Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, chemically active metals; calcium and heat. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: UN2291 Lead compounds, soluble n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Thermal decomposition products may include poisonous fumes of lead and chlorine. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard Alert: Poison (cumulative), Strong oxidizer, Possible risk of forming tumors, Suspected reprotoxic hazard, Environmental hazard.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025)

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

United States National Primary Drinking Water Regulations: MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg [Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead; MCLG = 0.01 mg[Cr]/L; MCL = 0.1 mg[Cr]/L as Chromium.

EPA ADI = (preschool children) less than the 3 mg[Pb]/week recommended provisionally for adults

EPA ADI: Chromium(VI) = 0.175 mg/day/man. EPA estimated adequate and safe intake (EASI) levels for chromium: **Infants**: age 0.0−0.5 year: 0.01−0.04 mg/day; age 0.5−1.0 year: 0.02−0.06 mg/day. **Children** age 1−3 years: 0.02−0.08 mg/day; age 4−6 years: 0.03−0.12 mg/day; age 7−10 years: 0.05−0.20 mg/day; age > or = to 11 years: 0.05−0.20 mg/day.

Adults: 0.05−0.20 mg/day.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number D008

EPCRA Section 313: Includes any unique chemical substance that contains lead as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as lead compounds, soluble, n.o.s.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, O, N; risk phrases: R45; R8; R61; R62; R33; R50/53; safety phrases: S53; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Lead chromate is an orange or orange-yellow crystalline solid or powder. Molecular weight = 323.19; 546.38 (lead chromate oxide); specific gravity (H_2O:1) = 6.1 @ 20°C; boiling point = (decomposes); freezing/melting point = 844°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Lead chromate is used to make paint pigments for wood and metal.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and active metals; hydrazine, sodium, and potassium; organics at elevated temperature. Reacts with aluminum dinitronaphthalene, iron(III) hexacyanoferrate (IV).

Permissible Exposure Limits in Air

ACGIH TLV[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen

ACGIH TLV[1] (*as lead*): 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK (lead chromate & lead chromate oxide): Carcinogen Category 3B

PAC Ver. 29[138]

7758-97-6

PAC-1: 0.036 milligram per cubic meter

PAC-2: 16 milligram per cubic meter

PAC-3: 97 milligram per cubic meter

As Chromium(VI), Inorganic Insoluble Compounds

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See NIOSH Pocket Guide, Appendixes A & C.

ACGIH TLV[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen

DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

As Lead:

NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: Carcinogen Category 3B

Australia: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA 0.05 milligram per cubic meter, carcinogen, 1993; Denmark: TWA 0.02 mg[Cr]/m^3, 1999; TWA 0.1 mg[Pb]/m^3, 1999; Finland: carcinogen, 1999; France: VME 0.05 mg[Cr]/m^3, VME 0.15 mg[Pb]/m^3, 1999; Japan 0.01 mg[Cr]/m^3, 1999; 0.1 mg[Pb]/m^3, 1999; Norway: TWA 0.1 mg[CrO_3]/m^3, 1999; Norway: TWA 0.05 mg[Pb]/m^3, 1999; Poland: TWA 0.1 milligram per cubic meter; STEL 0.3 milligram per cubic meter, 1999; Poland: MAC (TWA) 0.05 mg[Pb]/m^3, 1999; Sweden: TWA 0.02 mg[Cr]/m^3, carcinogen, 1999; Switzerland: MAK-W 0.05 mg[Cr]/m^3, carcinogen, 1999; United Kingdom: TWA 0.05 mg [Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for lead chromate in ambient air[60] ranging from 0.5 μ/m^3 (Connecticut and Virginia) to 1.0 μ/m^3 (Nevada).

Determination in Air:***Determination in Air***: For lead use NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206; #7024 for chromium, hexavalent.

Permissible Concentration in Water: *Lead:* Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L. *Chromium*: State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract. Lead chromate is a carcinogen-handle with extreme caution. Lead poisoning symptoms may include poor appetite; colic, upset stomach; headache, irritability, muscle or joint pains; and weakness. Permanent kidney damage can result from long term or high exposure. Breathing lead chromate can cause a hole in the inner nose. Irritation of nose, throat or bronchial tubes can also occur, with cough and/or wheezing. Skin contact with concentrated lead chromate can cause burns, deep ulcers; or an allergic skin rash.

Long-Term Exposure: Chromium may cause allergic dermatitis. Lead chromate has been shown to cause kidney cancer. Repeated or prolonged contact may cause skin sensitization; dermatitis, irritation, chronic ulcers, eczema. Repeated or prolonged inhalation exposure may cause asthma. Lead chromate may affect the kidneys. May cause increased blood pressure. May cause reproductive toxicity and genetic damage in humans. May cause lead poisoning with symptoms of poor appetite; upset stomach; colic, headache, irritability, muscle or joint pains and weakness; constipation, disturbed sleep and reduced memory. See also "Lead" entry.

Points of Attack: Kidneys, skin, lungs.

Medical Surveillance: NIOSH lists the following tests for chromates: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires employers to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: (*as chromic acid and chromates*) 8 hours (more than 8 hours of resistance to breakthrough >0,1 micron g/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; 4 hours (At least 4 but < 8 hours of resistance to breakthrough >0.1 micron $g/cm^2/min$): butyl rubber gloves, suits, boots; Viton gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129 *Chromium (VI)* and NIOSH 78-158: Lead, Inorganic Dusts and Fumes.

Respirator Selection: *As Lead*: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode. * Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations. ** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher. *as chromates*: NIOSH, as chromates: at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100 F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. *Note*: Store corrosives in this group in chemical resistant secondary containers and/or in corrosion proof cabinets. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead chromate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, zinc and ferric ferrocyanide), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A: *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN3085 Oxidizing solid, corrosive, n.o.s, Hazard Class: 5.1; Labels: 5.1-Oxidizer, 8-Corrosive material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead chromate may burn but does not easily ignite. Thermal decomposition products may include metal oxides of lead and chromium. NFPA recommends the use of water on fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: O, T + , N; risk phrases: R45; R8, R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S29; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead dioxide is a dark brown crystalline solid or powder. Molecular weight = 239.19; specific gravity (H_2O:1) = 9.64 @ 20°C; freezing/melting point = (decomposes) 290°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 3 (Oxidizer). Insoluble in water.

Potential Exposure: This material is used in electrodes for lead-acid batteries; in matches; explosives, and as a curing agent for polysulfide elastomers.

Incompatibilities: Lead dioxide is a powerful oxidizer. Violent reaction with many compounds, including reducing agents; chemically active metals; combustible materials, strong acids, alkaline earth sulfides, aluminum carbides, aluminum, amines, calcium sulfide, carbides, chlorine trifluoride, glycerin, hydrides, hydrochloric acid, hydrogen peroxide, hydrogen sulfide, hydroxylamine, magnesium, metal powders, metal sulfides, molybdenum, phenylhydrazine, phosphorous red/friction, phosphorous trichloride, silicon, sulfides, sulfur, sulfur dioxide, sulfur/friction, sulfuric acid, tungsten, hydrogen trisulfide.

Permissible Exposure Limits in Air

See below NIOSH IDLH value for inorganic lead.*

PAC Ver. 29[138]

PAC-1: 0.17 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 810 milligram per cubic meter

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

European OEL: 0.15 mg[Pb]/m^3 TWA (2002)

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age < 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Determination in Air: Use NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Lead dioxide can affect you when breathed in. Irritates eyes, skin, and respiratory tract. Lead dioxide should be handled as a teratogen-with extreme caution. Lead poisoning can cause poor appetite; colic, upset stomach; headaches, irritability, muscle or joint pains and weakness. Permanent kidney damage can result from high exposures.

Long-Term Exposure: Repeated, prolonged, or high exposures may cause kidney damage. May cause lead poisoning with symptoms of poor appetite; upset stomach; colic, headache, irritability, muscle or joint pains and weakness, constipation, disturbed sleep and reduced memory. See also "Lead" entry.

Points of Attack: Kidneys

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result. Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full- facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode. * Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations. ** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

At Any Detectable Concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100 F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead dioxide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood, paper and oil. Lead dioxide is regulated by OSHA Standard 1910.1025. All requirements of the standard must be followed. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A: *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1872 Lead dioxide, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep combustibles (wood, paper, and oil) away from spilled material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead dioxide does not burn but it will increase the intensity of a fire. Thermal decomposition products may include metal oxides of lead. Use extinguisher suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Conversion to soluble salt, precipitation as sulfide and return to supplier. Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Lead fluoborate L:0150

Formula: B_2F_8Pb; $Pb(BF_4)_2$

Synonyms: Borate(1-), tetrafluoro-, lead(2 +); Fluoborato de plomo (Spanish); Lead tetrafluoroborate; Tetrafluoro borate; Tetrafluoro borate(1-), lead(2 +)

CAS Registry Number: 13814-96-5

HSDB Number: 1991

RTECS Number: ED2700000

UN/NA & ERG Number: UN2291 (lead compound, soluble, n.o.s.)/151; UN2922 (Corrosive liquid, toxic, n.o.s.)/154

EC Number: 237-486-0

Regulatory Authority and Advisory Information

Carcinogenicity: Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Inadequate Evidence, Human Inadequate Evidence*, possibly carcinogenic to humans*, Group 2A, 1987; Carcinogenicity: EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: (*lead and compounds*) Cancer; 10/1/1992; (*lead and compounds*); Developmental/Reproductive toxin (male, female) 2/27/1987

Hazard Alert: Poison (cumulative), Corrosive, Reproductive toxin, Environmental hazard.

EPA ADI = (preschool children) less than the 3 mg[Pb]/week recommended provisionally for adults.

Air Pollutant Standard set. See below, "Permissible Exposure Limits in Air" section.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025)

Hazardous Substance (EPA) (RQ = 5000/2270)[4]

United States National Primary Drinking Water Regulations: MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg[Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead; MCLG = 4 mg[F]/L; MCL = 4 mg[F]/L; SMCL = 2.0 mg [F]/L, as Fluoride.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992); 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number D008

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as lead inorganic compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S29; S36/37; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead fluoborate is a nonflammable colorless liquid or crystalline powder. Faint odor. Molecular weight = 380.81; specific gravity (H_2O:1) = 1.75 @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water (decomposes).

Potential Exposure: This material is used in material finishing operations.

Incompatibilities: Aqueous solution is acidic. Incompatible with oxidizers, bases, active metals. Decomposes in water or alcohol. Attacks most metals; especially aluminum.

Permissible Exposure Limits in Air

See below NIOSH IDLH value for inorganic lead.*

13814-96-5

PAC Ver. 29[138]

PAC-1: 0.28 milligram per cubic meter

PAC-2: 220 milligram per cubic meter

PAC-3: 1300 milligram per cubic meter

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

European OEL: 0.15 mg[Pb]/m^3 TWA (2002)

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age < 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Lead fluoborate can affect you when breathed in and if swallowed from food, drinks, or cigarettes. Contact can cause skin and eye irritation and burns. Irritates the respiratory tract. Can cause headache, irritability, mood changes; reduced memory; and disturbed sleep.

Long-Term Exposure: Repeated exposure causes lead fluoborate build-up in the body and lead to lead or fluoride poisoning. Low levels may cause tiredness, mood changes; headaches, stomach problems, and trouble sleeping. Higher levels may cause aching, weakness, and concentration or memory problems. May damage the nervous system causing numbness, "pins and needles" weakness in the hands and feet. Lead fluoborate can also cause serious permanent kidney, brain damage, and damage the blood cells, causing anemia. Lead fluoborate exposure increases risk of high blood pressure. Lead compounds have been determined to be teratogens and may also cause reproductive damage, such as reduced fertility and interference with menstrual cycles. Lead fluoborate should be handled as a teratogen-with extreme caution.

Points of Attack: Kidneys, nervous system; brain, blood.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*:

Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

NIOSH lists the following tests for fluorides: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); CBC /differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This “chelating” drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes.*

Respirator Selection: Lead (1910.1025 & 1926.62): $<$ or = 0.5 milligram per cubic meter (10 × PEL)
Half-mask* air-purifying respirator equipped with high-efficiency filters**. $<$ or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. $<$ or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. $>$ 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead fluoborate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: UN2291 Lead compounds, soluble n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2922 Corrosive liquids, toxic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate and wash area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental

protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead fluoborate itself does not burn. Thermal decomposition products may include hydrogen fluoride and metal oxides of lead and boron. Use any agent suitable for type of surrounding fire. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R10; R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S29/35; S36/37; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead fluoride is a white to colorless, odorless crystalline (rhombic, orthorhombic) solid. Molecular weight = 245.19; specific gravity (H_2O:1) = 7.75 (cubic) @ 20°C; boiling point = 1290°C; freezing/melting point = 855°C; vapor pressure = 10 mmHg @ 904°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used to make other chemicals, underwater paints; electronic and optical parts (for growing single-crystal, solid-state lasers); in high-temperature dry-film lubricants; and making special grades of glass.

Incompatibilities: Violent reaction with oxidizers, chemically active metals; calcium carbide. May ignite combustibles, such as wood, paper, oil, etc.

Permissible Exposure Limits in Air

See below NIOSH IDLH values for inorganic lead and fluorides*

PAC Ver. 29[138]

7783-46-2

PAC-1: 0.18 milligram per cubic meter

PAC-2: 140 milligram per cubic meter

PAC-3: 830 milligram per cubic meter

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age $<$ 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Permissible Exposure Limits in Air

As Inorganic Fluorides:

*NIOSH IDLH = 250 mg[F]/m^3

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration

ACGIH TLV[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine prior to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Fluoride: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg [F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg[F]/L; *Lead*: Safe Drinking Water Act (47FR 9352) MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg[Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps. State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause skin and eye irritation and burns. Inhalation can irritate the nose and throat. Lead fluoride can cause headache, irritability, mood changes; reduced memory; and disturbed sleep. The fluoride ion can cause protoplasmic poisoning at higher concentrations. See also entry on "Fluorides." *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: While lead fluoride has not been identified as a teratogen, or a reproductive hazard, lead and certain lead compounds have been determined to be teratogens and may also cause reproductive damage, such as reduced fertility and interfere with menstrual cycles. Handle with extreme caution. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, and papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

As fluorides:

NIOSH/OSHA 12.5 milligram per cubic meter: Qm (APF = 25) (any quarter-mask respirator). 25 milligram per cubic meter: 95XQ (APF = 10)*[any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA * (any supplied-air respirator). 62.5 milligram per cubic meter: Sa:Cf (APF = 25)* + (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* if not present as a fume (any powered, air-purifying respirator with a high-efficiency particulate filter). 125 milligram per cubic meter: 100 F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, and P100]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). 250 milligram per cubic meter: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). Emergency or Planned Entry into Unknown Concentrations or IDLH Conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100 F (APF = 50)$^+$ [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, and P100]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection. *May need acid gas sorbent.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2291 Lead compounds, soluble n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical does not burn. Thermal decomposition products may include hydrogen fluoride, oxides of metal and lead fumes. Use any extinguishing agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as lead, inorganic compounds, n.o.s.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S29/35; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead iodide is a heavy, bright-yellow, odorless powder. Molecular weight = 461; specific gravity (H_2O:1) = 6.16 @ 20°C; boiling point = 954°C; freezing/melting point = 402°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Lead iodide is used in bronzing, gold pencils; mosaic gold; printing, and photography.

Incompatibilities: Lead iodide has weak oxidizing or reducing powers. Redox reactions can however still occur. The majority of compounds in this class are slightly soluble or insoluble in water. If soluble in water, then the solutions are usually neither strongly acidic nor strongly basic. These compounds are not water-reactive. Light sensitive[101] Contact with oxidizers or active metals may cause violent reaction.

Permissible Exposure Limits in Air

see below NIOSH IDLH value for lead*

10101-63-0

PAC Ver. 29[138]

PAC-1: 0.33 milligram per cubic meter

PAC-2: 270 milligram per cubic meter

PAC-3: 1600 milligram per cubic meter

As Iodides:

ACGIH TLV[1]: 0.01 ppm/0.1 milligram per cubic meter, inhalable fraction and vapor, TWA

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age $<$ 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Can cause headache, irritability, reduced memory and disturbed sleep. Lead poisoning can cause poor appetite; colic, upset stomach; headaches, irritability, muscle or joint pains and weakness.

Long-Term Exposure: Permanent kidney damage can result from long-term or high exposures. Repeated exposure may cause brain damage, and damage to the blood cells, leading to anemia. Higher levels can cause muscle and joint pains, weakness and fatigue. May cause nerve damage. Lead exposure increases the risk of high blood pressure. Lead iodide should be handled as a teratogen, with extreme caution. Repeated exposure may cause lead poisoning and/or iodism. Symptoms of iodism can include running nose, headache, mucous membrane irritation; and skin rash.

Points of Attack: Kidneys, brain, nervous system; blood.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead iodide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) and chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Lead iodide is regulated by an OSHA Standard, 1910.1025. All requirements of the standard must be followed.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous fumes of lead and iodine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Lead phosphate L:0180

Formula: O_8P_2Pb3; $Pb_3(PO_4)_2$

Synonyms: Bleiphosphat (German); C.I. 77622; Fasfato de plomo (Spanish); Lead orthophosphate; Lead phosphate (3:2); Lead(2 +) phosphate; Lead(II) phosphate; Normal lead orthophosphate; Perlex paste; Phosphoric acid, lead salt; Phosphoric acid, lead(2 +) salt (2:3); Plumbous phosphate; Trilead phosphate; Trilead bis(orthophosphate)

CAS Registry Number: 7446-27-7

HSDB Number: 2637

RTECS Number: OG3675000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 231-205-5 [*Annex I Index No.*: 082-006-00-3]

Regulatory Authority and Advisory Information

Carcinogenicity: Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2A, 1987; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: (*lead and compounds*) Cancer; 10/1/1992; (*lead and compounds*) Developmental/Reproductive toxin (male, female) 2/27/1987

Hazard Alert: Poison (cumulative), Highly acute toxicity, Possible risk of forming tumors, Reproductive toxin: Suspected of causing genetic defects, Environmental hazard.

EPA ADI = (preschool children) less than the 3 mg[Pb]/week recommended provisionally for adults.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025)

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

United States National Primary Drinking Water Regulations: MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg[Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead (Pb).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U145

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Form R Toxic Chemical Category Code: N420

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T + , N; risk phrases: R45; R26/27/28; R61; R33; R48/22; R50/53; safety phrases: S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Lead phosphate is a white powder or colorless crystals. Molecular weight = 811.51; specific gravity (H_2O:1) = 7 @ 20°C; freezing/melting point = 1014°C. Hazard identification (based on NFPA-704 M Rating System) (estimated): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Lead phosphate is used as a stabilizer in styrene and casein plastics.

Incompatibilities:Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and active metals.

Permissible Exposure Limits in Air

See below NIOSH IDLH value for inorganic lead.*

PAC Ver. 29[138]

PAC-1: 0.2 milligram per cubic meter

PAC-2: 150 milligram per cubic meter

PAC-3: 910 milligram per cubic meter

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.05 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age $<$ 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic, may be fatal if inhaled, swallowed or absorbed through skin. Avoid any skin contact. Effects of contact or inhalation may be delayed[31]. Lead phosphate can cause headache, irritability, reduced memory; and disturbed sleeping patterns. Lead enters the body by breathing and from contaminated food, beverages or cigarettes. Lead poisoning can cause poor appetite; colic, upset stomach; headaches, irritability, muscle or joint cramps and weakness.

Long-Term Exposure: Lead phosphate is a carcinogen, handle with extreme caution. Lead phosphate should be handled as a teratogen, with extreme caution. Permanent kidney damage can result from long-term or high exposures. Lead exposure increases the risk of high blood pressure. High or repeated exposure may damage the nerves resulting in loss of coordination in the arms and legs. Can cause brain damage and anemia.

Points of Attack: Kidneys, blood, nervous system., brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL) Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, and strong acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of metal (lead) and phosphorus. Use dry chemical, carbon dioxide; water spray; or extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, organic lead compounds are not included on the Ingredients Disclosure List.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead stearate is an organic lead compound. It is a white powder with a slight fatty odor. Molecular weight = 1734.87; 774.1466[193]; freezing/melting point = 116°C; flash point = 232°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: It is used as a stabilizer for plastics and rubber processing; in extreme-pressure lubricants and as a drier in varnishes.

Incompatibilities: Dust may form explosive mixture with air; keep away from high heat and sources of ignition. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

As Organic Lead:

ACGIH TLV[1]: No listing for organic lead compounds.

Determination in Air: Use (*for inorganic lead*) NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Ingestion, skin contact. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short-Term Exposure: Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance; headache, aching bones, and muscles; constipation, abdominal pains and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. Between 1 ounce and 1 pound of lead stearate may be fatal. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: While lead stearate has not been identified as a teratogen, or a reproductive hazard, lead and certain lead compounds have been determined to be teratogens and may also cause reproductive damage; such as reduced fertility and interfere with menstrual cycles. Handle with extreme caution. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin; a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: *For Inorganic Lead*: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, and papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, and strong acids. Dust may explode at high temperature. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of metal and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead (Pb).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U146

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R33; R40; R48/22; R50/53; R61; safety phrases: S29; S45; S53; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Lead subacetate is a white, heavy powder or gelatinous solid. Molecular weight = 807.71. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Permissible Exposure Limits in Air

basic; subacetate:

PAC-1: 5.4 milligram per cubic meter

PAC-2: 59 milligram per cubic meter
PAC-3: 360 milligram per cubic meter
As Organic Lead:
ACGIH TLV[1]: No listing for organic lead compounds.

Potential Exposure: Used as a decolorizing agent in sugar solutions and as an analytical chemical.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Determination in Air: Use (*for inorganic lead*) NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short-Term Exposure: Lead subacetate can cause headache, irritability, mood changes; reduced memory; and disturbed sleep. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: Lead subacetate may be a carcinogen in humans since it has been shown to cause kidney, lung, and brain cancer in animals. May be a teratogen in humans. May damage the testes. Repeated exposure may cause lead poisoning with symptoms of headache, irritability, disturbed sleep; tiredness, reduced memory and personality changes. Higher levels can cause muscle or joint pains, weakness, disturbed sleep; and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage, and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: (*for inorganic lead)* Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women $<$ 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, and papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, and strong acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1616 Lead acetate, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include metal oxides of lead and carbon. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R61; R33; R40; R48/22; R50/53; safety phrases: S29; S53; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters.

Description: Lead sulfate is a heavy, white crystalline powder. Molecular weight = 303.25; specific gravity (H_2O:1) = 6.2 @ 20°C; freezing/melting point = 1170°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: Lead sulfate is used in storage batteries and paint pigments. Used in the making of alloys, fast-drying oil varnishes; weighting fabrics; in lithography.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Contact with potassium can cause explosion. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides.

Permissible Exposure Limits in Air

See below NIOSH IDLH value for inorganic lead.*

PAC Ver. 29[138]

7446-14-2

PAC-1: 0.22 milligram per cubic meter

PAC-2: 170 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter

As Inorganic Lead:

*NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age < 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

Determination in Air: Use NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: This chemical is corrosive. Skin contact can cause severe irritation and burns, itching, rash and pigment changes. Eye contact can cause severe irritation and burns. Inhalation can cause irritation of the respiratory tract. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance; headache, aching bones and muscles; constipation, abdominal pain; and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: Highly irritating and corrosive substances can cause lung irritation that may lead to bronchitis. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Lungs, blood, kidneys, brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines “exposure” for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Note to Physician: Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication. For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): $<$ or $=$ 0.5 milligram per cubic meter ($10 \times$ PEL)
Half-mask* air-purifying respirator equipped with high-efficiency filters**. $<$ or $=$ 2.5 milligram per cubic meter ($50 \times$ PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. $<$ or $=$ 50 milligram per cubic meter ($1000 \times$ PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or $=$ 100 milligram per cubic meter ($2000 \times$ PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. $>$ 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode. * Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations. ** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: (1) Color code-White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead sulfate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2291 Lead compounds, soluble n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN1794 Lead sulfate with more than 3% free acid, Hazard class: 8; Labels: 8-Corrosive material. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lead sulfate is not combustible. Thermal decomposition products may include oxides of sulfur and metal. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazard Alert: Poison (cumulative), Reproductive toxin, Environmental hazard.

EPA ADI = (preschool children) less than the 3 mg[Pb]/week recommended provisionally for adults.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See 29 CFR 1910.1025)

Hazardous Substance (EPA) (RQ = 5000/2270)[4]

Section 261 Hazardous Constituents, waste number D008

United States National Primary Drinking Water Regulations: MCLG = zero mg[Pb]/L; MCL = Action Level = 0.015 mg [Pb]/L. Lead is regulated by a TT that requires systems to control the corrosiveness of their water. If more than 10% of tap water samples exceed the action level, water systems must take additional steps, as Lead (Pb).

EPCRA Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as lead and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number D008

RCRA Section 313: Includes any unique chemical substance that contains lead as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as lead compounds, soluble, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R20/22; R23/25; R33; R50/53; R61; R62; safety phrases: S20/21; S28; S29; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead sulfide is a silvery to black crystalline powder. Molecular weight = 239.25; specific gravity (H_2O:1) = 7.5 @ 20°C; boiling point = 1281°C (sublimes); freezing/melting point = 1114°C; vapor pressure = 1 mmHg @ 852°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Practically insoluble in water (0.000086 g/100 cc water @ 13°C).

Potential Exposure: Lead sulfide is used in ceramics, infrared radiation detectors, and semiconductors.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and iodine monochloride. Sulfides react with acids to produce toxic and flammable vapors of hydrogen sulfide.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

1314-87-0

PAC-1: 0.17 milligram per cubic meter
PAC-2: 140 milligram per cubic meter
PAC-3: 810 milligram per cubic meter

Inorganic Lead:

NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

NIOSH REL: 0.050 mg[Pb]/m^3 TWA. Suspected carcinogen. Limit exposure to lowest feasible level. [*Note*: The REL also applies to other lead compounds (as Pb)]. *Note*: NIOSH considers "lead" to mean metallic lead, lead oxides; and lead salts (including organic salts, such as lead "soaps" but excluding lead arsenate). Air concentrations should be maintained so that worker blood lead remains less than 0.060 mg[Pb]/100 g of whole blood. See NIOSH Pocket Guide, Appendix C.

ACGIH TLV[1]: 0.05 mg[Pb]/m^3 TWA; BEI: 30 μg[Pb]/100 mL (blood). (*Note*: The TLV also applies to lead, inorganic compounds) *Note*: women of child bearing potential whose blood exceeds 10 μg[Pb]/dL are at risk of delivering a child with a blood [Pb] over the current CDC guideline of 10 μg[Pb]/dL and may cause birth defects; confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: BAT: 400 μg[Pb]/L (blood) not fixed; 100 μg [Pb]/L (blood) women age $<$ 45; Carcinogen Category 2; Germ Cell Mutagen Group 3A.

In addition, Russia[43] set a MAC in the ambient air of residential areas (on a daily average basis) of 0.0017 milligram per cubic meter (about 6 times the same limits for lead compounds in general).

Determination in Air: Use NIOSH Analytical Method (IV) s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg[Pb]/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (dithizone) analysis, or by ICP optical emission spectrometry. That gives total lead; dissolved lead may be determined by 0.45 micron filtration prior to such analysis.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Lead sulfide is very slightly soluble in water and sulfides react with water, forming hydrogen sulfide. Eye contact may cause eye irritation and damage. Ingestion of large amounts of lead may lead to seizures, coma, and death. The effects of exposure to fumes and dusts of inorganic lead may not develop quickly. Symptoms may include decreased physical fitness, fatigue, sleep disturbance; headache, aching bones and muscles; constipation, abdominal pains and decreased appetite. These effects are reported to be reversible if exposure ceases. Inhalation of large amounts of lead may lead to seizures, coma, and death. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Lungs, blood, kidneys, brain.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910. 1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (under 1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Note to Physician: whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of lead poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See also NIOSH Criteria Document #78-158: *Lead, Inorganic Dusts and Fumes*.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lead sulfide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates) and chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture and acids. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required. UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include oxides of lead and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0% as lead compounds, n.o.s.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R20/21/22; R23/25; R32; R33; R33; R50/53; R61; R62; R63; safety phrases: S13; S20/21; S28; S29; S45; S53; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lead thiocyanate is a white or light yellow, odorless, crystalline powder. Odorless. Molecular weight = 323.36; specific gravity (H_2O:1) = 3.82; freezing/melting point = 190°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Slightly soluble in water; solubility = $<$ 0.05%.

Potential Exposure: An explosive, thermally unstable material. Used in making safety matches, primers for small arms cartridges; pyrotechnic devices; and in dyes.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with acids or acid fumes caused decomposition with fumes of cyanide. Will decompose in hot water.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 mg [Pb]/m^3

OSHA PEL: The employer shall assure that no employee is exposed to lead at concentrations greater than 50 μg/m^3 of air averaged over an 8-hour period. If an employee is exposed to lead for more than 8 hours in any work day, the permissible exposure limit, as a TWA for that day, shall be reduced according to the following formula: Maximum permissible limit (in μg/m^3) = 400 divided by the number of hours worked in the day [29 CFR 1910.1025(c)].

No PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: Use NIOSH Analytical Method (IV)s #7082, 7105, 7300, 7301, 7303, 7700, 7701, 7702, 9100, 9102, 9105; OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: Federal Drinking Water Standards: MCGL = zero mg/L; State Drinking Water Standards: Arizona: 50 μg[Pb]/L; State Drinking Water Guidelines: Arizona: 20 μg[Pb]/L; Maine: 10 μg [Pb]/L. Federal Drinking Water Guidelines: EPA 200 μg [CN]/L; State Drinking Water Standards: California 150 μg [CN]/L; State Drinking Water Guidelines: Arizona 220 μg [CN]/L; Maine. 140 μg[CN]/L; Minnesota 100 μg[CN]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN]/L assuming a water consumption of 15 L/day and 6 mg[CN]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long term consumption 0.5 mg[CN]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN]/L.

Determination in Water: 0.1 mg[Pb]/L in drinking water may cause chronic poisoning. The EPA limits lead in drinking water to 15 μg per liter. Various organizations worldwide have set other standards for lead in drinking water as follows[35] (all in mg/L): Argentina 0.01; the Czech Republic 0.05; Germany 0.04; EEC 0.05; Japan 0.10; Mexico 0.05; the former USSR-UNEP/IRPTC joint project 0.03; WHO 0.10. The states of Maine and Minnesota have set guidelines for lead in drinking water[61] at the level of 20 μg/L.

Routes of Entry: Inhalation, skin. Lead can be absorbed through skin at chronically toxic levels.

Harmful Effects and Symptoms

Short-Term Exposure: Skin and eye contact can cause irritation and burns. Lead thiocyanate can cause headache, irritability, mood changes; reduced memory; and disturbed sleep. *Note*: Lead is a cumulative poison. Increasing amounts can build up in the body, eventually reaching a point where symptoms and disability occur. Lead dust carried home on contaminated clothing can result in exposure and symptoms in other family members. Standards only protect for inhalation exposure. Extra precautions should be taken if skin exposure also occurs.

Long-Term Exposure: Repeated exposure can cause lead poisoning with symptoms of headache, irritability, disturbed sleep; tiredness, reduced memory and personality changes. Higher levels can cause muscle or joint pains, weakness, disturbed sleep; and easy fatigue. Exposure can increase the risk of high blood pressure. May cause kidney and brain damage; and anemia. Lead can accumulate in the body over a period of time. Therefore, long-term exposures to lower levels can result in a buildup of lead in the body and more severe symptoms. These may include anemia, pale skin, a Blue line at the gum margin; decreased handgrip strength; abdominal pain; severe constipation; nausea, vomiting, and paralysis of the wrist joint. Prolonged exposure may also result in kidney and brain damage. If the nervous system is affected, usually due to very high exposures, the resulting effects include severe headache, convulsions, coma, delirium and death. In nonfatal cases, recovery is slow and not always complete. Alcohol ingestion and physical exertion may bring on symptoms. Lead exposure increases the risk of high blood pressure. Continuous exposure can result in decreased fertility. Elevated lead exposure of either parent before pregnancy can increase the chances of miscarriage or birth defects. Exposure of the mother during pregnancy can cause birth defects.

Points of Attack: Blood, kidneys, brain, nervous system.

Medical Surveillance: Before first exposure and every 6 months thereafter, OSHA (1910.1025) requires your employer to provide: blood lead test, ZPP test (a special test for the effect of lead on blood cells). Examination of the nervous system. Prior to initial exposure, and annually for exposed person having blood lead readings exceeding 40 μg/100 g of whole blood, OSHA also requires a complete medical history, CBC and kidney function tests in addition to the tests listed above. OSHA defines "exposure" for these tests as air levels which average 30 micrograms of lead or more in a cubic meter of air. OSHA (1910.1020) requires your employer to send the doctor a copy of the lead standard and provide one for you. *Note*: Blood-lead level is a good indicator of total lead exposure. Current OSHA regulations require that if an individual has a blood-lead level greater than or equal to 0.050 mg lead per 100 ml blood, he or she must be removed from all exposures to lead and cannot return to the exposure environment until the blood level falls to 0.040 mg lead per 100 ml blood or less. The following tolerance levels for occupational exposures may also be useful: ACGIH BEI = 50 mg/L (blood); 150 mg/g creatinine (urine). DFG BAT = 70 mg/L (blood); 30 mg/L (blood) for women < 45 years old.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Administer saline cathartic and an enema. For relief of colic, administer antispasmodic (calcium gluconate, atropine, and papaverine). Consider morphine sulfate for severe pain.

Whole blood lead levels, circulating plasma/erythrocyte lead concentration ratio; urine ALA; and erythrocyte protoporphyrin fluorescent microscopy may all be useful in monitoring or assessing lead exposure. Chelating agents, such as Ca EDTA and penicillamine (*not penicillin*) have been found to be generally useful in the therapy of acute lead intoxication.

Antidotes and Special Procedures for Lead: Persons with significant lead poisoning are sometimes treated with Ca EDTA while hospitalized. This "chelating" drug causes a rush of lead from the body organs into the blood and kidneys, and thus has its own hazards, and must be administered only by highly experienced medical personnel under controlled conditions and careful observation. Ca EDTA or similar drugs should never be used to prevent poisoning while exposure continues or without strict exposure control as severe kidney damage can result.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Use any barrier that will prevent contamination from the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Work clothing should be HEPA vacuumed before removal. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Lead (1910.1025 & 1926.62): < or = 0.5 milligram per cubic meter (10 × PEL)

Half-mask* air-purifying respirator equipped with high-efficiency filters**. < or = 2.5 milligram per cubic meter (50 × PEL) Full-facepiece air-purifying respirator with high-efficiency filters**. < or = 50 milligram per cubic meter (1000 × PEL) (1) Any powered air-purifying respirator with high-efficiency filters**; or (2) Half-mask* supplied-air respirator operated in positive-pressure mode. < or = 100 milligram per cubic meter (2000 × PEL) Supplied-air respirators with full facepiece, hood, helmet, or suit, operated in positive-pressure mode. > 100 milligram per cubic meter, unknown concentration, or firefighting Full-facepiece, SCBA operated in positive-pressure mode.

* Full facepiece is required if the lead aerosols cause eye or skin irritation at the use concentrations.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodispersed particles of 0.3 μm in diameter or higher.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from hot water, heat, oxidizers; acids, acid fumes. Lead is regulated by an OSHA Standard 1910.1025. All requirements of the standard must be followed.

Shipping: UN2291 Lead compounds, soluble n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Neutralize with lime or sodium bicarbonate. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Use vacuum or a wet method to reduce dust. Do not dry sweep. When vacuuming, a HEPA filter should be used, not a standard shop vac. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is slightly flammable when exposed to heat or flame. Thermal decomposition products may include cyanides and oxides of nitrogen, sulfur and metal. Use dry chemical, carbon dioxide; water spray; alcohol foam, or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Leptophos L:0240

Formula: $C_{13}H_{10}BrCl_2O_2PS$; $C_6H_5PS(OCH_3)OC_6H_2BrCl_2$

Synonyms: Abar; *O*-(4-Bromo-2,5-dichlorophenyl) *O*-methyl phenylphosphonothioate; *O* -(2,5-Dichloro-4-bromophenyl) *O*-methyl phenylthiophosphonate; Fosvel; K62-105; MBCP; *O*-Methyl *O*-(4-bromo-2,5-dichlorophenyl)phenyl thiophosphonate; NK711; Phenylphosphonothioic acid *O*-(4-bromo-2,5-bromo-2,5-dichlorophenyl) *O*-methyl ester; Phosphonothioic acid, phenyl-, *O*-(4-bromo-2,5-dichlorophenyl) *O*-methyl ester; Phosvel; PSL; V.C.S.; VCS-506; Velsicol 506; Velsicol VCS 506

CAS Registry Number: 21609-90-5

HSDB Number: 2621

RTECS Number: TB1720000

UN/NA & ERG Number: (PIH) UN3464 (organophosphorus compound, solid, toxic, n.o.s)/151; UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 244-472-8 [*Annex I Index No.*: 015-093-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Combustible, Poison, Neurotoxin (cumulative), Environmental hazard.

SUPERFUND/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: inorganic compounds 0.1%; organic compounds 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R21; R25; R33; R39/25; R33; R50/53; safety phrases: S1/2; S25; S29/35; S36/37/39; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters

Description: Leptophos is a tan, waxy solid. Molecular weight = 412.07; freezing/melting point = about 70°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.028%.

Potential Exposure: A potential danger to those involved in the manufacture, formulation and application of this insecticide. Its use is not currently permitted in the United States of America.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Organophosphates are susceptible to formation of highly toxic and flammable phosphine gas in the presence of strong reducing agents such as hydrides and active metals. Partial oxidation by oxidizing agents may result in the release of toxic phosphorus oxides[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.7 milligram per cubic meter

PAC-2: 30 milligram per cubic meter

PAC-3: 53 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = >6$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and GI tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Death may occur from failure of the respiratory center; paralysis of the respiratory muscles; intense bronchoconstriction; or all three. This material is highly toxic; it is capable of causing death or permanent injury by exposure during normal use. LD_{50} = (oral-rat) 30 mg/kg.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, CNS; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below pre-employment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to Physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3464 Organophosphorus compound, solid, toxic, n.o.s, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling*:*Initial Isolation and Protective Action Distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include HCl and oxides of phosphorus, sulfur, nitrogen, and carbon. For small fires, use dry chemical, cargo dioxide, water spray; or foam. For large fires: use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be treated with alkali then burned in a landfill. Large quantities should be incinerated in a unit with effluent gas scrubbing[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT 49CFR172.101, Inhalation Hazard Chemical.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292].

WGK[100] (German Aquatic Hazard Class): No value found (all above CAS numbers). [3-Severe hazard to water. (est.)]

Description: Lewisite is a colorless, odorless liquid when pure. Industrially produced lewisite is an amber to dark brown oily liquid with an odor of geraniums. It turns violet to black or green with age. Odor is not a reliable indicator of the presence of toxic amount of vapor. Blister agent, lewisite (L) rapidly decomposes in relative humidity over 70%. Lewisite is a complex mixture of several cis-and trans-isomer compounds. In chemical agent grade lewisite, the L-1 isomer [2-Chlorovinylarsonous dichloride] generally predominates. (L-1) Molecular weight = 207.32; specific gravity (H_2O:1) = 1.888 @ 20°C; volatility = 2500 milligram per cubic meter @20°C; specific gravity (H_2O:1) = 1.89 @ 20; boiling point = 190°C (decomposes); freezing/melting point = -13°C. Explosive limits: LEL = 84,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704M Rating System): Health 4, Flammability 1, Reactivity 1. Sinks in water and is slightly soluble; solubility = 0.5 g/L. (L-2) Molecular weight = 233.35. (L-3) Molecular weight = 2593.394.

The three homologues, L-1, L-2 [Bis(2-chlorovinyl)arsinous chloride], and L-3 [Tris(2-chlorovinyl)arsine] form from the catalyzed reaction of arsenic trichloride and acetylene. L-1 forms initially, but it continues to react with acetylene to form L-2 and L-3. L-1 is the vesicant agent. L-2 and L-3 are also toxic, but considerably less than L-1.

Mustard-lewisite (military designation HL) is a liquid mixture of distilled mustard (HD) and lewisite (L) and has some properties of both. HL is both a blister agent (vesicant) and an alkylating agent (causes damage to the DNA of rapidly dividing cells). The mustard-lewisite mixture requires lower ambient temperatures before it will freeze; this property allows for improved ground dispersal and aerial spraying. Due to its low freezing point, the mixture remains a liquid in cold weather and at high altitudes. The mixture with the lowest freezing point consists of 63% Lewisite and 37% mustard. Mustard-lewisite mixture may have a garlic odor. Odor, however, should not be depended on to detect HL mixture[77]. Exposure to large amounts of HL may be fatal.

Potential Exposure: A potential danger to those involved in the manufacture or use of this organo-arsenic warfare agent which is a vesicant. L-1, L-2, and L-3 have been used as a blister-agent type war gas.

Mustard-lewisite mixture was developed to achieve a lower freezing point for ground dispersal and aerial spraying.

Persistence of Chemical Agent: Agents L or HL: Summer: 1 to 3 days; Winter: May last for weeks.

Incompatibilities: Lewisite reacts with water and sweat; and, as it breaks down in water or sweat, it produces arsenic containing materials which are less dangerous than lewisite but still dangerous. Heating causes lewisite to yield arsenic trichloride, *tris*-(2-chlorovinyl)arsine, and *bis*-(2-chlorovinyl)chloroarsine. Lewisite attacks copper, aluminum and its alloys. Mustard-lewisite mixture is rapidly corrosive to brass at 65°C and will corrode steel at a rate of 0.0001 in. of steel per month at 65°C. It will hydrolyze into hydrochloric acid, thiodiglycol, and nonvesicant arsenic compounds. Lewisite hydrolyzes in acidic medium to form hydrochloric acid and nonvolatile (solid) chlorovinylarsenous oxide, a less potent blister agent than lewisite. See the emergency response cards for hydrochloric acid and chlorovinylarsenous oxide. Lewisite hydrolyzes in basic media, as in decontamination with alcoholic, caustic, or carbonate solution, to form acetylene and trisodium arsenate[77]. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air The Surgeon General's Working Group (United States Department of Health and Human Services) recommends (for the working place) 0.003 milligram per cubic meter, Ceiling Concentration

PAC Ver. 29[138]

L-1; L-2; L-3

PAC-1: 0.0.23 milligram per cubic meter

PAC-2: $\mathbf{0.25_A}$ milligram per cubic meter

PAC-3: $\mathbf{0.74_A}$ milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60 minute values.

Determination in Water: Lewisite dissolves rapidly in water and breaks down into toxic products that are much less dangerous than lewisite, but still poisonous, containing arsenic products. Warn pollution control authorities and advise shutting water intakes. Octanol-water coefficient: Log K_{ow} (estimated) = 2.56. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Lewisite is a cell irritant, blister agent; and systemic poison that can be absorbed through skin; a few drops can cause death. It produces an immediate searing sensation in the eye, and permanent loss of sight if not decontaminated within 1 minute. It produces an immediate and strong stinging sensation to the skin, followed by reddening within 30 minutes and blistering after about 13 hours. This material causes pulmonary edema, diarrhea, restlessness, weakness, subnormal temperature and low blood pressure. Inhalation of high concentrations may be fatal in as short a time as 10 minutes. Lethal dose in humans is 6 ppm (inhalation), 20 mg/kg (skin). Eye injury below 300 mg-min./m^3. Pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause sensitization and chronic lung impairment. It is a suspected carcinogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to Physician: For severe poisoning, BAL has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you will not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. There are differing guidelines for decontamination and more research is needed to identify the optimal decontamination method. The effect of lewisite and mustard-lewisite can be prevented by rapid topical application of 2,3-dimercaptopropanol, known as BAL which reacts with lewisite to form a stable nontoxic cyclic product. Decontaminate with diluted household bleach (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Be sure you have decontaminated the victims as much as you can before they leave the area so that they do not spread the Lewisite. Use the antidote "Anti-Lewisite." Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 ounces per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items. *Note*: Decontamination wash water (effluent) will contain toxic arsenic.

Personal Protective Methods:

General Information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

Level A: (*Red Zone*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

Level B: (Red Zone): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

Level C: (Yellow Zone): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using air purifying respirators (APR) or powered-air purifying respirators (PAPR) are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting face-piece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

Level D: (Green Zone): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear full facepiece respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: ***Requirements for Respiratory Protection for Inorganic Arsenicals with Significant Vapor Pressure***

$<$ or $= 100\ \mu g/m^3$ (1) Half-mask* air-purifying respirator equipped with high-efficiency filter** and acid gas cartridge; or (2) Any half-mask* supplied-air respirator. $<$ or $= 500\ \mu g/m^3$ (1) Front-or back-mounted gas mask equipped with high-efficiency filter** and acid gas canister; (2) Any full-facepiece supplied-air respirator; or (3) Any full-facepiece SCBA. $<$ or $= 10{,}000\ \mu g/m^3$ Half-mask* supplied-air respirator operated in positive-pressure mode. $<$ or $= 20{,}000\ \mu g/m^3$ Supplied-air respirator with full facepiece, hood, or helmet or suit, operated in positive-pressure mode. $> 20{,}000\ \mu g/m^3$, unknown concentrations, or firefighting: Any full-facepiece SCBA operated in positive-pressure mode.

* Half-mask respirators shall not be used for protection against arsenic trichloride, as it is rapidly absorbed through the skin.

** A high-efficiency filter means a filter that is at least 99.97% efficient against monodisperesed particles of 0.3 μm in diameter or higher.

Storage: (1) Color code-Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code-Red Stripe (UN3162): Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalies.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required (Lewisite). UN3280 Organoarsenic compound, liquid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required (Lewisite), Potential Inhalation Hazard (Special Provision 5). UN2927 Toxic liquids, corrosive, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required (Lewisite). Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial Isolation and Protective Action Distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small Spills (from a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large Spills (from a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Agents L-1, L-2, L-3, & HL when used as a weapon

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large Spills (*from a large package or from many small packages*)

First: Isolate in all directions (ft/m) 300/100
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.6/1.0

BACK OFF! Isolate a wide area around the release and call for expert help. If in a building, evacuate and confine vapors by closing doors and shutting down heating, ventilation, and air conditioning systems. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Avoid contact with eyes and skin; avoid breathing vapors. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors.

Small Spills: Cover with vermiculite, diatomaceous earth, clay, or fine sand and neutralize as soon as possible using large amounts of alcoholic caustic, carbonate, or Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]. Caution: acetylene given off. Place into containers for later disposal. Large Spills: dike far ahead of spill for later disposal. Can be decontaminated by supertropical bleach, or caustic soda. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include HCl, arsenic, and oxides of carbon. Principles and methods for destruction of chemical weapons: “Destruction of chemical weapons” means a process by which chemicals are converted in an essentially irreversible way to a form unsuitable for production of chemical weapons, and which in an irreversible manner renders munitions and other devices unusable as such. Each nation shall determine how it shall destroy chemical weapons, except that the following processes may not be used: dumping in any body of water, land burial, or open-pit burning. It shall destroy chemical weapons only at specifically designated and appropriately designed and equipped facilities. Each nation shall ensure that its chemical weapons destruction facilities are constructed and operated in a manner to ensure the destruction of the chemical weapons; and that the destruction process can be verified under the provisions of this Convention [Organization for the Prohibition of Chemical Weapons; Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons and Their Destruction]. Heating causes lewisite to yield arsenic compounds: arsenic trichloride (A: 1570), *tris*-(2-chlorovinyl)arsine, and *bis*-(2-chlorovinyl)chloroarsine. Firefighting gear (including SCBA) does not provide adequate protection. Use unattended equipment whenever possible. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Specially trained personnel operating from a safe distance can fight fires using foam or dry chemicals, or use fog streams to extinguish burning liquids. Thermal decomposition products may include chlorine and arsenic. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray from unattended equipment to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

List of Stockholm Convention POPs: Annex A (Elimination)

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R20/21; R25; R48/22; R50/53; R62; R63; R64; safety phrases: S1/2; S13; S29; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lindane is a white to yellow, crystalline powder with a slight, musty odor (pure material is odorless). Molecular weight = 390.82; specific gravity (H_2O:1) = 1.85; boiling point = 323.3°C; freezing/melting point = 112.8°C; vapor pressure = 0.00001 mmHg; Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water. Noncombustible solid, but may be dissolved in flammable liquids.

Potential Exposure: Lindane has been used against insects in a wide range of applications including treatment of animals, buildings, humans for ectoparasites, clothes, water for mosquitoes; living plants; seeds and soils. Some applications have been abandoned due to excessive residues, e.g., stored foodstuffs. Formulators, distributors and users of lindane represent a special risk group. The major use of lindane in recent years has been to pretreat seeds. Thus, those engaged in treatment and planting can be exposed.

Incompatibilities: Lindane decomposes on contact with powdered iron, aluminum, and zinc and with alkalis producing trichlorobenzene. Corrosive to metals

Permissible Exposure Limits in Air

NIOSH IDLH = 50 milligram per cubic meter

OSHA PEL: 0.5 milligram per cubic meter TWA [skin]

NIOSH REL: 0.5 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.5 milligram per cubic meter TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC Ver. 29[138]

PAC-1: 9.1 milligram per cubic meter

PAC-2: 100 milligram per cubic meter

PAC-3: 1000 milligram per cubic meter
DFG MAK: 0.1 milligram per cubic meter, inhalable fraction; [skin]; Carcinogen Category 4; Pregnancy Risk Group C
Austria: MAK 0.5 milligram per cubic meter, [skin], 1999; Denmark: TWA 0.5 milligram per cubic meter, [skin], 1999; Finland: TWA 0.5 milligram per cubic meter, [skin], 1999; France: VME 0.5 milligram per cubic meter, [skin], 1999; Norway: TWA 0.5 milligram per cubic meter, 1999; the Philippines: TWA 0.5 milligram per cubic meter, [skin], 1993; Switzerland: MAK-W 0.5 milligram per cubic meter, [skin], 1999; the Netherlands: MAC-TGG 4 μg/m^3, [skin], 2003; Turkey: TWA 0.5 milligram per cubic meter, [skin], 1993; United Kingdom: TWA 0.1 milligram per cubic meter, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for lindane in ambient air[60] ranging from zero (North Dakota) to 0.068 μ/m^3 (Massachusetts) to 1.19 μ/m^3 (Kansas) to 1.2 μ/m^3 (Pennsylvania) to 1.67 μ/m^3 (New York) to 5.0 μ/m^3 (Connecticut, Florida, South Carolina) to 8.0 μ/m^3 (Virginia) to 12.0 μ/m^3 (Nevada).

Determination in Air: Collection on a filter, workup with isooctane, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method 5502[18].

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.0002 mg/L; MCLG, 0.0002 mg/L. Federal Drinking Water Standards: EPA 0.2 μg/L; Federal Drinking Water Guidelines: EPA 0.2 μg/L; State Drinking Water Guidelines: Arizona 0.2 μg/L; Maine 0.2 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol-water coefficient: Log $K_{\text{ow}} = > 3.5$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, skin absorption; ingestion, eye and/or skin contact. Fish Tox = 0.11310000 MATC (EXTRA HIGH).

Harmful Effects and Symptoms

Short-Term Exposure: Lindane irritates the eyes and the respiratory tract and may affect the CNS. Symptoms of exposure include vomiting, faintness, tremor, restlessness, muscle spasms; unsteady gait; and convulsions may occur as a result of exposure. Elevated body temperature and pulmonary edema have been reported in children. Coma, respiratory failure and death can result. Exposure to vapors of this compound or its thermal decomposition products may lead to headache, nausea, vomiting, and irritation of the eyes, nose, and throat. Lindane is a stimulant of the nervous system; causing violent convulsions that are rapid in onset and generally followed by death or recovery within 24 hours. The probable human oral lethal dose in 50−500 mg/kg, or between 1 teaspoon and 1 ounce for a 150 lb (70 kg) person. Human Tox = 0.20000 ppb MCL (Extra High).

Long-Term Exposure: Liver and/or kidney problems. Repeated or prolonged contact with skin may cause dermatitis. May damage the liver and kidneys. May damage the nerves in the arms and legs, possibly with weakness and poor coordination. May cause a serious drop in the blood cell count (aplastic anemia) or in the white blood cell count (agranulocytopenia). The Department of Health and Human Services has determined that hexachlorocyclohexanes (HCH) may reasonably be anticipated to be carcinogenic. Liver cancer has been seen in laboratory rodents that ate HCH for long periods of time. In animals, there is evidence that oral exposure to lindane during pregnancy results in an increased incidence of fetuses with extra ribs. However, ATSDR reports that animal studies have not shown birth defects in the babies of animals fed HCH during pregnancy. BCH has been detected in human breast milk.

Points of Attack: Eyes, CNS; blood, liver, kidneys, skin.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; CBC; urine (chemical/metabolite). Blood test for lindane (may not be accurate longer than 1 week following last exposure). Liver and kidney function tests. See "*Occupational Health Guidelines for Chemical Hazards*," NIOSH Pub Nos. 81-123; 88-118, Suppls. I-IV. 1981-1995.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Employees should wash immediately when skin is wet or contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: Up to 5 milligram per cubic meter: Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). Up to 12.5 milligram per cubic meter: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter).* Up to 25 milligram per cubic meter: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 50 milligram per cubic meter: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode; or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). Escape: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly sealed containers in a cool, dry place away from light and incompatible materials. Protect containers against physical damage. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include HCl, phosgene and oxides of carbon. Use dry chemical, carbon dioxide; water spray; or foam for small fires. Use water spray, fog, or foam for large fires. Move container from fire area if this can be done without risk. Use water to keep fire-exposed containers cool. Isolate hazard area and deny entry. Stay upwind and keep out of low areas. Ventilate closed spaces before entering. Wear positive breathing apparatus and special protective clothing. Fight fire from maximum distance, dike fire control water for later disposal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For the disposal of lindane, a process has been developed involving destructive pyrolysis @ 400–500°C with a catalyst mixture which contains 5%–10% of either cupric chloride, ferric chloride; zinc chloride; or aluminum chloride on activated carbon. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group C, possible human carcinogen; Carcinogenicity: GHS Category 2: Suspected human carcinogen

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin (3/19/1999)

Hazard Alert: Poison, Endocrine disruptor (high), Suspected reprotoxic hazard, Reproductive and developmental toxin (TRI), Possible endocrine disruptor, Environmental hazard.

Marine Pollutant, IMDG

Potential Ground water Pollutant [California FAC Section 13145(d)/12811, active]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

Hazardous to aquatic life or environment, with possible long lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R22; R48/22; R50/53; R62; R63; safety phrases: S2; S29/35; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: White crystalline solid or powder. Odorless. Commercial product may be available a water soluble or emulsifiable concentrate. Molecular weight = 249.11; specific gravity (H_2O:1) = 1.492 @ 20°C; freezing/melting point = 93−94°C; vapor pressure = 1.43×10^{-6} mmHg @ 25°C[83]. Slightly soluble in water; solubility = 75 mg/L @ 25°C.

Potential Exposure: Inhibits photosynthesis. Linuron is a selective, pre-emergence urea herbicide used to control grasses and broadleaf weeds in carrots, beans, peas, asparagus, maize, potatoes, soybeans, sorghum, wheat, bananas, coffee, cotton, and ornamentals. It is also used for control of annual weeds in storehouses, roadsides, fence rows and other noncrop lands. Linuron is frequently used in formulations with other herbicides, insecticides, and fungicides.

Incompatibilities: Amides are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Similar organic amides react with azo and diazo compounds, releasing toxic gases. Contact with reducing agents can release flammable gases. Amides are very weak bases but they can react as acids, forming salts. Mixing amides with dehydrating agents such as such as phosphorus pentoxide or thionyl chloride generates the corresponding nitrile[101].

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: State Drinking Water Standards: Florida 14 μg/L; Minnesota 1.0 μg/L

Determination in Water: Octanol-water coefficient: Log $K_{ow} = > 3.0$. Values above 3.0 are likely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Intermediate−42.00007 ppb, MATC.

Routes of Entry: Dermal contact, ingestion, inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or burns. Inhalation should be avoided; use

NIOSH-or CEN (UK)-approved APRs for pesticides. Ingestion may cause nausea, vomiting, and diarrhea. LD_{50} (oral, rat) = 1146 mg/kg; LD_{50} (dermal, rat) = > 2.5 g/kg.

Long-Term Exposure: Developmental problems. Possible mutagen. Human toxicity (long term)(101): High−5.60 ppb, Health Advisory.

Points of Attack: Skin; reproductive system

Medical Surveillance: Preliminary medical exam to detect chronic diseases of CNS, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and advice for medical monitoring. Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone, and serum luteinizing hormone may be carried out if, in the opinion of a physician, they are indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not induce vomiting when formulations containing petroleum solvents are ingested. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where the neat (undiluted) test chemical is weighed and diluted, wear a NIOSH-approved half face respirator equipped with a combination filter cartridge, i.e., organic vapor/acid gas/HEPA (specific for organic vapors, HCl, acid gas, SO_2, and a high efficiency particulate filter)[88]

Storage: Color code-Blue: Health Hazard/Poison. Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Large Spills: Dike far ahead of spill for later disposal. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. Fire involving storage or vehicular tanks: Isolate for 800 m/0.5 mile in all directions; also, consider initial evacuation for 800 m/0.5 mile in all directions. On a small fire: use dry chemical, CO_2, water spray or regular foam. On a large fire: use water spray, fog or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. Fire involving tanks: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a unit operating at 850°C equipped with off-gas scrubbing equipment. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Liquefied petroleum gas (LPG)L:0270

Formula: C_3H_8-C_3H_6-C_4H_{10}-C_4 H_8 (mixture)

A mixture of propane (C_3H_8) and butane (C_4H_{10}).

Synonyms: Bottled gas; Compressed petroleum gas; Gas de petroleo licuado (Spanish); Liquefied hydrocarbon gas; L.P.G.; Petroleum gas, liquefied; Propane-butane-(propylene); Pyrofax

CAS Registry Number: 68476-85-7

HSDB Number: 7914

RTECS Number: SE7545000

UN/NA & ERG Number: UN1075/115

EC Number: 270-704-2 [*Annex I Index No.*: 649-202-00-6]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable gas, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Hazard symbols, risk, & safety statements: Hazard symbol: F + , T; risk phrases: R3; R5; R12; R21; R45; R46; safety phrases: S33; S38; S41; S45; S53 (see Appendix 4).

Description: LPG is a colorless, noncorrosive, odorless mixture of gases when pure. A foul-smelling odorant is usually added. Shipped as a liquefied compressed gas (a mixture of propane, butanes, propylene, and butylenes). Molecular weight: 43.9; boiling point ≥ 6°C; 42−44°C (propane); −1°C (butane); flash point = (flammable gas): −104°C (propane); −60°C (butane). Explosive limits: LEL = 2.1%; UEL: 9.5% (propane); LEL = 1.9%; UEL: 8.5% (butane); Autoignition temperature = about 400°C: 466°C (propane); 405°C (butane). Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.

Potential Exposure: LPG is used as a fuel propellant; in metal cutting; and in the production of petrochemicals.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, and epoxides. Contact with chlorine dioxide may cause fire and explosions. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm [LEL]

Conversion factor: 1 ppm = 1.72−2.37 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 1000 ppm/1800 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/1800 milligram per cubic meter TWA

ACGIH TLV[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1−C_4)

PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 2.30E + 05 ppm

PAC-3: 4.00E + 05 ppm

The Philippines: TWA 1000 ppm (1800 milligram per cubic meter), 1993; Switzerland: MAK-W 1000 ppm (1800 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (1800 milligram per cubic meter), 1993; United Kingdom: TWA 1000 ppm (1750 milligram per cubic meter); STEL 1250 ppm, 2000; the Netherlands: MAC-TGG 1800 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 1000

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Liquefied petroleum gas can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels could cause suffocation and death from lack of oxygen. Contact with liquid liquefied petroleum gas can cause frostbite.

Points of Attack: Respiratory system; CNS.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: Skin Contact: Do not rub. Seek medical attention. Breathing: Remove the person from exposure. Begin (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do not rub the affected areas or flush them with water. In order to prevent further tissue damage, do not attempt to remove frozen clothing from frostbitten areas. If frostbite has not occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid d unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash

Respirator Selection: 2000 ppm: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode. Escape: SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code-Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Metal containers involving the transfer of 5 gallons or more of liquefied petroleum gas should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Sources of ignition, such as smoking and open flames are prohibited where liquefied petroleum gas is handled, used, or stored. Wherever liquefied petroleum gas is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1075 Petroleum gases, liquefied or Liquefied petroleum gas; Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Liquefied petroleum gas is a flammable gas. The flame may be invisible. Thermal decomposition products may include oxides of carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Flaring using smokeless flare designs.

Lithium L:0280

Formula: Li

Synonyms: Li; Lithium, elemental; Lithium metal; Lithium monohydride

CAS Registry Number: 7439-93-2

HSDB Number: 647

RTECS Number: OJ5540000

UN/NA & ERG Number: UN1415 (Dangerous when wet)/138; UN3089 (Metal powder, flammable, n.o.s.)/170

EC Number: 231-102-5 [*Annex I Index No.*: 003-001-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Strong reducing agent, Dangerously water reactive, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R10; R14/15; R15/29; R34; R61; R62; R63; safety phrases: S1/2; S8; S43; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Lithium is a silvery to grayish-white metal that turns yellow on exposure to air and/or moisture. Molecular weight = 6.94; specific gravity (H_2O:1) = 5.3 @ 20°C; boiling point = 1342°C; freezing/melting point = 181°C; vapor pressure = 5.92×10^{-13} mmHg @ 127°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2 ₩. Violent reaction with water forming lithium hydroxide and flammable hydrogen gas.

Potential Exposure: Lithium is used in inorganic syntheses; the manufacture of storage batteries; heat transfer liquids; and metal alloys.

Incompatibilities: Violent reaction with water, forming flammable hydrogen gas and corrosive lithium hydroxide, a strong caustic solution. Heating may cause violent combustion or explosion. Finely divided particles or powdered form may ignite spontaneously in air. Contact with air forms corrosive fumes of lithium hydroxide. Violent reaction with oxidizers, acetonitrile, nitric acid; arsenic, bromobenzene, carbon tetrachloride; hydrocarbons, halogens, halons, sulfur, and many other substances. Forms impact- and friction-sensitive mixtures with bromobenzene, carbon tetrabromide, chloroform (weak explosion), iodoform, halogens, halocarbons, methyl dichloride; methyl diiodide and other substances. Attacks plastics, rubber, ceramic materials; concrete, sand, and metal alloys: cobalt, iron, manganese, nickel.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 3.3 mg[Li]/m^3

PAC-2: 36 mg[Li]/m^3

PAC-3: 220 mg[Li]/m^3

Determination in Air: Use OSHA Analytical Method ID-121; NIOSH Analytical Method #8005, Elements in blood or tissue.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Contact can cause severe skin and eye burns. Inhalation can irritate the respiratory tract causing coughing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure to lithium can cause loss of appetite; nausea, tremor, muscle twitches; apathy, convulsions, coma and death.

Long-Term Exposure: Exposure can cause loss of appetite; nausea, vomiting, diarrhea, and abdominal pain; headache; muscle weakness; loss of coordination; confusion, seizures, and coma. May affect the thyroid gland causing goiter. May affect the kidneys and heart function. Exposure may cause an allergy to develop, affecting the skin, blood vessels, and/or possibly the lungs.

Points of Attack: Lungs, thyroid, kidneys, heart, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: EKG, blood test for lithium. Thyroid function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to lithium, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-

approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: UN1415 Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. UN3089 (1) Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code-Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Reacts with body moisture, forming corrosive lithium hydroxide: (3) Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect storage containers from physical damage. Lithium must be stored to avoid contact with water, halogenated compounds, carbon dioxide; oxidizers, strong acids; alcohols, metals chlorinated arsenic compounds; hydrocarbons, sulfur, acetonitrile, nitrogen, and many other materials, since violent reactions occur. Store in tightly closed containers under kerosene or neutral oil in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where lithium is used, handled or stored in a manner that could create a potential fire or explosion hazard. Wherever lithium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1415 Lithium, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep lithium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Lithium is a highly reactive, combustible solid that is difficult to extinguish. Can be spontaneously flammable in temperatures > 180°C. Thermal decomposition products may include lithium oxide. Do not use water, foam, dry chemical, halogenated hydrocarbons; CO_2 on fire or adjacent fire. Use Class D extinguishers, dry clay; dry graphite; limestone, or appropriate special metal fire extinguishing powder. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Lithium*, Trenton, NJ (November, 1999)

Lithium aluminum hydride L:0285

Formula: AlH_4Li; $LiAlH_4$

Synonyms: Aluminum lithium hydride; Lithium alanate; Lithium aluminohydride; Lithium aluminum tetrahydride; Lithium tetrahydroaluminate

CAS Registry Number: 16853-85-3

HSDB Number: 648

RTECS Number: BD0100000

UN/NA & ERG Number: UN1410 (dry)/138; UN1411 (ether solution)/138

EC Number: 240-877-9 [*Annex I Index No.*: 001-002-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Dangerously water reactive, Strong reducing agent,

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, C; risk phrases: R14/15; R35; safety phrases: S1/2; S7/8; S21; S26; S36/37/39; S43; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Lithium aluminum hydride is a white to gray powder. A combustible solid. Molecular weight + 37.96;

decomposes @ 125°C; specific gravity (H_2O:1) = 0.92 @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2 ₩. Reacts with water.

Potential Exposure: This material is used as a catalyst and as a specialty reducing agent in organic synthesis.

Incompatibilities: Combustible solid. Can ignite spontaneously in moist air or heat. Decomposes on heating @ 125°C forming aluminum, lithium hydride and flammable hydrogen gas. A strong reducing agent; violent reaction with oxidizers. Violent reaction with water, alcohols, acids, dimethylether, ethers, tetrahydrofuran, benzoyl peroxide; boron trifluoride etherate. Reduces carbon dioxide or sodium hydrogen carbonate to methane and ethane at elevated temperatures. These flammable or explosive gases can form when CO_2 extinguishers are used to fight hydride fires. Forms explosive complexes with ether, dimethylamine and various tetrazoles. Tetrazoles include, 2-methyl, 2-ethyl, 5-ethyl, 2-methyl-5-vinyl, 5-amino-2-ethyl [United States Pat. 3 396 170, 1968, Cameo].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 8.4 milligram per cubic meter

PAC-2: 92 milligram per cubic meter

PAC-3: 550 milligram per cubic meter

Permissible Concentration in Water: No criteria set. Reacts violently with water.

Routes of Entry: Inhalation, ingestion, eyes and/or skin.

Harmful Effects and Symptoms

Short-Term Exposure: Lithium aluminum hydride can affect you when breathed in. Contact can cause severe burns of the eyes and skin. Exposure can irritate the eyes, nose, throat and lungs, causing coughing and sneezing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause loss of appetite; nausea, confusion, tremor, and muscle twitching. High exposure can cause coma and death.

Long-Term Exposure: Can cause loss of appetite; nausea, vomiting, diarrhea, and abdominal pain; headache; muscle weakness; loss of coordination; confusion, seizures, and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Thyroid gland, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests. Thyroid function tests. If symptoms develop or overexposure is suspected, the following maybe useful: serum lithium level. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 5 milligram per cubic meter, use a NIOSH/ MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code-Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. (3) Color code-Yellow Stripe (strong reducing agent): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lithium aluminum hydride must be stored to avoid contact with water, air, acids, alcohols, benzoyl peroxide; boron trifluoride etherate; ethers, tetrahydrofuran, and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where lithium aluminum hydride is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of lithium aluminum hydride. Wherever lithium aluminum hydride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Open only in inert atmospheres or very low humidity rooms.

Shipping: UN1410 Lithium aluminum hydride (dry), Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN1411 Lithium aluminum hydride, ethereal, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 3-Flammable liquid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Decomposes at 125°C forming flammable hydrogen gas. The heat generated may cause ignition and/or explosion[136]. Thermal decomposition products may include lithium hydroxide, lithium hydride and metal oxides. Do not use water, CO_2 or foam. Use Class D extinguishers, dry sand; dry clay; dry limestone, dry graphite. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. Fire may restart after it has been extinguished. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

California Proposition 65 Developmental/Reproductive toxin 1/1/1991.

Hazard Alert: Poison, Corrosive (aqueous solution), Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, FDA proprietary drug.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R11; R14; R15; R20/21/22; R34; R36/37/38; R41; R62; R63; safety phrases: S7/8; S16; S24/25; S26; S36/37/39; S43; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Lithium carbonate is a white hygroscopic powder. Molecular weight = 73.89; specific gravity (H_2O:1) = 2.11 @ 20°C; boiling point = 1310°C (decomposes below BP); freezing/melting point = 720°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Slightly soluble in water.

Potential Exposure: Lithium carbonate is used in treatment of manic-depressive psychoses; to make ceramics and porcelain glaze; varnishes, dyes, pharmaceuticals, coating of arc-welding electrodes; battery alloys; nucleonics, luminescent paints; glass ceramics; lubricating greases; in aluminum production.

Incompatibilities: The aqueous solution is a strong base. Reacts violently with acids, powdered calcium and fluorine.

Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, powdered calcium, fluorine, moisture. Corrodes aluminum, copper, zinc.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 3.1 milligram per cubic meter

PAC-2: 34 milligram per cubic meter

PAC-3: 210 milligram per cubic meter

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50} = (oral-rat) 525 mg/kg. Contact causes skin, eye and respiratory tract irritation. Inhalation can cause nausea, vomiting, diarrhea, and abdominal pain. Can cause lung irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache; muscle weakness; muscle twitching; blurred vision; loss of coordination; confusion, seizures, and coma. May affect the CNS; cardiovascular, and GI systems if ingested.

Long-Term Exposure: May cause damage to the developing fetus. May cause skin allergy and dermatitis. High exposure can cause enlarged thyroid (goiter). May damage the stomach, kidneys and may affect the heart function. May cause reproductive toxicity in humans.

Points of Attack: Skin, thyroid, kidneys, heart.

Medical Surveillance: Blood tests for lithium level. Kidney function tests. Thyroid function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. Refer to FDA regulation for Good Manufacturing Practices 21CFR210.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, fluorine, oxidizers, and acids. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:. UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of metal and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Sufficient Evidence, carcinogenic to humans, Group 1, 1997; NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; EPA (inhalation): Known human carcinogen; EPA (oral): Not Classifiable as to human carcinogenicity; NTP: Known to be a human carcinogen

California Proposition 65 Chemical[102]: (*hexavalent chromium*) Cancer 2/27/1987; Developmental/Reproductive toxin (male, female) 12/19/2008

Hazard Alert: Poison, Strong oxidizer, sensitization hazard (skin), Reproductive toxin, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as chromium compounds

United States National Primary Drinking Water Regulations: MCLG = 0.01 mg[Cr]/L; MCL = 0.1 mg[Cr]/L as Chromium

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Toxic Pollutant (Section 401.15); Section 313 Water Priority Chemicals (57FR41331, 9/9/1992).

EPA EPA ADI: (14307-35-8) Chromium(VI) = 0.175 mg/day/man. EPA EASI levels for chromium: **Infants**: age 0.0−0.5 year: 0.01−0.04 mg/day; age 0.5−1.0 year: 0.02−0.06 mg/day. **Children** age 1−3 years: 0.02−0.08 mg/day; age 4−6 years: 0.03−0.12 mg/day; age 7−10 years: 0.05−0.20 mg/day; age > or = to 11 years: 0.05−0.20 mg/day. **Adults**: 0.05−0.20 mg/day.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as chromium compounds, waste number not listed.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: Chromium(VI) compounds: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: E, O, T + , N; risk phrases: R45; R2; R8; R21; R25; R26; R34; R42; R46; R48/23; R50/53; R60; R61; safety phrases: S29/35; S45; S53; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Lithium chromate is a yellow crystalline powder. Molecular weight = 129.88 (lithium chromate oxide); 165.92; 131.90 (*dilithium chromate*); specific gravity (H_2O:1) = 2.15, no temp. (lithium chromate oxide); freezing/melting point = 75°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Used as a corrosion inhibitor, heat transfer agent; and oxidizing agent in leather and metal finishing. Also used in photography, wood preservatives; batteries, safety matches, and cement.

Incompatibilities: Aqueous solution is caustic. A strong oxidizer; strong reaction with reducing agents, combustibles, organic material, hydrazine, chromic acid; sulfur, acids. Attacks plastics and aluminum.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.37 milligram per cubic meter

PAC-2: 6.5 milligram per cubic meter

PAC-3: 39 milligram per cubic meter

As Chromium(VI) Inorganic Soluble Compounds:

NIOSH IDLH = 15 mg[Cr(VI)]/m^3

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See NIOSH Pocket Guide, Appendixes A & C.

ACGIH TLV[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift

Determination in Air: Use NIOSH Analytical Method (IV) #7024, Chromium.

Permissible Concentration in Water: State Drinking Water Guidelines: California 10 μg[Cr(VI)]/L; Maine 35 μg[Cr(VI)]/L. For the protection of freshwater aquatic life: EPA's maximum drinking water level (MCL) is 0.1 mg/L[62]. United States National Primary Drinking Water Regulations (total chromium): MCLG = 0.01 mg[Cr]/L; MCL = 0.1 mg[Cr]/L.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide); or by ICP optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods[49].

Routes of Entry: Inhalation, eye and/or skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact causes severe skin and eye irritation and burns. Inhalation can irritate the nose and throat causing coughing and wheezing. Inhalation may cause cancer.

Long-Term Exposure: Chromium may cause allergic dermatitis. Repeated exposure can cause loss of appetite; nausea, tremor, and convulsions. Lithium chromate is a hexavalent chromium compound, and a possible human carcinogens. Handle with care. Related chromium compounds are teratogenic. Can irritate the lungs; may cause bronchitis to develop. May cause skin allergy. Repeated exposure may cause personality changes of depression, anxiety or irritability. Prolonged exposure may cause deep slow-healing ulcers on the skin, and a sore or hole in nasal septum. May damage the liver and kidneys.

