16	D-Pantothenyl alcohol (dexpanthenol)	0.62
0.002	17	Vitamin B_{12} (cyanocobalamin)	2.00 mg
0.007	18	Flavor	0.70 mL
QS	19	Deionized purified water	QS to 1 L
QS	20	HyFlo filter aid	QS
QS	21	Hydrochloric acid	QS
QS	22	Sodium hydroxide	QS

Manufacturing Directions

1. Manufacture under complete carbon dioxide (CO_2) protection.
2. Load 780 g (portion of item 1) of sorbitol solution into a jacketed stainless steel tank. The remaining sorbitol will be used later.
3. Add parabens (unless added previously), niacinamide, and riboflavin to the sorbitol or glucose solution.
4. Heat solution to 85°C to 90°C, and mix until the ingredients are dissolved.
5. Remove heat.
6. While mixing, cool the main solution to 50°C to 60°C.
7. Hold at this temperature while bubbling CO_2 into it.
8. CO_2 protection must be continued for the remainder of the manufacturing procedure.
9. Heat 50 mL of purified water to boiling, and bubble CO_2 into it while cooling to 55°C.
10. Add and dissolve, with mixing, iron sulfate with 30 mL of purified water at 55°C.
11. Use CO_2 protection.
12. Warm the solution to 50°C to 55°C while mixing to dissolve; then, slowly add the solution, with good mixing, to the previous solution.
13. This addition should be made as soon as possible to prevent oxidation.
14. Add the pyridoxine, saccharin sodium, and sodium cyclamate, and mix until dissolved.
15. Cool the solution to 30°C.
16. Add the ascorbic acid, with good stirring, to 78 g of reserved sorbitol; make a slurry.
17. Use a container that has plenty of headspace.
18. Then, add the sodium bicarbonate slowly in small portions to the ascorbic acid slurry, with stirring, until all of the powder has been added and most of the foaming has stopped.
19. Add this slurry slowly to the solution from the previous step with vigorous mixing until a uniform solution results.
20. Rinse the mixing container with 22 g of the reserved sorbitol, and add to the product with stirring.
21. Add and dissolve thiamine hydrochloride with mixing.
22. If necessary, warm the D-pantothenyl alcohol until liquefied, and add it to the 0.5 mL CO_2-saturated purified water.
23. Use an additional 0.5 mL of CO_2-saturated purified water to thoroughly rinse the container of D-pantothenyl alcohol, and add this to the D-pantothenyl alcohol solution.
24. Mix the D-pantothenyl alcohol solution thoroughly until it is homogeneously dispersed.
25. Add the D-pantothenyl alcohol solution to the main solution with mixing.
26. Use an additional 0.5 mL of CO_2-saturated purified water to rinse out the container in which the D-pantothenyl alcohol solution is made, and add to the product with mixing.

27. Dissolve the vitamin B_{12} in 0.5 mL of purified water to make a clear solution, and add this to the product with good mixing.
28. Dissolve the guarana flavor in the 10 g of propylene glycol reserved from earlier step with good stirring.
29. Add this solution to the product with good mixing.
30. Check pH (range: 3.00–3.30).
31. Adjust, if necessary, with a solution of 10% sodium hydroxide or 10% hydrochloric acid depending on the test results.
32. Adjust the volume of the product with the remaining 30 g of the sorbitol solution and if necessary, purified water to 1 L.
33. Mix for 1 hour.
34. Allow to stand overnight to eliminate entrapped CO_2 gas.
35. Readjust volume to 1 L with purified water.
36. Mix for 1 hour.
37. Filter by adding HyFlo filter aid and mixing it, followed by passing through a filter press.
38. Do not allow temperature to exceed 30°C.
39. Bubble CO_2 gas into clear filtrate for 5 minutes; then seal tank, and hold product under CO_2 protection.

VITAMIN B COMPLEX AND VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
33.00	1	Thiamine mononitrate	33.00
4.00	2	Riboflavin	4.00
10.00	3	Pyridoxine hydrochloride	10.00
66.00	4	Nicotinamide	66.00
17.00	5	Calcium D-pantothenate	17.00
350.00	6	Tartaric acid (powder)	350.00
450.00	7	Sodium bicarbonate	450.00
750.00	8	Sucrose, crystalline	750.00
30.00	9	Kollidon® 30	30.00
QS	10	Isopropanol	QS
500.00	11	Ascorbic acid (crystalline)	500.00
3.00	12	Riboflavin	3.00
10.00	13	Cyanocobalamin (gelatin-coated, 0.1%)	10.00
10.00	14	Orange flavor	10.00
2.00	15	Saccharin sodium	2.00
5.00	16	Cyclamate sodium	5.00
50.00	17	PEG-6000 (powder)	50.00

Manufacturing Directions

1. Granulate mixture of items 1 to 9 with solvent item 10, dry, pass through a 0.8 mm sieve, mix with items 13 to 17, and press with high compressive force at a maximum relative atmospheric humidity of 30%.
2. Compress 2315 mg in 20 mm biplanar punches.

VITAMIN B COMPLEX AND VITAMIN C INSTANT GRANULES

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
3.60	1	Thiamine hydrochloride	3.60
5.70	2	Riboflavin phosphate sodium	5.70
45.00	3	Nicotinamide	45.00
4.50	4	Pyridoxine hydrochloride	4.50
15.0	5	Cyanocobalamin (gelatin-coated, 0.1%)	15.00
150.0	6	Ascorbic acid (powder)	150.00
723.00	7	Sucrose	723.00
51.00	8	Kollidon® 30	51.00
QS	9	Ethanol	180 mL

Manufacturing Directions

1. Mix items 1 to 7, granulate with solution of items 8 and 9, dry, and pass through a 0.8 mm sieve.
2. Fill 1 g of the granules in sachets (or 10 g in 100 mL flakes as dry syrup) to produce yellow, homogeneous granules dispersible in cold water.
3. Approximately 1 g of the granules (= 1 sachet) corresponds to two daily vitamin B and vitamin C requirements of adults.
4. Because of the high loss of riboflavin phosphate sodium, it should be substituted by riboflavin.

VITAMIN B COMPLEX AND VITAMIN C SYRUP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.60	1	Thiamine hydrochloride	0.60
0.55	2	Riboflavin phosphate sodium	0.55
2.50	3	Nicotinamide	2.50
1.20	4	Dexpanthenol	1.20
0.55	5	Pyridoxine hydrochloride	0.55
9.00	6	Ascorbic acid (crystalline)	9.00
0.25	7	Orange flavor	0.25
0.05	8	EDTA sodium	0.05
0.50	9	Propyl gallate	0.50
2.00	10	Sorbic acid	2.00
5.00	11	Kollidon® 25	5.00
10.00	12	Sorbitol (crystalline)	10.00
9.00	13	Glycerol	9.00
10.00	14	1,2-Propylene glycol (pharma)	10.00
5.00	15	Water	5.00
QS	16	Sugar syrup (64% sucrose in water)	QS to 1 kg

Manufacturing Directions

1. Mix solution of items 1 to 5 with sugar syrup, adjust the clear solution to approximately pH 4.2, and use nitrogen as an inert gas in the final packaging; 10 g provides 2 to 3 RDA.

VITAMIN B COMPLEX AND VITAMIN C SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
0.15	1	Thiamine hydrochloride	0.15
0.15	2	Riboflavin phosphate sodium	0.15
0.70	3	Nicotinamide	0.70
0.035	4	Dexpanthenol	0.035
0.15	5	Pyridoxine hydrochloride	0.15
2.25	6	Ascorbic acid (crystalline)	2.25
0.28	7	Orange aroma	0.28
0.56	8	EDTA sodium	0.56
186.50	9	Propylene glycol (pharma) + water (2:1)	186.50
0.15	10	Paraben	0.15
84.30	11	Sorbitol (crystalline)	84.30
562.50	12	Sucrose (crystalline)	562.50
42.00	13	Water	42.00

Manufacturing Directions

1. Dissolve items 1 to 8 in item 2.
2. Prepare a solution of items 10 to 13 by heating.
3. Cool, and mix with solution of the balance of the formulation.
4. Adjust to a pH of 4.2 to 4.5.
5. Adjust volume with water. Use more if necessary.
6. Use nitrogen as an inert gas during packaging.

VITAMIN B COMPLEX AND VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
5.00	1	Thiamine mononitrate	5.00
5.00	2	Riboflavin	5.00
5.00	3	Pyridoxine hydrochloride	5.00
0.50	4	Folic acid	0.50
30.00	5	Niacin	30.00
0.10	6	Biotin	0.10
10.00	7	Calcium D-pantothenate	10.00
150.00	8	Ascorbic acid (crystalline/powder)	150.00
172.40	9	Ludipress®	172.40
20.00	10	Kollidon® VA 64	20.00
2.00	11	Magnesium stearate	2.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and mix.
2. Use medium to low compressive force to compress 400 mg in 10 mm biplanar punches.

VITAMIN B COMPLEX AND VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Thiamine hydrochloride	15.00
2.00	2	Riboflavin	2.00
5.00	3	Pyridoxine hydrochloride	5.00
25.00	4	Choline bitartrate	25.00
10.00	5	Nicotinamide	10.00
100.00	6	Ascorbic acid (crystalline/powder)	100.00
220.00	7	Ludipress®	220.00
8.00	8	Stearic acid	8.00

Manufacturing Directions

1. Mix all ingredients, pass through a 0.8 mm sieve, and mix.
2. Use medium to low compressive force to compress 411 mg in 12 mm biplanar punches.
3. The thiamine mononitrate formulation is more stable compared with the thiamine hydrochloride formulation.

VITAMIN B COMPLEX, CHOLINE, AND BILE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
60.00	1	Acid dehydrochloric (powder)	60.00
100.00	2	Choline dihydrogen citrate	100.00
20.00	3	Niacinamide (white powder)	20.00
100.00	4	Inositol	100.00
2.50	5	Riboflavin (2% excess)	2.55
0.50	6	Pyridoxine hydrochloride	0.50
30.00	7	Povidone (K value, 29–32)	30.00
100.00	8	Racemethionine (crystals)	100.00
60.00	9	Ox bile extract (powder, No. 30 mesh) (Bilein)	60.00
–	10	Alcohol dehydrated (200 proof)	26.00
3.00 µg	11	Cyanocobalamin (oral powder in gelatin, 1000 µg/g)	3.30
3.00	12	Thiamine hydrochloride (powder, regular), with excess	3.60
8.40	13	Magnesium stearate (impalpable powder)	8.40
8.40	14	Stearic acid (fine powder)	8.40

Manufacturing Directions

1. Mill dehydrochloric acid, choline dihydrogen citrate, nicotinamide, inositol, and methionine through a 600 µm screen.
2. Combine milled mixture from first step with riboflavin, pyridoxine hydrochloride, povidone, and ox bile extract in mass mixer.
3. Add alcohol QS (approximately 26 g or 32.7 mL) slowly to the mass.
4. Mass for approximately 45 minutes in mixer.
5. Scrape all material from the mass mixer as much as possible.
6. Rinse mass mixer between runs.
7. Granulate through a comminuting or similar mill or a 4.76 mm screen.
8. Dry at 49°C to less than 1% LOD.
9. Sift through an 840 µm screen in a shaker, and grind coarsely through a comminuting mill (knives forward, medium speed).
10. Pass one-half of the base granulation through a 1.68 mm screen into a blender if necessary.
11. Mix cyanocobalamin oral powder with an equal volume of base granulation, and charge into a blender through a 1.68 mm screen.
12. Blend thiamine hydrochloride, magnesium stearate, and stearic acid.
13. Then, hand-screen mixture through a 600 µm screen.
14. Load into a blender through a 1.68 mm screen with the remainder of the base granulation, and blend for 20 minutes.
15. Compress and coat tablets using an appropriate formulation to render required color and sealing of tablet.

VITAMIN B COMPLEX SYRUP

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
0.60	1	Thiamine hydrochloride	0.60
0.55	2	Riboflavin 5-phosphate sodium	0.55
2.50	3	Nicotinamide	2.50
1.20	4	Dexpanthenol	1.20
0.55	5	Pyridoxine hydrochloride	0.55
2.00	6	Sorbic acid	2.00
0.05	7	EDTA sodium	0.05
2.25	8	Vanillin	2.25
465.00	9	Sucrose	465.00
25.00	10	Kollidon® 25	25.00
90.00	11	Glycerol	90.00
100.00	12	Propylene glycol (pharma)	100.00
310.00	13	Water	310.00

Manufacturing Directions

1. Dissolve the sucrose in the hot mixture of glycerol, propylene glycol, and water.
2. Cool to room temperature, and dissolve the other components to obtain a clear solution.

VITAMIN B COMPLEX SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
0.66	1	Dexpanthenol	0.66
4.40	2	Nicotinamide	4.40
0.22	3	Pyridoxine hydrochloride	0.22
0.60	4	Riboflavin-5-phosphate sodium	0.60
1.50	5	Thiamine hydrochloride	1.50
350.00	6	Sorbitol (70% solution)	350.00
11.20	7	Propylene glycol	11.20
0.84	8	Methylparaben	0.84
0.168	9	Propylparaben	0.168
550.00	10	Maltitol solution (Lycasin 80/55)	550.00
0.15	11	Edetate disodium (sodium EDTA)	0.15
3.72	12	Citric acid (monohydrate)	3.72
3.72	13	Sodium citrate	3.72
2.50	14	Sodium benzoate	2.50
0.50	15	Saccharin sodium	0.50
150.00	16	Glycerin (glycerol)	150.00
1.50	17	Flavor	1.50
1.00	18	Flavor	1.00
–	19	Purified water	QS to 1 L

Manufacturing Directions

1. Load items 6, 10, and 16 in a manufacturing vessel, and mix for 5 minutes.
2. Dissolve items 8 and 9 in item 7 in a stainless steel container.
3. Put the entire container in hot water (60–70°C), and stir to dissolve the contents.
4. Add the clear solution to the mixer.
5. Dissolve items 11 and 12 in 40 g of purified water in a stainless steel container.
6. Add the clear solution to the mixer.
7. Dissolve items 13, 14, and 15 in 50 g of purified water in a stainless steel container.
8. Add the clear solution to mixer, and mix for 5 minutes.
9. Dissolve item 1 in 10 g of purified water in a stainless steel container.
10. Add the clear solution to mixer.
11. Dissolve items 3 and 5 in 10 g of purified water in a stainless steel container.
12. Add the clear solution to mixer.

13. Dissolve items 2 and 4 in 30 g of purified water in a stainless steel container.
14. Add the clear yellow solution to mixer, and mix for 5 minutes.
15. Add items 17 and 18 to mixer.
16. Bring the volume up to 1 L with purified water, and finally, mix for 15 to 20 minutes.
17. Check and record the pH (limit: 4.4–4.8 at 25°C).
18. If required, adjust pH with 20% citric acid or 20% sodium citrate solution.
19. Filter the syrup at 1.5 bar.
20. Recirculate approximately 200 to 300 mL syrup.
21. Transfer the filtered syrup to the storage vessel, flushing with nitrogen gas.
22. Store the syrup under a nitrogen blanket for NMT 2 days prior to filling.