Points of Attack: Lungs, liver, kidneys, skin.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: Blood gas analysis, CBC; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Lung function tests. Evaluation by a qualified allergist. Liver and kidney function tests. Check skin daily for blisters or little bumps, the first sign of “chrome ulcers.” If not treated early, these can last for years following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). Escape: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from acids, hydrazine, chromic acid; combustible materials; sulfur, aluminum, plastics; and reducing agents.

Shipping: UN3288 Toxic solids, inorganic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of lithium and chromium. Use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Lithium hydride is an off-white to grayish, translucent, odorless solid or white powder that darkens rapidly on exposure to light. Molecular weight = 7.95; specific gravity (H_2O:1) = 0.783; boiling point = (decomposes below BP) 850°C; freezing/melting point = 689–692°C; Autoignition temperature = 200°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Reacts with water releasing caustic lithium hydroxide and flammable hydrogen gas.

Potential Exposure: Lithium hydride is used in preparation of lithium aluminum hydride; as a desiccant; it is used in hydrogen generators and in organic synthesis as a reducing agent and condensing agent with ketones and acid esters; it is reportedly used in thermonuclear weapons.

Incompatibilities: A Strong reducing agent. Incompatible with oxidizers, halogenated hydrocarbons; acids can cause fire and explosion. Reacts with water, forming caustic lithium hydroxide and flammable hydrogen gas; reaction may cause ignition. May ignite spontaneously in moist air and may reignite after fire is extinguished. Dangerous when wet. Reacts with water to form hydrogen and lithium hydroxide. Powdered form and liquid oxygen form an explosive compound. Decomposes exothermically on contact with acids and upon heating to about 500°C, producing flammable hydrogen gas. Reacts with carboxylic acids, lower alcohols; chlorine, and ammonia (at 400°C), forming explosive hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 0.5 milligram per cubic meter

OSHA PEL: 0.025 milligram per cubic meter TWA

NIOSH REL: 0.025 milligram per cubic meter TWA

ACGIH TLV[1]: 0.025 milligram per cubic meter TWA

PAC * Ver. 29[138]

PAC-1: **0.025_E** milligram per cubic meter

PAC-2: **0.1_E** milligram per cubic meter

PAC-3: **0.5_E** milligram per cubic meter

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E.**"

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 0.025 milligram per cubic meter, 1993; Austria: MAK 0.025 milligram per cubic meter, 1999; Belgium: TWA 0.025 milligram per cubic meter, 1993; Denmark: TWA 0.025 milligram per cubic meter, 1999; Finland: TWA 0.025 milligram per cubic meter; STEL 0.075 milligram per cubic meter, 1999; France: VME 0.025 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.025 milligram per cubic meter, 2003; the Philippines: TWA 0.025 milligram per cubic meter, 1993; Poland: MAC (TWA) 0.025 milligram per cubic meter, 1999; Switzerland: MAK-W 0.025 milligram per cubic meter, 1999; Turkey: TWA 0.025 milligram per cubic meter, 1993; United Kingdom: TWA 0.025 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, and Vietnam: ACGIH TLV: TWA 0.025 milligram per cubic meter. Several states have set guidelines or standards for lithium hydride in ambient air[60] ranging from 0.4 μ/m^3 (Virginia) to 0.5 μ/m^3 (Connecticut) to 2.0 μ/m^3 (North Dakota) to 6.0 μ/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 0.3 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Lithium hydride is an alkaline-corrosive agent. Contact with eyes may result in severe damage to the cornea, conjunctiva, and blood vessels. Extreme caution is advised. Acute exposure to lithium hydride may result in irritation and burning of the skin, eyes, and mucous membranes. Increased salivation, dysphagia (difficulty in swallowing), abdominal pain; and spontaneous vomiting may occur. Stridor (high-pitched, noisy respirations), dyspnea (shortness of breath), and pulmonary edema are also common. Apathy and mental confusion may develop, with progression to coma and death.

Long-Term Exposure: Lithium can cause loss of appetite; nausea, vomiting, diarrhea, and abdominal pain; headache; muscle weakness; loss of coordination; confusion, seizures and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system; CNS; thyroid, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Thyroid function tests. Kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear appropriate clothing to prevent any possibility of contact with air of >0.1 milligram per cubic meter content. Wear eye protection to prevent any possibility of eye contact. Provide emergency showers and eyewash if air containing >0.5 milligram per cubic meter is involved. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: Up to 0.25 milligram per cubic meter: 100XQ (any air-purifying respirator with a high-efficiency particulate filter); or Sa (APF = 10) (any supplied-air respirator); Up to 0.5 milligram per cubic meter: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: 100F (APF = 50) (any air-purifying, full facepiece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code-Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Store under nitrogen in a cool, ventilated area. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. (2) Color code-Yellow Stripe (strong reducing agent): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Protect containers against physical damage. Store in isolated, well-ventilated, cool, dry area.

Shipping: UN1414 Lithium, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material. UN2805 Lithium hydride, fused solid, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not touch spilled materials. Do not allow material to contact water. Shovel up small spills with noncombustible absorbent material. Confine large spills with dikes, sheets, or tarps to stop spreading. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include caustic fumes of lithium hydroxide and metal oxides. Lithium hydride can form airborne dust clouds which may explode on contact with flame, heat, or oxidizing materials. Additionally, spontaneous ignition occurs when nitrous oxide and lithium hydride are mixed. Lithium hydride also forms explosive mixtures with liquid oxygen. Do not use water, carbon dioxide; dry chemical; or halogenated extinguishing agents; such as carbon tetrachloride. Use Class D extinguishers, dry sand; dry graphite; dry limestone, or ground dolomite-based dry chemical extinguishers, such as "Lith-X." Wear protective goggles or face shield, rubberized gloves; flame-proof outer clothing; respirator, and high boots or shoes. Large fires: withdraw from area and let fire burn, as lithium hydride may continue to re-ignite. A fire, once started, cannot be extinguished by ordinary methods. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Lithium hydride may be mixed with sand, sprayed with butanol and then with water, neutralized and flushed to a sewer with water.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet: Lithium Hydride, #1128, Bromine*, Trenton, NJ, (April 2004)

Lithium nitrate L:0320

Formula: $LiNO_3$

Synonyms: Nitric acid, lithium salt

CAS Registry Number: 7790-69-4

RTECS Number: QU9200000

UN/NA & ERG Number: UN2722/140

EC Number: 232-218-9

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Strong oxidizer.

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; MCL = 10 mg/L as nitrates

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xi; risk phrases: R8; R36/38; safety phrases: S17; S22; S24/25; S26; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Lithium nitrate is a colorless deliquescent powder. Molecular weight = 68.95; specific gravity (H_2O:1) = 2.38; freezing/melting point = 253°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Lithium nitrate is used in ceramics, pyrotechnics, salt baths; refrigeration systems; and rocket propellants.

Incompatibilities: May explode when exposed to sparks, shock and heat. Violent reactions with combustible materials; oxidizers, organic materials; reducing agents; strong acids.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Lithium nitrate can affect you when breathed in. Repeated heavy exposure may lead to lithium poisoning. This can cause loss of appetite; nausea, tremor, muscle twitches, apathy, convulsions, coma, and death. Contact with lithium nitrate water solution or powder can cause severe skin and eye burns. A very low sodium diet can increase your risk of health problems from exposure to lithium.

Long-Term Exposure: Lithium can cause loss of appetite; nausea, vomiting, diarrhea, and abdominal pain; headache; muscle weakness; loss of coordination; confusion, seizures and coma. Can affect the thyroid gland causing goiter. May cause kidney damage.

Points of Attack: Thyroid, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum lithium level. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to solid lithium nitrate use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposures to liquid lithium nitrate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code-Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Lithium nitrate must be stored to avoid contact with wood, paper, oil, and heat; and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Protect containers against physical damage, heat, shock, and sparks. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A: Code for the Storage of Liquid and Solid Oxidizers for detailed handling and storage.

Shipping: UN2722 Lithium nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use water only. Do not use dry chemical, carbon dioxide; or foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Lomustine L:0330

Formula: $C_9H_{16}ClN_3O_2$

Synonyms: Belustine; CCNU; Cecenu; CEENU; 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea; (Chloro-2-ethyl)-1-cyclohexyl -3-nitrosourea; *N*-(2-Chloroethyl)-*N*′-cyclohexyl-*N*-nitrosourea; Chloroethylcyclohexylnitrosourea; CINU; ICIG1109; Lomustine; NCI-C04740; NSC-79037; RB 1509; SRI2200

CAS Registry Number: 13010-47-4

HSDB Number: 6519

RTECS Number: YS4900000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n. o.s.)/154; UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 235-859-2

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC:

Animal Sufficient Evidence; Human Inadequate Evidence, Group 2A, 1999.

California Proposition 65 Chemical[102]: Cancer 1/1/1988; Developmental/Reproductive toxin, as 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea 7/1/1990.

Hazard Alert: Poison, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R/25; R36/37/38; R42; R51; R62; R63; safety phrases: S41; S45; S53 (see Appendix 4)

Description: Lomustine is a pale yellow powder. Molecular weight = 233.73; freezing/melting point = 88−90°C. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, administration or consumption of this antineoplastic (anti-cancer) agent.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Long-Term Exposure: There is sufficient evidence that 1-(2-chloroethyl)-3-cyclohexyl-1-nitrosourea (CCNU) is carcinogenic in experimental animals. CCNU caused lung cancers in rats following intraperitoneal or intravenous injection. In mice, intraperitoneal injections of CCNU resulted in a slight increase in the incidence of lymph system neoplasms. Applied to the skin of mice, CCNU did not induce skin tumors, but the duration of the experiment was inadequate. Evidence for the carcinogenicity of CCNU in humans is inadequate. In several reported cases, cancer patients who received CCNU developed leukemia. With one exception, all of these patients also had received other cytotoxic agents and/or irradiation.

Points of Attack: Blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; biologic tissue/biopsy; urine (chemical/metabolite).

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA-or European Standard EN 149-approved SCBA that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code-Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include HCl, and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

M

Magnesium M:0100

Formula: Mg
Synonyms: Magnesium metal; Magnesium pellets; Magnesium powder; Magnesium ribbons; Magnesium scalpings; Magnesium shavings; Magnesium sheet; Magnesium turnings
CAS Registry Number: 7439-95-4
HSDB Number: 654
RTECS Number: OM210000
UN/NA & ERG Number: UN1869 (magnesium or magnesium alloys with >50% Mg in pellets, turnings or ribbons)/138; UN1418 (powder, magnesium or alloys)/138; UN2950 (granules)/138.
EC Number: 012-002-00-9 (pellets); 012-001-00-3 (powder, pyrophoric)

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 100 (ACG).

Hazard Alert: Flammable solid, Strong reducing agent, Pyrophoric (dust/powder), Water and air reactive

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R15; R17; R19; R22; R34; R36/37/38; R40; safety phrases: S1; S7/8; S16; S26; S33; S36/37; S43; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water. (particles >1 mm).

Description: Magnesium is a light, silvery-white metal in various forms, and is a fire hazard. Molecular weight = 24.31; specific gravity (H_2O:1) = 1.74 @ 20°C; boiling point = 1090°C; freezing/melting point = 649°C (pellets); 651°C (powder); autoignition temperature = 473°C (powder). Explosive limits: LEL = 0.03 kg/m^3. Ignition temperature of dust cloud = 520°C; minimum explosive concentration = 0.020 oz/ft^3[209]. Relative explosion hazard of dust: Severe. Hazard identification (based on NFPA-704 M Rating System): (*powder, turnings and ribbon*) Health 0, flammability 1, reactivity 1₩. Reacts with water, releasing flammable hydrogen gas.

Potential Exposure: Magnesium alloyed with manganese, aluminum, thorium, zinc, cerium, and zirconium, is used in aircraft, ships, automobiles, hand tools, etc., because of its lightness. Dow metal is the general name for a large group of alloys containing over 85% magnesium. Magnesium wire and ribbon are used for degassing valves in the radio industry and in various heating appliances; as a deoxidizer and desulfurizer in copper, brass, and nickel alloys; in chemical reagents; as the powder in the manufacture of flares, incendiary bombs, tracer bullets, and flashlight powders; in the nuclear energy process; and in a cement of magnesium oxide and magnesium chloride for floors. Magnesium is an essential element in human and animal nutrition and also in plants, where it is a component of all types of chlorophyll. It is the most abundant intracellular divalent cation in both plants and animals. It is an activator of many mammalian enzymes.

Incompatibilities: Dust may form explosive mixture with air. Capable of self-ignition in moist air. The substance is a strong reducing agent. Reacts violently with, oxidizers, strong acids; acetylene, ammonium salts; arsenic, beryllium fluoride, carbon tetrachloride, carbonates, chloroform, cyanides, chlorinated hydrocarbons; ethylene oxide; hydrocarbons, metal oxides; methanol, phosphates, silver nitrate; sodium peroxide; sulfates, trichloroethylene, and many other substances, causing fire and explosion hazards. Finely divided material, in powdered, chip or sheet form, reacts with moisture or acids, evolving flammable hydrogen gas, causing fire and explosion hazard. Finely divided form is readily ignited by a spark or flame. It splatters and burns at above 1260°C.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) Ver. 29[138]
PAC-1: 18 milligram per cubic meter
PAC-2: 200 milligram per cubic meter
PAC-3: 1200 milligram per cubic meter
No standards set for elemental magnesium.

Determination in Air: Filter collection and atomic absorption analysis.

Permissible Concentration in Water: The World Health Organization (WHO) has established European and International desirable limits ranging from 30 to 125 mg/L, depending on the sulfate concentration. If the sulfate exceeds 250 mg/L, the magnesium is limited to 30 mg/L. The WHO specifies an absolute maximum of 150 mg/L for magnesium in drinking water. In view of the fact that concentrations of magnesium in drinking water are less than those that impart astringent taste, they pose no health problem and are more likely to be beneficial; no limitation for reasons of health is needed.

Determination in Water: Magnesium in water can be determined by atomic-absorption spectrophotometry, with a sensitivity of 15 mg/L, and by photometry with a sensitivity of 100 μg/L.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. Inhaling dust can irritate the respiratory tract, causing coughing, wheezing, and/or shortness of breath. Magnesium and magnesium compounds are mild irritants to the conjunctiva and nasal mucosa, but are not specifically toxic. Inhalation may cause metal fume fever; the symptoms may be delayed for 4−12 hours following exposure. On the skin, these hot particles are capable of producing second and third degree burns, but they respond to treatment as other thermal burns do. Metallic magnesium foreign bodies in the skin cause no unusual problems in humans. In animal experiments, however, they have caused “gas-gangrene”-massive localized

DOI: http://dx.doi.org/10.1016/B978-0-323-38968-6.00012-0

gaseous tumors with extensive necrosis. Magnesium salts at levels over 700 g/L (especially magnesium sulfate) have a laxative effect, particularly on new users, although the human body can adapt to the effects of magnesium with time.

Long-Term Exposure: Repeated exposure can cause an accumulation in the body, causing upset stomach.

Medical Surveillance: There is no special test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If fragments have become imbedded in the skin and removal cannot be ensured by thorough scrubbing, medical attention for thorough removal is recommended. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4–12 hours following exposure: it may last less than 36 hours. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. *Note to Physician*: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Personal Protective Methods: It burns with an intense flame; do not look directly at fire; wear adequate eye protection. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to magnesium, use a National Institute for Occupational Safety and Health (NIOSH)/MSHA (US) or EN149 (Europe)-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved self-contained breathing apparatus (SCBA) with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Red Stripe: Flammability Hazard (*powder, turnings, and ribbon are flammable solids*): Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Magnesium must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric); and chlorine trifluoride, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water. Use only nonsparking tools and equipment, especially when opening and closing containers of magnesium. Protect storage containers from physical damage.

Shipping: UN1869 Magnesium pellets, turnings or ribbons, Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN1418 Magnesium, powder or Magnesium alloys, powder, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 4.2-Spontaneously combustible material. UN2950 Magnesium granules, coated, particle size not $<149\ \mu m$, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use a vacuum to reduce dust during clean-up. Do not dry sweep. Collect powdered material and deposit in sealed containers. Ventilate area after clean-up is complete. Keep magnesium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium is a combustible solid or a flammable powder. It burns with an intense flame. Thermal decomposition products may include poisonous magnesium oxide. Reacts violently with fire extinguishing agents, such as water, carbon dioxide and powder. Dangerous when wet. It burns in a current of steam. Finely divided materials form explosive mixture with air. Fire may restart after it has been extinguished. Use dry sand, MetL-X powder, or G-1 graphite powder, soda ash; Class D extinguishers, or talc. *Do not use water* or hydrous agents. Fire may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Chlorate M:0110

Formula: Cl_2MgO_6; $Mg(ClO_3)_2$

Synonyms: Chlorate salt of magnesium; Chloric acid, De-Fol-Ate; Chloric acid, magnesium; E-Z-Off; Magnesium dichlorate; Magnesium salt; Magron; MC defoliant; Ortho MC

CAS Registry Number: 10326-21-3

HSDB Number: 7630 as chlorate compounds

RTECS Number: FO0175000

UN/NA & ERG Number: UN2723/140

EC Number: 233-711-1

Regulatory Authority and Advisory Information

Hazard Alert: Powerful oxidizer, Explosive, Environmental hazard (runoff from fire), Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: O; risk phrases: R8; R63; safety phrases: S7/8; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Magnesium chlorate is white crystalline solid. Molecular weight = 191.21; boiling point = 120°C; freezing/melting point = 35°C. Soluble in water (reaction).

Potential Exposure: Used as a drying agent and defoliant.

Incompatibilities: A strong oxidizer. Potentially explosive. Violent reactions with arsenic, carbon, charcoal, copper, phosphorus, sulfur, magnesium oxide; metal sulfides (copper sulfide, arsenic sulfide, tin sulfide; fuels, and strong acids. Reacts with moisture.

Permissible Exposure Limits in Air Russia[43] set a MAC in ambient air in residential areas of 0.1 milligram per cubic meter both on a momentary and a daily average basis.

Determination in Air:

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible concentration in Water: *Chlorates*: State Drinking Water Guidelines: California 800 μg/L; Maine 7 μg/L.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Magnesium chlorate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Inhaling the dust irritates the respiratory system. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness dizziness, trouble breathing; collapse, and possible death. Breathing the dust can irritate the air passages, cause sore throat and/or cough with phlegm.

Long-Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop with coughing, phlegm, and/or shortness of breath. May affect the kidneys.

Points of Attack: Lungs, blood.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to magnesium chlorate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a powered-air purifying respirator (PAPR). Where there is potential for high exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Oxidizer. Potentially explosive. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with magnesium chlorate all handlers should be trained on its proper handling and storage. Magnesium chlorate must be stored to avoid contact with aluminum, arsenic, carbon, copper, phosphorus, sulfur, magnesium oxide, metal sulfides; fuels and strong acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Store in a cool, well-ventilated area away from incompatible materials listed above. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN2723 Magnesium chlorate. Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Spilled magnesium chlorate tends to become very sensitive to shock or friction and is an explosion hazard. Keep magnesium chlorate out of sewers since it can ignite flammable or combustible materials and thus cause a fire or explosion hazard. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium chlorate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Containers may explode in fire; use water spray to keep fire-exposed containers cool. Thermal decomposition products may include hydrogen chlorine and magnesium oxide. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Hydride M:0120

Formula: H_2Mg; MgH_2

Synonyms: Dihydride magnesium; Magnesium(II) hydride; Magnesium dihydride

CAS Registry Number: 7693-27-8; 60616-74-2

HSDB Number: 7065 as magnesium compounds

RTECS Number: OM3560000

UN/NA & ERG Number: UN2010/138

EC Number: 231-705-3

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Pyrophoric hazard, Violently reactive with water, Strong reducing agent.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xi; risk phrases: R11; R14/15; R17; R36/37/38; safety phrases: S2; S7; S8; S16; S26; S36/37/39; S41; S43A; S41 (see Appendix 4)

Description: Magnesium hydride is a coarse, gray crystalline solid. Molecular weight = 26.33; freezing/melting point ≥200°C; flash point = 110°C. Hazard identification (NJDHSS): Health 1, flammability 4, reactivity 2₩. Insoluble in water; dangerous reaction releasing magnesium hydroxide, flammable hydrogen gas, and possibly enough heat to ignite the hydrogen.

Potential Exposure: Used in hydrogen production and in production of magnesium alcoholates.

Incompatibilities: A strong reducing agent. Pyrophoric: the powder or dust may ignite spontaneously in air, or in the presence of moisture. Contact with water or steam forms magnesium hydroxide, flammable hydrogen gas, and enough heat to ignite the hydrogen. Violent reaction with oxidizers, alcohols, halogens, chlorinated solvents. Incompatible with strong acids, acid chlorides, alcohols, amines and aldehydes. Store under nitrogen. Decomposes @ 280°C in high vacuum.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Magnesium hydride can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm.

Long-Term Exposure: Long-term effects are unknown at this time.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to magnesium hydride, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a particulate (dust/fume/mist) filter. Particulate filters must be checked every day before work for physical damage, such as rips or tears and replaced and needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Store under inert gas. Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Store under nitrogen in tightly closed containers in cool (decomposes >250°C), well-ventilated area. Keep containers dry at all times. Magnesium hydride reacts violently with water, releasing caustic material, heat, and flammable gas. Sources of ignition, such as smoking and open flames, are prohibited where magnesium hydride is handled, used, or stored.

Shipping: UN2010 Magnesium hydride, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use vacuum to reduce dust during clean-up. Do not use dry sweep. Collect powdered material in the most safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep magnesium hydride out of sewers because of possibility of fire or explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium hydride is a flammable and reactive solid. Thermal decomposition products may include oxides of metal and harmful and irritating gases. Use dry chemical, sand, soda ash; or lime extinguishers. *Do not use water*, carbon dioxide; or foam. Magnesium hydride can catch fire spontaneously in air or in the presence of moisture. Fire may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Nitrate M:0130

Formula: MgN_2O_6; $Mg(NO_3)_2$

Synonyms: Nitric acid, Magnesium salt; Nitromagnesite

CAS Registry Number: 10377-60-3; 10213-15-7 (hexahydrate)

HSDB Number: 660

RTECS Number: OM3750000

UN/NA & ERG Number: UN1474/140

EC Number: 233-826-7; S41 (see Appendix 4).

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Irritant.

United States National Primary Drinking Water Regulations: MCLG = 10 mg[N]/L; Maximum Contaminant Level (MCL) = 10 mg/L as nitrates

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xi; risk phrases: R8; R34; R36/37/38; safety phrases: S7/8; S17; S26; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Magnesium nitrate is white crystalline solid. Molecular weight = 148.33; 256.45 (hexahydrate); specific gravity (H_2O:1) = 1.45 @ 20°C (dihydrate); freezing/melting point = 129°C (dihydrate); 95−100°C (hexahydrate). It decomposes @ 330°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 2 OX. A strong oxidizer. Soluble in water.

Potential Exposure: Magnesium nitrate is used in fireworks and in the production of concentrated nitric acid.

Incompatibilities: A powerful oxidizer. Violent reaction with dimethylformamide, reducing agents; combustibles, fuels, organic and easily oxidizable matter.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Magnesium nitrate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. The dust can irritate the eyes and air passages, causing sore throat and/or cough with phlegm. Exposure can interfere with the ability of the blood to carry oxygen, causing headaches, weakness, nausea and a bluish color to the skin and lips (methemoglobinemia). Higher levels can cause trouble breathing; collapse and even death.

Long-Term Exposure: Repeated exposure can cause headache, weakness, and dizziness.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to magnesium nitrate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved

SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8–10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Magnesium nitrate must be stored to avoid contact with dimethyl formamide, fuels and strong reducing agents such as hydrides; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Avoid storage on wood floors. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1474 Magnesium nitrate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep magnesium nitrate out of sewers since it can ignite flammable and combustible materials and thus cause a fire or explosion hazard. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, metal, and oxygen. Oxidizers may increase the intensity or violence of fire. Extinguish fire using an agent suitable for type of surrounding fire. Use water spray to keep fire-exposed containers cool. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Oxide M:0140

Formula: MgO

Synonyms: Akro-mag; Animag; Calcined brucite; Calcined magnesia; Calcined magnesite; Granmag; Magcal; Magchem 100; Maglite; Magnesia; Magnesia fume; Magnesia USTA; Magox; Marmag; Periclase; Seawater magnesia

CAS Registry Number: 1309-48-4

HSDB Number: 1652

RTECS Number: OM3850000

UN/NA & ERG Number: UN1418 (powder)/138

EC Number: 215-171-9

Regulatory Authority and Advisory Information

Hazard Alert: Possible risk of forming tumors, FDA-over the counter drug.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Magnesium oxide forms a finely divided white particulate dispersed in air. Molecular weight = 40.31; specific gravity (H_2O:1) = 3.6 @ 20°C; boiling point = 3600°C; freezing/melting point = 2825°C; vapor pressure = 51.5 mmHg @ 2832°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 1. Poor solubility in water.

Potential Exposure: Used in oil refining, pulp and paper mills; tire manufacturing; in the manufacture of refractory crucibles; fire bricks; magnesia cements and boiler scale compounds. Exposure may occur when magnesium is burned, thermally cut, or welded upon.

Incompatibilities: Violent reaction with halogens/interhalogens, chlorine trifluoride, bromine pentalfluoride; strong acids. Phosphorus pentachloride and magnesium oxide react with brilliant incandescence (Mellor 8:1016. 1946–1947)[101]. May ignite and explode when heated with sublimed sulfur, magnesium powder, or aluminum powder.

Permissible Exposure Limits in Air

NIOSH IDLH = 750 milligram per cubic meter (fume)

OSHA PEL: 15 milligram per cubic meter (*total particulate; fume*) TWA

NIOSH: There is inadequate data to propose an exposure limit. See Appendix D of *The NIOSH Pocket Guide*

ACGIH TLV[1]: 10 milligram per cubic meter TWA (*inhalable fraction*); not classifiable as a human carcinogen

PAC Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 120 milligram per cubic meter
PAC-3: 730 milligram per cubic meter
DFG MAK: 4 milligram per cubic meter, inhalable fraction; 1.5 milligram per cubic meter, respirable fraction; see Sections V(f) and V(g). See V(h) for fume; Pregnancy Risk Group C
Arab Republic of Egypt: TWA 10 milligram per cubic meter, 1993; Australia: TWA 10 milligram per cubic meter, 1993; Austria: MAK 6 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter, 1993; France: VME 10 milligram per cubic meter, 1999; Hungary: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; Norway: TWA 10 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter, 2003; Poland: MAC (TWA) fume 5 milligram per cubic meter, MAC (TWA) dust 10 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 6 milligram per cubic meter, 1999; Turkey: TWA 15 milligram per cubic meter, 1993; United Kingdom: TWA 10 mg[Mg]/m^3, total inhalable dust; TWA 4 mg[Mg]/m^3, fume and respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for magnesium oxide fume in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7300 (Elements by ICP), #7301, #7303; OSHA Analytical Method #ID-125G.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal for magnesium oxide of 138 μg/L based on health effects.

Routes of Entry: Inhalation of fume, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and respiratory tract. Magnesium in the form of nascent magnesium oxide can cause metal fume fever with cough, chest pain; flu-like fever; if inhaled in sufficient quantity. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure.

Long-Term Exposure: It has been noted that magnesium workers show a rise in serum magnesium—although no significant symptoms of ill health have been identified. Some investigators have reported higher incidence of digestive disorders and have related this to magnesium absorption, but the evidence is scant.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: NIOSH lists the following test for fume exposure: whole blood (chemical/metabolite).

First Aid: Breathing: If a person breathes large amounts of this chemical, move the exposed person to fresh air at once. If breathing has stopped, perform mouth-to-mouth resuscitation. Keep the affected person warm and at rest. Get medical attention as soon as possible[77]. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours. *Note to Physician*: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics and antipyretics.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. magnesium oxide.

Respirator Selection: *as fume* OSHA: *up to 150 milligram per cubic meter*: 95XQ [Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. Sa (APF = 10) (any supplied-air respirator). *Up to 375 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PAPRDMFu* (any PAPR with a dust, mist, and fume filter). *Up to 750 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter) SCBAF (APF = 50) (any SCBA with a full facepiece) SaF (APF = 50) (any supplied-air respirator with a full facepiece.) *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement; also Flammability Hazard (4.2): Store flammable solids (spontaneously combustible) up to maximum allowable quantity per control area in an approved flammable storage area. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store finely divided powder, chips or shavings separately in detached fire-resistant building isolated from flammables, combustibles, or other yellow coded materials. Protect against physical damage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Magnesium oxide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates, and chlorine trifluoride), halogens, strong acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated, "No Smoking" area away from moisture. Use nonsparking type tools and equipment, including explosion proof ventilation. Containers of this material may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product.

Shipping: UN1418 Magnesium, powder or Magnesium alloys, powder Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 4.2-Spontaneously combustible material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Thermal decomposition products may include oxides of metal. May ignite and explode when heated with sublimed sulfur, magnesium powder, or aluminum powder. Use any extinguisher suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Magnesium Oxide (Fume), Trenton, NJ (January 2007).

Magnesium Perchlorate M:0150

Formula: Cl_2MgO_8; $Mg(ClO_4)_2$

Synonyms: Ammonium perchlorate, anhydrous; Ammonium perchlorate, hexahydride; Anhydrone; Dehydrite; Perchlorate de magnesium (French); Perchloric acid, Magnesium salt

CAS Registry Number: 10034-81-8

HSDB Number: 661

RTECS Number: SC8925000

UN/NA & ERG Number: UN1475/140

EC Number: 233-108-3

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer, Explosive.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Magnesium perchlorate is a white crystalline solid. Molecular weight; 223.21; specific gravity (H_2O:1) = 2.6 @ 20°C; freezing/melting point ≥ 250°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 3 (Oxidizer). Soluble in water.

Potential Exposure: Magnesium perchlorate is used as a drying agent for gases and as an oxidizing agent.

Incompatibilities: A powerful oxidizer. Violent reaction with reducing agents; alkenes (above 220°C), ammonia gas; organic matter; ethylene oxide, finely divided or powdered metals, combustible materials, phosphorus, dimethylsulfoxide, mineral acids; wet argon; hydrazines, alcohols, wet fluorobutane; butyl fluorides; organic materials. Forms explosive material with ethyl alcohol. Incompatible with many materials. Shock or heat may cause magnesium perchlorate to explode.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 4.9 milligram per cubic meter

PAC-2: 54 milligram per cubic meter

PAC-3: 320 milligram per cubic meter

Permissible concentration in Water: *Chlorates*: State Drinking Water Guidelines: California 800 μg/L; Maine 7 μg/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Magnesium perchlorate can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm. High levels can interfere with the ability of the blood to carry oxygen, causing headaches, dizziness, and a bluish color to the skin. Very high levels could cause death.

Long-Term Exposure: Can irritate the lungs. Repeated exposure may cause bronchitis.

Points of Attack: Lungs, blood.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following maybe useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to magnesium perchlorate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Magnesium perchlorate must be stored to avoid contact with fuels, finely powdered metals; mineral acids; ammonia, ethylene oxide; phosphorus, dimethyl sulfoxide and trimethyl phosphite, since violent reactions occur. Shock may cause magnesium perchlorate to explode. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Do not store on wood floors. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1475 Magnesium perchlorate, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use vacuum to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium perchlorate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Thermal decomposition products may include hydrogen chloride and metal oxide of magnesium. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Peroxide M:0160

Formula: MgO_2

Synonyms: IXPER 25M; Magnesium dioxide; Magnesium superoxol; Peromag; Peróxido de magnesio (Spanish); Peroxyde de magnésium (French)

CAS Registry Number: 14452-57-4 (MgO); 1335-26-8 (MgO_2)

HSDB Number: 7986

RTECS Number: OM4100000

UN/NA & ERG Number: UN1476/140

EC Number: 238-438-1

Regulatory Authority and Advisory Information

Hazard Alert: Strong oxidizer.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Magnesium peroxide is a white, odorless crystalline solid. Molecular weight = 56.31 (MgO_2); 40.3 (MgO); decomposes above 100°C. Insoluble in water; slow decomposition releasing oxygen.

Potential Exposure: Magnesium peroxide is used as a bleaching and oxidizing agent, and in the manufacture of antacids and antiinfective drugs.

Incompatibilities: Powerful oxidizer. Dangerous fire risk with flammable and combustible materials. Violent reaction with acids. Keep away from moisture; causes the release of oxygen and heat.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Magnesium peroxide can affect you when breathed in. Contact can irritate or even burn the skin and eyes. Breathing the dust can irritate the air passages, causing sore throat and/or cough with phlegm.

Long-Term Exposure: This chemical is a very irritating substance, and it may cause lung effects or damage.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Where there is potential exists for exposures to magnesium peroxide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Magnesium peroxide must be stored to avoid contact with acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep magnesium peroxide dry. In contact with moisture, it is a dangerous fire hazard because it releases oxygen and much heat. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1476 Magnesium peroxide, Hazard Class: 5.1; Labels: 5.1-Oxidizer.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use a vacuum or a wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Magnesium peroxide itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Thermal decomposition products may include magnesium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Magnesium Silicide M:0170

Formula: Mg_2Si

Synonyms: Dimagnesium silicide; Silanediylidenedimagnesium

CAS Registry Number: 22831-39-6; 39404-03-0

HSDB Number: 7065 as magnesium compounds

RTECS Number: OM4367000

UN/NA & ERG Number: UN2624/138

EC Number: 245-254-5

Regulatory Authority and Advisory Information

Hazard Alert: Strong reducing agent, Dangerously water reactive; Possible pyrophoric hazard (moist air).

Hazard symbols, risk, & safety statements: Hazard symbol: F; risk phrases: R11; R14/15; R19; R29; safety phrases: S7/8; S9; S14; S16; S21; S33; S41; S43; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Magnesium silicide is a slate blue crystalline solid. Molecular weight = 76.71; freezing/melting point = 778°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 2~~W~~. Dangerous reaction with water, releasing flammable gases including hydrogen, and possibly silane gas as well.

Potential Exposure: Magnesium silicide is used in the semiconductor industry and to produce certain aluminum alloys.

Incompatibilities: Possibly pyrophoric, especially in moist air. Pyrophoric; mixtures with air are spontaneously explosive. A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, mineral acids, strong acids, strong bases. Reacts with water; releasing explosive hydrogen gas and may also release self-igniting toxic silane gas.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: No criteria set.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate the skin and/or eyes. Breathing the dust can irritate the air passages, causing cough with phlegm. In contact with moisture or acid or acid mist, a highly irritating and flammable gas (silane) is released.

Long-Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large

quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to magnesium silicide, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator equipped with particulate (dust/fume/mist) filters. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Flammable solid. Color code—Red: Flammability Hazard: Handle under dry, inert gas; keep away from moisture. Store in a flammable materials storage area. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids. Keep dry at all times. Sources of ignition, such as smoking and open flames, are prohibited where magnesium silicide is handled, used, or stored.

Shipping: UN2624 Magnesium silicide, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum; do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep magnesium silicide out of sewers because of possibility of fire or explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Magnesium silicide is a flammable solid. Releases flammable silane gas on contact with water. Thermal decomposition may include silicon oxide and oxide of metal. Use dry chemical, soda ash; or lime extinguishers. *Do not use water* or foam. May ignite spontaneously in air. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, Reportable Quantity (RQ): 100 lb (45.4 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N, Xi; risk phrases: R22; R33; R43; R50/53; R62; R63; safety phrases: S2; S24; S29/35; S37; S41; S46; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Malathion is a deep-brown to yellow liquid with a garlic-like odor. Clear and colorless when pure; freezing/melting point = 3°C; molecular weight = 330.38; boiling point = 156−157°C; vapor pressure = 8×10^{-6} mmHg @ 20°C; flash point ≥163°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: Malathion is marketed as 99.6% technical grade liquid. Available formulations include wetable powders (25% and 50%), emulsifiable concentrates, dusts, and aerosols. Malathion is used as a broad spectrum insecticide and acaricide in the control of certain insect pests on fruits, vegetables, and ornamental plants. It has been used in the control of houseflies, mosquitoes, lice; and on farm and livestock animals.

Incompatibilities: Reacts violently with strong oxidizers, magnesium, alkaline pesticides. Attacks metals including iron, steel, tin plate; lead, copper; and some plastics, coatings, and rubbers.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 milligram per cubic meter

OSHA PEL: 15 milligram per cubic meter (*total dust*) TWA[skin]

NIOSH REL: 10 milligram per cubic meter TWA[skin]

ACGIH TLV[1]: 1 milligram per cubic meter TWA measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; TLV-BEI$_A$ issued as Acetylcholinesterase inhibiting pesticides.

PAC* Ver. 29[138]

PAC-1: **15$_{\mathbf{A}}$** milligram per cubic meter

PAC-2: **120$_{\mathbf{A}}$** milligram per cubic meter

PAC-3: **390$_{\mathbf{A}}$** milligram per cubic meter

*AEGLs (Acute Emergency Guideline Levels) are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 15 milligram per cubic meter inhalable fraction TWA; Peak Limitation Category II(4); Pregnancy Risk Group D

Arab Republic of Egypt: TWA 10 milligram per cubic meter [skin], 1993; Australia: TWA 10 milligram per cubic meter [skin], 1993; Austria: MAK: 10 milligram per cubic meter, 1999; Belgium: TWA 10 milligram per cubic meter [skin], 1993; Denmark: TWA 5 milligram per cubic meter [skin], 1999; Finland: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter, 1999; France: VME 10 milligram per cubic meter [skin], 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter [skin], 2003; Norway: TWA 5 milligram per cubic meter, 1999; the Philippines: TWA 15 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 1 milligram per cubic meter, MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 10 milligram per cubic meter [skin], 1999; Thailand: TWA 15 milligram per cubic meter, 1993; Turkey: TWA 15 milligram per cubic meter [skin], 1993; United Kingdom: TWA 10 milligram per cubic meter [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Argentina[35]: STEL 1.5 milligram per cubic meter. Russia[43] has set MAC values in the ambient air of residential areas at 0.015 milligram per cubic meter on a momentary basis and 0.006 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for malathion, in ambient air[60] ranging from 33.3 μ/m^3 (New York) to 100 μ/m^3 (Florida, North Dakota, South Carolina) to 160 μ/m^3 (Virginia) to 200 μ/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method ID-62.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.05 mg/L. The MAC in water bodies used for fishery purposes is zero. Several states have set guidelines for malathion in drinking water[61] ranging from 40 μg/L (Maine to 140 μg/L (Kansas) to 160 μg/L (California).

Determination in Water: Fish Tox = 0.28991000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation of vapor, skin absorption; ingestion and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Malathion is representative of a general class called organophosphates. The effects caused by many short term exposures during a week's time can be accumulated and felt as one intense response. Sometimes effects are not felt until hours or days after exposure. *Inhalation*: No effects were reported from exposures of up to 86 milligram per cubic meter for 42 days. The only effect reported due to inhalation was the reduction in activity of an important nervous system enzyme. *Skin*: Important route of exposure during formulation and usage. Prolonged contact (hours) along with poor hygiene has resulted in irritation, as well as symptoms listed under ingestion. *Eyes*: Direct contact can lead to irritation and discomfort. *Ingestion*: Swallowing of malathion has caused severe poisoning and death. Swallowing of 1½−3 oz of a moisture (50% malathion) has caused severe poisoning with symptoms which include nausea, vomiting, headache, abdominal pain; diarrhea, difficulty in breathing; fall in blood pressure; muscle spasms; paralysis, loss of reflexes; convulsions, and coma. Between 3½ and 5 oz of a mixture (50% malathion) has caused death. Human Tox = 100.00000 ppb (VERY LOW).

Long-Term Exposure: Prolonged, daily contact with exposed areas of skin has led to skin irritation and sensitization. May cause genetic changes (mutations). High or repeated exposure may damage the nerves, causing weakness, dizziness, and poor coordination in arms and legs. Repeated exposures may cause personality changes; depression, anxiety, or irritability.

Points of Attack: Eyes, skin, respiratory system; liver, blood cholinesterase, central nervous system; cardiovascular system, gastrointestinal tract.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count (CBC). Consider chest X-ray following acute overexposure. Preplacement and periodic medical examination shall include: comprehensive initial or interim medical and work histories. A physical examination which shall be directed toward, but not limited to evidence of frequent headache, dizziness, nausea, tightness of the chest; dimness of vision; and difficulty in focusing the eyes. Determination, at the time of the preplacement examination, of a baseline or working baseline erythrocyte ChE activity. A judgment of the worker's physical ability to use negative or positive pressure regulators as defined in 29 CFG 1910.134. Periodic examinations shall be made available on an annual basis or at some other interval determined by the responsible physician. Medical records shall be maintained for all workers engaged in the manufacture or formulation of malathion and such records shall be kept for at least 1 year after termination of employment. Pertinent medical information shall be available to medical representatives of the United States Government, the employer and the employees. Erythrocyte cholinesterase levels should be checked as noted above and as described in detail by NIOSH Criteria Document No. 76-205.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician or trained medical personnel: Administer atropine, 2 mg (0.030 g) intramuscularly or intravenously as soon as any local or systemic signs or symptoms of an intoxication are noted; repeat the administration of atropine every 3−8 minutes until signs of atropinization (mydriasis, dry mouth, rapid pulse; hot and dry skin) occur; initiate treatment in children with 1 mg of atropine. Watch respiration, and remove bronchial secretions if they appear to be obstructing the airway; intubate if necessary. Give 2-PAM (Pralidoxime; Protopam), 2.5 g in 100 mL of sterile water or in 5% dextrose and water, intravenously, slowly, in 15−30 minutes; if sufficient fluid is not available, give 1 g of 2-PAM in 3 mL of distilled water by deep intramuscular injection; repeat this every half hour if respiration weakens or if muscle fasciculation or convulsions recur.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: 4 hours: Teflon gloves, suits, boots; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. *Respirator Protection*: Engineering controls shall be used wherever feasible to maintain airborne malathion concentrations below the recommended work-place environment limit. Compliance with the work-place environmental limit by the use of respirators is allowed only when airborne malathion concentrations are in excess of the work-place environmental limit because required engineering controls are being installed or tested, when nonroutine maintenance or repair is being accomplished, or during emergencies. When a respirator is thus permitted, it shall be selected and used in accordance with NIOSH requirements.

Respirator Selection: *100 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator) SCBA (any SCBA). 250 *milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprOvHie (APF = 25) (any PAPR with an organic vapor cartridge in combination with a high-efficiency particulate filter); SCBAF (APF = 50) (any SCBA with full facepiece) SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated, uninhabited area below 25°C. Store to avoid contact with oxidizers and alkaline pesticides. Store where possible leakage from containers cannot endanger the worker. Maintain regular inspection of containers for any leakage. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Malathion is combustible but ignites with difficulty. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. A fire should be extinguished with agents suitable to the surrounding combustibles. Thermal decomposition products may include sulfur dioxide and phosphoric acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Malathion is reported to be "hydrolyzed almost instantly" at pH 12; 50%; hydrolysis at pH 0 requires 12 hours. Alkaline hydrolysis under controlled conditions (0.5 *n* NaOH in ethanol) gives quantitative yields of $(CH_3O)_2P(S)SNa$, whereas hydrolysis in acidic media yields $(CH_3O)_2P(S)OH$. On prolonged contact with iron or iron-containing material, it is reported to break down and completely lose insecticidal activity. Incineration together with a flammable solvent in a furnace equipped with afterburner and scrubber is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Maleic Hydrazide M:0220

Formula: $C_4H_4N_2O_2$

Synonyms: BH dock killer; BOS MH; Burtolin; Chemform; De-cut; Desprout D Rexel-super P; 1,2-Dihydropyridazine-3,6-dione; 1,2-Dihydro-3,6-pyradazinedione; 1,2-Dihydro-3,6-pyridazinedione; EC 300; ENT 18,870; Fair 30; Fair plus; Fair ps; Hydrazid hydrazida maleica (Spanish); 6-Hydroxy-3(2*H*)-pyridazinone; KMH; Maintain 3; MAH; Malazide; Maleic acid hydrazide; Maleic hydrazide; Maleic hydrazine acid; Maleic hydrazide fungicide; Malein 30; *N,N*-Maleoylhydrazine; Malzid; Mazide; MH 30; MH 40; MH 36 Bayer; Po-San (with 9*h*-fluorene-9-carboxylic acid, 2-chloro-9-hydroxy-, methyl ester); Regulox; Regulox w; Regulox 50w; Retard; Royal MH 30; Royal Slo-gro; Slo-gro; Sprout-stop; Stuntman; Sucker-stuff; Super DE-sprout; Super sprout stop; 1,2,3-Tetrahydro-3,6-dioxopyridazine; Vondaldhyde; Vondrax

CAS Number: 123-33-1

HSDB Number: 1162

RTECS Number: UR5950000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 204-619-9

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans; IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987

Hazard Alert: Combustible solid, Irritant, Suspected reprotoxic hazard.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U148

CERCLA RQ: 5000 lb (2270 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, T; risk phrases: R40; R36/37/38; R51; safety phrases: S16; S26; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Maleic hydrazide is a colorless crystalline solid. Odorless. Molecular weight = 112.10; specific gravity $(H_2O{:}1) = 1.62$ @ 25°C; freezing/melting point = 307°C. Autoignition temperature = >400°C. Hazard identification (based on NFPA-704M Rating System): Health 2, flammability 1, reactivity 0. Highly soluble in water.

Potential Exposure: Maleic hydrazide is a pyridazine/pyridazinone herbicide, plant growth regulator, and fungicide that is registered for use on tobacco, potatoes, onions, nonbearing citrus, turf, utility and highway rights-of-way, airports, industrial land, lawns, recreational areas, ornamental/shade trees and ornamental plants. Most of the use of maleic hydrazide in the United States is on tobacco. Banned for use in EU countries. Actively registered for use in the United States.

Incompatibilities: Contact with flammable material may cause fire and explosions. Contact with combustible or oxidizable materials may form heat-, shock-, and friction-sensitive explosive mixtures. Static electricity may also cause explosions. Keep away from all acids, especially dibasic organic acids, ammonium compounds, antimony sulfide, arsenic trioxide, metal sulfides, powdered metals, calcium aluminum hydride, cyanides, manganese dioxide, phosphorus, selenium, sulfur, thiocyanates, zinc. May be corrosive to brass and its alloys.

Permissible Exposure Limits in Air:

PAC Ver. 29[138]

PAC-1: 11 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 750 milligram per cubic meter

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: 4000 μg/L; State Drinking Water Guidelines: Maine 3500 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: A lowest observed adverse-effect level (LOAEL) of 500 mg/kg/day has been calculated. On the basis of this, the USEPA has calculated a lifetime health advisory for an adult of 3.5 mg/L. Octanol−water coefficient: Log $K_{ow} = < 1.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—19,952.62315 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, ingestion, skin and/eye contact. Absorbed through the intact skin

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes, skin, and mucous membranes. Ingestion can cause tremors and muscle spasms. Sin contact may cause sensitization. LD_{50} (oral, rat) $= > 3500$ mg/kg; LD_{50} (dermal, rat) ≥ 4000 mg/kg.

Long-Term Exposure: May cause tumors. May cause liver damage and acute central nervous system effects. May cause mutations (genetic changes). Human toxicity (long term)[101]: Very low—4000.00 ppb, Health Advisory.

Points of Attack: Central nervous system, liver, skin

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Liver function tests. Examination by a qualified allergist. Tests of the nervous system. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: *Skin*: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eyes*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−23 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA >11 milligram per cubic meter. Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Dampen spilled material with acetone to avoid dust.

Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

HSDB Number: 6792

RTECS Number: ZB3200000

UN/NA & ERG Number: UN2771 (solid)/151; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: [*Annex I Index No*.: 006-076-00-1]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group B2, probable human carcinogen

California Proposition 65 Chemical[102]: Carcinogen (1/1/1990)

Hazard Alert: Poison, Possible thyroid effects. Combustible, Possible risk of forming tumors, Sensitization hazard, Suspected of causing genetic defects, Suspected reprotoxic hazard, Suspected reprotoxic hazard (TRI), Possible endocrine disruptor, Environmental hazard, Agricultural chemical.

California EPA AB2588-Air Toxics “Hot Spots” Chemicals (CAL) as manganese or zinc compounds

The “Director’s List” (CAL/OSHA) as manganese and zinc compounds

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as manganese compounds

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%, manganese compounds, Form R Toxic Chemical Category Code: N450

Clean Water Act: Section 307 Toxic Pollutants as zinc compounds

United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc; SMCL = 0.05 mg[Mg]/L as manganese

Hazardous to aquatic life or environment, with possible long-lasting effects[291]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R45; R43; R50; R62, R63; safety phrases: S2; S29/35; S36/37, S41; S46; S61 (see Appendix 4).

Description: Grayish-yellow powder. Molecular weight = 266.31; specific gravity (H_2O:1) = 1.99; boiling point = (decomposes); freezing/melting point = (decomposes). Vapor pressure = very low/negligible. Flash point = >135°C. Low solubility in water.

Potential Exposure: Mancozeb is a dithiocarbamate fungicide. It is used to control a wide variety of fungal diseases, including potato blight, leaf spot, scab (on apples and pears), and rust (on roses). It is used on fruits, vegetables, nuts and field crops, and many more. It is also used as a seed treatment of cotton, potatoes, corn, safflower, sorghum, peanuts, tomatoes, flax, and cereal grains.

Incompatibilities: Combustible material. Dust may form explosive mixture in air. Decomposes in temperatures above 170°C. Keep away from water, acid, oxidizing materials. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of Dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides. Corrosive to iron, copper brass, and zinc metals, especially in the presence of moisture. Contact with lime, moisture can cause decomposition. Decomposes on prolonged storage. Degradation produces ethylene thiourea.

Permissible Exposure Limits in Air:

Mancozeb

PAC Ver. 29[139]

PAC-1: 3 milligram per cubic meter

PAC-2: 56 milligram per cubic meter

PAC-3: 990 milligram per cubic meter

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Determination in Air: *Manganese*: Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: *Manganese*: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg[Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. *Zinc*: Federal Drinking Water Guidelines: 4 ppb[14] State Drinking Water Guidelines: Maine 25 μg[Zn]/L. Canadian Drinking Water Standards: AO ≤ 5.0 mg[Zn]/L. Safe Drinking Water Act (47FR 9352): SMCL = 5 mg[Zn]/L as Zinc; SMCL = 0.05 mg[Mn]/L as Manganese. WHO limit: 400 μg(Mn)/L

Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV−VIS Spectrophotometry. Octanol−water coefficient: Log K_{ow} = < 1.5. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: High—3.16731 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Low levels of toxicity but may be a thyroid toxin. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heartbeat. Severe exposure may result in death. Unlike carbamates, the dithiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-syrups. LD_{50} (oral, rat) = > 5 g/kg.; LD_{50} (dermal, rat) = > 5 g/kg.

Long-Term Exposure: Thyroid function. May cause tumors. May cause thyroid problems. A Reproductive Toxin. May be a Reproductive Toxin (may enlarge ovarian cells). Skin sensitizer. Human toxicity (long term)[101]: High—5.82363 ppb, CHCL (Chronic Human Carcinogen Level).

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes. Dithiocarbamates can affect thyroid function.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. There are tests available to measure zinc in your blood, urine, hair, saliva, and feces. High levels of zinc in the feces can mean high recent zinc exposure. High levels of zinc in the blood can mean high zinc consumption and/or high exposure.

Tests to measure zinc in hair may provide information on long-term zinc exposure; however, the relationship between levels in your hair and the amount of zinc you were exposed to is not clear. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC and chest X-ray following acute overexposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 oz of water. Do not induce vomiting. *Note to physician or authorized medical personnel*: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic might consider administering a drug or other inhalation therapy. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral- and Clay-Based; Dirt/Earth[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBA >3 milligram per cubic meter. NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN2771 Dithiocarbamate and Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible solid. Thermal decomposition products may include oxides of nitrogen, sulfur, metal, and carbon. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform to USEPA regulations for storage, transportation, treatment, and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers. A potential candidate for liquid injection incineration at a temperature range of 650 to 1600°C and a residence time 0.1 to 2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820 to 1600°C and residence times of seconds for liquids and gases, and hours for solids[83].

Maleic Acid M:0200

Formula: $C_4H_4O_4$; HOOCCH=CHCOOH

Synonyms: *cis*-Butenedioic acid, (Z)-; Butenedioic acid, (Z)-; *cis*-Butenedioic anhydride; (Z)-1,2-Ethylenedicarboxylic acid; *cis*-1,2-Ethylenedicarboxylic acid; 1,2-Ethylenedicarboxylic acid, (Z); *cis*-1,2-Ethylenedicarboxylic acid, toxilic acid; Maleinic acid; Malenic acid; Toxilic acid

CAS Registry Number: 110-16-7

HSDB Number: 666

RTECS Number: OM9625000

UN/NA & ERG Number: UN2215/156

EC Number: 203-742-5 [*Annex I Index No.*: 607-095-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Combustible, Corrosive, Sensitization hazard, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, Xn, Xi; risk phrases: R22; R36/37/38; R43; R62; safety phrases: S2; S24; S26; S28; S37; 46; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Maleic acid is a white crystalline solid. Faint, acid like odor. Molecular weight = 116.08; specific gravity (H_2O:1) = 1.59; boiling point = (decomposes below BP@ 135°C); freezing/melting point = 131°C; also listed @ 138−139°C; vapor pressure = 3.59×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Highly soluble in water; solubility = > 75%. Aqueous solution is a strong acid.

Potential Exposure: Maleic acid is used to make artificial resins, antihistamines, and to preserve (retard rancidity) of fats and oils.

Incompatibilities: Dust may form explosive mixture with air, Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, amines, reducing agents; alkali metals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 2.1 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < −0.6. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Maleic acid can affect you when breathed in and by passing through your skin. Contact can cause severe eye burns leading to permanent damage. Contact can irritate the skin. Exposure may cause you to feel dizzy and lightheaded. Exposure can irritate the nose, throat, and lungs and cause coughing or shortness of breath. Very high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation and bronchitis. May affect the kidneys.

Points of Attack: Lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that. Lung function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following maybe useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For maleic acid (>70%) Natural rubber, Neoprene, nitrile + PVC, nitrile, polyethylene, and Viton are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: Where there is potential exists for exposure to maleic acid as dust, mist, of fume, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filer. Greater protection is provided by a PAPR. Where there is potential for exposures to maleic acid as a liquid exists, or for high exposures, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Maleic acid must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); amines (such as aniline) and alkali metals (such as sodium and potassium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored.

Shipping: UN2215 Maleic acid, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors−contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not easily ignite. Thermal decomposition products may include oxides of carbon. Small fire: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. Large fire: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *DO NOT GET WATER ON SPILLED SUBSTANCE OR INSIDE CONTAINERS*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Liquid: incinerate after mixing with a flammable solvent. Use afterburner for complete combustion. Solid: dissolve in a flammable solvent or package in paper and burn. See above.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Maleic anhydride is colorless needles, white lumps, or pellets. Irritating, choking odor. Molecular weight = 98.06; specific gravity (H_2O:1) = 1.32 @ 60°C; boiling point = 202.2°C; freezing/melting point = 52.6°C; vapor pressure = 0.2 mmHg @ 20°C; 7.5 mmHg @ 74°C; flash point = 102°C (cc); autoignition temperature = 477°C. Explosive limits: LEL = 1.4%; UEL: 7.1%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 1. Soluble in water, slow, possibly dangerous, reaction; solubility = 40%. Maleic anhydride may be transported as hot (70°C) liquid.
Potential Exposure: Maleic anhydride is used in unsaturated polyester resins; Agricultural chemical, and lubricating additives; in the manufacture of unsaturated polyester resins; in the manufacture of fumaric acid; in alkyd resin manufacture; in the manufacture of pesticides e.g., malathion, maleic hydrazide, and captan).
Incompatibilities: Reacts slowly with water (hydrolyzes) to form maleic acid, a medium-strong acid. Dust may form explosive mixture with air. Reacts with strong oxidizers, oil, water, alkali metals; strong acids; strong bases. Violent reaction with alkali metals and amines above 66°C. Dangerous reaction with oxidizers, amines, alkali metals, and hydroxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).
Permissible Exposure Limits in Air

cubic meter; STEL 3 milligram per cubic meter, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. The Czech Republic: TWA 1.0 milligram per cubic meter with the same value as an STEL[35]. Russia[35,43] set a MAC for ambient air in residential areas of 0.2 milligram per cubic meter on a momentary basis and 0.05 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for maleic anhydride in ambient air[60] ranging from 0.14 μ/m^3 (Massachusetts) to 3.3 μ/m^3 (New York) to 10.0 μ/m^3 (Florida and South Carolina) to 12.0 μ/m^3 (North Carolina) to 17 μ/m^3 (Virginia) to 20 μ/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada) to 100.0 μ/m^3 (North Carolina and North Dakota).

Determination in Air: Use NIOSH (IV), Method #3512; OSHA Analytical Method 25 or 86.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Maleic anhydride severely irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inhalation may cause asthmatic reactions. The symptoms of asthma may be delayed for several hours and are aggravated by physical effort. Subacute inhalation of maleic anhydride can cause severe headaches, nosebleeds, nervousness, nausea, and temporary impairment of vision. It can also lead to conjunctivitis and corneal erosion. Maleic anhydride may be transported as hot liquid; skin contact causes burns.

Long-Term Exposure: Repeated or prolonged skin contact may cause allergy and dermatitis. Repeated or prolonged inhalation exposure may cause bronchial asthma. Repeated exposure to concentrations above 1.25 ppm has caused asthmatic responses in workers. Allergies have developed so that lower concentrations of maleic anhydride can no longer be tolerated. An increased incidence of bronchitis and dermatitis has also been noted among workers with long-term exposure to maleic anhydride. Repeated exposure may cause photophobia (abnormal visual intolerance to light), double vision; bronchial asthma.

Points of Attack: Eyes, respiratory system; skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended. Lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Anyone who has developed symptoms of asthma due to contact with maleic anhydride should avoid all further contact with this chemical. Consider chest X-ray following acute overexposure. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. The symptoms of asthma may be delayed for several hours and are aggravated by physical effort. Rest and medical observation are highly recommended. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. 8 hours: Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends rubber, Neoprene, nitrile, polyvinyl chloride, and polystyrene as protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note*: May causes eye damage; eye protection needed.

Storage: Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Maleic anhydride must be stored to avoid contact with water and strong oxidizers (such as chlorine and bromine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2215 Maleic anhydride, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Maleic anhydride is a combustible solid. Thermal decomposition products may include oxides of carbon. The molten form may explode in the heat of fire. Dust clouds of the vapor of molten maleic anhydride are explosive on contact with spark or flame. Use of dry chemicals or water extinguishers may cause an explosion. Small fire: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. Large fire: Use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *DO NOT GET WATER ON SPILLED SUBSTANCE OR INSIDE CONTAINERS.* If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration: care must be taken that complete oxidation to nontoxic products occurs.

Regulatory Authority and Advisory Information

IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987

Hazard Alert: Combustible, Flammable solid (fine material), Possible risk of forming tumors, Suspected of causing genetic defects, Agricultural chemical.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U148

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 5000 lb (2270 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R22; R36/37/38; R40; R51/53; R62; safety phrases: S7; S23; S26; S36; S36/37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Maleic hydrazide is a crystalline solid. Molecular weight = 112.10; specific gravity = 1.6 @ 25°C; freezing/melting point = (decomposes) 260°C; 292°C[136]. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Slightly soluble in cold water; more soluble in hot.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this plant growth retardant.

Incompatibilities: Dust may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Slightly corrosive to iron and zinc. Maleic hydrazide forms water-soluble alkali-metal and amine salts. It is slightly acidic and may be titrated as a monobasic acid. Mild oxidation produces a compound which reacts instantly with dienes at −77°C/ − 107°F to form crystalline derivatives. It is incompatible with pesticides that are highly alkaline in reaction. This chemical is slightly corrosive to iron and zinc. In the presence of heavy metal and iron, zinc, calcium, and magnesium ions, sparingly soluble salts are formed[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 11 milligram per cubic meter

PAC-2: 130 milligram per cubic meter

PAC-3: 750 milligram per cubic meter

Permissible Concentration in Water: A LOAEL of 500 mg/kg/day has been calculated. On the basis of this, the United States Environmental Protection Agency has calculated a lifetime health advisory for an adult of 3.5 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritation of eyes, skin and mucous membranes; tremors, muscle spasms, and skin sensitization are among the consequences of MH exposure. LD_{50} (oral-rat) = 3800 mg/kg (slightly toxic).

Long-Term Exposure: May cause liver damage and acute central nervous system effects. May cause mutations (genetic changes).

Points of Attack: Central nervous system; liver, skin.

Medical Surveillance: Liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Tests of the nervous system.

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−23 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/24/25; R50/53; safety phrases: S1/2; S23; S27; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to waters[206].

Description: Malononitrile is a white powder or colorless, odorless crystalline substance. Molecular weight = 66.07; specific gravity (H_2O:1) = 1.05 @ 34°C; boiling point = 220°C; freezing/melting point = 30.5°C; vapor pressure = 11 mmHg @ 99°C; flash point = 130°C (oc). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Soluble in water; solubility = 13%.

Potential Exposure: Malononitrile is used in organic synthesis; as a lubricating oil additive; for thiamine synthesis; for pteridine-type anticancer agent synthesis; and in the synthesis of photosensitizers, acrylic fibers, and dyestuffs. It has also been used in the treatment of various forms of mental illness. It has been used as a leaching agent for gold.

Incompatibilities: Incompatible with strong bases. May polymerize violently on prolonged heating @ 129°C, or in contact with strong bases at lower temperatures. Nitriles may polymerize in the presence of metals and some metal compounds. They are incompatible with acids; mixing nitriles with strong oxidizing acids can lead to extremely violent reactions. Nitriles are generally incompatible with other oxidizing agents such as peroxides and epoxides. The combination of bases and nitriles can produce hydrogen cyanide. Nitriles are hydrolyzed in both aqueous acid and base to give carboxylic acids (or salts of carboxylic acids). These reactions generate heat. Peroxides convert nitriles to amides. Nitriles can react vigorously with reducing agents. Acetonitrile and propionitrile are soluble in water, but nitriles higher than propionitrile have low aqueous solubility. They are also insoluble in aqueous acids[101].

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.70 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 3 ppm/8 milligram per cubic meter TWA; *Nitriles*: 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

PAC* Ver. 29[138]

PAC-1: 0.07 ppm

PAC-2: $\mathbf{0.77}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{2.3}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. Connecticut has set a guideline or standard for malononitrile in ambient air[60] of 160 μ/m^3.

Permissible Concentration in Water: Russia[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Metabolized by body to cyanide and thiocyanate; effects of inhalation of toxic fumes will be related to cyanide. Causes brain and heart damage related to lack of cellular oxygen. It is classified as extremely toxic. Probable oral lethal dose for humans is 5−50 mg/kg, or between seven drops and one teaspoonful, for a 70 kg (150 lb) person. Symptoms of cyanide poisoning include rapid and irregular breathing; anxiety, confusion, odor of bitter almonds (on breath or vomitus); nausea, vomiting (if oral exposure), irregular heartbeat; a feeling of tightness in the chest; bright pink coloration of the skin; unconsciousness followed by convulsions; involuntary urination and defecation, paralysis and respiratory arrest (heart will beat after breathing stops).

Medical Surveillance: See NIOSH Criteria Document *212 Nitriles*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 80 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator). *Up to 200 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 400 milligram per cubic meter*: SCBAF (APF = 50) (any SCBA with a full facepiece) SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 667 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere for prolonged storage. Keep away from strong bases. May polymerize violently on prolonged heating @ 129°C, or in contact with strong bases at lower temperatures. May spontaneously explode on storing above 70−80°C.

Shipping: UN2647 Malononitrile, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3439 Nitriles, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Nitriles spill

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Avoid all skin contact, inhalation; and ingestion. Take up *small spills* with sand or other noncombustible material. Dike far ahead of *large spills* for later disposal. Do not touch spilled material; stop leak if you can do so without risk. Stay upwind and out of low areas. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide, oxides of nitrogen and carbon. Use chemical, carbon dioxide; water spray, fog, or foam. Move container from fire area if you can do it without risk. Wear positive pressure breathing apparatus and special protective clothing. May explode spontaneously or polymerize violently on heating. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Maneb M:0240

Formula: $C_4H_6MnN_2S_4$

Synonyms: Aamangan; Akzo Chemie Maneb; BASF-Maneb Spritzpulver (German); Bavistin M, cosmic; Carbamic acid, ethylenebis(dithio-), manganese salt; Carbamodithioic acid, 1,2-ethanediylbis-, manganese salt; Chem neb; Chloroble M; Cleanacres; CR 3029; Delsene M flowable; Dithane M 22 special; EBDC; ENT 14,875; 1,2-Ethanediylbis(carbamodithioato)(2−)-manganese; 1,2-Ethanediylbiscarbamodithioic acid, manganese complex; 1,2-Ethanediylbiscarbamodithioic acid, manganese(2+) salt(1:1); 1,2-Ethanediylbismaneb, manganese(2+) salt (1:1); Ethylenebisdithiocarbamate manganese; *N*,*N*′-Ethylene bis(dithiocarbamate manganeux) (French); Ethylenebis(dithiocarbamato), manganese; Ethylenebis(dithiocarbamic acid), manganese salt; Ethylenebis(dithiocarbamic acid) manganous salt; 1,2-Ethylenediylbis(carbamodithioato) manganese; F 10; Griffin manex; Kypman 80; Lonocol M; Manam; Maneb 80; Maneba; Manebe (French); Manebe 80; Manebgan; Manesan; Manex; Mangan (II)-[*N*,*N*′-aethylen-bis (dithiocarbamate)] (German); Manganese ethylene-1,2-bisdithiocarbamate; Manganese(II) ethylene di(dithiocarbamate); Manganous ethylenebis(dithiocarbamate); Manoc; Manzate; Manzate D; Manzate Maneb fungicide; Manzeb; Manzin; M-Diphar; MEB; MNEBD; Multi-W, kascade; Nespor; Plantifog 160M; Polyram M; Remasan chloroble M; Rhodianehe; Sopranebe; Squadron and Quadrangle Manex; Superman Maneb F; Sup'r flo; Tersan-LSR; Trimangol; Trimangol 80; Trimanoc; Trithac; Tubothane; Unicrop Maneb; Vancide; Vancide Maneb 80; Vassgro Manex

CAS Registry Number: 12427-38-2; *(alt.)* 301-03-1; *(alt.)* 11004-49-2; *(alt.)* 12125-33-6; *(alt.)* 20316-06-7; *(alt.)* 28355-56-8; *(alt.)* 133317-06-3

HSDB Number: 4063

RTECS Number: OP0700000

UN/NA & ERG Number: UN2210 (with not <60% maneb)/135; UN2968 (Maneb or maneb preparation, stabilized against self-heating)/135

EC Number: 235-654-8 [*Annex I Index No.*: 006-077-00-7]

Regulatory Authority and Advisory Information

Carcinogenicity: EPA, Cancer Classification: Group B2, Probable Human Carcinogen; IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: *S. cerevisiae-homozygosis*; Weakly Positive: In vitro UDS-human fibroblast; Negative: *S. cerevisiae* gene conversion

California Proposition 65 Chemical[102]: Cancer 1/1/1990.

Hazard Alert: Highly flammable, Possible thyroid effects, Spontaneously combustible (nonstabilized), Dangerously water reactive (dangerous when wet), Sensitization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%, manganese compounds, Form R Toxic Chemical Category Code: N450

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn, N, Xi; risk phrases: R40; R20; R36; R43; R63; R50/53; R62; R63; safety phrases: S2; S21; S25; S29/35; S36/37; S41; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Maneb is a yellow powder or crystalline solid with a faint odor. Molecular weight = 265.30; freezing/melting point = 130°C (decomposes below MP). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 1. Moderately soluble in water. Maneb is likely to generate heat spontaneously, especially when wet. The heat may be sufficient to cause ignition.

Potential Exposure: A potential danger to those involved in manufacture, formulation, and application of this broad spectrum dithiocarbamatefungicide. Some dithiocarbamates have been used as rubber components. DFG warns of danger of skin sensitization. The BPS Pesticide incident in West Helena, AK resulted in an explosion and death of three firemen. The burning of a 1000-lb sack of Azinphos Methyl or the flashing of Maneb which was present on the facility may have caused the explosion[101].

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, water. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of Dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides.

Permissible Exposure Limits in Air

Manganese:

IDLH = 500 mg[Mn]/m^3 (manganese compounds and fume)

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 2.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg [Mn]/m^3, short term exposure limit 0.6 mg[Mn]/m^3, 1993; Poland: MAC (TWA) 0.3 mg[Mn]/m^3, 1993; Russia: STEL 0.5 milligram per cubic meter, 1993; United Kingdom: TWA 5 mg[Mn]/m^3, 2000

Determination in Water: OSHA Analytical Method 107. EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV−VIS Spectrophotometry.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been determined by MAS/National Response Center (MAS/NRC) to be 0.035 mg/L. An acceptable daily intake (ADI) of 0.005 mg/kg/day has been calculated for maneb. The state of Maine has set a guideline for maneb in drinking water[61] of 10 μg/L. *Manganese*: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg[Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. WHO limit: 400 μg(Mn)/L

Determination in Water: Fish Tox = 0.00193000 ppb (EXTRA HIGH).

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Maneb irritates the eyes, skin, and respiratory tract. Maneb is low in acute toxicity and does not present alarming properties during long-term administration to experimental animals, except at very high dosages. However, it is a material of concern because of evidence of mutagenic and teratogenic effects as well as the possibility of nitrosation to carcinogenic nitrosamines. A rebuttable presumption against registration of maneb for pesticide uses was issued by EPA on August 10, 1977 on the basis of oncogenicity, teratogenicity and hazard to wildlife. Human Tox = 5.73770 ppb (HIGH).

Long-Term Exposure: Repeated skin contact can cause skin sensitization and rash. High or repeated exposures may interfere with thyroid function (causing goiter); damage to the central nervous system; affect liver function, or cause kidney damage.

Points of Attack: Skin, thyroid, liver, kidneys, central nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Thyroid function tests. Consider kidney and liver function tests with higher or repeated exposures. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red Stripe: Dangerous when wet materials release flammable gases on contact with water. Do not store this material in a room protected by water sprinkler systems. Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Maneb must be stored to avoid contact with water, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, moisture, heat, and oxidizing materials. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2210 Maneb or Maneb preparations with not <60% maneb, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material, 4.2-Spontaneously combustible material. UN2968 Maneb stabilized or Maneb preparations, stabilized against self-heating, Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. Keep maneb out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, soda ash; sand, or lime extinguishers. *Do not use water*. Thermal decomposition products may include hydrogen sulfide, carbon disulfide and oxides of nitrogen, sulfur, and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Maneb is unstable to moisture and is hydrolyzed by acids and hot water. It decomposes at about 100°C but may spontaneously decompose vigorously when stored in bulk. Incineration is the preferred disposal means[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Manganese (Dust & Fume) M:0250

Formula: Mn

Synonyms: Colloidal manganese; Cutaval; Elemental manganese; JIS-G 1213; Manganese-55; Manganese element; Manganeso (Spanish); Tripart liquid; Tronamag

CAS Registry Number: 7439-96-5 (elemental)

HSDB Number: 550

RTECS Number: OO9275000

UN/NA & ERG Number: UN3089 (Metal powder, flammable, n.o.s.)/170; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 231-105-1

Regulatory Authority and Advisory Information

EPA (*Mn and inorganic compounds*): Not Classifiable as to human carcinogenicity.

Hazard Alert: Pyrophoric (powder), Neurotoxic (cumulative), Flammable solid (powder), Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112), as manganese compounds; also as radionuclides of manganese compounds (Mn 51, 52, 52m, 53, 54, 56).

CERCLA *Reportable Quantities (RQs) for radionuclides of Manganese, radioactive compounds*: Persons in charge of vessels or facilities are required to notify the NRC immediately, when there is a release of this designated hazardous substance, in an amount equal to or greater than its RQ reported in curies (ci)/TBq (terabecquerel):

- Manganese$_{52}$; Manganese$_{54}$: RQ ≥ 10 ci/0.37 × 10^{11} TBq
- Manganese$_{56}$: RQ ≥ 100 ci/3.7 × 10^{12} Tbq
- Manganese$_{51}$; Manganese$_{52m}$; Manganese$_{53}$: RQ ≥ 1000 ci/3.7 × 10^{13} TBq

The toll free number of the NRC is (800) 424-8802. The rule for determining when notification is required is stated in 40 CFR 302.4 (Section IV. D.3.b).

Safe Drinking Water Act (47FR 9352): SMCL = 0.05 mg/L

EPA TSCA CHEMICAL INVENTORY Section 8(b) as manganese

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xi; risk phrases: R11; R15; R17; R23/24/25; R34; R36/38; R62; safety phrases: S21; S26; S27; S36/37/39; S43; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Not hazardous.

Description: Manganese is a combustible, lustrous, brittle, silvery soft metal. It may be found in chunks, powder, or flakes. The most important ore containing manganese is pyrolusite. Manganese may also be produced from ferrous scrap used in the production of electric and open-hearth steel. Molecular weight = 54.94; specific gravity (H_2O:1) = 7.3 (metal); boiling point = 2061°C; freezing/melting point = 1246°C. Hazard identification (based on NFPA-704 M Rating System): (*dust*): Health 0, flammability 2, reactivity 2₩. Insoluble in water, reaction releases flammable hydrogen gas.

Potential Exposure: Manganese is used in the production of steel; and in the manufacture of welding rod coatings and fluxes; in the iron and steel industry in steel alloys, e.g., ferro-manganese, silico-manganese, manganin, spiegeleisen; and as an agent to reduce oxygen and sulfur content of molten steel. Other alloys may be formed with copper, zinc, and aluminum. Manganese and its compounds are utilized in the manufacture of dry cell batteries (MnO_2), paints, varnishes, inks, dyes, matches, and firework; as a fertilizer, disinfectant, bleaching agent; laboratory reagent; drier for oils; an oxidizing agent in the chemical industry particularly in the synthesis of potassium permanganate; and as a decolorizer and coloring agent in the glass and ceramics industry. Exposure may occur during the mining, smelting, and refining of manganese; in the production of various materials; and in welding operations with manganese-coated rods. Manganese normally is ingested as a trace nutrient in food. The average human intake is approximately 10 mg/day.