VITAMIN B COMPLEX SYRUP (WITHOUT B_{12})

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
570.00	1	Sucrose[a]	570.00
70.00	2	Glycerin (glycerol)	70.00
3.72	3	Citric acid (monohydrate)	3.72
1.00	4	Edetate disodium (sodium EDTA)	1.00
0.90	5	Calcium pantothenate (10% excess)	1.00
5.70	6	Sodium citrate	5.70
0.84	7	Methylparaben	0.84
0.168	8	Propylparaben	0.168
1.90	9	Benzoic acid	1.90
1.14	10	Strawberry flavor manefils	1.14
9.60	11	Alcohol (ethanol, 95%)	9.60
1.50	12	Thiamine hydrochloride (50% excess)	1.50
0.20	13	Pyridoxine hydrochloride (10% excess)	0.22
4.00	14	Nicotinamide (10% excess)	4.40
0.30	15	Riboflavin sodium phosphate (50% excess)	0.60
QS	16	Purified water	QS to 1 L

[a] 513 mg for thiamine mononitrate and 504 mg for thiamine hydrochloride.

Manufacturing Directions

1. Flush with nitrogen gas (purity 99.95%).
2. Add 400 g of purified water to the manufacturing vessel, and heat to 90°C to 95°C.
3. Add item 1 while mixing at low speed.
4. After addition of item 1, mix for 30 to 35 minutes at high speed (temperature: 90–95°C).
5. Cool to 40°C while mixing at low speed.
6. Disperse 1 g of filter aid in 10 g of cooled purified water (25–30°C) in a stainless steel container to prepare a slurry.
7. Add the slurry to the syrup in syrup vessel.
8. Mix for 15 minutes at high speed.
9. Filter the syrup at 1.5 bar.
10. Recirculate approximately 40 to 60 mL syrup.
11. Transfer the filtered syrup to the storage vessel.
12. Recharge the filtered syrup to the manufacturing vessel.
13. Start mixing.
14. Add item 2 to the syrup vessel while mixing at high speed.
15. Add item 3 to the syrup vessel while mixing to dissolve at high speed.
16. Dissolve item 4 in 6 g of cooled purified water (25–30°C), and add to the syrup vessel while mixing at high speed.
17. Dissolve item 5 in 6 g of cooled purified water, and add to the syrup vessel while mixing at high speed for 30 minutes.
18. Dissolve item 6 in 10 g of cooled purified water (25–30°C), and add to the syrup vessel while mixing at high speed.
19. Dissolve items 7 to 10 in item 11 in a stainless steel container, and add to the syrup vessel while mixing at high speed for 15 minutes.
20. Dissolve items 12 and 13 in 6 g of cooled purified water (25–30°C) in a separate stainless steel container, and add to the syrup vessel while mixing at high speed.
21. Rinse the container with 1 g of cooled, purified water (25–30°C), and add the rinsings to the syrup vessel while mixing at high speed.
22. Flush the vessel with nitrogen gas (purity 99.95%) for 15 minutes.
23. Dissolve item 14 in 9 g of cooled purified water in a separate stainless steel container, and add to the syrup vessel while mixing at high speed.
24. Rinse the container with 1 g of cooled purified water (25–30°C), and add the rinsings to the syrup vessel while mixing at high speed.
25. Dissolve item 15 in 4 g of cooled, purified water (25–30°C) in a separate stainless steel container, and add to the syrup vessel while mixing at high speed.
26. Rinse the container with 1 g of cooled, purified water, and add the rinsings to the syrup vessel while mixing at high speed.
27. Bring the volume up to 1 L with cooled, purified water (25–30°C), and finally, mix for 15 minutes at high speed.
28. Check and record the pH (limit: 4.3–4.7 at 25°C).
29. If required, adjust pH with 10% solution of citric acid or sodium citrate.
30. Flush the syrup with nitrogen gas (purity 99.95%) for 15 minutes.

31. Close the tank.
32. Hold the syrup for 12 hours.
33. Filter the syrup at 1.5 bar.
34. Recirculate approximately 40 to 60 mL syrup.
35. Transfer the filtered syrup to the storage vessel.

VITAMIN B COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
25.00	1	Thiamine mononitrate or hydrochloride	25.00
25.00	2	Riboflavin	25.00
80.00	3	Nicotinamide	80.00
40.00	4	Calcium D-pantothenate	40.00
16.00	5	Pyridoxine hydrochloride	16.00
0.16	6	Cyanocobalamin (gelatin coated, 0.1%)	16.00
282.00	7	Avicel™ PH101	282.00
16.00	8	Kollidon® 30	16.00
3.00	9	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Compress in 12 mm biplanar punches with medium to high compressive force.
3. The mononitrate formulation is preferred for stability reasons.

VITAMIN B COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.30	1	Thiamine mononitrate	2.30
2.60	2	Riboflavin	2.60
2.30	3	Nicotinamide	2.30
2.20	4	Calcium D-pantothenate	2.20
2.70	5	Pyridoxine hydrochloride	2.70
0.024	6	Cyanocobalamin (gelatin coated, 0.1%)	2.40
280.00	7	Ludipress®	280.00
14.00	8	Flavor (Firmenich)	14.00
0.050	9	Saccharin sodium	0.05
4.00	10	Cyclamate sodium	4.00
5.00	11	Magnesium stearate	5.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, and mix.
2. Compress 314 mg using low compression force and 8 mm biplanar punches.
3. According to the European Commission, this formulation is classified as dietary food.

VITAMIN B COMPLEX TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
15.00	1	Microcrystalline cellulose (Avicel™ PH102)	15.00
0.20	2	Colloidal silicon dioxide (Aerosil® 200)	0.20
3.00	3	Calcium pantothenate	3.00
9.33	4	Powdered cellulose	9.33
35.60	5	Lactose (spray dried)	35.60
0.91	6	Magnesium stearate	0.91
20.00	7	Nicotinamide	20.00
2.10	8	Pyridoxine hydrochloride	2.10
2.00	9	Riboflavin base	2.00
0.80	10	Talc (fine powder)	0.80
2.10	11	Thiamine mononitrate	2.10

Manufacturing Directions

1. Riboflavin base is a fine powder that tends to form globules while mixing.
2. Disperse the base carefully with Aerosil® and lactose.
3. Mix items 9 and 2 and 6.67 g of item 5 in the drum of a drum mixer for 10 minutes.
4. Pass the mix two times through a 500 µm sieve using a sifter.
5. Pass items 3, 8, and 11 and 6.67 g of item 5 through a granulator fitted with a 1.0 mm sieve.
6. Pass items 1, 4, and 7 and 22.27 g of item 5 through a granulator fitted with a 1.0 mm sieve.
7. Pass items 6 and 10 through a sifter fitted with a 500 µm sieve.
8. Load sieved material from previous step to the blender.
9. Load sieved material to the blender.
10. Blend the powders for 15 minutes.
11. Load lubricant powders into the blender, and mix for an additional 5 minutes.
12. Compress 91 mg at low RH (55–60%).
13. Coat tablets with a sealing coat, color coat, and polishing coat.

VITAMIN B COMPLEX, VITAMIN A, VITAMIN C, AND VITAMIN D SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
60.00	1	Sucrose	600.00
1.00	2	Methylparaben	1.00
0.20	3	Propylparaben	0.20
1.00	4	Edetate disodium (sodium EDTA)	1.00
10.00	5	Ascorbic acid (50% excess)	15.00
0.80	6	Sodium hydroxide	0.80
4.00	7	Nicotinamide (5% excess)	4.20
0.40	8	Riboflavin sodium phosphate (8% excess)	0.43
1.00	9	Thiamine hydrochloride (50% excess)	1.50
1.20	10	Pyridoxine hydrochloride (10% excess)	1.32
0.50	11	Monosodium glutamate (sodium glutamate)	0.50
1.26 µg	12	Cyanocobalamin (50% excess)	0.0018
150.00	13	Propylene glycol	150.00
1000.0 IU	14	Vitamin A palmitate (1.75 MM IU/g) (54% excess)	0.88
100.0 IU	15	Cholecalciferol (40 MM IU/g) (52% excess)	0.0038
13.20	16	Polysorbate 80 (Tween 80)	13.20
2.50	17	Poloxyl 20 cetostearyl ether (Cetomacrogol 1000)	2.50
0.30	18	Lemon oil terpeneless	0.30
0.84	19	Strawberry oil (composed)	0.84
QS	20	Purified water	QS to 1 L

Manufacturing Directions

1. This product is an aqueous solution of water-soluble vitamins with oily vitamin A palmitate and cholecalciferol solubilized in water using the surfactant system of Tween 80 and Cetomacrogol.
2. This syrup is a solubilized oil surfactant system and is affected by heat and rate of mixing.
3. The temperature of the solution must not exceed 30°C at the time of final mixing.
4. The final mixing must be continuous, without any interruption.
5. For the preparation of oily phase, the container must be dry.
6. Before start of batch, cool approximately 80 mL of purified water, and flush with nitrogen gas (purity, 99.95%).
7. Use this water for making solutions and for adjusting the volume.
8. Add 420 g of purified water to the manufacturing vessel, and heat to 90°C to 95°C.
9. Add items 2 and 3 while mixing to dissolve.
10. Add item 1 while mixing at slow speed.
11. After addition of item 1, mix for 30 to 35 minutes at high speed and a temperature of 90°C to 95°C.
12. Cool to 25°C to 30°C while mixing at low speed.
13. Bubble nitrogen gas for 10 minutes.
14. Add item 4 to the syrup while mixing at high speed to dissolve.
15. Add item 5 to the syrup while mixing at high speed to dissolve.
16. Add 4.00 g of purified water (25°C) in a separate container, and dissolve item 6 by using a stirrer.
17. Transfer the cooled item 6 solution to the syrup tank while mixing at high speed.
18. Mix for 15 minutes.
19. Check the pH of the syrup (limit: 3.75–3.85).
20. Add items 7 to 11 one by one to the syrup in the manufacturing vessel while mixing at high speed to dissolve.
21. Mix for 10 minutes.
22. Add 6 g of cold purified water (25°C) in a separate container, and dissolve item 12.
23. Add to the manufacturing vessel while mixing at high speed.
24. Rinse the container with cooled purified water (approximately 2 mL), and transfer the rinsing to the syrup-manufacturing vessel. Mix well at high speed.
25. Add item 13 to the manufacturing vessel while mixing at high speed.
26. Warm item 14 to 70°C in a separate stainless steel container in a water bath.
27. Warm item 16 to 70°C, and mix well with item 14 under nitrogen atmosphere.
28. Add item 15 while mixing.
29. Melt item 17 in a stainless steel container, and add with stirring to mix well.
30. Cool to 30°C while mixing under nitrogen atmosphere.
31. Add items 18 and 19 to the oily phase solution, and mix for 15 minutes at high speed.
32. Check and record the volume of the oily phase.
33. Start mixing, and continue mixing (mixing must be continuous).
34. Start the addition of the oily phase solution in a thin stream (do not stop mixing during addition of oily phase).
35. After the addition is complete, mix for an additional 15 minutes at high speed.
36. Rinse the oily phase vessel with a sufficient quantity of syrup from the syrup vessel.
37. Transfer the rinsings to the syrup vessel.
38. Bring the volume up to 1 L with cooled purified water (25°C), and finally, mix for 20 minutes at high speed.
39. Check and record the pH (limit: 3.75–3.85 at 25°C).
40. Filter the syrup at 1.5 bar.
41. Recirculate approximately 40 to 60 mL syrup.

VITAMIN B COMPLEX, VITAMIN A, VITAMIN C, AND VITAMIN D TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
2.00	1	Thiamine mononitrate (20% excess)	2.40
1.00	2	Riboflavin (10% excess)	1.10
74.50	3	Lactose (spray dried)	74.50
15.00	4	Nicotinamide	15.00
300 IU	5	Vitamin D_3 (dry powder, 100,000 IU/g)	3.60
3000 IU	6	Vitamin A palmitate (250,000 IU/g)	18.00
36.00	7	Cellulose (microcrystalline) (Avicel™ PH102)	36.00
20.00	8	Ascorbic acid (90%) (33% excess)	26.60
1.00	9	Silicon dioxide (colloidal) (Aerosil® 200)	1.00
1.80	10	Magnesium stearate	1.80

Manufacturing Directions

1. Mix items 1 and 2 and 13.33 g of item 3 in a drum using a drum mixer for 10 minutes.
2. Pass the mix through a 250 µm sieve using a sifter.
3. Collect in a stainless steel drum, and load into the blender.
4. Pass items 4 to 7 and 61.17 g of item 3 through a granulator fitted with a 1 mm sieve.
5. Collect in a stainless steel drum, and load into the blender.
6. Pass item 8 through a Fitz mill fitted with sieve number 24230.
7. Collect in a stainless steel drum, and load into the blender.
8. Mix for 10 minutes.
9. Pass item 9 through a 500 µm sieve using a sifter.
10. Collect in a polyethylene bag.
11. Pass item 10 through a 250 µm sieve using a sifter.
12. Collect in the same polyethylene bag.
13. Mix, and add 0.53 to 1.33 g powder from the previous step.
14. Mix gently.
15. Add to the blender.
16. Mix for 3 minutes.
17. Unload lubricated granules in stainless steel drums.
18. Compress 180 mg in 7 mm round concave punches.
19. Apply a sealing coat, a color coat, and finishing coat (see Appendix).

VITAMIN B COMPLEX, VITAMIN A, VITAMIN C, VITAMIN D, AND CALCIUM DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
675.00	1	Glycerin (96%)	675.00
16.66	2	Niacinamide (white powder)	16.66
2.73	3	Riboflavin-5′-phosphate sodium (3% excess)	2.82
0.50	4	Methylparaben	0.50
1.00	5	Acid benzoic	1.00
105.00	6	Saccharin sodium (powder)	105.00
73.36	7	Calcium chloride (granules, dihydrate)	73.36
28.78	8	Ferrous gluconate	28.78
2.25	9	Thiamine hydrochloride (powder, regular) (35% excess)	3.375
1.00	10	Pyridoxine hydrochloride	1.00
83.33	11	Ascorbic acid (white powder) (35% excess)	112.50
0.25	12	Oil orange terpeneless	0.25
0.081	13	Alcohol (ethanol; 190 proof, nonbeverage)	0.081
80.00	14	Polysorbate 80	80.00
0.16	15	Butylated hydroxyanisole (BHA)	0.16
0.66	16	Viosterol in corn oil (syn., oleovitamin D; 1000 mD/g) (25% excess)	0.83
0.056	17	Vitamin A palmitate (1,500,000 IU/g)	0.056
10.00	18	Caramel (acid proof)	10.00
QS	19	Deionized purified water	QS to 1 L

Manufacturing Directions

1. Product must not stand more than 1 week before filling.
2. Avoid unnecessary exposure of product to light, air, and heat.
3. Manufacture and store product under complete CO_2 protection.
4. Avoid vigorous mixing.
5. Charge glycerin and 210 mL purified water into a stainless steel jacketed tank.
6. Add, with mixing, in the following order: niacinamide, riboflavin-5′-phosphate sodium, methylparaben USP, benzoic acid, and saccharin sodium.
7. Continue mixing, heat to 95°C to 100°C, and hold to completely dissolve the ingredients.
8. Add in calcium chloride portions, and stir until complete solution is obtained.
9. Continue mixing, and cool to 70°C to 75°C.

10. Add ferrous gluconate with mixing, and dissolve at 70°C to 75°C.
11. Check for the absence of undissolved material.
12. Check volume, if necessary. Replace lost purified water by heating with additional previously boiled purified water, QS to 750 mL.
13. Cool with mixing to room temperature (25–30°C) while bubbling CO_2 gas through.
14. Continue the CO_2 gas bubbling for balance of the process.
15. Add and dissolve each ingredient in this order: thiamine hydrochloride, pyridoxine hydrochloride, and ascorbic acid.
16. Dissolve oil orange in ethyl alcohol and add to mixture with stirring.
17. Heat polysorbate 80 to 50°C to 60°C, and hold for approximately 10 minutes with slow mixing.
18. Add and dissolve butylated hydroxyanisole.
19. Mix slowly and saturate with CO_2 while cooling to 25°C to 30°C.
20. Add and dissolve viosterol in corn oil and vitamin A palmitate, mixing well and continuing CO_2 gas bubbling.
21. Add polysorbate solution to main batch, and mix thoroughly.
22. Rinse container with a portion of the main batch, and add.
23. Heat 50 mL purified water to 35°C to 40°C while bubbling CO_2 gas through.
24. Add the caramel color.
25. Mix well until uniform consistency is obtained.
26. Add to main batch.
27. Rinse container with a small quantity of purified water that has been previously saturated with CO_2 gas.
28. Add to the main batch.
29. Add purified water that has been previously saturated with CO_2 gas, QS to 1 L.
30. Filter without using a filter aid. Cycle to achieve clarity.
31. Maintain carbon dioxide cover.

VITAMIN B COMPLEX, VITAMIN A, VITAMIN C, VITAMIN D, AND MINERAL TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
61.00	1	Ascorbic acid (coated), EC	61.00
5.50	2	Calcium pantothenate	5.50
8.00 µg	3	Cyanocobalamin	0.008
4.00	4	Copper sulfate, $5H_2O$	4.00
1.70	5	Magnesium oxide (heavy)	1.70
10.00	6	Nicotinamide	10.00
0.575	7	Pyridoxine hydrochloride	0.575
0.16	8	Potassium iodide	0.16
2.30	9	Riboflavin	2.30
3.25	10	Thiamine mononitrate	3.25
24.00	11	Vitamin A palmitate (250,000 IU/g)	24.00
4.80	12	Vitamin D_3 powder (100,000 IU/g)	4.80
2.20	13	Zinc sulfate, $7H_2O$	2.20
19.265	14	Lactose monohydrate	19.265
25.00	15	Cellulose (microcrystalline) (Avicel™ PH102)	25.00
3.00	16	Povidone (PVP K-90)	3.00
6.50	17	Cellulose (microcrystalline) (Avicel™ PH102)	6.50
7.00	18	Crospovidone (Kollidon® CL)	7.00
1.00	19	Colloidal silicon dioxide (Aerosil® 200)	1.00
0.75	20	Magnesium stearate	0.75
3.00	21	Microcrystalline cellulose (powder)	3.00
–	22	Alcohol (absolute)	18.46

Manufacturing Directions

1. Dissolve item 16 in item 22 using a stirrer.
2. Dissolve item 3 while stirring to obtain a clear solution.
3. Press items 2, 6, 7, 9, 10, 14, and 15 through a 500 µm stainless steel sieve in a sifter.
4. Load into mixer, and mix for 5 minutes at high speed.

5. Knead the dry powder with binding solution while mixing at high speed for 3 minutes.
6. After the addition is complete, scrape the sides and blades.
7. Mix for an additional 2 minutes using a mixer and chopper at high speed. Check the end point of granulation.
8. (The end point occurs when the granulation consists of few or no lumps.) If required, add an additional quantity of item 22, and record this extra quantity of item 22.
9. Unload the wet granules in stainless steel trays for drying.
10. Transfer the trays to an oven.
11. Keep the door partially open.
12. Switch on the oven, with air circulation, heater switched off, for 2 hours to evaporate alcohol.
13. Close the door of the oven.
14. Dry the granules at 55°C for 12 hours.
15. After 4 hours of drying, scrape the semidried granules to break up the lumps to promote uniform drying.
16. Check the LOD (limit: 0.8–1.2%).
17. If required, dry further at 55°C for 2 hours.
18. Check the LOD.
19. Grind the dried granules through a 1.25 mm sieve using a granulator set at medium speed.
20. Load granules into the blender.
21. Mix items 4 and 13 and 3.08 g of item 17 in a polyethylene bag.
22. Mill through a Fitz mill using sieve number 1530–0030 (knives forward, medium speed).
23. Collect in stainless steel drum.
24. Add to blender.
25. Sift items 1, 11, and 12 through a 630 µm sieve.
26. Add to blender.
27. Sift items 5, 8, 18, 19, and 21 and 3.42 g of item 17 through a 500 µm sieve.
28. Add to blender.
29. Mix for 5 minutes.
30. Sift item 20 through a 250 µm sieve.
31. Mix a portion of the powder mix (approximately 3.85 g) with sieved item 20.
32. Add to the blender.
33. Mix for 1 minute.
34. Compress 185 mg per tablet using 7 mm round, concave punches.
35. Coat using a subcoat, a color coat, and a finishing coat (see Appendix).

VITAMIN B COMPLEX, VITAMIN A, VITAMIN C, VITAMIN D, AND VITAMIN E PEDIATRIC DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
8333 IU	1	Vitamin A palmitate (1.7 M IU/g) (50% excess)	7.35
666 IU	2	Vitamin D (40 M IU/g) (Cholecalciferol)	0.021
75.00	3	Polysorbate 80 (Tween 80)	75.00
0.005	4	Lemon oil terpeneless	0.050
0.88	5	Vitamin E (oily) (alpha-tocopheryl acetate)	0.88
0.50	6	Edetate disodium (sodium EDTA)	0.50
83.33	7	Ascorbic acid (30% excess)	108.33
1.00	8	Saccharin sodium	1.00
2.50	9	Thiamine hydrochloride (50% excess)	3.75
16.66	10	Nicotinamide (5% excess)	17.50
0.833	11	Pyridoxine hydrochloride (5.6% excess)	0.88
2.00	12	Riboflavin sodium phosphate (7.9% excess as riboflavin)	2.16
700.00	13	Glycerin (glycerol)	700.00
250.00	14	Purified water	250.00

Manufacturing Directions

1. This product is a microemulsion and is a thermolabile preparation.
2. The temperature of the solution must not exceed 25°C at the time of processing.
3. Add 200 g of purified water to the manufacturing vessel.
4. Bubble nitrogen gas during all stages of the process.
5. Charge items 6 to 12 one by one into the manufacturing vessel while mixing.
6. Check that all materials are dissolved completely.
7. Load item 13 into the manufacturing vessel while mixing at slow speed.
8. Mix for 5 minutes.
9. Add item 3 in a separate stainless steel container.
10. Mix items 1, 2, 4, and 5 one by one using stirrer.
11. Mix for 1 hour at slow speed.
12. Add oil-phase preparation to the aqueous phase at a rate of 4 mL/min while mixing at slow speed, and continue nitrogen gas bubbling throughout the process.

13. Rinse the oil-phase container with 50 g of nitrogen-bubbled and cooled purified water, and transfer the rinsings to the manufacturing vessel.
14. Adjust the volume to 1 L using nitrogen-bubbled purified water.
15. Mix for 15 minutes at slow speed.
16. Check and record the volume and pH (limit: pH 2.8–4.2).
17. Filter the solution through a Sartorius prefilter and 0.2 µm membrane filter into receiving tank.
18. Bubble with nitrogen gas for 15 minutes.

VITAMIN B COMPLEX, VITAMIN C, AND CALCIUM EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
7.00	1	Thiamine mononitrate	7.00
5.00	2	Riboflavin	5.00
25.00	3	Nicotinamide	25.00
20.00	4	Pyridoxine hydrochloride	20.00
12.00	5	Calcium D-pantothenate	12.00
75.00	6	Calcium carbonate	75.00
164.00	7	Calcium glycerophosphate	164.00
400.00	8	Sodium bicarbonate	400.00
300.00	9	Tartaric acid (powder)	300.00
400.00	10	Sucrose (crystalline)	400.00
350.00	11	Sucrose (powder)	350.00
50.00	12	Kollidon® 30	50.00
10.00	13	Kollidon® 30	10.00
QS	14	Isopropanol	QS
550.00	15	Ascorbic acid (powder)	550.00
2.00	16	Riboflavin	2.00
5.00	17	Cyanocobalamin (gelatin-coated, 0.1%)	5.00
40.00	18	PEG-6000 (powder)	40.00
50.00	19	Kollidon® CL	50.00

Manufacturing Directions

1. Granulate mixture of items 1 to 12 with solution of item 19.
2. Granulate items 13 to 18 separately, dry at 60°C with vacuum, mix with item 1, and blend.
3. Compress 2.5 g using 20 mm planar punches at medium to high compression force.

VITAMIN B COMPLEX, VITAMIN C, AND FERROUS SULFATE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Ferrous sulfate	300.00
15.00	2	Kollidon® 30	15.00
6.00	3	Kollidon® 30	6.00
QS	4	2-Propanol	QS
45.00	5	Thiamine mononitrate	45.00
10.00	6	Riboflavin	10.00
82.00	7	Pyridoxine hydrochloride	82.00
69.00	8	Nicotinamide	69.00
470.00	9	Ascorbic acid (powder)	470.00
690.00	10	Ludipress®	690.00
50.00	11	PEG-6000 (powder)	50.00
9.00	12	Aerosil® 200	9.00

Manufacturing Directions

1. Granulate the mixture of items 1 to 2 with solution of items 5 to 12.
2. Pass through a 0.8 mm sieve.
3. Mix with items 3 and 4.
4. Compress with high compressive force 25 to 30 kN. Compress 1750 mg in 20 mm biplanar punches.

VITAMIN B COMPLEX, VITAMIN C, AND IRON SYRUP

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
QS	1	Glucose (liquid), NF	QS to 1 L
225.00	2	Purified water, USP	225.00
0.30	3	Methylparaben	0.30
1.00	4	Acid benzoic, USP	1.00
5.00	5	Alcohol (ethanol; 190 proof, nonbeverage), USP	5.00
10.00	6	Nicotinamide niacinamide (white powder), USP	10.00
10.00	7	Riboflavin; use riboflavin 5-phosphate sodium	10.00
2.00	8	Pyridoxine hydrochloride, USP	2.00
20.00	9	Ascorbic acid (white powder), USP	28.00
0.03	10	Dye	0.03
0.02	11	Dye	0.02
2.00	12	Thiamine hydrochloride (powder, regular), USP	2.40
2.00	13	D-Pantothenyl alcohol	2.50
2.00 µg	14	Vitamin B_{12} (cyanocobalamin, USP)	3.40 mg
200.00	15	Sucrose, NF	200.00
0.028 mL	16	Flavor	2.80 mL
QS	17	Hydrochloric acid	2.00 mL
QS	18	Carbon dioxide gas	QS

Manufacturing Directions

1. This preparation is susceptible to oxidation and must be protected from air and sunlight at all times.
2. Carbon dioxide must be used extensively to prevent oxygen from reacting with the materials.
3. All purified water must be boiled prior to use for 10 minutes and cooled under CO_2 protection.
4. Charge 100 mL of purified water into a suitably sized stainless steel tank.
5. Add the riboflavin, nicotinamide, benzoic acid, and paraben.
6. Rinse the tank down with 10 mL purified water, seal, and heat with mixing to 95°C.
7. Continue mixing and heating for 15 minutes until solution is complete.
8. Commence cooling with continuous mixing.
9. When the solution has cooled to 50°C to 70°C, add and dissolve the sugar.
10. Commence CO_2 protection when the temperature reaches 40°C.
11. Slurry the ascorbic acid in 75 or 110 mL of CO_2-saturated purified water (use the smaller quantity only if using a total of 225 mL water), and add to bulk solution when temperature has reached 25°C to 35°C.
12. Rinse the ascorbic acid vessel with 10 mL purified water, and add rinsings to bulk.
13. Mix for at least 30 minutes.
14. Dissolve thiamine and pyridoxine in 20 mL CO_2-saturated purified water, and add to bulk solution at 25°C to 35°C.
15. Add 10 mL CO_2-saturated purified water to the D-pantothenyl alcohol, and warm on a water bath until solution is complete.
16. Add vitamin B_{12}, and mix until dissolved.
17. Add and dissolve dyes.
18. Add this solution to the bulk solution, and mix thoroughly.
19. Mix flavor with 95% of alcohol, and add to the bulk solution.
20. Rinse the container with the remaining alcohol, and add to the bulk with vigorous agitation.
21. Check pH (range: 3.0–3.3).
22. Use hydrochloric acid to adjust if necessary.
23. Adjust the final volume with liquid glucose.
24. Filter through suitable medium until clear and bright.

VITAMIN B COMPLEX, VITAMIN C, AND IRON SYRUP

Bill of Materials

Scale (mg/5 mL)	Item	Material Name	Qty/L (g)
QS	1	Sorbitol solution, USP	QS to 1 L
QS	2	Purified water, USP	225.00
0.20	3	Methylparaben	0.20
0.020	4	Propylparaben, NF	0.02
2.00	5	Nicotinamide niacinamide (white powder), USP	10.00
10.00	6	Riboflavin; use riboflavin 5-phosphate sodium, with excess	10.64
10.00	7	Iron sulfate (ferrous sulfate; granular), USP	10.00
3.60	8	Saccharin sodium (powder), USP	3.60
2.00	9	Pyridoxine hydrochloride, USP	2.00
25.00	10	Ascorbic acid (white powder), USP, with excess	28.00
0.03	11	Dye	0.030
0.02	12	Dye	0.020
2.00	13	Thiamine hydrochloride (powder, regular), USP, with excess	2.40
2.00	14	D-Pantothenyl alcohol, with excess	2.50
2.0 µg	15	Vitamin B_{12} cyanocobalamin, USP, with excess	3.40 mg
1.00	16	Flavor	1.00
10.00	17	Propylene glycol, USP	10.00
QS	18	Hydrochloric acid	2.00 mL
–	19	HyFlo filter aid	1.00
QS	20	Carbon dioxide gas	QS

Manufacturing Directions

1. This preparation is susceptible to oxidation and must be protected from air and sunlight at all times.
2. Carbon dioxide must be used extensively to prevent oxygen from reacting with the materials.
3. All purified water must be boiled prior to use for 10 minutes and cooled under CO_2 protection.
4. Charge 950 g of sorbitol solution into a jacketed stainless steel tank, and heat to 95°C to 100°C.
5. Heat 250 mL of purified water to boiling for 10 minutes, and bubble CO_2 into it while cooling to room temperature.
6. Add, with stirring, the parabens, niacinamide, and riboflavin 5-phosphate sodium.
7. Rinse the container with 5 mL of water.
8. Stir well.
9. Mix until solution is obtained, and check the clarity.
10. Remove the source of heat from the vessel.
11. Thoroughly deoxygenate the liquid by bubbling CO_2 through the liquid, and allow to cool to 50°C to 60°C.
12. Heat 15 mL of water to 70°C, saturate with CO_2, and dissolve saccharin sodium (item 8) and pyridoxine hydrochloride in 5 mL of water. Add to the main bulk.
13. Rinse the container with 2.5 mL of water.
14. Cool the solution to 30°C with CO_2 protection.
15. Dissolve ascorbic acid in 120 mL of water.
16. Rinse the container with 5 mL of water.
17. Dissolve dyes in 3 mL of water.
18. Rinse the container with 2 mL of water.
19. Mix dye solution with ascorbic acid solution.
20. Add this to the main bulk with stirring.
21. Dissolve thiamine in 30 mL of water, and add to the main bulk.
22. Rinse the container with 2.5 mL of water.
23. Add 10 mL of water to the D-pantothenyl alcohol, and warm up on a water bath until in solution.
24. Add this mixture to the main bulk.
25. Rinse the container with 2.5 mL of water.
26. Dissolve vitamin B_{12} in 12.5 mL of water, and add to the main bulk.
27. Rinse the container with 2.5 mL of water.
28. Mix flavor with 7.5 g of propylene glycol until mixture is homogeneous, and add to the main bulk.
29. Rinse the container with 2.5 g of propylene glycol, and add to the main bulk with vigorous agitation.
30. Check pH (range: 3.0–3.3).
31. Use hydrochloric acid to adjust if necessary.
32. Adjust the volume of the product with sorbitol solution, and mix for 30 minutes to ensure homogeneity.
33. Add the HyFlo filter aid, and mix.
34. Filter the liquid through a filter press previously washed in purified water.
35. Transfer the clear filtrate into a clean, closed vessel.
36. Mix for 15 minutes while bubbling CO_2 gas.