Incompatibilities: Dust, powder, or finely divided material has been known to be pyrophoric or explosive in air. Compact, solid metallic magnesium is nonflammable. Reacts with water (slowly), steam, or acid producing flammable hydrogen gas. Reacts violently with concentrated hydrogen peroxide. Incompatible with nitrogen gas above 200°C. Oxidizers, nitric acid; nitrogen, finely divided aluminum and other metals; sulfur dioxide; carbon dioxide + heat may cause fire and explosions.

Permissible Exposure Limits in Air

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

PAC Ver. 29[138]

PAC-1: 3 milligram per cubic meter

PAC-2: 5 milligram per cubic meter

PAC-3: 1800 milligram per cubic meter

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

The Czech Republic 2.0 milligram per cubic meter (6.0 milligram per cubic meter as a ceiling value). Standards for ambient air in residential areas have been set as follows: The Czech Republic; momentary basis (milligram per cubic meter) 0.03; daily average basis (milligram per cubic meter) 0.01; Russia; momentary basis (milligram per cubic meter) 0.01; daily average basis (milligram per cubic meter) 0.001. Several states have set guidelines or standards for manganese in ambient air[60] ranging from 2.0 μ/m^3 (Rhode Island) to 10 μ/m^3 (North Dakota) to 17 μ/m^3 (Virginia) to 20 μ/m^3 (Connecticut and South Dakota) to 25 μ/m^3 (Pennsylvania) to 119 μ/m^3 (Nevada) to 300 μ/m^3 (North Carolina).

Determination in Air: ***Manganese***: Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg [Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. WHO limit: 400 μg(Mn)/L

Determination in Water: The manganese detection limit by direct flame atomization is 2 μg/L. However, solvent extraction is used for many determinations. Analytic conditions are more critical for the extraction of manganese than for most other metals, because many manganese-chelate complexes are unstable in solution. With pH control and immediate analysis after extraction, accurate determinations are possible. When the graphite furnace is used to increase sample atomization, the detection limit is lowered to 0.01 μg/L or ng/L according to NAS/NRC.

Routes of Entry: Inhalation of dust or fume; limited percutaneous absorption of liquids; ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Manganese dust and fumes are irritants to the eyes and mucous membranes of the respiratory tract, and apparently are completely innocuous to the intact skin. Inhalation of dust may cause bronchitis and pneumonitis. The effects may be delayed.

Long-Term Exposure: The substance may have effects on the lungs and nervous system; resulting in bronchitis, pneumonitis, neurologic, and neuropsychiatric disorders (manganism). Animal tests show that this substance possibly causes toxic effects upon human reproduction. Chronic manganese poisoning has long been recognized as a clinical entity. The dust or fumes (manganous compounds) enter the respiratory tract and are absorbed into the blood stream. Manganese is then deposited in major body organs with a special predilection for the liver, spleen, and certain nerve cells of the brain and spinal cord. Among workers there is a very marked variation in individual susceptibility to manganese. Some workers have worked in heavy exposure for a lifetime and shown no signs of the disease; others have developed manganese intoxication within as little as 49 days of exposure. The early phase of chronic manganese poisoning is most difficult to recognize, but it is also important to recognize since early removal from the exposure may arrest the course of the disease. The onset is insidious, with apathy, anorexia, absthenia. Headache, hypersomnia, spasms, weakness of the legs, arthralgias, and irritability are frequently noted. Manganese psychosis follows with certain definitive features: unaccountable laughter, euphoria, impulsive acts; absent-mindedness, mental confusion; aggressiveness and hallucinations. These symptoms usually disappear with the onset of true neurological disturbances, or may resolve completely with removal from manganese exposure. Progression of the disease presents a range of neurological manifestations that can vary widely among individuals affected. Speech disturbances are common: monotonous tone, inability to speak above a whisper; difficult articulation; incoherence, even complete muteness. The face may take on mask-like quality, and handwriting may be affected by micrographia. Disturbances in gait and balance occur, and frequently propulsion, retropropulsion and lateropropulsion are affected, with no movement for protection when falling. Tremors are frequent, particularly of the tongue, arms, and legs. These will increase with intentional movements and are more frequent at night. Absolute detachment, broken by sporadic or spasmodic laughter, ensues, and as in extrapyramidal affections, there may be excessive salivation and excessive sweating. At this point the disease is indistinguishable from classical Parkinson's disease. Chronic manganese poisoning is not a fatal disease although it is extremely disabling. Manganese dust is no longer believed to be a causative factor in pneumonia. If there is any relationship at all, it appears to be as an aggravating factor to a preexisting condition. Freshly formed fumes have been reported to cause fever and chills similar to metal fume fever.

Points of Attack: Respiratory system, central nervous system, brain, lungs, blood, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; CBC; chest X-ray; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: A complete exam of the nervous system. CBC. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 hours following exposure: it may last less than 36 hours. Medical observation is recommended.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: UN3089 (1) Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Manganese must be stored to avoid contact with water and steam since flammable hydrogen gas is produced. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Protect storage against physical damage.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid. UN3077

Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Thermal decomposition products may include oxides of metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform to USEPA regulations for storage, transportation, treatment, and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers. Manganese metal-sanitary landfill. Manganese chloride or sulfate-chemical conversion to the oxide followed by land filling, or conversion to the sulfate for use in fertilizer. Consult with environmental regulatory agencies for guidance on acceptable disposal practices.

EC Number: 215-202-6 [*Annex I Index No.*: 025-001-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Powerful oxidizer, Neurotoxin (cumulative), Suspected reprotoxic hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Safe Drinking Water Act (47FR 9352): SMCL = 0.05 mg/L

EPA TSCA CHEMICAL INVENTORY Section 8(b) as manganese

EPCRA Section 313: Includes any unique chemical substance that contains manganese as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%, Form R Toxic Chemical Category Code: N450.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as manganese compounds, n.o.s.

Hazard symbols, risk, & safety statements: Hazard symbol: O, Xn; risk phrases: R8; R9; R20/22; R63; safety phrases: S13; S16; S25; S26; S27; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Manganese dioxide is a black crystalline solid or powder. Molecular weight = 86.94; specific gravity (H_2O:1) = 5.1 @ 20°C; freezing/melting point = (decomposes) 553°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 3 (oxidizer). Insoluble in water.

Potential Exposure: Manganese dioxide is used as depolarizer for dry cell batteries, for production of manganese metal; as an oxidizing agent; laboratory reagent; and in making pyrotechnics and matches; in dry cell batteries.

Incompatibilities: A powerful oxidizer. Incompatible with strong acids; reducing agents; combustible materials (such as fuel and clothing; organic materials. Mixtures with calcium hydride is a heat- and friction-sensitive explosive. Vigorous reaction with hydrogen sulfide, diboron tetrafluoride; calcium hydride; chlorine trifluoride; hydrogen peroxide; hydroxyaluminum chloride; anilinium perchlorate. Decomposes when heated above 553°C producing manganese(III)oxide and oxygen, which increases fire hazard. Reacts violently with aluminum (thermite reaction), potassium azide; rubidium acetylide; in the presence of heat.

Permissible Exposure Limits in Air

Manganese:

NIOSH IDLH = 500 mg[Mn]/m^3

OSHA PEL: 5 mg[Mn]/m^3 Ceiling Concentration (inorganic compounds and fume)

NIOSH REL: 1 mg[Mn]/m^3 TWA; 3 mg[Mn]/m^3 STEL

ACGIH TLV[1] 0.02 mg[Mn]/m^3, respirable fraction; 0.1 mg[Mn]/m^3, inhalable fraction; not classifiable as a human carcinogen.

DFG MAK (*inorganic compounds and fume*): 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

PAC Ver. 29[138]

PAC-1: 4.7 milligram per cubic meter

PAC-2: 7.9 milligram per cubic meter

PAC-3: 690 milligram per cubic meter

DFG MAK: 0.5 mg[Mn]/m^3 inhalable fraction (Mn and its inorganic compounds); Pregnancy Risk Group C

Australia: TWA 5 mg[Mn]/m^3, 1993; Belgium: TWA 5 mg [Mn]/m^3, 1993; Denmark: TWA 2.5 mg[Mn]/m^3, 1999; Finland: TWA 0.5 mg[Mn]/m^3, 1999; Hungary: TWA 0.3 mg[Mn]/m^3; STEL 0.6 mg[Mn]/m^3, 1993; Japan 0.3 mg [Mn]/m^3, respirable dust, 1999; Norway: TWA 2.5 mg [Mn]/m^3, 1999; Poland: MAC (TWA) 0.3 mg[Mn]/m^3, MAC 5 mg[Mn]/m^3, 1999; Sweden: NGV 1 mg[Mn]/m^3, TGV 2.5 mg[Mn]/m^3 (respirable dust), 1993; Sweden: NGV 2.5 mg[Mn]/m^3, TGV 5 mg[Mn]/m^3 (total dust), 1993; United Kingdom: TWA 5 mg[Mn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg [Mn]/m^3.

Determination in Air: *Manganese*: Use NIOSH Analytical Method, Elements by ICP, #7300; #7301; #7303; #9102; Elements in blood or tissue, #8005; Metals in urine, #8310; OSHA Analytical Method, ID-125G or ID121.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg [Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg[Mn]/L; New Hampshire: 100 μg[Mn]/L. WHO limit: 400 μg(Mn)/L

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Manganese dioxide can affect you when breathed in. Inhalation can cause irritation of the respiratory system. Manganese dioxide can cause a flu-like illness, with chills, fever, and aching. Chest congestion can occur with cough and shortness of breath. It can cause an asthma-like lung allergy. The effects may be delayed.

Long-Term Exposure: Repeated exposure can cause permanent brain damage. Early symptoms include poor appetite; weakness and sleepiness. Later effects include speech, balance, and personality changes. Later symptoms are identical to Parkinson's Disease. High or repeated exposure may cause permanent lung damage; kidney and liver damage and cause anemia. May affect the lungs and nervous system; causing bronchitis, pneumonitis, neurologic, and neuropsychiatric disorders (manganism). Animal tests show that this substance may cause toxic effects upon human reproduction.

Points of Attack: Lungs, blood, central nervous system; liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: complete exam of the nervous system. CBC. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. Evaluation for brain effects. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Color code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially organic materials, flammables and combustibles, and other incompatible materials. Oxidizers, including oxidizing gases, should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Manganese dioxide must be stored to avoid contact with heat and flammable materials and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. See also incompatibilities above. Store in a cool, well-ventilated area away from incompatible materials listed above. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage.

Shipping: UN1479 Oxidizing solid, n.o.s., Hazard Class: 5.1; Labels: 5.1-Oxidizer, Technical Name Required. UN3137 (powder) Oxidizing solid, flammable, Hazard Class: 5.1; Labels: 5.1-Oxidizer, 4.1 Flammable solid, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Manganese dioxide itself does not burn, but it will intensify an existing fire. Thermal decomposition products may include oxides of metal. Use extinguishing agents suitable for surrounding fire if material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform to USEPA regulations for storage, transportation, treatment, and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers.

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as manganese compounds, n.o.s.
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, N; risk phrases: R40, R23/24/25; R36/37/38; R50/53; safety phrases: S1; S23; S26; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Manganese, tricarbonyl methylcyclo-pentadienyl is a dark orange liquid. Faintly pleasant, herb-like odor. Molecular weight = 218.10; specific gravity (H_2O:1) = 1.39 @ 20°C; boiling point = 231.67°C; freezing/melting point = 1.11°C; vapor pressure = 7.3 mmHg @ 100°C; flash point = 110°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Practically insoluble in water.
Potential Exposure: MMT is used as an octane improver in unleaded gasoline, other distillate fuels, and fuel oils; as a smoke abater in fuels.
Incompatibilities: Light causes decomposition. May be air-reactive. A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, halogens.
Permissible Exposure Limits in Air
OSHA PEL: None [5 mg[Mn]/m^3 Ceiling Concentration (vacated 6/30/1993)]
NIOSH REL: 0.2 mg[Mn]/m^3 TWA [skin]
ACGIH TLV[1]: 0.2 mg[Mn]/m^3 TWA [skin]
PAC Ver. 29[138]
PAC-1: 0.3 milligram per cubic meter
PAC-2: 0.6 milligram per cubic meter
PAC-3: 6.9 milligram per cubic meter
Australia: TWA 0.2 milligram per cubic meter [skin], 1993; Belgium: TWA 0.2 milligram per cubic meter [skin], 1993; Denmark: TWA 0.1 ppm (0.2 mg[Mn]/m^3) [skin], 1999; Finland: TWA 0.2 milligram per cubic meter; STEL 0.6 milligram per cubic meter [skin], 1993; France: VME 0.2 milligram per cubic meter [skin], 1999; Switzerland: MAK-W 0.1 ppm (0.2 mg[Mn]/m^3), 1999; United Kingdom: TWA 0.2 mg[Mn]/m^3; STEL 0.6 mg[Mn]/m^3 [skin], 2000; the Netherlands: MAC-TGG 0.2 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 mg [Mn]/m^3 [skin]. States have set guidelines or standards for MCT in ambient air[60] ranging from 2.0 μ/m^3 (North Dakota) to 3.5 μ/m^3 (Virginia) to 4.0 μ/m^3 (Connecticut) to 5.0 μ/m^3 (Nevada). These compare to values for methyl cyclopentadienyl manganese tricarbonyl of 1.0 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).
Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 50 μg[Mn]/L; State Drinking Water Standards: New York: 300 μg[Mn]/L; State Drinking Water Guidelines: California 500 μg[Mn]/L; Connecticut: 500 μg[Mn]/L; Maine: 500 μg[Mn]/L; Minnesota: 300 μg [Mn]/L; New Hampshire: 100 μg[Mn]/L. WHO limit: 400 μg(Mn)/L.
Routes of Entry: Inhalation, ingestion; skin and/or eye contact; absorbed through the skin.
Harmful Effects and Symptoms
Short-Term Exposure: In concentrated form this compound is highly toxic by all routes of exposure. Irritates the eyes, skin, and respiratory tract. Medical observation is indicated. Approximately 5−15 mL, when spilled on the hand and wrist of a worker, produced toxic effects within 3−5 minutes. Giddiness, "thick tongue," nausea, and headache were reported to occur after skin exposure. Human exposure data are limited; the primary site of action is reported to be the central nervous system; may cause tissue lesions. LD_{50}(oral-rat) = 8 mg/kg.

Long-Term Exposure: Can cause kidney and lung damage
Points of Attack: Respiratory system, skin, central nervous system; kidneys.
Medical Surveillance: Examination of the nervous system. Kidney function tests. Lung function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Up to 10 milligram per cubic meter*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *Up to 50 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: UN3281 Metal carbonyls, liquid n.o.s. Hazard class 6.1. Technical name required, Potential Inhalation Hazard (Special Provision 5).
Spill Handling:
Metal carbonyls, liquid n.o.s.
Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.9/1.5
Night 3.4/5.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 3000/900
Then: Protect persons downwind (mi/km)
Day 7.1+/11+
Night 7.0+/11+*
"+" means distance can be larger in certain atmospheric conditions.
Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Large spills can be cleaned up using JP-4L or JP-5 (jet engine fuels). Isopropyl alcohol may be used to clean up moderate spills, while methyl ethyl ketone should be used for cleaning *small spills* and quick disconnects. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive

concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of metal and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Generators of waste (equal to or greater than 100 kg/mo) containing this contaminant, EPA hazardous waste number N450, must conform to USEPA regulations for storage, transportation, treatment, and disposal of waste. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Dispose of contents and container to an approved waste disposal plant. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. All federal, state, and local environmental regulations must be observed. Do not discharge into drains or sewers.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Limited Evidence; Animal No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1987. United States Environmental Protection Agency Gene-Tox Program, Positive: *D. melanogaster* sex-linked lethal; *S. cerevisiae*-reversion; Negative: *D. melanogaster*-whole sex chrom. loss; Negative: *D. melanogaster*-nondisjunction; Host-mediated assay.

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction), Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R22; R38; R41; R51/53; R62; R63; safety phrases: S2; S26; S29; S37; S39; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: MCPA is a colorless crystalline solid. Molecular weight = 200.63; freezing/melting point = 118.8°C; vapor pressure = 1.5×10^{-6} mmHg @ 20°C. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this postemergence herbicide, used for control of broadleaf weeds in agricultural applications.

Incompatibilities: A weak acid. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with alkalis.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Poland: MAC (TWA) 1 milligram per cubic meter, MAC (STEL) 3 milligram per cubic meter, 1999

Determination in Air: No method available.

Permissible Concentration in Water: Russia set a MAC in surface water of 0.25 mg/L. The United States Environmental Protection Agency has determined a no-observed-adverse-effects-level (NOAEL) of 1.0 mg/kg/day from which they have calculated a long-term advisory of 0.35 mg/L (350 μg/L) for an adult. They have further calculated a lifetime health advisory of 0.0036 mg/L (3.6 μg/L) for an adult. In addition, Maine has set a guideline for MCPA in drinking water[61] of 2.5 μg/L.

Determination in Water: No method available. Fish tox = 17,986.45312000 ppb (VERY LOW). Octanol−water coefficient: Log $K_{ow} = 3.3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. Irritates the eyes, skin, and respiratory tract. This material is moderately toxic. LD_{50}(oral-rat) = 700 mg/kg. Human Tox = 4.00000 (HIGH). The approximate lethal dose to a 150-lb man is 3.3 tablespoonfuls (Sax).

Long-Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction MCPA is classified as a chlorophenoxy-herbicide. These herbicides are a possible carcinogen to humans. May cause decreased blood pressure. May cause genetic changes.

Medical Surveillance: Monitor blood pressure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3345 Phenoxyacetic acid derivative pesticide, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Also, can be precipitated with divalent cations. Carbon or peat can be used as sorbents.

Fire Extinguishing: Solid material not combustible. Liquid formulations containing organic solvents may be flammable. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added flammable solvent; incinerator equipped with fume scrubber[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Description: Nitrogen mustard is a pale yellow, oily, mobile liquid with a faint odor of herring. *Nitrogen mustards* are colorless when pure but are typically a yellow to brown oily substance. Odors are variably described as; sweet, agreeable, slightly garlic- or mustard-like. NIOSH reports HN-2 as having "a fruity odor at high concentrations, and a soapy or fishy odor at low concentrations." Molecular weight = 156.07; specific gravity (H_2O:1) = 1.12 @ 25°C; boiling point = 87°C @ 18 mmHg; 75°C @ 10 mmHg (HN-2 decomposes before its boiling point is reached or condenses under all conditions; the reactions involved could generate enough heat to cause an explosion)[77]; freezing/melting point: −60°C; vapor pressure = 0.29 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. This compound is soluble in water; releases corrosive vapors.

Potential Exposure: Drug used in treatment of cancer. Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal[77]. Sulfur mustards were formerly used as a gas warfare agent. Nitrogen mustards have not previously been used in warfare[77].

Incompatibilities: HN-2 is not stable except as dry crystals. Polymerization of HN-2 results in components that present an explosion hazard in open air[77]. Avoid contact or contamination with oxidizers e.g., nitrates, oxidizing acids; chlorine bleaches pool chlorine); which may result in ignition. Unstable in the presence of light and heat and forms dimers at temperatures above 50°C. Corrosive to ferrous alloys beginning @ 65°C. Polymerizes slowly, so munitions would be effective for several years. Heated to decomposition emits hydrogen chloride and nitrogen oxide. Contact with metals may evolve flammable hydrogen gas[77]. *Note*: Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine vigorously chlorinate nitrogen mustards to the carbon chain, giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

An amine and a chemical base: will neutralize acids to form salts plus water with an exothermic reaction. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen is generated by amines in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air

The Surgeon General's Working Group (United States Department of Health and Human Services) recommends (for the workplace) 0.003 milligram per cubic meter, Ceiling Concentration. Same for United States military. Several states have set guidelines for nitrogen mustard in ambient sir[60] New York and South Carolina at zero.

PAC HN-2*

51-75-2 [(Bis(b-chloroethyl)methylamine; Nitrogen mustard; Nitrogen mustard-2]

PAC Ver. 29[138]

PAC-1: 0.002 milligram per cubic meter

PAC-2: $\mathbf{0.022}_{\mathbf{A}}$ milligram per cubic meter

PAC-3: $\mathbf{0.37}_{\mathbf{A}}$ milligram per cubic meter

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2A; Germ Cell Mutation Category 2

Determination in Water: A water contaminant. Octanol−water coefficient: Log K_{ow} = (estimated) 0.91 @ pH 7.4; 1.53[77]

Routes of Entry: Inhalation, ingestion; skin and/or eye contact (vapor or liquid).

Harmful Effects and Symptoms

Nitrogen mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells. Clinical effects do not appear until hours after exposure. Nitrogen mustards penetrate and bind quickly to cells of the body; their health effects develop slowly. The full extent of cellular injury may not be known for days. The sooner after exposure that health effects occur, the more likely it is that the patient/victim was exposed to a high concentration of HN-2. Similarly, the sooner that health effects occur, the more likely it is that they will progress and become severe. *Eye exposure*: The eyes are the organs that are most sensitive to mustard vapor; eye injury may occur within 1 to 2 hours after severe exposure, or 3 to 12 hours after a mild to moderate exposure. Inhalation exposure: Airway injury may occur within 2 to 6 hours after severe exposure and within 12 to 24 hours after mild exposure. Skin exposure: The symptom-free (latent) period is 6 to 12 hours in temperate conditions; hot, humid weather strikingly increases the action of nitrogen mustards. Some skin injury may appear as late as 48 hours after exposure[77]. Toxic doses as low as 400 mg/kg have been reported in humans. Blood clots may occur at site of intravenous injection and tissue damage if outside vein. Powerful vesicant (causes blisters) when it contacts skin, mucous membranes, or eyes. Delayed toxicity-missed menstrual periods, alopecia (hair loss), hearing loss, tinnitus (ringing in ears), jaundice, impaired spermatogenesis and germinal aplasia, swelling, and hypersensitivity. May damage fetus in pregnant women[88].

Short-Term Exposure: Extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although this agent can cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Irritates and burns the eyes, with possible permanent damage. Skin contact can cause irritation, burns with itching and blisters. Inhalation can cause irritation of the respiratory tract with wheezing and coughing. Higher exposure can cause headache, nausea, vomiting, and dizziness. Symptoms of exposure include nausea and vomiting; bleeding, skin lesions; menstrual irregularities. Toxic doses as low as 400 mg/kg have been reported in humans. Blood clots may occur at site of intravenous injection, and tissue damage if outside vein. Powerful vesicant (causes blisters) when it contacts skin, mucous membranes; or eyes. *Delayed toxicity*-missed menstrual periods, alopecia (hair loss), hearing loss; tinnitus (ringing in ears), jaundice, impaired spermatogenesis and germinal aplasia; swelling, and hypersensitivity. High exposure can cause tinnitus (ringing in the ears) and possible hearing loss.

Long-Term Exposure: Bone marrow suppression resulting in damage to the blood forming (hematopoietic) system. Early signs of bone marrow suppression include: a low white blood cell count; an increased risk for developing infections; a tendency for easy bruising and bleeding. May cause lymph node damage and a weakened immune system. It also causes liver and kidney damage; damage to the reproductive systems of both men and women leading to decreased fertility. It is mutagenic, toxic to the developing embryo, and carcinogenic. Following significant whole-body (systemic) absorption of nitrogen mustard, injury to the bone marrow, lymph nodes, and spleen may cause a drop in white blood cell counts (beginning on days 3 to 5), which can result in an increased risk for developing (life-threatening) infections. Counts of red blood cells and platelets may also fall due to bone marrow damage. Chloramines can cause eye/nose irritation; stomach discomfort; anemia.

Points of Attack: Bone marrow, hearing.

Medical Surveillance: CBC. Audiogram.

First Aid: There is no antidote for nitrogen mustard toxicity. Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage[77]. Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 hours. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified chemical, biological, radiological, nuclear (CBRN) SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: Safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A totally encapsulating chemical protective (TECP) suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using air-purifying respirators (APR) or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage[77]. Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first 2 minutes following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/healthcare providers or the healthcare facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing. (2) Patients exposed to liquid should be decontaminated by

(a) Washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged, because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes; or open wounds with sterile saline or water.

(3) The healthcare provider should (a) check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process. (b) Be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time consuming process. The healthcare provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Where a potential exposure to the chemical exists, use a NIOSH-certified CBRN full facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. Military driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3

Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300

Then: Protect persons downwind (mi/km)

Day 1.1/1.8

Night 2.8/4.5

HN-2, when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

NIOSH.

Mefluidide M:0307

Formula: $C_{11}H_{13}F_3N_2O_3S$

Synonyms: Acetamide, *N*-(2,4-dimethyl-5-[((trifluoromethyl) sulfonyl)amimo)phenyl]-; 5-Acetamido-2,4-dimethyltrifluoromethanesulfonanilide; *N*-[(2,4-Dimethyl-5-((trifluoromethyl) sulfonyl)amino)phenyl] acetamide; 2′,4′-Dimethyl-5-[(trifluoromethyl)sulfonamido] acetanilide; EMmHgK; MBR 12325; Methafluoridamid; S 15733; VEL 3973; Vistar herbicide

CAS Number: 53780-34-0

HSDB Number: 6698

RTECS Number: AE2460000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 258-767-4

Regulatory Authority and Advisory Information

This product is considered hazardous under the criteria of the Federal OSHA Hazard Communication Standard 29 CFR 1910.1200.

SARA Title III, Section 311/312 Hazard Category: Immediate Health Hazard

Description: White crystalline solid. Some formulations are a dark brown liquid. Molecular weight = 310.29; freezing/melting point = 184°C. Vapor pressure = 2.40×10^{-8} mmHg @ 25°C (est)[83]; Henry's law constant = 1.28×10^{-11} atm m^3/mol @ 25°C (est)[83]; flash point ≥ 212°C. Slightly soluble in water. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Mefluidide is an anilide herbicide and plant growth regulator used to control ornamental and non-ornamental woody plants, ground cover, hedges, trees, turfgrass, and broadleaf weeds. Both the diethanolamine and potassium salts are actively used in the United States Not refistered for use in the EU.

Incompatibilities: May react with strong oxidizers such as chlorates, peroxides, nitrates, etc.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 4000 μg[F]/L; Federal Drinking Water Guidelines: EPA 2000 μg[F]/L; State Drinking Water Standards: California 2000 μg[F]/L; Delaware 2000 μg[Fl]/L; Pennsylvania 2000 μg[Fl]/L; State Drinking Water Guidelines: Arizona 4000 μg[F]/L; Maine 1680 μg[F]/L. Safe Drinking Water Act: MCL = 4 mg[F]/L; MCLG = 4 mg[F]/L; SMCL = 2 mg/F/L, as Fluoride.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 3.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood. Fish toxicity (threshold)[101]: Very low—19,076.48500 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Eyes; dermal contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: May cause eye, skin, and respiratory tract irritation. May be absorbed through the unbroken skin. Harmful if swallowed, with gastrointestinal irritation. LD_{50} (oral, rat) = >3.5 g/kg; LD_{50} (dermal, rabbit) = > 2 g/kg.

Long-Term Exposure: Fluorides may cause bone disease (pain and tenderness of the bones); mottled teeth in children. Human toxicity (long term)[101]: Very low—2100.00 ppb, Health Advisory.

Points of Attack: Bones.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur and carbon and hydrogen fluoride gas. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Melamine M:0310

Formula: C_3H_6N6; $NC(NH_2)NC(NH_2)NC(NH_2)$

Synonyms: Cyanuramide; Cyanurotriamide; Cyanurotriamine; 1,3,5-Triazine-2,4,6-triamine; 2,4,6-Triaminotriazine

CAS Registry Number: 108-78-1; *(alt.)* 504-18-7; *(alt.)* 65544-34-5; *(alt.)* 67757-43-1; *(alt.)* 68379-55-5; *(alt.)* 70371-19-6; *(alt.)* 94977-27-2

HSDB Number: 2648

RTECS Number: OS0700000

UN/NA & ERG Number: None

EC Number: 203-615-4

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1999; NCI: Carcinogenesis Studies (feed); clear evidence: rat; NCI: Carcinogenesis Studies (feed); no evidence: mouse. United States Environmental Protection Agency Gene-Tox Program, Inconclusive: *D. melanogaster* sex-linked lethal.

Hazard Alert: Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R62; R63;?; safety phrases: (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Melamine is a white crystalline solid. Molecular weight = 126.15; specific gravity (H_2O:1) = 1.6; freezing/melting point = (decomposes) 347°C[138]; vapor pressure = 50 mmHg @ 315°C; flash point ≥ 300°C; autoignition temperature ≥ 500°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Practically insoluble in water.

Potential Exposure: Manufactured from urea, melamine is used in the manufacture of plastics, melamine-formaldehyde resins; rubber, synthetic textiles; laminates, adhesives, and molding compounds.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Melamine neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen may be generated in combination with strong reducing agents such as hydrides, nitrides, alkali metals, and sulfides.

Permissible Exposure Limits in Air Kansas[60] has set a guideline for melamine in ambient air of 24.39 μ/m^3.

Determination in Air:

PAC Ver. 29[138]

PAC-1: 30 milligram per cubic meter

PAC-2: 340 milligram per cubic meter
PAC-3: 630 milligram per cubic meter

Routes of Entry: Inhalation and ingestion

Harmful Effects and Symptoms

Short-Term Exposure: Irritates, eyes, skin, and mucous membranes. May cause dermatitis in humans.

Long-Term Exposure: May cause kidney damage. There is limited evidence that melamine causes cancer in animals.

Points of Attack: Kidneys, skin.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping:

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Melamine itself does not burn. Use any extinguishing agent suitable for surrounding fire. Thermal decomposition include ammonia fumes, hydrogen cyanide, and oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; IARC: Human Sufficient Evidence; Animal Sufficient Evidence, Group1, 1998.

California Proposition 65 Chemical[102]: Cancer 2/27/1987; Developmental/Reproductive toxin 7/1/1990.

Hazard Alert: Poison, Probably combustible, Possible risk of forming tumors, Reproductive toxin: possible risk of gene damage/impaired fertility; Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U150

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn; risk phrases: R45; R26/27/28; R36/37/38; R42; R46; R50/53; R62; R63; safety phrases: S22; S26; S36/37/39; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)].

Description: Melphalan forms solvated crystals from methanol. Molecular weight = 305.23; freezing/melting point = 182−183°C. (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0.

Potential Exposure: An alkylating agent. Healthcare workers may be exposed. As a drug it is an immunosuppressant, used in the treatment of multiple myeloma and cancer of the ovary. It is also used in investigation of other types of cancer and as an antineoplastic in animals. Human exposure to melphalan occurs principally during its use in cancer treatment. Melphalan is administered orally or intravenously. Adult dosage is 6 mg/day, 5 days per month. Has been used as a military poison gas (a nitrogen mustard, alkaline, crystals).

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Harmful Effects and Symptoms

Short-Term Exposure: LD_{50}(oral-rat) = 11.2 mg/kg. This material is highly toxic; local irritant of the skin, eyes and, mucous membranes. Skin rash, nausea, vomiting.

Long-Term Exposure: A Confirmed Human Carcinogen capable of causing leukemia and Hodgkin's disease. High or repeated exposure causes marked bone marrow depression with possible anemia, neutropenia, and thrombocytopenia.

Points of Attack: Blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum lutenizing hormone (LH) may be indicated.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Speed in removing material from skin is of extreme importance. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20 to 30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; move to the fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure the his airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi[70]. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may be a combustible solid. Thermal decomposition products may include hydrogen chloride and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Mephosfolan M:0330

Formula: $C_8H_{16}NO_3PS_2$

Synonyms: AC 47470; American cyanamid CL-47470; CL-47,470; Cyclic propylene(diethoxyphosphinyl) dithioimdocarbonate; Cytrolane; *p,p*-Diethyl cyclic propylene ester of phosphonodithioimidocarbonic acid; Diethyl(4-methyl-1,3-dithiolan-2-ylidene)phosphoroamidate; 2-(Diethoxyphosphinylimino)-4-methyl-1,3-dithiolane; EI-47470; ENT 25,991; (4-Methyl-1,3-dithiolan-2-ylidene)phosphoramidic acid, diethyl ester

CAS Registry Number: 950-10-7

HSDB Number: 6411

RTECS Number: JP1050000

UN/NA & ERG Number: (PIH) UN3018 (organophosphorus pesticide, liquid, toxic)/152; UN2810 (toxic liquid, organic, n.o.s.)/153

EC Number: 213-447-3 [*Annex I Index No.*: 015-094-00-9]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Neurotoxin (cumulative), Combustible, Environmental hazard.

Banned or Severely Restricted (in agriculture) (India) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R33; R51/53; safety phrases: S1/2; S29/35; S36/37/39; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [2-Hazard to waters (est.)].

Description: Mephosfolan is a yellow to amber liquid. Molecular weight = 269.34; boiling point = 120°C @ 1.0 mmHg. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Moderately soluble in water.

Potential Exposure: A potential danger to those involved in the production, formulation, and application of this insecticide and acaricide. Not currently registered for use in the US.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Similar organic amides react with azo and diazo compounds, releasing toxic gases. Contact with reducing agents can release flammable gases. Amides are very weak bases but they can react as acids, forming salts. Mixing amides with dehydrating agents such as such as phosphorus pentoxide or thionyl chloride generates the corresponding nitrile[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.82 milligram per cubic meter

PAC-2: 9 milligram per cubic meter

PAC-3: 54 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = \sim 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This is a highly to extremely toxic material. LD_{50}(oral-rats) = 9 mg/kg. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All

protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible material. Thermal decomposition products may include oxides of nitrogen, phosphorus, sulfur, and carbon. Vapors may travel to a source of ignition, and flash back. Use foam, carbon dioxide; or dry chemical. Use water spray to absorb vapors. Avoid breathing vapors. Keep upwind. Wear SCBA. Avoid bodily contact with the material. Wear full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Mepiquat Chloride M:0336

Formula: $C_7H_{16}ClN$

Synonyms: *N,N*-Dimethylpiperidinium chloride; 1,1-Dimethylpiperidinium chloride; 1,1-Dimethylpiperidin-1-ium chloride; BAS 08301 W; BAS 85559X; Mepex;

Mepichlor; Mepplus; Pix; Ponnax; Roquat; Terpal (with ethephon)
CAS Number: 24307-26-4
HSDB Number: 7059
RTECS Number: TN4939200
UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171
EC Number: 246-247-6 [*Annex I Index No.*: 613-127-00-7]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard Alert: Environmental hazard.

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

Hazardous to aquatic life or environment, with possible long-lasting effects[194].

Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R52/53 safety phrases: S2; S29/35; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [2-Hazard to water. (est.)].

Description: White crystalline solid, off-white powder, or pinkish liquid. Slightly sweet, musty odor; molecular weight = 149.63; specific gravity (H_2O:1) = 1.17; boiling point = (decomposes) >100°C; freezing/melting point ≥ 300°C with discoloration ~296°C[83]. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Highly soluble in water; solubility = 52.9 g/100 mL[83].

Potential Exposure: A quarternary ammonium salt herbicide and plant growth regulator registered solely for use on cotton, to control growth and yield.

Incompatibilities: Decomposes in temperatures above 320°C. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Concentration in Water: Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < -3$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—100,000.00 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Ingestion, inhalation, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material may cause irritation to the skin, eyes, and respiratory tract. LD_{50} (oral, rat) = < 500 mg/kg; LD_{50} (dermal, rabbit) = > 2 g/kg.

Long-Term Exposure: Human toxicity (long term)[101]: Very low—4200.00 ppb, Health Advisory.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the Worker Protection Standard (WPS) for agricultural pesticides, 40 CFR 170.240(d)(4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Green: General storage may be used. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, acids, water, or combustible materials.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Eliminate all ignition sources (no smoking, flares, sparks, or flames in immediate area). Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand, or other noncombustible material and transfer to containers. Do not get water inside containers.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, carbon, and hydrogen chloride fumes. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *Small fire*: Dry chemical, carbon dioxide, or water spray. *Large fire*: dry chemical, carbon dioxide, alcohol-resistant foam, or water spray. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal; do not scatter the material. *Fire involving tanks or car/ trailer loads*: Fight fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank. Always stay away from tanks engulfed in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Incineration with effluent gas scrubbing is recommended[22]. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Noncombustible containers should be compacted and buried under more than 16 in/40 cm. of soil[83]. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercuric acetate is a white crystalline solid with a mild vinegar-like odor. Molecular weight = 318.69; specific gravity (H_2O:1) = 3.28 @ 20°C; freezing/melting point = 178−180°C (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Mercuric acetate is used chiefly for mercuration of organic compounds; for the absorption of ethylene; as a chemical intermediate for phenylmercuric acetate; a mildewcide; and other organomercury compounds. It is used as a catalyst in organic synthesis; and in the manufacture of pharmaceuticals.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Light and heat can cause decomposition.

Permissible Exposure Limits in Air

As mercury alkyl compounds

NIOSH IDLH = 10 mg[Hg]/m^3

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin]

PAC-3: 3.2 milligram per cubic meter

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II (8) danger of skin sensitization; Carcinogen Category 3B

Australia: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3, 1999; Finland: TWA 0.05 mg[Hg]/m^3, 1993; France: VME 0.1 mg[Hg]/m^3 [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg [Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg [Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg[Hg]/m^3, 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: TWA 0.025 mg[Hg]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, ZEALAND, Singapore, Vietnam; ACGIH TLV: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3 [skin]

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg/L; Federal Drinking Water Guidelines: EPA 2 μg/L; State Drinking Water Guidelines: Arizona 3 μg/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric acetate is corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Inhalation of the aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Signs and symptoms of acute exposure to mercuric acetate may be severe and include increased salivation; foul breath; inflammation and ulceration of the mucous membranes; abdominal pain; and bloody diarrhea. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances; dyspnea (shortness of breath), chest pain, and circulatory collapse may be observed.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin), or cause skin to turn gray. Skin allergy may also occur. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. Has been shown to be a teratogen in animals.

Points of Attack: Eyes, skin, central nervous system; peripheral nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: eye exam. Consider lung function tests for persons with frequent exposure. Exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Antidotes and Special Procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL (British Anti-Lewisite), dimercaprol, dithiopropanol ($C_3H_8OS_2$) has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #73-11024.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern] * (canister). *to 2.5 milligram per cubic meter*: CcrFS* (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

*End-of-service life indicator (ESLI) required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS* (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); light, heat, and acids.

Shipping: UN1629 Mercury acetate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Avoid breathing dusts. If material is not involved in fire, keep material out of water sources and sewers. Do not touch spilled material; stop leak if you can do so without risk. Small wet spills: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: With clean shovel place material into clean, dry container, and cover; move containers from spill area. *Large spills*: Dike far ahead of spill for later disposal. Acute exposure to mercuric acetate may require decontamination and life support for the victim. Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies, such as plastic sheeting and disposable plastic bags to assist in preventing spread of contamination. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include mercury oxide and mercury. May burn but is difficult to ignite. Extinguish fire using agent suitable for type of surrounding fire. Material itself does not burn or burns with difficulty. Use water in flooding quantities as fog. Use foam, carbon dioxide, or dry chemical to extinguish fires. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Wear boots, protective gloves, and goggles. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Wear SCBA when fighting fires involving this material. If contact with the material is anticipated, wear full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/1990

Hazard Alert: Poison, Reproductive toxin, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg [Hg]/L as mercury

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds, and alkyloxylalkyl and aryl mercury compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R33; R34; R36/37/38; R42; R50/53; safety phrases: S13; S16; S23; S26; S28; S29/35; S36/37; S39; S45; S57; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercuric Bromide is a crystalline solid. Molecular weight = 360.41; boiling point = 322°C; freezing/melting point = 236°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: This compound has applications in medicine.

Incompatibilities: Violent reaction with active metals; potassium, sodium. Store away from heat and light.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[Hg]/m^3

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin]

ACGIH TLV[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; Biological Exposure Index (BEI) (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week

PAC not available

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II (8) danger of skin sensitization; Carcinogen Category 3B

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric bromide can affect you when breathed and by passing through skin. Overexposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums; memory loss; increased saliva; personality changes and permanent brain damage may result. Skin contact may cause burns or skin allergy, or gray skin color. Contact causes eye burns with permanent damage. Heating or use near acid releases toxic mercury vapors. Mercury can build with permanent damage. Mercury can build up in the body. Health effects have been reported below NIOSH exposure levels.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to Shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA), urine test for mercury (should be less than 0.02 mg/L). Eye exam. After suspected illness or overexposure, repeat the test above and get a blood test for mercury. Consider chest X-ray after acute overexposure. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Antidotes and Special Procedures for medical personnel*: The drug NAP has been used to treat mercury poisoning, with mixed success. *Note to physician*: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when

skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern] * (canister). *Up to 2.5 milligram per cubic meter*: CcrFS* (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS* (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and acids. Mercuric bromide must be stored to avoid contact with sodium and potassium, since violent reactions occur.

Shipping: UN1634 Mercuric bromides, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercuric bromide may burn, but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include mercury and bromium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercury bichloride is an odorless white crystalline solid. Molecular weight = 271.49; specific gravity (H_2O:1) = 5.6 @ 20°C; boiling point = 304°C; freezing/melting point = 277°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water; solubility = 7.38% @ 20°C.

Potential Exposure: Mercuric chloride is used as dip for bulbs and tubers; for earthworm control; as repellent to ants, roaches, etc.; in preserving wood and anatomical specimens; embalming, browning, etching steel and iron; as a catalyst for organic synthesis; disinfectant, antiseptic, tanning; textile printing aid; manufacture of dyes; in agricultural chemicals; dry batteries; pharmaceuticals, and photographic chemicals.

Incompatibilities: A strong reducing agent; keep away from oxidizers. Mercuric chloride may explode with friction or application on heat. Mixtures of mercuric chloride and sodium or potassium are shock sensitive and will explode on impact. Avoid contact with acids or acid fumes. Also avoid the presence of formats, sulfites, hypophosphites, phosphates, sulfide; albumin, gelatin, alkalies, alkaloid salts; ammonia, lime water; antimony, arsenic, bromides, borax, carbonates, reduced iron, copper; iron, lead, silver salts; infusions of cinchona; columbo, oak bark or senna; and tannic acid.

Permissible Exposure Limits in Air

PAC-3: 38 milligram per cubic meter

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B

Australia: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3 [skin], 1999; Finland: TWA 1 mg[Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3, 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg[Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg [Hg]/m^3 [skin], 1999; Thailand STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: TWA 0.025 mg[Hg]/mg, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption. Octanol−water coefficient: $\text{Log } K_{\text{ow}} = 0.12$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive. The substance is corrosive to the eyes, the skin, and the respiratory tract. Corrosive on ingestion. Inhalation of its aerosol may cause lung edema. The substance may cause effects on the kidneys. Exposure far above OEL may result in death. The effects may be delayed. Medical observation is indicated. It is classified as extremely toxic. All forms of mercury are poisonous if absorbed. Probable oral lethal dose is 5−50 mg/kg; between seven drops and one teaspoonful for a 150-lb person. Mercuric chloride is one of the most toxic salts of mercury. Material attacks the gastrointestinal tract and renal systems. Signs and symptoms of acute exposure or mercuric chloride may be severe and include increased salivation; foul breath; inflammation and ulceration of the mucous membranes; abdominal pain; and bloody diarrhea. Dermal exposure may result in dermatitis (red, inflamed skin) and burns. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances; circulatory collapse; chest pain; and dyspnea (shortness of breath) may be observed.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure.

Points of Attack: Eyes, skin, central nervous system; peripheral nervous system; kidneys. Organs.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; Nerve Conduction Studies; Neurologic Examination/Electromyography; Thyroid Function Test/Thyroid Profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye exam. Consider lung function tests for persons with frequent exposure. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider chest X-ray after sudden overexposure. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Antidotes and Special Procedures for medical personnel*: The drug NAP has been used to treat mercury poisoning, with limited success. *Note to physician*: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern] * (canister). *Up to 2.5 milligram per cubic meter*: CcrFS* (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

* ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS* (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Mercuric chloride must be stored to avoid contact with potassium and sodium, since violent reactions occur. See also “Incompatibilities,” above. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN1624 Mercuric chloride, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible. Extinguish with water spray, fog, foam, dry chemical or carbon dioxide.

Move container from fire area. Wear SCBA and full body protective clothing. Thermal decomposition products may include hydrogen chloride mercury fumes and oxides of mercury. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 209-741-6

Regulatory Authority and Advisory Information

Carcinogenicity: ACGIH: A4, not classifiable as a human carcinogen

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/1990

Hazard Alert: Poison, Reproductive toxin, Environmental hazard, Agricultural chemical.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg[Hg]/L as mercury; MCLG = 0.2 mg[CN^-]/L; MCL = 0.2 mg[CN^-]/L as cyanide.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R33; R34; R36/37/38; R42; R50/53; safety phrases: S13; S16; S23; S26; S28A; S29; S36/37; S39; S45; S57; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercuric cyanide is an odorless, white crystalline solid; turns gray to dark brown when exposed to light. Molecular weight = 252.63; specific gravity (H_2O:1) = 4 @ 20°C; decomposes @ 319°C. Explosive limits: LEL = 59,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Soluble in water.

Potential Exposure: Mercuric cyanide is used in medicine, germicidal soaps, photography and in making cyanogen gas.

Incompatibilities: Violent reaction with fluorine, magnesium, sodium nitrite, acids. Heating or contact with acid releases toxic mercury and flammable hydrogen cyanide gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

*See below NIOSH IDLH values for mercury and cyanide**

PAC Ver. 29[138]

PAC-1: 0.094 milligram per cubic meter

PAC-2: 0.13 milligram per cubic meter

PAC-3: 35 milligram per cubic meter

ACGIH: A4, not classifiable as a human carcinogen

As inorganic mercury compound

*NIOSH IDLH = 10 mg[Hg]/m^3

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin]
ACGIH TLV[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week
DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II (8) danger of skin sensitization; Carcinogen Category 3B
As cyanide compound (for reference)
*NIOSH IDLH = 25 mg[CN]/m^3
OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA
NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 minutes, Ceiling Concentration
ACGIH TLV[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140. See also NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L. Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L. Federal Drinking Water Standards: EPA 200 μg[CN$^-$]/L; Federal Drinking Water Guidelines: EPA 200 μg[CN$^-$]/L; State Drinking Water Standards: California 150 μg[CN$^-$]/L; State Drinking Water Guidelines: Arizona 220 μg[CN$^-$]/L; Maine 140 μg[CN$^-$]/L; Minnesota 100 μg[CN$^-$]/L. United States Army field drinking-water standards for cyanide: 2 mg[CN$^-$]/L assuming a water consumption of 15 L/day and 6 mg[CN$^-$]/L assuming a water consumption of 5 L/day. United States Army field drinking-water standards for cyanide, long-term consumption 0.5 mg[CN$^-$]/L; Short-term consumption; Raw water constituents (maximum) 20 mg[CN$^-$]/L.

Determination in Water

Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric cyanide can affect you when breathed and by passing through skin. Direct contact causes eye irritation and possible damage. Overexposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums; memory loss; increased saliva; metallic taste; personality changes and brain damage. Skin contact can cause irritation, skin allergy, or a gray skin color. Mercury can build up in the body. Heating or contact with acid or acid mist causes the release of toxic mercury and cyanide vapors; may cause bronchitis and lung irritation. Overexposure to cyanide can cause sudden death.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure. Organic mercury substances have been identified as human teratogens. Some related compounds damage the developing fetus and decrease fertility in males and females. It is unknown for certain if mercuric cyanide causes these effects so care is indicated.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye exam. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern] * (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: *ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Mercuric cyanide must be stored to avoid contact with fluorine, magnesium and sodium nitrite, since violent reactions occur. Mercuric cyanide should not contact acid or heat because it will release flammable hydrogen cyanide gas. Store in tightly closed containers in a cool, well-ventilated area away from light. Protect containers from physical damage.

Shipping: UN1636 Mercuric cyanide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury cyanide may burn, but does not readily ignite. Decomposes in temperatures above 300°C. Thermal decomposition products may include hydrogen cyanide, mercury fumes and oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return to supplier for mercury recovery and deactivation.

RTECS Number: OW5250000

UN/NA & ERG Number: UN1638 (solution and solid)/151

EC Number: 231-873-8

Regulatory Authority and Advisory Information

Carcingenicity: ACGIH: A4, Not classifiable as a human carcinogen

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/1990

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg[Hg]/L as mercury

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.

EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R26/27/28; R33; R34; R36/37/38; R42; R50/53; R63; safety phrases: S13; S16; S23; S26; S28; S29; S36/37; S39; S45; S57; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mecuric iodide is a heavy, scarlet red, odorless, crystalline solid. It may be shipped as a red solution. It turns to a yellow powder @ 127°C and red upon cooling. Molecular weight = 454.4; specific gravity (H_2O:1) = 6.3 @ 20°C; boiling point = (sublimes) 350°C; freezing/melting point = 259°C; vapor pressure = 100 mmHg @ 262°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: Mercuric iodide is used in medicine and in analytical chemistry.

Incompatibilities: Violent reaction with active metals; potassium, sodium, acids, chlorine trifluoride. Inorganic mercury compounds are incompatible with acetylene, ammonia, chlorine dioxide; azides, calcium (amalgam formation), sodium carbide, lithium, rubidium, copper. Mercury iodide is a mild reducing agent. Keep away from oxidizers. Reacts with sodium azide to form mercury(II) azide, which is shock-, friction-, and heat-sensitive. Incompatible with acetylene, ammonia, chlorine dioxide, azides, chlorine trifluoride, calcium (because of amalgam formation), sodium carbide, lithium, rubidium, copper (NIOSH, 1997).

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.17 milligram per cubic meter

PAC-2: 0.23 milligram per cubic meter

PAC-3: 63 milligram per cubic meter

As iodides

ACGIH TLV[1]: 0.01 ppm/0.1 milligram per cubic meter, inhalable fraction and vapor, TWA

As inorganic mercury compound

NIOSH IDLH = 10 mg[Hg]/m^3/m^3

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration
NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin]
ACGIH TLV[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week
DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II (8) danger of skin sensitization; Carcinogen Category 3B

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric iodide can affect you when breathed and by passing through skin. Skin contact can be fatal. Overexposure can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums; memory loss; increased saliva; metallic taste and personality changes. Permanent brain damage may result. Skin contact may cause skin burns, skin allergy, or a gray skin color. Eye contact can cause permanent damage. Heating or contact with acid or acid mist releases toxic mercury vapors. Mercury accumulates in the body. Health effects have been reported below exposure levels of 0.1 milligram per cubic meter.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6–12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider lung function tests for persons with frequent exposure. Eye exam. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider chest X-ray after sudden exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Antidotes and Special Procedures for authorized medical personnel*: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Mercuric iodide must be stored to avoid contact with chlorine trifluoride; sodium and potassium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from light, acids and heat. Protect containers from physical damage.

Shipping: UN1638 Mercury iodide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include iodine and mercury vapors. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, O, N; risk phrases: R8; R26/27/28; R33; R34; R36/37/38; R42; R50/53; R62; safety phrases: S13; S16; S17; S23; S26; S28; S29/35; S36/37; S39; S45; S57; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercuric nitrate is a white to yellowish crystalline solid with an odor like nitric acid. Normally exists as the hemihydrate or the dihydrate. Molecular weight = 324.6; specific gravity (H_2O:1) = 4.3 @ 20°C; boiling point = (decomposes); freezing/melting point = 79°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Highly soluble in water.

Potential Exposure: Mercuric nitrate is used in making other chemicals; in felt manufacture and in making mercury fulminate.

Incompatibilities: A strong oxidizer. Reacts violently with combustibles, petroleum hydrocarbons; reducing agents; aldehydes, ammonia, ketones, phosphorus. Reacts with acetylene, alcohol, phosphine, and sulfur to form shock-sensitive compounds. Aqueous solution attacks most metals. Vigorous and dangerous reaction with petroleum hydrocarbons. Incompatible with organic materials; acetylene, ethanol, phosphine, sulfur, hypophosphoric acid. Inorganic mercury compounds are incompatible with acetylene, ammonia, chlorine dioxide; azides, calcium (amalgam formation), sodium carbide; lithium, rubidium, copper. Decomposes in heat or on exposure to light, producing toxic fumes (mercury, nitrogen oxides).

Permissible Exposure Limits in Air

As inorganic mercury compounds

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric nitrate can affect you when breathed in and passed through skin (causing systemic poisoning). Eye contact causes ulceration of conjunctiva and cornea. Skin contact causes irritation and possible dermatitis. Acute systemic poisoning can be fatal within a few minutes. Death by uremic poisoning can be delayed 5−12 days. Overexposure can damage kidneys. Mercury poisoning can cause "shakes," irritability, sore gums; increased saliva; personality change and brain damage. Eye contact may cause burns. Heating or contact with acid or acid mist causes release of toxic mercury vapors and lung effects. Mercury accumulates in the body. Health effects have been reported below TLV levels of 0.1 milligram per cubic meter. Acute poisoning has resulted from inhaling dust concentrations of 1.2−8.5 milligram per cubic meter.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin), or cause skin to turn gray. Skin allergy may occur. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure. There is limited evidence that this chemical reduces fertility in males and females. Repeated exposures may cause brown staining of the eyes and may affect peripheral vision.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; Nerve Conduction Studies; Neurologic Examination/Electromyography; Thyroid Function Test/Thyroid Profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye exam. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing. Eye examination.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. *Antidotes and Special Procedures for authorized medical personnel*: The drug NAP has been used to treat mercury poisoning, with mixed success. *Note to physician*: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Mercuric nitrate must be stored to avoid contact with organic materials; acetylene, ethanol, phosphine, sulfur, and hypophosphoric acid, since violent reactions occur. See also "Incompatibilities." Do not store on wooden floors.

Shipping: UN1625 Mercuric nitrate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but enhances combustion of other substances. Mercuric nitrate is a dangerous fire risk on contact with combustible and organic materials (wood, paper, oils, etc.). Thermal decomposition products may include mercury and oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, O, N, Xn; risk phrases: R8; R26/27/28; R33; R34; R36/37/38; R42; R50/53; R62; R63; safety phrases: S13; S16; S17; S23; S26; S28; S29/35; S36/37; S39; S45; S57; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercuric oxide is a red or orange-red heavy crystalline powder; yellow when finely powdered. Molecular weight = 216.59; specific gravity (H_2O:1) = 11.14 @ 20°C; freezing/melting point = (decomposes) 500°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Mercuric oxide is used for wound sealing and canker treatment of fruit and rubber trees; chemical intermediate for mercury salts; organic mercury compounds; chlorine monoxide; as an antiseptic in pharmaceuticals; component of dry cell batteries; pigment and glass modifier; fungicide; preservative in cosmetics; analytical reagent; formerly used in antifouling paints.

Incompatibilities: A powerful oxidizer. Decomposes on exposure to light, when heated above 500°C, producing highly toxic fumes including mercury and oxygen, which will add to the intensity of an existing fire. Violent reaction with combustible materials; other oxidizers; acetyl nitrate; aluminum, diboron tetrafluoride; reducing agents; phospham, hydrogen trisulfide (on ignition); hydrazine hydrate; hydrogen peroxide; hypophosphorous acid; acetyl nitrate; chlorine, hypophosphorous acid; magnesium (when heated), disulfur dichloride; alcohols, alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium). Forms heat- or impact-sensitive explosive mixtures with sulfur, phosphorus and other nonmetals, potassium, magnesium, sodium, and other chemically active metals. Incompatible with strong bases and light.

Permissible Exposure Limits in Air

NIOSH IDLH = 10 mg[Hg]/m^3/m^3

OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration

NIOSH REL: Hg (*vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; Other: 0.1 mg[Hg]/m^3 Ceiling Concentration [skin]

ACGIH TLV[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 16 milligram per cubic meter

PAC-3: 30 milligram per cubic meter

DFG MAK: 0.1 mg[Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B

Australia: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Belgium: TWA 0.05 mg[Hg]/m^3 [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3 [skin], 1999; Finland: TWA 0.05 mg [Hg]/m^3, 1999; France: VME 0.1 mg[Hg]/m^3 [skin], 1999; Hungary: TWA 0.02 mg[Hg]/m^3; STEL 0.04 mg[Hg]/m^3, 1993; Japan: 0.05 mg[Hg]/m^3, 1999; Norway: TWA 0.05 mg[Hg]/m^3, 1999; the Philippines: TWA 0.05 mg [Hg]/m^3, 1993; Poland: MAC (TWA) 0.05 mg[Hg]/m^3, MAC (STEL) 0.15 mg[Hg]/m^3, 1999; Russia: TWA 0.05 mg[Hg]/m^3; STEL 0.01 mg[Hg]/m^3, 1993; Sweden: NGV 0.05 mg[Hg]/m^3 [skin], 1999; Thailand: STEL 0.05 mg[Hg]/m^3, 1993; United Kingdom: LTEL 0.05 mg [Hg]/m^3; STEL 0.15 mg[Hg]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia set a MAC for ambient air in residential areas of 0.003 milligram per cubic meter on a daily average basis.

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric oxide dust has a corrosive effect on eyes, skin, and respiratory tract. This material is highly toxic by ingestion, inhalation, or skin absorption. Very short exposure to small quantities may cause death or permanent injury. Following ingestion, mercuric oxide is readily converted to mercuric chloride, the most dangerous mercury compounds. Signs and symptoms of acute exposure to mercuric oxide may be severe and include increased salivation; foul breath; inflammation and ulceration of the mucous membranes; abdominal pain; and bloody diarrhea. Oliguria (scanty urination), anuria (suppression of urine formation), and acute renal failure may be noted. Weak pulse, seizures, psychic disturbances; circulatory collapse; chest pain; and dyspnea (shortness of breath) may be observed.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; and kidney failure. There is limited evidence that this chemical is a teratogen in animals. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes; and decreased peripheral vision.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6–12 months after, a complete medical history and exam is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA), Urine test for mercury (should be less than 0.02 mg/L). Eye exam. After suspected illness or overexposure, repeat the test above and get a blood test for mercury. Consider chest X-ray after acute overexposure. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing. Evaluation by a qualified allergist. Eye examination. Consider chest X-ray following acute overexposure.

First Aid: Remove victims from exposure. Emergency personnel should avoid self-exposure to mercuric oxide. Evaluate vital signs, including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen or other respiratory support.

Remove contaminated clothing as soon as possible. If eye exposure has occurred, remove any contact lenses at once; eyes must be flushed with lukewarm water for at least 15 minutes. Wash exposed skin areas for 15 minutes with soap and water. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures in the event of inhalation or ingestion of HgO. Rush to a healthcare facility.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Mercury vapor*: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; * or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).* *ESLI required.

Other mercury compounds: NIOSH/OSHA Up to 1 milligram per cubic meter: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). Up to 10 milligram per cubic meter: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).* *Note*: *ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chlorine, hydrogen peroxide; hypophosphorous acid; hydrazine hydrate; magnesium (when heated), disulfur dichloride; hydrogen trisulfide; reducing agents. See also "Incompatibilities."

Shipping: UN1641 Mercuric oxide, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for clean-up of mercury are available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but enhances combustion of other substances. Thermal decomposition products may include mercury fumes and oxides of metal (mercury). For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Wear full body protective clothing and SCBA. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.
Description: Mercuric sulfate is a white, odorless, crystalline solid. Molecular weight = 296.65; specific gravity (H_2O:1) = 6.47 @ 20°C; freezing/melting point = (decomposes). Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0₩. Decomposes in water to yellow mercuric subsulfate and sulfuric acid.
Potential Exposure: Mercuric sulfate is used in making other chemicals; as a battery electrolyte and in extracting gold and silver from rock.
Incompatibilities: Contact with water produces sulfuric acide and insoluble basic mercuric subsulfate. Reacts with acids producing mercury vapors. Violent reaction with gaseous hydrogen chloride above 121°C. Decomposes in heat or on exposure to light, producing toxic fumes of mercury and sulfur oxides. Attacks magnesium, aluminum, zinc, iron, lead, copper.
Permissible Exposure Limits in Air
NIOSH IDLH = 10 mg[Hg]/m^3/m^3

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.
Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.
Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.
Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Mercuric sulfate can affect you when breathed in and by passing through skin. Irritates the skin and is corrosive to the eyes and the respiratory tract. Corrosive if ingested. Inhalation of the aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Overexposure can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums; memory loss; increased saliva; personality change and even permanent brain damage. Heating or contact with acid or acid "mist" causes release of toxic mercury vapors, and lung effects have been reported below permissible exposure levels. The substance may cause effects on the gastrointestinal tract. Very high exposure may result in death.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; and kidney failure. Organic mercury substances have been identified as a teratogen in humans. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes; and decreased peripheral vision.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical exam and history is strongly recommended, with: exam of the nervous system; including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Eye exam. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Consider nerve conduction tests, urinary enzymes and neurobehavioral testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning with limited success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Mercury vapor: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, water and gaseous hydrogen chloride.

Shipping: UN1645 Mercury sulfates, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is nonflammable. Use agent suitable to surrounding fire. Thermal decomposition products may include mercury and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 7420 (2) as mercury, total dust
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1 lb (0.454 kg)
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.
Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).
Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.
Hazard symbols, risk, & safety statements: Hazard symbol: T+, N, Xn; risk phrases: R20/21/22; R23/24/25; R25; R26/27/28; R33; R34; R36/37/38; R42; R48/21/22; R50/53; R62; R63; safety phrases: S7; S13; S16; S23; S26; S28; S29; S36/3739; S45; S57; S60; S61; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercury is a silvery, mobile, odorless liquid. Molecular weight = 200.59; boiling point = 356−357°C; freezing/melting point = −39°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 0, reactivity 0. Insoluble in water.

Potential Exposure: Mercury is used as a catalyst, in dental applications; and in pharmaceuticals; as a liquid cathode in cells for the electrolytic production of caustic and chlorine. It is used in electrical apparatus (lamps, rectifiers, and batteries) and in control instruments (switches, thermometers, and barometers).

Incompatibilities: Heating mercury causes the formation of toxic mercury oxide fumes. Reacts violently with alkali metals; acetylene, azides, ammonia gas; chlorine, chlorine dioxide; many acids; most metals; ground mixtures of sodium carbide, and ethylene oxide. Contact with methyl azide forms shock- and spark-sensitive explosives. Attacks copper and many other metals, forming amalgams.

Permissible Exposure Limits in Air
NIOSH IDLH = 10 mg[Hg]/m^3/m^3
OSHA PEL: 0.1 mg[Hg]/m^3 Ceiling Concentration
NIOSH REL: (*Hg vapor*): 0.05 mg[Hg]/m^3 TWA[skin]; 0.1 mg[Hg]/m^3 Ceiling Concentration; [skin]
ACGIH TLV[1]: 0.025 mg[Hg]/m^3 TWA [skin]; not classifiable as a carcinogen; BEI (preshift) 35 μg[Hg]/100 mL creatinine total inorganic Hg in urine; 15 μg[Hg]/L total inorganic Hg in blood; end-of-shift at end-of-work-week
PAC Mercury* Ver. 29[138]
(vapor)
PAC-1: 0.15 milligram per cubic meter
PAC-2: **1.7**$_{\mathbf{A}}$ milligram per cubic meter
PAC-3: **8.9**$_{\mathbf{A}}$ milligram per cubic meter
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. Emergency Response Planning Guidelines
ERPG-1: Inappropriate
ERPG-2: 0.25 ppm
ERPG-3: 0.5 ppm
DFG MAK (*elemental and inorganic compounds*): 0.1 mg [Hg]/m^3; Peak Limitation Category II(8) danger of skin sensitization; Carcinogen Category 3B
Arab Republic of Egypt: TWA 0.05 milligram per cubic meter, 1993; Australia: TWA 0.1 milligram per cubic meter [skin], 1993; Austria: MAK 0.005 ppm (0.05 milligram per cubic meter, 1999; Belgium: TWA 0.1 milligram per cubic meter [skin], 1993; Denmark: TWA 0.05 mg[Hg]/m^3 [skin], 1999; Finland: TWA 0.05 milligram per cubic meter, 1993; France: VME 0.05 milligram per cubic meter [skin] (*vapor*), 1999; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, 2003; Japan: 0.05 milligram per cubic meter, 1999; Norway: TWA 0.05 milligram per cubic meter, 1999; Poland: MAC (TWA) vapors 0.025 milligram per cubic meter, MAC (STEL) vapors 0.2 milligram per cubic meter, 1999; Sweden: NGV 0.05 milligram per cubic meter (*vapor*), 1999; Switzerland: MAK-W 0.005 ppm (0.05 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 0.01 milligram per cubic meter [skin], 1993; Turkey: TWA 0.1 milligram per cubic meter [skin], 1993; United Kingdom: TWA 0.025 mg[Hg]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand,

Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia[35,43] set a MAC for ambient air in residential areas of 0.0003 milligram per cubic meter. Several states have set guidelines or standards for mercury in ambient air[60] ranging from 0.024 μ/m^3 (Kansas) to 0.01−0.08 milligram per cubic meter (Montana) to 0.167 μ/m^3 (New York) to 0.2−2.0 μ/m^3 (Connecticut) to 0.24 μ/m^3 (Pennsylvania) to 0.25 μ/m^3 (South Carolina) to 0.5 μ/m^3 (North Dakota) to 0.5−1.0 μ/m^3 (Florida) to 0.8 μ/m^3 (Virginia) to 2.0 μ/m^3 (Nevada) to 3.0 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #6009; OSHA Analytical Method ID-140.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.002 mg/L; MCLG, 0.002 mg/L. Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Exposure to levels below 1 milligram per cubic meter has been shown to produce nonspecific symptoms, such as shyness, insomnia, anxiety and loss of appetite. Higher levels (1−3 milligram per cubic meter for 2−5 hours) may cause headache, salivation, metallic taste; chills, cough, fever, tremors, abdominal cramps; diarrhea, nausea, vomiting, tightness in the chest; difficult breathing; fatigue, lung irritation and possible lung tissue damage. Symptoms may begin several hours after exposure and may last a week. Large doses may result in flu-like symptoms, which, in severe cases, may result in death due to pneumonia. *Lethal blood level in humans*: 0.4−22 mg/mL. *Skin*: Can be absorbed through the skin. Can cause irritation. Prolonged contact with skin can result in symptoms listed above. *Eyes*: Can cause eye irritation. *Ingestion*: Generally does not produce ill effects.

Long-Term Exposure: May cause skin allergy. Mercury accumulates in the brain quickly during exposure but is released from the brain very slowly. This will result in a build-up in brain tissue over a long time. The liver and kidneys may also be damaged by mercury accumulation. It may cause headache, dizziness, restlessness, irritability, sleepiness, tremors, defective muscle control; increased salivation; loose teeth; irritation of the gums with a Blue line between teeth and gums; loss of appetite; nausea, vomiting, diarrhea, liver damage; changes in urine; raised red areas and blisters of skin; impaired memory and possible permanent brain damage. Repeated exposure (usually more than 5 years) may cause clouding of the eyes; gray skin color. Frequency of complaints and severity of symptoms increase with levels of exposure, most notably above 0.1 milligram per cubic meter. However, many of these symptoms have been reported at levels below recommended limits due to the accumulation of mercury over long term. There is limited evidence that mercury may cause an increase in spontaneous abortions in exposed women.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; nerve conduction studies; neurologic examination/electromyography; thyroid function test/thyroid profile; urine (chemical/metabolite); urine (chemical/metabolite) prior to shift, prior to next shift; urine (chemical/metabolite), sediment; urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: exam of the nervous system (including handwriting test to detect early hand tremor). Urine mercury level (usually less than 0.02 mg/L). Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full- facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APRs or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Mercury vapor: NIOSH: *Up to 0.5 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 2.5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*
*ESLI required.

Other mercury compounds: NIOSH/OSHA *Up to 1 milligram per cubic meter*: CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern];* or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]* (canister). *Up to 5 milligram per cubic meter*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern];* or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTS (APF = 50) [any PAPR with a tight-fitting facepiece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 10 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS* [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).*

*ESLI required.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Mercury must be stored to avoid contact with chlorine dioxide; nitric acid; nitrates, ethylene oxide; chlorine and methylazide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acetylene, ammonia and nickel.

Shipping: UN2809 Mercury, Hazard class: 8; Labels: 8-Corrosive material, 6.1-Poisonous material.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Wearing protective equipment and clothing, clean up the spill with an industrial vacuum cleaner with a charcoal filter to absorb mercury vapor. For mercury spilled in cracks, cover with zinc dust to form an amalgam, or cover with calcium polysulfide with excess sulfur. Do not sweep or use compressed air to blow mercury droplets as it can increase air concentrations. Store contaminated or waste mercury in tightly covered or vapor-proof containers pending removal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury is not combustible. Use agent suitable for surrounding fire. Thermal decomposition products may include oxides of metal. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Accumulate for purification and re-use if possible. Mercury vapors may be adsorbed or treated with sulfide solutions and then sent to mercury recovery operations[22].

Mercury Alkyl Compounds M:0440

Formula: CH_3ClHg; CH_3HgCl
Synonyms: *Methyl mercury chloride*: Caspan; Chloromethylmercury; Methylmercuric chloride; Methylmercury chloride; MMC; Monomethyl mercury chloride. *Dimethyl mercury*: Mercury dimethyl
CAS Registry Number: 115-09-3 (methyl mercury chloride); 593-74-8 (dimethyl mercury); 22967-92-6 (methyl mercury cation)
HSDB Number: 7785 (115-09-3); 3930 (22967-92-6)
RTECS Number: OW6320000 (methyl mercury ion); OW1225000 (methyl mercury chloride)
UN/NA & ERG Number: UN2025 (mercury compounds, solid, n.o.s.)/151
EC Number: 204-064-2 (chloromethylmercury); 209-805-3 [*Annex I Index No*.: 080-007-00-3] (dimethylmercury)
Regulatory Authority and Advisory Information
Carcinogenicity: IARC: Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1993 (dimethyl mercury); EPA: Possible Human Carcinogen; Methylmercury compounds are possibly carcinogenic to humans (Group 2B).
California Proposition 65: Developmental/Reproductive toxin (7/1/1987), Cancer (5/1/1996) as methyl mercury compounds.
Hazard Alert: Poison, High acute toxicity (dimethyl mercury and other Hg organics), Reproductive toxin, Organometallic, Potential reducing agent, Environmental hazard.
MCLs (Safe Drinking Water Act)
United States Environmental Protection Agency Gene-Tox Program, Negative: In vivo cytogenetics-mammalian oocyte; Inconclusive: Rodent dominant lethal (dimethyl mercury)
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112)
Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds
United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg[Hg]/L as mercury
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as mercury compounds, n.o.s.
EPCRA Section 313: Includes any unique chemical substance that contains mercury as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0% (dimethyl mercury)
United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant
California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/1990
Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.
Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).
Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.
European/International Regulations (*593-74-8*): Hazard symbol: T+, N; risk phrases: R45; R26/27/28; R33; R50/53; safety phrases: S1/2; S13; S28; S36; S41; S45; S60; S61 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to waters (est. based on GHS Class)].
Description: Dimethyl mercury is a volatile colorless liquid with faint sweet odor. Molecular weight = 230.66; specific gravity (H_2O:1) = 3.17 @ 20°C; boiling point = 93°C; vapor pressure = 79 mmHg @ 29°C. Soluble in water. Methyl mercury chloride is a colorless, crystalline solid. Molecular weight = 251.08; freezing/melting point = 170°C. Practically insoluble in water; solubility = < 0.1 mg/mL @ 21°C.
Potential Exposure: Alkyl mercury compounds have been used as seed disinfectants and for fungicides. They have also been used in organic synthesis.
Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May be sensitive to light.
Permissible Exposure Limits in Air
NIOSH IDLH = 2 mg[Hg]/m^3
OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 mg[Hg]/m^3 Ceiling Concentration
NIOSH REL: 0.01 mg[Hg]/m^3 TWA; 0.03 mg[Hg]/m^3 STEL [skin]
ACGIH TLV[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg[Hg]/m^3 STEL [skin]
PAC Ver. 29[138]
593-74-8, dimethyl mercury
PAC-1: 0.034 milligram per cubic meter
PAC-2: 0.046 milligram per cubic meter
PAC-3: 2.3 milligram per cubic meter
22967-92-6, methyl mercury cation
PAC-1: 0.032 milligram per cubic meter
PAC-2: 0.043 milligram per cubic meter
PAC-3: 2.1 milligram per cubic meter
DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3B
Australia: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3 [skin], 1993; Austria: MAK 0.01 mg[Hg]/m^3, 1999; Belgium: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3 [skin], 1993; Denmark: TWA 0.01 mg[Hg]/m^3 [skin], 1999; Finland: TWA 0.01 mg[Hg]/m^3 [skin], 1999; France: VME 0.01 mg[Hg]/m^3 [skin], 1999; Norway: TWA 0.01 mg[Hg]/m^3, 1999; the Philippines: TWA 0.01 mg [Hg]/m^3, 1993; Poland: MAC (TWA) 0.01 mg[Hg]/m^3, MAC (STEL) 0.01 mg[Hg]/m^3, 1999; Sweden: NGV 0.01 mg [Hg]/m^3 [skin], 1999; Thailand: TWA 0.01 mg[Hg]/m^3;

STEL 0.04 mg[Hg]/m^3, 1993; Turkey: TWA 0.01 mg[Hg]/m^3 [skin], 1993; United Kingdom: TWA 0.01 mg[Hg]/m^3; STEL 0.03 mg[Hg]/m^3 [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.01; STEL 0.03 milligram per cubic meter [skin]. In addition, North Dakota has set guidelines for alkyl mercury compounds in ambient air[60] of 1−3 μ/m^3 (0.0001−0.0003 milligram per cubic meter).