VITAMIN B COMPLEX, VITAMIN C, AND VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Niacinamide, (white powder), USP	100.00
750.00	2	Ascorbic acid; use sodium ascorbate (microcrystalline), USP	843.65
30.00	3	Calcium pantothenate, USP	30.00
10.00	4	Riboflavin, USP	10.00
5.00	5	Pyridoxine hydrochloride, USP	5.25
40.00	6	Povidone, USP	40.00
68.00	7	Anhydrous isopropyl alcohol	68.00
15.00	8	Thiamine mononitrate (powder), USP	15.75
24.79	9	Vitamin E, USP, D,L-alpha-tocopheryl acid succinate	33.71
150.00 µg	10	Folic acid (powder), USP	0.18
5.00	11	Magnesium stearate	5.00
40.00	12	Cellulose (microcrystalline), NF	40.00
4.00 µg	13	Vitamin B_{12}; use cyanocobalamin powder in gelatin (1000 µg/g)	4.20

Manufacturing Directions

1. Avoid unnecessary exposure to light and moisture.
2. Mill the nicotinamide and the sodium ascorbate through a 600 µm screen fitted to a Fitz mill or similar (impact forward, high speed).
3. Load into a suitable mass mixer.
4. Load calcium pantothenate, riboflavin, and pyridoxine hydrochloride into the mass mixer.
5. Dry blend for 5 minutes.
6. Dissolve povidone in alcohol (approximately 84 mL) in a separate container.
7. While mixing the blended powders, add the povidone solution.
8. Continue to mix until a satisfactory granule mass is obtained.
9. If required, use additional alcohol.
10. Granulate through a Fitz mill, or similar, using a 5/8 in. band (15.88 mm aperture or similar) or a 4.76 mm screen with knives forward at slow speed.
11. Dry the granulation at 49°C to less than 1.5% LOD.
12. Sift the dry granulation through a 1.19 mm screen.
13. Pass remaining coarse granules through a No. 2 band (1.59 mm aperture or similar) using a Fitz mill or similar (knives forward, medium speed).
14. Blend together the thiamine mononitrate, vitamin E, folic acid, magnesium stearate, and a portion of the microcrystalline cellulose.
15. Mill blended powders through a 600 µm screen (impact forward, high speed).
16. Care must be taken to prevent losses.

17. Load half of the base granulation, the balance of the microcrystalline cellulose, and the powder blend into a suitable blender.
18. Blend for 5 minutes.
19. Add balance of base granulation, and blend for 15 minutes.
20. Do not mill cyanocobalamin.
21. Blend together by hand the cyanocobalamin with a portion of the blended powders.
22. Return to the blender, and blend for 15 minutes.
23. Compress using ovaloid-shaped punches.
24. Seal tablets with a subcoat, and then apply color coat and finishing coating.

VITAMIN C AND CALCIUM CARBONATE EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
300.00	1	Calcium; use calcium carbonate	315.00
450.00	2	Sodium bicarbonate/tartaric acid (powder)	450.00
600.00	3	Kollidon® 30	600.00
35.00	4	Kollidon® 30	35.00
200.00	5	Isopropanol	200.00
400.00	6	Sucrose (crystalline)	400.00
500.00	7	Ascorbic acid (crystalline, with excess)	550.00
120.00	8	Kollidon® CL	120.00
60.00	9	PEG-6000 (powder)	60.00

Manufacturing Directions

1. Granulate mixture of items 1 to 3 with a solution of items 4 and 5, mix with item 6, and dry.
2. Add items 7 to 9, and press with high compressive force at a maximum atmospheric RH of 30%.
3. Compress 2500 mg in 20 mm biplanar punches.

VITAMIN C AND VITAMIN E LOZENGES

Bill of Materials

Scale (mg/lozenge)	Item	Material Name	Qty/1000 Lozenges (g)
100.00	1	Ascorbic acid (crystalline)	100.00
50.00	2	Vitamin E acetate (dry powder, SD 50)	100.00
400.00	3	Dextrose	400.00
4.00	4	Kollidon® 90 F	4.00
25.00	5	Isopropanol	25.00
6.00	6	PEG-6000 (powder)	6.00

Manufacturing Directions

1. Granulate mixture of items 1 to 4 with isopropanol, dry, pass through a 0.8 mm sieve, mix with item 6, and press with high compression force.
2. Compress 600 mg using 12 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Ascorbic acid: 222.20 mg ascorbic acid and 312.50 mg sodium ascorbate microcrystalline	500.00
850.00	2	Sorbitol (granular)	850.00
100.00	3	Lactose (120 mesh)	100.00
3.30	4	FD&C Yellow dye No. 5 lake	3.30
82.90	5	Cellulose (microcrystalline), NF (Avicel™ PH101)	82.90
11.60	6	Silica gel	11.60
8.29	7	Flavor	8.29
0.50	8	Flavor	0.50
8.29	9	Sodium cyclamate	8.29
33.20	10	Magnesium stearate	33.20

Manufacturing Directions

1. Pass the ascorbic acid, sodium ascorbate, sorbitol, lactose, FD&C Yellow dye, microcrystalline cellulose, silica gel, flavors, and sodium cyclamate through a 420 μm screen.
2. Using a comminuting mill, pass the coarse granules through a 420 μm screen (knives forward, medium speed).
3. Transfer milled materials to a suitable blender, and blend for 5 minutes.
4. Screen the magnesium stearate by hand through an 840 μm screen, and transfer to blender.
5. Mix for 1 minute.
6. Compress using 18 mm standard concave punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
422.00	1	Ascorbic acid (powder)	422.00
283.00	2	Microcrystalline cellulose	283.00
130.00	3	Sucrose (powder)	130.00
80.00	4	Sucrose (crystalline)	80.00
24.00	5	Kollidon® VA 64	24.00
24.00	6	Cyclamate sodium	24.00
20.00	7	PEG-6000 (powder)	20.00
12.00	8	Orange flavor and strawberry flavor	12.00
2.00	9	Aerosil® 200	2.00
1.00	10	Saccharin sodium	1.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm sieve, and press into tablets with medium to high compression force.
2. Compress 250 mg (for 100 mg strength), 1250 mg (for 500 mg strength), or 2500 mg (for 500 mg strength).

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Ascorbic acid (crystalline)	500.00
1100.00	2	Sorbitol (crystalline)	1100.00
200.00	3	Sucrose (crystalline)	200.00
200.00	4	Sucrose (powder)	200.00
300.00	5	Dextrose	30.00
100.00	6	PEG-6000 (powder)	100.00
10.00	7	Magnesium stearate	10.00
10.00	8	Aerosil® 200	10.00
1.00	9	Saccharin sodium	1.00
10.00	10	Cyclamate sodium	10.00
30.00	11	Orange flavor	30.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium to high compression force.
2. Compress 2080 mg using 20 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ascorbic acid (crystalline)	100.00
450.00	2	Sodium ascorbate (crystalline)	450.00
264.00	3	Sorbitol (crystalline)	264.00
200.00	4	Sucrose (crystalline)	200.00
200.00	5	Sucrose (powder)	200.00
300.00	6	Dextrose	300.00
60.00	7	PEG-6000 (powder)	60.00
3.00	8	Magnesium stearate	3.00
4.00	9	Aerosil® 200	4.00
1.00	10	Saccharin sodium	1.00
10.00	11	Cyclamate sodium	10.00
20.00	12	Orange flavor	20.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium to high compression force.
2. Compress 1295 mg using 16 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
6.70	1	Anhydrous silica (colloidal) (Aerosil® 200)	6.70
40.00	2	Cellulose (microcrystalline) (Avicel™ PH101)	40.00
6.50	3	Aspartame	6.50
170.00	4	Ascorbic acid (coated), EC	170.00
10.50	5	Orange flavor (dry)	10.50
13.00	6	Carmellose sodium (sodium CMC 7 MFD)	13.00
2.80	7	Orange dye	2.80
470.00	8	Dextrates, NF	470.00
19.50	9	Magnesium stearate	19.50
13.00	10	Stearic acid (fine powder)	13.00
160.00	11	Sorbitol (powder)	160.00
388.00	12	Sodium ascorbate (granular)	388.00

Manufacturing Directions

1. Processing should be done in a controlled temperature and humidity area (limit: RH, 40–50%; temperature, 20–25°C).
2. Mix items 2 and 7 in a polyethylene bag for 1 to 2 minutes.
3. Sift twice through a 250 μm sieve.

4. Collect in a polyethylene bag, and check the uniformity of dispersion.
5. If required, sift again.
6. Mix items 3, 5, and 6 in a polyethylene bag for 1 to 2 minutes.
7. Sift once through a 250 µm sieve.
8. Add to the first step, and mix for 1 to 2 minutes.
9. Sift items 4, 8, 11, and 12 once through a 1000 µm sieve, and collect in a stainless steel drum.
10. Add the sieved materials from the preceding steps to the stainless steel drum.
11. Mix in a drum blender for 2 to 3 minutes.
12. Mix items 1, 9, and 10 in a polyethylene bag for 1 to 2 minutes.
13. Sift twice through a 500 µm sieve.
14. Add 25 to 30 g of granules to the lubricant mixture.
15. Mix for 1 to 2 minutes.
16. Add this mixture to the granules.
17. Mix in a drum blender for 1 minute.
18. Check the moisture content (limit: moisture content NMT 3.5%).
19. Check temperature and humidity before beginning compression (limit: RH, 40–50%; temperature, 20–25°C).
20. Compress 1300 mg per tablet using 16 mm punches.
21. Fill appropriate amounts for lower strength (e.g., 100 mg tablets in 10 mm punches).

VITAMIN C CHEWABLE TABLETS WITH DEXTROSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ascorbic acid (crystalline); use ascorbic acid (coated, 97.5%), EC	110.00
500.00	2	Dextrose	500.00
4.00	3	Kollidon® 90 F	4.00
30.00–50.00	4	Water and/or isopropanol	30.00–50.00
6.00	5	PEG-6000 (powder)	6.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 4 and 5 (in a fluidized bed), sieve, add item 3, and press with high compression force.
2. Compress 620 mg in 12 mm biplanar punches.
3. If no fluidized bed is available, the use of water as a granulation solvent should be avoided.
4. The use of coated ascorbic acid does not increase the stability.

VITAMIN C CHEWABLE TABLETS WITH FRUCTOSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
120.00	1	Ascorbic acid (powder)	120.00
500.00	2	Fructose	500.00
200.00	3	Ludipress®	200.00
100.00	4	Avicel™ PH101	100.00
15.00	5	Kollidon® VA 64	15.00
4.00	6	Aerosil® 200	4.00
35.00	7	PEG-6000 (powder)	35.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 970 mg in 12 mm biplanar punches.

VITAMIN C CHEWABLE TABLETS WITH SUCROSE

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Ascorbic acid	500.00
850.00	2	Sucrose, crystalline	850.00
575.00	3	Avicel™ PH101	575.00
60.00	4	Kollidon® VA 64	60.00
15.00	5	Magnesium stearate	15.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with medium compression force.
2. Compress 2000 mg in 20 mm biplanar punches.

VITAMIN C DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Quantity/L (g)
100.00	1	Ascorbic acid (white powder), USP	100.00
979.00	2	Propylene glycol, USP	979.00

Manufacturing Directions

1. Keep under CO_2 protection at all times. Avoid contact with iron. Use stainless steel or glass-lined equipment only.
2. Load 868 g propylene glycol into a glass-lined or suitable stainless steel jacketed tank.
3. While mixing, heat to 70°C to 80°C.
4. Bubble CO_2 gas into the propylene glycol from the bottom of the tank.
5. Add and dissolve the ascorbic acid into the propylene glycol with a minimum of stirring under CO_2 protection.
6. When the ascorbic acid is in solution, immediately cool to approximately 25°C while continuing to mix.
7. Also, while cooling, change adding CO_2 from the bottom of the tank to adding it at the top of the tank.
8. QS to 1 L, using propylene glycol, and mix for at least 10 minutes.
9. Use a prefilter pad and a lint-free filter paper. Recirculate the product through the filter press until sparkling clear.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1000.00	1	Vitamin C (as ascorbic acid)	1000.00
800.00	2	Tartaric acid (fine crystals)	800.00
1000.00	3	Sodium bicarbonate	1000.00
0.50	4	Riboflavin	0.50
20.00	5	Saccharin sodium	20.00
20.00	6	Sodium chloride (milled)	20.00
50.00	7	Lime flavor	50.00
1709.50	8	Sugar (fine crystals)	1709.50
QS	9	Alcohol	QS

Manufacturing Directions

1. All operations must be carried out at a RH of less than 40% at 25°C.
2. Active substance granulates: If saccharin sodium is lumpy, sieve it by means of a centrifugal granulator (1 mm) or a 3 mm band sieve.
3. Suck into the mixer the entire amount of sugar, ascorbic acid, tartaric acid, and saccharin sodium (previously sieved, if required), together with first part sieved sodium bicarbonate (open filter, closed bypass; jacket temperature of 40°C); backflash filter twice, evacuate to approximately 800 mbar, and close filter.
4. Mix with mixer for approximately 10 minutes (jacket temperature 40°C) at a speed of 50 rpm.
5. Turn off the mixer, and evacuate to 10 mbar (open filter, closed bypass; jacket temperature of 40°C).
6. Separately dissolve or suspend riboflavin in alcohol.
7. Suck this granulating liquid into the evacuated vessel at a mixer speed of 30 rpm (closed filter, closed bypass; jacket temperature of 40°C).
8. With jacket heating turned off, granulate up to a product temperature of 60°C at a mixer speed of 110 rpm (time required is approximately 20–25 minutes).
9. At a jacket temperature of 56°C and a mixer rotation speed of approximately 15 rpm, dry for 2 to 5 minutes (closed filter, open bypass).
10. When dust develops in the course of further drying, close the bypass and open the filter.
11. At a mixer speed of 20 rpm and interval setting (2 min/15 s), continue the drying at a jacket temperature of approximately 58°C and vacuum of 10 mbar until a total drying time of 10 to 20 minutes is reached.
12. Sieve the active substance granulate by sucking it by means of vacuum at a jacket temperature of approximately 59°C and a mixer speed of 20 rpm through a Buehler universal mill (1.5 mm screen) directly into a suitable container.
13. Preferable RH of the active substance is less than 10%.
14. Sieve milled sodium chloride and lime flavor through a round hand sieve (1 mm) with a diameter of approximately 38 cm. Add to sieved sodium carbonate (second part) in a mixing drum, and mix (e.g., tumble mix, 19 rpm for 10 minutes).
15. Combine this dry mix (sucked by vacuum) with the active substance granulate.
16. Finally, add the remaining sieved and lump-free sodium bicarbonate (third part).
17. Mix the mixture that is ready for compression for 45 minutes.
18. The preferable RH of the mixture is less than 20%.
19. In a suitable rotary tablet press, compress effervescent tablets with a weight of 4600 mg and a hardness of 8 kpi.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ascorbic acid (powder), with excess	112.00
200.00	2	Sorbitol (instant)	200.00
1000.00	3	Anhydrous citric acid	1000.00
587.00	4	Sodium bicarbonate	587.00
65.00	5	PEG-6000 (powder)	65.00
10.00	6	Lemon flavor	10.00
25.00	7	Cyclamate sodium	25.00
1.00	8	Saccharin sodium	1.00

Manufacturing Directions

1. Dry the sodium bicarbonate for 1 hour at 100°C, mix with the other components, pass all through a 0.8 mm sieve, and press with high compression force at a maximum atmospheric RH of 30%.
2. Compress 2050 mg in 20 mm biplanar punches.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
1000.00	1	Ascorbic acid (crystalline)	1000.00
800.00	2	Sorbitol (crystalline)	800.00
150.00	3	Anhydrous citric acid	150.00
660.00	4	Sodium bicarbonate	660.00
80.00	5	PEG-6000 (powder)	80.00
QS	6	Lemon flavor	QS
QS	7	Cyclamate sodium	QS
QS	8	Saccharin sodium	QS

Manufacturing Directions

1. Dry the sodium bicarbonate for 1 hour at 100°C, mix with the other components, pass all through a 0.8 mm sieve, and press with high compression force at a maximum atmospheric RH of 30%.
2. Compress 2690 mg in 20 mm biplanar punches.