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Alkyl mercury compounds can be absorbed through the skin. When deposited on the skin, they give no warning, and if contact is maintained, can cause second-degree burns. Sensitization may occur. Alkyl mercurials have very high toxicity. *Systemic*: The central nervous system; including the brain, is the principal target tissue for this group of toxic compounds. Severe poisoning may produce irreversible brain damage resulting in loss of higher functions. The effects of chronic poisoning with alkyl mercury compounds are progressive. In the early stages, there are fine tremors of the hands; and in some cases, of the face and arms.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure. With repeated or continued exposure, tremors may become coarse and convulsive; scanning speech with moderate slurring and difficulty in pronunciation may also occur. The worker may then develop an unsteady gait of a spastic nature which can progress to severe ataxia of the arms and legs. Sensory disturbances including tunnel vision, blindness, and deafness are also common. A late symptom, constriction of the visual fields, is rarely reversible and may be associated with loss of understanding and reason which makes the victim completely out of touch with his environment. Severe cerebral effects have been seen in infants born to mothers who had eaten large amounts of methylmercury-contaminated fish.

Points of Attack: Eyes, skin, central nervous system; peripheral nervous system; kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Preplacement and periodic physical examinations should be concerned particularly with the skin, vision, central nervous system; and kidneys. Consideration should be given to the possible effects on the fetus of alkyl mercury exposure in the mother. Constriction of visual fields may be a useful diagnostic sign. Blood and urine levels of mercury have been studied, especially in the case of methylmercury. A precise correlation has not been found between exposure levels and concentrations. They may be of some value in indicating that exposure has occurred, however.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. These compounds should be stored in a refrigerator or a cool, dry place away from oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2025 Mercury compounds, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums and deposited in sealed containers. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include (for methyl mercury chloride) hydrogen chloride and toxic fumes of chlorine and mercury. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mercury thiocyanate is a white, odorless powder. Molecular weight = 316.79; freezing/melting point = (decomposes) ~165°C. Explosive limits: LEL = 23,000 ppm; UEL: unknown. Slightly soluble in cold water.

Potential Exposure: Mercury thiocyanate is used in photography and fireworks.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Mercury thiocyanate is sensitive to heat; expands to many times its original volume and then decomposes at freezing/melting point forming toxic fumes of sulfur oxides, mercury cyanide, and nitrogen oxides. Contact with acid or acid fumes causes release of toxic mercury and cyanide vapors. Incompatible with chlorine, reducing agents such as hydrides, sulfides.

Permissible Exposure Limits in Air

As organo mercury compounds

NIOSH IDLH = 2 mg[Hg]/m^3

OSHA PEL: 0.01 milligram per cubic meter TWA; 0.04 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.01 milligram per cubic meter TWA; 0.03 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter TWA; 0.03 milligram per cubic meter STEL [skin]

PAC Ver. 29[138]

PAC-1: 0.12 milligram per cubic meter

PAC-2: 0.16 milligram per cubic meter

PAC-3: 44 milligram per cubic meter

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3 [skin] Danger of skin sensitization; Carcinogen Category 3

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Mercury thiocyanate can affect you when breathed in. High or repeated exposures can cause kidney damage. Mercury poisoning can cause "shakes," irritability, sore gums; memory loss; increased saliva; metallic taste; personality change and/or brain damage. Skin and eye contact can cause irritation, allergy and a gray skin color. Heating or contact with acid or acid "fumes" causes release of toxic mercury or cyanide vapors and lung effects. Health effects may occur below recommended exposure levels.

Long-Term Exposure: Repeated or prolonged contact with skin may result in allergy, dermatitis, rash. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure. Related mercury compounds may damage the developing fetus and decrease fertility in males and females.

Points of Attack: Eyes, skin, central nervous system; peripheral nervous system; kidneys.

Medical Surveillance: NIOSH lists the following tests for inorganic mercury: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; end-of-shift at end-of-work-week; biologic tissue/biopsy; Nerve Conduction Studies; Neurologic Examination/ Electromyography; Thyroid Function Test/Thyroid Profile; urine (chemical/metabolite); urine (chemical/metabolite) Prior to Shift, prior to next shift; urine (chemical/metabolite), Sediment; urinalysis (routine). Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended with: exam of the nervous system; including handwriting. Kidney function tests. Urine test for mercury (should be less than 0.02 mg/L). After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 milligram per cubic meter*: SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 2 milligram per cubic meter*: Sa:Pd,Pp (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and acids, including fumes.

Shipping: UN1646 Mercury thiocyanate, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Restrict persons not wearing protective equipment from the danger area of spill until clean-up is complete. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for clean-up of mercury spills should be available. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mercury thiocyanate may burn, but does not readily ignite. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen, sulfur; metal (mercury). Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group E, Evidence of noncarcinogenicity for humans.

Hazard Alert: Combustible, Sensitization hazard, Suspected reprotoxic hazard, Environmental hazard.

Hazardous to aquatic life or environment, with possible long-lasting effects[194]. Harmful to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R22; R43; R51/53; R61; safety phrases: S2; S13; S24; S29/35; S37; S41; S46; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [2-Hazard to water. (est. based on GHS class)].

Description: Combustible, white crystalline solid or powder. Odorless. Molecular weight = 297.34; specific gravity (H_2O:1) = 1.22; boiling point = 294°C; freezing/melting point = 67−68°C; 69−72°C; vapor pressure = 6×10^{-6} mmHg @ 20°C; flash point = > 100°C (cc).

Hazard identification (based on NFPA-704M Rating System): Health 2, flammability 2, reactivity 0. Highly soluble in water; solubility = 7.0 g/L @ 20°C.

Potential Exposure: Metalaxyl is phenylamide systemic fungicide used on a variety of food and nonfood crops including tobacco, turf and conifers, and ornamentals. Used in combination with fungicides of different mode of action as a foliar spray on tropical and subtropical crops; as a seed treatment to control downy mildew; and as a soil fumigant to control soil-borne pathogens. Banned for use in EU.

Incompatibilities: Incompatible with alkaline materials, strong acids, oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Concentration in Water: Federal Drinking Water Guidelines: 400 ppb[93] State Drinking Water Guidelines: Maine 420 μg/L Runoff from spills or fire control may cause water pollution.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <2.0. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—9099.97083 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Ingestion, inhalation, dermal contact

Harmful Effects and Symptoms

Short-Term Exposure: Contact may burn eyes, skin, and respiratory tract. Eye contact may cause permanent damage. May cause skin allergy. Toxic if ingested. LD_{50} (oral, rat) = 600−700 mg/kg.; LD_{50} (dermal, rat) = > 2000 mg/kg.

Long-Term Exposure: Prolonged or frequent exposure may cause liver damage; skin allergy. Human toxicity (long term)[101]: Very low—518.00 ppb, Health Advisory

Points of Attack: Skin, eyes, liver.

Medical Surveillance: Check liver function. Consult a physician if poisoning is suspected or if redness, itching, or burning of the eyes or skin develop. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids; strong alkalies. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be destroyed by alkaline hydrolysis. Admixture with alkali can be followed by soil burial. Larger quantities can be disposed of by incineration in admixture with acetone or xylene and using effluent gas scrubbing. Do not reuse empty container; proper disposal required.

Mesitylene M:0460

Formula: C_9H_{12}; $C_6H_3(CH_3)_3$

Synonyms: Benzene, 1,3,5-trimethyl-; *sym*-Trimethylbenzene; *symmetrical*-Trimethylbenzene; TMB; 1,3,5-Trimethylbenzene; Trimethyl benzol

CAS Registry Number: 108-67-8

HSDB Number: 92

RTECS Number: OX6825000

UN/NA & ERG Number: UN2325/129

EC Number: 203-604-4 [*Annex I Index No.*: 601-025-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Extremely Hazardous Substance (EPA-SARA, Dropped From Listing in 1988).

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi, N; risk phrases: R10; R36/37/38; R51/53; R61; R62; safety phrases: S2; S29; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters.

Description: Mesitylene is a clear, colorless liquid. Distinctive, aromatic odor. Molecular weight = 120.19; specific gravity (H_2O:1) = 0.86; boiling point = 164.7°C; freezing/melting point = −44.7°C; vapor pressure = 0.79 mmHg @ 9°C; flash point = 50°C (cc); autoignition temperature = 559°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Practically insoluble in water; solubility = 0.002%.

Potential Exposure: Mesitylene is used as raw material in chemical synthesis and as ultraviolet stabilizer; as a paint thinner, solvent, and motor fuel component; as an intermediate in organic chemical manufacture.

Incompatibilities: Vapors forms explosive mixture with air. Violent reaction with nitric acid. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.92 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 25 ppm/125 milligram per cubic meter TWA

ACGIH TLV[1]: 25 ppm TWA (lists a single CAS number for mixed isomers)

PAC* Ver. 29[138]

PAC-1: $\mathbf{140}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{360}_{\mathbf{A}}$ ppm

PAC-3: 480 ppm

*AEGLs are marked with a subscript “**A**” and correspond to 60-minute values.

DFG MAK: 20 ppm/100 milligram per cubic meter; Pregnancy Risk Group C (all isomers of trimethylbenzene)

Denmark: TWA 25 ppm (120 milligram per cubic meter), 1999; Japan: 25 ppm (120 milligram per cubic meter), 1999; Norway: TWA 20 ppm (100 milligram per cubic meter), 1999; Sweden: NGV 25 ppm (120 milligram per cubic meter), KTV 35 ppm (170 milligram per cubic meter), 1999; Switzerland: MAK-W 25 ppm (125 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 100 milligram per cubic meter; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 25 ppm

Determination in Air: Use OSHA Analytical Method PV-2091.

Permissible Concentration in Water: No method available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.4$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Symptoms of exposure can also include headache, drowsiness, fatigue, dizziness, nausea, a lack of coordination; vomiting, confusion. Acute-lowest toxic concentration for humans is 10 ppm, resulting in central nervous system effects. Liquid deposition in lungs causes chemical pneumonitis. Symptoms of exposure include: nervousness, tension, anxiety, asthmatic bronchitis, and skin irritation.

Long-Term Exposure: Repeated exposures can cause headaches, tiredness, and a feeling of nervous tension. Can affect the blood cells and the blood's clotting ability; hypochromic anemia. Delayed or chronic health hazard is possible asthmatic bronchitis with coughing and/or shortness of breath. The use of alcoholic beverages enhances the effect. May cause liver damage. The liquid destroys the skin's natural oils, causing drying, and cracking.

Points of Attack: Eyes, skin, respiratory system; central nervous system; blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. CBC and platelet count. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 25 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full facepiece respirator than by a half-mask respirator, and even greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. This chemical must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: UN1993 Flammable liquids, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are

required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or alcohol foam. *Large fires*: water spray, fog, or alcohol foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 205-502-5 [*Annex I Index No.*: 606-009-00-1]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R11; R20/21/22; R36/37/38; safety phrases: S2; S21; S25 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Mesityl oxide is a clear, pale yellow, or colorless liquid with a strong peppermint odor. The odor threshold is 0.05 ppm. Molecular weight = 98.16; specific gravity $(H_2O{:}1) = 0.854$; boiling point = 130°C; freezing/melting point = −59°C; vapor pressure = 10 mmHg @ 26°C; flash point = 30.6°C; autoignition temperature = 343°C. Explosive limits: LEL = 1.4%; UEL: 7.2%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 1. Slightly soluble in water; solubility = 3%[77].

Potential Exposure: Mesityl oxide is used as a solvent for cellulose esters and ethers and other resins in lacquers and inks. It is used in paint and varnish removers and as an insect repellent.

Incompatibilities: May form explosive mixture with air. May be able to form explosive peroxides. May react violently with nitric acid; aliphatic amines; alkanolamines, 2-aminoethanol, ethylene diamine; chlorosulfonic acid; oleum (fuming sulfuric acid). Not compatible with oxidizers, strong acids; strong bases; reducing agents; halogens. Dissolves some forms of plastics, resins and rubber. Attacks copper.

Permissible Exposure Limits in Air

NIOSH IDLH = 1400 ppm [LEL]

OSHA PEL: 25 ppm/100 milligram per cubic meter TWA

NIOSH REL: 10 ppm/40 milligram per cubic meter TWA

ACGIH TLV[1]: 15 ppm/60 milligram per cubic meter TWA; 25 ppm/100 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 25 ppm

PAC-2: 830 ppm

PAC-3: 5000 ppm

DFG MAK: 5 ppm/20 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D

Australia: TWA 15 ppm (60 milligram per cubic meter); STEL 25 ppm, 1993; Austria: MAK 25 ppm (100 milligram per cubic meter), 1999; Denmark: TWA 10 ppm (40 milligram per cubic meter), 1999; Finland: TWA 25 ppm (100 milligram per cubic meter); STEL 75 ppm (300 milligram per cubic meter) [skin], 1999; France: VME 15 ppm (60 milligram per cubic meter), 1999; Norway: TWA 10 ppm

(40 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 60 milligram per cubic meter, 2003; Poland: MAC (TWA) 20 milligram per cubic meter, MAC (STEL) 100 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 15 ppm (60 milligram per cubic meter), 1999; Turkey: TWA 25 ppm (100 milligram per cubic meter), 1993; United Kingdom: TWA 15 ppm (61 milligram per cubic meter); STEL 25 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 25 ppm. Several states have set guidelines or standards for mesityl oxide in ambient air[60] ranging from 0.6 to 1.0 milligram per cubic meter (North Dakota to 0.8 milligram per cubic meter (Connecticut) to 1.0 milligram per cubic meter (Virginia) to 1.429 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1301 for Ketones (II)[18]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates and burns the eyes and skin. May cause permanent eye damage. Irritates the respiratory tract causing coughing, wheezing and shortness of breath. Exposure causes headache, sleepiness, dizziness, loss of coordination. Exposure far above OEL may result in narcosis, unconsciousness, coma.

Long-Term Exposure: The liquid destroys the skin's natural oils. May affect the liver, kidneys and lungs. May cause anemia.

Points of Attack: Eyes, skin, respiratory system; blood, liver, kidneys, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Lung function tests. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: 8 hours: Responder suits. Also, Viton/chlorobutyl rubber is among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For more information about engineering controls, see NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *250 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *500 ppm*: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1400 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd, Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. See incompatibilities above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN1229 Mesitly oxide, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive

limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid, Highly toxic inhalation hazard. TSCA: 40CFR716.120(d)1 as aldehydes.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R11; R22; R26/27/28; safety phrases: S2; S13; S16; S21; S25; S46; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Metaldehyde is a white crystalline powder with a mild menthol odor. Molecular weight = 176.24; boiling point = 112−116°C; freezing/melting point = 47°C; flash point = 36°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 1. Practically insoluble in water.

Potential Exposure: It is used as a poison for slugs and snails, and as a fuel in small heaters.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Inhalation may be fatal. Contact can irritate the eyes, skin and respiratory tract. Exposure can cause nausea, vomiting, diarrhea, abdominal pain; irritability, sleepiness, muscle twitching; convulsions, coma, and death.

Long-Term Exposure: May cause kidney and liver damage. May damage the developing fetus.

Points of Attack: Kidneys, liver.

Medical Surveillance: Kidney function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with metaldehyde all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, transfer automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1332 Metaldehyde, Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Fire may restart after it has been extinguished. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Methanearsonic Acid M:0532

Formula: CH_5AsO_3

Synonyms: ANSAR; Arsonic acid, methyl-; MAA; Methylarsinic acid; Methylarsonic acid; Monomethylarsonic acid; MSMA

CAS Number: 124-58-3

HSDB Number: 845

RTECS Number: PA1575000

UN/NA & ERG Number: UN3465 (organoarsenic compound, solid, n.o.s.)/151

EC Number: 204-705-6 [*Annex I Index No.*: 033-002-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Suspected reprotoxic hazard, Environmental hazard.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds

RCRA Section 261 Hazardous Constituents, waste number D004 (arsenic compounds) EPCRA Section 304 RQ: CERCLA, 1 lb (0.454 kg)

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0% (organic arsenic)

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B) arsenical pesticides liquid, toxic, flammable, n.o.s.

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as arsenic compounds Permissible Exposure Limits for Chemical Contaminants (CAL/OSHA) as arsenic compounds

The "Director's List" (CAL/OSHA) as arsenic compounds

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23; R25; R50/53; safety phrases: S1/2; S20/21; S28; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to waters (est.)].

Description: White crystalline solid. Molecular weight = 140.01; freezing/melting point = 161°C. Highly soluble in water.

Potential Exposure: Methanearsonic acid is an organoarsenic herbicide.

Incompatibilities: A strong acid. Incompatible with caustics, ammonia, amines, amides, organic anhydrides, isocyanates, vinyl acetate, alkylene oxides, epichlorohydrin. May not be compatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition. Attacks metals in the presence of moisture

Permissible Exposure Limits in Air:

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA

ACGIH TLV[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI: Determinant: Inorganic arsenic plus methylated metabolites in urine; Sampling Time: end of workweek; BEI = 35 μg[As]/L. The determinant may be present in biological specimens collected from subjects who have not been occupationally exposed, at a concentration which could affect interpretation of the result. Such background concentrations are incorporated in the BEI value.

NIOSH IDLH = 5 mg[As]/m^3

PAC *as arsenic, organic compounds* Ver. 26, no value in Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 2.5 milligram per cubic meter

PAC-3: 350 milligram per cubic meter

Determination in Air: Filter; Reagent: Ion chromatography/hydride atomic absorption: NIOSH IV [#5022, Arsenic, organo-][18].

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 10 μg[As]/L; State Drinking Water Guidelines: Arizona 10 μg[As]/L; Connecticut 10 μg[As]/L EPA MCL: 0.010 mg[As]/L[40 CFR 141.62]. Canadian Drinking Water Standards: IMAC 0.025 [As] mg/L.

Determination in Water: *For arsenic*: The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma optical emission spectrometry. See OSHA Method #ID-105 for arsenic[58]

Routes of Entry: Inhalation, eyes, ingestion, dermal and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of arsenic poisoning usually appear one-half to 1 hour after ingestion, but may be delayed many hours. Symptoms include a sweetish metallic taste and garlicky odor; difficulty in swallowing; abdominal pain; vomiting and painful diarrhea; dehydration, thirst, and cramps; dizziness, stupor, and delirium, rapid heartbeat, headache, skin disorders, and coma. LD_{50} (oral, rat) = 1700 mg/kg; LD_{50} (dermal, rabbit) = > 2.5 g/kg.

Long-Term Exposure: Chronic exposure to arsenic compounds can cause dermatitis and digestive disorders. Renal damage may develop. May be a liver and kidney toxin.

Points of Attack: Skin, liver, and kidneys.

Medical Surveillance: Test for urine arsenic. Levels should not be greater than 100 μg/g of creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests. Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests if necessary[83,30]. Liver and kidney function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic.*"

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code−Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Calcium arsenate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. The United States Environmental Protection Agency recommends storing pesticides in their original containers, complete with labels listing ingredients, use directions, and first aid for poisoning. Do not store pesticides in places where flooding is possible or where they might spill or leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3465 Organoarsenic compound, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Organoarsenic compound, solid or liquid

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m)) 500/60
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include arsine and oxides of arsenic. This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Chemical Treatability of Arsenic—(1) Concentration Process: Chemical Precipitation; Chemical Classification: Metal; Scale of Study: Pilot Scale; Type of Wastewater Used: Domestic Wastewater + Pure Compound; Results of Study: 5 ppm @ 4 gpm @ pH = 7.0. Iron system—90% reduction; low lime system—80% reduction; high lime system—76% reduction; (3 coagulant systems were used; Iron system used 45 ppm as Fe of $Fe_2(SO_4)_3$ @ pH = 6.0. Low lime system used 20 ppm Fe of $Fe_2(SO_4)_3$ and 260 ppm of CaO @ pH = 10.0. High line system used 600 ppm of CaO @ pH = 11.5. Chemical coagulation was followed by multimedia filtration); (2) Concentration Process: Chemical Precipitation; Chemical Classification: Metal; Scale of Study: Full Scale

Continuous Flow; Type of Wastewater Used: Domestic Wastewater; Results of Study: Effluent character (ppb): 2.5, 56% reduction with lime; 3.3, 24% reduction with lime; (lime dose of 350−400 ppm as calcium oxide @ pH = 11.3)[72]

Methacrylic Acid M:0490

Formula: $C_4H_6O_2$: $CH_2{=}C(CH_3)COOH$

Synonyms: Acide methacrylique (French); Acido metacrilico (Spanish); Acido α-metacrilico (Spanish); Acrylic acid, 2-methyl-; Glacial methacrylic acid; Methacrylic acid, inhibited; α-Methyl-acrylic acid; Methacrylsaeure (German); 2-Methylpropenoic acid; 2-Methyl-2-propenoic acid; 2-Propenoic acid, 2-methyl-; Propionic acid, 2-methylene

CAS Registry Number: 79-41-4

HSDB Number: 2649

RTECS Number: OZ2975000

UN/NA & ERG Number: UN2531 (stabilized)/153 (P)

EC Number: 201-204-4 [*Annex I Index No*.: 607-088-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Corrosive, Reducing agent, Polymerization hazard (nonstabilized), Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, F; risk phrases: R10; R19; R21/22; R35; R61; R62; safety phrases: S1/2; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methacrylic acid is a colorless liquid. Molecular weight = 86.1; specific gravity (H_2O:1) = 1.01 (liquid); boiling point = 162.8°C; freezing/melting point = 16.1°C; vapor pressure = 1 mmHg @ 25.5°C; flash point = 77°C (oc); 68°C (cc); autoignition temperature = 68°C. Explosive limits: LEL = 1.6; UEL: 8.8. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 2. Soluble in water; solubility = 9% @ 25°C. Aqueous solution is a strong acid.

Potential Exposure: Methacrylic acid is used in preparation of methacrylates and carboxylated polymers; in the production of the material or its alkyl esters, as monomers or comonomers for synthetic resins for the production of plastic sheets, moldings, and fibers.

Incompatibilities: Vapor may form explosive mixture with air. A reducing agent; incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Aqueous solution is strongly acidic: incompatible with strong acids; caustics, ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin. Will polymerize readily from heating above 59°F/15°C, or due to the presence of light, oxidizers (e.g., peroxides); or in the presence of traces of hydrochloric acid, with fire or explosion hazard. Attacks metals. *Note*: Typically contains 100 ppm of monomethyl ether hydroquinone (150-76-5) as an inhibitor to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.52 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 20 ppm/70 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 20 ppm/70 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: $\mathbf{6.7}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{61}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{220}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 5 ppm/18 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group C

Australia: TWA 20 ppm (70 milligram per cubic meter), 1993; Austria: MAK 20 ppm (70 milligram per cubic meter), 1999; Belgium: TWA 20 ppm (70 milligram per cubic meter), 1993; Denmark: TWA 20 ppm (70 milligram per cubic meter), 1999; Finland: TWA 20 ppm, 1999; France: VME 20 ppm (70 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 70 milligram per cubic meter, 2003; Russia: STEL 10 milligram per cubic meter [skin], 1993; Sweden: NGV 20 ppm (70 milligram per cubic meter), KTV 30 ppm (100 milligram per cubic meter), 1999; Switzerland: MAK-W 20 ppm (70 milligram per cubic meter), 1999; United Kingdom: TWA 20 ppm (72 milligram per cubic meter); STEL 40 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 20 ppm. Several states have set guidelines or standards for methacrylic acid in ambient air[60] ranging from 0.7 milligram per cubic meter (North Dakota) to 1.2 milligram per cubic meter (Virginia) to 1.4 milligram per cubic meter (Connecticut) to 1.67 milligram per cubic meter (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2005

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = < 1.0$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methacrylic acid can affect you when breathed in. A corrosive substance. Exposure can irritate the nose and throat. Methacrylic acid is a corrosive chemical and contact can burn the eyes, causing permanent damage. It can irritate and burn the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: High or repeated exposure may damage the kidneys. Methacrylic acid can cause an allergic skin rash.

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: kidney and liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: 8 hours: butyl rubber gloves, suits, boots; Viton gloves, suits; 4H and Silver Shield gloves, Responder suits; Trychem 1000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 20 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Methacrylic acid should be stored at temperatures below 15°C. Sources of ignition, such as smoking and open flames are prohibited where methacrylic acid is handled, used, or stored. Wherever methacrylic acid is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2531 Methacrylic acid, stabilized, Hazard class: 8; Labels: 8-Corrosive material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Using caution, neutralize remainder with aqueous sodium carbonate or lime. Then wash away with plenty of water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Sealed containers may rupture explosively at elevated temperatures from polymerization. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

RCRA Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8015 (5); 8240 (5)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, T+; risk phrases: R11; R19; R23/24/25; R36/37/38; R62; safety phrases: S1/2; S9; S16; S18; S21; S29; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methylacrylonitrile is a colorless liquid with an odor like bitter almonds. It is reported that methacrylonitrile cannot be detected by its smell even at concentrations which are already dangerous for humans. Hence, special attention must be given to ventilation and estimations of the amount of poison present must be carried out frequently. Molecular weight = 67.1; specific gravity (H_2O:1) = 0.81; boiling point = 90.6°C; freezing/melting point = −35.8°C; vapor pressure = 40 mmHg @ 12.8°C; flash point = 1.1°C (cc). Explosive limits: LEL = 2%; UEL: 6.8%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2. Slightly soluble in water; solubility in water = 3%.

Potential Exposure: This material is used as a monomer in the preparation of polymeric coatings and elastomers.

Incompatibilities: May form explosive mixture with air. Methacrylonitrile evolves flammable concentrations of vapor at temperatures down to 12.8°C. Thus, at room temperatures, flammable concentrations are liable to be present[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aliphatic amines, alkanolamines, alkali, and light. Heat sensitive; polymerization may occur due to elevated temperature, visible light, or contact with a concentrated alkali. *Note*: Typically contains 50 pm of monoethyl ether hydroquinone (662-62-8) as an inhibitor to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.74 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 7.0 ppm.

OSHA PEL: None

NIOSH REL: 1 ppm/3 milligram per cubic meter TWA [skin]; *Nitriles*: 2 ppm, Ceiling Concentration, not to be exceeded in any 15-minute work period.

ACGIH TLV[1]: 1 ppm/2.7 milligram per cubic meter TWA [skin]

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.091}_{\mathbf{A}}$ ppm

PAC-2: $\mathbf{1.0}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{3.1}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. Australia: TWA 1 ppm (3 milligram per cubic meter) [skin], 1993; Belgium: TWA 1 ppm (2.7 milligram per cubic meter) [skin], 1993; Denmark: TWA 1 ppm (3 milligram per cubic meter) [skin], 1999; Finland: TWA 1 ppm (3 milligram per cubic meter); STEL 3 ppm (9 milligram per cubic meter) [skin], 1999; France: VME 1 ppm (3 milligram per cubic meter) [skin], 1999; Norway: TWA 1 ppm (3 milligram per cubic meter), 1999; Switzerland: MAK-W 1 ppm (3 milligram per cubic meter) [skin], 1993; the Netherlands: MAC-TGG 3 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm [skin]. Several states have set guidelines or standards for methacrylonitrile in ambient air[60] ranging from 0.7 milligram per cubic meter (North Dakota) to 1.2 milligram per cubic meter (Virginia) to 1.4 milligram per cubic meter (Connecticut) to 1.667 milligram per cubic meter (Nevada).

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 0.7$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Converted to cyanide in the body! A lacrimator (causes tearing); an insidious poison which causes delayed skin reactions. Very readily absorbed through skin. Highly toxic by all routes of exposure. Signs and symptoms of acute exposure to methylacrylonitrile may include hypertension (high blood pressure) and tachycardia (rapid heart rate), followed by hypotension (low blood pressure) and bradycardia (slow heart rate). Cherry-red mucous membranes and blood, cardiac arrhythmias, and other cardiac abnormalities are common. Cyanosis (blue tint to the skin and mucous membranes) is not a consistent finding. Tachypnea (rapid respiratory rate) may be followed by respiratory depression. Lung hemorrhage and pulmonary edema may also occur. Headache, vertigo (dizziness), agitation, and giddiness may be followed by combative behavior, convulsions, paralysis, protruding eyeballs; dilated and unreactive pupils; and coma. Methylacrylonitrile is irritating to the skin and mucous membranes. Lacrimation (tearing) and a burning sensation of the mouth and throat are common. Excessive salivation; nausea, and vomiting may also occur.

Long-Term Exposure: May cause liver damage. May cause nervous system damage, causing weakness in the legs. See NIOSH Criteria Document 212 *Nitriles*.

Points of Attack: Eyes, skin, liver, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: exam of the nervous system. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential exists for exposures *over 1 ppm*; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methylacrylonitrile is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methylacrylonitrile should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylacrylonitrile. Wherever methylacrylonitrile is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3079 Methacrylonitrile, stabilized, Labels: 6.1; Hazard class: 6.1, 3-Flammable liquid, Inhalation Hazard Zone B.

Spill Handling:

Methacrylonitrile, *Initial isolation and protective action distances*

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m)) 200/60
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, CO_2, water spray; or alcohol foam extinguishers. Methacrylonitrile evolves flammable concentrations of vapor at temperatures down to 12.8°C. Thus, at room temperatures, flammable concentrations are liable to be present[101]. Also, the chemical will explode due to its tendency to polymerize violently. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Add alcoholic NaOH, then oxidize with sodium hypochlorite. After reaction, flush to sewer with water[24].

Methallyl Alcohol M:0510

Formula: C_4H_8O; $CH_2{=}C(CH_3)CH_2OH$
Synonyms: Isopropenyl carbinol; 2-Methyl-2-propen-1-ol; 2-Propen-1-ol, 2-methyl-
CAS Registry Number: 513-42-8
RTECS Number: UD5250000
UN/NA & ERG Number: UN2614/129
EC Number: 208-161-0

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Primary irritant (w/o allergic reaction).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36/37/38; R50 Safety phrases: S16; S21; S26; S36/37/39; S51 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [2-Hazard to water. (est.)].

Description: Methallyl alcohol is a colorless liquid. Pungent odor. Molecular weight = 72.12; boiling point = 114°C; flash point = 33°C. Autoignition temperature = > 300°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an intermediate in organic synthesis.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aliphatic amines; isocyanates, DMSO.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Air: Use NIOSH Analytical Method (IV) #1402, for Alcohols III

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Passes through the skin.

Routes of Entry: Inhalation; dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methallyl alcohol can cause irritation to the skin, eyes and respiratory tract. May be able to pass through the unbroken skin.

Long-Term Exposure: Similar allyl compounds cause liver damage. However, it is not known for certain that this chemical causes the same effects.

Points of Attack: Liver. Respiratory system.

Medical Surveillance: Respiratory system and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures to methallyl alcohol, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure is chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2614 Methallyl alcohol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methallyl alcohol is a flammable liquid. Thermal decomposition products may include oxides of carbon. Water may be ineffective. Alcohol foam is the recommended extinguishing agent. Acrid fumes and smoke are released in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methamidophos M:0520

Formula: $C_2H_8NO_2PS$; $CH_3OP(O)(NH_2)SCH_3$

Synonyms: Acephate-met; Bay 71625; Bayer 71628; Chevron 9006; Chevron ortho 9006; *O*,*S*-Dimethyl ester of amide of amidothioate; *O*,*S*-Dimethyl phosphoramidothioate; ENT 27,396; GS-13005; Hamidop; Metamidofos (Spanish); Metamidofos estrella; Monitor; MTD; MTD 600; NSC 190987; Ortho 9006; Pillaron; SRA 5172; Supracide; Tahmabon; Tamaron; Thiophosphorsaeure-*O*, *S*-dimethylesteramid (German)

CAS Registry Number: 10265-92-6

HSDB Number: 1593

RTECS Number: TB4970000

UN/NA & ERG Number: (PIH) UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 233-606-0 [*Annex I Index No*.: 015-095-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Neurotoxin (cumulative), Combustible.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) [methamidophos (soluble liquid formulations of the substance that exceed 600 g active ingredient/L)]

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; Risk phrases R24; R26/28; R33; S41; R50; safety phrases: S1/2; S28; S36/37; S41; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methamidophos is an off-white crystalline solid. Molecular weight = 141.14; specific gravity (H_2O:1) = 1.31 @ 44.5°C; freezing/melting point = 40°C; vapor pressure = 3×10^{-4} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this insecticide on vegetables and cotton.

Incompatibilities: Incompatible with strong acids or alkali. Attacks mild steel and copper-containing alloys (technical grade).

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.11 milligram per cubic meter

PAC-2: 1.2 milligram per cubic meter

PAC-3: 7.1 milligram per cubic meter

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 165.16992000 ppb (LOW).

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma; loss of reflexes and loss of sphincter control. Acute exposure to methamidophos may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may be noted, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur. This material is highly toxic; LD_{50}(oral-rat) = 7.5 mg/kg. Human Tox = 7.00000 ppb (HIGH).

Long-Term Exposure: The substance may have effects on the nervous system; resulting in delayed neuropathy. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization of an antidote or performance of other invasive procedures. The effects may be delayed. Medical observation recommended.

Note to Physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (aka TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m)) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*: use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Metham–Sodium M:0526

Formula: $C_2H_4NNaS_2$; $C_2H_4NNaS_2 \cdot 2H_2O$ (dihydrate)

Synonyms: A7-Vapam; Basamid-fluid; Busan; Carbam; Carbamic acid, methyldithio-, monosodium salt; Carbamic acid, *N*-methyldithio-, monosodium salt; Carbamic acid, *N*-methyldithio-, sodium salt; Carbamodithioic acid, methyl-, monosodium salt; Carbam, sodium salt; Carbathion; Carbathione; Carbation; Carbothion; Chap-fume; Diethylamino-2,6-acetoxylidide; Discovery; Herbatim (dihydrate); Karbation; Karbation (dihydrate); Maposol; Maposol (dihydrate); Metacide; Metham dihydrate; Metam-fluid BASF; Methan-sodium; *N*-Methylaminodithioformic acid sodium salt; *N*-Methylaminomethanethionothiolic acid sodium salt; Methylcarbamodithioic acid sodium salt; Methyldithiocarbamic acid, sodium salt; Monam (dihydrate); N-869; N 869 (dihydrate); Nematin; Sectagon; Sistan; SMDC (dihydrate); SMDC; Sodium Metam; Sodium Metham; Sodium *N*-methylaminodithioformate; Sodium *N*-methylaminomethanethionothiolate; Sodium methylcarbamodithioate; Sodium methyldithiocarbamate; Sodium *N*-methyldithiocarbamate; Sodium monomethyldithiocarbamate; Solasan 500; Solesan 500; Sometam; Trapex; Trimaton (dihydrate); Trimatron; Ucetam; Vapam; Vapam (dihydrate); Vaporooter (dihydrate); VPM (dihydrate); VPM fungicide; VPN; Woodfume VAPAM

CAS Number: 137-42-8; 6734-80-1 (dihydrate)

HSDB Number: 1767

RTECS Number: FC2100000

UN/NA&ERG Number: UN3267 (Corrosive liquid, basic, organic, n.o.s.)/153; UN2771(Dithiocarbamate, solid)/151

EC Number: 205-293-0 [*Annex I Index No*.: 006-013-00-8]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group B2, Probable human carcinogen.

California Proposition 65 Chemical[102]: Carcinogen, 11/6/1998; developmental toxin 5/15/1998

Hazard Alert: Poison, Possible thyroid effects, Endocrine disruptor (high), Corrosive, Suspected reprotoxic hazard, Water reactive, Sensitization hazard, Environmental hazard, Agricultural chemical.

EPA Hazardous Waste Number (RCRA No.): U384

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

United States DOT Regulated marine pollutant (49CFR172.101, Appendix B)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, Xi, C, N; risk phrases: R20/21/22; R31/34; R43;

R50/53; R63; safety phrases: S1/2; S26; S29/35; S36/37/39; S45; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to water. (est.)].

Description: A yellow to nearly clear yellow-green solution. Also described as a colorless to white crystalline solid. Unpleasant sulfur-amine odor, similar to that of carbon disulfide. Molecular weight = 129.18, 165.21 (dihydrate); freezing/melting point decomposes; boiling point = 110°C (technical product); vapor pressure = 20 mmHg @ 20°C. Readily soluble in water; solubility = 722 g/L @ 20°C. ₩ Water reactive. Slow reaction upon dilution, releasing toxic gases of hydrogen sulfide and methylisothiocyanate. This reaction is accelerated by the addition of acid[101].

Potential Exposure: A dithiocarbamate fungicide, nematicide, herbicide, soil fumigant, and algaecide A general soil biocide that is used to control weeds, weed seeds, roots, tubers, rhizomes, insects, nematodes and soil inhabiting fungi on all food and nonfood crops. Also used as a preplanting fumigant in seed beds, vine crops, fruit trees, row crops, flowers and ornamentals. Environmental friendly; it breaks down after two weeks into carbon dioxide, water, and sodium and sulfur in small amounts. A United States Environmental Protection Agency Restricted Use Pesticide (RUP).

Incompatibilities: Slow reaction upon dilution in water releasing toxic gases of hydrogen sulfide and methyl isothiocyanate. This reaction is accelerated by the addition of acid[88]. May liberate toxic gas when in contact with acids. Combustible; vapors when heated or dust from dry material may form explosive mixture in air. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of Dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides. Corrosive to iron, copper brass and zinc metals, especially in the presence of moisture. Heat alkalies (lime), moisture can cause decomposition. Degradation produces ethylene thiourea.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Permissible Concentration in Water: State Drinking Water Guidelines: California 20 μg/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV–VIS Spectrophotometry. Octanol–water coefficient: Log $K_{ow} = < 0.5$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Intermediate—60.02431 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: The acute symptoms of exposure to metam sodium are excessive salivation, sweating, fatigue, weakness, nausea, headache, dizziness, eye and respiratory tract irritation, and skin irritation in the form of rashes[88]. Concentrated solutions are corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heartbeat. Severe exposure may result in death. Unlike carbamates the dithiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-syrups. LD_{50} (oral, rat) = LD_{50} (oral, rat) = 845 mg/kg[83]; LD_{50} (dermal, rat) ≥ 500 mg/kg.

Long-Term Exposure: Thyroid effects. May cause skin sensitization; Liver and urinary tract effects. Human toxicity (long term)[101]: High—1.76768 ppb, CHCL (Chronic Human Carcinogen Level).

Points of Attack: Thyroid (possible goiter). Respiratory system, central nervous system, cardiovascular system, skin and eyes, liver, urinary tract.

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC and chest X-ray following acute overexposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Thyroid function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.[31]

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral- and Clay-Based; Dirt/Earth[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. (2) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3267 Corrosive liquid, basic, organic, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN2771 Dithiocarbamate and Thiocarbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: First remove all sources of ignition. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do it without risk. Prevent entry into waterways, sewers, basements, or confined areas. Absorb or cover with dry earth, sand or other noncombustible material and transfer to containers. *Do not get water inside containers*.[31] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, disodium oxide, sulfur, and carbon. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. A potential candidate for liquid injection incineration at a temperature range of 650 to 1600°C and a residence time 0.1 to 2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820 to 1600°C and residence times of seconds for liquids and gases, and hours for solids[83].

"In-Row Sprayblade Fumigation with Metam Sodium to Control Weeds and Diseases," *Skagit Veg Trials*, Anderson, W. C. "Andy," and Haglund, William A., Washington State University, Mount Vernon, WA. http://www.mtvernon.wsu.edu/SkagitVegTrials/methamsodium.html.

Methane M:0530

Formula: CH_4

Synonyms: Biogas; Fire damp; Marsh gas; Metano (Spanish); Methyl hydride; Natural gas

CAS Registry Number: 74-82-8

HSDB Number: 167

RTECS Number: PA1490000

UN/NA & ERG Number: UN1971 (compressed gas)/115; UN1972 (liquefied gas)/115

EC Number: 200-812-7 [*Annex I Index No.*: 601-001-00-4]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable gas; Strong reducing agent, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R5; R12; R21; safety phrases: S1; S2; S9; S16; S33; S38; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Methane is an odorless, colorless gas. Molecular weight = 16.05; boiling point = −162°C; freezing/melting point = −183°C; autoignition temperature = 537°C. Explosive limits: LEL = 5.0%; UEL: 15.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 0. Insoluble in water. Natural gas consists primarily of methane (85%) with lesser amounts of ethane (9%), propane (3%), nitrogen (2%), and butane (1%).

Potential Exposure: Methane is used as a fuel and in the manufacture of organic chemicals, acetylene, hydrogen cyanide, and hydrogen. It may also be a cold liquid. Natural gas is used principally as a heating fuel. It is transported as a liquid under pressure. It is also used in the manufacture of various chemicals including acetaldehyde, acetylene, ammonia, carbon black; ethyl alcohol; formaldehyde, hydrocarbon fuels; hydrogenated oils; methyl alcohol; nitric acid; synthesis gas; and vinyl chloride. Helium can be extracted from certain types of natural gas.

Incompatibilities: May form explosive mixture with air. A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts violently with bromine pentafluoride, chlorine dioxide, nitrogen trifluoride, oxygen difluoride and liquid oxygen. In general, avoid contact with all oxidizers.

Permissible Exposure Limits in Air Any loss of containment of Methane in a confined area can lower the oxygen content and cause suffocation. Oxygen content should be tested to ensure that it is at least 19% by volume.

OSHA PEL: Simple asphyxiant-inert gas and vapor

ACGIH TLV[1]: ACGIH TLV[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1-C_4)

PAC Ver. 29[138]

PAC-1: 65,000 ppm

PAC-2: 2.30E + 05 ppm

PAC-3: 4.00E + 05 ppm

Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 10,000 ppm (6700 milligram per cubic meter), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Simple asphyxiant

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: High levels can cause suffocation. Symptoms are due to a decrease in the concentration of oxygen available for breathing and include dizziness, difficult breathing; bluish color of the skin and loss of consciousness. Any contact with liquid can cause freezing burns.

Long-Term Exposure: No effects reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur, employees should be equipped with special clothing designed to prevent freezing of body tissues.

Respirator Selection: Exposure to methane is dangerous because it can replace oxygen and lead to suffocation. Only

NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in positive-pressure mode should be used in oxygen deficient environments. Chemical cartridge respirators should not be used where methane exposure occurs. For high exposures use air supplied respirators.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methane must be stored to avoid contact with oxidizers (such as oxygen, chlorine, bromine, perchlorates, peroxides, nitrates, and permanganates), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where methane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of methane. Wherever methane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1971 Methane, compressed or Natural gas, compressed (with high methane content), Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1972 Methane, refrigerated liquid (cryogenic liquid) or Natural gas, refrigerated liquid (cryogenic liquid), with high methane content), Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. The flame may be invisible. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Incomplete combustion of natural gas may produce carbon monoxide. Use water spray to disperse vapors. *Small fires*: use dry chemical or carbon dioxide extinguishers. *Large fires*: use water spray, fog, or foam. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Incineration (flaring).

Methane Sulfonyl Chloride M:0533

Formula: CH_3ClO_2S

Synonyms: Chloromethyl sulfone; Chlorure de sulfonylméthane (French); Cloruro de metansulfonilo (Spanish); Mesyl chloride; Methanesulfonic acid chloride; Methyl sulfochloride; Methylsulfonyl chloride

CAS Registry Number: 124-63-0

HSDB Number: 5605
RTECS Number: PB2790000
UN/NA & ERG Number: (PIH) UN3246/156
EC Number: 204-706-1
Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as chloride

Hazard Alert: Poison inhalation hazard, Corrosive, Suspected of causing genetic defects, Water Reactive (danger) United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C; risk phrases: R24/25; R26/27/28; R34; R36/37; R51; safety phrases: S24/25; S27; S41; S45; S53; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Pale yellow corrosive liquid. Unpleasant, pungent odor. Molecular weight = 114.55; specific gravity (H_2O:1) = 1.477 @ 18°C; boiling point = 161°C; freezing/melting point = −33°C; vapor pressure = 3.09 mmHg @ 25°C[72]; flash point = > 100°C. Henry's law constant = 4.38×10^{-5} atm m^3/mol @ 25°C (est)[72]. Practically insoluble in water; solubility = 8.6×10^3 mg/mL @ 25°C (est.)[72]; ₩ Slow, dangerous decomposition, forming hydrogen chloride

Potential Exposure: Chemical intermediate in various industries including pesticides, flame retardants, pharmaceuticals, plastics. A solvent, curing agent, and chemical stabilizer. Laboratory chemical.

Incompatibilities: Vapors may form explosive mixture with air. Slowly reacts with water, releasing toxic and corrosive hydrogen chloride gas. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, DMSO, ethers, strong acids, strong bases.

Permissible Exposure Limits in Air:

PAC* Ver. 29[138]
PAC-1: 0.19 ppm
PAC-2: **2.1$_{\mathbf{A}}$** ppm
PAC-3: **6.2$_{\mathbf{A}}$** ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 1.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin/eye absorption.

Harmful Effects and Symptoms

Short-Term Exposure: Can be fatal if inhaled. Very toxic by ingestion, inhalation, or skin absorption. Corrosive to the skin, eyes, and respiratory tract. Exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the blood and central nervous system. Acute effects reported[138]: Central nervous system; Respiratory toxin-acute effects other than severe or moderate irritation; Eye-acute effects other than irritation, Gastrointestinal tract, Kidney. LD_{50}(oral-rat) = < 100 mg/kg.

Long-Term Exposure: Gastrointestinal tract-chronic effects; Narcotic, may be addictive.

Points of Attack: CNS, kidney, blood

Medical Surveillance: Medical observation is recommended for 24 to 48 hours following breathing overexposure, as pulmonary edema may be delayed. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC and chest X-ray following acute overexposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear positive-pressure, SCBA. Wear chemical protective clothing which is specifically recommended by the manufacturer. Structural firefighter's protective clothing provides only limited protection.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA)

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with cacodylic acid you should be trained on its proper handling and storage.

Shipping: UN3246 Methanesulfonyl chloride, Hazard Class 6.1; Labels: 6.1-Poison Inhalation Hazard, 8-Corrosive material, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank,

portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).
Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3
Stay upwind and uphill. Isolate the area of release or fire and deny entry. Remove all ignition sources. Stop the release if it can be done safely from a distance. All equipment used to handle this material must be grounded. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. *Small spill*: Cover with *dry* earth, *dry* sand, or other noncombustible material followed with plastic sheet to minimize spreading or contact with water or rain. Use clean nonsparking tools to collect material and place material into loosely covered plastic containers for later disposal. Prevent material and runoff from entering sewers and waterways if it can be done safely well ahead of the release. Use vapor suppressing foam to disperse vapors—contain runoff. Water spray may reduce vapor, but may not prevent ignition in enclosed spaces. Ventilate confined area if it can be done without placing personnel at risk. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of sulfur, carbon and toxic and corrosive hydrogen chloride gas. Combustible. *Small fire*: Use *dry* chemical, CO_2, *dry* sand, or alcohol-resistant foam. May react with foams releasing corrosive/toxic gases. *Large fire*: use water spray or alcohol-resistant foam if it is available in sufficient amounts. Under favorable conditions, experienced crews can use coordinated fog streams to sweep the flames off the surface of the burning liquid. Combustible material: may burn but does not ignite readily. Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks). Vapors may travel to source of ignition and flash back. Containers may explode when heated or if contaminated with water. Keep exposures cool long after fire is out to protect against reignition. Do not direct straight streams into the liquid. Cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not get water on spilled substance or inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. If material or contaminated runoff from fire control enters waterways, notify downstream users of potentially contaminated water. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information
Hazard Alert: Poison inhalation hazard, Possible cumulative neurotoxin, Suspected of causing genetic defects, Agricultural Chemical Primary irritant (w/o allergic reaction), Environmental hazard.
Banned or Severely Restricted (Philippines) (UN)[13]

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R21; R28; R33; R36/37/38; R50/53; R62; safety phrases: S1/2; S22; S28; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methidathion is a colorless crystalline solid. Molecular weight = 302.34; specific gravity (H_2O:1) = 1.5 @ 20°C; freezing/melting point = 39−40°C; vapor pressure = 1×10^{-6} mmHg @ 24°C. Very slightly soluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this nonsystemic insecticide.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.8 milligram per cubic meter

PAC-2: 20 milligram per cubic meter

PAC-3: 160 milligram per cubic meter

Determination in Water: Fish Tox = 0.15019000 ppb (EXTRA HIGH)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: This material is poisonous to humans. Its toxic effects are by action on the nervous system. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control. Human volunteers ingesting 0.11 mg/kg/day for 6 weeks had no clinical effects. LD_{50}(oral-rat) = 20 mg/kg (highly toxic). Symptoms are similar to parathion poisoning and may include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, dizziness, giddiness, weakness, muscle twitching; difficult breathing; sensation of tightness of chest; blurring or dimness of vision; and loss of muscle coordination. Death may occur from failure of the respiratory center; paralysis of the respiratory muscles; intense bronchoconstriction, or all three. Human Tox = 1.05000 ppb (HIGH).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn, but does not ignite readily. Thermal decomposition products may include oxides of phosphorus, sulfur, nitrogen, and carbon. *For small fires*, use dry chemical, carbon dioxide; water spray; or foam. *For large fires*, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Treat with strong alkali, mix with soil and bury in the case of small quantities[22]. For large quantities, use incineration with effluent gas scrubbing.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as mercaptodimethur.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R25; R50/53; safety phrases: S1/2; S22; S29/35; S37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methiocarb is a colorless crystalline powder. Molecular weight = 225.34; boiling point = 325°C; freezing/melting point = 121.5°C; vapor pressure = 2.7×10^{-7} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Practically insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of this nonsystemic acaricide and insecticide.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.4 milligram per cubic meter

PAC-2: 15 milligram per cubic meter

PAC-3: 90 milligram per cubic meter

Determination in Air: Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Determination in Water: Fish Tox = 0.04597000 ppb (EXTRA HIGH)

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact irritates the skin and eyes. Inhalation will irritate the respiratory tract. As a carbamate insecticide, this compound is a reversible cholinesterase inhibitor and acts on the nervous system. It is classified as very toxic, and the probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb adult. Symptoms include salivation, slowed heartbeat; spontaneous urination and defecation; labored breathing; headache; blurred vision; tremor, slight paralysis; and muscle twitching. Exposure to carbamate poisoning can also result in nausea, vomiting, diarrhea, abdominal pain; convulsions, coma and death. LD_{50} = 60 mg/kg[77]

Long-Term Exposure: The substance may have effects on the nervous system; liver.

Points of Attack: Central nervous system; liver, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical does not burn. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. Extinguish with dry chemical, carbon dioxide; water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Remove material with contaminated soil and place in impervious containers. May be incinerated in a pesticide incinerator at the specified temperature/dwell-time combination. Any liquids, sludges, or solid residues generated should be disposed of in accordance with all applicable federal, state, and local pollution control requirements. If appropriate incineration facilities are not available, material may be buried in a chemical waste landfill. May be amenable to biological treatment at a municipal sewage treatment plant. (Sax/DPIMR).

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to waters (est.)].

Description: Methomyl is a white crystalline solid with a slight sulfurous odor. A noncombustible solid, that may be dissolved in flammable liquids that may alter physical properties listed here. Molecular weight = 162.24; specific gravity (H_2O:1) = 1.295; boiling point = 335°C; freezing/melting point = 78−79°C; vapor pressure = 5×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Moderately soluble in water; solubility 58 g/L @ 25°C.

Potential Exposure: Methomyl is a broad-spectrum insecticide used as insecticide in many vegetables, field crops; certain fruit crops; and ornamentals.

Incompatibilities: Keep away from strong bases, strong oxidizers. Heat causes decomposition forming toxic and irritating fumes including nitrogen oxides; sulfur oxides; hydrogen cyanide; methylisocyanate.

Permissible Exposure Limits in Air

OSHA PEL: None

PAC-2: 10 milligram per cubic meter

PAC-3: 23 milligram per cubic meter

Australia: TWA 2.5 milligram per cubic meter, 1993; Belgium: TWA 2.5 milligram per cubic meter, 1993; Denmark: TWA 2.5 milligram per cubic meter [skin], 1999; France: VME 2.5 milligram per cubic meter [skin], 1999; Norway: TWA 2.5 milligram per cubic meter, 1999; Switzerland: MAK-W 2.5 milligram per cubic meter [skin], 1999; United Kingdom: TWA 2.5 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 2.5 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Several states have set guidelines or standards for methomyl in ambient air[60] ranging from 25 μ/m^3 (North Dakota) to 40 μ/m^3 (Virginia) to 50 μ/m^3 (Connecticut) to 59.5 μ/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601. Organonitrogen pesticides. OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; NIOSH Analytical Method (IV) #5601.

Permissible Concentration in Water: The United States Environmental Protection Agency has calculated a NOAEL of 2.5 mg/kg/day from which a lifetime health advisory of 175 μg/L has been calculated. The state of Maine has set a guideline for methomyl in drinking water[61] of 50 μg/L.

Determination in Water: By high-performance liquid chromatography as described in EPA Health Advisory cited below. Fish Tox = 80.25646000 ppb (INTERMEDIATE). Octanol−water coefficient: Octanol−water coefficient: Log K_{ow} = 0.63. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Cholinesterase inhibitor. Irritates the eyes. May affect the nervous system; resulting in respiratory failure; convulsions. Exposure may result in death. Methomyl has high oral toxicity, moderate inhalation toxicity, and low skin toxicity. The probable oral lethal dose for humans is between seven drops and one teaspoon for a 150-lb adult. Death is due to respiratory arrest. Acute exposure to methomyl usually leads to a cholinergic crisis. Signs and symptoms may include increased salivation; lacrimation (tearing), spontaneous defecation; and spontaneous urination. Pinpoint pupils; blurred vision; tremor, muscle twitching; and loss of muscle coordination may occur. Mental confusion; convulsions, and coma may also be noted. Gastrointestinal effects include nausea, vomiting, diarrhea, and abdominal pain. Bradycardia (slow heart rate) occurs frequently. Dyspnea (shortness of breath), pulmonary edema; and respiratory arrest may also occur. LD_{50} = 17 mg/kg[77].

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Methomyl may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause anemia.

Points of Attack: Eyes, respiratory system; central nervous system; cardiovascular system, liver, kidneys, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: Tychem 1000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full facepiece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures over 2.5 milligram per cubic meter, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases; strong oxidizers (such as chlorine, bromine, and fluorine). Do not store in area where temperature is less than 32°F/0°C.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Keep unnecessary people away; isolate hazard areas and deny entry. Stay upwind and keep out of low areas. Do not touch spilled material, or handle broken packages without protective equipment. Do not breathe dust, vapors, or the fumes from burning material. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methomyl does not burn. Use any agent suitable for surrounding fire. Thermal decomposition products may include nitrogen oxides; sulfur oxides; hydrogen cyanide; methylisocyanate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Alkaline hydrolysis leads to complete degradation to nontoxic products[22]. May be dissolved in water and sprayed into a furnace with effluent gas scrubbing also. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Methoprene M:0565

Formula: $C_{19}H_{34}O_3$

Synonyms: Altosid; Apex; Diacon; Dianex; 2,4-Dodecadienoic acid, 11-methoxy-3,7,11-trimethyl-, ispropyl ester, (E,E)-; 2,4-Dodecadienoic acid, 11-methoxy-3,7,11-trimethyl-, 1-methylethyl ester, (E,E)-; Ent 70,460; Extinguish; Fleatrol; Isopropyl (2E,4E)-11-methoxy-3,7,11-trimethyl-2,4-dodecadienoate; Isopropyl (E,E)-11-methoxy-3,7,11-trimethyl-2,4-dodecadienoate; Kabat; Manta; (E,E)-11-Methoxy-3,7,11-trimethyl-2,4-dodecandienoate; 1-Methylethyl (E,E)-11-methoxy-3,7,11-trimethyl-2,4-dodecadienoate; Moorman's IGR cattle concentrate; Ovitrol; Pharorid; Precor; ZR-515

CAS Number: 40596-69-8

HSDB Number: 6926

RTECS Number: JR1685000

UN/NA & ERG Number:

UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 254-993-2

Regulatory Authority and Advisory Information

Carcinogenicity[83]: IARC, Group 3 not classifiable as to its carcinogenicity in humans.

Description: Amber colored liquid. Faint fruity odor. Molecular weight = 310.47; specific gravity (H_2O:1) = 0.93; boiling point = 135 @ 0.06 mmHg; flash point ≥ 90°C. Slightly soluble in water; solubility = 1.40 ppm.

Potential Exposure: Methoprene is a natural insect growth regulator (IGR) that mimics juvenile hormone(s) and is used against a variety of insects including horn flies, mosquitoes, beetles, tobacco moths, sciarid flies, fleas (eggs and larvae), fire ants, pharoah ants, midge flies and Indian meal moths. Controlling some of these insects, methoprene is used in the production of a number of foods including meat, milk, mushrooms, peanuts, rice and cereals. It also has several uses on domestic animals (pets) for controlling fleas and to control insects in wastewater, sludge beds and ponds. For oral use in dogs, 9 weeks of age and older and 4 lb body weight or greater, for the prevention and control of flea populations [21 CFR 520.1390].

Incompatibilities: This material may react as an ester. Esters react with acids to liberate heat along with alcohols and acids. Strong oxidizing acids may cause a vigorous reaction that is sufficiently exothermic to ignite the reaction products. Heat is also generated by the interaction of esters with caustic solutions. Flammable hydrogen is generated by mixing esters with alkali metals and hydrides.

Determination in Water: Octanol−water coefficient: Log $K_{ow} \geq 5.0$. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Dermal contact, eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Moderately toxic by skin absorption and if ingested. Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided LD_{50} (oral, rat) = > 25 g/kg; (dermal, rat) = > 2 g/kg. Very low toxicity.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Do not induce vomiting when formulations containing petroleum solvents are ingested

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Combustible. Thermal decomposition products include acrid smoke, and oxides of nitrogen, sodium, sulfur and carbon. Combustible. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal Method Suggested: It is the responsibility of chemical waste generators to determine if a discarded chemical is classified as a hazardous waste. See 40 CFR Parts 261.3 for United States Environmental Protection Agency guidelines for the classification determination. In addition, in order to ensure complete and accurate classification, waste generators must consult state and local hazardous waste regulations. Incineration might be an effective disposal procedure where permitted. If an efficient incinerator is not available, the product should be mixed with large amounts of combustible material and contact with the smoke should be avoided. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers.

Methotrexate M:0570

Formula: $C_{20}H_{22}N_8O_5$

Synonyms: Amethopterin; 4-Amino-4-deoxy-N^{10}-methylpteroyl glutamate; 4-Amino-4-deoxy-N^{10}-methylpteroylglutamic;

4-Amino-10-methylfolic acid; 4-Amino-N^{10}-methylpteroylglutamic acid; Antifolan; *N*-Bismethylpteroylglutamic acid; CL-14377; L-(+)-*N*-[*p*-([(2,4-Diamino-6-pteridinyl)methyl] methylamino)-benzoylglutamic acid; EMT 25,299; Emtexate; HDMTX; Methopterin; Methotextrate; Methylaminopterin; MTX; NCI-C04671; NSC-740; R 9985

CAS Registry Number: 59-05-2

HSDB Number: 3123

RTECS Number: MA1225000

UN/NA & ERG Number: UN1544 (Alkaloids, solid, n.o.s.)/151; UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-413-8

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Studies (ipr); no evidence: mouse, rat

California Proposition 65 Developmental/Reproductive toxin 1/1/1989.

Hazard Alert: Poison, Reproductive toxin, Drug, Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R25; R36/37; R61; R62; safety phrases: S26; S36/37/39; S45; S63; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to water. (est.)].

Description: Methotrexate is an orange-brown crystalline powder. Molecular weight = 454.50; freezing/melting point = (decomposes) 185−204°C. Insoluble in water.

Potential Exposure: Methotrexate is an alkaloid anticancer drug available in tablet or injectable liquid form. A chemotherapy drug that interferes with DNA and RNA synthesis. It is also an insect chemosterilant.

Incompatibilities: Combustible. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, light, UV, moisture.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes.

Long-Term Exposure: Methotrexate causes mutations (genetic changes). Such chemicals may have a cancer or reproductive risk. Methotrexate is a probable teratogen in humans. There is limited evidence that methotrexate may affect sperm production in males. When taken as a medical drug, methotrexate can cause nausea, vomiting, loss of appetite; weight loss; bloody diarrhea; sores inside the mouth; hair loss and skin rash. It can also damage the liver and kidneys. Methotrexate can damage bone marrow causing low blood cell count. It is not known if the effects can occur from work-place exposures.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: CBC. Liver and kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn. Wear splash-proof chemical goggles when working with liquid, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to methotrexate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. A regulated, marked area should be established where methotrexate is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from light and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1544 Alkaloids, solid, n.o.s. or Alkaloid salts, solid, n.o.s. poisonous, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin 1/1/1993

Hazard Alert: Highly Flammable, Suspected reprotoxic hazard, Suspected of causing genetic defects, Hormone, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%. as 2-Methoxyethyl acetate

Hazard symbols, risk, & safety statements: Hazard symbol: F, T; risk phrases: R11; R20/21/22; R36/37/38; R62; R63; safety phrases: S53; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methoxyethyl acetate is a colorless liquid. Mild, ethereal odor. Molecular weight = 118.15; specific gravity (H_2O:1) = 1.005 @ 20°C; boiling point = 143°C; freezing/melting point = −70°C; vapor pressure = 2 mmHg @ 20°C; flash point = 48.9°C (cc); autoignition temperature = 380°C. Explosive limits: LEL = 1.7%; UEL: 8.2%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Soluble in water.

Potential Exposure: Methoxyethyl acetate is used as a solvent for resins, oils, greases and inks. It is also an ingredient of lacquers, paints and adhesives.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrates. May be able to form explosive peroxides.

Permissible Exposure Limits in Air

NIOSH IDLH = 200 ppm
Conversion factor: 1 ppm = 4.83 milligram per cubic meter @ 25°C & 1 atm
Odor threshold = 0.33 ppm.
OSHA PEL: 25 ppm/120 milligram per cubic meter TWA [skin]
NIOSH REL: 0.1 ppm/0.5 milligram per cubic meter TWA [skin]
ACGIH TLV[1]: 0.1 ppm/0.5 milligram per cubic meter TWA [skin]; BEI issued.
PAC Ver. 29[138]
PAC-1: 0.3 ppm
PAC-2: 670 ppm
PAC-3: 4000 ppm
DFG MAK: 1 ppm/4.9 milligram per cubic meter (sum of the concentrations of EGMEA and its acetate in air); Peak Limitation Category II(8) [skin]; Pregnancy Risk Group B
Australia: TWA 5 ppm (24 milligram per cubic meter) [skin], 1993; Austria: MAK 5 ppm (25 milligram per cubic meter) [skin], 1999; Belgium: TWA 5 ppm (24 milligram per cubic meter) [skin], 1993; Denmark: TWA 5 ppm (24 milligram per cubic meter) [skin], 1999; Finland: TWA 25 ppm (120 milligram per cubic meter); STEL 40 ppm (180 milligram per cubic meter) [skin], 1999; France: VME 5 ppm (24 milligram per cubic meter) [skin], 1999; Hungary: TWA 25 milligram per cubic meter; STEL 50 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 1.5 milligram per cubic meter [skin], 2003; Norway: TWA 5 ppm (22 milligram per cubic meter), 1999; the Philippines: TWA 25 ppm (120 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 25 milligram per cubic meter, MAC (STEL) 100 milligram per cubic meter, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 5 ppm (25 milligram per cubic meter), KTV 10 ppm (50 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 5 ppm (25 milligram per cubic meter), KZG-W 10 ppm (50 milligram per cubic meter) [skin], 1999; Turkey: TWA 25 ppm (120 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 5 ppm (25 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 ppm [skin]. Several states have set guidelines or standards for methoxyethyl acetate in ambient air[60] ranging from 0.24 milligram per cubic meter (North Dakota) to 0.4 milligram per cubic meter (Virginia) to 0.48 milligram per cubic meter (Connecticut) to 0.571 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1451, Methyl cellosolve acetate; OSHA Analytical methods 53, 79.

Determination in Water: Octanol—water coefficient: Log $K_{ow} = 0.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: 2-Methoxyethyl acetate can affect you when breathed in and by passing through your skin. Exposure to the vapor can irritate the eyes. High levels of exposure can cause headache, vomiting, dizziness, fatigue, confusion, lightheadedness, and unconsciousness. Higher exposure can cause irritation of the nose, throat, and lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the blood and central nervous system.

Long-Term Exposure: Repeated high exposures can damage the brain and nervous system. May affect the blood, liver and kidneys. May cause low blood count (anemia). In animals: narcosis; reproductive, teratogenic effects.

Points of Attack: Eyes, respiratory system; kidneys, brain, central nervous system; peripheral nervous system; reproductive system, hematopoietic system.

Medical Surveillance: Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests; liver function tests; kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: CBC. Exam of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: butyl rubber gloves, suits, boots; Tychem 1000 suits. **4 hours**: Saranex coated suits; 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1 ppm*: Sa (APF = 10) (any supplied-air respirator). *2.5 ppm* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); SaF (APF = 50) (any supplied-air respirator with a full facepiece). *100 ppm*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *200 ppm*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Methoxyethyl acetate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong caustics, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where 2-methoxyethyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever 2-methoxyethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1189 Ethylene glycol monomethyl ether acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Beware of possible presence of peroxides[22] in which case open burning may be used.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: 2-Methoxyethyl Acetate, Trenton, NJ (November 1999).

Methoxyfenozide M:0603

Formula: $C_{22}H_{28}N_2O_3$

Synonyms: Benzoic acid, 3-methoxy-2-methyl-2-(3,5-dimethylbenzoyl)-2-(1,1-dimethylethyl)hydrazide; Intrepid; Prodigy

CAS Number: 161050-58-4

HSDB Number: 7936

RTECS Number: Not found

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: Not assigned

Regulatory Authority and Advisory Information

Carcinogenicity: EPA Not likely a human carcinogen

Acute Hazard Warning Label: 3 Cautions

Hazard Alert: Suspected groundwater pollutant

Description: White crystalline solid or powder. Molecular weight = 368.47; specific gravity (H_2O:1) = 0.63; boiling point = (decomposes); freezing/melting point = 204−207°C; vapor pressure = 3.5×10^{-11} mmHg @ 25°C[83]. Henry's law constant = 3.84×10^{-12} atm m^3/mol @ 25°C (est)[83]. Low solubility in water.

Potential Exposure: Methoxyfenozide is a diacylhydrazine insecticide used to prevent insects from molting, or shedding their exoskeleton in order to grow, e.g., caterpillars and lychee webworms.

Permissible Concentration in Water: Federal Drinking Water Guidelines: 700 ppb[14].

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3.5. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Dermal contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved APRs for pesticides. Harmful if swallowed. At high levels of exposure may affect glandular systems. LD_{50} (oral, dermal, rat) = > 5 g/kg.

Long-Term Exposure: At high levels of exposure may affect endocrine system, thyroid and adrenal glands.

Points of Attack: Adrenal glands, Endocrine system, thyroid

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Exam of the nervous system. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Applicators and other handlers must wear: Coveralls worn over long-sleeved shirt and long pants; Chemical-resistant gloves such as DuPont Tychem suit fabrics, barrier laminate, or Viton; Chemical-resistant footwear plus socks; Protective eye wear; Chemical-resistant headgear for overhead exposure; Chemical-resistant apron when cleaning equipment, mixing, or loading[83]. Agricultural Use/Engineering Controls: When handlers use closed systems, enclosed cabs, or aircraft in a manner that meets the requirements listed in the WPS for agricultural pesticides, 40 CFR 170.240(d) (4-6), the handler PPE requirements may be reduced or modified as specified in the WPS. Firefighters should wear NIOSH approved SCBA and full protective clothing.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methoxyethylmercuric Acetate M:0600

Formula: $C_5H_{10}HgO_3$; $CH_3OCH_2CH_2HgOOCCH_3$

Synonyms: Acetato(2-methoxyethyl)mercury; Acetoxy(2-methoxyethyl)mercury; Cekusil Universal A; Landisan; MEMA; Mercuran; Mercury, acetoxy(2-methoxyethyl)-; Methoxyethylmercury acetate; 2-Methoxyethylmerkuriacetat (German); Panogen; Panogen M; Panogen Metox; Radosan

CAS Registry Number: 151-38-2

HSDB Number: 6387

RTECS Number: OV6300000

UN/NA & ERG Number: UN2777/151; UN2025 (mercury compounds, solid, n.o.s.)/151

EC Number: 205-790-2

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1993 (dimethyl mercury); EPA: Possible Human Carcinogen; Methylmercury compounds are possibly carcinogenic to humans (Group 2B).

California Proposition 65: Developmental/Reproductive toxin (7/1/1987), Cancer (5/1/1996) as methyl mercury compounds.

Hazard Alert: Poison, Combustible, Organometallic, Strong reducing agent, Water reactive, Reproductive toxin: Suspected of causing genetic defects, Environmental hazard, Agricultural chemical.

Banned or Severely Restricted (in agriculture) (In United Kingdom)[13]

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg [Hg]/L as mercury

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as mercury compounds.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*593-74-8*): Hazard symbol: T+, N; risk phrases: R45; R15; R26/27/28; R33; R50/53; R62; safety phrases: S1/2; S13; S28; S29/35; S36; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to water. (est.)].

Description: Methoxyethylmercuric acetate is a crystalline solid. Molecular weight = 318.74; freezing/melting point = 42°C; vapor pressure = 1×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0₩. Soluble in water; reactive, may release toxic or flammable vapors[101].

Potential Exposure: Used as a pesticide in seed treatment for cotton and small grains. It is no longer approved for this use. It exhibits high fungicidal activity against leaf stripe of barley; stinking smut of wheat; snow mold of rye; against seedling diseases in beets and legumes; and for dressing "seed" potatoes, bulbs, and tubers. Not registered as a pesticide in the United States.

Incompatibilities: Strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Corrosive to iron and other metals.

Permissible Exposure Limits in Air

NIOSH IDLH = 2 mg[Hg]/m^3

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

PAC Ver. 29[138]
PAC-1: 0.048 milligram per cubic meter
PAC-2: 0.064 milligram per cubic meter
PAC-3: 3.2 milligram per cubic meter
DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3
In addition, North Dakota has set guidelines for alkyl mercury compounds in ambient air[60] of 1−3 μ/m^3 (0.0001−0.0003 milligram per cubic meter).

Permissible Concentration in Water: Presumably this material is covered in the Priority Toxic Pollutant Category. It is not specifically cited as an organomercurial as is methyl mercury. Very Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly toxic. Target organs are brain and central nervous system. Inhalation can cause lung damage; ingestion can cause kidney damage. Women of childbearing age should avoid exposure. Patients complain of headache, paresthesia of tongue, lips, fingers, and toes; a metallic taste in mouth; gastrointestinal disturbances; gas, and diarrhea. Nervous system symptoms may appear first after a relatively slight exposure or have a latency period: slight loss of coordination; loss of coordination of speech; writing and gait. Uncoordination may progress to loss of ability to control voluntary movements. Irritability and bad temper may progress to mania. Stupor or coma may develop. Blisters or dermatitis may be present on skin. Symptoms persist for years even in cases of mild exposure.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis and allergy. Repeated or prolonged exposure may cause brain damage and nervous system damage. Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; and kidney failure. Organic mercury substances have been identified as teratogen in humans. Can cause mercury to accumulate in the body and cause mercury poisoning. May cause permanent damage, such as gray colored skin, brown staining of the eyes; and decreased peripheral vision.

Points of Attack: Eyes, skin, brain, central nervous system; peripheral nervous system; kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with: eye exam. Consider lung function tests for persons with frequent exposure. Exam of the nervous system. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Antidotes and Special Procedures for medical personnel: The drug NAP has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning, BAL [dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area

Shipping: UN2025 Mercury compounds, solid, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN2777 Mercury based pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for clean-up of mercury are available. Ventilate area after clean-up is complete. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include metal fumes of mercury. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Runoff from fire control or dilution water may cause pollution. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 4-Methoxyphenol is a colorless to white, waxy solid with an odor of caramel and phenol. A combustible solid. Molecular weight = 124.15; specific gravity (H_2O:1) = 1.55 @ 20°C; boiling point = 246°C; freezing/melting point = 52−53°C; flash point = 132°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: This compound is used in the manufacture of antioxidants, pharmaceuticals, plasticizers and dyestuffs. It is used as a stabilizer and UV inhibitor in various polymers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, acid chlorides; acid anhydrides. Under certain conditions, a dust cloud can probably explode if ignited by a spark or flame.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA

PAC Ver. 29[138]
PAC-1: 15 milligram per cubic meter
PAC-2: 49 milligram per cubic meter
PAC-3: 320 milligram per cubic meter
Australia: TWA 5 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter, 1993; Denmark: TWA milligram per cubic meter, 1999; France: VME 5 milligram per cubic meter, 1999; Norway: TWA 5 milligram per cubic meter, 1999; United Kingdom: TWA 5 milligram per cubic meter, 2000; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 5 milligram per cubic meter

Determination in Air: No NIOSH Analytical Method available. See OSHA Analytical Method 32.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: 4-Methoxyphenol can affect you when breathed in and by passing through your skin. Contact can cause severe eye burns and permanent damage. Irritates the skin, nose, throat, upper respiratory system. A central nervous system depressant.

Long-Term Exposure: Prolonged contact can cause severe skin burns and scars. Repeated exposure may cause discoloration of the eye and skin. Damage to the vision may occur. May cause skin sensitization.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. If symptoms develop or overexposure is suspected, the following may be useful: exam of the eyes and vision, including a "slit-lamp" exam. Examination of the central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential exists for exposures over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a high efficiency particulate filter. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode; or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Protect containers from physical damage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where 4-methoxyphenol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3335 Aviation regulated solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 4-Methoxyphenol may burn, but does not readily ignite. Use dry chemical or carbon dioxide extinguishers. Thermal decomposition products may include oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: 4-Methoxyphenol, Trenton, NJ (March 2000).

Methyl Acetate M:0620

Formula: $C_3H_6O_2$: CH_3COOCH_3
Synonyms: Acetate de methyle (French); Acetic acid, methyl ester; Devoton; Methylacetat (German); Methyl acetic ester; Methyle (acetate de) (French); Methyl ethanoate; Tereton
CAS Registry Number: 79-20-9
HSDB Number: 95
RTECS Number: AI9100000
UN/NA & ERG Number: UN1231/129
EC Number: 201-185-2 [*Annex I Index No.*: 607-021-00-X]

Regulatory Authority and Advisory Information
Hazard Alert: Highly flammable, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36; R41; R63; R66; R67; safety phrases: S16; S21; S26; S29; S33; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl acetate is a colorless liquid with a fruity odor. Molecular weight = 74.09; specific gravity (H_2O:1) = 0.924; boiling point = 57.8°C; freezing/melting point = −99°C; vapor pressure = 100 mmHg @ 9.4°C; flash point = −10°C; autoignition temperature = 455°C. The explosive limits are LEL = 3.1%; UEL: 16%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0₩. Soluble in water; solubility = 25%.

Potential Exposure: Methyl acetate is used as a solvent in lacquers and paint removers; and as an intermediate in pharmaceutical manufacture.

Incompatibilities: Vapor may form explosive mixture with air. A Strong reducing agent. Incompatible water, acids, nitrates, strong oxidizers; alkalis. Attacks some plastics. Attacks many metals in presence of water. Reacts slowly with water, forming acetic acid and methanol. Decomposes in heat; on contact with air, bases, strong oxidizers; UV-light; possible fire and explosion hazard.

Permissible Exposure Limits in Air
NIOSH IDLH = 3100 ppm [LEL]
Conversion factor: 1 ppm = 3.03 milligram per cubic meter @ 25°C & 1 atm
Odor threshold = 4.6 ppm.
OSHA PEL: 200 ppm/610 milligram per cubic meter TWA
NIOSH REL: 200 ppm/610 milligram per cubic meter TWA; 250 ppm/760
milligram per cubic meter STEL
ACGIH TLV[1]: 200 ppm/606 milligram per cubic meter TWA; 250 ppm/757 milligram per cubic meter STEL
PAC Ver. 29[138]
PAC-1: 250 ppm
PAC-2: 1700 ppm
PAC-3: 10,000 ppm
DFG MAK: 100 ppm/310 milligram per cubic meter TWA; Peak Limitation Category I(4); Pregnancy Risk Group C
Australia: TWA 200 ppm (610 milligram per cubic meter); STEL 250 ppm, 1993; Austria: MAK 200 ppm (610 milligram per cubic meter), 1999; Belgium:
TWA 200 ppm (610 milligram per cubic meter); STEL 250 ppm (760 milligram per cubic meter), 1993; Denmark: TWA 150 ppm (455 milligram per cubic meter), 1999; Finland: TWA 200 ppm (610 milligram per cubic meter); STEL 250 ppm (765 milligram per cubic meter), 1993; France: VME 200 ppm (610 milligram per cubic meter), VLE 250 ppm (760 milligram per cubic meter), 1999; Hungary: TWA 200 milligram per cubic meter; STEL 500 milligram per cubic meter [skin] 1993; the Netherlands: MAC-TGG 610 milligram per cubic meter, 2003; Norway: TWA 100 ppm (305 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (610 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 750 milligram per cubic meter, 1999; Russia: TWA 200 ppm; STEL 100 milligram per cubic meter, 1993; Sweden: TWA 150 ppm (450 milligram per cubic meter); STEL 300 ppm (900 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (610 milligram per cubic meter), KZG-W 400 ppm (1220 milligram per cubic meter), 1999; Turkey: TWA 200 ppm (610 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (616 milligram per cubic meter); STEL 250 ppm (770 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 250 ppm. Several states have set guidelines or standards for methyl acetate in ambient air[60] ranging from 6.1−7.6 milligram per cubic meter (North Dakota) to 12.2 milligram per cubic meter (Connecticut) to 14.524 milligram per cubic meter (Nevada) to 15 milligram per cubic meter (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) #1458.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.2. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms
Short-Term Exposure: Methyl acetate can affect you when breathed in and by passing through your skin. Irritates the eyes and respiratory tract. Eye irritation may be serious. May affect the central nervous system; causing dizziness, lightheadedness, and unconsciousness Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: The liquid destroys the skin's natural oils. Repeated or high exposure may cause irritation, dryness and cracking. Repeated or high exposures may cause methanol poisoning, which can cause headaches, dizziness, coma; and affect the optic nerve, causing blindness. Death can occur.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: For those with frequent or potentially high exposures (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. Vision exam. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** 4H and Silver Shield gloves. **4 hours:** Teflon gloves, suits, boots. Also, butyl rubber is among the recommended protective materials. Safety equipment suppliers and manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); *3100 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl acetate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), and strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong alkalis and nitrates. Sources of ignition, such as smoking and open flames, are prohibited where methyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl acetate.

Shipping: UN1231 Methyl acetate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl Acetylene M:0630

Formula: C_3H_4; $CH_3C{=}CH$

Synonyms: Acetylene, methyl-; Allylene; Propine; Propyne

CAS Registry Number: 74-99-7

HSDB Number: 2508

RTECS Number: UK4250000

UN/NA & ERG Number: UN3161/115 (P)

EC Number: 200-828-4

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable gas. Polymerization hazard, Suspected reprotoxic hazard, Frostbite/Cryogenic burn hazard, Asphyxiation hazard, Contains gas under pressure; may explode if heated.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xi; risk phrases: R5; R12; R17; R19; R20/21/22; R36/37/38; S61; safety phrases: S1; S2; S6; S16; S26; S27; S33; S36/37/39; S38; S43; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water.

Description: Methyl acetylene is a flammable, colorless gas. Sweet odor. A fuel that is shipped as a liquefied compressed gas. Molecular weight = 40.07; boiling point = −23.3°C; freezing/melting point = −104°C; vapor pressure = 3876 @ 20°C; relative vapor density (air = 1) = 1.41. Explosive limits: LEL = 1.7%; UEL: 11.7%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 3. Practically insoluble in water; solubility 0.4%.

Potential Exposure: This material may be used as a liquid rocket propellant, in admixture with propadiene as an industrial cutting fuel.

Incompatibilities: Forms explosive gas mixture with air. The liquid material in cylinders contains about 30% propadiene. Detonation may occur at 95°C.[136] May form explosive peroxides. Can decompose explosively on heating and @ 4.5−5.6 atmospheres of pressure. Strong oxidizers may cause fire and explosions. Forms shock sensitive compounds with copper, magnesium, silver and their alloys. Copper or copper alloys containing more than 67% copper should not be used in handling equipment. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1700 ppm [LEL]

Conversion factor = 1 ppm = 1.64 milligram per cubic meter

OSHA PEL: 1000 ppm/1650 milligram per cubic meter TWA

NIOSH REL: 1000 ppm/1650 milligram per cubic meter TWA

ACGIH TLV[1]: 1000 ppm/1640 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 230 ppm

PAC-2: 2500 ppm

PAC-3: 15,000 ppm

Australia: TWA 1000 ppm (1650 milligram per cubic meter); STEL 1250 ppm, 1993; Austria: MAK 1000 ppm (1650 milligram per cubic meter), 1999; Belgium: TWA 1000 ppm (1640 milligram per cubic meter); STEL 1250 ppm (2050 milligram per cubic meter), 1993; Denmark: TWA 1000 ppm (1650 milligram per cubic meter), 1999; Finland: TWA 1000 ppm (1650 milligram per cubic meter); STEL 1250 ppm (2065 milligram per cubic meter), 1999; France: VME 1000 ppm (1650 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1650 milligram per cubic meter, 2003; the Philippines: TWA 1000 ppm (1650 milligram per cubic meter), 1993; Switzerland: MAK-W 1000 ppm (1650 milligram per cubic meter), 1999; Turkey: TWA 1000 ppm (1650 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1000 ppm

The Federal standard[58] the DFG MAK value[3] and the ACGIH TWA value is 1000 ppm (1650 milligram per cubic meter). Several states have set guidelines or standards for methyl acetylene in ambient air[60] ranging from 16.5−20.4 milligram per cubic meter (North Dakota) to 30 milligram per cubic meter (Virginia) to 33 milligram per cubic meter (Connecticut) to 39.286 milligram per cubic meter (Nevada).

Determination in Air: Gas collection bag; none; Gas chromatography/Flame ionization detection; NIOSH (II-5), Method #S8.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Rapid evaporation of the liquid may cause frostbite. Exposure can cause headache, dizziness, convulsions, and loss of consciousness.

Long-Term Exposure: Can irritate the lungs. May cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Central nervous system; lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1700 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). Escape: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. May form peroxides in storage. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN3161 Liquefied gas, flammable, n.o.s., Hazard Class: 2.1; Labels: 2.1-Flammable gas, Technical Name Required. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode. *Note*: Stopping the flow of gas is a better course of action than trying to extinguish the fire[17]. It may be dangerous to extinguish the flame and allow the gas to continue to flow; as an explosive mixture may be formed with air which may cause greater damage than the original fire if allowed to burn.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methyl acrylate is a clear, colorless liquid with a sharp, fruity odor. Molecular weight = 86.1; specific gravity (H_2O:1) = 0.96; boiling point = 85°C; freezing/melting point = −76.5°C; vapor pressure = 100 mmHg @ 28°C; flash point = −3°C (oc); autoignition temperature = 468°C. Explosive limits: LEL = 2.8%; UEL: 25%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 2. Slightly soluble in water; solubility = 6%.

Potential Exposure: Methyl acrylate is used in production of acrylates, copolymers, barrier resins; and surfactants for shampoos; as a monomer in the manufacture of polymers for plastic films, textiles, paper, and leather coating resins. It is also used as a pesticide intermediate and in pharmaceutical manufacture.

Incompatibilities: Forms explosive mixture in air. Incompatible with nitrates, oxidizers, such as peroxides, strong alkalis. Polymerizes easily from heat, light, peroxides; usually contains an inhibitor, such as hydroquinone.

Permissible Exposure Limits in Air

NIOSH IDLH = 250 ppm

Conversion factor: 1 ppm = 3.52 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/35 milligram per cubic meter TWA [skin]

NIOSH REL: 10 ppm/35 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 2 ppm/7 milligram per cubic meter TWA [skin]; danger of sensitization.
PAC Ver. 29[138]
PAC-1: 6 ppm
PAC-2: 170 ppm
PAC-3: 1000 ppm
DFG MAK: 5 ppm/18 milligram per cubic meter, Peak Limitation Category I(1) danger of skin sensitization; Pregnancy Risk Group D
Several states have set guidelines or standards for methyl acrylate in ambient air[60] ranging from 4.8 μ/m^3 (Massachusetts) to 350 μ/m^3 (North Dakota) to 500 μ/m^3 (Virginia) to 700 μ/m^3 (Connecticut) to 833 μ/m^3 (Nevada).
Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1459; #2552; OSHA Analytical Method 92.
Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.02 mg/L.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.79$. Unlikely to bioaccumulate in marine organisms.
Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Methyl acrylate can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Eye and skin contact can cause severe irritation and burns. A lacrimator. Breathing high levels may cause severe lung irritation and may lead to fluid in the lungs (pulmonary edema). This can cause death. Prolonged contact can cause severe damage to the skin and eyes.
Long-Term Exposure: Prolonged or repeated exposure to methyl acrylate may cause liver and kidney damage. Exposure may cause skin sensitization and allergy to develop.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Liver and kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: butyl rubber gloves, suits, boots; Tychem 1000 suits. **4 hours**: Teflon gloves, suits, boots. Also, polyvinyl alcohol is among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: NIOSH: *Up to 100 ppm*: Sa (APF = 10) (any supplied-air respirator). *250 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).
Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl acrylate must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. At temperatures above 20°C a violent reaction could take place. Methyl acrylate should always be used with an inhibitor. Check that the correct concentration of inhibitor is used; if it is not, a violent reaction

could occur. Sources of ignition, such as smoking and open flames, are prohibited where methyl acrylate is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl acrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl acrylate. Wherever methyl acrylate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1919 Methyl acrylate, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Polymerization hazard, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R19; R36/37/38; safety phrases: S7/9; S16; S21; S25; S26; S33; S37/39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methylal is a colorless liquid with a pungent odor. Molecular weight = 76.1; specific gravity (H_2O:1) = 0.86 @ 20°C; boiling point = 42°C; freezing/melting point = −105°C; vapor pressure = 750 mmHg @ 42°C; flash point = −32°C; autoignition temperature = 237°C. Explosive limits: LEL = 2.2%; 10,000 ppm[138]; UEL: 13.8%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Soluble in water; solubility = 33%.

Potential Exposure: Methylal is used as a specialty fuel and as a solvent in adhesives and protective coatings.

Incompatibilities: Vapors may form explosive mixture with air. Methylal may be able to form unstable and explosive peroxides. Heating may cause explosion. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Hydrolyzes readily in presence of acids to generate aldehydes.

Permissible Exposure Limits in Air

Several states have set guidelines or standards for methylal in ambient air[60] ranging from 3.875−31.0 milligram per cubic meter (North Dakota) to 62.0 milligram per cubic meter (Connecticut) to 73.8 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #1611[18].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylal can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure to high levels may cause you to feel dizzy, lightheaded, and to pass out. Methylal can irritate the eyes, nose, throat and skin. Very high levels may irritate the lungs. High exposure may damage the liver and kidneys.

Long-Term Exposure: The liquid removes the skin's natural oils. Repeated exposure may damage the liver and kidneys.

Points of Attack: Skin, eyes, respiratory system; central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2200 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). Unknown concentrations or IDLH conditions: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methylal must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, bromine, nitrates and permanganates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylal is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methylal should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylal. Wherever methylal is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1234 Methylal, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl alcohol is a colorless, volatile liquid with a mild odor. Molecular weight = 32.04; specific gravity (H_2O:1) = 0.79 @ 20°C; boiling point = 64.6°C; freezing/melting point = −98°C; vapor pressure = 75 mmHg @ 15°C; flash point = 12°C; autoignition temperature = 464°C. Explosive limit: LEL = 6.0%; UEL: 36.0%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Soluble in water.

Potential Exposure: Methyl alcohol is used as a starting material in organic synthesis of chemicals, such as formaldehyde, methacrylates, methyl amines, methyl halides; ethylene glycol and pesticides and as an industrial solvent for inks, resins, adhesives, and dyes. It is an ingredient in paint and varnish removers, cleaning and dewaxing preparations; spirit duplicating fluids; embalming fluids; antifreeze mixtures; and enamels and is used in the manufacture of photographic film; plastics, celluloid, textile soaps; wood stains; coated fabrics; shatterproof glass; paper coating; waterproofing formulations; artificial leather; and synthetic indigo and other dyes. It has also found use as an extractant in many other processes; an antidetonant fuel-injection fluid for aircraft; a rubber accelerator; and a denaturant for ethyl alcohol.

Incompatibilities: Methanol reacts violently with strong oxidizers, causing a fire and explosion hazard.

ERPG-3: 5000 ppm

DFG MAK: 200 ppm/270 milligram per cubic meter Peak Limitation Category II(4) [skin]; Pregnancy Risk Group C; BAT: 30 mg/L methanol in urine/end-of-shift; for long-term exposure, after several shifts

Arab Republic of Egypt: TWA 200 ppm (260 milligram per cubic meter) [skin], 1993; Australia: TWA 200 ppm (260 milligram per cubic meter); STEL 250 ppm [skin], 1993; Austria: MAK 200 ppm (260 milligram per cubic meter) [skin], 1999; Belgium: TWA 200 ppm (262 milligram per cubic meter); STEL 250 ppm [skin], 1993; Denmark: TWA 200 ppm (260 milligram per cubic meter) [skin], 1999; Finland: TWA 200 ppm (260 milligram per cubic meter); STEL 250 ppm [skin], 1999; France: VME 200 ppm, VLE 1000 ppm, 1999; Hungary: TWA 50 milligram per cubic meter; STEL 100 milligram per cubic meter [skin], 1993; Japan 200 ppm (260 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 260 milligram per cubic meter [skin], 2003; Norway: TWA 100 ppm (130 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (260 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter, MAC (STEL) 300 milligram per cubic meter, 1999; Russia: TWA 200 ppm; STEL 5 milligram per cubic meter [skin], 1993; Sweden: NGV 200 ppm (250 milligram per cubic meter), KTV 250 ppm (350 milligram per cubic meter) [skin], 1999; Thailand: TWA 200 ppm (260 milligram per cubic meter), 1993; Turkey: TWA 200 ppm (260 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (255 milligram per cubic meter); STEL 250 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 250 ppm [skin]. Russia[43] set a MAC in ambient air in residential areas of 1.0 milligram per cubic meter on a momentary basis and 0.5 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for methanol in ambient air[60] ranging from 0.036 milligram per cubic meter (Massachusetts) to 0.62 milligram per cubic meter (Kansas) to 2.6−3.1 milligram per cubic meter (North Dakota) to 4.3 milligram per cubic meter (Virginia) to 5.2 milligram per cubic meter (Connecticut and South Dakota) to 6.19 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method #2000, Methanol[18]; #2549 Volatile organic compounds; OSHA Analytical Method 91.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 3600 μg/L based on health effects. Russia[43] set a MAC in water bodies used for domestic purposes of 3 mg/L and in water bodies used for fishery purposes of 0.1 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = (estimated) < -0.77. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapor; percutaneous absorption of liquid; ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation*: Below 500 ppm symptoms are rarely felt. Can cause headache, vomiting, irritation of the nose and throat; dilation of the pupils; feeling of intoxication; loss of muscle coordination; excessive sweating; bronchitis and convulsions. Very high exposures may result in stupor, cramps and visual difficulties, such as spotted vision; sensitivity to light; eye tenderness and blindness. Recovery is not always complete and symptoms may recur without additional exposure. *Skin*: Can cause dry and cracked skin, irritation and reddening. Skin absorption can be enough to contribute to symptoms described under inhalation. *Eyes*: Can cause irritation of eyes. *Ingestion*: Symptoms are similar to those under inhalation, plus damage to liver, kidneys and heart. Nerve damage may occur causing loss of coordination and blindness. Recovery is not always complete. Death may occur. Usual fatal dose is about 100−250 mL but death from ingestion has occurred from as little as 30 mL (about 1 ounce).

Long-Term Exposure: Exposure to low levels may cause many of the symptoms listed above. Skin contact causes dryness and cracking. May cause liver damage. Because methyl alcohol is slowly eliminated from body, repeated low exposures may build-up to high levels, causing severe symptoms. Recovery is not always complete. Methanol has been found to be a teratogen (changes in the genetic material) in animals. Whether it does in humans is unknown.

Points of Attack: Eyes, skin, respiratory system; central nervous system; gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite) pH (Hydrogen ion concentration); whole blood (chemical/metabolite), pre- and postshift; blood plasma, bicarbonate, expired air, liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite) end-of-work-week; urine (chemical/metabolite) prior to next shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight. A NIOSH-certified CBRN full- facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APRs or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. **8 hours:** butyl rubber gloves, suits, boots; Teflon gloves, suits, boots; Viton gloves, suits, Saranex coated suits; 4H and Silver Shield gloves, Responder suits, Trellchem HPS suits; Trychem 1000 suits. Also, Viton/chlorobutyl rubber, polyvinyl acetate, styrene/butadiene rubber, Viton/Neoprene, butyl/Neoprene, and chlorinated polyethylene are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm*: Sa (APF = 10) (any supplied-air respirator). *5000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *6000 ppm*: SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*:

SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine). Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methyl alcohol is handled, used, or stored. Metal containers involving the transfer of 5 gal or more should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl alcohol.

Shipping: UN1230 Methanol, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous material. (International)

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn; risk phrases: R5; R12; R20; R21; R37/38; R41; safety phrases: S1; S2; S16; S26; S33; S38; S39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methylamine is a colorless gas with a fish- or ammonia-like odor; at low concentrations a fishy odor. Shipped as a liquefied compressed gas. The odor threshold is 3.2 ppm. Molecular weight = 31.06; specific gravity (H_2O:1) = 0.7 @ 20°C (liquid); boiling point = -6.3°C; freezing/melting point = -94°C; relative vapor density (air = 1) = 1.08; vapor pressure = 750 mmHg @° -7°C; flash point = flammable gas; autoignition temperature = 430°C. Explosive limits: LEL = 4.9%; UEL: 20.7%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 4, reactivity 0. Soluble in water.

Potential Exposure: Methylamine is used in organic synthesis; a starting material for *N*-oleyltaurine, a surfactant; and *p*-*N*-methylaminophenol sulfate, a photographic developer. It has possible uses in solvent extraction systems in separation of aromatics from aliphatic hydrocarbons. It is also used in the synthesis of many different pharmaceuticals; pesticides and rubber chemicals.

Incompatibilities: A medium-strong base. Reacts violently with strong acids; mercury, strong oxidizers; nitromethane. Corrosive to copper, zinc alloys; aluminum, and galvanized surfaces.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 1.27 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 10 ppm/12 milligram per cubic meter TWA

NIOSH REL: 10 ppm/12 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/6.4 milligram per cubic meter; 15 ppm/19 milligram per cubic meter STEL

PAC* Ver. 29[138]

PAC-1: $\mathbf{15_A}$ ppm

PAC-2: $\mathbf{64_A}$ ppm

PAC-3: $\mathbf{350_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 10 ppm/13 milligram per cubic meter TWA; Peak Limitation Category I(1); a momentary value of 10 mL/m^3/13 milligram per cubic meter should not be exceeded; Pregnancy Risk Group D

Australia: TWA 10 ppm (12 milligram per cubic meter), 1993; Austria: MAK 10 ppm (12 milligram per cubic meter), 1999; Belgium: TWA 10 ppm (13 milligram per cubic meter), 1993; Denmark: TWA 10 ppm (12 milligram per cubic meter) [skin], 1999; Finland: STEL 10 ppm (12 milligram per cubic meter) [skin], 1999; France: VLE 10 ppm (12 milligram per cubic meter), 1999; Japan: 10 ppm (13 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 6.4 milligram per cubic meter, 2003; Norway: TWA 10 ppm (12 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (12 milligram per cubic meter), 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 15 milligram per cubic meter, 1999; Russia: TWA 10 ppm; STEL 1 milligram per cubic meter [skin], 1993; Sweden: NGV 10 ppm (13 milligram per cubic meter), KTV 20 ppm (25 milligram per cubic meter) [skin], 1999; United Kingdom: TWA 10 ppm (13 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 15 ppm. Several states have set guidelines or standards for methylamine in ambient air[60] ranging from 28.6 μ/m^3 (Kansas) to 40.0 μ/m^3 (New York) to 120 μ/m^3 (Florida and North Dakota) to 200 μ/m^3 (Virginia) to 240 μ/m^3 (Connecticut) to 286 μ/m^3 (Nevada) to 300 μ/m^3 (South Carolina).

Determination in Air: Use OSHA Analytical Method 40.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for drinking purposes of 1.0 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.69$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylamine can affect you when breathed and by passing through your skin. Contact with the liquid can cause frostbite and severe burns of the eyes and skin. The vapor can irritate the eyes, nose, throat, and lungs. Higher levels can cause a build-up of fluid (pulmonary edema). This can cause death.

Long-Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking. May cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** Responder suits; Trychem 1000 suits. **4 hours:** Teflon gloves, suits, boots. Also, nitrile rubber, Styrene-butadiene rubber, Neoprene, Silvershield, and PVC are among the recommended protective materials. Prevent possible skin freezing from direct liquid contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid. Wear gas-proof chemical goggles and face shield when working with the gas, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm*: CcrFS (APF = 50) [any chemical cartridge respirator with a full facepiece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) [any PAPR with cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red: Flammability Hazard: Store in a flammable (liquid or solid materials) storage area or approved cabinet away from sources if ignition. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methylamine must be stored to avoid contact with mercury, flammable materials; and strong oxidizers, (such as chlorine dioxide, or bromine); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methylamine is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylamine. Wherever methylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1061 Methylamine, anhydrous, Hazard Class: 2.1; Labels: 2.1-Flammable gas. UN1235 Methylamine, aqueous solution, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: *Liquid*: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Alternatively, spread heavily with sodium bisulfate and sprinkle with water. Then drain into a sewer (see next sentence) with a large amount of water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylamine is a flammable liquid or gas. If you are dealing with gas, stop the flow of gas if it can be done safely. Use water to keep fire-exposed containers cool and to protect people attempting shut-off. For water solutions, use water spray, CO_2, dry chemical, and alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

EC Number: 203-767-1 [*Annex I Index No*.: 606-024-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xn; risk phrases: R10; R20/22; R26/28; R36/37/38; R40; R48/20/22; RSafety phrases: S2; S22/25; S24/25; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl amyl ketone is a clear colorless liquid with a mild, banana-like odor. Molecular weight = 114.19; specific gravity (H_2O:1) = 0.81 @ 20°C; boiling point = 151.1°C; freezing/melting point = −35.6°C; vapor pressure = 7.5 mmHg @ 36°C; flash point = 39°C; autoignition temperature = 393°C. Explosive limits: LEL = 1.1% @ 66°C; 15,000 ppm[138]; UEL: 7.9% @ 121°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 0. Poor solubility in water; solubility = 0.4%.

Potential Exposure: Methyl amyl ketone is used as a solvent in metal roll coatings and in synthetic resin finishes; as a solvent for nitrocellulose in lacquers and as a relatively inert reaction medium.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkalis, alkaline materials, strong acids, strong bases. Attacks some forms of plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 800 ppm
Conversion factor: 1 ppm = 4.67 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: 100 ppm/465 milligram per cubic meter TWA
NIOSH REL: 100 ppm/465 milligram per cubic meter TWA
ACGIH TLV[1]: 50 ppm/233 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 150 ppm
PAC-2: 670 ppm
PAC-3: 4000 ppm
Australia: TWA 50 ppm (235 milligram per cubic meter), 1993; Belgium: TWA 50 ppm (233 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (230 milligram per cubic meter), 1999; Finland: TWA 50 ppm (230 milligram per cubic meter); STEL 75 ppm (345 milligram per cubic meter), 1999; France: VME 50 ppm (235 milligram per cubic meter), 1999; Norway: TWA 25 ppm (115 milligram per cubic meter), 1999; Sweden: TWA 25 ppm (120 milligram per cubic meter); STEL 50 ppm (250 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 233 milligram per cubic meter, 2003; United Kingdom: LTEL 50 ppm (240 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 50 ppm. Several states have set guidelines or standards for methyl *n*-amyl ketone in ambient air[60] ranging from 2.35−4.65 milligram per cubic meter (North Dakota) to 3.9 milligram per cubic meter (Virginia) to 4.7 milligram per cubic meter (Connecticut) to 5.595 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Methods #1301; #2553, Ketones II[18]

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl *n*-amyl ketone can affect you when breathed in and by passing through your skin. Irritates the eyes and the respiratory tract. May affect the central nervous system. Breathing the vapor can cause dizziness and lightheadedness, and can make you pass out.

Long-Term Exposure: Causes skin irritation with cracking and drying; destroys the skin's natural oils. May cause liver and kidney damage. May affect the nervous system.

Points of Attack: Eyes, skin, respiratory system; central nervous system; peripheral nervous system.

Medical Surveillance: NIOSH lists the following tests: pulmonary function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **4 hours**: 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones.*

Respirator Selection: *800 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl (*n*-amyl) ketone must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, chlorates, nitrites, and permanganates, since violent reaction occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Sources of ignition, such as smoking and open flames are prohibited where methyl (*n*-amyl) ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN1110 *n*-Amyl Methyl ketone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 202-870-9 [*Annex I Index No*.: 612-015-00-5]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Suspected reprotoxic hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N; risk phrases: R10; R23/24/25; R33; R50/53; R61; safety phrases: S1/2; S28; S33; S36/37; S45; S50/53; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: *N*-Methylaniline is a yellow to light brown oily liquid with a weak, ammonia-like odor. Turns reddish-brown if left standing. The odor threshold is 1.7 ppm. Molecular weight = 107.17; specific gravity (H_2O:1) = 0.99 @ 20°C; boiling point = 195.6°C; freezing/melting point = −57°C; vapor pressure = 0.3 mmHg @ 20°C; flash point = 79.4°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Practically insoluble in water.

Potential Exposure: The material is used as an intermediate in organic synthesis, as a solvent and as an acid acceptor.

Incompatibilities: Reacts violently with strong acids; acid chlorides; acid anhydrides; strong oxidizers. Attacks some plastic.

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm

Conversion factor: 1 ppm = 4.38 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 2 ppm/9 milligram per cubic meter [skin] TWA

NIOSH REL: 0.5 ppm/2 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.5 ppm/2.2 milligram per cubic meter TWA [skin]

PAC Ver. 29[138]

PAC-1: 1.5 ppm

PAC-2: 17 ppm

PAC-3: 100 ppm

DFG MAK: 0.5 ppm/2.2 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group D

Arab Republic of Egypt: TWA 2 ppm (9 milligram per cubic meter) [skin], 1993; Australia: TWA 0.5 ppm (2 milligram per cubic meter) [skin], 1993; Austria: MAK 0.5 ppm (2 milligram per cubic meter) [skin], 1999; Belgium: TWA 0.5 ppm (2.2 milligram per cubic meter) [skin], 1993; Denmark: TWA 0.5 ppm (2.25 milligram per cubic meter) [skin], 1999; France: VME 0.5 ppm (2 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 2 milligram per cubic meter, 2003; Poland: MAC (TWA) 2 milligram per cubic meter, 1999; Turkey: TWA 2 ppm (9 milligram per cubic meter) [skin], 1993; United Kingdom: TWA 0.5 ppm (2.2 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm [skin]. Russia[43] set a MAC in ambient air in residential areas of 0.04 milligram per cubic meter (40 μ/m^3) both on a momentary and a daily average basis. Several states have set guidelines or standards for *n*-methylaniline in ambient air[60] ranging from 20 μ/m^3 (North Dakota) to 35 μ/m^3 (Virginia) to 40 μ/m^3 (Connecticut) to 47.6 μ/m^3 (Nevada).

Determination in Air: Bubbler; sodium hydroxide; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #3511.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.69$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylaniline can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Exposure to methylaniline can interfere with the ability of the blood to carry oxygen (methemoglobinemia). This can cause headaches, weakness, dizziness, dyspnea (breathing difficulty), cyanosis, a bluish color of the lips and nose. Higher exposure can cause shortness of breath; collapse and even death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can damage the bladder, causing bloody urine.

Long-Term Exposure: Repeated exposures may cause liver and kidney damage, and a low blood count (anemia). Repeated or prolonged contact may cause skin sensitization.

Points of Attack: Respiratory system, liver, kidneys, blood, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methhemoglobin; CBC; urinalysis (routine). Also, if symptoms develop or overexposure is suspected, the following may be considered: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm*: Sa (APF = 10) (any supplied-air respirator). *12.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *25 ppm*: SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *100 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methylaniline must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylaniline is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2294 *N*-Methylaniline, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.

Hazard Alert: Combustible liquid, Sensitization hazard, Chemical pneumonia hazard (if swallowed).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R10; R22; R36/37/38; R43; R50/53; safety phrases: S16; S26; S36/37; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl benzoate is a colorless, oily, transparent, liquid. Pleasant odor. Molecular weight = 136.16; specific gravity (H_2O:1) = 1.08 @ 20°C; boiling point = 199.9°C; freezing/melting point = −12.5°C; vapor pressure = 1 mmHg @ 39°C; flash point = 83°C. Explosive limits: LEL = 17,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: Used as food additive and as a solvent for cellulose esters and ethers, resins and rubber.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.57 milligram per cubic meter @ 25°C & 1-atm.

PAC Ver. 29[138]

PAC-1: 1.1 ppm

PAC-2: 12 ppm

PAC-3: 42 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Inhalation can cause coughing and wheezing. Swallowing the liquid may cause chemical pneumonia.

Long-Term Exposure: May cause skin sensitization and allergy. May cause an asthma-like allergy. Can affect the nervous system causing tremors and muscle weakness.

Points of Attack: Skin, lungs, nervous system.

Medical Surveillance: Evaluation by a qualified allergist. Lung function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician*: *Inhalation*: Bronchodialators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl benzoate all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; strong bases; oxidizers, nitrates. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: None found.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) Only as methyl bromide and ethylene dibromide mixture, liquid

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R23/25; R36/37/38; R48/20; R50; R59; R61; R62; R68; safety phrases: S1/2; S15; S27; S36/39; S38; S41; S45; S57; S59; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl bromide is a colorless gas with a chloroform-like odor at high concentrations. A liquid below 3.3°C. Shipped as a liquefied compressed gas. Molecular weight = 94.95; specific gravity (H_2O:1) = 1.73; boiling point = 3.3°C; freezing/melting point = −93.7°C; relative vapor density (air = 1) = 3.36; vapor pressure = 1.9 atm; flash point = practically nonflammable except in presence of a high energy ignition sources; autoignition temperature = 537°C. Explosive limits: LEL = 10.0%; UEL: 16.0%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0₩. Slightly soluble in water; solubility = 2%. Reacts with water; reaction is extremely slow, releasing methanol and hydrobromic acid.

Potential Exposure: Methyl bromide is used in fire extinguishers; as a fumigant in pest control and as a methylation agent in industry as an insect fumigant for soil, grain, warehouses, mills, ships, etc. It is also used as a chemical intermediate and a methylating agent; a refrigerant; a herbicide; a low-boiling solvent in aniline dye manufacture; for degreasing wool; for extracting oils from nuts, seeds, and flowers; and in ionization chambers. It is used as an intermediate in the manufacture of many drugs.

Incompatibilities: Attacks aluminum to form *spontaneously* flammable aluminum trimethyl. Incompatible with strong oxidizers, aluminum, dimethylsulfoxide, ethylene oxide; water. Attacks zinc, magnesium, alkali metals and their alloys. Attacks some rubbers and coatings. Methyl bromide reacts with water to generate hydrobromic acid and methanol but the reaction is so slow that it can be disregarded for most practical purposes[101].

Permissible Exposure Limits in Air

NIOSH IDLH = Ca. [250 ppm]

Conversion factor: 1 ppm = 3.89 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 20 ppm/80 milligram per cubic meter Ceiling Concentration [skin]

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 1 ppm/3.9 milligram per cubic meter [skin]; not classifiable as a human carcinogen

DFG MAK: [skin], Carcinogen Category 3B

PAC* Ver. 29[138]

PAC-1: 19 ppm

PAC-2: **210**$_{\mathbf{A}}$ ppm

PAC-3: **740**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Arab Republic of Egypt: TWA 5 ppm (20 milligram per cubic meter) [skin] 1993; Australia: TWA 5 ppm (20 milligram per cubic meter) [skin], 1993; Austria: Suspected: carcinogen, 1999; Denmark: TWA 5 ppm (20 milligram per cubic meter) [skin], 1999; Finland: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm (40 milligram per cubic meter) [skin], 1999; France: VME 5 ppm (20 milligram per cubic meter), 1999; Hungary: TWA 10 milligram per cubic meter; STEL 20 milligram per cubic meter [skin], 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter [skin], 2003; Norway: TWA 5 ppm (20 milligram per cubic meter), 1999; the Philippines: TWA 20 ppm (80 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 5 milligram per cubic meter, MAC (STEL) 40 milligram per cubic meter, 1999; Russia: STEL 1 milligram per cubic meter, 1993; Sweden: NGV 5 ppm (19 milligram per cubic meter), KTV 10 ppm (40 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 5 ppm (20 milligram per cubic meter), KZG-W 10 ppm (40 milligram per cubic meter) [skin], 1999; Thailand: TWA 20 ppm (80 milligram per cubic meter), 1993; Turkey: TWA 20 ppm (80 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (20 milligram per cubic meter); STEL 15 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. The Czech Republic: MAC 1.0 milligram per cubic meter. Russia has set MAC values for the ambient air in residential areas of 0.02 milligram per cubic meter on a momentary basis and 0.01 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for methyl bromide in ambient air[60] ranging from 2.6 μ/m^3 (Massachusetts) to 47.6 μ/m^3 (Kansas) to 100 μ/m^3 (South Carolina) to 200 μ/m^3 (North Dakota) to 350 μ/m^3 (Virginia) to 400 μ/m^3 (Connecticut) to 476 μ/m^3 (Nevada) to 480 μ/m^3 (Pennsylvania).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method 2520[18]; OSHA Analytical Method PV-2040.

Permissible Concentration in Water: *To protect human health*: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 1.9 μg/L[6]. States which have set guidelines for methyl bromide in drinking water[61] include Arizona @ 2.5 μg/L and Kansas at 0.19 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: $\text{Log } K_{ow} = 1.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, percutaneous absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl bromide irritates the respiratory tract. Inhalation of the gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the central nervous system; causing psychological disturbances. Signs and symptoms of acute exposure to methyl bromide may be severe and include tremors, convulsions, brain hemorrhage; paralysis, coma, and permanent brain damage. Respiratory effects include cough, tachypnea (rapid respiratory rate), pulmonary edema; and respiratory collapse. Cyanosis (blue tint to the skin and mucous membranes), pallor, ventricular fibrillation; and circulatory collapse may also occur. Lethargy, profound weakness; headache, dizziness, mental confusion; slurring of speech; staggering gait; and blurred or double vision are often found. Gastrointestinal signs and symptoms include nausea, vomiting, abdominal pain; and anorexia. Oliguria (scanty urination), anuria (lack of urine formation), kidney hemorrhage; and kidney failure may occur. Contact with methyl bromide may cause dermatitis (red, inflamed skin) and conjunctivitis (red, inflamed eyes). *Inhalation*: A level of 35 ppm can cause nausea, vomiting, loss of appetite; headache, dizziness, drowsiness and dimming of vision. These effects go away soon after exposure ceases. Headaches, dizziness, and weakness can be felt @ 100 ppm and can last for months after exposure. Higher levels have caused coughing, nose and throat irritation; disturbed speech and walk; visual disturbances; twitching, numbness, paralysis, convulsions and permanent nerve damage. Symptoms are often delayed 24 to 48 hours. Exposures of 10,000 ppm for a few minutes can cause death. Can cause abdominal cramps; respiratory failure resulting in death. *Skin*: Contact with liquid can cause burning or tingling sensation; itching, redness and swelling. Large amounts can cause blisters, numbness or aching pain. Methyl bromide can be absorbed through the skin and cause symptoms described under inhalation. Death has occurred from skin absorption. *Eye*: Can cause irritation, tearing, reddening or burning pain. *Ingestion*: Can cause throat and stomach irritation as well as symptoms described under inhalation. *Note*: Do not wear *ordinary rubber gloves* or *adhesive bandages* while using methyl bromide. It can dissolve rapidly through rubber or adhesive tape and cause severe symptoms.

Long-Term Exposure: Levels between 20 and 35 ppm can cause symptoms as described under short term inhalation. Symptoms can last months or years, or can be permanent. Repeated or prolonged contact with skin may cause dermatitis, lung damage and broncho-spasms. Methyl bromide may affect the central nervous system; causing paralysis, poor vision; psychological disorders; hallucinations, numbness in the arms and legs; brain damage. May cause liver and kidney damage. Methyl bromide is a mutagen and may have a cancer risk. May damage the testes.

Points of Attack: Eyes, skin, respiratory system; central nervous system; brain. Cancer site in animals: lung, kidney, and fore-stomach tumors.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood serum; chest X-ray, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); urine (chemical/metabolite). Evaluate the central nervous system; respiratory tract, and skin in preplacement and periodic examinations. Blood test for bromides (unexposed persons usually have serum levels of 5 mg/L or below). Kidney function tests. Evaluation for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 hours:** Responder suits; Trychem 1000 suits. **4 hours:** butyl rubber gloves, suits, boots; Neoprene rubber gloves, suits, boots; Teflon gloves, suits, boots. Also, Saranex and styrene-butadiene rubber are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Poison gas. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on non-wooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in well-ventilated area away from direct sunlight. Maintain temperature below 40°C; avoid heat sources. Protect against physical damage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: UN1062 Methyl bromide, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.3/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.2/1.9

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas, but only in presence of a high energy ignition source. It is nonflammable at room temperature. Thermal decomposition products may include hydrogen bromide and carbon monoxide. Establish forced ventilation to keep levels below explosive limit. If liquid is spilled, evacuate area of spill; absorb liquid in vermiculite, dry sand; earth, or similar material and deposit in sealed containers for later disposal. If gas is leaked, do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. A poisonous gas. Must be handled by experts: the recommended disposal procedure is to spray the gas into the fire box of an incinerator equipped with an afterburner and scrubber (alkali)[22].

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, animal Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Hazard Alert: Highly flammable, Polymerization hazard, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard. Listed for Tier 1 screening as an endocrine disruptor.[88]

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R11; R19; R48/23; R62; R63; R67; safety phrases: S1/2; S21; S36/37; R45; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl-*tert*-butyl ether is a colorless liquid. Molecular weight = 88.15; specific gravity (H_2O:1) = 0.74 @ 20°C; boiling point = 55°C; freezing/melting point = −109°C; vapor pressure = 75 mmHg @ −2°C;

flash point = −10°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 1. Soluble in water.

Potential Exposure: Used as an organic solvent; as an octane booster in unleaded gasolines; in making other chemicals; and in medicine to dissolve gall stones.

Incompatibilities: May form explosive mixture with air. May be able to form unstable peroxides. Much less likely to form peroxides than other ethers. Incompatible with strong acids. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May accumulate static electrical charges, and cause ignition of its vapors.

(275 milligram per cubic meter), 2000; the Netherlands: MAC-TGG 180 milligram per cubic meter, 2003

Determination in Air: Use NIOSH Analytical Method #1615, MTBE.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause difficulty concentrating and thinking. Higher levels can cause headache, nausea, dizziness, weakness and lightheadedness.

Long-Term Exposure: May cause kidney damage. May cause tumors.

Points of Attack: Kidneys.

Medical Surveillance: Kidney function tests. The use of alcoholic beverages should be avoided before or during use.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Do not drink any alcoholic beverages before or during use.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with MTBE all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers; strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2398 Methyl *tert*-butyl ether, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Solid streams of water may spread fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): No value found. [1-Low hazard to water. (est.)].

Description: MNBK is a colorless liquid with an acetone-like odor. The odor threshold is 0.08 ppm. Molecular weight = 100.18; specific gravity (H_2O:1) = 0.83 @ 20°C; boiling point = 127°C; freezing/melting point = −57°C; vapor pressure = 10 mmHg @ 39°C; flash point = 25°C (cc); autoignition temperature = 423°C. Explosive limits: LEL = 1.2%; UEL: 8.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: The material is used as a solvent.

Incompatibilities: Vapors may form explosive mixture with air. Violent reaction with oxidizers. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. May form unstable peroxides. Attacks plastics. May accumulate static electrical charges, and cause ignition of its vapors.

Permissible Exposure Limits in Air

NIOSH IDLH = 1600 ppm

Conversion factor: 1 ppm = 4.10 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm/410 milligram per cubic meter TWA

NIOSH REL: 1 ppm/4 milligram per cubic meter TWA

ACGIH TLV[1]: 5 ppm/20 milligram per cubic meter TWA; 10 ppm/40 milligram per cubic meter STEL [skin]

DFG MAK: 5 ppm/21 milligram per cubic meter TWA; Peak Limitation Category II(8) [skin]; BAT: 5 mg [hexane-2,5-dione + 4,5-dihydroxy-2-hexanone]/L in urine at end-of-shift

PAC Ver. 29[138]

PAC-1: 10 ppm

PAC-2: 830 ppm

PAC-3: 5000 ppm

Australia: TWA 5 ppm (20 milligram per cubic meter), 1993; Austria: MAK 5 ppm (21 milligram per cubic meter), 1999; Belgium: TWA 5 ppm (20 milligram per cubic meter) [skin], 1993; Denmark: TWA 1 ppm (4 milligram per cubic meter) [skin], 1999; Finland: TWA 5 ppm (20 milligram per cubic meter); STEL 10 ppm (40 milligram per cubic meter) [skin], 1999; France: VME 5 ppm (20 milligram per cubic meter), VLE 8 ppm (35 milligram per cubic meter), 1999; Hungary: TWA 20 milligram per cubic meter; STEL 40 milligram per cubic meter [skin], 1993; the Netherlands:

MAC-TGG 2 milligram per cubic meter, 2003; Norway: TWA 1 ppm (4 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (410 milligram per cubic meter), 1993; Poland: MAC (TWA) 10 milligram per cubic meter, MAC (STEL) 50 milligram per cubic meter, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 1 ppm (4 milligram per cubic meter), KTV 2 ppm (8 milligram per cubic meter) [skin], 1999; Turkey: TWA 100 ppm (410 milligram per cubic meter), 1993; United Kingdom: TWA 5 ppm (21 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 ppm [skin]. Several states have set guidelines or standards for MBK in ambient air[60] ranging from 54 μ/m^3 (Massachusetts) to 80 μ/m^3 (Connecticut) to 200 μ/m^3 (North Dakota) to 350 μ/m^3 (Virginia) to 476 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1300, Ketones, #2555; OSHA Analytical Method PV-2031[18].

Determination in Water: Octanol–water coefficient: $\text{Log } K_{ow} = 1.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl-*n*-butyl ketone can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. May affect the nervous system. Exposure may result in unconsciousness. Overexposure can cause you to feel dizzy and lightheaded and to pass out.

Long-Term Exposure: Repeated or prolonged contact with skin may cause drying and cracking. Exposure can damage the nerves, causing numbness and weakness, especially in the hands and feet. The vapor can irritate eyes, nose, and throat. There is limited evidence that this chemical may have reproductive effects. It may damage the male reproductive system. Handle with extreme caution. Exposure to other aliphatic monoketones e.g., methyl ketone, methyl propyl ketone, methyl amyl ketone, hexyl ketone, etc.) may exacerbate the nerve damage caused by this chemical.

Points of Attack: Eyes, skin, respiratory system; central nervous system; peripheral nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, the following are recommended: exam of the nervous system. CBC. If symptoms develop or overexposure has occurred, the following may be useful: Nerve conduction tests should be considered. For males who suspect any problems conceiving a child, semen analysis and sperm count may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Saranex is recommended in the literature. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *10 ppm*: Sa (APF = 10) (any supplied-air respirator). *25 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 ppm*: SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1600 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methyl *n*-butyl ketone must be stored to avoid contact with strong oxidizers (such as peroxides, chlorates, perchlorates, permanganates, and nitrates) because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, and flames. Sources of ignition, such as smoking and open flames are prohibited where methyl *n*-butyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gal or more of methyl *n*-butyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl *n*-butyl ketone.

Shipping: UN1224 Ketones, liquid, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methyl chloride is a colorless gas with a faint, sweet odor which is not noticeable at dangerous concentrations. The odor threshold is 10 ppm. Shipped as a liquefied compressed gas. Molecular weight = 50.49; specific gravity (H_2O:1) = 0.92; boiling point = −24.1°C; freezing/melting point = −97.7°C; relative vapor density (air = 1) = 1.78; vapor pressure = 750 mmHg @ −24.4°C; flash point = flammable gas; autoignition temperature = 632°C. Explosive limits: LEL = 8.1%; 55,000 ppm[138]; UEL: 17.4%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Slightly soluble in water (reaction); solubility 0.5%.

Potential Exposure: Methyl chloride is used as a methylating and chlorinating agent in organic chemistry; Used in production of silicones and tetramethyl lead. In petroleum refineries it is used as an extractant for greases, oils, and resins. Methyl chloride is also used as a solvent in the synthetic rubber industry; as a refrigerant; and as a propellant in polystyrene foam production. In the past it has been used as a local anesthetic (freezing). It is an intermediate in drug manufacture.

Incompatibilities: Violent reaction with chemically active metals, such as potassium, powdered aluminum; zinc, and magnesium. Reaction with aluminum trichloride, ethylene. Reacts with water (hydrolyzes) to form hydrochloric acid. Attacks many metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 2000 ppm, potential occupational carcinogen

OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 300 ppm [5 minutes max peak in any 3 hours] [skin]

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 50 ppm/103 milligram per cubic meter TWA; 100 ppm/207 milligram per cubic meter STEL; [skin]; not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: 150 ppm

PAC-2: **910**$_{\mathbf{A}}$ ppm

PAC-3: **3000**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 50 ppm/100 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group B; Carcinogen Category 3

Arab Republic of Egypt: TWA 50 ppm (105 milligram per cubic meter), 1993; Australia: TWA 50 ppm (105 milligram per cubic meter); STEL 100 ppm, 1993; Austria: MAK 50 ppm (105 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (103 milligram per cubic meter); STEL 100 ppm (207 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (105 milligram per cubic meter), 1999; Finland: TWA 50 ppm (105 milligram per cubic meter); STEL 75 ppm (160 milligram per cubic meter), 1999; France: VME 50 ppm (105 milligram per cubic meter), VLE 100 ppm, carcinogen, 1999; the Netherlands: MAC-TGG 52 milligram per cubic meter, 2003; Japan: 50 ppm (100 milligram per cubic meter), 1999; Norway: TWA 25 ppm (50 milligram per cubic meter), 1999; the Philippines: TWA 100 ppm (210 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter; STEL 160 milligram per cubic meter, 1999; Russia: TWA 50 ppm; STEL 5 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (100 milligram per cubic meter), KTV 100 ppm (200 milligram per cubic meter), 1999; Switzerland: MAK-W 50 ppm (105 milligram per cubic meter), KZG-W 100 ppm (210 milligram per cubic meter); Thailand: TWA 100 milligram per cubic meter; STEL 200 milligram per cubic meter, 1993; Turkey: TWA 100 ppm (210 milligram per cubic meter), 1993; United Kingdom: TWA 50 ppm (105 milligram per cubic meter); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, IN New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 100 ppm [skin]. Several states have set guidelines or standards for methyl chloride in ambient air[60] ranging from 1.6 μ/m^3 (Michigan) to 74.12 μ/m^3 (Kansas) to 1050−2050 μ/m^3 (North Dakota) to 1750 μ/m^3 (Virginia) to 2100 μ/m^3 (Connecticut and New York) to 2500 μ/m^3 (Nevada) to 2520 μ/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method (IV) #1001.

Permissible Concentration in Water: *To protect human health*: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 1.9 μg/L[6]. In addition, Several states have set guidelines for methyl chloride in drinking water[61] ranging from 0.19 μg/L (Kansas) to 0.50 μg/L (Arizona).

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography and mass spectrometry (EPA Method #624). Octanol−water coefficient: Log $K_{ow} = 0.9$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Illness has been reported at concentrations of 500 ppm. 10,000 ppm for 30 minutes has caused death. Can cause nausea, vomiting, painful neck; loss of appetite. More severe exposure may result in the above plus headache; diarrhea, dizziness, loss of coordination; tremors of hands and lips; drooping eyelids and eye twitch. Very severe exposure may include the above plus burning sensation in mouth and throat; mustard-like taste; difficulty in swallowing; hallucinations, loss of memory; cold and clammy skin; rapid breathing; unconsciousness, coma and death. Onset of symptoms may be delayed several hours after exposure. Effects may last weeks or months. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin*: Contact with liquefied gas may cause freezing of skin, burns and permanent damage. Other symptoms are muscular pain, anemia, muscle weakness and fever. *Eyes*: Contact with the liquid can cause frostbite and severe burns, leading to permanent damage. May cause dimness of sight and abnormally dilated pupils. *Ingestion*: Ingestion of liquefied gas will cause freezing of mouth and throat.

Long-Term Exposure: Long-term exposure may affect the testes, causing decreased production of male hormones and sperm. There is limited evidence that methyl chloride causes kidney cancer in animals. May damage the liver and kidneys. May cause brain damage. May cause blurred or double vision, and "drunken" behavior.

Points of Attack: Central nervous system; liver, kidneys, brain, reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that. Lung function tests. Exam of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Kidney function tests. Liver function tests. Examination for brain effects. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 hours:** Viton gloves, suits, Saranex coated suits, Barricade coated suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits. **4 hours:** Teflon gloves, suits, boots. Prevent possible skin freezing from direct liquid contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Flammable gas. Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl chloride must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) or chemically active metals (such as sodium, potassium; powdered aluminum; zinc, and magnesium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and direct sunlight. Sources of ignition, such as smoking and open flames are prohibited where methyl chloride is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever methyl chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1063 Methyl chloride, or Refrigerant gas R 40, Hazard Class: 2.1; Labels: 2.1-Flammable gas. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration with adequate scrubbing and ash disposal facilities.

Hazard Alert: Highly flammable liquid, Highly toxic, Corrosive, Polymerization hazard, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction)
Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)
Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)
Hazard symbols, risk, & safety statements: Hazard symbol: C, F, T+; risk phrases: R11; R19; R23/24/25; R34; R50/53; safety phrases: S9; S16; S21; S25; S26; S28; S33; S38; S36/37/39; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to water. (est.)].
Description: Methyl 2-chloroacrylate is a colorless liquid. Molecular weight = 120.54; specific gravity (H_2O:1) = 1.89 @ 20°C; boiling point = 52.22°C; vapor pressure = 12 mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 0. Slightly soluble in water; solubility = < 1 mg/mL @ 22°C.
Potential Exposure: Used to make acrylic high polymer with properties closely resembling those of polymethylmethacrylate. Monomer for specialty polymers e.g., aircraft glazing)[72]. Corrosive. Lacrimator.
Incompatibilities: Vapor may form explosive mixture with air. May hydrolyze upon contact with moisture. Incompatible with nitrates. Methyl 2-chloroacrylate is sensitive to prolonged exposure to light, moisture and heat[101]. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, and polymerizers. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). May be a polymerization hazard.
Permissible Exposure Limits in Air
PAC Ver. 29[138]
PAC-1: 0.091 ppm
PAC-2: 1 ppm
PAC-3: 36 ppm
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short-Term Exposure: Corrosive and a lacrimator. It is a skin, eye, and lung irritant; may cause skin burns and eye damage. A trace on skin causes large blisters. Inhalation of high concentrations may cause rapid breathing; headache, nausea, lethargy, convulsions, and death. Also, high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.
Points of Attack: Lungs.
Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2929 Toxic liquids, flammable, organic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Technical Name Required.

Spill Handling:

Toxic liquids, flammable, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.9/4.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen chloride and oxides of carbon. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methyl chloroformate is a colorless liquid with an unpleasant, acrid odor. This is a highly corrosive and flammable material. Molecular weight = 94.5; specific gravity (H_2O:1) = 1.22; boiling point = 71°C; freezing/melting point = −61°C; flash point = 17°C; autoignition temperature = 504°C. Explosive limits: LEL = 55,000 ppm; UEL: unknown. Flammability limits: LEL = 6.7%; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 1₩. Slightly soluble in water reacts forming hydrogen chloride, methanol and oxides of carbon.

Potential Exposure: Used in synthesis of pharmaceuticals; herbicides, plastics and other organic chemicals; as a solvent in the photographic industry; as a chemical intermediate in the production of other chemicals. In WWI it was used as military tear-producing warfare agent.

Incompatibilities: May form explosive mixture with air. Violent reaction with alkali metals; ethers. Incompatible with strong acids; strong bases; alcohols, oxidizers, dimethylsulfoxide; dimethyl formamide. Contact with water or moisture produces corrosive and poisonous hydrogen chloride gas, methanol and carbon monoxide. Corrodes metals in the presence of moisture. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air
PAC* Ver. 29[138]
PAC-1: 0.6 ppm
PAC-2: **2.2**$_{\mathbf{A}}$ ppm
PAC-3: **6.7**$_{\mathbf{A}}$ ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.
DFG MAK: 0.2 ppm/0.78 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group C

Routes of Entry: Ingestion, inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Can be fatal if ingested or inhaled. A concentration of 190 ppm has been lethal in 10 minutes. Highly corrosive, contact can irritate and burn the skin and eyes, with possible permanent damage. Inhalation irritates the respiratory tract causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Can cause sensitization and skin allergy. Can cause lung irritation and bronchitis. After 2−3 inhalations, brief initial irritation may occur followed by massive symptoms (heavy cough) after 36 hours. Relapse may occur in the following days with eventual recovery.

Points of Attack: Skin, lungs.

Medical Surveillance. Lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area.(1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl chloroformate all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from all forms of moisture, oxidizers, strong acids; strong bases. See incompatibilities for other materials to avoid. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1238 Methyl chloroformate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material Inhalation Hazard Zone A.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 1.4/2.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride, phosgene and oxides of carbon. *Do not use water*. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Methyl Cyanoacrylate M:0790

Formula: $C_5H_5NO_2$: $CH_2{=}C(CN)COOCH_3$

Synonyms: Acrylic acid, 2-cyano-, methyl ester; Adhere; 2-Cyanoacrylic acid methyl ester; Eastman 910 monomer; Mecrylate; 2-Propenoic acid, 2-cyano-, methyl ester; Super Bonder; Super Glue

CAS Registry Number: 137-05-3

HSDB Number: 1207
RTECS Number: AS7000000
UN/NA & ERG Number: UN3334 (Aviation regulated liquid, n.o.s.)/171 (ICOA/IATA)
EC Number: 205-275-2 [*Annex I Index No.*: 607-235-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Suspected reprotoxic hazard, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R10; R36/37/38; R62; safety phrases: S2; S23; 24/25; S26; S41 (see Appendix 4).

Description: Methyl cyanoacrylate is a thick, clear liquid adhesive. The odor threshold is 2.2 ppm. Molecular weight = 111.11; specific gravity (H_2O:1) = 1.10 @ 27°C; boiling point = 201°C; freezing/melting point = −23°C; vapor pressure = 0.2 mmHg @ 20°C; flash point = 78.9°C. Explosive limits: LEL = 15,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 1. Insoluble in water.

Potential Exposure: Methyl 2-cyanoacrylate is used in production of coatings and textiles; in the manufacture of quick-setting, high-strength, adhesive cements. Often found around the home; bonds eyes and skin in seconds. *Keep out of the reach of children*.

Incompatibilities: Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur). Reacts violently with water, bases, and peroxides. Contact with alcohols, water, amines, and alkalis can cause rapid polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.54 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 2 ppm/8 milligram per cubic meter TWA; 4 ppm/16 milligram per cubic meter STEL
ACGIH TLV[1]: 0.2 ppm/1 milligram per cubic meter TWA
PAC Ver. 29[138]
PAC-1: 0.6 ppm
PAC-2: 0.85 ppm
PAC-3: 5.1 ppm
DFG MAK: 2 ppm/9.2 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D

Australia: TWA 2 ppm (8 milligram per cubic meter); STEL 4 ppm, 1993; Austria: MAK 2 ppm (8 milligram per cubic meter), 1999; Belgium: TWA 2 ppm (9.1 milligram per cubic meter); STEL 4 ppm (18 milligram per cubic meter), 1993; Denmark: TWA 2 ppm (8 milligram per cubic meter), 1999; Finland: TWA 2 ppm (9 milligram per cubic meter); STEL 4 ppm (18 milligram per cubic meter) [skin], 1993; France: VME 2 ppm (8 milligram per cubic meter), VLE 4 ppm (16 milligram per cubic meter), 1999; Norway: TWA 2 ppm (8 milligram per cubic meter), 1999; Sweden: NGV 2 ppm (9 milligram per cubic meter), KTV 4 ppm (18 milligram per cubic meter), 1999; Switzerland: MAK-W 2 ppm (9 milligram per cubic meter), 1999; United Kingdom: STEL 0.3 ppm (1.4 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.2 ppm. Several states have set guidelines or standards for methyl cyanoacrylate in ambient air[60] ranging from 48 μ/m^3 (Nevada) to 80−160 μ/m^3 (North Dakota) to 130 μ/m^3 (Virginia) to 160 μ/m^3 (Connecticut).

Determination in Air: Use OSHA Analytical Method 55.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl 2-cyanoacrylate can affect you when breathed in. Exposure can irritate the eyes, nose and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Inhalation of vapor may cause an asthmatic reaction. Contact can irritate the eyes and skin. Capable of instantly gluing skin tissue.

Long-Term Exposure: Methyl 2-cyanoacrylate may cause a skin allergy to develop. Once an allergy has developed, even very small future exposures will cause rash and itching. Repeated exposure may affect the liver and kidneys. May be able to cause lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with plenty of soap and water. Remove cured adhesive with hot soapy water. Do not pull or scrape off adhesive as skin can also come off. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 2* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA approve SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methyl 2-cyanoacrylate must be stored to avoid contact with water, alkaline materials or peroxides, since violent reactions occur. Store in original containers under refrigerated conditions at 2 to 8°C. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN3334 Aviation regulated liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material. Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include cyanide and nitrogen oxides. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Avoid water unless you can flood the area. Water causes methyl 2-cyanoacrylate to polymerize and possibly to ignite spontaneously. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction), Static charge accumulation possible/low flash point and LEL.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F; Xn, N; risk phrases: R11; R38; R51/53; R38; R65; R67; safety phrases: S2; S9; S16; S21; S33; S61; S62; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methylcyclohexane, an alkene, is a colorless liquid with a faint benzene-like odor. The odor threshold is

630 ppm (this is above the OEL). Molecular weight = 98.21; specific gravity (H_2O:1) = 0.79 @ 20°C; boiling point = 100°C; freezing/melting point = −126°C; vapor pressure = 40 mmHg @ 22°C; flash point = −3.9°C (cc), −5.9°C (oc); autoignition temperature = 258°C. Explosive limits: LEL = 1.1%; UEL: 6.7%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Insoluble in water.

Potential Exposure: Methylcyclohexane is used as a solvent for cellulose derivatives particularly with other solvents; and as an organic intermediate in organic synthesis. A component of jet fuel.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 1200 ppm

OSHA PEL: 500 ppm/2000 milligram per cubic meter TWA

NIOSH REL: 400 ppm/1600 milligram per cubic meter TWA

ACGIH TLV[1]: 400 ppm/1610 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 1200 ppm (10−49% LEL)

PAC-2: 1700 ppm (10−49% LEL)

PAC-3: 10,000 ppm (50−99% LEL)

DFG MAK: 200 ppm/810 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D

Australia: TWA 400 ppm (1600 milligram per cubic meter), 1993; Belgium: TWA 400 ppm (1610 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (805 milligram per cubic meter), 1999; Finland: TWA 400 ppm (1600 milligram per cubic meter); STEL 500 ppm (2000 milligram per cubic meter), 1999; France: VME 400 ppm (1600 milligram per cubic meter), 1999; Japan: 400 ppm (1600 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 1600 milligram per cubic meter, 2003; the Philippines: TWA 500 ppm (2000 milligram per cubic meter), 1993; Poland: MAC (TWA) 500 milligram per cubic meter, MAC (STEL) 2000 milligram per cubic meter, 1999; Russia: TWA 400 ppm; STEL 50 milligram per cubic meter, 1993; Switzerland: MAK-W 400 ppm (1600 milligram per cubic meter), KZG-W 800 ppm (3200 milligram per cubic meter), 1999; Turkey: TWA 500 ppm (2000 milligram per cubic meter), 1993; United Kingdom: LTEL 400 ppm (1600 milligram per cubic meter); STEL 500 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 400 ppm. Several states have set guidelines or standards for methyl cyclohexane in ambient air[60] ranging from 16−20 milligram per cubic meter (North Dakota) to 27 milligram per cubic meter (Virginia) to 32 milligram per cubic meter (Connecticut) to 38.095 milligram per cubic meter (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1500 for Hydrocarbons, BP 36−126°C[18].

Permissible Concentration in Water: Vermont has set a guideline for drinking water of 28.6 mg/L[61].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Harmful if inhaled or swallowed. Vapor or mist is irritating to the eyes, mucous membrane and upper respiratory tract and skin. Narcotic effects and dermatitis[136,1999].

Short-Term Exposure: Methylcyclohexane can affect you when breathed in. Irritates the eyes, skin and respiratory tract. May affect the central nervous system; exposure may cause dizziness, lightheadedness. High levels may act as an anesthetic. Unconsciousness and death may occur at higher levels. Aspiration hazard. Ingesting or breathing the liquid may cause chemical pneumonitis. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of chemical pneumonitis or pulmonary edema are aggravated by physical effort. This can result in death.

Long-Term Exposure: Prolonged or repeated skin contact can cause cracking and drying of exposed areas. May affect the liver and kidneys. Possible sensitization of the skin or lungs.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys, liver.

Medical Surveillance: Liver and kidney function tests. Check for chemical pneumonia. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Evaluation by a dermatologist. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1200 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Methylcyclohexane must be stored to avoid contact with strong oxidizers, (such as chlorine, bromine, chlorine oxide, nitrates and permanganates), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methylcyclohexane is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methylcyclohexane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methylcyclohexane.

Shipping: UN2296 Methylcyclohexane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire-fighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Methylcyclohexanol is a straw-colored liquid. Weak, menthol-like odor. The odor threshold is 490 ppm. (higher than the OEL). Molecular weight = 114.21; specific gravity (H_2O:1) = 0.92; boiling point = 155−180°C (technical grade); freezing/melting point = −50°C; vapor pressure = 2 mmHg @ 30°C; flash point = 65−68°C; autoignition temperature = 296°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: Methylcyclohexanol is used as a lacquer solvent; as a blending agent in textile soaps and as an antioxidant in lubricants.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Attacks some plastics, rubber, and coatings.

Several states have set guidelines or standards for methyl cyclohexanol in ambient air[60] ranging from 2.35−3.5 milligram per cubic meter (North Dakota) to 3.9 milligram per cubic meter (Virginia) to 4.7 milligram per cubic meter (Connecticut) to 5.595 milligram per cubic meter (Nevada).

Determination in Air: Charcoal tube; CH_2Cl_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1404. See also NIOSH: Methylcyclohexanol Method #S374.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.1. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylcyclohexanol can affect you when breathed in and by passing through your skin. Irritates the eyes and the skin. High levels of the vapor may cause irritation of eyes and upper respiratory tract. Repeated or prolonged exposure can cause headaches, irritation of the eyes, nose, and throat; and can also cause a skin rash. High exposures from skin contact or inhalation may cause damage to the heart, liver, kidneys, and lungs, and may result in death.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin rash. Animal studies have shown this chemical to cause liver and kidney damage.

Points of Attack: Eyes, skin, respiratory system; central nervous system; kidneys, liver.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful. Lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable

probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methylcyclohexanol must be stored to avoid contact with strong oxidizers (such as peroxides, chlorates, perchlorates, nitrates, and permanganates), since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where methylcyclohexanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2617 Methylhexylhexanone, flammable, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R3; R11; R20/21; R36/37; safety phrases: S2; S25; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: *o*-Methylcyclohexanone is a colorless liquid with a weak peppermint-like odor (also reported to be acetone-like). Molecular weight = 112.19; specific gravity (H_2O:1) = 0.92 @ 20°C; boiling point = 165°C; freezing/melting point = −13.9°C; flash point = 47.8°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: Methylcyclohexanone is used as a solvent in making varnish, plastics, and as a rust remover. Also used in the leather industry.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with peroxides may form unstable heat- and shock-sensitive explosives.

Several states have set guidelines or standards[60] for methylcyclohexanone in ambient air ranging from 2.3−3.45 milligram per cubic meter (North Dakota) to 3.9 milligram per cubic meter (Virginia) to 4.6 milligram per cubic meter (Connecticut) to 5.476 milligram per cubic meter (Nevada).

Determination in Air: Collection in an adsorption tube, workup with acetone; analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #2521[18].

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: *o*-Methylcyclohexanone can affect you when breathed in and by passing through your skin. It can irritate the skin, eyes, nose, and throat. Breathing the vapor can cause headaches, dizziness, or lightheadedness. Contact can strongly irritate and even damage the eyes.

Long-Term Exposure: Repeated or prolonged contact with skin may cause dermatitis to develop with thickening and cracking. May affect the liver, kidneys, and lungs.

Points of Attack: Skin, respiratory system; liver, kidneys, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: Sa (APF = 10) (any supplied-air respirator). *600 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front—or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. *o*-methylcyclohexanone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where *o*-Methylcyclohexanone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2297 Methylcyclohexanone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methylcyclopentane M:0830

Formula: C_6H_{12}; $C_5H_9CH_3$

Synonyms: Cyclopentane, methyl-; MCP; Methylcyclopentane; Methylpentamethylene

CAS Registry Number: 96-37-7

HSDB Number: 876

RTECS Number: GY4640000

UN/NA & ERG Number: UN2298/128

EC Number: 202-503-2

Regulatory Authority and Advisory Information

Hazard Alert: Extremely flammable, Electrostatic hazard, Narcotic fumes.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn; risk phrases: R12; R22; R20/21/22; R36/37/38; R65; safety phrases: S16; S21; S24/25; S26; S36/37; S45; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found [1-Low hazard to water. (est.)].

Description: Methyl cyclopentane is a colorless liquid with a sweet gasoline-like odor. Molecular weight = 84.18; specific gravity (H_2O:1) = 0.75 @ 20°C; boiling point = 71.8°C; freezing/melting point = −142°C; vapor pressure = 100 mmHg @ 17.9°C; flash point = < −23.8°C; autoignition temperature = 228.9°C. Explosive limits: LEL = 1.0%; UEL: 8.35%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0.

Potential Exposure: This material is used as a solvent; as a fuel; and in chemical synthesis.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH: 100 ppm/350 milligram per cubic meter TWA; STEL 510 ppm/1800 milligram per cubic meter [15 minutes]

ACGIH TLV[1]: 500 ppm/1760 milligram per cubic meter TWA; 1000 ppm/3500 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 14 ppm

PAC-2: 160 ppm

PAC-3: 940 ppm

DFG MAK: 500 ppm/1800 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Determination in Air: Charcoal tube; CS_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1500, for Hydrocarbons, BP 36−126°C.

Determination in Water: Log $K_{ow} = > 3$. Values above 3.0 are likely to bioaccumulate in aquatic organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylcyclopentane can affect you when breathed in. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Higher levels can cause death. Exposure can irritate the eyes, nose and throat. Contact can irritate the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Can cause central nervous system excitement followed by depression.

Long-Term Exposure: May cause damage to the nervous system.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Examination of the respiratory system and nervous system. Medical observation and rest is recommended for 24 to 48 hours after breathing overexposure, as asthma symptoms may be delayed. If signs of allergy are detected, the exposed person(s) should avoid all further contact with this chemical. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to liquid methyl cyclopentane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl cyclopentane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where methyl cyclopentane is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl cyclopentane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl cyclopentane. Wherever methyl cyclopentane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2298 Methyl cyclo pentane, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl cyclopentane is a flammable liquid. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Water may be ineffective on fire. Thermal decomposition products may include oxides of carbon. Establish forced ventilation to keep levels below explosive limit. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

RTECS Number: VV3500000

UN/NA & ERG Number: (PIH) UN1242/139

EC Number: 200-877-1

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Highly flammable liquid, Pyrophoric hazard, Violently reactive with water (dangerous when wet), Corrosive, Primary irritant (w/o allergic reaction).

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard symbols, risk, & safety statements: Hazard symbol: F, T+, C; Xn; risk phrases: R11; R14/15; R17; R20/22; R28; R29; R34; R35; R36/37/38; R34; R40; R43; R45; R51; safety phrases: S1; S7/9; S16; S21; S22; S26; S30; S36/37/39; S41; S43; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl dichlorosilane is a clear, straw-colored liquid. Molecular weight = 115.04; specific gravity (H_2O:1) = 1.1 @ 27°C; boiling point = 41°C; freezing/melting point = −93°C; vapor pressure = 429 mmHg @ 25°C; flash point = −9°C; autoignition temperature = 316°C. Explosive limits: LEL = 6.0%; 2000 ppm[138]; UEL: 55.0%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2₩. Reacts violently with water, rapidly releasing heat, gaseous hydrogen chloride and flammable hydrogen.

Potential Exposure: This material is used to make siloxanes and other silicone polymer (polysiloxane) materials.

Incompatibilities: May form explosive mixture with air. Reacts violently with water producing heat, corrosive hydrochloric acid and flammable hydrogen. Methyl dichlorosilane may spontaneously ignite on contact with air (even under inert gas) and on contact with potassium permanganate, lead(II) oxide; copper oxide; silver oxide. Violent reaction with oxidizers. Decomposes on contact with hot surfaces or flames producing toxic and corrosive fumes including silicon oxides, hydrogen chloride, and phosgene. Decomposes on contact with alkaline compounds producing highly flammable hydrogen gas. Corrodes many metals in presence of water. Attacks some plastics, rubber and coatings.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: **0.90**$_{\mathbf{A}}$ ppm

PAC-2: **11**$_{\mathbf{A}}$ ppm

PAC-3: **50**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. ***face***.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl dichlorosilane is a corrosive chemical and contact can cause severe eye and skin burns leading to permanent damage. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a build-up of fluid in the lungs (pulmonary edema). This can cause death.

Long-Term Exposure: May cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposure to methyl dichlorosilane, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Protect from all forms of moisture. (1) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl dichlorosilane must be stored to avoid contact with water; violent reactions occur once hydrogen chloride and heat is produced. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl dichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl dichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl dichlorosilane. Wherever methyl dichlorosilane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1242 Methyldichlorosilane Hazard Class: 4.3; Labels: 4.3-Dangerous when wet material; 8-Corrosive material, 3-Flammable liquid.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

when spilled in water

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.5/0.8
Night 1.6/2.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in dry lime, dry sand; soda ash or a similar material and deposit in sealed containers. Following cleanup neutralize spill area by flushing with large quantities of water and then treat spill area with sodium bicarbonate. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl dichlorosilane is a flammable liquid and may spontaneously ignite in air. Thermal decomposition products may include hydrogen chloride, phosgene and oxides of silicon and carbon. Use dry chemical or CO_2 extinguishers. *Do not use water*. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See “Spill Handling.”

WGK[100] (German Aquatic Hazard Class): No value found [3-Severe hazard to waters (est.)].

Description: 4,4′-Methylenebis (2-chloroaniline) is a yellow to light gray-tan pellet and is also available in liquid form. Molecular weight = 267.15; specific gravity (H_2O:1) = 1.44; freezing/melting point = 110°C; vapor pressure =

1×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Slightly soluble in water.

Potential Exposure: 4,4′-Methylenebis(2-chloroaniline) is used as a curing agent in the polyurethane industry for isocyanate containing polymers; in the production of solid elastomeric parts. Other uses are in the manufacture of crosslinked urethane foams used in automobile seats and safety padded dashboards; it is also used in the manufacture of gun mounts; jet engine turbine blades; radar systems; and components in home appliances.

Incompatibilities: Reacts with chemically active metals e.g., potassium, sodium, magnesium, and zinc). May ignite on contact with cellulose nitrate of high surface area. Incompatible with acrolein, acrylonitrile, *tert*-butyl nitroacetylene; ethylene oxide; isopropyl chlorocarbonate; maleic anhydride, triisobutylaluminum.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.003 milligram per cubic meter TWA [skin]; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.01 ppm/0.11 milligram per cubic meter TWA; Suspected Human Carcinogen [skin] BEI issued.