VITAMIN C EFFERVESCENT TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
500.00	1	Sodium hydrogen carbonate	500.00
430.00	2	Tartaric acid	430.00
8.00	3	Kollidon® 25	8.00
0.20	4	2-Propanol	200.00 mg
550.00	5	Ascorbic acid (crystalline)	550.00
660.00	6	Sucrose	660.00
67.00	7	PEG-6000 (powder)	67.00
67.00	8	Dextrose (powder)	67.00
10.00	9	Orange flavor	10.00
1.00	10	Saccharin sodium	1.00

Manufacturing Directions

1. Granulate mixture of items 1 and 2 with solution of items 2 and 3, pass through a 0.5 mm sieve, and dry at 60°C.
2. Dry mixture of items 5 and 6 at 60°C.
3. Mix together with the previous granules and with items 7 to 10.
4. At a maximum atmospheric RH of 30%, press to effervescent tablets.
5. Compress 2300 mg in 20 mm biplanar punches.

VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ascorbic acid (coated), with excess	104.00
2.40	2	Anhydrous colloidal silica (Aerosil® 200)	2.40
60.00	3	Cellulose (microcrystalline) (Avicel™ PH102)	60.00
0.13	4	FD&C Yellow dye No.10 lake	0.13
37.00	5	Lactose (spray dried)	37.00
3.20	6	Glyceryl behenate (glyceryl monostearate)	3.20
2.40	7	Stearic acid (fine powder)	2.40
1.00	8	Magnesium stearate	1.00

Manufacturing Directions

1. Processing should be done under controlled temperature and humidity (limit: RH, 40–50%; temperature, 20–25°C).
2. Mix items 5 and 4 in a polyethylene bag for 1 to 2 minutes.
3. Sift twice through a 630 μm sieve.
4. Collect in a polyethylene bag.
5. Check the uniformity of dispersion.
6. If required, sift again.
7. Sift item 3.
8. Sift mixture from first step and item 2 through a 630 μm sieve.
9. Load into a drum blender.
10. Sift item 4 through a 630 μm sieve.
11. Load into the mix in the drum blender.
12. Mix items 6, 7, and 8 in a polyethylene bag for 1 to 2 minutes.
13. Sift through a 250 μm sieve.
14. Collect in a polyethylene bag.
15. Add 13.33 g to 20.00 g of granules to the lubricant mixture.
16. Mix for 1 to 2 minutes.
17. Add this to the mix in a stainless steel drum blender.
18. Mix in a drum blender for 2 minutes.
19. Check the temperature and humidity before beginning compression (limit: RH, 40–45%; temperature, 20–25°C).
20. Compress 210 mg in 8 mm round concave punches.

VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Ascorbic acid (powder)	100.00
232.00	2	Ludipress®	232.00
1.00	3	Magnesium stearate	1.00

Manufacturing Directions

1. Mix all components, sieve, and press into 335 mg tablets.
2. Compression force affects disintegration time.

VITAMIN C TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
200.00	1	Ascorbic acid (powder)	200.00
231.00–256.00	2	Ludipress®	231.00–256.00
25.00	3	Kollidon® VA 64	25.00
15.00	4	Kollidon® CL	15.00
1.20	5	Aerosil® 200	1.20
2.50	6	Magnesium stearate	2.50

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm screen, and press with medium compression force (18 kN).
2. Compress 499 mg in 12 mm biplanar punches.

VITAMIN E AND BENZOCAINE SOLUTION

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
50.00	1	Vitamin E acetate	50.00
20.00	2	Benzocaine	20.00
50.00	3	Lutrol F 127	50.00
250.00	4	Cremophor (RH, 40%)	250.00
2.00	5	Sorbic acid	2.00
628.00	6	Water	628.00

Manufacturing Directions

1. Dissolve sorbic acid and benzocaine in water at 60°C, and slowly add the heated mixture of vitamin E acetate and Cremophor at an RH of 40% and temperature of 60°C to 65°C.
2. Cool the clear solution to approximately 5°C, and dissolve Lutrol F 127 to obtain a clear, colorless viscous liquid.

VITAMIN E CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
100.00	1	Vitamin E acetate (SD 50)	200.00
493.00	2	Ludipress®	493.00
390.00	3	Sorbitol (crystalline)	390.00
100.00	4	Mannitol	100.00
400.00	5	Dicalcium phosphate (granulated with 5% Kollidon® 30)	400.00
7.00	6	Aerosil® 200	7.00
3.00	7	Magnesium stearate	3.00

Manufacturing Directions

1. Mix all components, pass through a 0.8 mm screen, and press with high compression force.
2. Compress 711 mg in 12 mm biplanar punches.

VITAMIN E CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
150.00	1	Vitamin E acetate (dry powder, 50%)	300.00
300.00	2	Sorbitol	300.00
6.00	3	Aerosil® 200	6.00
0.20	4	Saccharin sodium	0.20
6.00	5	Magnesium stearate	6.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 620 mg in 12 mm biplanar punches.

VITAMIN E CHEWABLE TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
400.00	1	Vitamin E acetate (dry powder, SD 50)	800.00
790.00	2	Ludipress®	790.00
20.00	3	Aerosil® 200	20.00
QS	4	Flavors	QS

Manufacturing Directions

1. Pass all components through a 0.5 mm sieve, mix, and press with high compression force.
2. Compress 1665 mg tablets in 20 mm biplanar punches.

VITAMIN E CONCENTRATE (WATER-MISCIBLE)

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
105.00	1	Vitamin E acetate	105.00
250.00	2	Cremophor (RH, 40%)	250.00
QS	3	Preservative	QS
QS	4	Water	QS to 1 L

Manufacturing Directions

1. Heat the mixture of items 1 and 2 and solution of item 3 in item 4 separately to approximately 65°C.
2. Slowly add to the well-stirred solution to obtain a clear, colorless liquid that is miscible with water.

VITAMIN E DROPS

Bill of Materials

Scale (mg/mL)	Item	Material Name	Qty/L (g)
50.00	1	Vitamin E acetate	50.00
160.00	2	Cremophor (RH, 40%)	160.00
QS	3	Preservative	QS
QS	4	Water	QS to 1 L

Manufacturing Directions

1. Heat mixture of items 1 and 2 and solution of item 3 in 4 to approximately 65°C.
2. Add them slowly to obtain a clear or lightly opalescent, colorless liquid.

VITAMIN E GEL CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
100.00	1	Vitamin E acetate	100.00
150.00	2	Propylene glycol (pharma)	150.00
200.00	3	Lutrol F 127	200.00
550.00	4	Water	550.00

Manufacturing Directions

1. Mix vitamin E acetate with propylene glycol, and add the water.
2. After cooling to approximately 6°C, slowly dissolve Lutrol F 127 in the well-stirred mixture.
3. Maintain cool until the air bubbles escape to obtain a turbid white gel at temperatures from 20°C to 50°C with viscosity at 25°C of approximately 120,000 mPa.

VITAMIN E SOFTGEL CAPSULES

Bill of Materials

Scale (mg/Capsule)	Item	Material Name	Qty/1000 Capsules (g)
400.00	1	Vitamin E preparation, USP	400.00
25.00	2	Soybean oil, USP	25.00
QS	3	Gelatin mass (clear)	QS

Manufacturing Directions

1. Weigh items 1 and 2, and transfer into a suitable stainless steel container; mix for a minimum of 1 hour, screen, and transfer into tanks through a No. 80 to No. 100 mesh of stainless steel.
2. Encapsulate 425 mg of mixture into size 7.5 oval capsules using clear gelatin mass.

VITAMIN E SOLUTION WITH ETHANOL

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/L (g)
0.10	1	Vitamin E acetate	0.10
4.00–5.00	2	Cremophor, EL	4.00–5.00
570.00	3	Water	570.00
380.00	4	Ethanol (96%)	380.00

Manufacturing Directions

1. Heat mixture of item 1 and 2 to approximately 60°C. Stir well.
2. Slowly add the warm solvent mixture of items 3 and 4 to obtain a clear, colorless liquid of low viscosity.

VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Vitamin E acetate (dry powder, SD 50)	100.00
140.00	2	Mannitol	140.00
140.00	3	Tablettose®	140.00
15.00	4	Kollidon® VA 64	15.00
2.00	5	Magnesium stearate	2.00
10.00	6	Aerosil® 200	10.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 410 mg in 12 mm biplanar punches.

VITAMIN E TABLETS

Bill of Materials

Scale (mg/tablet)	Item	Material Name	Qty/1000 Tablets (g)
50.00	1	Vitamin E acetate (dry powder, SD 50)	100.00
300.00	2	Sorbitol (crystalline)	300.00
3.00	3	Magnesium stearate	3.00
3.00	4	Aerosil® 200	3.00

Manufacturing Directions

1. Pass all components through a 0.8 mm sieve, mix, and press with high compression force.
2. Compress 413 mg in 12 mm biplanar punches.

ZINC OXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
7.00	1	Magnesium aluminum silicate	7.00
641.00	2	Water	641.00
7.00	3	Unimulse C	7.00
30.00	4	Propylene glycol	30.00
30.00	5	Eucalyptus oil	30.00
30.00	6	Lanolin oil	30.00
50.00	7	Dimethicone (350 cS)	50.00
50.00	8	Benzoate alcohol (C12–C15)	50.00
100.00	9	Polysorbate 80	100.00
50.00	10	Zinc oxide	50.00
10.00	11	Cornstarch	10.00
QS	12	Preservatives	QS

Manufacturing Directions

1. Slowly add item 1 to the water, agitating with maximum shear until smooth.
2. Add items 3 and 4, mixing each time until uniform.
3. Mix items 5 to 10 until uniform, and mix with other portions until uniform.
4. Add items 11 and 12, and mix until smooth.

ZINC OXIDE OINTMENT

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
120.00	1	Cetearyl alcohol, PEG-40 castor oil, and sodium cetearyl sulfate	120.00
180.00	2	Petrolatum	180.00
60.00	3	Oleoyl oleate	60.00
60.00	4	Mineral oil (light)	60.00
100.00	5	Zinc oxide	100.00
QS	6	Water	QS
10.00	7	Propylene glycol, diazolidinyl urea, methylparaben, and propylparaben	10.00

Manufacturing Directions

1. Mix and heat items 1 to 5 to 70°C to 75°C.
2. Mix and heat items 6 and 7 to 70°C to 75°C.
3. While stirring, add second mixture to first mixture.
4. Begin cooling, and continue stirring until batch reaches 30°C; then, homogenize.

ZINC PYRITHIONE SHAMPOO

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/1000 Tablets (g)
547.50	1	Deionized water	547.50
7.50	2	Hydroxyethylcellulose	7.50
347.00	3	TEA-lauryl sulfate	347.00
43.00	4	PEG-20 lanolin alcohol ether	43.00
20.00	5	Glycol stearate	20.00
15.00	6	Cocamide MEA	15.00
10.00	7	Zinc pyrithione (48%)	20.00
QS	8	Fragrance, preservative	QS

Manufacturing Directions

1. Add item 2 to the water, and mix.
2. In a separate vessel, combine items 3 to 5, heat to 80°C, and mix.
3. Cool to 50°C.
4. Add items 6 and 7, and mix.
5. Add this mixture to mixture of item 2.
6. Cool to 40°C, and add item 8.

ZINC UNDECYLENATE CREAM

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
7.50	1	Magnesium aluminum silicate	7.50
487.50	2	Deionized water	487.50
100.00	3	Sorbitol 70%	100.00
10.00	4	Polysorbate 80	10.00
200.00	5	Zinc undecylenate	200.00
50.00	6	Caprylic acid	50.00
30.00	7	C12–C15 benzoate alcohol	30.00
15.00	8	Polysorbate 80	15.00
20.00	9	C18–C36 acid	20.00
80.00	10	Glyceryl stearate and PEG-100 stearate	80.00
QS	11	Preservatives	QS

Manufacturing Directions

1. Slowly add item 1 in the water, mixing with maximum available shear until smooth.
2. Add items 2 to 5 in order, mixing each until uniform.
3. Avoid incorporating air. Heat with stirring to 70°C to 75°C.
4. Heat items 6 to 10 separately to 70°C to 75°C, and add to the mixture with mixing while cooling. Fill at 45°C to 50°C.

ZIRCONIUM OXIDE LOTION

Bill of Materials

Scale (mg/g)	Item	Material Name	Qty/kg (g)
15.00	1	Magnesium aluminum silicate	15.00
3.00	2	Carboxymethylcellulose sodium (medium viscosity)	3.00
796.50	3	Water	796.50
40.00	4	Zirconium oxide	40.00
50.00	5	Propylene glycol	50.00
80.00	6	Isopropyl alcohol	80.00
15.00	7	Benzocaine	15.00
0.50	8	Menthol	0.50
QS	9	Preservative	QS

Manufacturing Directions

1. Dry blend items 1 and 2, and slowly add them to the water while agitating with maximum shear until smooth.
2. Add items 4 and 5 and then items 6 to 9. Mix.

Cosmetic Formulations

LIGHT LIP GLOSS

Ingredient	Content (w/w%)
Pentaerythrityl tetraisostearate	37.99
Triisostearin	4.00
Diisostearyl malate	4.00
Glyceryl behenate/eicosadioate	3.00
Polyethylene terephthalate polymethyl methacrylate	1.00
C.i. 15985	0.01
Hydrogenated polyisobutene[a]	50.00
Total	100.00

[a] Kinetic viscosity (98.9°C): 300 mm^2/s

Manufacturing Directions

1. Heat all ingredients to 80°C, and dissolve them.
2. Mix uniformly.
3. Pour into a mold, and cool to 25°C.

HEAVY LIP GLOSS

Ingredient	Content (w/w%)
Pentaerythrityl tetraisostearate	28.00
Triisostearin	10.00
Diisostearyl malate	8.00
Glyceryl behenate/eicosadioate	2.00
Polyethylene terephthalate Polymethyl methacrylate	2.00
Hydrogenated polyisobutene[a]	50.00
Total	100.00

[a] Kinetic viscosity (98.9°C): 800 mm^2/s

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 80°C, and dissolve them.
2. Mix uniformly.
3. Pour into a mold, and cool to 25°C.

LIP CARE PASTE

	Ingredient	Content (w/w%)
A	Polyglyceryl-10 behenate/eicosadioate	4.00
	Glycerin	24.00
	Diglycerin	7.00
	Water	5.00
B	Glyceryl behenate/eicosadioate	3.00
	Diisostearyl malate	54.50
C	Pigment base	2.50
Total	100.00	

PIGMENT BASE : PENTAERYTHRITYL TETRAISOSTEARATE (60.0 w/w%), C.I. 45440 (32.0 w/w%), C.I.19140 (8.0 w/w%)

Manufacturing Directions

1. Manufacturing Directions Heat A ingredients to 80°C, and dissolve.
2. Mix uniformly.
3. Heat B ingredients to 80°C, and dissolve.
4. Mix uniformly.
5. Add product of step 4 to product of step 2 while mixing by a dispersion mixer.
6. Cool to 60°C.
7. Add C ingredients slowly while mixing.
8. Cool to 25°C.