PAC Ver. 29[138]

PAC-1: 0.03 ppm

PAC-2: 0.94 ppm

PAC-3: 21 ppm

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 0.02 ppm (0.22 milligram per cubic meter) [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.02 ppm (0.22 milligram per cubic meter) [skin], carcinogen, 1993; Finland: TWA 0.02 ppm (0.2 milligram per cubic meter); STEL 0.06 ppm [skin], 1993; Finland: TWA 0.02 ppm (0.2 milligram per cubic meter); STEL 0.06 ppm, carcinogen, 1999; France: VME 0.02 ppm (0.22 milligram per cubic meter), carcinogen, 1999; Japan: 0.005 milligram per cubic meter [skin], 2A carcinogen, 1999; the Netherlands: MAC-TGG 0.02 milligram per cubic meter, 2003; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.02 milligram per cubic meter, carcinogen, 1999; United Kingdom: TWA 0.005 milligram per cubic meter [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Suspected Human Carcinogen. Several states have set guidelines or standards for MOCA in ambient air[60] ranging from zero (Nevada and North Dakota); to 0.015 μ/m^3 (Connecticut); to 0.55 μ/m^3 (Pennsylvania); to 1.0 μ/m^3 (Rhode Island); to 2.2 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method #8302, MBOCA in urine; OSHA Analytical Method 24; ID-71

Determination in Water: Octanol−water coefficient: Log K_{ow} = ~4. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: 4,4′-Methylenebis(2-chloroaniline) can affect you when breathed in and by passing through your skin. 4,4′-Methylenebis(2-chloroaniline) is a carcinogen; handle with extreme caution. Exposure can interfere with the ability of the blood to carry oxygen causing headaches, dizziness, nausea, and a bluish color to the skin and lips. High levels can cause trouble breathing; collapse and death. Contact can irritate the eyes. High or repeated exposures may affect the kidneys, cause a low blood count and cause bloody urine.

Long-Term Exposure: May cause methemoglobinemia, anemia, kidney irritation. A potential occupational carcinogen. May affect the kidneys.

Points of Attack: Liver, blood, kidneys. Cancer site in animals: liver, lung and bladder tumors.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level. CBC. Kidney function tests. Preplacement and periodic examinations should include a history of exposure to other carcinogens, alcohol and smoking habits; use of medications; and family history. Special attention should be given to liver size and function and to any changes in lung symptoms or X-rays.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. *Note to Physician*: Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** Saranex coated suits, Barricade coated suits. **4 hours:** 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin

is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFAg100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. 4,4′-Methylenebis(2-chloroaniline) must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include chlorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible, Sensitization hazard, Primary irritant (w/o allergic reaction).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi; risk phrases: R23; R36/37/38; R42/43; safety phrases: S1/2; S26; S28; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: DMDI is a clear, colorless to light-yellow liquid. Molecular weight = 262.39; specific gravity (H_2O:1) = 1.07 @ 25°C; freezing/melting point = 19−23°C; vapor pressure = 0.001 mmHg @ 20°C; flash point ≥202°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 1 Insoluble in water; reactive, slow decomposition.

Potential Exposure: A potential danger to those involved in the manufacture of this compound or its use in the production of light-stable, nonyellowing polyurethane resins.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acylchlorides may cause explosive polymerization. Attacks some plastics, rubber and coatings. Contact with metals may evolve flammable hydrogen gas. May accumulate static electrical charges, and may cause ignition of its vapors. May slowly polymerize if heated above 122°F/50°C. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.73 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.01 ppm/0.11 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.005 ppm/0.054 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 0.015 ppm

PAC-2: 0.29 ppm

PAC-3: 1.7 ppm

Belgium: TWA 0.005 ppm (0.054 milligram per cubic meter), 1993; Denmark TWA 0.005 ppm (0.054 milligram per cubic meter), 1999; Norway: TWA 0.005 ppm (0.05 milligram per cubic meter), 1999; Sweden: TWA 0.005 ppm; STEL 0.01 ppm, 1999; United Kingdom: TWA 0.02 mg(NCO)/m^3; STEL 0.07 mg[NCO]/m^3, 2000; the Netherlands: MAC-0.11 milligram per cubic meter [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.005 ppm. Several states have set guidelines or standards for ambient air[60] ranging from 0.8 μ/m^3 (Virginia) to 1.1 μ/m^3 (North Dakota 0−3.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5525; OSHA Analytical Method PV-2092

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylene bis(4-cyclohexylisocyanate) can affect you when breathed in. Exposure can irritate the eyes, nose and throat. Higher levels can irritate the lungs, causing a build-up of fluid (pulmonary edema). This can cause death. Contact can irritate and burn the eyes, causing permanent damage. Skin contact can cause blisters.

Long-Term Exposure: Methylenebis(4-cyclohexylisocyanate) can cause an asthma-like allergy to develop. Future exposures can cause asthma attacks with shortness of breath; wheezing, cough; and/or chest tightness. Repeated exposures may permanently damage the lungs.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal at first if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.1 ppm*: Sa (APF = 10) (any supplied-air respirator). * *Up to 0.25 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode.)* *Up to 0.5 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methylene bis(4-cyclohexylisocyanate) must be stored to avoid contact with alcohols, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, heat, air, amines, strong bases and chemically active metals.

Shipping: UN2206 Isocyanates, toxic, n.o.s. or Isocyanate solutions, toxic, n.o.s., flash point >61°C and boiling point <300°C, Hazard Class: 6.1; Labels: 6.1-Poisonous materials., Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Dampen spilled solid material with 60%−70% ethanol to avoid airborne dust. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylene bis(4-cyclohexylisocyanate) may burn, but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers. Thermal decomposition products may include hydrogen cyanide, cyanides, ammonia, nitriles, and oxides of nitrogen. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

California Proposition 65 Chemical[102]: Cancer 10/1/1981

Hazard Alert: Combustible, Corrosive, Possible risk of forming tumors, Suspected of causing genetic defects, Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List concentration Reporting Level: 0.1%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, N; risk phrases: R45; R34; R50/53; R62; safety phrases: S29/35; S41; S45; S53; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: 4,4′-Methylenebis(*N*,*N*-dimethyl)benzenamine is a yellow crystalline compound. Molecular weight = 254.41; boiling point = 390°C; freezing/melting point = 90−91°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: 4,4′-methylenebis(*N*,*N*-dimethyl) benzenamine is used as an intermediate in dye manufacture and as an analytical reagent in the determination of lead.

Incompatibilities: Strong acids, oxidizers, acid chlorides; acid anhydrides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance is a potential carcinogen; follow safe work and usage practices.

DFG MAK: Carcinogen Category 2

The state of North Dakota has set a guideline for ambient air[60] of zero concentration.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: 4,4′-Methylenebis (*N*,*N*′-dimethyl) aniline can affect you when breathed in and by passing through your skin. 4,4′-Methylenebis(*N*,*N*-dimethyl)aniline is a carcinogen; handle with extreme caution. High exposure can interfere with the ability of the blood to carry oxygen (a condition called methemoglobinemia). This can cause headaches, dizziness, weakness and a bluish color to the skin and lips. Higher levels can cause trouble breathing; collapse and death.

Long-Term Exposure: May be a carcinogen. It has been shown to cause liver and thyroid cancer in animals.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material (s) involved and take precautions to protect themselves. *Note to Physician*: Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Methylenebis(*N*,*N*-dimethyl)benzenamine. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue—coded chemicals. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. 4,4′-Methylenebis(N,N-dimethyl)benzenamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3259 Amines, solid, corrosive, n.o.s, or Polyamines, solid, corrosive, n.o.s., Hazard class: 8; Labels: 8-Corrosive material, Technical Name Required. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with 60%−70% acetone to avoid airborne dust. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray, alcohol or polymer foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MDI is a white to light-yellow, odorless flakes. A liquid above 37°C. Molecular weight = 250.27; specific gravity (H_2O:1) = 1.23 (solid @ 25°C); 1.19

(liquid @ 50°C); boiling point = 313.9°C @ 5 mm; freezing/melting point = 37.2°C; vapor pressure = 0.0000005 mmHg @ 20°C; flash point = 198.9°C (cc); autoignition temperature = 240°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 1. Slightly soluble in water (reaction).

Potential Exposure: MDI is used in the production of polyurethane foams and plastics; polyurethane coatings; elastomers, and thermoplastic resins.

Incompatibilities: May form explosive mixture with air. Isocyanates are highly flammable and reactive with many compounds, even with themselves. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Reaction with moist air, water or alcohols may form amines and insoluble polyureas and react exothermically, releasing toxic, corrosive or flammable gases, including carbon dioxide; and, at the same time, may generate a violent release of heat increasing the concentration of fumes in the air. Incompatible with amines, aldehydes, alkali metals, ammonia, carboxylic acids, caprolactum, alkaline materials, glycols, ketones, mercaptans, hydrides, organotin catalysts, phenols, strong acids, strong bases, strong reducing agents such as hydrides, urethanes, ureas. Elevated temperatures or contact with acids, bases, tertiary amines, and acylchlorides may cause explosive polymerization. Attacks some plastics, rubber and coatings. May accumulate static electrical charges, and may cause ignition of its vapors. Unstable above 100°F/38°C. Polymerizes at temperatures above 204°C. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 75 milligram per cubic meter

Conversion factor: 1 ppm = 10.24 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.02 ppm/0.2 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.005 ppm/0.05 milligram per cubic meter TWA; 0.2 milligram per cubic meter/0.020 ppm/10 minutes, Ceiling Concentration

ACGIH TLV[1]: 0.005 ppm TWA, measured as inhalable fraction and vapor [skin]; BEI_A issued as Acetylcholinesterase inhibiting pesticides.

PAC* Ver. 29[138]

PAC-1: 0.45 milligram per cubic meter

PAC-2: **5_E** milligram per cubic meter

PAC-3: **55_E** milligram per cubic meter

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E.**"

DFG MAK: 0.05 milligram per cubic meter, inhalable fraction; danger of sensitization of the airways and skin; Peak Limitation Category I(1); a momentary value of 0.1 milligram per cubic meter should not be exceeded; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 10 μg[4,4′-Diaminodiphenylmetane]/DL-creatinine in urine/end-of-shift.

Austria: MAK 0.005 ppm (0.05 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium TWA 0.005 ppm (0.051 milligram per cubic meter); STEL 0.02 ppm, 1993; Denmark TWA 0.005 ppm (0.05 milligram per cubic meter), 1999; France: VME 0.01 ppm (0.1 milligram per cubic meter), VLE 0.02 ppm (0.2 milligram per cubic meter), 1999; Hungary TWA 0.05 milligram per cubic meter; STEL 0.1 milligram per cubic meter, 1993; Japan 0.05 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.05 milligram per cubic meter, 2003; the Philippines: TWA 0.02 ppm (0.2 milligram per cubic meter), 1993; Poland: MAC (TWA) 0.05 milligram per cubic meter, MAC 0.2 milligram per cubic meter, 1999; Russia: STEL 0.5 milligram per cubic meter [skin] 1993; Sweden: NGV 0.005 ppm, TGV 0.01 ppm, 1999; Switzerland: MAK-week 5 ppm (15 milligram per cubic meter); STEL 25 ppm (75 milligram per cubic meter), 1999; Thailand TWA 0.02 ppm (0.2 milligram per cubic meter), 1993; United Kingdom TWA 0.02 mg[NCO]/m^3; STEL 0.07 mg[NCO]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.005 ppm. Several states have set guidelines or standards for MDI in ambient air[60] ranging from 0.2 μ/m^3 (Rhode Island) to 0.67 μ/m^3 (New York) to 1.0 μ/m^3 (Connecticut) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (North Dakota and South Carolina) to 5.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5521, #5522, #5525; OSHA Analytical Method 18, 33, 47.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: A lacrimator. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Vapors are irritating at 0.001−0.026 ppm and may cause shortness of breath; asthma, sore throat; coughing, wheezing, chest tightness; depression, headache, nasal discharge and insomnia. May cause allergic respiratory reactions. Symptoms may be delayed Up to 8 hours after exposure. *Skin*: Causes irritation, redness, and pain. May cause a rash. Irritation begins at levels of 0.05−0.1 ppm. May adhere firmly to skin. Attempts to remove it may increase or produce irritation. *Eyes*: Irritation at 0.05−0.1 ppm causing redness, pain and blurred vision. *Ingestion*: Causes abdominal spasms and vomiting.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated or prolonged inhalation exposure may cause asthma-like allergy. Prolonged exposure may lead to permanent breathing or respiratory problems.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); red blood cells/count; sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Evaluation by a qualified allergist. Preplacement and periodic medical examinations should include chest rentgenography, pulmonary function tests; and an evaluation of any respiratory disease or history of allergy. Periodic pulmonary function tests may be useful in detecting the onset of pulmonary sensitization.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: 4H and Silver Shield gloves; Barricade coated suits; Responder suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *0.5 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBA (any SCBA). *1.25 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *2.5 milligram per cubic meter*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *75 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store at temperatures indicated on labels; separately from acids, bases, amines, alcohols and ammonia; with ventilation along the floor. Since MDI will react with moisture in the air, the storage area should be a dry place, away from all sources of fire or ignition.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Use carbon dioxide, dry chemical, or halons. In case of large fires, water spray may be used to cool drums, taking care to prevent direct contact between water and MDI. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R20; R52/53; safety phrases: S2; S24; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water. (Manufacturer[206]).

Description: Methylene bromide is a colorless liquid with a sweet, pleasant odor. Molecular weight = 173.85; specific gravity (H_2O:1) = 2.49 @ 20°C; boiling point = 96−97°C; freezing/melting point = −53°C; vapor pressure = 44 mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 1. Slightly soluble in water.

Potential Exposure: Methylene bromide is used as a solvent and as a chemical intermediate.

Incompatibilities: Mixture with potassium forms a shock-sensitive explosive. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, sodium amide, strong acids, strong bases, alkaline earth metals, aluminum, magnesium. The substance decomposes on contact with hot surfaces producing hydrogen bromide.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 3 ppm

PAC-2: 33 ppm

PAC-3: 200 ppm

Russia: STEL: 10 milligram per cubic meter, 1993

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methylene bromide can affect you when breathed in. Contact can irritate the eyes and skin. May affect the nervous system and blood, resulting in impaired functions and formation of carboxyhemoglobinemia. Exposure can cause you to feel dizzy, lightheaded and to pass out. High levels can cause death. Methylene bromide can cause the heart to beat irregularly or stop. This can cause death.

Long-Term Exposure: Repeated skin contact can cause dryness and itching; removal of the skin's natural oils. May cause liver and kidney damage.

Points of Attack: Blood, kidneys, liver, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Serum bromine level. Carboxyhemoglobin level. Holter monitor (a special 24-hour EKG to look for irregular heartbeat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methylene bromide exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed container in a well-ventilated area away from potential high heat sources. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2664 Dibromomethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylene bromide may burn, but does not readily ignite. Thermal decomposition products may include bromine and bromide. Use dry chemical, carbon dioxide; alcohol or polymer foam extinguishers. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methylene chloride is a nonflammable, colorless liquid with a chloroform-like odor. A gas above 40°C/104°F. The odor is noticeable @ 250 ppm. However, this level substantially exceeds the OSHA STEL and must not be relied upon as an adequate warning of unsafe concentrations. Molecular weight = 84.93; specific gravity (H_2O:1) = 1.33 @ 20°C; boiling point = 40°C; freezing/melting point = −97°C; relative vapor density (air = 1) = 2.91; vapor pressure = 750 mmHg @ 39.3°C; autoignition temperature = 556°C. Explosive limits: LEL = 13%; UEL: 23%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Soluble in water; solubility = 2%.

Potential Exposure: Methylene chloride is used mainly as a low-temperature extractant of substances which are adversely affected by high temperature. It can be used as a solvent for oil, fats, waxes, bitumen, cellulose acetate; and esters. It is also used as a paint remover; as a degreaser; and in aerosol propellants.

Incompatibilities: Incompatible with strong oxidizers, caustics; chemically active metals, such as aluminum, magnesium powders; potassium, lithium, and sodium; concentrated nitric acid causing fire and explosion hazard. Contact with hot surfaces or flames causes decomposition producing fumes of hydrogen chloride and phosgene gas. Attacks some forms of plastics, rubber and coatings. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH = 2300 ppm, potential occupational carcinogen.

Conversion factor: 1 ppm = 3.47 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL] 25 ppm TWA; 125 ppm STEL, a potential occupational carcinogen, see 29CFR1910.1052; for Construction see 56FR57036.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 50 ppm/174 milligram per cubic meter TWA; BEI: 0.2 mg[dichloromethane]/L in urine/end-of-shift; confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: $\mathbf{200_A}$ ppm

PAC-2: $\mathbf{560_A}$ ppm

PAC-3: $\mathbf{6900_A}$ ppm [> 50% LEL but <100% LEL]

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 100 ppm/350 milligram per cubic meter; BAT: 5% [CO-Hb] in blood, at end-of-shift; 1 mg[dichloromethane]/L in blood/end-of-shift; Carcinogen Category 3A

Australia: TWA 100 ppm (350 milligram per cubic meter), carcinogen, 1993; Austria: MAK 100 ppm (360 milligram per cubic meter), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (174 milligram per cubic meter), carcinogen, 1993; Denmark: TWA 35 ppm (122 milligram per cubic meter) [skin], 1999; Finland: TWA 100 ppm (350 milligram per cubic meter); STEL 250 ppm (870 milligram per cubic meter), 1999; France: VME 50 ppm (180 milligram per cubic meter), VLE 100 ppm, continuous carcinogen, 1999; Hungary: STEL 10 milligram per cubic meter, carcinogen, 1993; the Netherlands: MAC-TGG 350 milligram per cubic meter, 2003; Norway: TWA 35 ppm (125 milligram per cubic meter), 1999; the Philippines: TWA 500 ppm (1740 milligram per cubic meter), 1993; Poland: MAC (TWA) 20 milligram per cubic meter; STEL 50 milligram per cubic meter, 1999; Russia: TWA 100 ppm; STEL 50 milligram per cubic meter, 1993; Sweden: NGV 35 ppm (120 milligram per cubic meter), KTV 70 ppm (250 milligram per cubic meter) [skin] 1999; Switzerland: MAK-W 100 ppm (360 milligram per cubic meter), KZG-W 500 ppm (1800 milligram per cubic meter), 1999; Thailand: TWA 500 milligram per cubic meter; STEL 1000 milligram per cubic meter, 1993; Turkey: TWA 500 ppm (1740 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (350 milligram per cubic meter); STEL 300 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans; the Czech Republic: TWA 500 milligram per cubic meter; Standards for methylene chloride in ambient air in residential areas have been set by Russia[43] @ 8.8 milligram per cubic meter on a momentary basis and by the Czech Republic[35] @ 3.0 milligram per cubic meter on a momentary basis and 1.0 milligram per cubic meter on a daily average basis. Several states have set guidelines or standards for methylene chloride in ambient air[60] ranging from 0.2 μ/m^3 (Rhode Island) to 2.4 μ/m^3 (Massachusetts and North Carolina) to 55.55 μ/m^3 (Kansas) to 1167 μ/m^3 (New York) to 3500 μ/m^3 (South Dakota) to 3500−17,400 μ/m^3 (North Dakota) to 58,000 μ/m^3 (Virginia) to 7000 μ/m^3 (Connecticut) to 8333 μ/m^3 (Pennsylvania) to 8700 μ/m^3 (Indiana) to 8750 μ/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method #1005, Methylene chloride; #3800, Organic and Inorganic Gases, #2549, Volatile organic compounds; OSHA Analytical Methods 59 and 80.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): MCL, 0.005 mg/L; MCLG, zero. *To protect human health*: preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L[6]. A lifetime health advisory could not be calculated by EPA[48]. Several states have set standards and guidelines for methylene chloride in drinking water[61] ranging from standards of 2 μg/L (New Jersey) to 100 μg/L (New Mexico) and guidelines of 4.7 μg/L (Arizona) to 25 μg/L (Connecticut) to 40 μg/L (California) to 48 μg/L (Minnesota and Vermont) to 50 μg/L (Kansas) to 150 μg/L (Maine). Russia set a MAC[35] of 7.5 mg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography, plus mass spectrometry (EPA Method #624). Octanol−water coefficient: Log $K_{ow} = 1.25$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation of vapors, percutaneous absorption of liquid; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the blood, causing the formation of methemoglobin, and carboxyhemoglobin. Exposure can cause irregular heartbeat or cause heart to stop. This can cause death. *Inhalation*: Levels of 300−700 ppm for 3−5 hours has caused slight loss of muscle control and coordination. Effects of high concentrations include headaches, stupor, dizziness, fatigue, drunken behavior; chest pain; arm and leg pains; loss of feeling; loss of appetite; hot flashes and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. *Skin*: Contact is painful and highly irritating if confined on the skin by gloves or clothing. Absorbed slowly through the skin to cause symptoms listed under inhalation. *Eyes*: May cause pain, irritation, burns, and permanent damage. *Ingestion*: The liquid may cause chemical pneumonitis. Accidental ingestion of paint removers containing methylene chloride as the main ingredient have reportedly caused headache, nausea, vomiting, visual disturbance; presence of blood in the urine; and unconsciousness. *Note*: Methylene chloride is changed to carbon monoxide in the human body. This is a particularly hazardous condition for those who have a history of heart trouble or those who are also exposed to carbon monoxide. See “Carbon monoxide” Fact Sheet. These persons should take extra precautions.

Long-Term Exposure: Liver problems; increased risk of cancer. Repeated or prolonged skin contact may cause drying and cracking. May be carcinogenic to humans. It has been shown to cause liver and lung cancer in animals. May affect the central nervous system and liver, causing degenerative brain disease and enlargement of the liver. See symptoms as above. Prolonged exposure can cause changes in blood, hallucinations, and decreased response to visual and auditory stimulation. Most of the effects will disappear after exposure stops. Methylene chloride caused genetic effects in certain bacteria and caused birth defects in chickens. In laboratory studies, methylene chloride has also been shown to cause tumors in mice and rats. Whether methylene chloride causes birth defects or tumors in humans is not known.

Points of Attack: Eyes, skin, cardiovascular system; central nervous system. Cancer site in animals: lung, liver, salivary and mammary gland tumors.

Medical Surveillance: OSHA mandates the following tests: laboratory surveillance; carboxyhemoglobin; eectrocardiogram (resting); hematocrit; liver function tests; cholesterol level. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), carboxyhemoglobin; whole blood (chemical/metabolite), carboxyhemoglobin, end-of-shift; whole blood (chemical/metabolite), carboxyhemoglobin, prior to next shift; whole blood (chemical/metabolite), end-of-shift; CBC; expired air, expired air, end-of-shift; liver function tests; urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: Special 24 hours EKG (Holter monitor) to look for irregular heartbeat. Blood carboxyhemoglobin (this must be done within a few hours after exposure). Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** polyvinyl alcohol gloves; 4H and Silver Shield gloves, Responder suits, Trellchem HPS suits; Trychem 1000 suits. **4 hours:** Teflon gloves, suits, boots; Barricade coated suits 4,4′-Methylenedianiline 101-77-9 Prevent skin contact. **8 hours:** 4H and Silver Shield gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Methylene chloride (1910.1052): < or = 625 ppm (parts per million) (25 × PEL): Continuous-flow supplied-air respirator, hood or helmet. < or = 1250 ppm (50 × PEL): (1) Full-facepiece supplied-air respirator operated in negative-pressure (demand) mode; or (2) Full-facepiece SCBA operated in negative-pressure (demand) mode. < or = 5000 ppm (200 × PEL): (1) Continuous-flow supplied-air respirator, full-facepiece; (2) Pressure-demand supplied-air respirator, full-facepiece; or (3) Positive-pressure full-facepiece SCBA. >5000 ppm or unknown concentration: (1) Positive-pressure full-facepiece SCBA; or (2) Full-facepiece pressure-demand supplied-air respirator with an auxiliary self-contained air supply. *Firefighting*: Positive-pressure full-facepiece SCBA. *Emergency escape*: (1) Any continuous-flow or pressure-demand SCBA; or (2) Gas mask with organic vapor canister.

Shipping: UN1593Dichloromethane, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.

Methyl Ethyl Ether M:0910

Formula: C_3H_8O

Synonyms: Ether, ethyl methyl; Ethane, methoxy-; Ethyl methyl ether; Methane, ethoxy; Methoxyethane

CAS Registry Number: 540-67-0

HSDB Number: 414

RTECS Number: KO0260000

UN/NA & ERG Number: UN1039/115 (P)

EC Number: [*Annex I Index No.*: 603-020-00-3]

Regulatory Authority and Advisory Information

Hazard Alert: Extremely flammable gas, Polymerization hazard

Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R2; R12; R19; safety phrases: S9; S16; S33; S45 (see Appendix 4)

Description: Methyl ethyl ether is a colorless liquid or gas at room temperature. Molecular weight = 60.11; boiling point = 11°C; flash point = −37°C; autoignition temperature = 190°C. Explosive limits: LEL = 2.0%; UEL: 10.1%; hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 1. Soluble in water.

Potential Exposure: Used as a medicine and anesthetic.

Incompatibilities: May form explosive mixture with air. Incompatible, dangerous reaction with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.). Keep away from alkaline materials, strong acids (may be explosive), strong bases. May form explosive peroxides on standing.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short-Term Exposure: Contact irritates the skin, eyes, and nose. Inhalation can cause lightheadedness and can reduce concentration. Higher levels of exposure may cause unconsciousness and even cause death.

Long-Term Exposure: Repeated contact may cause skin dryness and cracking. Prolonged high exposure may affect the brain.

Points of Attack: Brain, skin.

Medical Surveillance: Evaluate for brain effect, such as memory, concentration, sleeping patterns and mood; headache and fatigue. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Prior to working with methyl ethyl ether all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1039 Methyl ethyl ether or Ethyl methyl ether, Hazard Class: 2.1; Labels: 2.1-Flammable gas.

Spill Handling: *Liquid*: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Liquid*: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use alcohol foam extinguishers. Water may not be effective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to

cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Thermal decomposition products may include oxides of carbon. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R36/37; R62; R63; R66; R67; safety phrases: S2; S9; S16; S21; S25; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MEK is a clear, colorless liquid. Fragrant, mint-like, moderately sharp odor. Molecular weight = 72.11; specific gravity (H_2O:1) = 0.81; boiling point = 79.8°C; freezing/melting point = −87°C; vapor pressure = 75 mmHg @ 21.2°C; flash point = −9°C (cc); autoignition temperature = 505°C. Explosive limits: LEL = 1.4% @ 93°C; 14,000 ppm[138]; UEL: 11.4% @ 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Soluble in water; solubility = 28%.

Potential Exposure: MEK is used as a solvent in nitrocellulose coating and vinyl film manufacture; in smokeless powder manufacture; in cements and adhesives and in the dewaxing of lubricating oils. It is also an intermediate in drug manufacture.

Incompatibilities: May form explosive mixture with air. Violent reaction with strong oxidizers, amines, ammonia, inorganic acids; caustics, isocyanates, pyridines.

Incompatible with potassium *tert*-butoxide, 2-propanol, chlorosulfonic acid; oleum. Attacks some plastics. Ketones are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates.

Permissible Exposure Limits in Air

NIOSH IDLH = 3000 ppm

Conversion factor: 1 ppm = 2.95 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 5.4 ppm

OSHA PEL: 200 ppm/590 milligram per cubic meter TWA

NIOSH REL: 200 ppm/590 milligram per cubic meter TWA; 300 ppm/885 milligram per cubic meter STEL

ACGIH TLV[1]: 200 ppm/590 milligram per cubic meter TWA; 300 ppm/885 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 200 ppm

PAC-2: **2700**$_{\mathbf{A}}$ ppm

PAC-3: **4000**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 200 ppm/590 milligram per cubic meter [skin]; Peak Limitation Category I(1); Pregnancy Risk Group C; BAT: 5 milligram per cubic meter in urine, at end-of-shift

Australia: TWA 150 ppm (445 milligram per cubic meter); STEL 300 ppm, 1993; Austria: MAK 200 ppm (590 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (590 milligram per cubic meter); STEL 300 ppm (885 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (145 milligram per cubic meter) [skin], 1999; Finland: STEL 100 ppm, 1993; France: VME 200 ppm (600 milligram per cubic meter), 1999; Hungary: TWA 200 milligram per cubic meter; STEL 600 milligram per cubic meter, 1993; India: TWA 200 ppm (590 milligram per cubic meter); STEL 300 ppm (885 milligram per cubic meter), 1993; the Netherlands: MAC-TGG 590 milligram per cubic meter [skin], 2003; Norway: TWA 75 ppm (220 milligram per cubic meter), 1999; the Philippines: TWA 200 ppm (590 milligram per cubic meter), 1993; Poland: MAC (TWA) 200 milligram per cubic meter, MAC (STEL) 850 milligram per cubic meter, 1999; Russia: TWA 200 ppm; STEL 200 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (150 milligram per cubic meter), KTV 100 ppm (300 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (590 milligram per cubic meter), KZG-V 400 ppm (1180 milligram per cubic meter), 1999; Turkey: TWA 200 ppm (590 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (600 milligram per cubic meter), STE 300 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 300 ppm. The Czech Republic: (ambient air in residential areas) have been set[35] at 0.3 milligram per cubic meter on a momentary and a daily average basis; Russia (in ambient air in residential areas): 0.1 milligram per cubic meter on a momentary basis. Several states have set guidelines or standards for methyl ethyl ketone in ambient air[60] ranging from 0.16 milligram per cubic meter (Massachusetts) to 1.967 milligram per cubic meter (New York) to 3.7−88.5 milligram per cubic meter (North Carolina) to 5.9 milligram per cubic meter (Florida) to 5.9−8.85 milligram per cubic meter (North Dakota) to 9.8 milligram per cubic meter (Virginia) to 11.8 milligram per cubic meter (Connecticut and South Dakota) to 14.048 milligram per cubic meter (Nevada) to 14.75 milligram per cubic meter (South Carolina).

Determination in Air: Use NIOSH Analytical Method #2500, Methyl ethyl ketone; #2555; #3800; #8002 in blood; #2549 Volatile organic compounds; OSHA Analytical Methods 16, 84, and 1004.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L. The EPA[48] has set a lifetime health advisory @ 170 μg/L. Several states have set guidelines for methyl ethyl ketone in drinking water[61] ranging from 60 μg/L (Massachusetts) to 170 μg/L (Arizona) to 172 μg/L (Minnesota) to 270 μg/L (New Jersey)[59] to 750 μg/L (Maine) to 1000 μg/L (Connecticut).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.29$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and the respiratory tract. May affect the central nervous system. *Inhalation*: Human exposures to levels of 350 ppm caused irritation of the nose and throat. Exposure can cause dizziness, lightheadedness, headache, nausea, blurred vision. Numbness in fingers, arms and legs, accompanied by headache, nausea, vomiting and fainting have occurred after exposure to levels of 300−600 ppm. *Skin*: Contact can irritate the skin causing rash and burning feeling. Liquid is absorbed readily and may cause numbing of fingers and arms. *Eyes*: Contact can irritate and cause burns and permanent damage. Exposure to levels of 200 ppm produced irritation. *Ingestion*: Can cause irritation of the mouth, throat, and stomach, the severity of which will be dependent upon amount swallowed. Symptoms of poisoning include nausea, vomiting, stomach pain and diarrhea. Death can occur from ingestion of as little as 1 ounce.

Long-Term Exposure: Repeated exposure can cause drying and cracking of the skin. Has been implicated in certain nervous system and brain disorders characterized by weakness, fatigue, sleep disturbances; reduced coordination; heaviness in chest and numbness of hands and feet. These symptoms may develop after 1 year of exposure to vapor concentrations of 50−200 ppm. Improvement is gradual and may take years after exposure is discontinued. Animal tests show that this chemical is a teratogen in animals and possibly causes toxic effects upon human reproduction.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift. If symptoms develop, or overexposure is suspected, exam of the nervous system is recommended. Special tests for nerve damage, called nerve conduction studies, may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber and chlorobutyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: *Up to 3000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or CcrOv (APF = 10) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: *NIOSH*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl ethyl ketone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flame. Sources of ignition, such as smoking and open flames are prohibited where methyl ethyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of methyl ethyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl ethyl ketone.

Shipping: UN1193 Methyl ethyl ketone or Ethyl methyl ketone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration[22].

EC Number: 215-661-2

Regulatory Authority and Advisory Information

Hazard Alert: Flammable, Strong oxidizer, Highly Reactive Substance/Explosive decomposition hazard, Polymerization hazard (nonstabilized), Static charge accumulation possible, Possible risk of forming tumors, Primary irritant (w/o allergic reaction).

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U160

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MEKP, an organic peroxide, is a colorless liquid. Molecular weight = 176.21; specific gravity (H_2O:1) = 1.12 @ 15°C; boiling point = (decomposes) 117.8°C; flash point = 82.22°C (oc) 60% MEKP[52]. Autoignition temperature = 555.56°C. Explosive limits: LEL = 20,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 2, reactivity 2. Insoluble in water.

Potential Exposure: MEKP is used as a curing agent for thermosetting polyester resins and as a crosslinking agent and catalyst in the production of other polymers.

Incompatibilities: Forms explosive mixture with air (flash point varies). MEKP may exist in several different structures; decomposition temperatures may vary. Pure substance is shock-sensitive. Explosive decomposition above 176°F/80°C (also reported @ 230°F/110°C). Keep away from sources of ignition, heat, sunlight. A strong oxidizer. Violent reaction with strong acids; strong bases; reducing agents; combustible substances, organic materials; chemical accelerants; oxides of heavy metals; salts, trace contaminants; amines. May accumulate static electrical charges, and cause ignition of its vapors. Commercial product is diluted with 40% dimethyl phthalate, cyclohexane peroxide; or diallyl phthalate to reduce sensitivity to shock.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.21 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 0.2 ppm/1.5 milligram per cubic meter Ceiling Concentration

ACGIH TLV[1]: 0.2 ppm/1.5 milligram per cubic meter Ceiling Concentration

PAC Ver. 29[138]

PAC-1: 0.18 ppm

PAC-2: 20 ppm

PAC-3: 22 ppm

DFG MAK: Produces very severe skin effects. See Section X(a).

Australia: TWA 0.2 ppm (1.5 milligram per cubic meter), 1993; Belgium: STEL 0.2 ppm (1.5 milligram per cubic meter), 1993; Denmark: TWA 1 milligram per cubic meter, 1999; Finland: STEL 0.2 ppm (1.5 milligram per cubic meter) [skin], 1999; France: VLE 0.2 ppm (1.5 milligram per cubic meter), 1999; Norway: TWA 1 milligram per cubic meter, 1999; the Netherlands: MAC 1.5 milligram per cubic meter, 2003; Switzerland: MAK-W 0.2 ppm (1.5 milligram per cubic meter), 1999; United Kingdom: STEL 0.2 ppm (1.5 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: Ceiling Concentration 0.2 ppm. Several states have set guidelines or standards for MEK peroxide in ambient air[60] ranging from 11.0 μ/m^3 (Virginia) to 15.0 μ/m^3 (North Dakota) to 30.0 μ/m^3 (Connecticut and South Dakota) to 36.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3508; OSHA Analytical Method 77.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl ethyl ketone peroxide can affect you when breathed in and by passing through your skin. Contact can irritate the skin, and burn and permanently damage the eyes. Exposure can irritate the nose and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Methyl ethyl ketone peroxide may affect the liver and kidneys. May cause lung irritation and bronchitis. May cause skin allergy.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function test. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. butyl rubber; Neoprene, and Viton are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 0.2* ppm; Use an NIOSH/MSHA or European Standard EN 149-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use an NIOSH/MSHA or European Standard EN 149-approved SCBA with a full facepiece operated in pressure-demand or other positive mode.

Storage: Color code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Methyl ethyl ketone peroxide must be stored to avoid contact with heat, shock and organics, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from organics. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl ethyl ketone peroxide. Sources of ignition, such as smoking and open flames are prohibited where methyl ethyl ketone peroxide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever methyl ethyl ketone peroxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3105 Organic peroxide type D, liquid, Hazard Class: 5.2; Labels: 5.2-Organic peroxide, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. MEKP may be destroyed by adding 20% NaOH solution slowly in a quantity about 10 times the weight of MEKP. Incineration is recommended if NaOH treatment is not used.

EC Number: 203-250-0

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Corrosive.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C, N; risk phrases: R10; R20/21/22; R34; R41; R52/53; safety phrases: S24/25; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: 2-Methyl-5-ethyl pyridine is a colorless liquid with a sharp, aromatic odor. Molecular weight = 121.20; boiling point = 128°C; flash point = 39°C; also listed @ 68°C; autoignition temperature = 538°C. Explosive limits: LEL = 1.1%; UEL: 6.6%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Slightly soluble in water.

Potential Exposure: In manufacture of nicotinic acid, vinyl pyridine monomer; in intermediates for insecticides, germicides and textile chemicals.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, aldehydes, acid chlorides; chloroformates, isocyanates, phenols, cresols.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Russia: MAC 2 milligram per cubic meter[43].

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Irritates and may be corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, nausea, vomiting, and diarrhea. Moderately toxic by oral and dermal routes.

Long-Term Exposure: May affect the central nervous system causing muscle weakness, loss of coordination; and loss of consciousness.

Points of Attack: Lungs, nervous system.

Medical Surveillance: Consider chest X-ray following acute overexposure. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN23002-Methyl-5-ethylpyridine, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyleugenol M:0945

Formula: $C_{11}H_{14}O_2$
Synonyms: 4-Allyl-1,2-dimethoxybenzene; 1-Allyl-3,4-dimethoxybenzene; 4-Allylveratrole; Benzene, 4-Allyl-1, 2-dimethoxy-; Chavibetol methyl ether; 1,2-Dimethoxy-4-allylbenzene; 3,4-Dimethoxyallylbenzene; 1-(3,4-Dimethoxyphenyl)-2-propene; 3-(3,4-Dimethoxyphenyl) propene; 1,2-Dimethoxy-4-(2-propenyl)benzene; Eugenol methyl ether; 1,3,4-Eugenol methyl ether; Eugenyl methyl ether; Methyl eugenol ether; *o*-Methyleugenol; Veratrole, 4-allyl-; Veratrole methyl ether
CAS Registry Number: 93-15-2
HSDB Number: 4505
RTECS Number: CY2450000
UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153
EC Number: 202-223-0
Regulatory Authority and Advisory Information
Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen.
California Proposition 65 Chemical[102]: Cancer 11/16/2001
Hazard Alert: Poison, Agricultural Chemical; Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn; risk phrases: R22; R36/37/38; R40; R62; safety phrases: S2; S26; S36/37/39; S41 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: Clear colorless to pale yellow liquid. Spicy, earthy odor. Bitter burning taste. This chemical is combustible. Molecular weight = 178.23; specific gravity (H_2O:1) = 1.0396 @ 20°C; vapor density = > 1.0; boiling point = 249°C; 254.7°C @ 760 mmHg; melting point = −4°C; vapor pressure = 0.02 mmHg @ 20°C; 1 mmHg @ 85°C; flash point = 99°C; 109°C. Hazard identification (based on NFPA-704 M Rating System): Health 0; flammability 1; reactivity 0. Practically insoluble in water; solubility = < 1 mg/mL at 20°C; 500 mg/L.
Potential Exposure: Methyl eugenol is a naturally occurring substance found in the essential oils of several plant species. Methyleugenol is used as a flavoring agent in jellies, baked goods, nonalcoholic beverages, chewing gum, candy, pudding, relish, and ice cream. Methyleugenol has been used as an anesthetic in rodents. It also is used as an insect attractant in combination with insecticides.[NTP 2000]
Incompatibilities: Methyleugenol is Incompatible with strong oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Contact with reducing agents may cause the release of hydrogen gas.
Permissible Exposure Limits in Air: No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.
Determination in Air:
No NIOSH or OSHA method available.
Permissible Concentration in Water: Not found.
Determination in Water: Bluegill (*Lepomis macrochirus*) LC_{50} = 8233 μg/L, Moderately Toxic; Rainbow trout, donaldson trout (*Oncorhynchus mykiss*) LC_{50} = 6450 μg/L, Moderately Toxic. Octanol−water coefficient: Log K_{ow} = > 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.
Routes of Entry: Skin, eyes, inhalation, ingestion.
Harmful Effects and Symptoms
Short-Term Exposure: This compound is a Primary irritant (w/o allergic reaction) and sensitizer and may cause contact dermatitis. Symptoms of exposure to this compound include nausea, vomiting, diarrhea, circulatory collapse, dizziness, rapid and shallow breathing, unconsciousness, convulsions, abdominal burning, dysuria, hematuria, tachycardia, bronchial irritation, anuria, pulmonary edema, bronchial pneumonia, and renal damage. LD_{50}(oral-rat 810 mg/kg; LC_{50} = (inhal.-rat) = > 4800 milligram per cubic meter.
Long-Term Exposure: This compound may be irritating to the skin and eyes.
Points of Attack: Liver, kidneys; skin, respiratory tract.
Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy.
First Aid: *Eyes*: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy.
Personal Protective Methods: Wear protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Recommended gloves: Ansell 5.109 (Latex); thickness: 0.18 mm; Breakthrough time: *15 minutes*; Edmont 29-870 (Neoprene); thickness: 0.51 mm; Breakthrough time: *135 minutes*; North Model F-091 (Viton); thickness: 0.41 mm; Breakthrough time: *480 minutes*.
Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149-approved respirator; or use Follow regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149-approved respirator such as a half face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas and SO_2) with a dust/mist filter.

Storage: Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. You should protect this material from exposure to light, and store it under ambient temperatures.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

First remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. All contaminated clothing and absorbent paper should be sealed in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60%−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Thermal decomposition products may include oxides of carbon. Wear a SCBA in pressure-demand, NIOSH/MSHA or European Standard EN 149-approved respirator, and full protective gear. Use water spray to keep fire-exposed containers cool. Containers may explode in the heat of a fire. Extinguishing media; cool containers with flooding quantities of water until well after fire is out. Fires involving this material can be controlled with a dry chemical, carbon dioxide, or Halon extinguisher. A water spray may also be used.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl Formate M:0950

Formula: $C_2H_4O_2$: $HCOOCH_3$

Synonyms: Formiate de methyle (French); Formiato de metilo (Spanish); Formic acid, methyl ester; Methyle (formiate de) (French); Methylformiat (German); Methyl methanoate

CAS Registry Number: 107-31-3

HSDB Number: 232

RTECS Number: LQ8925000

UN/NA & ERG Number: UN1243/129

EC Number: 203-481-7 [*Annex I Index No.*: 607-014-00-1]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Extremely flammable, Agricultural Chemical.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F+, Xn; risk phrases: R12; R20/22; R36/37; safety phrases: S1; S2; S9; S16; S24; S26; S33 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl formate is a colorless liquid with a pleasant odor. Molecular weight = 60.06; specific gravity (H_2O:1) = 0.98; boiling point = 3.7°C; freezing/melting point = −100°C; vapor pressure = 476 mmHg @ 20°C; flash point = −32.8°C; autoignition temperature = 449°C. Explosive limits: LEL = 4.5%; UEL: 23.0%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 0₩. Soluble in water; solubility = 30%. Releases formic acid.

Potential Exposure: Methyl formate is used as a solvent; as an intermediate in pharmaceutical manufacture; and as a fumigant.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Reacts slowly with water to form methanol and formic acid. Contact with water, steam releases formic acid. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

NIOSH IDLH = 4500 ppm

Conversion factor: 1 ppm = 2.46 milligram per cubic meter @ 25°C & 1 atm

Odor threshold = 2000 ppm.

OSHA PEL: 100 ppm/250 milligram per cubic meter TWA

NIOSH REL: 100 ppm/250 milligram per cubic meter TWA; 150 ppm/375 milligram per cubic meter STEL

ACGIH TLV[1]: 100 ppm/246 milligram per cubic meter TWA; 150 ppm/368 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 100 ppm

PAC-2: 830 ppm

PAC-3: 5000 ppm

DFG MAK: 50 ppm/120 milligram per cubic meter TWA; Peak Limitation Category II(4); [skin]; Pregnancy Risk Group C

Australia: TWA 100 ppm (250 milligram per cubic meter); STEL 150 ppm, 1993; Austria: MAK 100 ppm (250 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (246 milligram per cubic meter); STEL 150 ppm (369 milligram per cubic meter), 1993; Denmark: TWA 100 ppm (250 milligram per cubic meter), 1999; Finland: TWA 100 ppm (250 milligram per cubic meter); STEL 150 ppm (375 milligram per cubic meter), 1999; France: VME 100 ppm (250 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 250 milligram per cubic meter, 2003; Sweden: TWA 100 ppm (250 milligram per cubic meter); STEL 150 ppm (350 milligram per cubic meter), 1999; Switzerland: MAK-W 100 ppm (250 milligram per cubic meter), KZG-W 200 ppm (500 milligram per cubic meter), 1999; Turkey: TWA 100 ppm (250 milligram per cubic meter), 1993; United Kingdom: TWA 100 ppm (250 milligram per cubic meter); STEL 150 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 150 ppm. Several states have set guidelines or standards for methyl formate in ambient air[60] ranging from 2.50−3.75 milligram per cubic meter (North Dakota) to 4.2 milligram per cubic meter (Virginia) to 5.0 milligram per cubic meter (Connecticut) to 5.952 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH (II-5) Method #S-291. OSHA Analytical Method PV-2041

Determination in Water: Octanol−water coefficient: Octanol−water coefficient: Log $K_{\text{ow}} = -0.2$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl formate can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs and cause a build-up of fluid (pulmonary edema). This can cause death. High levels attack the nervous system and cause you to become dizzy, lightheaded; and may cause unconsciousness and death.

Long-Term Exposure: Prolonged or repeated contact can cause cracking and drying of the skin. Repeated exposure can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Eyes, lungs, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm*: Sa (APF = 10) (any supplied-air respirator). *2500 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *4500 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentration or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl formate must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, chlorine dioxide; nitrates, and permanganates; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methyl formate is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl formate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl formate. Wherever methyl formate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1243 Methyl formate, Hazard Class: 3; Labels: 3-Flammable liquid

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; atomizing in a suitable combustion chamber.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl hydrazine is a fuming, colorless liquid with an ammonia-like odor. The odor threshold is 1.3−1.7 ppm. Molecular weight = 46.07; specific gravity (H_2O:1) = 0.88 @ 20°C; boiling point = 87.8°C; freezing/melting point = −52.4°C; vapor pressure = 38 mmHg @ 20°C; 75 mmHg @ 33°C; flash point = 70°C[101]; autoignition temperature = 194°C. Explosive limits: LEL = 2.5%; UEL: 92.0%[17]. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2. Slightly soluble in water.

Potential Exposure: MMH has been used as the propellant in liquid propellant rockets; it is also used as a solvent and as an organic intermediate.

Incompatibilities: May form explosive mixture with air. Methyl hydrazine is a highly reactive reducing agent and a medium strong base. May explode if heated. Violent reaction with strong oxidizers, such as fluorine, chlorine, combustibles, nitric acid; hydrogen peroxide. Incompatible with acids, alcohols, glycols, isocyanates, phenols, cresols; porous materials, such as earth, asbestos, wood and cloth. Oxides of iron or copper, manganese, lead, copper or their alloys can lead to fire and explosions. Attacks cork, some plastics, coatings and rubber.

Permissible Exposure Limits in Air

NIOSH IDLH = 20 ppm, potential occupational carcinogen

Conversion factor: 1 ppm = 1.89 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.2 ppm/0.35 milligram per cubic meter Ceiling Concentration [skin]

NIOSH REL: 0.04 ppm/0.08 milligram per cubic meter [120-minute] Ceiling Concentration; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 0.01 ppm/0.019 milligram per cubic meter [skin]; confirmed animal carcinogen with unknown relevance to humans.

PAC* Ver. 29[138]

PAC-1: 0.028 ppm

PAC-2: $\mathbf{0.90_A}$ ppm

PAC-3: $\mathbf{2.7_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: [skin] danger of skin sensitization.

Australia: TWA 0.2 ppm (0.35 milligram per cubic meter) [skin], carcinogen, 1993; Belgium: STEL 0.2. ppm (0.38 milligram per cubic meter) [skin], Carcinogen 1993; Denmark: TWA 0.04 ppm (0.08 milligram per cubic meter) [skin], 1999; Finland: STEL 0.2 ppm (0.35 milligram per cubic meter) [skin], 1999; France: VME 0.2 ppm (0.35 milligram per cubic meter), 1999; Norway: TWA 0.08 milligram per cubic meter, 1999; the Netherlands: MAC 0.35 milligram per cubic meter [skin], 2003; Poland: MAC (TWA) 0.02 milligram per cubic meter, MAC (STEL) 0.1 milligram per cubic meter, 1999; Switzerland: MAK-W 0.2 ppm (0.35 milligram per cubic meter) [skin], 1999; Thailand: TWA 0.2 ppm (0.35 milligram per cubic meter), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for methyl hydrazine in ambient air[60] ranging from 0 (Maryland, North Dakota and Texas) to 0.88 μ/m^3 (Pennsylvania) to 1.17 μ/m^3 (New York) to 1.75 μ/m^3 (South Carolina) to 3.5 μ/m^3 (Virginia) to 8.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3510.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -1.03$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Corrosive to the eyes, skin, respiratory tract; and if ingested; may cause permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the central nervous system; liver and blood; causing excitability, vomiting, tremors, convulsions, formation of methemoglobin; and death. Exposure at high concentrations may result in death. The effects may be delayed. Symptoms of acute exposure to methyl hydrazine may include facial numbness, facial swelling; and increased salivation. Headache, twitching, seizure, convulsions, and coma may also occur. Gastrointestinal signs and symptoms include anorexia, nausea, and vomiting. Methyl hydrazine is toxic to the liver, ruptures red blood cells; and may cause kidney damage. Methyl hydrazine vapors are extremely toxic and the liquid is corrosive to skin. Methyl hydrazine is the strongest convulsant and the most toxic of methyl-substituted hydrazine derivatives. It is more toxic than hydrazine. At high doses, it is a strong central nervous system poison.

Long-Term Exposure: May damage the liver, kidneys, and blood, resulting in formation of methemoglobin. This substance causes liver cancer in animals and is possibly carcinogenic to humans.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, blood, cardiovascular system. Cancer site in animals: lung, liver, blood vessels; and intestine tumors.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; pulmonary function tests. Before beginning employment and at regular times after that, the following is recommended: CBC. If symptoms develop or overexposure has occurred, the following may be useful: consider lung function tests, especially if lung symptoms are present. Test for kidney and liver function. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** Responder suits; Trychem 1000 suits. Also, Viton, chlorobutyl rubber, and CR-39 may offer some protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area.(1) Color code—Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl hydrazine must be stored to avoid contact with oxides of iron and copper; manganese, lead, and copper alloys; porous materials (such as earth, asbestos, wood and cloth); oxidizers (such as perchlorates, hydrogen peroxide, chlorates, nitrates, permanganates); and fuming nitric acid; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and sparks. Sources of ignition, such as smoking and open flames, are prohibited where methyl hydrazine is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl hydrazine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl hydrazine. Wherever methyl hydrazine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN1244 Methylhydrazine, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material, Inhalation Hazard Zone A

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase

with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.9/1.5
Night 1.4/2.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. For small fires, use dry chemical, carbon dioxide; water spray, and alcohol foam. For large fires, use water spray, fog, or foam. Keep unnecessary people away and isolate the hazardous area. Stay upwind and keep out of low-lying areas. Fire exposed containers should be kept cool with water. Use water spray to disperse vapors and protect responders attempting to stop a leak which has not ignited. Move container from fire area if it can be done without risk. Wear positive pressure breathing apparatus and special (full) protective clothing. No skin surface should be exposed. See "Isolation Distances" above. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. There are 2 alternatives[24]: Dilute with water, neutralize with sulfuric acid, then flush to sewer with large volumes of water or incinerate with added flammable solvent in furnace equipped with afterburner and alkaline scrubber.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R21; R23/25; R37/38; R40; R51; R62; safety phrases: S1/2; S36/37; S38; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Methyl iodide is a colorless liquid. Pungent, ethereal odor. Turns yellow, red, or brown on exposure to light and moisture. Molecular weight = 141.94; specific gravity (H_2O:1) = 2.28 @ 20°C; boiling point = 42.4°C; freezing/melting point = −66.4°C; vapor pressure = 750 mmHg @ 42°C. Explosive limits: LEL = 20,000 ppm; UEL: unknown. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. ₩Slightly soluble in water; solubility = 1%. Slowly reacts with water forming poisonous hydrogen iodide.

Potential Exposure: Methyl iodide is used in fire extinguishers; as an intermediate in the manufacture of pharmaceuticals and some pesticides.

Incompatibilities: May form explosive mixture with air. Slowly reacts with water forming poisonous hydrogen iodide. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Violent reaction with strong oxidizers, strong reducing agents, strong bases; trialkylphosphines, silver chlorite; calcium, oxygen, sodium. Decomposes @ 270°C. Halogenated aliphatic compounds are moderately or very reactive. Halogenated organics generally become less reactive as more of their hydrogen atoms are replaced with halogen atoms. Low molecular weight haloalkanes are highly flammable and can react with some metals to form dangerous products. Materials in this group are incompatible with strong oxidizing and reducing agents. Also, they are incompatible with many amines, alkylphosphines, nitrides, azo/diazo compounds, alkali metals (sodium), and epoxides[101].

Permissible Exposure Limits in Air

NIOSH IDLH = 100 ppm, potential occupational carcinogen

Conversion factor: 1 ppm = 5.80 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 5 ppm/28 milligram per cubic meter TWA [skin]

NIOSH REL: 2 ppm/10 milligram per cubic meter TWA [skin]; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A

ACGIH TLV[1]: 2 ppm/12 milligram per cubic meter TWA [skin]

PAC Ver. 29[138]

PAC-1: $\mathbf{25_E}$ ppm

PAC-2: $\mathbf{50_E}$ ppm

PAC-3: $\mathbf{125_E}$ ppm

*ERPG [Emergency Response Planning Guidelines] are marked with a subscript "**E**."

DFG MAK: [skin] Carcinogen Category 2

Australia: TWA 2 ppm (10 milligram per cubic meter) [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 2 ppm (12 milligram per cubic meter) [skin], Carcinogen 1993; Denmark: TWA 1 ppm (5.6 milligram per cubic meter) [skin], 1999; Finland: TWA 5 ppm (28 milligram per cubic meter); STEL 10 ppm (56 milligram per cubic meter) [skin], 1999; Norway: TWA 1 ppm (5 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 10 milligram per cubic meter [skin], 2003; Poland: MAC (TWA) 10 milligram per cubic meter; MAC (STEL) 30 milligram per cubic meter, 1999; Sweden: NGV 1 ppm (6 milligram per cubic meter), KTV 5 ppm (30 milligram per cubic meter) [skin], carcinogen, 1999; Switzerland: MAK-W 0.3 ppm (2 milligram per cubic meter) [skin], carcinogen, 1999; United Kingdom: TWA 2 ppm (12 milligram per cubic meter) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 2 ppm [skin]

Determination in Air: Use NIOSH Analytical Method #1014[18].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.63$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl iodide can affect you when breathed in and by passing through your skin. Methyl iodide is a carcinogen; handle with extreme caution. Contact can irritate the eyes and cause severe skin burns. It can cause brain damage leading to disorientation and psychotic behavior. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure may cause nausea, vomiting, diarrhea, dizziness, slurred speech; visual disturbances; irritability, loss of muscle control, drowsiness, delirium, serious mental disorders; coma; and death.

Long-Term Exposure: Can cause lung irritation and bronchitis. May cause kidney damage. May affect the brain leading to disorientation and personality changes. Exposure can cause nausea, vomiting, vertigo (an illusion of movement), ataxia, slurred speech; drowsiness, dermatitis. A potential occupational carcinogen.

Points of Attack: Eyes, skin, respiratory system; kidneys, central nervous system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider urine test for iodine. Consider chest X-ray after acute overexposure. Evaluate for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours:** Viton gloves, suits; Responder suits; Trychem 1000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2644 Methyl iodide, Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental

Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 300/100

Then: Protect persons downwind (mi/km)

Day 0.2/0.3

Night 0.5/0.8

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Methyl iodide itself does not burn. Thermal decomposition products may include iodine. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 203-737-8 [*Annex I Index No.*: 606-026-00-4]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable liquid, Static charge accumulation possible, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn; risk phrases: R11; R20; safety phrases: S2; S21; S23; S24/25; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MIAK is a colorless liquid with a pleasant, fruity odor. Molecular weight = 114.21; specific gravity (H_2O:1) = 0.81; boiling point = 144°C; freezing/melting point = −74°C; vapor pressure = 5 mmHg @ 20°C; flash point = 43.3°C; autoignition temperature = 191°C. Explosive limits: LEL = 1.0% @ 93.3°C; UEL: 8.2% @ 93.3°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: MIAK is used as a solvent for cellulose esters, acrylics, and vinyl copolymers.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/475 milligram per cubic meter TWA

NIOSH REL: 50 ppm/240 milligram per cubic meter TWA

ACGIH TLV[1]: 50 ppm/234 milligram per cubic meter TWA

PAC Ver. 29[138]

PAC-1: 50 ppm

PAC-2: 69 ppm
PAC-3: 190 ppm
DFG MAK: 10 ppm/47 milligram per cubic meter TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D
Australia: TWA 50 ppm (240 milligram per cubic meter), 1993; Belgium: TWA 50 ppm (234 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (230 milligram per cubic meter), 1999; Finland: TWA 50 ppm (230 milligram per cubic meter); STEL 75 ppm (350 milligram per cubic meter), 1999; France: VME 50 ppm (240 milligram per cubic meter), 1999; Norway: TWA 25 ppm (115 milligram per cubic meter), 1999; Sweden: TWA 25 ppm (120 milligram per cubic meter); STEL 50 ppm (250 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 233 milligram per cubic meter, 2003; United Kingdom: TWA 50 ppm (237 milligram per cubic meter); STEL 100 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 50 ppm. In addition, Several states have set guidelines or standards for MIAK in ambient air[60] ranging from 2.4 milligram per cubic meter (North Dakota) to 4.0 milligram per cubic meter (Virginia) to 4.6 milligram per cubic meter (Connecticut) to 5.714 milligram per cubic meter (Nevada).

Determination in Air: OSHA Analytical Method PV-2042

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.72 (estimated). Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl isoamyl ketone can affect you when breathed in and by passing through your skin. Exposure can cause you to become dizzy, lightheaded and to pass out. Contact can irritate the eyes and skin. Repeated exposure can cause a skin rash. Methyl isoamyl ketone vapors can irritate the nose and throat. MIAK may affect the kidneys.

Long-Term Exposure: Skin contact causes skin rash and drying and cracking. High exposures may cause liver damage and may affect the kidneys.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *Up to 500 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)];* or Sa (APF = 10) (any supplied-air respirator.) * *Up to 1250 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]* *Up to 2500 ppm*: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)];* or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 5000 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd, Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong oxidizers (such as chlorine, bromine, and fluorine; reducing agents; and aldehydes. Sources of ignition, such as smoking and open flames are prohibited where methyl isoamyl ketone is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl isoamyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters.

Shipping: UN23025-Methylhexan-2-one, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Flammable liquid.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R10; R37; safety phrases: S2; S24/25 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MIBC is a colorless liquid with a mild odor. The odor threshold is 0.52 ppm. Molecular weight = 102.20; specific gravity (H_2O:1) = 0.81; boiling point = 132.8°C; freezing/melting point = −90°C; vapor pressure = 3 mmHg @ 20°C; flash point = 48.9°C. The explosive limits are LEL = 1.0%; UEL: 5.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: MIBC is used as a solvent; in the formulation of brake fluids; as an intermediate in organic synthesis.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids, peroxysulfuric acid, strong bases, caustics, aliphatic amines; isocyanates. Contact with alkali metals produces hydrogen gas.

Permissible Exposure Limits in Air

NIOSH IDLH = 400 ppm

Conversion factor: 1 ppm = 4.18 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 25 ppm/100 milligram per cubic meter TWA [skin]

NIOSH REL: 25 ppm/100 milligram per cubic meter TWA; 40 ppm/165 milligram per cubic meter STEL [skin]

PAC not available
DFG MAK: 20 ppm/85 milligram per cubic meter TWA; Peak Limitation Category I(1); Pregnancy Risk Group D
Australia: TWA 25 ppm (100 milligram per cubic meter); STEL 40 ppm [skin], 1993; Austria: MAK 25 ppm (50 milligram per cubic meter) [skin], 1999; Belgium: TWA 25 ppm (104 milligram per cubic meter); STEL 40 ppm [skin] 1999; Denmark: TWA 25 ppm (100 milligram per cubic meter) [skin], 1999; Finland: TWA 25 ppm (100 milligram per cubic meter); STEL 40 ppm (170 milligram per cubic meter) [skin], 1999; France: VME 25 ppm (100 milligram per cubic meter) [skin], 1999; the Netherlands: MAC-TGG 100 milligram per cubic meter [skin], 2003; Russia: STEL 10 milligram per cubic meter [skin], 1993; Poland: MAC (TWA) 100 milligram per cubic meter; MAC (STEL) 160 milligram per cubic meter, 1999; Switzerland: TWA 25 ppm (100 milligram per cubic meter); STEL 125 ppm [skin], 1993; Switzerland: MAK-W 25 ppm (100 milligram per cubic meter), KZG-W 125 ppm (500 milligram per cubic meter) [skin], 1999; United Kingdom: TWA 25 ppm (106 milligram per cubic meter); STEL 40 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 40 ppm [skin]. North Dakota has set a guideline for MIBC in ambient air[60] of 1.0−1.65 milligram per cubic meter.

Determination in Air: Use NIOSH Analytical Method #1402, alcohols II; #1405; OSHA Analytical Method 7[18].

Determination in Water: Octanol−water coefficient: $\text{Log}\, K_{ow} = 1.4$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: MIBC can affect you when breathed in and by passing through your skin. Breathing the vapor can irritate the eyes, nose, and throat. Contact with the liquid can burn the eyes and can irritate the skin. Exposure to high concentrations can cause you to feel dizzy, lightheaded, and to pass out.

Long-Term Exposure: Long-term contact can cause drying and cracking of the skin.

Points of Attack: Eyes, skin, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, pulmonary function tests; urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite) end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *250 ppm*: Sa (APF = 10) (any supplied-air respirator). *400 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl amyl alcohol must be stored to avoid contact with peroxides, chlorates, perchlorates, permanganates, and nitrates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methyl amyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2053Methyl isobutyl carbinol, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak

until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; other, more flammable solvent may be added.

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MIBK is a colorless liquid with a pleasant, sweet, fruity odor. Molecular weight = 100.16; specific gravity (H_2O:1) = 0.80 @ 20°C; boiling point = 117°C; freezing/melting point = −84°C; vapor pressure = 16 mmHg @ 20°C; 7.5 mmHg @ 9°C; flash point = 18°C; autoignition temperature: 450°C. Explosive limits: LEL = 1.2% @ 93°C; UEL: 8.0% @ 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 1. Slightly soluble in water; solubility = 2%.

Potential Exposure: MIBK is used as a solvent; a denaturant; and as an extractant; in the manufacture of methyl amyl alcohol; as a solvent in paints, varnishes, and lacquers; as an alcohol denaturant; as a solvent in uranium extraction from fission products.

Incompatibilities: Able to form unstable and explosive peroxides on contact with air. Reacts violently with strong oxidizers, potassium *tert*-butoxide; strong acids; aliphatic amines; reducing agents.

Permissible Exposure Limits in Air

NIOSH IDLH = 500 ppm

Conversion factor: 1 ppm = 4.10 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.88 ppm.

OSHA PEL: 100 ppm/410 milligram per cubic meter TWA

NIOSH REL: 50 ppm/205 milligram per cubic meter TWA; 75 ppm/300 milligram per cubic meter STEL
ACGIH TLV[1]: 20 ppm/82 milligram per cubic meter TWA; 75 ppm/307 milligram per cubic meter STEL; BEI issued.
PAC Ver. 29[138]
PAC-1: 75 ppm
PAC-2: 500 ppm
PAC-3: 3000 ppm
DFG MAK: 20 ppm/83 milligram per cubic meter Peak Limitation Category I(2) [skin]; Pregnancy Risk Group C; BAT: 3.5 mg[hexone]/L in urine/end-of-shift.
Austria: MAK 100 ppm (400 milligram per cubic meter), 1999; Denmark: TWA 25 ppm (100 milligram per cubic meter) [skin], 1999; France: VME 50 ppm (205 milligram per cubic meter), 1999; Japan: 50 ppm (105 milligram per cubic meter) [skin], 1999; Norway: TWA 25 ppm (105 milligram per cubic meter), 1999; Poland: MAC (TWA) 200 milligram per cubic meter; MAC (STEL) 300 milligram per cubic meter, 1999; Sweden: NGV 25 ppm (100 milligram per cubic meter), KTV 50 ppm (200 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 104 milligram per cubic meter, 2003. For ambient air in residential areas: The Czech Republic[35] MAC 0.2 milligram per cubic meter both on a momentary and a daily average basis; Russia[35]: MAC of 0.1 milligram per cubic meter on a once daily basis. Several states have set guidelines or standards for MIBK in ambient air[60] ranging from 0.28 milligram per cubic meter (Massachusetts) to 0.683 milligram per cubic meter (New York) to 2.05 milligram per cubic meter (Florida, North Dakota, South Carolina) to 2.50 milligram per cubic meter to 3.4 milligram per cubic meter (Virginia) to 4.1 milligram per cubic meter (Connecticut) to 4.76 milligram per cubic meter (Nevada) to 30.8 milligram per cubic meter (North Carolina).

Determination in Air: Charcoal adsorption, workup with CS_2; analysis by gas chromatography/flame ionization. See NIOSH (I) Method #1300, Ketones; #2555; OSHA Analytical Method 1004[18].

Permissible Concentration in Water: The state of Massachusetts has set[61] a guideline for MIBK in drinking water of 40 μg/L (0.04 mg/L). Russia has set a limit in surface water of 0.2 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl isobutyl ketone can affect you when breathed in. Exposure to high concentrations can cause you to feel dizzy and lightheaded, and to pass out. Breathing the vapor may cause loss of appetite; nausea, vomiting, and diarrhea. Contact or the vapor can irritate the eyes, nose, mouth, throat. Contact can irritate the skin. Ingestion may cause chemical pneumonitis. Effects may include severe pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Long-term exposure may damage the liver and kidneys. Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as chemical pneumonitis or pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon and styrene-butadiene rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl isobutyl ketone must be stored to avoid contact with strong oxidizers because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, and flames. Sources of ignition, such as smoking and open flames are prohibited where methyl isobutyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of methyl isobutyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl isobutyl ketone.

Shipping: UN1245 Methyl isobutyl ketone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration[22].

WGK[100] (German Aquatic Hazard Class): *Note*: Methyl isocyanate "Caused the death of thousands in 1984 in Bhopal, India when released accidentally as a vapor following an exothermic reaction caused by contamination with water" [*Chemical Engineering News*, 1985, 63(6), p. 27][101].

Description: Methyl isocyanate is a colorless liquid. Sharp odor which is a lachrymator (causes tears) and has poor warning properties: IDLH = 3 ppm; odor threshold = 2.1 ppm. Molecular weight = 57.05; specific gravity (H_2O:1) = 0.96; boiling point = 38°C; freezing/melting point = −45°C; vapor pressure = 348 mmHg @ 20°C; 750 mmHg @ 39°C; flash point = −7°C; autoignition temperature = 534°C. Explosive limits: LEL = 5.3%; 73,330 ppm[138]; UEL: 26°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2. ₩ Reacts with water; solubility = 10% @ 15°C. Reaction with water is slow and violent.

Potential Exposure: Methyl isocyanate is used in carbamates and as chemical intermediate; in the manufacture of a wide variety of pesticides; in the production of polyurethane foams and plastics. A release of this chemical was involved in the world's largest chemical accident, causing the death of thousands of industrial workers in 1984 in Bhopal, India.

Incompatibilities: Highly flammable liquid. Vapors may form explosive mixture with air. Rapid reaction in presence of acid, alkalis, amine; iron, tin, copper, their salts; or their catalysts (such as triphenylarsenic oxide, triethylphosphine, and tributyltin oxide). Exothermic reaction with water, producing carbon dioxide, highly flammable and air-reactive methylamine, dimethylurea and/or trimethyl biuret. The reaction with water is slow @ ≤20°C, but violent at elevated temperatures and/or in the presence of acids and bases. *Elevated temperatures may cause explosive polymerization*. This chemical usually contains inhibitors to prevent polymerization. Reacts with water, acids, alcohols, glycols, amines, amides, ammonia, caprolactum, caustics, strong oxidizers. Attacks some plastics, rubber or coatings. Attacks some forms of plastic, rubber and coatings.

Permissible Exposure Limits in Air
NIOSH IDLH = 3 ppm

Several states have set guidelines or standards for methyl isocyanate in ambient air[60] ranging from 0.17 μ/m^3 (New York) to 0.5 μ/m^3 (North Dakota) to 0.8 μ/m^3 (Virginia) to 1.0 μ/m^3 (Connecticut and South Dakota).

Determination in Air: Use OSHA Analytical Method 54.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Corrosive to the respiratory tract. Causes irritation of eyes, nose, throat, and lungs; bronchitis, cough, shortness of breath; increased secretions; chest pain; difficulty in breathing; and increased blood acidity. Allergic reactions may occur and trigger asthmatic response in sensitized individuals. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Results of human volunteer experiments indicate the exposure for 1−5 min at 0.4 ppm causes no irritation of eyes, nose or throat; @ 2 ppm, irritation and tearing; @ 4 ppm, stronger symptoms; and @ 21 ppm exposure is unbearable; NIOSH reports that 3 ppm is immediately dangerous to life and health (IDLH). Improvement will occur in a few days if the dose is very low, and proper supportive therapy is given. At higher doses and longer durations of exposure, death may be immediate or delayed more than a month. *Skin*: Corrosive. Extremely irritating; can cause chemical burns. *Eyes*: Corrosive to the eyes. Levels of 2 ppm may cause irritation and tearing. Ulceration has occurred at high levels. Very high levels may lead to permanent damage and blindness. *Ingestion*: Corrosive; causes vomiting, diarrhea, and abdominal pain.

Long-Term Exposure: May cause allergic sensitization of skin and respiratory tract. Subsequent exposure even at extremely low levels may cause asthma attacks. May cause chronic lung disease and increased susceptibility to lung infection. May affect the lungs, causing tissue lesions. Exposure may cause miscarriages among pregnant women.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 second); sputum cytology; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended. Lung function tests. These may be normal at first if person is not having an attack at the time. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Warning: Effects may be delayed for up to 15 hours. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: Prevent skin contact. **8 hours:** polyvinyl alcohol gloves; Barricade coated suits; Responder suits, Trellchem HPS suits; Trychem 1000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.2 ppm*: Sa (APF = 10) (any supplied-air respirator). *0.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *1 ppm*: SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *3 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl isocyanate must be stored to avoid contact with water, acid, alkali, amines, or iron, tin, copper (or their salts); and certain other catalysts, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or heat. Sources of ignition, such as smoking and open flames are prohibited where methyl isocyanate is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl isocyanate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl isocyanate. Wherever methyl isocyanate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2480 Methyl isocyanate Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone A

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 3.6/5.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 3000/1000
Then: Protect persons downwind (mi/km)
Day 7.0+/11.0+*
Night 7.0+/11.0+*

*+ means distance can be larger in certain atmospheric conditions.

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. For spills Up to 5 gal, cover with 6 inches of activated carbon for each 1 inch of liquid depth and let stand. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: *Elevated temperatures can cause explosion*. Highly flammable liquid. Thermal decomposition products may include hydrogen cyanide and oxides of nitrogen and carbon. Material is extremely hazardous to health; areas must be entered with extreme care. Full protective clothing, including SCBA (coat, pants, gloves, boots, and bands around legs, arms and waist) should be provided. No skin surface should be exposed. Vapors are heavier than air and will collect in low areas. Small fires: dry chemical, carbon dioxide, water spray, or foam. Large fires: water spray, fog, or foam[101]. Vapors may travel long distances to ignition sources and flashback. Containers may explode in fire. Stay away from ends of tanks. Do not get water inside container. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Spray cooling water on containers that are exposed to flames until well after fire is out. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full face pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration in the presence of a flammable solvent[22]. A flue gas scrubber is recommended as well.

Methyl Isopropyl Ketone M:1020

Formula: $C_5H_{10}O$; $CH_3COCH(CH_3)_2$
Synonyms: 2-Acetyl propane; Isopropyl methyl ketone; 3-Methyl-2-butanone; 3-Methyl butan-2-one; MIPK
CAS Registry Number: 563-80-4
HSDB Number: 7915
RTECS Number: EL9100000
UN/NA & ERG Number: UN2397/127
EC Number: 209-264-3 [*Annex I Index No.*: 606-007-00-0]
Regulatory Authority and Advisory Information
California Proposition 65 Chemical[102]: Developmental/ Reproductive toxin, *delisted 4/4/2014*
Hazard Alert: Highly flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).
Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.
Hazard symbols, risk, & safety statements: Hazard symbol: F+; risk phrases: R12; R36/37/38; R62; safety phrases: S2; S7; S9; S16; S33; S41; S45 (see Appendix 4).
WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.
Description: MIPK is a colorless liquid with an acetone-like odor. Molecular weight = 86.15; specific gravity (H_2O:1) = 0.81 @ 16°C; boiling point = 93°C. Freezing = −92°C; vapor pressure = 42 mmHg @ 20°C; flash point = 21.1°C; autoignition temperature = 475°C. Explosive limits: LEL = 1.2%; UEL: 8%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Slightly soluble in water; solubility = 0.5% @ 20°C.
Potential Exposure: This ketone is used as a solvent for nitrocellulose lacquers.
Incompatibilities: Vapors may form explosive mixture with air. Ketones are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.53 milligram per cubic meter @ 25°C & 1 atm
OSHA PEL: None
NIOSH REL: 200 ppm/705 milligram per cubic meter TWA
ACGIH TLV[1]: 200 ppm/705 milligram per cubic meter TWA, Excursion Limit Recommendation: Excursions in worker exposure levels may exceed 3 times the TLV-TWA for no more than a total of 30 minutes during a work day, and under no circumstances should they exceed 5 times the TLV-TWA, provided that the TLV-TWA is not exceeded.
PAC Ver. 29[138]
PAC-1: 60 ppm
PAC-2: 660 ppm
PAC-3: 4000 ppm
Australia: TWA 200 ppm (705 milligram per cubic meter), 1993; Belgium: TWA 200 ppm (705 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (705 milligram per cubic meter), 1999; Finland: TWA 200 ppm (700 milligram per cubic meter); STEL 250 ppm (875 milligram per cubic meter), 1999; France: VME 200 ppm (705 milligram per cubic meter), 1999; Norway: TWA 100 ppm (350 milligram per cubic meter), 1999; Switzerland: MAK-W 200 ppm (720 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 705 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 200 ppm. Several states have set guidelines or standards for MIPK in ambient air[60] ranging from 7.05 milligram per cubic meter (North Dakota) to 11.75 milligram per cubic meter (Virginia) to 14.1 milligram per cubic meter (Connecticut) to 16.786 milligram per cubic meter (Nevada).
Determination in Air: No NIOSH Analytical Method available.
Routes of Entry: Inhalation of vapor, skin absorption; ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short-Term Exposure: Eye, nose, throat and skin irritation. In high concentrations, narcosis may be produced with symptoms of headache, nausea, vomiting, lightheadedness, dizziness, a lack of coordination; narcosis, and unconsciousness.
Long-Term Exposure: Removes the skin's natural oils; causes drying and cracking.
Points of Attack: Eyes, skin, respiratory system.
Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working

with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: Where there is potential exists for exposures *over 200* ppm; Use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with an organic vapor cartridge/canister. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from aldehydes. Sources of ignition, such as smoking and open flames are prohibited where methyl isopropyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl isopropyl ketone. Wherever methyl isopropyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN23973-Methylbutan-2-one, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Highly flammable solid, Corrosive, Water reactive, Possible sensitization hazard. Environmental hazard, Suspected reprotoxic hazard, Primary irritant (w/o allergic reaction).

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, N, Xi; risk phrases: R11; R23/25; R29; R34; R43; R50/53; safety phrases: S1/2; S21; S29/35; S36/37; S38; S41; S45; S60, S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl isothiocyanate is a crystalline solid. Horseradish, acrid odor. Molecular weight = 73.12; boiling point = 119°C; freezing/melting point = 35−36°C; flash point = 32°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 0₩. Slightly soluble in water; reacts, releasing carbon dioxide and methylamine gases.

Potential Exposure: It is used as a soil fumigant. A mixture of methyl isothiocyanate and chlorinated C-3 hydrocarbons is used as a soil fumigant for control of weeds, fungi, insects, and nematodes.

Incompatibilities: Dust may form explosive mixture with air. Reacts with water, releasing carbon dioxide and methylamine gases. Unstable and reactive; sensitive to oxygen and to light. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, alcohols, strong bases, amines, water, heat and cold. Attacks iron, zinc and other metals.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: $\mathbf{0.27_A}$ milligram per cubic meter

PAC-2: $\mathbf{17_A}$ milligram per cubic meter

PAC-3: $\mathbf{50_A}$ milligram per cubic meter

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. Russia[43] set a MAC in work-place air of 0.1 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Highly irritating to the eyes, skin, and mucous membranes. Coughing, wheezing, and/or shortness of breath and other symptoms of extreme pulmonary irritation would be expected if vapors are inhaled. Very high exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure can cause headache, dizziness, depression, seizures, and even loss of consciousness. This material is very toxic; probable human oral lethal dose is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150 lb) person. Human oral minimum lethal dose: approximately 1 g/kg.

Long-Term Exposure: May cause skin allergy, and bronchitis. May affect the thyroid gland.

Points of Attack: Lungs, skin, thyroid.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. These may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Evaluation of thyroid function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyl isothiocyanate exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. (1) Color code—

Blue: Health Hazard/Toxics/Poisons: Store in a secure poison location. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where methyl isothiocyanate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2477 Methyl isothiocyanate, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Inhalation Hazard Zone B.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.2/0.3

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and wash area following clean-up. Ventilate and wash spill areas when clean-up is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl isothiocyanate is a flammable solid. Thermal decomposition products may include cyanides, oxides of sulfur, nitrogen, and carbon. Use dry chemical, CO_2, water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl mercaptan is a colorless gas or white liquid with a disagreeable odor like garlic or rotten cabbage. Shipped as a liquefied compressed gas. The odor threshold is 0.002 ppm. Molecular weight = 48.11; specific gravity (H_2O:1) = 8.7 @ 20°C (liquid @ 0°C); boiling point = 5.9°C; freezing/melting point = −123°C; vapor pressure = 1.7 atm; 750 mmHg @ 5.7°C; relative vapor density (air = 1) = 1.66; flash point = −17°C (liquid). Explosive limits: LEL = 3.9%; 100,000 ppm[138]; UEL: 21.8%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 4, reactivity 0. Soluble in water; solubility = 2%.

Potential Exposure: Methyl mercaptan is used in methionine synthesis, and widely as an intermediate in pesticide manufacture. A foul-smelling odorant usually added to chemicals, including pesticides.

Incompatibilities: Violent reaction with strong oxidizers, bleaches, copper, nickel and their alloys; aluminum. Reacts with acids producing flammable and toxic hydrogen sulfide.

Permissible Exposure Limits in Air

NIOSH IDLH = 150 ppm

Conversion factor: 1 ppm = 1.97 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 0.0016 ppm.

OSHA PEL: 10 ppm/20 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.5 ppm/1 milligram per cubic meter [15-minute] Ceiling Concentration

ACGIH TLV[1]: 0.5 ppm/0.98 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.005_A}$ ppm

PAC-2: $\mathbf{23_A}$ ppm

PAC-3: $\mathbf{68_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 0.5 ppm/1.0 milligram per cubic meter TWA; Peak Limitation Category II(2); Pregnancy Risk Group D

Australia: TWA 0.5 ppm (1 milligram per cubic meter), 1993; Austria: MAK 0.5 ppm (1 milligram per cubic meter), 1999; Belgium: TWA 0.5 ppm (0.98 milligram per cubic meter), 1993; Denmark: TWA 0.5 ppm (1 milligram per cubic meter), 1999; Finland: TWA 0.5 ppm (1 milligram per cubic meter); STEL 1.5 ppm (3 milligram per cubic meter), 1999; France: VME 0.5 ppm (1 milligram per cubic meter), 1999; Hungary: STEL 1 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 1 milligram per cubic meter, 2003; Norway: TWA 0.5 ppm (1 milligram per cubic meter), 1999; the Philippines: TWA 10 ppm (20 milligram per cubic meter), 1993; Poland: MAC (TWA) 1 milligram per cubic meter; MAC (STEL) 2 milligram per cubic meter, 1999; Russia: STEL 0.8 milligram per cubic meter, 1993; Sweden: NGV 1 ppm, 1999; Switzerland: MAK-W 0.5 ppm (1 milligram per cubic meter), KZG-W 1 ppm (2 milligram per cubic meter), 1999; Thailand: TWA 10 ppm (20 milligram per cubic meter), 1993; Turkey: TWA 10 ppm (20 milligram per cubic meter), 1993; United Kingdom: TWA 0.5 ppm (1 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 0.5 ppm. Russia[43] set a MAC in ambient air in residential areas of 9×10^{-6} milligram per cubic meter on a momentary basis. Several states have set guidelines or standards for methyl mercaptan in ambient air[60] ranging from 3.3 μ/m^3 (New York) to 10 μ/m^3 (Florida, North Dakota, South Carolina) to 16 μ/m^3 (Virginia) to 20 μ/m^3 (Connecticut) to 24 μ/m^3 (Nevada) to 50 μ/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2542, Mercaptans; OSHA Analytical Method 26.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 13.8 μg/L based on health effects. Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 μg/L.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes, skin and respiratory tract. Skin contact can cause frostbite. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. May affect the central nervous system. Signs and symptoms of acute exposure to methyl mercaptan may include fever, cough, shortness of breath; a feeling of tightness and burning in the chest; respiratory distress; respiratory paralysis; and respiratory failure/collapse. Headache, loss of the sense of smell, dizziness, staggering gait, and heightened emotions may occur. Gastrointestinal symptoms include difficulty in swallowing; redness of the tongue and pharynx; nausea, vomiting, abdominal pain; and diarrhea. Urinary disturbances may also be found.

Long-Term Exposure: May cause liver and kidney damage. Repeated exposure may cause bronchitis. Memory loss, damage to the central and peripheral nervous systems; tremor, convulsions, and coma may also occur. May affect the blood cell causing anemia.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, central nervous system; blood.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 hours:** Barricade coated suits; Responder suits; Trychem 1000 suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear the proper chemical goggles (indirect vent, impact and slash-resistant with liquids; nonvented, impact resistant with fumes, gases, or vapors) and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *25 ppm*: CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Check oxygen content prior to entering storage area. Poison gas. (1) Color code—Blue: Health Hazard/Poison: Store in a secure poison location. This gas is highly toxic. Even slight exposure to these gasses can cause death. Store outdoors in a secure, restricted area that containing warning signs. This area must be roofed and shaded with the cylinders stored off the ground and separated from all other products assigned to other hazard categories and radiant heat sources on nonwooden floors. If indoors, store in a well-ventilated areas in temperatures not to exceed 50°C. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl mercaptan must be stored to avoid contact with water; steam; or strong acids (such as hydrochloric, sulfuric, and nitric); because toxic flammable vapors will be released. It should not contact oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area sway from heat or sparks. Sources of ignition, such as smoking and open flames are prohibited where methyl mercaptan is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl mercaptan should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl mercaptan. Compressed gas cylinders should be affixed to a wall. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. The storage area for flammable toxic gases should have electrical equipment conforming to Article 500 of the National Electrical Code.

Shipping: UN1064 Methyl mercaptan, Hazard Class: 2.3; Labels: 2.3-Poisonous gas, 2.1-Flammable gas, Inhalation Hazard Zone C. Cylinders must be transported in a secure upright position, in a well-ventilated truck. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 500/150
Then: Protect persons downwind (mi/km)
Day 0.7/1.1
Night 2.0/3.2

If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with SCBA to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Evacuate area endangered by gas. See isolation distances above. Combustion produces irritating sulfur dioxide. Very dangerous when exposed to heat, flame, or oxidizers. On decomposition it emits highly toxic fumes of sulfur oxides. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return refillable compressed gas cylinders to supplier. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration followed by effective scrubbing of the effluent gas.

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1993 (dimethyl mercury); EPA: Possible Human Carcinogen; Methylmercury compounds are possibly carcinogenic to humans (Group 2B).

California Proposition 65: Developmental/Reproductive toxin (7/1/1987), Cancer (5/1/1996) as methyl mercury compounds.

Hazard Alert: Poison, Combustible, Organometallic, Strong reducing agent, Suspected reprotoxic hazard, Environmental hazard.

United States National Primary Drinking Water Regulations: MCLG = 0.002 mg[Hg]/L; MCL = 0.002 mg [Hg]/L as mercury

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%. as mercury compounds.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure) (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

European/International Regulations (*593-74-8*): Hazard symbol: T+, N; risk phrases: R45; R26/27/28; R33; R50/53; R63; safety phrases: S1/2; S13; S28; S29/35; S36; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)].

Description: Methylmercuric dicyanamide is a crystalline solid. Molecular weight = 298.72; freezing/melting point = 156°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Soluble in water.

Potential Exposure: This material is used as a fungicide; a seed, soil, and turf treatment especially for cereals, sorghum, sugar beets, cotton, and flax. Not registered for use as a pesticide in the United States.

Incompatibilities: A strong reducing agent. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

as organo mercury compound

NIOSH IDLH = 2 mg[Hg]/m^3

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 milligram per cubic meter Ceiling Concentration

NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 milligram per cubic meter STEL [skin]

PAC Ver. 29[138]

PAC-1: 0.045 milligram per cubic meter

PAC-2: 0.06 milligram per cubic meter

PAC-3: 3 milligram per cubic meter

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3

North Dakota has set guidelines for alkyl mercury compounds in ambient air[60] of $1-3\ \mu/m^3$

Permissible Concentration in Water: Federal Drinking Water Standards: EPA 2 μg[Hg]/L; Federal Drinking Water Guidelines: EPA 2 μg[Hg]/L; State Drinking Water Guidelines: Arizona 3 μg[Hg]/L.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short-Term Exposure: Alkyl mercury compounds are primary skin irritants and may cause dermatitis. When deposited on the skin, they give no warning, and if contact is maintained, can cause second-degree burns and blisters. Sensitization may occur. In the case of ingestion there is nausea and abdominal pain. Vomiting and diarrhea may occur. Burning or prickling of the lips, tongue, and extremities. The patient may be confused, hallucinate, be irritable, have disturbed sleep; loss of muscular coordination; and memory loss. Visual fields may narrow concentrically; emotional instability may occur as well as inability to concentrate, with stupor and coma. Methylmercuric dicyanamide is extremely toxic to humans. The probable lethal dose for humans is 5−50 mg/kg of body weight (between seven drops and one teaspoon for a 150-lb person). Humans may be poisoned by feeding on the flesh of animals which have ingested this fungicide. Eating treated seeds may also cause poisoning. The poisoning may show delayed manifestations on the nervous system. Patients frequently become gradually worse after their illness is recognized and exposure is stopped.

Long-Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome; or kidney failure. The central nervous system; including the brain, is the principal target tissue for this group of toxic compounds. Severe poisoning may produce irreversible brain damage resulting in loss of higher functions. The effects of chronic poisoning with alkyl mercury compounds are progressive. In the early stages, there are fine tremors of the hands; and in some cases, of the face and arms. With continued exposure, tremors may become coarse and convulsive; scanning speech with moderate slurring and difficulty in pronunciation may also occur. The worker may then develop an unsteady gait of a spastic nature which can progress to severe ataxia of the arms and legs. Sensory disturbances including tunnel vision, blindness, and deafness, are also common. A late symptom, constriction of the visual fields, is rarely reversible and may be associated with loss of understanding and reason which makes the victim completely out of touch with his environment. Severe cerebral effects have been seen in infants born to mothers who had eaten large amounts of methyl mercury-contaminated fish.

Points of Attack: Eyes, skin, central nervous system; peripheral nervous system; kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended: eye exam. Consider lung function tests for persons with frequent exposure. Exam of the nervous system. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Examination of the central nervous system; and kidneys. Consideration should be given to the possible effects on the fetus of alkyl mercury exposure in the mother. Constriction of visual fields may be a useful diagnostic sign. Blood and urine levels of mercury have been studied, especially in the case of methylmercury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or

P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2777 Mercury based pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Thermal decomposition products may include oxides of mercury, nitrogen and carbon. Fire and runoff from fire control water may produce irritating or poisonous gases of mercury and nitrogen oxides. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R19; R36/37/38; R43;

R62; R63; safety phrases: S2; S21; S24; S37; S46; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl methacrylate is a colorless liquid. Acrid, fruity odor. The odor threshold is 0.05−0.083 ppm. Molecular weight = 100.12; specific gravity (H_2O:1) = 0.94; boiling point = 101°C; freezing/melting point = −48°C; vapor pressure = 29 mmHg @ 20°C; 75 mmHg @ 40°C; flash point = 10°C; autoignition temperature = 421°C. Explosive limits: LEL = 1.7%; 53,000 ppm[138]; UEL: 8.2 to 12.5%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 2. Slightly soluble in water; solubility = 1.5%. Physical and toxicological properties may be affected by the inhibitor such as hydroquinone.

Potential Exposure: Virtually all of the methyl methacrylate monomer produced is used in the production of polymers, such as surface coating resins; plastics (Plexiglas and Lucite); ion exchange resins; and plastic dentures.

Incompatibilities: Vapor may form explosive mixture with air. Reacts in air to form a heat-sensitive explosive product @ 60°C. Incompatible with nitrates, oxidizers, peroxides, strong acids; strong alkalis; oxidizers, reducing agents; amines, moisture. Contact with benzoyl peroxide may cause ignition, fire and explosion. May polymerize if subjected to heat, polymerization catalysts e. g., azoisobutyronitrile, dibenzoyl peroxide; di-*tert*-butyl peroxide, propionaldehyde); strong oxidizers; or ultraviolet light. May contain an inhibitor, such as hydroquinone.

Permissible Exposure Limits in Air

NIOSH IDLH = 1000 ppm

Conversion factor: 1 ppm = 4.09 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm/410 milligram per cubic meter TWA

NIOSH REL: 100 ppm/410 milligram per cubic meter TWA

ACGIH TLV[1]: 50 ppm/205 milligram per cubic meter TWA; 100 ppm/410 milligram per cubic meter STEL, sensitizer, not classifiable as a human carcinogen

PAC* Ver. 29[138]

PAC-1: **17**$_{\mathbf{A}}$ ppm

PAC-2: **120**$_{\mathbf{A}}$ ppm

PAC-3: **570**$_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: 50 ppm/210 milligram per cubic meter TWA; Peak Limitation Category I(2); danger of skin sensitization; Pregnancy Risk Group C

Australia: TWA 100 ppm (410 milligram per cubic meter), 1993; Austria: MAK 50 ppm (210 milligram per cubic meter), 1999; Belgium: TWA 100 ppm (410 milligram per cubic meter), 1993; Finland: TWA 100 ppm (410 milligram per cubic meter); STEL 150 ppm (615 milligram per cubic meter), 1999; France: VME 100 ppm (410 milligram per cubic meter), VLE 200 ppm (820 milligram per cubic meter), 1999; Hungary: TWA 50 milligram per cubic meter; STEL 150 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 40 milligram per cubic meter, 2003; the Philippines: TWA 100 ppm (410 milligram per cubic meter), 1993; Poland: MAC (TWA) 50 milligram per cubic meter; MAC (STEL) 400 milligram per cubic meter, 1999; Russia: STEL 10 milligram per cubic meter, 1993; Sweden: NGV 50 ppm (200 milligram per cubic meter), KTV 150 ppm (600 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 50 ppm (210 milligram per cubic meter), KZG-W 100 ppm (420 milligram per cubic meter), 1999; United Kingdom: TWA 50 ppm (208 milligram per cubic meter); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 100 ppm. Russia has set MAC values for ambient air in residential areas of 0.1 milligram per cubic meter on a momentary basis and also on a daily average basis. Several states have set guidelines or standards for methyl methacrylate in ambient air[60] ranging from 7.0 μ/m^3 (Massachusetts) to 1367 μ/m^3 (New York) to 4100 μ/m^3 (Florida and North Dakota) to 6800 μ/m^3 (Virginia) to 8200 μ/m^3 (Connecticut) to 9742 μ/m^3 (Nevada) to 10,250 μ/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2537, Methyl methacrylate; OSHA Analytical Method 94

Permissible Concentration in Water: A limit in drinking water has been set by Russia[43] at 0.01 mg/L. Maine[61] has set a guideline for methyl methacrylate in drinking water of 200 μg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 1.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can irritate eyes and skin. Inhalation irritates the respiratory tract. High exposure can cause dizziness, lightheadedness narcosis, and unconsciousness.

Long-Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated or prolonged inhalation exposure may cause asthma. May affect the central nervous system and the peripheral nervous system. May affect the kidneys and liver. May damage the developing fetus.

Points of Attack: Central nervous system; kidneys, liver, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: polyvinyl alcohol gloves; 4H and Silver Shield gloves; Barricade coated suits; Trellchem HPS suits. **4 hours**: Teflon gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:PD, PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl methacrylate must be stored to avoid contact with oxidizers, such as nitrates, permanganates, perchlorates, chlorates, and peroxides; strong alkalis, such as sodium hydroxide and potassium hydroxide; and strong acids, such as nitric acid, hydrochloric acid, and sulfuric acid; since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and ionizing radiation, because methyl methacrylate will react and release heat quickly causing an explosion. Store and use with an appropriate inhibitor. Lack of an appropriate inhibitor may cause an explosive reaction.

Shipping: UN1247 Methyl methacrylate monomer, stabilized, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition includes oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration may be allowed.

Regulatory Authority and Advisory Information

Carcinogenicty: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical[102]: Cancer 4/1/1988.

Hazard Alert: Poison, Corrosive, Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R22; R34; R36/37/38 R45; R62; R63; R68; safety phrases: S26; S36/37/39; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Clear, colorless to amber liquid. Molecular weight = 110.14; specific gravity = 1.29 @ 20°C; boiling point = 202°C @ 760.0 mmHg; freezing/melting point = 20°C; vapor pressure = 0.31 mmHg @ 25°C (est.)[72]; flash point = 104°C (cc); Henry's law constant = 4×10^{-6} atm m^3/mol @ 25°C (est)[72]. Soluble in water; solubility = $\geq$ 150 g/L @ 20°C.

Potential Exposure: Research chemical and cancer drug. No longer produced commercially in the United States.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Esters are generally incompatible with nitrates. Moisture may cause hydrolysis or other forms of decomposition.

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 1. Unlikely to bioaccumulate in marine organisms. EPA Method 8250; 3540; 3550; EAD-1625

Routes of Entry: Inhalation, dermal contact.

Harmful Effects and Symptoms

Short-Term Exposure: A corrosive material. May cause irritation and burns of the skin, eyes, and respiratory tract. May cause permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. LD_{50}(oral-rat) = < 300 mg/kg

Long-Term Exposure: Potential carcinogen. Possible risk of forming tumors. Suspected of causing genetic defects.

Points of Attack: GI tract, kidneys, brain.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered.

First Aid Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

UN2810 Toxic liquids, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 1000/300
Then: Protect persons downwind (mi/km)
Day 1.1/1.8
Night 2.8/4.5

First remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. All contaminated clothing and absorbent paper should be sealed in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60%−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Wear a SCBA in pressure-demand, NIOSH/MSHA or European Standard EN 149-approved respirator, and full protective gear. During a fire or heated to decomposition, irritating and highly toxic gases may be generated and it emits acrid smoke, irritating fumes and toxic fumes of carbon monoxide and carbon dioxide. Use water spray to keep fire-exposed containers cool. Containers may explode in the heat of a fire. Extinguishing media; cool containers with flooding quantities of water until well after fire is out. Fires involving this material can be controlled with a dry chemical, carbon dioxide, or Halon extinguisher. A water spray may also be used.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of lab chemicals or expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant as Parathion-methyl.

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure)[methyl-parathion (emulsifiable concentrates (EC) @ or $>$ 19.5% active ingredient and dusts @ or $>$ 1.5% active ingredient)].

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, F, N; risk phrases: R5; R10; R24; R26/28; R33; R48/22; R50/53; safety phrases: S1/2; S22-; S28; S29/35; S36/37/39; S41; S45; S60; 61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl parathion is a white to yellow-brown, crystalline solid with a garlic odor. Molecular weight = 263.22; specific gravity (H_2O:1) = 1.36; boiling point = 147.8; freezing/melting point = 37.2°C. The commercial product in xylene is a tan liquid (80% methyl parathion/20% xylene); vapor pressure = 0.00001 mmHg @ 20°C; flash point (in xylene) = 46°C[101]. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 2. Slightly soluble in water; solubility = 0.006% @ 25°C. Commercial product may contain xylene. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: A severely hazardous pesticide formulation. Alert: This material is used as an insecticide on over 50 crops, primarily cotton, and on several ornamentals.

Incompatibilities: Incompatible with oxidizers, strong bases; heat. Mixtures with magnesium, or endrin may be violent or explosive. Slightly decomposed by acid solutions. Rapidly decomposed by alkalies. Explosive risk when heated above 50°C. The liquid xylene solution decomposes violently @ 120°C.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.2 milligram per cubic meter TWA [skin]

ACGIH TLV[1]: 0.2 milligram per cubic meter TWA, measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued as Acetylcholinesterase inhibiting pesticides.

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values. Australia: TWA 0.2 milligram per cubic meter [skin], 1993; Belgium: TWA 0.2 milligram per cubic meter [skin], 1993; Denmark: TWA 0.2 milligram per cubic meter [skin], 1999; Finland: TWA 0.2 milligram per cubic meter; STEL 0.6 milligram per cubic meter [skin], 1999; France: VME 0.2 milligram per cubic meter [skin], 1999; Hungary: TWA 0.1 milligram per cubic meter; STEL 0.2 milligram per cubic meter [skin], 1993; Norway: TWA 0.2 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.2 milligram per cubic meter [skin], 2003; Russia: STEL 0.1 milligram per cubic meter [skin], 1993; Switzerland: MAK-W 0.2 milligram per cubic meter [skin], 1999; United Kingdom: LTEL 0.2 milligram per cubic meter; STEL 0.6 milligram per cubic meter [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia set a MAC for ambient air in residential areas of 0.008 milligram per cubic meter on a once daily basis. Several states have set guidelines or standards for methyl parathion in ambient air[60] ranging from 2.0 μ/m^3 (North Dakota) to 3.5 μ/m^3 (Virginia) to 4.0 μ/m^3 (Connecticut) to 5.0 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2112, Methyl parathion.

Permissible Concentration in Water: Russia set a MAC in water bodies used for domestic purposes of 0.02 mg/L. Two states have set guidelines for methyl parathion in drinking water of 30 μg/L-in California and Kansas[61]. A lifetime health advisory of 2 μg/L has been developed by EPA.

Determination in Water: Fish Tox = 5.59677000 ppb (HIGH). Octanol–water coefficient: Log K_{ow} = 2.7 (pure); 2.04(V). Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl parathion may affect the nervous system; causing convulsions, respiratory failure; and possible death. A cholinesterase inhibitor. Acute exposure to parathion-methyl may produce the following symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. High exposure may result in death. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur. Because this is a potential mutagen, handle it as a possible carcinogen-with extreme caution. Methyl parathion may damage the developing fetus. This material is extremely toxic; the probable oral lethal dose is 5–50 mg/kg, or between seven drops and one teaspoonful for a 150-lb person. Human Tox = 2.00000 ppb (HIGH).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause personality changes; depression, anxiety, irritability. May cause liver damage. May damage the developing fetus.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects of exposure may be delayed. Medical monitoring is advised[101].

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working

with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *2 milligram per cubic meter*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *5 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any PAPR with an organic vapor cartridge in combination with a high-efficiency particulate filter). *10 milligram per cubic meter*: CcrFOv100 (APF = 50) [any air-purifying full facepiece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [Any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *200 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:PD, PP (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from heat sources, since violent reactions may occur. See incompatible material listed above. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN3017 Organophosphorus pesticides, liquid, toxic, flammable, flash point not <23°C, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3.-Flammable liquid. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Often available and used in a flammable liquid solution Thermal decomposition products may include oxides of phosphorus, nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors from the liquid are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration (816°C, 0.5 second minimum for primary combustion; 1204°C, 1.0 second for secondary combustion) with adequate scrubbing and ash disposal facilities. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Hazard Alert: Poison inhalation hazard, Corrosive, Violently water reactive.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 100 lb (45.4 kg).

United States National Primary Drinking Water Regulations: SMCL = 250 mg[Cl^-]/L as Chloride

United States DOT 49CFR172.101, Inhalation Hazardous Chemical (PIH).

Hazard symbols, risk, & safety statements: Hazard symbol: T + ; risk phrases: R14; R26; R29; R34; safety phrases: S1; S26; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Methyl phosphonic dichloride is a low melting solid or colorless to pale yellow liquid. Pungent odor. Molecular weight = 132.91; specific gravity (H_2O:1) = 1.385 @ 20°C; boiling point = 162°C; freezing/melting point = 32°C; vapor pressure = 760 mmHg @ 163°C; flash point $\geq$ 50°C (oc). Explosive limits: LEL = 17,000 ppm; UEL: Unknown. ₩ Mixes violently with water, forming hydrogen chloride. Physical and toxicological properties may be affected by the carrier solvents used in commercial formulations.

Potential Exposure: Used as a chemical intermediate in pesticide manufacture.

Incompatibilities: Highly flammable; mists or Vapors may form explosive mixture with air. Reacts with moist air forming fumes of hydrogen chloride; may spontaneously ignite. Reacts with water or alcohol, forming hydrochloric acid. The reaction may be violent and ignite unreacted material. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, amines, ethers. May react violently, possibly explosively, when mixed with ethers and trace amounts of metal salts.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.13 milligram per cubic meter

PAC-2: 1.4 milligram per cubic meter

PAC-3: 6.2 milligram per cubic meter

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Poisonous if inhaled or swallowed. Highly corrosive. Contact causes severe burns to skin and eyes. May cause permanent damage. Inhalation causes irritation. High levels of exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause lung irritation; bronchitis to develop.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance. Lung function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Poison inhalation chemical (PIH); check oxygen content prior to entering storage area. Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN9206 Methyl phosphonic dichloride, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material. Domestic (United States), Inhalation Hazard Zone B. UN3390 Toxic by inhalation liquid, corrosive, n.o.s. with an $LC_{50} \leq 1000\,mL/m^3$ and saturated vapor concentration ≥ 10 LC_{50} Hazard Class: 6.1; Labels: 6.1-Poisonous materials, 8-Corrosive material, Technical Name Required, Inhalation Hazard Zone B.

Spill Handling:

Fully encapsulating, vapor protective clothing should be worn for spills and leaks with no fire. *Eliminate* all ignition sources (no smoking, flares, sparks or flames in immediate area). Do not touch or walk through spilled material. Stop leak if you can do it without risk.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.1/0.2

Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 200/60

Then: Protect persons downwind (mi/km)

Day 0.3/0.5

Night 0.4/0.6

Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Do not breathe vapors. Do not get water inside container; stop leak if you can do so without risk. Do not touch spilled material. Use water spray to reduce vapors but do not put water on leak or spill area. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Dike spill for later disposal; do not apply water unless directed to do so. Clean up only under supervision of an expert. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: If tank, rail car or tank truck is involved in a fire, *isolate* for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. Thermal decomposition releases corrosive and irritation hydrogen chloride gas, and oxides of phosphorus and carbon. Containers may explode in heat of fire. Approach fire with extreme caution: If possible let fire burn; there is a good chance of explosive reignition. Do NOT use water, foam, or CO_2 on material itself. Do NOT use water on adjacent fires. Runoff may create fire or explosion hazard. Also, runoff from fire control may cause pollution. *Small fire*: Use *dry* chemical, *dry* graphite, soda ash, lime, or *dry* sand. *Large fire*: Specially trained personnel operating from a safe distance can fight fire using *dry* sand, *dry* chemical, soda ash, lime, or other inert material if it is available in sufficient amounts; or, withdraw from area and let fire burn. IF material is not leaking, cool exposed containers with large quantities of water from unattended equipment or remove intact containers if it can be done safely. *Do not allow water to get inside containers*. If cooling streams are ineffective (*venting sound increases in volume and pitch, tank discolors or shows signs of deforming*), withdraw immediately to a secure location. Always stay away from ends of tanks, especially when engulfed in flames. May reignite after fire is extinguished. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl Propionate M:1200

Formula: $C_4H_8O_2$

Synonyms: Methyl propanoate; Methyl propylate; Propanoic acid, methyl ester; Propionate de methyle (French); Propionato de metilo (Spanish)

CAS Registry Number: 554-12-1

HSDB Number: 5688

RTECS Number: UF5970000

UN/NA & ERG Number: UN1248/129

EC Number: 209-060-4 [*Annex I Index No.*: 607-027-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F; Xn; risk phrases: R2; R11; R20/21; safety phrases: S2; S15; S16; S21; S24; S29; S33; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyl propionate is colorless liquid with a sweet, fruity, rum-like odor. Molecular weight = 88.12; boiling point = 80°C; freezing/melting point = −87°C; flash point = −2.2°C; autoignition temperature = 469°C. Explosive limits: LEL = 2.5%; UEL: 13.0%; hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 3, reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a solvent; and in making paints, lacquers, and varnishes. Also used in flavorings and fragrances.

Incompatibilities: May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Keep away from heat and moisture.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Russia: STEL 10 milligram per cubic meter, 1993

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact can cause skin and eye irritation. Harmful if inhaled.

Long-Term Exposure: Repeated high exposures may cause dizziness, lightheadedness, loss of coordination; and difficult breathing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl propionate all handlers should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids; strong bases. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1248 Methyl propionate, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Methyl Propyl Ketone M:1220

Formula: $C_5H_{10}O$; $CH_3COCH_2CH_2CH_3$

Synonyms: Ethyl acetone; Methyl-*n*-propyl ketone; MPK; 2-Pentanone

CAS Registry Number: 107-87-9

HSDB Number: 158

RTECS Number: SA7875000

UN/NA & ERG Number: UN1249/127

EC Number: 203-528-1

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xn: Risk phrases: R11; R22; R36/37/38; R62; safety phrases: S9; S16; S21; S26; S29; S33; S37/38/39; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: MPK is a colorless to water-white liquid with a strong odor resembling acetone and ether. Molecular weight = 86.15; specific gravity (H_2O:1) = 0.81 @ 20°C; boiling point = 102°C; freezing/melting point = −78°C; vapor pressure = 27 mmHg @ 20°C; flash point = 7.22°C (cc); autoignition temperature = 452°C. Explosive limits: LEL = 1.5%; UEL: 8.2%. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 0. Slightly soluble in water; solubility = 6%.

Potential Exposure: MPK is used as a solvent; as a synthetic food flavoring agent; and in organic synthesis; as a solvent replacement for diethyl ketone and acetone.

Incompatibilities: Ketones are incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates. Attacks some plastics.

Permissible Exposure Limits in Air

NIOSH IDLH = 1500 ppm

Conversion factor: 1 ppm = 3.52 milligram per cubic meter @ 25°C & 1 atm

Odor Threshold = 7.7 ppm.

OSHA PEL: 200 ppm/700 milligram per cubic meter TWA

NIOSH REL: 150 ppm/530 milligram per cubic meter TWA

ACGIH TLV[1]: 150 ppm/529 milligram per cubic meter STEL

PAC Ver. 29[138]

PAC-1: 150 ppm

PAC-2: 830 ppm

PAC-3: 5000 ppm

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 200 ppm (700 milligram per cubic meter), STEL 250 ppm, 1993; Austria: MAK 200 ppm (700 milligram per cubic meter), 1999; Belgium: TWA 200 ppm (705 milligram per cubic meter), STEL 250 ppm (881 milligram per cubic meter), 1993; Denmark: TWA 200 ppm (700 milligram per cubic meter), 1999; Finland: TWA 200 ppm (700 milligram per cubic meter), STEL 250 ppm (875 milligram per cubic meter), 1999; France: VME 200 ppm (700 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 700 milligram per cubic meter, 2003; the Philippines: TWA 200 ppm (700 milligram per cubic meter), 1993; Poland: MAC (TWA) 100 milligram per cubic meter; MAC (STEL) 800 milligram per cubic meter, 1999; Russia: STEL 200 milligram per cubic meter, 1993; Switzerland: MAK-W 200 ppm (700 milligram per cubic meter), KZG-W 400 ppm (1400 milligram per cubic meter), 1999; Turkey: TWA 200 ppm (700 milligram per cubic meter), 1993; United Kingdom: TWA 200 ppm (716 milligram per cubic meter), STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 250 ppm

Determination in Air: Use NIOSH Analytical Method #1300, Ketones, #2555 Ketones I[18].

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 1$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl propyl ketone can affect you when breathed in and by passing through your skin. Exposure to the vapor can irritate the eyes, nose, throat, and lungs. Skin exposure to the liquid can cause a rash or burning feelings on contact. Contact irritates the eyes. Inhalation causes coughing, wheezing, and/or shortness of breath. Exposure to high concentrations can cause you to feel dizzy and lightheaded and to pass out.

Long-Term Exposure: Long-term exposure can cause drying and cracking of the skin. Can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1500 ppm*: CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl propyl ketone must be stored to avoid contact with oxidizers, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks or flame. Sources of ignition, such as smoking and open flames are prohibited where methyl propyl ketone is handled, used, or stored. Metal containers used in the transfer of 5 gal or more of methyl propyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl propyl ketone. Wherever methyl propyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1249 Methyl propyl ketone, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl propyl ketone is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard, Inhalation hazard, Highly flammable, Corrosive

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T+; risk phrases: R11; R26; R27/28; R37/38; R41; safety phrases: S16; S26; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water (mfg.); 3-Severe hazard to water (lit.).

Description: Methyl silicate is a liquid. Molecular weight = 152.22; specific gravity (H_2O:1) = 1.02 @ 20°C; boiling point = 121°C; freezing/melting point = −1.3°C; vapor pressure = 12 mmHg @ 25°C; 7.5 mmHg @ 14.4°C; flash point = 20°C (cc). ₩ Practically insoluble in water; decomposes releasing toxic, flammable gases.

Potential Exposure: Methyl silicate is used in coating screens of television picture tubes. It may be used in mold binders and in corrosion-resistant coatings; as well as in catalyst preparation and as a silicone intermediate.

Incompatibilities: Vapor may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, including alkaline earth metals, metals, strong acids, strong bases; water, moisture, steam decomposes releasing toxic, flammable gases. Violent reaction with metal hexafluorides of rhenium, molybdenum, and tungsten. Contact with metals may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.23 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: None

NIOSH REL: 1 ppm/6 milligram per cubic meter TWA

ACGIH TLV[1]: 1 ppm/6 milligram per cubic meter TWA

PAC* Ver. 29[138]

PAC-1: 0.083 ppm

PAC-2: $\mathbf{0.91}_{\mathbf{A}}$ ppm

PAC-3: $\mathbf{1.4}_{\mathbf{A}}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: Danger of skin sensitization

Australia: TWA 1 ppm (6 milligram per cubic meter), 1993; Belgium: TWA 1 ppm (6 milligram per cubic meter), 1993; Denmark: TWA 1 ppm (6 milligram per cubic meter), 1999; Finland: TWA 5 ppm (30 milligram per cubic meter), STEL 10 ppm (60 milligram per cubic meter), 1999; France: VME 1 ppm (6 milligram per cubic meter), 1999; Japan: 1 ppm (6 milligram per cubic meter), 1999; Norway: TWA 1 ppm (6 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 6 milligram per cubic meter, 2003; United Kingdom: TWA 1 ppm (6.3 milligram per cubic meter), STEL 5 ppm (32 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 1 ppm

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Methyl silicate can affect you when breathed in. Severely irritates and burns the eyes and skin. Exposure to the vapor can cause severe eye damage and cause permanent blindness. This can occur Up to 12 hours after exposure has ceased, even if no irritation is noticed at the time. Inhalation irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Exposure to high levels can damage the lungs and kidneys.

Long-Term Exposure: May cause liver and/or kidney damage. Can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Eyes, respiratory system; kidneys, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: exam of the eyes and vision; kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working

with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 1 ppm* to liquid methyl silicate, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Where there is potential for high exposures exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and moisture. Sources of ignition, such as smoking and open flames are prohibited where methyl silicate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2606 Methyl orthosilicate, Hazard class: 6.1; Labels: 6.1-Poisonous materials, 3-Flammable liquid.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.3/0.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include silicon oxide. Use dry chemical, carbon dioxide; alcohol or polymer foam extinguishers. *Do not use water*. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NTP: Carcinogenesis studies; on test (prechronic studies), October 2000

California Proposition 65 Chemical[102]: Developmental/Reproductive toxin, female, *delisted 4/4/2014*.

Hazard Alert: Flammable, Polymerization Hazard, Possible risk of forming tumors, Reproductive toxin: Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Environmental hazard.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%

Hazardous to aquatic life or environment, with possible long-lasting effects[293]. Toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi, N; risk phrases: R10; R19; R36/37; R51/53; R62; safety phrases: S2; S29; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water.(est.)].

Description: Methylstyrene is a colorless liquid with a characteristic odor. Molecular weight = 118.19; specific gravity (H_2O:1) = 0.91 @ 17°C; boiling point = 165.6°C; freezing/melting point = −23.3°C; vapor pressure = 2 mmHg @ 20°C; flash point = 46.11°C; autoignition temperature = 574°C. Explosive limits: LEL = 1.9%; UEL: 6.1%. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 2, reactivity 0. Insoluble in water.

Potential Exposure: Methylstyrene is used as additive, plasticizer, and copolymer; used in the production of modified polyester and alkyd resin formulations.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, peroxides, halogens, catalysts for vinyl or ionic polymers; aluminum, iron chloride; copper. Methylstyrene may form unstable peroxides; may polymerize. Usually contains an inhibitor, such as *tert*-butyl catechol.

Permissible Exposure Limits in Air

NIOSH IDLH = 700 ppm

Conversion factor: 1 ppm = 4.83 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 100 ppm/480 milligram per cubic meter Ceiling Concentration

NIOSH REL: 50 ppm/240 milligram per cubic meter TWA; 100 ppm/485 milligram per cubic meter STEL

ACGIH TLV[1]: 10 ppm/48 milligram per cubic meter TWA, confirmed animal carcinogen with unknown relevance to humans

PAC Ver. 29[138]
PAC-1: 100 ppm
PAC-2: 830 ppm
PAC-3: 5000 ppm

DFG MAK: 50 ppm/250 milligram per cubic meter TWA; Peak Limitation Category I(2); Pregnancy Risk Group D

Australia: TWA 50 ppm (240 milligram per cubic meter); STEL 100 ppm, 1993; Austria: MAK 100 ppm (480 milligram per cubic meter), 1999; Belgium: TWA 50 ppm (242 milligram per cubic meter); STEL 100 ppm (484 milligram per cubic meter), 1993; Denmark: TWA 50 ppm (240 milligram per cubic meter), 1999; Finland: TWA 100 ppm (480 milligram per cubic meter); STEL 150 ppm (720 milligram per cubic meter), 1999; France: VME 50 ppm (240 milligram per cubic meter), 1999; Norway: TWA 50 ppm (240 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 240 milligram per cubic meter, 2003; Switzerland: MAK-W 50 ppm (240 milligram per cubic meter), 1999; Thailand: TWA 100 ppm (480 milligram per cubic meter), 1993; United Kingdom: STEL 100 ppm (491 milligram per cubic meter), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 100 ppm. Russia[43] set a MAC for ambient air in residential areas of 0.04 milligram per cubic meter (40 μ/m^3) both on a momentary and a daily average basis. Several states have set guidelines or standards for methylstyrene in ambient air[60] ranging from 2.4−4.85 milligram per cubic meter (North Dakota) to 4.0 milligram per cubic meter (Virginia) to 4.8 milligram per cubic meter (Connecticut) to 5.714 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH Analytical Method 1501, aromatic hydrocarbons; OSHA Analytical Method 7[18].

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = > 3. Values above 3.0 are likely to bioaccumulate in aquatic organisms and possibly in the food chain, especially seafood.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: The substance irritates the eyes, skin, and the respiratory tract. Prolonged skin contact causes a burning sensation; redness and blisters. Exposure can cause headache, dizziness, lightheadedness, and difficult breathing.

Long-Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and allergy with itching and skin rash. May affect the central nervous system; kidneys, and liver. May cause brain effects or damage.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver and kidneys.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite). Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Evaluate for brain effects. Evaluate nervous system. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). *700 ppm*: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2303 Isopropenylbenzene, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible and reactive liquid. Thermal decomposition products may include oxides of carbon. Water may be ineffective. Use dry chemical, carbon dioxide; alcohol foam; or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, often by admixture with a more flammable solvent[24].

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Isopropenyl Benzene, Trenton, NJ (June 1999).

Methyltetrahydrofuran M:1250

Formula: $C_5H_{10}O$

Synonyms: Furan, tetrahydromethyl-; 2-Methyl-tetrahydrofuran; Methyltetrahydrofuran, 2-

CAS Registry Number: 96-47-9; 25265-68-3

HSDB Number: 5115

RTECS Number: LU6208000

UN/NA & ERG Number: UN2536/127 (P)

EC Number: 246-769-8

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable, Polymerization hazard.

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R11; R19; R36/37/38; R41; R51; safety phrases: S2; S16; S21 S23; S24/25; S26; S33; S39; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to waters (*CAS*: *96-47-9*).

Description: Methyltetrahydrofuran is a colorless liquid. Ethereal odor. Molecular weight = 86.2; specific gravity (H_2O:1) = 0.85 @ 20°C; boiling point = 80°C; freezing/melting point = −136°C; flash point = −11°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 3, reactivity 1. Explosive limits: LEL: 1.2%, UEL: 5.5%. Slightly soluble in water.

Potential Exposure: Used as a chemical intermediate and a solvent.

Incompatibilities: Vapor may form explosive mixture with air. Unless stabilized with BHT (butylated hydroxytoluene) this chemical may form unstable and explosive peroxides in the presence of air or light. Liquid forms explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

96-47-9

PAC-1: 4 ppm

PAC-2: 44 ppm

PAC-3: 260 ppm

Routes of Entry: Inhalation, skin and/or eye contact, ingestion.

Harmful Effects and Symptoms

Short-Term Exposure: Contact irritates the skin and eyes. May cause serious eye damage. Irritates the respiratory tract. Harmful when ingested.

Long-Term Exposure: Closely related chemicals affect the nervous system; although it is not known whether this chemical has this effect.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyltetrahydrofuran all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2536 Methyltetrahydrofuran, Hazard Class: 3; Labels: 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Methyl Thiocyanate M:1260

Formula: C_2H_3NS; CH_3CNS

Synonyms: Methyl rhodanate; Methylrhodanid (German); Methyl sulfocyanate; Methylthiokyanat; Thiocyanic acid, methyl ester

CAS Registry Number: 556-64-9

HSDB Number: 5691

RTECS Number: XL1575000

UN/NA & ERG Number: UN2929/131; UN1992/131

EC Number: 209-134-6

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Flammable, Fast acting poison (ingestion)

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 20,000

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 20,000 lb (9080 kg)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10,000 lb (4540 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R10; R23/24/24; R36/37/38; safety phrases: S1/2; S16; S26; S27; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Methyl thiocyanate is a colorless liquid. Onion-like odor. Molecular weight = 73.12; specific gravity $(H_2O:1) = 1.07$ @ 20°C; boiling point = °C; boiling point = 130−133°C; freezing/melting point = −51°C[72]; flash point = ∼35°C. Very slightly soluble in water. Carrier solvents used in commercial formulations may change physical and toxicological properties.

Potential Exposure: It is used as an agricultural insecticide; a fumigant; and as a research chemical. No evidence of commercial production in the United States.

Incompatibilities: Incompatible with nitric acid. Violent reactions have occurred when mixed with chlorates, nitrates, nitric acid; peroxides, potassium chlorate; and sodium chlorate.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 17 milligram per cubic meter

PAC-2: 28 milligram per cubic meter

PAC-3: 140 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Prolonged skin absorption may produce various eruptions; runny nose; dizziness, cramps, nausea, vomiting and mild or severe disturbances of the nervous system. This material is highly toxic if ingested. The ingestion of a concentrated solution may lead to vomiting. The principal systemic reaction is probably one of central nervous system depression, interrupted by periods of restlessness; abnormally fast and deep respiratory movements and convulsions. Death is usually due to respiratory arrest from paralysis of the medullary centers.

Long-Term Exposure: May cause injury to the liver and kidneys.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note*: Because cyanide is probably largely responsible for poisonings, antidotal measures against cyanide should be instituted promptly. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *(for cyanides) Up to 25 milligram per cubic meter*: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any SCBA with full facepiece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFS100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN2929 Toxic liquids, flammable, organic, n.o.s., Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, Technical Name Required. UN1992 Flammable liquids, toxic, n.o.s., Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Toxic liquids, flammable, organic, n.o.s.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.5
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/180
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.9/4.6

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Small fires: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Thermal decomposition products may include nitrogen oxides; sulfur oxides. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Methyl Trichlorosilane M:1280

Formula: CH_3Cl_3Si

Synonyms: Methylsilicochloroform; Methylsilyl trichloride; KA 13; LS 40 (silane); Methylsilicon trichloride; Trichloromethylsilicon; Silane, trichloromethyl-; Trichloromethylsilane

CAS Registry Number: 75-79-6; *(alt.)* 175446-71-6

HSDB Number: 840

RTECS Number: VV4550000

UN/NA & ERG Number: UN1250/155

EC Number: 200-902-6 [*Annex I Index No.*: 014-004-00-5]

Regulatory Authority and Advisory Information

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Hazard Alert: Exposure can be lethal, Highly flammable, Violently reactive with water, Primary irritant (w/o allergic reaction).

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 500 lb (227 kg)

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U164

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: F, Xi; risk phrases: R2; R11; R14; R36/37/38; safety phrases: S1; S2; S21, S26; S39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Methyltrichlorosilane is a colorless liquid with a sharp hydrochloric acid-like odor. Molecular weight = 149.48; specific gravity (H_2O:1) = 1.3 @ 20°C; boiling point = 66°C; freezing/melting point = −90°C; vapor pressure = 146.7 mmHg @ 18°C; 757 mmHg @ 7°C; flash point = −6.2°C; −8°C (cc); autoignition temperature ≥404°C. Explosive limits: LEL = 7.6%; 14,000 ppm[138]; UEL ≥20%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2₩. Reacts violently with water, rapidly releasing corrosive hydrogen chloride gas.

Potential Exposure: Methyltrichlorosilane is used as an intermediate to make silicones; for making water repellants, electrical insulation; and heat resistant paints; and other products.

Incompatibilities: Vapors may form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Chlorosilanes react vigorously with bases and both organic and inorganic acids generating toxic and/or flammable gases. Chlorosilanes react with water, moist air, or steam to produce heat and toxic, corrosive fumes of hydrogen chloride. They may also produce flammable gaseous hydrogen. Attacks metals and rubbers and plastics in the presence of moisture.

Permissible Exposure Limits in Air

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.6_A}$ ppm

PAC-2: $\mathbf{7.3_A}$ ppm

PAC-3: $\mathbf{33_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: If the eyes have come in contact with methyltrichlorosilane, then irritation, pain, swelling, corneal erosion; and blindness may result. Dermatitis (red, inflamed skin), severe burns, pain, and shock generally follow dermal exposure. As with other chlorosilanes, acute exposures may be highly toxic and may cause death or permanent injury after very short exposures to small quantities. Skin contact may produce severe burns with pain and risk of secondary infections. Ingestion may produce oral, esophageal, and stomach burns; intensity will vary from mild to very severe; gastrointestinal damage is rare but may occur. Signs and symptoms of acute ingestion of methyltrichlorosilane may include excessive salivation; intense thirst; difficulty in swallowing; chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of methyltrichlorosilane. Acute inhalation exposure may result in hoarseness, laryngitis, a feeling of suffocation, dyspnea (shortness of breath), choking, respiratory tract irritation; chest pain. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. Sneezing, bleeding of the nose and gums; and ulceration of the nasal and oral mucosa may also occur.

Long-Term Exposure: Very irritating material may affect the lungs and bronchitis may develop. Renal toxicity has been observed in animals.

Points of Attack: Lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyltrichlorosilane exists, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl trichlorosilane must be stored to avoid contact with water, acids, chemically active metals (such as potassium, sodium, magnesium, and zinc); and alkalis, since violent reactions occur and hydrogen chloride is produced. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where methyltrichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of methyl trichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl trichlorosilane. Wherever methyltrichlorosilane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN1250 Methyltrichlorsilane, Hazard Class: 3; Labels: 3-Flammable liquid, 8-Corrosive material.

Spill Handling:

Methyltrichlorsilane when spilled in water

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.1/0.2
Night 0.2/0.3
Large spills (From a large package or from many small packages)
First: Isolate in all directions (ft/m) 200/60
Then: Protect persons downwind (mi/km)
Day 0.4/0.6
Night 1.3/2.0

Consider consulting an expert. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Spills can be neutralized by flushing with large quantities of water followed by treatment with sodium bicarbonate. Provide adequate protection against generated hydrogen chloride. Do not allow water to get into container since resulting pressure could cause container to rupture. Protect against potentially violent reaction with water. Avoid breathing vapors and contact with skin. Establish forced ventilation to keep levels below explosive limit. Collect leaking liquid in sealable, dry containers; *do not use plastic containers*. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Remove to a safe place. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include hydrogen chloride and oxides of carbon. Dry chemical or carbon dioxide may be used for small fires. *Do not use water* or hydrous agents. However, water may be used for large fires if firefighters are protected from violent reactions of methyltrichlorosilane with water. Water may be used to keep containers cool. SCBA is required as combustion/decomposition yields acid gases/pulmonary irritants. Corrosion-resistant protective clothing, as well as appropriate foot, hand, arm, head, eye, and face protection are required where contact is possible. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

Methyl Vinyl Ketone M:1290

Formula: C_4H_6O; $CH_2{=}CHCOCH_3$

Synonyms: Acetyl ethylene; 3-Butene-2-one; Methylene acetone; Methyl-vinyl-cetone (French); Methylvinylketon (German); Metil vinil cetona (Spanish); MVK; γ-Oxo-α-butylene; Vinyl methyl ketone

CAS Registry Number: 78-94-4

HSDB Number: 716

RTECS Number: EM9800000

UN/NA & ERG Number: (PIH) UN1251 (stabilized)/131 (P)

EC Number: 201-160-6

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Highly flammable liquid, High acute toxicity, Lacrimator, Highly flammable liquid, Polymerization hazard, Corrosive, Suspected of causing genetic defects, Sensitizer hazard (skin), Environmental hazard.

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

United States DOT 49CFR172.101, Inhalation Hazardous Chemical

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, C, F, N, Xi: Risk phrases: R11; R19; R20/21/22; R26/27/28; R34; R43; R50/53; R62; safety phrases: S16; S21; S26; S28; S29/35; S36/37/39; S38; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Methyl vinyl ketone is a colorless liquid. Pungent odor. Molecular weight = 70.1; specific gravity (H_2O:1) = 0.84 @ 20°C; boiling point = 81.4°C; flash point = −7°C; autoignition tem evaluation by a dermatologist. Temperature = 491°C. Explosive limits: LEL = 2.1%; 13,000 ppm[138]; UEL: 15.6%. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 3, reactivity 2. Easily mixes with water.

Potential Exposure: Methyl vinyl ketone is used as an alkylating agent, a starting material for plastics; and an intermediate in the synthesis of steroids and Vitamin A.

Incompatibilities: Vapors may form explosive mixture with air. Heat or shock may cause explosive polymerization. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrated amines, azo, diazo, azido compounds, carbamates, organic cyanates.

Permissible Exposure Limits in Air

Odor Threshold = 0.5 milligram per cubic meter.

ACGIH TLV[1]: 0.2 ppm/0.6 milligram per cubic meter [skin] danger of skin sensitization, Ceiling Concentration

PAC* Ver. 29[138]

PAC-1: $\mathbf{0.17_A}$ ppm

PAC-2: $\mathbf{1.2_A}$ ppm

PAC-3: $\mathbf{2.4_A}$ ppm

*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.

DFG MAK: [skin] danger of skin sensitization.

Russia: STEL 0.1 milligram per cubic meter [skin], 1993

Determination in Water: Octanol−water coefficient: Log K_{ow} = < 0.5. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Warning*: Methyl vinyl ketone is easily absorbed through the skin, causing general poisoning; inhalation has central nervous system depressant effects. It is irritating to mucous membranes and respiratory tract and to the skin; it is a lachrymator and can cause eye injury. Liquid or high concentration of vapors causes blistering of the skin. Similar to other ketones; can cause sore throat, sneezing, coughing, and salivation. Inhalation may cause nausea and vomiting; inhalation of high concentrations can cause headache, dizziness, fainting, tremor, lack of coordination, lowered body temperature; depressed respiratory and heart rate; gasping, coma, and death. Direct aspiration of liquid into lungs can cause chemical pneumonia. Exposure may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: May cause skin sensitization.

Points of Attack: Lungs, skin, nervous system.

Medical Surveillance: Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a qualified medical professional might consider administering a corticosteroid spray. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. If symptoms develop or overexposure is suspected, chest X-ray should be considered. Cigarette smoking may exacerbate pulmonary injury and should be discouraged for at least 72 hours following exposure. Evaluation by an allergist and/or dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: For emergency situations, wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferred. Inside storage should be in a standard flammable liquids storage room. Separate from oxidizing materials. MVK vapors are uninhibited and may form polymers in the flame arresters of storage tanks, resulting in stoppage of vent.

Shipping: UN1251 Methyl vinyl ketone, stabilized, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material, Inhalation Zone A.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 48-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 300/90
Then: Protect persons downwind (mi/km)
Day 0.2/0.3
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 2500/800
Then: Protect persons downwind (mi/km)
Day 1.0/1.5
Night 1.9/3.1

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of carbon. Use dry chemical, alcohol foam, or carbon dioxide. Water spray may be ineffective as an extinguishing agent. *Small fires*: dry chemical, carbon dioxide; and foam. *Large fires*: fog or foam. Move container form fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. Spray cooling water on containers that are exposed to flames until well after fire is out. Wear positive pressure breathing apparatus and special protective clothing. *See above for isolation distances*. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

2-Methyl-5-Vinyl Pyridine M:1300

Formula: C_8H_9N

Synonyms: 5-Ethenyl-2-methylpyridine; MVP; 5-Vinyl-2-picoline

CAS Registry Number: 140-76-1

HSDB Number: 6325

RTECS Number: UT2975000

UN/NA & ERG Number: UN2810 (toxic liquid, organic, n.o.s.)/153 P; UN3073 (stabilized)/131 (P)

EC Number: 205-432-5

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Inhalation hazard, Flammable, Polymerization Hazard, Primary irritant (w/o allergic reaction).

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 500 lb (227 kg)

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, F; risk phrases: R10; R19; R20/21/22; safety phrases: S16; S24/25; S28; S30; S45; S46; S53(see Appendix 4)

Description: 2-Methyl-5-vinylpyridine is a clear to faintly opalescent liquid. Molecular weight = 119.18; specific gravity (H_2O:1) = 0.99 @ 20°C; boiling point = 181°C; vapor pressure = 1.71 mmHg @ 25°C; flash point = 74°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 2, reactivity 0.

Potential Exposure: 2-Methyl-5-vinylpyridine is used as a monomer for resins; oil additive; ore flotation agent; and dye acceptor.

Incompatibilities: Can polymerize exothermically. May form explosive mixture with air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, hydrides and other strong reducing agents. 2-Methyl-5-vinylpyridine neutralizes acids in exothermic reactions to form salts plus water. May be incompatible with isocyanates, halogenated organics, peroxides, phenols (acidic), epoxides, anhydrides, and acid halides. Flammable gaseous hydrogen may be generated in combination with strong reducing agents, such as hydrides[101].

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.17 milligram per cubic meter

PAC-2: 1.9 milligram per cubic meter

PAC-3: 6.6 milligram per cubic meter

Russia[43] set a MAC in work-place air of 2.0 milligram per cubic meter.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: This material is poisonous by ingestion, inhalation, and absorption through the skin. Vapors may cause dizziness or suffocation. Inhalation may be fatal

Long-Term Exposure: May cause liver and kidney damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area separated from strong oxidants, strong bases; strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: UN3073 Vinylpyridines, stabilized, Hazard class: 6.1; Labels: 6.1-Poison Inhalation Hazard, 3-Flammable liquid, 8-Corrosive material. UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: *Danger*: This chemical is a poisonous inhalation hazard. Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: Not assigned

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA Group B2, probable human carcinogen

California Proposition 65 Chemical[102]: Carcinogen (1/1/1990) and developmental toxin (3/30/1999)

Hazard Alert: Poison, Possible thyroid effects, Suspected reprotoxic hazard, Developmental Toxin; Endocrine Disruptor (Confirmed, German Environmental Agency)

EPA ADI = 0.0003 mg/kg

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%

EPA Hazardous Waste Number (RCRA No.): U114

Clean Water Act: Section 307(a)(1) Toxic Pollutants subject to effluent limitations as zinc and compounds

United States National Primary Drinking Water Regulations: SMCL = 5 mg[Zn]/L as Zinc

California EPA AB2588-Air Toxics "Hot Spots" Chemicals (CAL) as zinc compounds

The "Director's List" (CAL/OSHA) as zinc compounds

Description: Light yellow solid or powder at room temperature. Characteristic dithiocarbamate odor. Molecular weight 1088.7; specific gravity (H_2O:1) = 1.86; boiling point = (decomposes); freezing/melting point = (decomposes) $>140°C$; vapor pressure $\leq 10^{-7}$ mmHg @ 20°C. Practically insoluble in water.

Potential Exposure: Metiram is a dithiocarbamate fungicide used on fruits, vegetables, field crops and other crops and on ornamentals to protect against many types of fungi and other foliar diseases.

Incompatibilities: Combustible material. Dust may form explosive mixture in air. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides. Dithiocarbamate esters are combustible. They react violently with powerful oxidizers such as calcium hypochlorite. Poisonous gases are generated by the thermal decomposition of dithiocarbamate compounds, including carbon disulfide, oxides of sulfur, oxides of nitrogen, hydrogen sulfide, ammonia, and methylamine. Thio and dithiocarbamates slowly decompose in aqueous solution to form carbon disulfide and methylamine or other amines. Such decompositions are accelerated by acids. Flammable gases are generated by the combination of dithiocarbamate with aldehydes, nitrides, and hydrides. Dithiocarbamate are incompatible with acids, peroxides, and acid halides. Thermal decomposition products in fire includes oxides of nitrogen and sulfur. Corrosive to iron, copper brass and zinc metals, especially in the presence of moisture. Heat alkalies (lime), moisture can cause decomposition. Decomposes on prolonged storage. Degradation produces ethylene thiourea.

Permissible Concentration in Water: Safe Drinking Water Act (47FR 9352): SMCL = 5 mg[Zn]/L as Zinc. Canadian Drinking Water Standards: AO $\leq$ 5.0 mg[Zn]/L. Runoff from spills or fire control may cause water pollution.

Determination in Water: EPA EMSLC Method 630. The Determination of Dithiocarbamate Pesticides in Municipal and Industrial Wastewater by UV−VIS Spectrophotometry. Octanol−water coefficient: Log $K_{ow} = < 2.0$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Intermediate—24.87820 ppb, MATC (Maximum Acceptable Toxicant Concentration)

Routes of Entry: Poisoning can occur by inhalation, ingestion and absorption through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Low levels of toxicity. Concentrated solutions are slightly corrosive to eyes and mucous membranes. Dust inhalation can cause irritation of the respiratory system with sneezing. Eye contact can cause irritation, watering, pain, and inflammation of the eyelids. Dermal contact can cause irritation and minor ulceration. Ingestion can cause nausea, vomiting, fever, muscle twitching, seizure, rapid respiration, slow heartbeat. Severe exposure may result in death. Unlike carbamates the dithiocarbamates are not cholinesterase inhibitors, but some of them may react with recently ingested alcohol or alcohol-containing products including wine, medications, and cold remedies such as cough-syrups. LD_{50} (oral, rat) = > 2.5 g/kg; LD_{50} (dermal, rat) ≥ 2 g/kg.

Long-Term Exposure: May cause cancer; skin sensitization. Dithiocarbamates can affect thyroid function. Human toxicity (long term)[101]: High—2.10 ppb, Health Advisory.

Points of Attack: Thyroid function (may cause goiter). Respiratory system, central nervous system, cardiovascular system, skin, eyes. Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin).

Medical Surveillance: This chemical is a suspected or known human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and advice for medical monitoring. There are tests available to measure zinc in your blood, urine, hair, saliva, and feces. High levels of zinc in the feces can mean high recent zinc exposure. High levels of zinc in the blood can mean high zinc consumption and/or high exposure. Tests to measure zinc in hair may provide information on long-term zinc exposure; however, the relationship between levels in your hair and the amount of zinc you were exposed to is not clear. Before employment and at regular times after that, the following are recommended: If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC and chest X-ray following acute overexposure. Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious and able to swallow, have victim drink 4 to 8 oz of water. Do not induce vomiting. *Note to physician or authorized medical personnel*:

Personal Protective Methods: Reacts with the following absorbent materials: Cellulose-Based; Mineral- and Clay-Based; Dirt/Earth[88]. Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a tightly closed container in a dry, well-ventilated and secure poison location. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, carbon, sulfur and zinc. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Dispose of waste material as hazardous waste using a licensed disposal contractor to an approved landfill. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. A potential candidate for liquid injection incineration at a temperature range of 650 to 1600°C and a residence time 0.1 to 2 seconds. Also, a potential candidate for rotary kiln incineration at a temperature range of 820 to 1600°C and residence times of seconds for liquids and gases, and hours for solids[83].

Metobromuron M:1308

Formula: $C_9H_{11}BrN_2O_2$

Synonyms: 3-(4-Bromophenyl)-1-methoxy-1-methylurea; 3-(*p*-Bromophenyl)-1-methoxy-1-methylurea; *N*′-(4-Bromophenyl)-*N*-methoxy-*N*-methylurea; 3-(*p*-Bromophenyl)-1-methyl-1-methoxyurea; C-3126; CIBA 3126; Metobromuron [3-(*p*-bromophenyl)-1-methoxy-1-methylurea]; Patoran; Pattonex; Urea, *N*′-(4-bromophenyl)-*N*-methoxy-*N*-methyl-

CAS Number: 3060-89-7

HSDB Number: 1741

RTECS Number: YS3325000

UN/NA & ERG Number: UN3021 (liquid)/131; UN2767 (phenylurea, solid)/151

EC Number: 221-301-5

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Herbicide and aquatic algicide, Primary irritant (w/o allergic reaction), Agricultural chemical.

Hazard symbols, risk, & safety statements: Hazard Symbol (solid in a flammable hydrocarbon carrier): F, Xn; phrases; R11; R21/22/23; R36; R51; safety phrases: S16; S26; S36; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: White crystalline solid or powder. Commercial product may be dissolved in a flammable hydrocarbon carrier. Molecular weight = 259.11; specific gravity (H_2O:1) = 1.59; boiling point = (decomposes); freezing/melting point = 95°C; vapor pressure = 3×10^{-6} mmHg @ 20°C; soluble in water; solubility = 8.8 mg/L@ 20°C. Physical and toxicological properties may be affected by carrier solvents in commercial formulations.

Potential Exposure: Preemergence substituted urea herbicide used to control grasses and broadleaf weeds on flax, groundnuts, potatoes, beans, soybeans, sunflowers, tomatoes, and tobacco.

Incompatibilities: This organic bromine compound may react with strong oxidizers such as chlorates, peroxides, nitrates, permanganates, perchlorates, chlorine, fluorine, etc. Keep away from strong acids.

Determination in Water: FDA Method 242.4 *Method for Substituted Urea Herbicides* High Performance Liquid Chromatography with Fluorescence Detection with no detection limit reported. Octanol—water coefficient:

Log $K_{ow} = \sim 2.5$. Unlikely to bioaccumulate in marine organisms.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Harmful Effects and Symptoms

Short-Term Exposure: Contact with eyes or skin may cause irritation or injury. Inhalation should be avoided; use NIOSH- or CEN (UK)-approved APRs for pesticides. May be harmful if swallowed. Dermal contact may cause severe irritation or burns. LD_{50} (oral, rat) ≥ 5 g/kg.

Long-Term Exposure: May cause skin sensitization.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist, including exposure history and testing, may help diagnose allergy. Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not induce vomiting when formulations containing petroleum solvents are ingested. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Prior to working with Chloroxuron all handlers should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3021 Pesticides, liquid, flammable, toxic, flash point <23°C, Hazard Class: 3; Labels: 3-Flammable liquid, 6.1-Poisonous materials. Technical Name Required. UN2767 Phenyl urea pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: First remove all sources of ignition. Evacuate persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon, and corrosive fumes of bromine. Use dry chemical, carbon dioxide; water spray; or standard foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis is not recommended as a disposal procedure because of the generation of the toxic products, 3,4-dichloroaniline and dimethylamine. Incinerate in a unit with effluent gas scrubbing.

Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Metolachlor M:1310

Formula: $C_{15}H_{22}ClNO_2$

Synonyms: 2-Aethyl-6-methyl-*N*-(1-methyl-2-methoxyaethyl)-chloracetanilid (German); Bicep; CGA-24705; α-Chlor-6′-aethyl-*N*-(2-methoxy-1-methylaethyl)-acet-*o*-toluidin (German); 2-Chloro-6′-ethyl-*N*-(2-methoxy-1-methylethyl)acet-*o*-toluidide; α-Chloro-2′-ethyl-6′-methyl-*N*-(1-methyl-2-methoxyethyl)-acetanilide; 2-Chloro-*N*-(2-ethyl-6-methylphenyl)-*N*-(2-methoxy-1-methylethyl) acetamide; 2-Chloro-*N*-(6-ethyl-*o*-tolyl)-*N*-(2-methoxy-1-methylethyl)-acetamide; Codal; Cotoran Multi; Dual; 2-Ethyl-6-methyl-1-*N*-(2-methoxy-1-methylethyl)chloroacetanilide; Metelilachlor; Milocep; Ontrack 8E; Primagram; Primextra

CAS Registry Number: 51218-45-2; *(alt.)* 63150-68-5; *(alt.)* 94449-58-8

HSDB Number: 6706

RTECS Number: AN3430000

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s.)/151; UN3082 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 257-060-8

Regulatory Authority and Advisory Information

Carcinogenicity: EPA: Group C, Possible Human Carcinogen

Hazard Alert: Poison, Combustible, Suspected reprotoxic hazard, Suspected of causing genetic defects, Sensitization hazard (skin), Primary irritant (w/o allergic reaction), Environmental hazard.

EPA ADI: EPA/OPP oral reference dose (RfD) = 0.15 mg/kg.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi, Xn, N; risk phrases: R40; R11; R20/21/22; R36/37; R43; R60; R61; R62 Safety phrases: S16; S26; S29/35; S36/37; S57; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water (mfg.).

Description: Metolachlor is a colorless or tan to brown, oily liquid. Slightly sweet odor. Molecular weight = 283.79. Boiling point = 100°C @ 0.001 mmHg. It is stable to about 300°C. Vapor pressure = 1.5×10^{-5} mmHg @ 20°C. Flash point = 190°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 1, reactivity 0. Very slightly soluble in water; solubility = 510 ppm @ 20°C.

Potential Exposure: Metolachlor is a chlorinated acetamide selective herbicide used for weed control in corn and for controlling grasses in a variety of crops including cotton and peanuts.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, nitrates. Compounds of the carboxyl group react with all bases, both inorganic and organic (i.e., amines) releasing substantial heat, water and a salt that may be harmful. Incompatible with arsenic compounds (releases hydrogen cyanide gas), diazo compounds, dithiocarbamates, isocyanates, mercaptans, nitrides, and sulfides (releasing heat, toxic, and possibly flammable gases), thiosulfates and dithionites (releasing hydrogen sulfate and oxides of sulfur).

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Permissible Concentration in Water: Federal Drinking Water Guidelines (EPA): 700 μg/L. State Drinking Water Guidelines: Florida 110 μg/L; Massachusetts 110 μg/L; Maine 100 μg/L; Minnesota 800 μg/L for both metolachlor-ESA (ethane sulfonic acid) and metolachlor-OXA (oxanilic acid); Wisconsin 15 μg/L.

Determination in Water: Extraction with methylene chloride followed by separation by gas chromatography and measurement using a nitrogen-phosphorus detector. Fish Tox = 1117.14617000 ppb (VERY LOW).

Harmful Effects and Symptoms

Short-Term Exposure: Irritates the eyes and skin. The acute oral LD_{50} for rats is 2780 mg/kg (slightly toxic). Signs of human intoxication from metolachlor and/or its formulations (presumably following acute deliberate or accidental exposures) include abdominal cramps; anemia, ataxia, dark urine; methemoglobinemia, cyanosis, hypothermia, collapse, convulsions, diarrhea, gastrointestinal irritation; jaundice, weakness, nausea, shock, sweating, vomiting, CNS depression; dizziness, dyspnea, liver damage; nephritis, cardiovascular failure; skin irritation; dermatitis, sensitization dermatitis; eye and mucous membrane irrigation; corneal opacity and adverse reproductive effects. Human Tox = 100.00000 ppb (VERY LOW).

Long-Term Exposure: May cause tumors.

Points of Attack: Blood.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Test for methemoglobinemia. CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA—or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: UN2902 Pesticides, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3082 Environmentally hazardous substances, liquid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include hydrogen chloride, and oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

CAS Registry Number: 1129-41-5

HSDB Number: 6416

RTECS Number: FC8050000

UN/NA & ERG Number: UN2757(carbamate pesticides, solid, toxic)/151; UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 214-446-0 [*Annex I Index No*.: 006-056-00-2]

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Possible neurotoxin (methyl carbamate), Agricultural chemical.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P190

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06,Vol 71, No. 158] RQ: 1000 lb (454 kg)

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb (454 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: Xn, N; risk phrases: R22; R33; R51/53 Safety phrases: S2; S41; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water.(est.)].

Description: Metolcarb is a colorless crystalline solid. Molecular weight = 165.21; boiling point = 360°C; freezing/melting point = 74−75°C; vapor pressure = 1×10^{-5} mmHg @ 25°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 0, reactivity 0.

Potential Exposure: Metolcarb is an insecticide used for the control of rice leafhoppers, plant-hoppers; codling moth; citrus mealy bug; onion thrips; fruit flies; bollworms and aphids. Not registered as a pesticide in the United States.