LIPSTICK, BASIC

Ingredient	Content (w/w%)
Polyglyceryl-2 triisostearate	36.00
Neopentylglycol dicaprate	16.00
Hydrogenated polydecene	6.00
Dipentaerythrityl hexahydroxystearate/ hexastearate/ hexarosinate	16.00
Cholesteryl hydroxystearate	2.00
Ceresin	7.00
Euphorbia cerifera (candelilla) wax	7.00
Pigment base[a]	10.00
Total	100.00

[a] PIGMENT BASE: (DIISOSTEARYL MALATE) (50.0 w/w%), TITANIUM DIOXIDE (30.0 w/w%), C.I. 15850 (D&C Red No.6) (10.0 w/w%), C.I. 15850 (D&C Red No.7) (5.0 w/w%), MICA (5.0 w/w%)

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 90°C and dissolve them.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 20°C rapidly.

LIPSTICK, LIGHT GLOSSY

Ingredient	Content (w/w%)
Dipentaerythrityl tripolyhydroxystearate	12.00
Polyglyceryl-2 tetraisostearate	24.00
Diisostearyl malate	18.00
Hydrogenated polydecene	23.00
Ceresin	12.00
Polyethylene	1.00
Pigment base[a]	10.00
Total	100.00

[a] PIGMENT BASE: (DIISOSTEARYL MALATE) (50.0 w/w%), TITANIUM DIOXIDE (30.0 w/w%), C.I. 15850 (D&C Red No.6) (10.0 w/w%), C.I. 15850 (D&C Red No.7) (5.0 w/w%), MICA (5.0 w/w%)

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 100°C, and dissolve them.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 20°C rapidly.

LIPSTICK, CLEAR

Ingredient	Content (w/w%)
Triethylhexanoin	10.00
Hydrogenated polydecene	11.00
Diisostearyl malate	36.50
Cetyl ethylhexanoate	5.00
Dipentaerythrityl hexahydroxystearate/hexastearate/ hexarosinate	12.00
Trehalose isostearate esters	5.00
Euphorbia cerifera (candelilla) wax	4.00
Paraffin	3.00
Beeswax	1.50
Copernicia cerifera (carnauba) wax	1.00
Pigment base[a]	6.00
Pigment mixture[b]	5.00
Total	100.00

[a] PIGMENT BASE: (DIISOSTEARYL MALATE) (50.0 w/w%), TITANIUM DIOXIDE (30.0 w/w%), C.I. 15850 (D&C Red No. 6) (10.0 w/w%), C.I. 15850 (D&C Red No. 7) (5.0 w/w%), MICA (5.0 w/w%)

[b] PIGMENT MIXTURE: MICA (46.5 wt/wt%), TITANIUM DIOXIDE (43.0 wt/wt%), IRON OXIDES (5.5 w/w%), ALUMINA (5.0 w/w%)

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 90°C, and dissolve them.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 20°C rapidly.

LIPSTICK, SMOOTH

Ingredient	Content (w/w%)
Glyceryl tribehenate/isostearate/eicosandioate	6.00
Polyglyceryl-2 tetraisostearate	12.00
Hydrogenated polydecene	33.00
Diisostearyl malate	26.00
Ceresin	11.00
Pigment base[a]	12.00
Total	100.00

[a] PIGMENT BASE: (DIISOSTEARYL MALATE) (50.0 w/w%), TITANIUM DIOXIDE (30.0 w/w%), C.I. 15850 (D&C Red No. 6) (10.0 w/w%), C.I. 15850 (D&C Red No. 7) (5.0 w/w%), MICA (5.0 w/w%)

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 90°C, and dissolve them.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 20°C rapidly.

LIPSTICK (MOISTURE-RICH LIPSTICK)

Ingredient	Content (w/w%)
Dipentaerythrityl tripolyhydroxystearate	5.00
Glycerin	1.00
Triethylhexanoin	15.00
Polyglyceryl-2 triisostearate	24.00
Diisostearyl malate	19.00
Dipentaerythrityl hexahydroxystearate/hexastearate/ hexarosinate	10.00
Ceresin	4.80
Euphorbia cerifera (candelilla) wax	8.00
Microcrystalline wax	3.20
Pigment base[a]	10.00
Total	100.00

Manufacturing Directions

1. Heat all ingredients to 90°C, and dissolve.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 20°C rapidly.

BASE CREAM

	Ingredient	Content (w/w%)
A	Isotridecyl isononanoate	2.00
	Trehalose isostearate esters	1.00
	Cyclopentasiloxane	29.52
	Dimethicone/peg-10/15 cross polymer, Dimethicone	1.00
	Peg-10 dimethicone	4.00
	Titanium dioxide	3.00
	Iron oxides	0.23
	Vinyl dimethicone/methicone Silsesquioxane crosspolymer	10.00
	Polymethyl methacrylate	5.00
	Tocopherol	0.05
B	Ethanol	5.00
	Butylene glycol	3.00
	Sodium chloride	0.50
	Methylparaben	0.20
	Phenoxyethanol	0.50
	Water	35.00
	Total	100.00

Manufacturing Directions

1. Dissolve A ingredients at 25°C, and disperse uniformly.
2. Dissolve B ingredients at 25°C, and mix uniformly.
3. Add product of step 2 slowly to product of step 1 while mixing by a dispersion mixer.

OIL-BASED FOUNDATION

Ingredient	Content (w/w%)
Hydrogenated polydecene	17.00
Ethylhexyl palmitate	9.50
Trehalose isostearate esters	1.00
Phenyl trimethicone	4.50
Dimethicone	14.75
Microcrystalline wax	2.00
Paraffin	6.00
Titanium dioxide	9.52
Iron oxides	4.08
Mica	21.50
Polymethyl methacrylate	10.00
Tocopherol	0.05
Butylparaben	0.05
Methylparaben	0.05
Total	100.00

Manufacturing Directions

1. Heat all ingredients to 80°C, and dissolve.
2. Disperse uniformly.
3. Grind by a three-roll mill.
4. Heat to 80°C.
5. Pour into a mold.
6. Cool to 0°C.

SUNSCREEN (MOISTURE TYPE)

	Ingredient	Content (w/w%)
A	Diisostearyl malate	5.50
	Glyceryl tribehenate/isostearate/eicosandioate	3.00
	Cyclopentasiloxane	13.50
	Dimethicone[a]	9.00
	Peg-10 dimethicone	3.00
	Titanium dioxide	9.00
B	Butylene glycol	5.00
	Sodium chloride	1.00
	Methylparaben	0.20
	Water	50.80
	Total	100.00

[a] Kinetic viscosity (25.0°C): 10 mm^2/s

Manufacturing Directions

1. Manufacturing Directions Heat A ingredients to 70°C, and dissolve.
2. Disperse uniformly.
3. Heat B ingredients to 70°C, and dissolve.
4. Mix uniformly.
5. Add product of step 4 slowly to product of step 2 while mixing by a dispersion mixer.
6. Cool to 30°C.

SUNSCREEN (FRESH TYPE)

	Ingredient	Content (w/w%)
A	Erythrityl triethylhexanoate	4.50
	Glyceryl tribehenate/isostearate/eicosandioate	3.00
	Cyclopentasiloxane	13.50
	Dimethicone[a]	9.00
	Peg-10 dimethicone	3.00
	Titanium dioxide	10.00
B	Butylene glycol	5.00
	Sodium chloride	1.00
	Methylparaben	0.20
	Water	50.80
	Total	100.00

[a] Kinetic viscosity (25.0°C): 10 mm^2/s

MANUFACTURING DIRECTIONS

1. Manufacturing Directions Heat A ingredients to 70°C, and dissolve.
2. Disperse uniformly.
3. Heat B ingredients to 70°C, and dissolve.
4. Mix uniformly.
5. Add product of step 4 slowly to product of step 2 while mixing by a dispersion mixer.
6. Cool to 30°C.

WATERPROOF EYE LINER

Ingredient	Content (w/w%)
Glyceryl tribehenate/isostearate/eicosandioate	8.00
Erythrityl triethylhexanoate	1.00
Microcrystalline wax	6.00
Silica	1.00
Hydrogenated polyisobutene[a]	58.00
Iron oxides	15.00
Mica	11.00
Total	100.00

[a] Kinetic viscosity (37.8°C): 1.28 mm^2/s

Manufacturing Directions

1. Manufacturing Directions Heat all ingredients to 90°C, and dissolve.
2. Disperse uniformly by a dispersion mixer.
3. Pour into a mold, and cool to 25°C.

OIL-BASED FACIAL CLEANSER (AVAILABLE IN WET CONDITION)

	Ingredient	Content (w/w%)
A	Polyglyceryl-10 dioleate	14.00
	Polyglyceryl-2 sesquicaprylate	6.00
	Cetyl ethylhexanoate	79.90
B	Perfume	0.10
	Total	100.00

MANUFACTURING DIRECTIONS

1. Heat A ingredients to 80°C, and dissolve.
2. Mix uniformly.
3. Cool to 25°C.
4. Add B ingredients to product of step 3, and mix uniformly.

OIL-BASED FACIAL CLEANSER (FOR HEAVY MAKE-UP)

	Ingredient	Content (w/w%)
A	Polyglyceryl-10 dioleate	14.00
	Polyglyceryl-2 sesquicaprylate	6.00
	Cetyl ethylhexanoate	71.90
	Isononyl isononanoate	8.00
B	Perfume	0.10
	Total	100.00

Manufacturing Directions

1. Heat A ingredients to 80°C, and dissolve.
2. Mix uniformly.
3. Cool to 25°C.
4. Add B ingredients to product of step 3, and mix it uniformly.

OIL-FREE FACIAL CLEANSER (LIQUID)

Ingredient	Content (w/w%)
Peg-20 glyceryl triisostearate	10.00
Peg-20 glyceryl isostearate	10.00
Dipropylene glycol	30.00
Sodium citrate	0.07
Citric acid	0.03
Water	49.80
Perfume	0.10
Total	100.00

Manufacturing Directions

1. Dissolve all ingredients at 25°C.
2. Mix uniformly.

OIL-FREE FACIAL CLEANSER (GEL)

	Ingredient	Content (w/w%)
A	Polyglyceryl-10 behenate/eicosadioate	5.00
	PEG-20 glyceryl triisostearate	12.50
	PEG-20 glyceryl isostearate	12.50
	Dipropylene glycol	30.00
	Glycerin	10.00
	Water	17.20
B	1% carbomer solution (aq.)	10.00
C	1% sodium hydroxide solution (aq.)	2.60
D	Perfume	0.20
	Total	100.00

Manufacturing Directions

1. Heat A ingredients to 80°C, and dissolve.
2. Disperse uniformly by a dispersion mixer, and cool to 50°C.
3. Add B ingredients to product of step 2 while mixing.
4. Add C ingredients to product of step 3 while mixing.
5. Add D ingredients to product of step 4 while mixing.
6. Cool to 25°C.

MAKE-UP REMOVER (SEPARATE TYPE)

	Ingredient	Content (w/w%)
A	Erythrityl triethylhexanoate	15.00
	Cyclopentasiloxane	25.00
B	Butylene glycol	20.00
	Sodium chloride	1.00
	Water	38.90
	0.1% C.I. 42090 solution (aq.)	0.10
	Total	100.00

Manufacturing Directions

1. Dissolve A ingredients at 25°C, and mix uniformly.
2. Dissolve B ingredients at 25°C, and mix uniformly.
3. Pour both mixes into a mold.

CLEANSING PASTE

	Ingredient	Content (w/w%)
A	Polyglyceryl-10 behenate/eicosadioate	7.00
	Polyglyceryl-10 oleate	1.00
	Glycerin	24.00
	Butylene glycol	10.00
	Water	8.00
B	Glyceryl behenate/eicosadioate	3.00
	Hydrogenated lecithin	1.00
	Ethylhexyl palmitate	31.90
	Olea europaea (olive) fruit oil	14.00
C	Perfume	0.10
	Total	100.00

Manufacturing Directions

1. Heat A ingredients to 75°C, and dissolve.
2. Mix uniformly.
3. Heat B ingredients to 75°C, and dissolve.
4. Mix uniformly.
5. Add product of step 4 to product of step 2 while mixing by a dispersion mixer.
6. Cool to 60°C.
7. Add C ingredients to product of step 6, and cool to 25°C.

MASSAGE GEL

	Ingredient	Content (w/w%)
A	3-hydrogenated lecithin	1.00
	Isopentyldiol	10.00
	Glycerin	30.00
	Water	3.00
B	Triethylhexanoin	18.00
	Mineral oil	38.00
	Total	100.00

Manufacturing Directions

1. Heat A ingredients to 80°C, and dissolve.
2. Mix uniformly.
3. Heat B ingredients to 80°C, and dissolve.
4. Mix uniformly.
5. Add product of step 4 very slowly to product of step 2 while mixing by a dispersion mixer.
6. Continue to mix after adding for over 10 minutes.
7. Cool product of step 6 to 50°C while mixing by a dispersion mixer.
8. Cool to 25°C without mixing.

Part IV

Tablet Coating Formulations

Taylor & Francis
Taylor & Francis Group
http://taylorandfrancis.com

INTRODUCTION

Solid dosage forms are frequently coated for varied purposes, including the following:

- Mask taste and smell.
- Offer protection from the environment.
- Provide protection from gastric acid (enteric coating).
- Make dose easy to swallow.
- Provide identification.
- Add esthetic appeal.
- Hide surface defects.

Many types of coatings are available.

I. Sugar coating: Compressed tablets are coated with a colored or uncolored sugar layer that is water soluble and quickly dissolves after swallowing. The sugar coat protects the enclosed drug from the environment and provides a barrier to objectionable taste or odor. The sugar coat also enhances the appearance of the compressed tablet and permits manufacturing information to be imprinted. Sugar coating provides a combination of insulation, taste masking, smoothing the tablet core, coloring, and modified release. The disadvantages of sugar coating are the time and expertise required in the coating process and increased size, weight, and shipping costs. The sugar-coating process involves five separate operations:

   a. Sealing/waterproofing: Prior to applying any sugar/water syrup, the tablet cores must be sealed, thoroughly dried, and free of all residual solvents. The seal coat provides a moisture barrier and hardness to the surface of the tablet in order to minimize attritional effects. Core tablets having very rapid disintegration rates conceivably could start the disintegration process during the initial phase of sugar coating. The sealants are generally water-insoluble polymers/film formers applied from an organic solvent solution. The quantities of material applied as a sealing coat will depend primarily on the tablet porosity, since highly porous tablets will tend to soak up the first application of solution, thus preventing it from spreading uniformly across the surface of every tablet in the batch. Hence, one or more further applications of resin solution may be required to ensure that the tablet cores are sealed effectively. Common materials used as a sealant include shellac, zinc sulfate, cellulose acetate phthalate (CAP), polyvinylacetate phthalate, hydroxypropyl cellulose, hydroxypropyl methylcellulose, etc.

   b. Subcoating: Subcoating is the actual start of the sugar-coating process and provides the rapid buildup necessary to round up the tablet edge. It also acts as the foundation for the smoothing and color coats. Generally, two methods are used for subcoating. Dusting with powder and then drying is required when applying gum based solution and the routine is repeated until the desired shape is achieved. The other method is where a suspension of dry powder in gum/sucrose solution is applied, followed by drying the tablets. Thus, subcoating is a sandwich of alternate layers of gum and powder. It is necessary to remove the bulk of the water after each application of coating syrup.

   c. Grossing/smoothing: The grossing/smoothing process is specifically for smoothing and filing the irregularity on the surface generated during subcoating. It also increases the tablet size to a predetermined dimension. If the subcoating is rough with a large amount of irregularities, then the use of grossing syrup containing suspended solids will provide more rapid buildup and better filling qualities. Smoothing usually can be accomplished by the application of a simple syrup solution (approximately 60%–70% sugar solid). This syrup generally contains pigments, starch, gelatin, acacia, or opacifier if required. Small quantities of color suspension can be applied to impart a tint of the desired color when there are irregularities in coating.

   d. Color coating: This stage is often critical in the successful completion of a sugar coating process and involves the multiple application of syrup solution (60%–70% sugar solid) containing the requisite coloring matter. Mainly soluble dyes were used in the sugar coating to achieve the desired color, since a soluble dye will migrate to the surface during drying. But nowadays, insoluble certified lakes have virtually replaced the soluble dyes in pharmaceutical tablet coating. The most efficient process for color coating involves the use of a predispersed opacified lake suspension.

   e. Polishing: Sugar-coated tablets need to be polished to achieve a final elegance. Polishing is achieved by applying a mixture of waxes such as beeswax, carnauba wax, candelilla wax, or hard paraffin wax to tablets in a polishing pan.

II. Film Coating: Film coating is the deposition of a thin film of polymer surrounding the tablet core. Conventional pan equipment may be used, but nowadays, more sophisticated equipment is employed to provide a high degree of automation and coating time. The polymer is solubilized into solvent. Other additives such as plasticizers and pigments are added. The resulting solution is sprayed onto a rotated tablet bed. The drying conditions cause removal of the solvent, giving a thin deposition of coating material around each tablet core. Usually, a spray process is employed in the preparation of film-coated tablets. The Accela Cota is the prototype of a perforated cylindrical drum providing high drying air capacity. Fluidized-bed equipment has made a considerable impact; here, tablets are moving in a stream of air passing through the perforated bottom of a cylindrical column. With a smaller cylindrical insert, the stream of cores is rising in the center of the device together with a spray mist applied in the middle of the bottom. For fluidized-bed coating, very hard tablets (hardness >20 N) have to be used. The fundamental requirements are independent of the actual type of equipment being used and include adequate means of atomizing the spray liquid for application to the tablet core, adequate mixing and agitation of the tablet bed, and sufficient heat input in the form of drying air to provide the latent heat of evaporation of the solvent. This is particularly important with aqueous-based spraying and good exhaust facilities to remove dust and solvent-laden air. The materials used in film coating include the following:

a. Film formers
   i. Hydroxypropyl methylcellulose (HPMC): This is available in different viscosity grades. It is a polymer of choice for air suspension and pan spray coating systems because of its solubility characteristics in gastric fluid and organic and aqueous solvent systems. The advantages are that it does not affect tablet disintegration and drug availability; it is cheap, flexible, and highly resistant to heat, light, and moisture; it has no taste and odor; and color and other additives can be easily incorporated. The disadvantage is that when it is used alone, the polymer has a tendency to bridge or fill the debossed tablet surfaces. So, a mixture of HPMC and other polymers/plasticizers is used.
   ii. Methylhydroxy ethylcellulose (MHEC): This is available in a wide variety of viscosity grades. It is not as frequently used as HPMC, because it is soluble in fewer organic solvents.
   iii. Ethylcellulose (EC): Depending on the degree of ethoxy substitution, different viscosity grades are available. It is completely insoluble in water and gastric fluids. Hence, it is used in combination with water-soluble additives such as HPMC and not alone. Unplasticized ethylcellulose films are brittle and require film modifiers to obtain an acceptable film formulation. Aquacoat is an aqueous polymeric dispersion utilizing ethylcellulose. These pseudolatex systems contain high-solids, low-viscosity compositions that have coating properties quite different from those of regular ethylcellulose solution.
   iv. Hydroxypropyl cellulose (HPC): This is soluble in water below 40°C (insoluble above 45°C), gastric fluid, and many polar organic solvents. HPC is extremely tacky as it dries from the solution system. It is used for subcoating and not for color or glass coating. It gives a very flexible film.
   v. Povidone: The degree of polymerization decides the molecular weight of the material. It is available in four viscosity grades: K-15, K-30, K-60, and K-90. The average molecular weight of these grades is 10,000, 40,000, 160,000, and 360,000, respectively. K-30 is widely used as a tablet binder and in tablet coating. It has excellent solubility in a wide variety of organic solvents, water, and gastric and intestinal fluids. Povidone can be cross-linked with other materials to produce films with enteric properties. It is used to improve the dispersion of colorants in coating solution.
   vi. Sodium carboxymethyl cellulose: This is available in medium-, high-, and extra high-viscosity grades. It is easily dispersed in water to form colloidal solutions but is insoluble in most organic solvents and hence, not a material of choice for coating solutions based on organic solvents. Films prepared using it are brittle but adhere well to tablets. Partially dried films are tacky. So, coating compositions must be modified with additives.
   vii. Polyethylene glycols (PEG): PEG with low molecular weights (200–600) are liquid at room temperature and are used as plasticizers. High–molecular weight PEG (900–8000 series) are white, waxy solids at room temperature. A combination of PEG waxes with CAP gives films that are soluble in gastric fluids.
   viii. Acrylate polymers: These are marketed under the name of Eudragit®. Eudragit® E is a cationic copolymer. Only Eudragit® E is freely soluble in gastric fluid up to pH 5 and expandable and permeable above pH 5. This material is available as an organic

solution (12.5% in isopropanol/acetone), a solid material, or a 30% aqueous dispersion. Eudragit® RL and RS are copolymers with a low content of quaternary ammonium groups. These are available only as organic solutions and solid materials. They produce films for delayed action (pH dependent).

b. Solvents: Mostly, solvents are used either alone or in combination with water, ethanol, methanol, isopropanol, chloroform, acetone, methylene chloride, etc. Water is more often used, because there are no environmental and economic considerations. For drugs that readily hydrolyze in the presence of water, nonaqueous solvents are used.
c. Plasticizers: As solvent is removed, most polymeric materials tend to pack together in a three-dimensional honeycomb arrangement. Both internal and external plasticizing techniques are used to modify the quality of the film. A combination of plasticizers may be used to get the desired effect. The concentration of plasticizer is expressed in relation to the polymer being plasticized. Recommended levels of plasticizers range from 1% to 50% by weight of the film former. Commonly used plasticizers are castor oil, propylene glycol (PG), glycerin, lower–molecular weight (200–400 series) PEG, surfactants, etc. For aqueous coating, PEG and PG are more used, while castor oil and spans are primarily used for organic solvent–based coating solutions. An external plasticizer should be soluble in the solvent system used for dissolving the film former and the plasticizer. The plasticizer and the film former must be at least partially soluble or miscible in each other.
d. Colorants: Colorants can be used in solution form or in suspension form. To achieve proper distribution of suspended colorants in the coating solution requires the use of powdered colorants (<10 microns). Most common colorants in use are certified FD&C or D& colorants. These are synthetic dyes or lakes. Lakes are the choice for sugar or film coating, as they give reproducible results. The concentration of colorants in the coating solutions depends on the color shade desired, the type of dye, and the concentration of opaquant-extenders. If a very light shade is desired, a concentration of less than 0.01% may be adequate; on the other hand, if a dark color is desired, a concentration of more than 2.0% may be required. Inorganic materials (e.g., iron oxide) and natural coloring materials (e.g., anthocyanins, carotenoids, etc.) are also used to prepare coating solutions. Magenta red dye is nonabsorbable in biologic systems and resistant to degradation in the gastrointestinal tract. Opasray® (opaque color concentrate for film coating) and Opadry® (complete film coating concentrate) are promoted as achieving less lot-to-lot color variation.
e. Opaquant-extenders: These are very fine inorganic powders used to provide more pastel colors and increase film coverage. These inorganic materials provide a white coat or mask the color of the tablet core. Colorants are very expensive, and high concentrations are required. These inorganic materials are cheap. In the presence of these inorganic materials, the amount of colorants required decreases. The most commonly used materials are titanium dioxide, silicate (talc and aluminum silicates), carbonates (magnesium carbonates), oxides (magnesium oxide), and hydroxides (aluminum hydroxides).
f. Other components: Flavors, sweeteners, surfactants, antioxidants, antimicrobials, etc. may be incorporated into the coating solution.

III. Enteric Coating: This can be applied as one homogeneous layer, which can be white–opaque or colored. The advantage is that only one application is needed. In a two-layer system, the enteric formulation is applied first, followed by colored film. Both layers can be of enteric polymer, or only the basic layer can contain enteric polymer while the top layer is a fast-disintegrating and water-soluble polymer. Polymers used for enteric coating include the following:
a. Cellulose acetate phthalate (CAP): This is widely used in industry. Aquateric is a reconstituted colloidal dispersion of latex particles. It is composed of solid or semisolid polymer spheres of CAP ranging in size from 0.05 to 3 microns. Cellulose acetate trimellitate (CAT), developed as an ammoniated aqueous formulation, showed faster dissolution than a similar formulation of CAP. Disadvantages include: It dissolves above pH 6 only, delays the absorption of drugs, is hygroscopic and permeable to moisture in comparison with other enteric polymer, and is susceptible to hydrolytic removal of phthalic and acetic acid, changing the film properties. CAP films are brittle and usually used with other hydrophobic film-forming materials.
b. Acrylate polymers: Eudragit® L & Eudragit® S are two forms of commercially available enteric acrylic resins. Both of them produce films resistant to gastric fluid. Eudragit® L and S are soluble in intestinal fluid at pH 6 and 7, respectively. Eudragit® L is available as an organic solution (in isopropanol), solid, or aqueous dispersion. Eudragit® S is available only as an organic solution (in isopropanol) and a solid.
c. Hydroxypropyl methylcellulose phthalate: HPMCP 50, 55, and 55-s (also called HP-50, HP-55, and HP-55-s) is widely used. HP-55 is

recommended for general enteric preparation, HP-50 and HP-55-s for special cases. These polymers dissolve at pH 5 to 5.5.

d. Polyvinyl acetate phthalate: This is similar to HP-55 in stability and pH-dependent solubility.
e. Enteric coating can be combined with polysaccharides that are degraded by enzymes in the colon; e.g., cyclodextrin and galactomannan.

IV. Controlled-Release Coating: Polymers such as modified acrylates, water-insoluble cellulose (ethylcellulose), etc., used for controlled-release coating.
V. Compressed Coating: This type of coating requires a specialized tablet machine. Compression coating is not widely used, but it has advantages in some cases in which the tablet core cannot tolerate organic solvent or water and yet needs to be coated for taste masking or to provide delayed or enteric properties to the finished product, and also to avoid incompatibility by separating incompatible ingredients.
VI. Electrostatic Coating: Electrostatic coating is an efficient method of applying coating to conductive substrates. A strong electrostatic charge is applied to the substrate. The coating material containing conductive ionic species of opposite charge is sprayed onto the charged substrate. Complete and uniform coating of corners and adaptability of this method to such relatively nonconductive substrates as pharmaceuticals are limited.
VII. Dip Coating: Coating is applied to the tablet cores by dipping them into the coating liquid. The wet tablets are dried in a conventional manner in a coating pan. Alternative dipping and drying steps may be repeated several times to obtain the desired coating. This process lacks the speed, versatility, and reliability of spray-coating techniques. Specialized equipment has been developed to dip coat tablets, but no commercial pharmaceutical application has been obtained.
VIII. Vacuum Film Coating: Vacuum film coating is a new coating procedure that employs a specially designed baffled pan. The pan is hot water jacketed, and it can be sealed to achieve a vacuum system. The tablets are placed in the sealed pan, and the air in the pan is displaced by nitrogen before the desired vacuum level is obtained. The coating solution is then applied with an airless spray system. The heated pan causes evaporation, and the vapor is removed by the vacuum system. Because there is no high-velocity heated air, the energy requirement is low, and coating efficiency is high. Organic solvent can be effectively used with this coating system with minimum environmental or safety concerns.

Formulations for tablet coating are often proprietary to various manufacturers, as these address several formulation needs, as described previously. The suppliers of coating ingredients are often very open to sharing the coating technology, and companies are highly encouraged to make use of them, more particularly where the coating materials have an open Drug Master File (DMF) available for regulatory filings. The following companies are a very good source of information:

Eudragit® (www.pharma-polymers.com/pharma-polymers/en/eudragit/)
Colorcon® (www.colorcon.com/products/coatings)
Methocel/Ethocel (www.dow.com/dowexcipients/applications/tablet_coating.htm)

The advantage of using these prepackaged formulations is consistency in color matching, as well as other considerations regarding ease of use. The most significant aspect remains the choice of colors, which often determines the method of manufacturing the coating solutions. With a limited choice of dyes and lakes available for selection, manufacturers often use a combination of several colors and dyes along with agents such as talc for opaqueness to obtain the desired color and protection.

Given in the following is a current listing of approved colors in various regulatory regions.

APPROVED DRUG COLORANTS FOR INTERNAL USE IN JAPAN-1[A]

Name	CAS Number	Color Index Number	Precedent Limit	Compendia
Black Iron Oxide	12227-89-3	77499	1.539 mg	JPE
Caramel			1500 mg	JPE
Carbon Black	1333-86-4	77268:1	0.096 mg	JPE
Carmine	1390-65-4	75470	1.8 mg	JPE
β-Carotene	7235-40-7	40800	0.1%	JPE
Copper Chlorophyll			1.8 mg	Japan Pharmaceutical Codex
Glycyrrhiza Extract			300 mg	JP
Gold Leaf	7440-57-5		14 mg	JPE
Light Anhydrous Silicic Acid	7631-86-9		2.6 g	JP
Medicinal Carbon	16291-96-6		150 mg	JP

Note: JP: Japansese Pharmamacopeia; JPE: Japanese Pharmaceutical Excipient Directory; JPC: Japanese Pharmaceutical Codex; NF: National Formulary

[a] These colorants appear in the application column in the Japanese Pharmaceutical Excipients Directory 2007 (Japanese Version) as coloring agents. Precedent limits are quoted from the Japanese Pharmaceutical Excipients Directory 2007 (Japanese version). Each limit represents the maximum daily intake that a patient should consume from the use of a particular dosage form.

APPROVED DRUG COLORANTS FOR INTERNAL USE IN JAPAN-2[A]

Name	Alternate Name	Color Index Number	CAS Number	Precedent Limit
Amaranth[c]	Red No. 2, Acid Red 27	16185	915-67-3	b

[a] Based on colors approved by the Ministry of Health and Welfare (MHW) "Ministerial Ordinance to establish Tar colors which can be used in Pharmaceuticals"; No. 30; August 31, 1966. Aluminum lakes of these colors are also authorized.

[b] Not more than 0.1% by weight of color (lake or dye) can be used in a dosage form. If one colorant was combined with other colorants, total weight of these colorants must be less than 0.1% of the final product.

[c] These colorants make the list of the application column in the Japanese Pharmaceutical Excipients Directory 2007 (Japanese Version) as coloring agents.

APPROVED DRUG COLORANTS FOR USE IN CANADA

I. Colorants Approved for Internal and External Drug Use

Color	Alternate Name	Color Index Number	CAS Number
Acid Fuchsin D	**D&C Red No. 33**	**17200**	**3567-66-6**
Alizarin Cyanine Green F	D&C Green No. 5	61570	4403-90-1
Allura Red AC	FD&C Red No. 40	16035	25956-17-6
Amaranth	Delisted FD&C Red No. 2	16185	915-67-3
Anthocyanin (derived from juice expressed from fresh edible fruits or vegetables)			
β-apo-8′ Carotenal	–	40820	1107-26-2
Brilliant Blue FCF Sodium Salt	FD&C Blue No. 0	42090	3844-45-8
Brilliant Blue FCF Ammonium Salt	D&C Blue No. 4	42090	6371-85-2
Canthaxanthin	–	40850	514-78-3
Caramel	–	–	–
Carbon Black	–	77266	1333-86-4
Carmine	–	75470	1260-17-9
Carmoisine	Azorubine	14720	3567-69-9
β-Carotene	–	40800	7235-40-7
Chlorophyll	–	75810	479-61-8
Eosin YS Acid Form	D&C Red No. 21	45380:2	15086-94-9
Eosin YS Sodium Salt	D&C Red No. 22	45380	17372-87-1
Erythrosine	FD&C Red No. 3	45430	16423-68-0

This list is derived from Annex 1 of Directive 94/36/EC, colors permitted for use in foodstuffs. European Medicines Agency (EMEA) Guideline EMEA/CHMP/QWP/396951/2006 states that colorants mentioned in this annex are permitted for use in medicinal products.

[a] This is not D&C Yellow No. 10. Although the C.I. numbers are the same, the dyes differ in composition. Quinoline yellow is primarily the disulfonated quinoline dye, whereas D&C Yellow No. 10 is the monosulfonated color. Quinoline yellow is not accepted for use in the United States; conversely, D&C Yellow No. 10 cannot be used in the EU.

Another choice confronting manufacturers is whether to use an aqueous coating or an organic coating system; both have their advantages and disadvantages. While organic coatings provide greater protection against moisture uptake during the coating process (important for moisture-sensitive ingredients) and are easier to apply because of the fast evaporation of solvents, problems encountered with these coatings include environmental control of organic solvents going into the atmosphere, the need to perform solvent residue tests, and the need to have explosion-proof facilities; thus, aqueous coating systems are often preferred.

CELLULOSE BASED

Cellulose acetate phthalate (CAP)

Caution: Check with regulatory authorities about approved states of all dyes before using them.

HYDROXYPROPYL METHYLCELLULOSE (METHOCEL, HPMC) AQUEOUS COATINGS

Methocel-based coatings in an aqueous base are the most popular coating options; two methods of making solutions are possible.

If a lake is used, then alcohol is also included (see, for example, Holberry Red).

A. Brite Rose

Bill of Materials			
Scale (%, w/v)	Item	Material Name	Quantity/L
6.00	1	Hydroxypropyl methylcellulose 2910 (15 cps)	60.00 g
2.00	2	PEG-400 (low color)	20.00 g
2.00	3	PEG-8000	20.00 g
0.25	4	FD&C Red No. 30 Lake	2.50 g
2.00	5	Titanium dioxide (special coating grade)	20.00 g
QS	6	Deionized purified water	QS to 1 L

Manufacturing Directions

1. Place 250 mL of water into a suitable container, and heat to 60°C to 70°C.
2. With gentle stirring, disperse the hydroxypropyl methylcellulose onto the hot water; when the cellulose has wetted, quickly add 250 mL of cold water.

3. Stir until the dispersion is homogeneous, although the solution of cellulose may not be complete.
4. Dissolve PEG-8000 in 50 mL of water, and then add to the preceding step.
5. Add PEG-400 to the basic solution.
6. Load a suitable-size ball jar with the FD&C Red Dye No. 30 and titanium dioxide.
7. Add sufficient water to cover the pigment and balls.
8. Mill overnight or for 12 hours.
9. Other pigment reduction methods may be used to yield a particle size not greater than 1.0 µm.
10. Add milled pigments to the base solution from the previous step, and bring the volume up with cold water.
11. Use within 7 days.

G. Clear

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
6.00	1	Hydroxypropyl methylcellulose 2910 (15 cps)	60.00 g
0.10	2	Sorbic acid	1.00 g
2.00	3	Alcohol (200 proof), SD 3A	20.00 mL
2.00	4	PEG-400 (low color)[a]	20.00 g
2.00	5	PEG-8000 (optional)	20.00 g
QS	6	Deionized purified water	QS to 1 L

[a] Increase amount to 6.00 if item 5 is not used.

Manufacturing Directions

1. Place approximately 500 mL of water into a suitable vessel.
2. Heat water to 65°C to 70°C.
3. Add the PEG-8000 to the hot water, and dissolve (if used).

4. While maintaining gentle agitation, sprinkle the hydroxypropyl methylcellulose onto the surface of the hot water solution.
5. Position stirring head to avoid excessive entrainment of air.
6. When the cellulose has been dispersed, add the PEG-400.
7. Continue to stir until dispersion is homogeneous, although solution of cellulose may not be complete.
8. Stop stirring, and allow solution to stand until entrained air is removed.
9. Dissolve sorbic acid in alcohol, and ensure that the solution is complete.
10. When the solution from the preceding step is clear, add 250 mL of cold water, mix well, and add sorbic acid solution.
11. Mix, then bring up to volume with cold water.
12. Store coating solution in well-filled, well-sealed containers.
13. Use within 3 months.

0.75	7	Opadry-OY-S 29019 (clear)	0.75
QS	8	Purified water	225.00

Manufacturing Directions

1. The formula for this coating solution is prepared to obtain a weight gain of 10 mg per caplet (around 600 mg in weight).
2. Disperse item 1 in 175 g of purified water (70°C–80°C) while stirring.
3. Hold overnight for complete dispersion.
4. Disperse items 2 and 3 in 25 g of purified water (25°C–30°C).
5. Hold overnight for complete hydration.
6. Add mixture from previous step.
7. Homogenize using a homogenizer (gap setting = 1.5 mm).
8. Homogenize items 4, 5, and 6 in 50 g of hypromellose dispersion from the previous step twice, using a homogenizer (gap setting = 1.5 mm).
9. Pass the dispersion twice through a 90 µm sieve.
10. (*Note:* This is a critical step; follow instructions closely to prevent foreign particles and spots.) Preparation of polishing solution: Disperse item 7 in 25 g of purified water with slow stirring.
11. Make a vortex by slow stirring, and add the powder in such a way as to avoid foam formation.

0.75	7	Opadry-OY-S (clear)	0.75
QS	8	Purified water	225.00

Manufacturing Directions

1. Disperse item 1 in 175 g of purified water (70°C–80°C) while stirring.
2. Keep overnight for complete dispersion.
3. Disperse items 2 and 3 in 25 g of purified water (25°C–30°C).
4. Keep overnight for complete hydration.
5. Add together, and homogenize using homogenizer (gap setting = 1.5 mm).
6. Homogenize items 4, 5, and 6 in 50 g of hypromellose dispersion twice using homogenizer (gap setting = 1.5 mm).
7. Pass the dispersion twice through a 90 µm sieve.
8. (*Note:* This is a critical step; follow instructions closely to prevent foreign particles and spots.) Disperse item 7 in 25 g of purified water while stirring slowly.
9. Make a vortex by slow stirring, and add the powder in such a way as to avoid foam formation.

10. Follow the parameters for coating in Accela Cota:

Caplet load	620 g
Pan speed	4 rpm
Drying air temperature	70°C–75°C
Exhaust temperature	50°C–55°C
Fluid pressure	15–20 psi
Valve on spray gun	One revolution open
Atomizing pressure	55 psi
Nozzle orifice	1 mm
Nozzle distance to bed	250–280 mm
Difference of air pressure	−1.0 to −1.5 cm
Spray rate	200–225 g/min
Coating time	3.0–3.5 hours

11. Stir the dispersion at slow speed (6–10 rpm) continuously.
12. Spray the polishing solution under the same conditions as previously, adjusting the spray rate to 180 g/min.
13. Check the caplet surface every 5 minutes for sticking.
14. If sticking tends to appear, stop the coating immediately.
15. When the spraying is over, roll the tablets in a pan for 10 minutes with cold air blowing onto the caplets.
16. Unload the film-coated caplets into stainless steel containers lined with polyethylene bags.
17. Appearance is a light green, film-coated caplet that is smooth, with no sticking or chipping on the caplet surface.
18. Weight gain per caplet is NLT 10 mg/tablet.

QS	7	Methylene chloride	~625.00

Manufacturing Directions

1. Charge titanium dioxide and QS with alcohol into a Ball mill.
2. Mill the material for 16 hours.
3. Place 465 mL alcohol into a suitable mixing tank.
4. Start agitation.
5. Slowly add PEG-400 to mixing tank.
6. Mix for 5 minutes.
7. Add FD&C Yellow to the mixing tank with continued agitation.
8. Rinse bottle with alcohol tapped from mixing tank.
9. Return rinse to mixing tank.
10. Add FD&C Blue to the mixing tank, and rinse.
11. Mix for 2 hours.
12. Tap approximately 10 mL of solution from mixing tank after 0.5, 1, and 1.5 hours of mixing.
13. Put solution back into mixing tank. (*Note:* Tapping solution ensures that dye is not tapped into lower valve and/or pipeline.) Rinse the Ball mill with two rinses of 11.6 mL alcohol.
14. Reseal the Ball mill, and allow it to run for 2 to 5 minutes between rinses.
15. Empty content of the Ball mill and rinses into mixing tank.
16. Slowly sprinkle hydroxypropyl methylcellulose into mixing tank with constant agitation.
17. Agitate for an additional 15 minutes. *(Note:* Prevent the development of lumps by slowly sprinkling hydroxypropyl methylcellulose into the alcohol.) After mixing for 10 minutes, tap approximately 10 mL from the mixing tank, and put back into tank to recirculate.

18. Add sufficient methylene chloride (~474 mL) to bring up to volume.
19. Continue agitation for 2 hours.
20. After 0.5, 1, and 1.5 hours, tap approximately 10 mL of solution from mixing tank, and put back into mixing tank to recirculate.
21. (*Note:* No residue should be present in the solution when tapped at 1.5 hours; if some is present, then continue agitation, and tap every 15 minutes until no residue is observed.) *(Caution:* Avoid contact with methylene chloride and vapors; they may have toxic effects when swallowed or inhaled.) *(Note:* Nitrogen pressure may be used to assist bottle filling.) Strain mixing tank contents through two-ply cheesecloth, or similar, into suitable approved containers (one-half the total number of bottles). *(Note:* Lumps may obstruct spray nozzle.)

B. Red Mahogany

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L (g)
0.40	1	Titanium dioxide	4.00
45.00 v/v	2	Alcohol (200 proof), SD 3A	~375.30
0.40	3	Vanillin (crystals)	4.00
1.00	4	Propylene glycol	10.00
1.50	5	FD&C Red No. 40 Lake (29%)	15.00
1.00	6	Brown lake blend	10.00
4.00	7	Hydroxypropyl methylcellulose 2910 (15 cps)	40.00
QS	8	Methylene chloride	~530.40

C. Sun Orange

Bill of Materials

Scale (%)	Item	Material Name	Quantity/L (g)
3.00 (w/v)	1	Titanium dioxide	30.00
50.00 (v/v)	2	Alcohol (200 proof), SD 3A	~397.00
2.11 (w/v)	3	Propylene glycol	21.10
3.11 (w/v)	4	FD&C Yellow No. 5	31.10
0.20 (w/v)	5	FD&C Yellow No. 6	2.00
4.00 (w/v)	6	Hydroxypropyl methylcellulose 2910 (15 cps)	40.00
QS	7	Methylene chloride	~625.00

D. Dark Red

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L (g)
1.00	1	Titanium dioxide	10.00
20.00 v/v	2	Alcohol (200 proof), SD 3A	~200.00 mL
2.00	3	PEG-400 (low color)	20.00
0.02	4	Ponceau 4R dye (red)	20.00
0.0068	5	FD&C Blue No. 1	0.068
2.95	6	Hydroxypropyl methylcellulose 2910 (15 cps)	29.50
QS	7	Methylene chloride	QS to 1 L

E. Deep Yellow

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
2.00	1	Titanium dioxide	20.00 g
50.00	2	Alcohol (200 proof), SD 3A	~397.00 g
2.00	3	PEG-400 (low color)	20.00 g
2.00	4	FD&C Yellow No. 5 Lake	20.00 g
2.95	5	Hydroxypropyl methylcellulose 2910 (15 cps)	29.50 g
QS	6	Methylene chloride	QS to 1 L

F. Pale Yellow

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
1.50	1	Titanium dioxide	15.00 g
50.00	2	Alcohol (200 proof), SD 3A	~397.00 g
2.00	3	PEG-400 (low color), NF	20.00 g
0.50	4	FD&C Yellow No. 10 Aluminum Lake (14–17%)	5.00 g
2.95	5	Hydroxypropyl methylcellulose 2910 (15 cps)	29.50 g
QS	6	Methylene chloride	QS to 1 L

G. Scarlet Red

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
2.00	1	Titanium dioxide	20.00 g
20.00	2	Alcohol (200 proof), SD 3A	~200.00 g
2.00	3	PEG-400 (low color), NF	20.00 g
2.00	4	FD&C Yellow No. 7 Lake	20.00 g
1.00	5	FD&C Yellow No. 5 Lake	10.00 g
2.95	6	Hydroxypropyl methylcellulose 2910 (15 cps)	29.50 g
QS	7	Methylene chloride	QS to 1 L

HYDROXYPROPYL METHYLCELLULOSE/ HYDROXYPROPYL CELLULOSE (KLUCEL®) COATING

A. White

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
2.00	1	Titanium dioxide	20.00 g
0.50	2	Hydroxypropyl cellulose, NC	5.00 g
45.00	3	Alcohol (200 proof), SD 3A	~450.00 g
2.00	4	Propylene glycol	20.00 g
4.50	5	Hydroxypropyl methylcellulose 2910 (15 cps)	45.00 g
QS	6	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Place titanium dioxide and sufficient methylene chloride into suitably sized ball jars to cover the balls.
2. Mill for not less than 16 hours.
3. While mixing alcohol, add and disperse hydroxypropyl methylcellulose, hydroxypropyl cellulose, and propylene glycol, followed by 250 mL of methylene chloride.
4. Continue mixing until the dissolution is complete.
5. While mixing the solution from the second step, empty into it the contents of the ball jar, rinse the balls and jar with methylene chloride, add the rinsings to the batch, and mix.
6. Bring the batch up to volume with methylene chloride, and mix well until homogeneous.
7. Strain the batch through muslin into suitable, approved bottles.
8. Seal and store.

HYDROXYPROPYL METHYLCELLULOSE/ ETHYLCELLULOSE COATING

A. Reddish Orange Opaque

Bill of Materials

Scale (%, w/v)	Item	Material Name	Quantity/L
1.16	1	Titanium dioxide	11.60 g
45.00	2	Alcohol (dehydrated; 200 proof)	~450.00 g
0.20	3	Vanillin (crystals), NF	2.00 g
0.50	4	Albumen powder (white hen egg)	5.00 g
2.00	3	PEG-400 (low color), NF	20.00 g
1.30	4	FD&C Red No. 3	13.00 g
0.05	5	FD&C Red No. 2 (Amaranth), USP	0.50 g
0.20	6	FD&C Yellow No. 6	2.00 g
2.95	5	Hydroxypropyl methylcellulose 2910, USP (15 cps)	29.50 g
QS	6	Methylene chloride	QS to 1 L

Manufacturing Directions

1. Load vanillin, albumen, titanium dioxide, FD&C Red No. 3, FD&C Red No. 2, and FD&C Yellow No. 6 into a suitable-size ball jar.