Incompatibilities: Carbamates are incompatible with reducing agents such as hydrides, strong acids, oxidizing acids, peroxides, and bases. Contact with active metals or nitrides cause the release of flammable, and potentially explosive, hydrogen gas. May react violently with bromine, ketones. Incompatible with azo dyes, caustics, ammonia, amines, boranes, hydrazines, strong oxidizers.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 0.44 milligram per cubic meter

PAC-2: 4.8 milligram per cubic meter

PAC-3: 21 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Metolcarb is a carbamate insecticide. Signs and symptoms of poisoning by carbamates are similar to those for organic phosphorus compounds. Symptoms of poisoning by organic phosphorus compounds include headache, giddiness, nervousness; blurred vision; weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, myosis, tearing, salivation and other excessive respiratory tract secretion; vomiting, cyanosis, uncontrollable muscle twitches followed by muscular weakness; convulsions, coma, loss of reflexes; and loss of muscular control. Metolcarb exhibits high oral and skin toxicity, and moderate inhalation toxicity. Some carbamates appear to be carcinogenic, teratogenic, and/or mutagenic. Carbamates are cholinesterase inhibitors.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Carefully observe victim since effects may be delayed.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location under cool conditions. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Solid carbamate pesticides may burn but do not ignite readily. For small fires, use dry chemical, carbon dioxide; water spray, and foam. For large fires, use water spray, fog, or foam. Dike fire control water for later disposal. Stay upwind and keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Metribuzin M:1330

Formula: $C_8H_{14}N_4OS$

Synonyms: 4-Amino-6-*tert*-butyl-3-(methylthio)-1,2,4-triazin-5-one; 4-Amino-6-*tert*-butyl-3-methylthio-As-triazin-5-one; 4-Amino-6-(1,1-dimethylethyl)-3-(methylthio)-1,2,4-triazin-5-(4*H*)-one; As-triazin-5(4*H*)-one,4-amino-6-*tert*-butyl-3-(methylthio)-; Bay 61597; Bay DIC 1468; Bayer 6159H; Bayer 6443H; Bayer 94337; DIC 1468; Lexone; Lexoneex; Metribuzina (Spanish); Sencor; Sencoral; Sencorer; Sencorex; 1,2,4-Triazin-5-(4*H*)-one, 4-amino-6-(1,1-dimethylethyl)-3-(methylthio)-

CAS Registry Number: 21087-64-9

HSDB Number: 6844

RTECS Number: XZ2990000

UN/NA & ERG Number: UN2763 (triazine pesticide, solid, poisonous)/151

EC Number: 244-209-7 [*Annex I Index No*.: 606-034-00-8]

Regulatory Authority and Advisory Information

EPA: Not Classifiable as to human carcinogenicity.

Hazard Alert: Poison, Combustible, Highly flammable liquid, Agricultural chemical (triazine pesticide), Environmental hazard.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: F(liquid), Xn, N; risk phrases: R11; R20/21/22; R36; R50/53; safety phrases: S16; S26; S29/35; S36/37; S41; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [2-Hazard to water. (est.)].

Description: Metribuzin is a colorless crystalline solid. Commercial product may be a flammable solution. Mild, sulfurous odor. Molecular weight = 214.33; melting/freezing point = 125−127°C; vapor pressure = 4×10^{-7} mmHg; flash point (flammable liquid) = < 5°C. Slightly soluble in water; solubility = 1.2×10^3 ppm. Available in different concentrations (4%, 50%, 75%). Carrier solvents used in commercial formulations may change physical and toxicological properties.

Potential Exposure: A potential danger to those involved in manufacture, formulation, and application of this herbicide. A laboratory chemical. Used to make other chemicals.

Incompatibilities: Liquid is incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 5 milligram per cubic meter TWA

ACGIH TLV[1]: 5 milligram per cubic meter TWA, not classifiable as a human carcinogen

PAC not available

Guidelines or standards for metribuzin in ambient air[60] have been set by Several states ranging from 50 μ/m³ (North Dakota) to 100 μ/m³ (Connecticut) to 119 μ/m³ (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: Federal Drinking Water Guidelines: EPA 70 μg/L; State Drinking Water Guidelines: Florida 180 μg/L; Maine 175 μg/L; Minnesota 200 μg/L; Wisconsin 250 μg/L

Determination in Water: Solvent extraction with methylene chloride followed by exchange to acetone; separation by gas chromatography and measurement with a thermionic bead detector. Fish Tox = 7683.76758000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Metribuzin can affect you when breathed in and by passing through your skin. Acute poisoning can cause difficult breathing and drowsiness. High exposures may cause upset stomach; fatigue, and depression of the central nervous system; causing poor coordination; tremors and weakness.

Long-Term Exposure: Repeated or high exposure may cause liver enzyme changes; goiter, and affect thyroid function.

Points of Attack: Central nervous system; thyroid, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential exists for exposures *over 5 milligram per cubic meter*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved full facepiece respirator with a pesticide cartridge. Greater protection is provided by a PAPR. *Where there is potential for high exposures exists*, use a NIOSH/MSHA (US) or EN149 (Europe)-approved supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, dry area under inert gas. Prior to working with this chemical all handlers should be trained on its proper handling and storage. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: UN2763 Triazine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is

complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Metribuzin itself does not burn. The solution is highly flammable. Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Use a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

New Jersey Department of Health and Senior Services, *Hazardous Substances Fact Sheet*: Metribuzin, Trenton, NJ (January 2001).

Metsulfuron-methyl M:1345

Formula: $C_{14}H_{15}N_5O_6S$

Synonyms: Allie; Ally; Ally-20DF; Answer; Benzoic acid, 2-[((((4-methoxy-6-methyl-1,3,5-triazin-2-yl)amino) carbonyl)amino)sulfonyl]-methyl ester; Brush-off; Canvas; Cimarron; DMC weed control; DPD 63760H; DPX 6376; DPX-T 6376; Escort; Finesse; Gropper; Methyl-2-[[(4-methoxy-6-methyl-1,3,5-triazyn-2-yl)aminocarbonyl] aminosulfonyl]benzoate; Methyl 2-[((((4-methoxy-6-methyl-1,3,5-triazin-2-yl)amino)carbonyl) amino) sulfonyl]benzoate; Methyl 2-[3-(4-methoxy-6-methyl-1,3,5-triazin-2-yl)ureidosulphonyl]benzoate; NUP; Parti-san; Pasture MD; Riverdale; Rosulfuron

CAS Number: 74223-64-6

HSDB Number: 6849

RTECS Number: DH3563000

UN/NA & ERG Number: UN3077 (environmentally hazardous substances, solid, n.o.s.)/171

EC Number: 616-063-8 [*Annex I Index No*.: 613-139-00-2]

Regulatory Authority and Advisory Information

Carcinogenicity[83]: EPA, Not likely to be carcinogenic to humans.

Hazard Alert: Suspected reprotoxic hazard

Marine pollutant: IMDG, some formulations

Environmental hazard: IATA, some formulations

Hazard symbols, risk, & safety statements: Hazard symbol: N; risk phrases: R50/53; R63; safety phrases: S2; S60; S61; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: White, off-white or pale yellow crystalline solid. Slight, sweet odor; ester-like. Molecular weight = 381.37; specific gravity (H_2O:1) = 1.47; freezing/melting point = 158°C; 163°C; vapor pressure = 3×10^{-12} mmHg @ 25°C. Soluble in water; solubility = 108 mg/L @ 25°C.

Potential Exposure: Metsulfuron-methyl is a preemergence and postemergence sulfonylurea herbicide used to control annual grasses, brush, woody plants and broadleaf weeds. It can be applied to cereals including barley, rye and wheat and to pastures. It is primarily used to control brush, woody plants and broadleaf weeds on rights-of-way, fence rows, storage areas, highways and other noncrop areas.

Incompatibilities: Strong oxidizers. Stable in air to about 140 C. It is hydrolyzed in acid solutions.

Determination in Air: Filter; none; Gravimetric; NIOSH IV [Particulates NOR; #0500 (total), #0600 (respirable)][18].

Determination in Water: Hazardous to marine organisms with long-lasting effects. Octanol−water coefficient: Log $K_{ow} = < 2.5$. Unlikely to bioaccumulate in marine organisms. Fish toxicity (threshold)[101]: Very low—31,167.38603 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Routes of Entry: Inhalation, dermal contact, ingestion

Harmful Effects and Symptoms

Human health effects from the sulfonylurea herbicides at low environmental doses or at biomonitored levels from low environmental exposures are unknown. The sulfonylurea herbicides are generally of low toxicity in mammalian studies. Animal studies showed low acute toxicity and little chronic, reproductive, or developmental toxicity or teratogenic effects. Developmental or teratogenic effects tended only to occur at high or maternally toxic doses. At high sublethal, chronic oral doses, such nonspecific effects as weight loss and anemia were observed. Some chemical-specific effects were noted at high doses in animals[96].

Short-Term Exposure: May cause skin and eye irritation. Moderately poisonous if ingested or inhaled. LD_{50} (oral, rat) = > 5 g/kg; LD_{50} (dermal, rat) = > 2 g/kg.

Long-Term Exposure: May cause reproduction problems. Human toxicity (long term)[101]: Very low—1750.00 ppb, Health Advisory.

Points of Attack: Reproductive cells.

Medical Surveillance: Preliminary medical exam to detect chronic diseases of central nervous system, liver, heart, kidneys, lung, and skin, as well as endocrinological or immunological disturbances, should protect susceptible individuals. Periodical medical exams of internal organs, skin, and eyes are important to avoid chronic occupational intoxications. They should include lab and patch tests when necessary[83]. Comprehensive physical examination with emphasis on the genitourinary tract analysis to include sperm count, motility and morphology. Other tests, such as serum testosterone, serum FSH, and serum LH may be carried out if, in the opinion of a physician, they are indicated. Urinary levels of the sulfonylurea herbicides reflect recent exposure. There is very limited information on the biomonitoring of sulfonylurea herbicides or their metabolites. Detection of the metabolites may reflect exposure to more than one particular sulfonylurea herbicide or from exposure to environmental degradation products. The urinary metabolites dimethoxypyrimidine and dimethylpyrimidine can be used as nonspecific markers of exposure to the pyrimidinylsulfonylureas, a group that includes bensulfuron-methyl, halosulfuron, primisulfuron-methyl, and sulfosulfon. The urinary metabolite methoxymethyl triazine can be used as a nonspecific marker of exposure to the triazinylsulfonylureas, a group that includes chlorosulfuron, prosulfuron, and triasulfuron[96].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of dermal and/or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wherever and whenever workplace conditions warrant respirator use, a respiratory protection program must be followed that meets one or more of the following government standards: OSHA's 29 CFR 1910.134, ANSI Z88.2, or European Standard EN 149.

Storage: Color code—Blue: Health Hazard/Poison. Store in a secure poison location. Store in a refrigerator and protect from exposure to oxidizers or moisture[52]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store pesticides in original containers, complete with labels listing ingredients, use directions, and first aid. Keep them away from areas where flooding is possible or where they might leak into wells, drains, ground water, basements, or surface water.

Shipping: UN3077 Environmentally hazardous substances, solid, n.o.s., Hazard class: 9; Labels: 9-Miscellaneous hazardous material, Technical Name Required.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. If a spill occurs, clean it up promptly. Don't wash it away. Instead, sprinkle the spill with sawdust, vermiculite, or kitty litter. Sweep it into a plastic garbage bag, and dispose of it as directed on the pesticide product label. Ventilate area of spill or leak after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen, sulfur, and carbon. As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 m/150 ft for liquids and at least 25 m/75 ft for solids. *Fire involving storage or vehicular tanks*: Isolate for 800 m/0.5 mi in all directions; also, consider initial evacuation for 800 m/0.5 mi in all directions. *On a small fire*: use dry chemical, CO_2, water spray or regular *foam. On a large fire*: use water spray, fog, or regular foam. Do not scatter spilled material with high pressure streams of water. Move containers from fire area if you can do it without risk. Dike fire-control water for later disposal. *Fire involving tanks*: From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Always stay away from tanks engulfed in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is the responsibility of chemical waste generators to determine the toxicity and physical properties and of a discarded chemical and to properly identify its classification and certification as a hazardous waste and to determine the disposal method. United States Environmental Protection Agency guidelines for the classification determination are listed in 40 CFR Parts 261.3. In addition, waste generators must consult and follow all regional, national, state and local hazardous waste laws to ensure complete and accurate classification and disposal methods. Recycle any unused portion of the material for its approved use or return it to the manufacturer or supplier. Offer surplus and nonrecyclable solutions to a licensed disposal company. Dissolve or mix the pesticide with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber.

EC Number: 207-136-1

Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogen; IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; European GHS, Category 2.

California Proposition 65 Chemical[102]: Cancer 1/1/1988

Hazard Alert: Poison, Possible risk of forming tumors, Suspected of causing genetic defects, Drug

Hazard symbols, risk, & safety statements: Hazard symbol: T, F, Xn; risk phrases: R45; R11; R22; R23/24/25; R36/37/38; R39/23/24/25; SR40; R46; R50; R61; safety phrases: S7; S16; S26; S36/37; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to water. (est.)].

Description: Metronidazole is an odorless, white, yellow, or cream-colored crystalline solid. Darkens on exposure to light. Bitter, salty taste (do not test). Molecular weight = 171.18; freezing/melting point = 158−160°C. Practically insoluble in water; solubility = < 1 mg/mL @ 20°C.

Potential Exposure: Metronidazole is an orally administered drug for the treatment of infections due to *entamoeba histolytica*; *trichomonas vaginalis*; *giardia lamblia*, and has also been used for treating Vincent's infection. It can be used as a trichomonacide in veterinary medicine. One firm has petitioned EPA to use metronidazole as a disinfectant for cooling tower water.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

No standards or PAC available. This substance may still be harmful or dangerous; follow safe work and usage practices.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < -0.1$. Unlikely to bioaccumulate in marine organisms.

Harmful Effects and Symptoms

Short-Term Exposure: Symptoms of exposure include headache, anorexia, nausea, occasional vomitin; diarrhea and rash.

Long-Term Exposure: There is evidence that this substance is mutagenic, teratogenic and carcinogenic in animals. Possibly carcinogenic to humans.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Thermal decomposition products may include oxides of nitrogen and carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dispose of contents and container to an approved waste disposal plant. All federal, state, and local environmental regulations must be observed. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Regulatory Authority and Advisory Information

Hazard Alert: Poison inhalation hazard: exposure can be lethal, Super toxic, Neurotoxin (cumulative), Suspected of causing genetic defects, Agricultural chemical.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500 lb (227 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R27/28; R33; R50/53; R62; safety phrases: S1/2; S23; S28; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mevinphos is a pale yellow to orange high-boiling liquid. Weak odor. The carrier solvent may change the physical properties listed here. Molecular weight = 224.17; specific gravity (H_2O:1) = 1.25; boiling point = decomposes; freezing/melting point = 7°C (*trans*-); 21°C (*cis*-); vapor pressure = 0.0001 mmHg @ 20°C; flash point = 79.5°C (oc).[ICSC] Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 0. Soluble in water. Commercial product is a mixture of the *cis*- and *trans*-isomers. Insecticide that may be absorbed on a dry carrier.

Potential Exposure: Those engaged in the manufacture, formulation, and application of this super toxic contact and systemic insecticide and acaricide.

Incompatibilities: Decomposes in heat (below boiling point @ 300°C) producing phosphoric acid and phosphorous oxides fumes. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Corrosive to cast iron, some stainless steels and brass. Attacks some forms of plastics, rubber and coatings.

Permissible Exposure Limits in Air

NIOSH IDLH = 4 ppm

Conversion factor: 1 ppm = 9.17 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL: 0.1 milligram per cubic meter TWA [skin]

NIOSH REL: 0.01 ppm/0.1 milligram per cubic meter TWA; 0.03 ppm/0.3 milligram per cubic meter STEL [skin]

ACGIH TLV[1]: 0.01 milligram per cubic meter measured as inhalable fraction and vapor TWA [skin]; not classifiable as a human carcinogen; BEI_A issued as Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138]

PAC-1: 0.3 milligram per cubic meter

PAC-2: 4 milligram per cubic meter

PAC-3: 40 milligram per cubic meter

DFG MAK: 0.01 ppm/0.093 milligram per cubic meter TWA; Peak Limitation Category II(2) [skin]

Arab Republic of Egypt: TWA 0.01 ppm (0.1 milligram per cubic meter) [skin] 1993; Australia: TWA 0.01 ppm (0.1 milligram per cubic meter); STEL 0.03 ppm [skin] 1993; Austria: MAK 0.01 ppm (0.1 milligram per cubic meter) [skin] 1999; Belgium: TWA 0.01 ppm (0.09 milligram per cubic meter); STEL 0.03 ppm [skin] 1993; Denmark: TWA 0.01 ppm (0.1 milligram per cubic meter) [skin] 1999; Finland: TWA 0.001 ppm, 1999; France: VME 0.01 ppm (0.1 milligram per cubic meter) [skin] 1999; the Netherlands: MAC-TGG 0.1 milligram per cubic meter [skin] 2003; Norway: TWA 25 ppm (125 milligram per cubic meter), 1999; the Philippines: TWA 0.1 milligram per cubic meter [skin] 1993; Switzerland: MAK-W

0.01 ppm (0.1 milligram per cubic meter) [skin] 1999; Thailand: TWA 0.1 milligram per cubic meter, 1993; United Kingdom: TWA 0.01 ppm (0.09 milligram per cubic meter); STEL 0.03 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 0.27 milligram per cubic meter (skin)

Several states have set guidelines or standards for mevinphos in ambient air[60] ranging from 1−3 μ/m^3 (North Dakota) to 1.6 μ/m^3 (Virginia) to 2.0 μ/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: No criteria set. This chemical is highly toxic to aquatic life.

Determination in Water: Fish Tox = 0.96183000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Short-Term Exposure: Cholinesterase inhibitor. Mevinphos may affect the nervous system; causing convulsions, respiratory failure. This material is super toxic; the probable oral lethal dose for humans is less than 5 mg/kg, or a taste (less than seven drops) for a 150-lb person. It has direct and immediate effects whether it is swallowed, inhaled, or absorbed through the skin. Symptoms include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; headache, giddiness, dizziness, runny nose; tightness in the chest; blurring and dimming of vision; slurring of speech; twitching of muscles; mental confusion; disorientation, troubled breathing; bluing of skin, convulsions, coma, and death. Human Tox = 1.75000 ppb (HIGH)

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: NIOSH lists the following tests: Blood serum; Cholinesterase, Blood Serum, Red blood cells/count. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.1 ppm*: Sa (APF = 10) (any supplied-air respirator). *0.25 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *0.5 ppm*: SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *4 ppm*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: UN3018 Organophosphorus pesticides, liquid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials. UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous material.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30

Then: Protect persons downwind (mi/km)

Day 0.3/0.4

Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200

Then: Protect persons downwind (mi/km)

Day 1.4/2.3

Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include phosphoric acid and oxides of phosphorus and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mevinphos is 50% hydrolyzed in aqueous solutions at an unspecified temperature in 1.4 hours at pH 11, 35 days at pH 7; and 120 days at pH 6. Thermal decomposition is rapidly accomplished by lime sulfur. Mevinphos may also incinerated. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

United States DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R21; R28; R33; R50/53; safety phrases: S1/2; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Mexacarbate is an odorless, white to tan crystalline solid. Molecular weight = 222.32; freezing/melting point = 85°C; vapor pressure = 0.1 mmHg @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: It is an insecticide for nonagricultural uses, e.g., lawn and turf, flowers, gardens, vines, forest lands; woody shrubs and trees; and also a molluscicide. It is not produced or used commercially in the United States.

Incompatibilities: Alkalis, strong oxidizers.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.3 milligram per cubic meter

PAC-2: 14 milligram per cubic meter

PAC-3: 84 milligram per cubic meter

Determination in Water: Fish Tox = 31.03658000 ppb (INTERMEDIATE). Highly toxic to aquatic life with long-lasting effects. Do not allow release to the environment unless proper permits are obtained from the federal government.

Routes of Entry: Inhalation, ingestion, skin, and/or contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: Extremely toxic: probable oral lethal dose for humans is 5−50 mg/kg; between seven drops and one teaspoonful for 70 kg person (150 lb). Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. Symptoms of carbamate poisoning resemble those of parathion. This material is similar to carbaryl; symptoms of carbaryl exposure include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; sweating, lassitude and weakness. Runny nose and sensation of tightness in chest may occur with inhalation exposures. Blurring or dimness of vision, tearing, eye muscle spasm; loss of muscle coordination; slurring of speech; and twitching of muscles may also occur.

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Mexacarbate may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place or a refrigerator.

Shipping: UN2757 Carbamate pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. This chemical is a combustible solid. *Small fires*: dry chemical, carbon dioxide; water spray; or foam. *Large fires*: water spray, fog, or foam. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Mica M:1370

Formula: $Al_6H_4K_2O_{24}Si_6$; $K_2Al_4(Al_2Si_6O_{20})(OH)_4$

Synonyms: Amber mica; Biotite; Fluorophlogopite; Lepidolite; Margarite; Mica silicate; Muscovite; Phlogopite; Roscoelite, suzorite mica; Zimmwaldite

CAS Registry Number: 12001-26-2

HSDB Number: 2539

RTECS Number: VV8760000

UN/NA & ERG Number: Not regulated.

Regulatory Authority and Advisory Information

United States National Primary Drinking Water Regulations: SMCL = 0.05 to 0.2 mg[Al]/L as aluminum.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Description: Mica (muscovite), takes the form of a colorless, odorless solid that separates into flakes or thin sheets of hydrous silicates. Molecular weight = 398.3; specific gravity (H_2O:1) = 2.6−3.2 @ 20°C; freezing/melting point = 1387°C. Insoluble in water.

Potential Exposure: Mica is used as reinforcing filler for plastics, substitute for asbestos; for insulation in electrical equipment; used in the manufacture of roofing shingles, wallpaper and paint.

Incompatibilities: Silicates react with lithium.

Permissible Exposure Limits in Air
NIOSH IDLH = 1500 milligram per cubic meter
OSHA PEL: 20 mppcf, <1% crystalline silica TWA
NIOSH REL: 3 milligram per cubic meter respirable dust; containing <1% quartz TWA
ACGIH TLV[1]: 3 milligram per cubic meter respirable fraction TWA
PAC Ver. 29[138]
PAC-1: 9 milligram per cubic meter
PAC-2: 99 milligram per cubic meter
PAC-3: 590 milligram per cubic meter
Australia: TWA 2.5 milligram per cubic meter, 1993; Belgium: TWA 3 milligram per cubic meter, 1993; Switzerland: MAK-W 3 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 5 milligram per cubic meter (total dust); MAC-TGG 2.5 milligram per cubic meter (respirable dust), 2003; United Kingdom: TWA 10 milligram per cubic meter, total inhalable dust; TWA 0.8 milligram per cubic meter, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: TWA 3 milligram per cubic meter, respirable fraction

Determination in Air: Use NIOSH Analytical Method (IV) #0600, Particulates NOR (respiratory)

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Unknown at this time.

Long-Term Exposure: Pneumoconiosis; cough, dyspnea, weakness, weight loss. Repeated heavy exposure can irritate the lungs. After years of high exposure, lung scarring (fibrosis) may result. This causes an abnormal chest X-ray and may cause cough and a shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful. Lung function tests. Chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 15 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). *Up to 30 milligram per cubic meter*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 75 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *Up to 150 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 1500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: HieF$^+$(any air-purifying, full facepiece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Green: General storage may be used. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Mica silica itself does not burn. Thermal decomposition products may include oxides of metal and harmful and irritating gases. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consider recycling, otherwise, this chemical must be disposed of in compliance with existing federal and local regulations. Landfill.

EC Number: 202-027-5 [*Annex I Index No.*: 606-073-00-0]
Regulatory Authority and Advisory Information

Carcinogenicity: NTP 13th Report on Carcinogens, 2014: Reasonably anticipated to be a human carcinogenIARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; NCI: Carcinogenesis Studies (feed); clear evidence: rat, mouse, 1979.

California Proposition 65 Chemical[102]: Cancer 1/1/1988

Hazard Alert: Poison, Combustible, Suspected of causing genetic defects, Possible risk of forming tumors.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 0.1%.

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R45; R41; R62; R68; safety phrases: S25; S41; S45; S53 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Michler's ketone is a is a blue powder or white to green-colored leaflet material. Molecular weight = 268.39; boiling point ≥360°C (decomposition); freezing/melting point = 179°C; flash point = 220°C; autoignition temperature = 480°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: Mutagen. Animal Carcinogen. Michler's ketone is a dye intermediate and derivative of dimethylaniline. It is also used in antifreeze formulations, cosmetics, cleaning compounds; heat transfer fluids; as a chemical intermediate in the synthesis of at least 13 dyes and pigments, especially auramine derivatives.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from aldehydes, alkaline materials, strong acids, strong bases, strong reducing agents such as hydrideds and active metals. Contact with hydrogen peroxide may form heat- and shock-sensitive explosives.

Permissible Exposure Limits in Air

PAC Ver. 29[138]
PAC-1: 30 milligram per cubic meter
PAC-2: 330 milligram per cubic meter
PAC-3: 2000 milligram per cubic meter
DFG MAK: Carcinogen Category 2

Routes of Entry: Inhalation and skin adsorption.

Harmful Effects and Symptoms

Irritates the eyes, skin and mucous membranes. Absorbed through the skin.

Short-Term Exposure: May have a narcotic or anesthetic effect.

Points of Attack: Gastrointestinal or liver cancer

Long-Term Exposure: A potential occupational carcinogen.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Don't wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact*: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 minutes. Seek medical attention. *Inhalation*: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion*: If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance, If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/ manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place away from peroxides, aldehydes, strong acids. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN3143 Dyes, solid, toxic, n.o.s. or Dye intermediates, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poison Inhalation Hazard. UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN1602 Dyes, liquid, toxic, n.o.s or Dye intermediates, liquid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/ 75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not discharge into drains or sewers. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. If allowed, Incineration with effluent gas scrubbing is recommended. Containers must be disposed of properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Mineral Oil M:1385

Synonyms: Adepsine oil; Heavy mineral oil mist; Mist of white mineral oil; Cutting oil; Heat-treating oil; Hydraulic oil; Cable oil; Lubricating oil; Paraffin oil; Paroil-70; Slaboil; White mineral oil; White oil

CAS Registry Number: 8042-47-5; 64741-53-3; 64741-88-4; 64742-54-7; 8012-95-1; *(alt.)* 39355-35-6; *(alt.)* 79956-36-8; *(alt.)* 83046-05-3

HSDB Number: 1922

RTECS Number: PY8030000

EC Number: 232-455-8 (mineral oil); 232-384-2 (paraffin oils)

Regulatory Authority and Advisory Information

Carcinogenicity (*For untreated, mildly treated, and poorly refined mineral oils, and used mineral motor oils*): NTP 13th Report on Carcinogens, 2014: Known to be a human carcinogen; Mineral oils (untreated and mildly treated); NTP (*untreated and poorly refined*): Known to be a human carcinogen; IARC (*untreated and poorly refined*): Human Sufficient Evidence; Animal Limited Evidence, *carcinogenic to humans*, Group 1; IARC (*highly refined*): Human No Adequate Data, animal No Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Soots, tars, and mineral oils (untreated and mildly treated oils and used engine oils), cancer. 2/27, 1987.

Hazard Alert: Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction), Aspiration hazard.

FDA-When used as a lubricant with incidental food contact, mineral oil levels shall not exceed 10 ppm.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: Xi; risk phrases: R36/37/38; R41; R45; R62; safety phrases: S23; S24/25; S26; S26 (see Appendix 4)

Description: Mineral oil mist is a colorless, oily liquid aerosol dispersed in air with an odor like burned lubricating oil. The odor threshold is 1.0 ppm. Specific gravity (H_2O:1) = 0.865 @ 60°C; 0.83−0.91[138]; boiling point = 250−360°C; vapor pressure =< 0.5 mmHg @ 20°C; flash point = 185−193°C; autoignition temperature = 260−371°C. Hazard identification (based on NFPA-704 M Rating System): Health 0, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: Mineral oil is used in cosmetics, pharmaceutical bases; food, and fiber production; as carriers and bases; as a lubricating oil and as a solvent for inks in the printing industry. Oil mist would be encountered in quenching of hot metal parts and in metal machining operations.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong acids (especially nitric acid), strong bases.

Permissible Exposure Limits in Air

When used as a lubricant with incidental food contact, mineral oil levels shall not exceed 10 ppm.[FDA]

as oil mist (mineral)

NIOSH IDLH = 2500 milligram per cubic meter

OSHA PEL: 5 milligram per cubic meter TWA

NIOSH REL: 5 milligram per cubic meter TWA; 10 milligram per cubic meter STEL

ACGIH TLV[1]: 5 milligram per cubic meter inhalable fraction from highly refined and pure mineral oil, TWA

includes: *64741-53-3, 64741-88-4, 8042-47-5, 8012-95-1; 64742-54-7*

PAC Ver. 29[138]

PAC-1: 140 milligram per cubic meter

PAC-2: 1500 milligram per cubic meter

PAC-3: 8900 milligram per cubic meter

Australia: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; Belgium: TWA 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; Finland: TWA 5 milligram per cubic meter, 1999; Hungary: STEL 5 milligram per cubic meter, carcinogen, 1993; Japan: 3 milligram per cubic meter, Group 1 carcinogen, 1999; the Philippines: TWA 5 milligram per cubic meter, 1993; Poland: MAC (TWA) 5 milligram per cubic meter; MAC (STEL) 10 milligram per cubic meter, 1999; Russia: STEL 5 milligram per cubic meter, 1993; the Netherlands: MAC-TGG 5 milligram per cubic meter, 2003; Sweden: NGV 3 milligram per cubic meter; STEL 5 milligram per cubic meter, 1993; Switzerland: MAK-W 5 milligram per cubic meter, 1999; United Kingdom: LTEL 5 milligram per cubic meter; STEL 10 milligram per cubic meter, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: STEL 10 milligram per cubic meter. Several states have set guidelines or standards for mineral oil mist in ambient air[60] ranging from 16.7 μ/m^3 (New York); to 25 μ/m^3 (South Carolina); to 50 μ/m^3 (Florida); to 80 μ/m^3 (Virginia); to 100 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5026, Oil mist, mineral; #5524, Metalworking Fluids

Permissible Concentration in Water: The EEC[35] set a MAC in drinking water of 10 μg/L. Russia set a MAC in surface water for fishery purposes of 6.5 mg/L.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: May irritate nose and throat. If taken into lungs may cause coughing and swelling of lung tissue; may cause pneumonia. Similarity to kerosene indicates that headache, nausea, ringing in the ears, weakness, confusion, drowsiness, coma and death may occur. *Skin*: May cause redness and swelling if not promptly removed. *Eyes*: May cause severe irritation if not promptly removed. *Ingestion*: Will cause burning sensation in mouth, throat, and stomach if swallowed. Vomiting, diarrhea and belching may follow. If liquid gets into lungs it may cause rapid breathing; Blue skin coloration; rapid heartbeat; and fever with rapid onset of chemical pneumonia and possible secondary infection. Death may result from as little as half a liquid ounce in the absence of lung involvement. *Note*: Food grades are highly purified and are of low toxicity.

Long-Term Exposure: Prolonged contact may cause skin irritation; acne-like rash may develop. May cause skin allergy with itching and rash. There is some evidence that some substances referred to as "mineral oils" may be carcinogens. However, this information is unclear at this time and mineral oils (except for food grades) should be treated with caution.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Special tests of the sputum to look for oil droplets. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. *For untreated, mildly treated, and poorly refined mineral oils, and used motor oils*: These chemicals are known or suspected human carcinogens. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 milligram per cubic meter*: 100XQ (APF = 10) [Any APR with an N100, R100, or P100 filter (including N100, R100, and P100 filtering facepieces) except quarter-mask respirators]; or Sa (APF = 10) (any supplied-air respirator). *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter). *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *2500 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or Planned Entry into Unknown Concentrations or IDLH Conditions* SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).

For untreated, mildly treated, and poorly refined mineral oils, and used motor oils: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA—or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

List of Stockholm Convention POPs: Annex A (Elimination)

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292]. Do not allow release to the environment unless proper permits are obtained from the federal government.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xn, N; risk phrases: R45; R21/22; R40; R50/53; R62; R63; R64; safety phrases: S2; S13; S36/37; S41; S46; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Mirex is a snow-white crystalline solid. Molecular weight = 545.50; boiling point = (decomposes) 485°C; vapor pressure = 8×10^{-7} mm @ 20°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 1, reactivity 0. Insoluble in water.

Potential Exposure: A potential danger to those involved in the manufacture, formulation, and application of the insecticide (particularly effective against fire ants). Also used as a fire retardant in plastics. Not produced in the United States but may be found in imported products.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, dichromates.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 6.3 milligram per cubic meter

PAC-2: 69 milligram per cubic meter

PAC-3: 410 milligram per cubic meter

Several states have set guidelines or standards for mirex in ambient air[60] ranging from 0 (Massachusetts) to 0.03 μ/m^3 (New York) to 0.88 μ/m^3 (Pennsylvania) to 4500 μ/m^3 (South Carolina).

Permissible Concentration in Water: 0.001 mg/L for protection of aquatic life (Sax-reference below).

Determination in Water: Fish Tox = 1.98564000 ppb (HIGH).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short-Term Exposure: *Inhalation*: Can irritate the respiratory tract. This compound is moderately toxic (the LD_{50} value for rats is 300 mg/kg). *Skin*: Can cause irritation, burning sensation and rash. *Eyes*: Can cause irritation. *Ingestion*: No cases of human toxicity reported. Possible symptoms include nausea, vomiting, restlessness, tremor, weight loss; nervous system and liver abnormalities; skin rash and reproductive failure. Exposure can cause nausea and vomiting, headache, dizziness, muscular weakness; fatigue, convulsions and may cause unconsciousness.

Long-Term Exposure: May damage the developing fetus during lactation. May cause damage to the testes. May damage the liver and cause anemia. High exposure can cause arrhythmia (irregular heartbeat) and may cause death. Mirex has caused cataracts, liver and thyroid cancer and birth defects in both rats and mice. Whether it does so in humans is not known.

Points of Attack: Blood, liver, nervous system, unborn fetus. Reproductive system.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. CBC, liver function tests; EKG, examination of the nervous system. Pregnant women should avoid contact. Employees should be notified by a physician that this chemical may affect the reproductive system. In addition to comprehensive initial medical and work histories emphasizing reproductive experience and menstrual history, patient should have physical examination and testing of genitourinary tract, sperm count, motility, and morphology. If required, other tests, such as serum testosterone, serum FSH, and serum LH may be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to Physician*: Gastric lavage or catharsis may be useful. High urine organic chlorine indicative of exposure, but not severity.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Pesticide respirators may be used to limit exposure. Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in a cool area in closed containers away from oxidizers and dichromates. Always store pesticides in their original containers, complete with labels that list ingredients, directions for use, and first aid steps in case of accidental poisoning. Never store pesticides in cabinets with or near food, animal feed, or medical supplies. Do not store pesticides in places where flooding is possible or in places where they might spill or leak into wells, drains, ground water, or surface water[72]. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2761 Organochlorine pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum; do not use wet method. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mirex is a noncombustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Thermal decomposition products may include hydrogen chloride and oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

RTECS Number: CN0700000

DOT ID and ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3249 (medicine, solid, toxic, n.o.s)/151

EC Number: 200-008-6

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (ipr); clear evidence: rat; no evidence: mouse, 1975.

California Proposition 65 Chemical[102]: Cancer 4/1/1988.

Hazard Alert: Poison, Combustible, Possible risk of forming tumors, Suspected of causing genetic defects, Suspected reprotoxic hazard, Drug.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): U010

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 10 lb (4.54 kg)

Hazard symbols, risk, & safety statements: Hazard symbol: T+, Xn; risk phrases: R45; R22; R25; R26/27/28; R33; R40; R50/53; R62; R63; safety phrases: S22; S28; S36/37/39; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Mitomycin is a blue-violet crystalline solid. Molecular weight = 334.37; boiling point = 534°C; freezing/melting point = > 360°C; vapor pressure = 1×10^{-5} mmHg @ 25°C. Soluble in water.

Potential Exposure: This compound is an antitumor antibiotic complex. This drug is usually injected intravenously.

Incompatibilities: Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides, heat, strong light, calcium salts

Permissible Exposure Limits in Air

PAC Ver. 27, no values found in Ver. 29[138]

PAC-1: 2.1 milligram per cubic meter

PAC-2: 23 milligram per cubic meter

PAC-3: 23 milligram per cubic meter

Routes of Entry: Inhalation. It is not known if this chemical penetrates the unbroken skin.

Harmful Effects and Symptoms

Short-Term Exposure: Contact may irritate and damage the eyes. Toxic doses as low as 750 mg/kg have been reported in humans. The major toxic effect is myelosuppression, characterized by marked leukopenia and thrombocytopenia; this may be delayed and cumulative. Interstitial pneumonia and glomerular damage resulting in kidney failure are unusual but well documented complications. Administration of mitomycin has been recognized as, causing pneumonitis, alveolitis and pulmonary fibrosis. Administration of mitomycin can cause kidney damage. Kidney toxicity was observed in 1%–5% of patients. Depressed immune conditions were noted also. Headaches; blurred vision; confusion, drowsiness, fatigue, diarrhea, and pain have been occasionally noted as symptoms of mitomycin exposure. These do not appear to be dose related by intravenous administration. Fever and anorexia occur in 15% of patients. Hair loss, sloughing of skin; and loss of feeling occur in approximately 4% of patients. Labored breathing; cough and pneumonia occur in some cases. Renal toxicity is sometimes observed.

Long-Term Exposure: Causes mutations. Causes cancer in animals. There is limited evidence that Mitomycin C is a teratogen in animals. Can damage the bone marrow and cause kidney damage.

Points of Attack: Blood, Lungs, kidneys.

Medical Surveillance: This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: CBC and platelet count. Kidney function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Based on potential carcinogenicity the following is recommended by NIOSH: *At any detectable concentration*: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full-facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat (temperatures over 40°C). If you are required to work in a "sterile" environment you require special training. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required. UN3249 Medicine, solid, toxic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal. It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator.

Molybdenum M:1410

Formula: Mo

Synonyms: Elemental molybdenum; Molybdate; Molybdenum metal

CAS Registry Number: 7439-98-7

HSDB Number: 5032

RTECS Number: QA4680000 (elemental)

UN/NA & ERG Number: UN3089 (powder)/170

EC Number: 231-107-2

Regulatory Authority and Advisory Information

Hazard Alert: Highly flammable solid (powder/dust), Strong reducing agent, Suspected reprotoxic hazard, Suspected of causing genetic defects.

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard Symbol (powder): T, F+, Xi, Xn; risk phrases: R12; R36/38; R51/53; R48/20; R62; R63; R65; R67; safety phrases: S9; S16; S21; S26; S36/37/39; S61; S62 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): Nonhazard to water if particle size is >1 mm.

Description: Molybdenum is a silvery-white metal or dark gray or black powder with a metallic luster. Molecular weight = 95.94; specific gravity (H_2O:1) = 10.2; boiling point = 4639°C; freezing/melting point = 2623°C. Hazard identification (based on NFPA-704 M Rating System): Health 1, flammability 4, reactivity 0. Molybdenite is the only important commercial source. This ore is often associated with copper ore. Molybdenum is insoluble in water and soluble in hot concentrated nitric and sulfuric acid.

Potential Exposure: Most of the molybdenum produced is used in alloys: steel, stainless steel; tool steel; case iron; steel mill rolls; manganese, nickel, chromium, and tungsten. The metal is used in electronic parts (contacts, spark plugs, X-ray tubes, filaments, screens, and grids for radios); induction heating elements; electrodes for glass melting; and metal spraying applications. Molybdenum compounds are utilized as lubricants; as pigments for printing inks; lacquers, paints, for coloring rubber animal fibers, leather, and as a mordant; as catalysts for hydrogenation cracking; alkylation, and reforming in the petroleum industry; in Fischer−Tropsch synthesis; in ammonia production; and in various oxidation-reduction and organic cracking reactions; as a coating for quartz glass; in vitreous enamels to increase adherence to steel; in fertilizers, particularly for legumes; in electroplating to form protective coatings; and in the production of tungsten. Hazardous exposures may occur during high-temperature treatment in the fabrication and production of molybdenum products, spraying applications; or through loss of catalyst. MoO_3 sublimes above 800°C.

Incompatibilities: Metallic Mo is a combustible solid in form of dust or powder and is potentially explosive. Dust or powder may form explosive mixture with air. *Soluble compounds*: alkali metals; sodium, potassium, molten magnesium. *Insoluble compounds*: Violent reaction with oxidizers, nitric acid; sulfuric acid. Forms explosive mixture with potassium nitrate. Incompatible with oxidizers (chlorates, nitrates, peroxides, permanganates, perchlorates, chlorine, bromine, fluorine, etc.); contact may cause fires or explosions. Keep away from alkaline materials, strong bases, strong acids, oxoacids, epoxides.

Permissible Exposure Limits in Air

Mo, metal and insoluble compounds

NIOSH IDLH = 5000 mg[Mo]/m^3

OSHA PEL: 15 mg[Mo]/m^3 total dust TWA [*Note*: The PEL also applies to other insoluble molybdenum compounds (as Mo).]

NIOSH: See Appendix D of the *NIOSH Pocket Guide*.

ACGIH TLV[1]: 10 mg[Mo]/m^3 inhalable fraction; 3 mg [Mo]/m^3 respirable fraction. PAC Ver. 29[138]

elemental

PAC-1: 30 milligram per cubic meter

PAC-2: 330 milligram per cubic meter

PAC-3: 2000 milligram per cubic meter

Mo, soluble compounds

NIOSH IDLH = 1000 mg[Mo]/m^3

OSHA PEL: 5 mg[Mo]/m^3 TWA

NIOSH: See Appendix D of the *NIOSH Pocket Guide*.

ACGIH TLV[1]: 0.5 mg[Mo]/m^3 respirable fraction TWA confirmed animal carcinogen with unknown relevance to humans.

DFG MAK: No numerical value established. Data may be available; testing for carcinogenic effects.

Russia[43] established a MAC of 2 milligram per cubic meter for *soluble compounds, aerosol condensates*; 4 milligram per cubic meter for *soluble compounds as dusts*; MAC of 6 milligram per cubic meter for *insoluble compounds*. Several states have set guidelines or standards for molybdenum in ambient air[60] ranging from 100−200 μ/m^3 (Connecticut) to 119 μ/m^3 (Nevada) to 160 μ/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Russia[43] has established a molybdenum limit of 0.5 mg/L in bodies used for domestic purposes. EPA[32] has suggested a permissible ambient goal of 70 μg/L based on health effects.

Determination in Water: With atomic-absorption spectrophotometry, a detection limit of 20 μg/L is attainable by direct aspiration into the flame, necessitating concentration for ordinary determinations. When the graphite furnace is used to increase sample atomization the detection limit is lowered to 0.5 μg/L or. Neutron activation may be used at even lower detection limits, according to United States Environmental Protection Agency.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Contact irritates the skin and eyes. Inhalation can irritate the respiratory tract causing coughing and wheezing.

Long-Term Exposure: Can cause headache, fatigue, loss of appetite; muscle and joint pain. Uric acid levels may be elevated which can lead to gout. May damage the liver and kidneys. May cause low blood count (anemia). In animals: irritation of eyes, nose, throat; anorexia, diarrhea, weight loss; listlessness; liver, kidney damage. Soluble compounds e.g., sodium molybdate) and freshly generated molybdenum fumes, are considerably more toxic. Inhalation of high concentrations of molybdenum trioxide dust is very irritating to animals and has caused weight loss; diarrhea, loss of muscular coordination; and a high mortality rate. Molybdenum trioxide dust is more toxic than the fumes. Large oral doses of ammonium molybdate in rabbits caused some fetal deformities.

Points of Attack: *Soluble compounds*: Eyes, respiratory system; kidneys, blood. *Insoluble compounds*: Eyes, respiratory system; liver, kidneys.

Medical Surveillance: NIOSH lists the following tests for molybdenum and compounds: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). Preemployment and periodic physical examinations should evaluate any irritant effects to the eyes or respiratory tract and the general health of the worker. Liver and kidney function tests. CBC. Uric acid level. Molybdenum is considered to be an essential trace element in many species, including humans. However, excessive intake of molybdenum may produce signs of copper deficiency. The normal intake of copper in the diet may be sufficient to combat or prevent systemic toxic effects due to molybdenum poisoning.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection (chemical goggles and face shield unless full facepiece respiratory protection is worn). Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *For Insoluble Compounds*: OSHA *Up to 75 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator).+ *Up to 150 milligram per cubic meter*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 375 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any PAPR with a high-efficiency particulate filter).+ *Up to 750 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *Up to 5000 milligram per cubic meter*: Sa:Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp: ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA).+ If not present as a fume. *For Soluble Compounds*: *25 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator).* *50 milligram per cubic meter*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100;* or Sa (APF = 10) (any supplied-air respirator).* *125 milligram per cubic meter*: Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* or PAPRDM, if not present as a fume (any PAPR with a dust and mist filter).* *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Powder. Color code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials; oxidizers and oxidizing gases should have a boundary separation of 8−10 m or a 1-hour fire wall from flammable or reactive materials. Store flammable solids up to maximum allowable quantity per control area in an approved flammable storage area. Do not store in a basement. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Molybdenum must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from bromine, trifluoride; fluorine, chlorine trifluoride and lead dioxide.

Shipping: UN3089 Metal powders, flammable, n.o.s., Hazard Class: 4.1; Labels: 4.1-Flammable solid.

Spill Handling: Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of metal. Dust or powdered molybdenum may cause a dust explosion. Use dry chemicals appropriate for extinguishing metal fires, such as dry sand, dolomite or graphite. *Do not use water*. For large fires use extinguishing agents suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery is indicated whenever possible. Processes for recovery of Molybdenum from scrap, flue dusts, spent catalysts and other industrial wastes have been developed.

Molybdenum Trioxide M:1420

Formula: MoO_3

Synonyms: MO 1202T; Molybdena; Molybdenum oxide; Molybdenum(VI) oxide; Molybdenum oxide (MoO_3); Molybdenum(VI) oxide; Molybdenum(VI) trioxide; Molybdic acid anhydride; Molybdic anhydride; Trioxido de molibdeno (Spanish)

CAS Registry Number: 1313-27-5

HSDB Number: 1661

RTECS Number: QA4725000

DOT ID and ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 215-204-7 [*Annex I Index No.*: 042-001-00-9]

Regulatory Authority and Advisory Information
Carcinogenicity: ACGIH: A3, Confirmed animal carcinogen with unknown relevance to humans, as molybdenum, soluble compounds.[195]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Safe Drinking Water Act (47FR 9352): Priority List (55 FR 1470) as molybdenum

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: T, Xi, Xn; risk phrases: R40; R36/37; R40; R41; safety phrases: S2; S22; S25; S26; S36/37; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 1-Low hazard to water.

Description: Molybdenum trioxide is an odorless, white crystalline powder that turns yellow when heated. Molecular weight = 143.94; specific gravity (H_2O:1) = 4.9 @ 20°C; boiling point = 1155; freezing/melting point = 795°C. Hazard identification (based on NFPA-704 M Rating System): Health 2, flammability 0, reactivity 0. Slightly soluble in water.

Potential Exposure: Molybdenum trioxide is used in agriculture; manufacture of metallic molybdenum, ceramic glazes; enamels, pigments, and in analytical chemistry.

Incompatibilities: Explodes on contact with molten magnesium. Violent reaction with strong oxidizers, such as chlorine trifluoride; bromine pentafluoride. Not compatible with strong acids; active metals (sodium, potassium, lithium).

Permissible Exposure Limits in Air
NIOSH IDLH = 1000 mg[Mo]/m^3
OSHA PEL: 5 mg[Mo]/m^3 TWA *soluble compounds*
NIOSH: See Appendix D of the *NIOSH Pocket Guide*.
ACGIH TLV[1]: 0.5 mg[Mo]/m^3 TWA *soluble compounds*, confirmed animal carcinogen with unknown relevance to humans.
PAC Ver. 29[138]
PAC-1: 2.3 milligram per cubic meter
PAC-2: 43 milligram per cubic meter
PAC-3: 260 milligram per cubic meter
DFG MAK: Carcinogen Category 3B

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: No specific values set for MoO_3; see this section in the entry on “Molybdenum and Compounds.”

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms
Short-Term Exposure: Irritation of the skin and eyes. Dust or mist can irritate the respiratory tract causing cough and/or tightness in the chest. Can cause anorexia, weight loss; headache, muscle and joint aches; listlessness, hair loss; lack of muscular coordination; diarrhea, liver and kidney damage.

Long-Term Exposure: Can irritate the lungs; bronchitis may develop. May cause anemia. May affect the liver and kidneys.

Points of Attack: Lungs, blood, liver and kidneys.

Medical Surveillance: This soluble Mo chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. NIOSH lists the following tests for molybdenum and compounds: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: tests for liver and kidney function, CBC; uric acid level; lung function tests.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device*. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *For Soluble Compounds*: *25 milligram per cubic meter*: Qm (APF = 25) (any quarter-mask respirator). * *50 milligram per cubic meter*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; * or Sa (APF = 10) (any supplied-air respirator).* *125 milligram per cubic meter*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* or PAPRDM, if not present as a fume (any PAPR with a dust and mist filter).* *250 milligram per cubic meter*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SaT:Cf (APF = 50) (any supplied-air respirator that has a tight-fitting facepiece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any PAPR with a tight-fitting facepiece and a high-efficiency particulate filter);* or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1000 milligram per cubic meter*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full facepiece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, SCBA). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Molybdenum trioxide must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric); alkalis, sodium, potassium and molten magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during clean-up. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Molybdenum trioxide itself does not burn. Thermal decomposition products may include oxides of metal. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

United States DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates

Rotterdam Convention Annex III (Chemicals Subject to the PIC Procedure)[monocrotophos and dustable powder formulations containing a combination of monocrotophos (solid pesticide and soluble liquid formulations of the substance that exceed 600 g active ingredient/L)].

Hazardous to aquatic life or environment, with possible long-lasting effects[291,292].

Hazard symbols, risk, & safety statements: Hazard symbol: T+, N; risk phrases: R24; R26/28; R33; R50/53; R68; safety phrases: S1/2; S29/35; S36/37; S41; S45; S60; S61 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): No value found. [3-Severe hazard to waters (est.)].

Description: Monocrotophos is a colorless to reddish-brown solid with a mild ester odor. Molecular weight = 223.19; specific gravity (H_2O:1) = 1.3; boiling point = 125°C; freezing/melting point = 53.9°C (pure); 25−30°C (the reddish brown technical product); vapor pressure = 7×10^{-6} mm @ 20°C; flash point = > 93°C. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 1, reactivity 0. Soluble in water. Commercially available as a water-miscible solution.

Potential Exposure: The liquid form is a severely hazardous pesticide formulation. A potential danger to those involved in the manufacture, formulation, and application of this insecticide.

Incompatibilities: Alkaline pesticides. Attacks black iron, drum steel; stainless steel; brass.

Permissible Exposure Limits in Air

OSHA PEL: None

NIOSH REL: 0.25 milligram per cubic meter TWA

ACGIH TLV[1]: 0.05 milligram per cubic meter TWA, inhalable fraction and vapor [skin], not classifiable as a human carcinogen; BEI_A releases as Acetylcholinesterase inhibiting pesticides.

PAC Ver. 29[138]

PAC-1: 0.15 milligram per cubic meter

PAC-2: 0.63 milligram per cubic meter

PAC-3: 3.5 milligram per cubic meter

Several states have set guidelines or standards for monocrotophos in ambient air[60] ranging from 2.5 μ/m³ (North Dakota) to 40 μ/m³ (Virginia) to 5.0 μ/m³ (Connecticut) to 6.0 μ/m³ (Nevada). Australia: TWA 0.25 milligram per cubic meter, 1993; Belgium: TWA 0.25 milligram per cubic meter, 1993; Denmark: TWA 0.25 milligram per cubic meter, 1999; France: VME 0.25 milligram per cubic meter 1999; Switzerland: MAK-W 0.25 milligram per cubic meter, 1999; the Netherlands: MAC-TGG 0.25 milligram per cubic meter, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2045, Monocrotophos.

Determination in Water: Fish Tox = 728.00039000 ppb (VERY LOW)

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Monocrotophos is a highly toxic. May be fatal if swallowed or inhaled. It is a direct acting; water-soluble cholinesterase inhibitor which appears to be capable of penetration through the skin. It is excreted rapidly and does not accumulate in the body.

Short-Term Exposure: Acute exposure to monocrotophos may result in the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Dyspnea (shortness of breath) may lead to respiratory collapse. Giddiness is common. Monocrotophos acts on the nervous system. Extremely toxic; probable oral lethal dose to humans 5−50 mg/kg or between seven drops and 1 teaspoon for a 70-kg (150 lb) person. Repeated inhalation or skin contact with this material may, without symptoms, progressively increase susceptibility to poisoning. Monocrotophos may cause mutations. Handle with extreme caution. In animals: possible teratogenic effects. Human Tox = 0.35000 ppb (EXTRA HIGH).

Long-Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause personality changes with depression, anxiety, irritability.

Points of Attack: Eyes, respiratory system; central nervous system; cardiovascular system, blood cholinesterase, reproductive system.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider CBC. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, or wear dust-proof goggles and faceshield when working with powders or dust, unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gal or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2783 Organophosphorus pesticides, solid, toxic, Hazard Class: 6.1; Labels: 6.1-Poisonous materials.

Spill Handling:

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
Then: Protect persons downwind (mi/km)
Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (ft/m) 600/200
Then: Protect persons downwind (mi/km)
Day 1.4/2.3
Night 2.8/4.5

Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid or solid. Thermal decomposition products may include oxides of phosphorus, nitrogen and carbon. Like other organophosphorus pesticides, extinguish with dry chemical, carbon dioxide; water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in heat of fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be hydrolyzed with water[22]. Incineration in a unit with effluent gas scrubbing is recommended for larger amounts. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

EC Number: 203-815-1 [*Annex I Index No.*: 613-028-00-9]

Regulatory Authority and Advisory Information

Carcinogenicity: IARC: Human, No Adequate Data; Animal, Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999. United States Environmental Protection Agency Gene-Tox Program, Positive: Host-mediated assay.

Hazard Alert: Highly flammable, Possible risk of forming tumors, Suspected of causing genetic defects, Primary irritant (w/o allergic reaction).

Canada, WHMIS, Ingredients Disclosure List Concentration Reporting Level: 1.0%.

Hazard symbols, risk, & safety statements: Hazard symbol: C; risk phrases: R11; R20/21/22; R34; R62; safety phrases: S1/2; S21; S23; S36; S41; S45 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 2-Hazard to water.

Description: Morpholine is a colorless liquid with a weak ammonia or fish-like odor. The odor threshold is 0.01 ppm. Molecular weight = 87.14; specific gravity (H_2O:1) = 1.007; boiling point = 128.9°C; freezing/melting point = −5°C; vapor pressure = 6 mmHg @ 20°C; flash point = 37°C. Autoignition temperature: 310°C. Explosive limits: LEL = 1.4%; UEL: 11.2%. Hazard identification (based on NFPA-704 M Rating System): Health 3, flammability 3, reactivity 0. Soluble in water.

Potential Exposure: Morpholine is used as a separating agent for volatile amines; an intermediate for textile lubricants; in the synthesis of rubber accelerators and pharmaceuticals. It is also used as a solvent; as a boiler water additive; and in the formulation of waxes, polishers and cleaners.

Incompatibilities: Strong acids, strong oxidizers; metals, nitro compounds. Corrosive to metals; attacks copper and its compounds.

Permissible Exposure Limits in Air

NIOSH IDLH = 1400 ppm [LEL]

Conversion factor: 1 ppm = 3.56 milligram per cubic meter @ 25°C & 1 atm

OSHA PEL:20 ppm/70 milligram per cubic meter TWA [skin]

NIOSH REL:20 ppm/70 milligram per cubic meter TWA; 30 ppm/105 milligram per cubic meter STEL [skin]

ACGIH TLV[1] 20 ppm/71 milligram per cubic meter TWA [skin]

DFG MAK: 10 ppm/36 milligram per cubic meter TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group D

PAC Ver. 29[138]

PAC-1: 30 ppm

PAC-2: 1300 ppm

PAC-3: 8000 ppm

Australia: TWA 20 ppm (70 milligram per cubic meter); STEL 30 ppm [skin], 1993; Austria: MAK 20 ppm

(70 milligram per cubic meter) [skin], 1999; Belgium: TWA 20 ppm (71 milligram per cubic meter); STEL 30 ppm [skin] 1999; Denmark: TWA 20 ppm (70 milligram per cubic meter) [skin], 1999; Finland: TWA 20 ppm (70 milligram per cubic meter); STEL 30 ppm (105 milligram per cubic meter) [skin], 1999; France: VME 20 ppm (70 milligram per cubic meter), VLE 30 ppm (105 milligram per cubic meter), 1999; Hungary: STEL 10 milligram per cubic meter [skin], 1993; Norway: TWA 20 ppm (70 milligram per cubic meter), 1999; the Netherlands: MAC-TGG 36 milligram per cubic meter [skin], 2003; the Philippines: TWA 20 ppm (70 milligram per cubic meter) [skin], 1993; Poland: MAC (TWA) 70 milligram per cubic meter; MAC (STEL) 100 milligram per cubic meter, 1999; Russia: TWA 0.5 milligram per cubic meter; STEL 1.5 milligram per cubic meter [skin], 1993; Sweden: NGV 20 ppm (70 milligram per cubic meter), KTV 30 ppm (110 milligram per cubic meter) [skin], 1999; Switzerland: MAK-W 20 ppm (70 milligram per cubic meter), KZG-W 40 ppm (140 milligram per cubic meter) [skin], 1999; United Kingdom: TWA 20 ppm (72 milligram per cubic meter); STEL 30 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV: not classifiable as a human carcinogen. Russia set a MAC for ambient air in residential areas of 0.01 milligram per cubic meter (10 μ/m^3) on a once-daily basis. Several states have set guidelines or standards for morpholine in ambient air[60] ranging from 0.7−1.05 milligram per cubic meter (North Dakota) to 1.15 milligram per cubic meter (Virginia) to 1.4 milligram per cubic meter (Connecticut) to 1.6667 milligram per cubic meter (Nevada).

Determination in Air: Use NIOSH (II-3) Method #S-150.

Permissible Concentration in Water: Russia[35,43] set a MAC for water bodies used for domestic purposes of 0.04 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.9$. Unlikely to bioaccumulate in marine organisms.

Routes of Entry: Inhalation, skin absorption; ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: The substance is corrosive to the eyes, skin, and the respiratory tract. Contact can cause redness, swelling and burns. Exposure can cause corneal (eye) swelling resulting in blurring vision. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort.

Long-Term Exposure: Morpholine may damage the liver and kidneys. Can cause a skin rash.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin contact: **8 hours**: butyl rubber gloves, suits, boots; 4H and Silver Shield gloves. Also, polyvinyl alcohol, and Viton are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *550 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any PAPR with organic vapor cartridge(s)]. *1000 ppm*: CcrFOv (APF = 50) [any chemical cartridge respirator with a full facepiece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv (APF = 50) [any PAPR with a tight-fitting facepiece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any SCBA with a full facepiece); or SaF (APF = 50) (any supplied-air respirator with a full facepiece). *1400 ppm*: SaF:Pd,Pp (APF = 2000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF:Pd,Pp (APF = 10,000) (any SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv (APF = 50) [any air-purifying, full facepiece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, SCBA). *Note*: Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location; keep acids away from bases and red, yellow, and blue-coded chemicals. (2) Color code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Morpholine must be stored to avoid contact with strong acids; such as nitric acid; and strong oxidizers, such as chlorine, chlorine dioxide; bromine, nitrates, and permanganates, since violent reactions occur.

Shipping: UN2054 Morpholine, Hazard class: 8; Labels: 8-Corrosive material, 3-Flammable liquid.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from the danger area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Prolonged exposure of the containers to fire or heat may result in the violent rupturing and rocketing of the containers; parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions)[22].

Regulatory Authority and Advisory Information

Hazard Alert: Poison, Combustible.

United States Environmental Protection Agency Hazardous Waste Number (RCRA No.): P007

RCRA, 40CFR261, Appendix 8 Hazardous Constituents

Superfund/EPCRA 302, Extremely Hazardous Substances, TPQ = 500/10,000 lb(227/4550 kg)

Superfund/EPCRA 40CFR302.4, Appendix A and Section IV. D.3.b, RQ: 1000 lb(455 kg).

Hazard symbols, risk, & safety statements: Hazard symbol: T; risk phrases: R28; R50; safety phrases: S46; S41 (see Appendix 4).

WGK[100] (German Aquatic Hazard Class): 3-Severe hazard to water.

Description: Muscimol is a crystalline solid. Molecular weight = 114.12; freezing/melting point = 175°C (decomposes); vapor pressure = 1×10^{-5} mmHg @ 25°C.

Potential Exposure: Formerly used as a sedative and an antiemetic; and for experimental laboratory purposes.

Permissible Exposure Limits in Air

PAC Ver. 29[138]

PAC-1: 1.5 milligram per cubic meter

PAC-2: 17 milligram per cubic meter

PAC-3: 100 milligram per cubic meter

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short-Term Exposure: Muscimol is a potent central nervous system depressant. Initially, drowsiness, stupor, or sleep is followed by mild nausea and vomiting. Muscle spasms in extremities, various emotional changes and distorted perceptions of space and time; but only rarely hallucinations. This compound is a natural constituent of amanita mushrooms and is extremely toxic. It is a potent central nervous system depressant, and is believed to be responsible for most of the nervous system effects that result from eating this mushroom. The lowest toxic dose in humans has been reported @ 109 mg/kg.

Long-Term Exposure: Points of attack: central nervous system.

Medical Surveillance: Examination of the nervous system. Examination for brain effects.

First Aid: Move victim to fresh air. Call 911 or emergency medical service. Give artificial respiration if victim is not breathing. *Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.* Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes. For minor skin contact, avoid spreading material on unaffected skin. Keep victim warm and quiet. Effects of exposure (inhalation, ingestion, or skin contact) to substance may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. Medical observation is recommended for 24 to 48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a drug or other inhalation therapy.

Personal Protective Methods: Wear protective eye protection, gloves, and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use a NIOSH/MSHA (US) or EN149 (Europe)-approved respirator such as a supplied-air respirator with a full facepiece operated in the positive-pressure mode, or with a full facepiece, hood, or helmet in the continuous flow mode; or use a NIOSH/MSHA (US) or EN149 (Europe)-approved SCBA with a full facepiece operated in pressure-demand or other positive-pressure mode.

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical, personnel should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents.

Shipping: UN2811 Toxic solids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling: UN2811: Isolation Distance, Spill: 25 m/75 ft (NJ). Isolation Distance, Fire: 800 m/0.5 mi.[70] Evacuate persons not wearing protective equipment from the danger area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean-up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean-up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thermal decomposition products may include oxides of nitrogen and carbon. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are SCBAs that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is inappropriate and possibly dangerous to the environment to dispose of expired or waste drugs and pharmaceuticals by flushing them down the toilet or discarding them to the trash. Household quantities of expired or waste pharmaceuticals may be mixed with wet cat litter or coffee grounds, double-bagged in plastic, discard in trash. Larger quantities shall carefully take into consideration applicable DEA, EPA, and FDA regulations. If possible return the pharmaceutical to the manufacturer for proper disposal being careful to properly label and securely package the material. Alternatively, the waste pharmaceutical shall be labeled, securely packaged, and transported by a state licensed medical waste contractor to dispose by burial in a licensed hazardous or toxic waste landfill or incinerator. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform to EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK[100] (German Aquatic Hazard Class): No value found. (all CAS numbers).

Description: Mustard gas, a chlorinated sulfur compound(s), is an oily, yellow to black liquid (clear when pure). It has a sweet, burnt garlic or horseradish-like odor. The odor threshold for HD is 0.0006 milligram per cubic meter. Molecular weight = 159.08; specific gravity (H_2O = 1) = 1.27 @ 20°C; volatility = 610 milligram per cubic meter @ 20°C; 920 milligram per cubic meter @ 25°C; boiling point = (decomposes) 215−217°C; freezing/melting point = 13−14°C; vapor pressure = 0.072 mmHg @ 20°C; 0.11 mmHg @ 25°C; 0.09 mmHg @ 30°C; vapor density (air = 1) = 5.5; flash point (ignited by large explosive charges) = 104°C. Hazard identification (based on NFPA-704 M Rating System): Health 4, flammability 1, reactivity 1₩. Slightly soluble in water (reaction). Hydrolyzed, forming hydrochloric acid and thiodiglycol. Soluble in acetone, $CH_3(C1)$, tetrachloroethane, ethylbenzoate, and ether. Thickened is essentially the same as HD except for viscosity, which uses HD K125 (acryloid copolymer, 5%) as a thickener. K125 is not known to be hazardous except in a finely divided, powder form. The viscosity of HD is between 1000 and 1200 centistokes @ 25°C.

Mustard gas, sulfoxide: Molecular weight: 175.08. HT is a mixture of 60% HD and 40% Agent HT [(bis-(2-chloroethylthio ethyl)ether], a closely related vesicant with a lower freezing point). Agent HT is essentially the same as Agent HD, but HT is more stable. HT is a clear, yellowish, highly viscous liquid. It has a longer duration of effectiveness, and has a lower garlic-like odor similar to HD. Although volatility is low, vapors can reach hazardous levels in warm weather. Specific gravity (Specific gravity (H_2O:1): = 1.2361 @ 25°C; boiling point: 120°C @ 0.02 Torr; 174°C @ 2.0 Torr; freezing/melting point = 9.6−9.9°C; 13−14°C[77]; volatility (mg/L) = 4.1×10^{-4} @ 25°C; Viscosity (centistoke) = 14.7 @ 25°C; vapor pressure = 0.025 mmHg @ 0°C; 0.090 mmHg @ 30°C. Vapor density (air = 1) = 9.08; Flash point = 100°C. Practically insoluble in water; solubility = 0.8 g/L @ 20°C.

Potential Exposure: Mustard gas is used as an alkylating agent. It has also been used as a chemical warfare agent, causing delayed casualties. It is a vesicant and blister agent in chemical warfare (especially during World War I, military designation H or HD). Mustard gas is used as a model compound in biological studies. Mustard gas has been tested as an antineoplastic agent, but its clinical use as a tumor inhibitor has been minimal.

Incompatibilities: Sulfur mustard is stable at ambient temperatures. Reacts with oxidizers (vigorous), strong acids; acid fumes; strong alkalies; oxygen; water, steam, and other forms of moisture. On contact with acid or acid fumes, it emits highly toxic fumes of oxides of sulfur and chlorine. Rapidly corrosive to brass @ 65°C. Will corrode steel at a rate of 0.0001 in/month @ 65°C. HD reacts with water; will hydrolyze; forming HCI and thiodiglycol. When heated to decomposition (between149°C to 177°C), it emits gaseous hydrogen chloride and oxides of sulfur and chlorine. Contact with metals may evolve flammable hydrogen gas.

Persistence of Chemical Agent: HD: Summer: 3 days to 1 week; Winter: May last for weeks.

Permissible Exposure Limits in Air

Odor Threshold (HD) = 0.0006 milligram per cubic meter.
IDLH: 0.7 milligram per cubic meter
STEL: 0.003 milligram per cubic meter
WPL (Worker population limit): 0.0004 milligram per cubic meter
GPL (General population limit): 0.00002 milligram per cubic meter
AEGL (Acute Exposure Guidelines): 0.06 ppm/0.4 milligram per cubic meter (10 minute); 0.001 ppm/0.008 milligram per cubic meter (8 hours)
PAC* Ver. 29[138]

PAC-1: $\mathbf{0.010}_{\mathbf{A}}$ ppm
PAC-2: $\mathbf{0.020}_{\mathbf{A}}$ ppm
PAC-3: $\mathbf{0.32}_{\mathbf{A}}$ ppm
*AEGLs are marked with a subscript "**A**" and correspond to 60-minute values.
DFG MAK: [skin] Carcinogen Category 1 as bis(β-chloroethyl)sulfide
Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000
5819-08-9, Mustard gas, sulfoxide Ver. 29[138]
PAC-1: 0.52 ppm
PAC-2: 5.7 ppm
PAC-3: 34 ppm

Determination in Air: Available monitoring equipment for agent HD is the M8/M9 Detector paper, Blue bank tube; M256/M256A1 kits; bubbler. Depot Area Air Monitoring System (DAMMS); automated Continuous Air Monitoring System (ACMS); CAM-M1, Hydrogen Flame Photometric Emission Detector (HYFED); and the Minature Chemical Agent Monitor (MINICAM).

Determination in Water: Ecotoxicology: Octanol−water coefficient: Log K_{ow} (estimated) = 2.41. Unlikely to bioaccumulate in marine organisms. Bulk mustard can persist for decades in soil or water. When exposed to sea water, mustard forms a thick outer "crust" over a core of mustard which allows the mustard to be brought to the surface where it can injure unsuspecting fishermen, who may snare plastic lumps of mustard gas in their nets. Mustard and a number of its hydrolysis products are oxidized (air, oxygen, hypochlorite, hydrogen peroxide; nitric acid; potassium permanganate; and chromic acid) to give the less toxic sulfoxide and sulfone analogs. Mustard and its hydrolysis products do not significantly degrade in sunlight and are stable at less than 49°C.

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Sulfur mustard causes severe, delayed burns to the eyes, skin, and respiratory tract. Sulfur mustard damages cells within minutes of contact; however, the onset of pain and other health effects is delayed until hours after exposure. Large exposures to sulfur mustard may be fatal[92].

Short-Term Exposure: Contact with the liquid or exposure to high vapor concentrations can cause severe burns and permanent eye damage. There is no pain on contact, but hours later redness, swelling and pain occur. Blindness may result. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The symptoms of pulmonary edema are aggravated by physical effort. In 1−12 hours there may be coughing, swollen eyelids, reddened skin; and severe itching. There may be swelling and destruction of tissue in the respiratory tract and exposed skin. Ingestion may cause nausea and destruction of tissue in the respiratory tract and exposed skin. Ingestion may cause nausea and vomiting. The median lethal dosage is 1500 mg-minute/m^3 for inhalation and 10,000 mg-minute/m^3 for skin absorption (masked personnel). The median incapacitating dosage is 200 mg-minute/m^3 for eye injury and 2000 mg-minute/m^3 for skin absorption (masked personnel). Wet skin absorbs more material than dry skin. May cause death or permanent injury after very short exposure to small quantities. It is a blistering gas and is highly irritating to eyes, skin, and lungs. Pulmonary lesions are often fatal. HD is a vesicant (causing blisters) and alkylating agent producing cytotoxic action on the hematopoietic (blood-forming) tissues which are especially sensitive. The rate of detoxification of HD in the body is very slow and repeated exposures produce a cumulative effect. Median doses of HD in humans are: LD_{50} (skin) = 100 mg/kg; ICt_{50} (skin) = 2000 mg-min/m^3 @ 21−27°C (humid environment); = 1000 mg-min/m^3 @ 32°C (dry environment); ICt_{50} (eyes) = 200 mg-min/m^3; ICt_{50} (inhalation) = 1500 mg-min/m^3 (Ct unchanged with time) LD_{50} (oral-rat) = 0.7 mg/kg. Maximum safe Ct for skin and eyes are 5 and 2 mg-min/m^3, respectively.

Acute physiological action, local: HD affects both the eyes and the skin. *Skin* damage occurs after percutaneous resorption. Being lipid soluble, HD can be reabsorbed into all organs. Skin penetration is rapid without skin irritation. Swelling (blisters) and reddening (erythema) of the skin occurs after a latency period of 4−24 hours following the exposure, depending on degree of exposure and individual sensitivity. The skin healing process is very slow. Tender skin, mucous membrane and perspiration covered skin are more sensitive to the effects of HD. HD's effect on the skin, however, is less than on the eyes. Local action on the eyes produces severe necrotic damage and loss of eyesight. Exposure of eyes to HD vapor or aerosol produces lacrimation, photophobia; and inflammation of the conjunctiva and cornea.

Acute physiological action, systemic: occur primarily through inhalation and ingestion. The HD vapor or aerosol is less toxic to the skin or eyes than the liquid form. When inhaled, the upper respiratory tract (nose, throat, trachea) is inflamed after a few hours latency period, accompanied by sneezing, coughing, and bronchitis, loss of appetite; diarrhea, fever, and apathy. Exposure to nearly lethal dose of HD can produce injury to bone marrow; lymph nodes; and spleen, as indicated by a drop in WBC count and, therefore, results in increased susceptibilty to local and systemic infections. Ingestion of HD will produce severe stomach pains, vomiting, and bloody stools after a 15−20-minute latency period.

Long-Term Exposure: HD can cause sensitization, chronic bronchitis and lung impairment, (cough, shortness of breath; chest pain); and cancer of the mouth, throat, respiratory tract, skin, and leukemia. It may also cause birth defects. Mustard gas is a carcinogen.

Points of Attack: Lungs, eyes.

Medical Surveillance. This chemical is a suspected human carcinogen. Exposed persons should contact a physician for advice regarding the possible long-term health effects and potential recommendation for medical monitoring. Recommendations from the physician may depend upon the specific compound, its chemical, physical, and toxicity properties, the exposure level, length of exposure, and the route of exposure. Lung function tests. Examination of the eyes, including slit lamp. Consider chest X-ray following acute overexposure.

First Aid: There is no antidote for sulfur mustard toxicity. If this chemical gets into the eyes instantly flush with water. A delay of seconds can cause permanent damage. *Inhalation*: Remove from the source *immediately*. If breathing has stopped, give artificial respiration. If breathing is difficult, administer oxygen. *Seek medical attention immediately*. *Eye contact*: Speed in decontaminating the eyes is absolutely essential. Remove person from the liquid source, flush the eyes immediately with water by tilting the head to the side, pulling the eyelids apart with the fingers and pouring water slowly into the eyes. Do not cover eyes with bandages but, if necessary, protect eyes by means of dark or opaque goggles. *Transfer the patient to a medical facility immediately. Ingestion*: Do not induce vomiting. Give victim milk to drink. Seek medical attention immediately. *Skin contact*: Don respiratory protective mask and gloves; remove victim from agent source immediately. Flush skin and clothes with solution of sodium hypochlorite or liquid household bleach (see decontamination procedure below) within one minute. Cut and remove contaminated clothing, flush contaminated skin area again with sodium hypochlorite solution, then wash contaminated skin area with soap and water. If shower facilities are available, wash thoroughly and transfer to medical facility. If the skin becomes contaminated with a thickened agent, blot/wipe the material off immediately with an absorbent pad/paper towel prior to using decontaminating solution.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you don't have the equipment and training don't enter the hot zone to rescue and decontaminate victims. If the victim can't move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you won't have to touch the victim; don't even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 minutes. Wash−strip−wash−evacuate up wind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but don't let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 minutes. Be sure you've decontaminated the victims as much as you can before they leave the area so that they don't spread the agent. Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gal of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods:

General information: first responders should use a NIOSH-certified CBRN SCBA with a level a protective suit when entering an area with an unknown contaminant or when entering an area where the concentration of the contaminant is unknown. Level a protection should be used until monitoring results confirm the contaminant and the concentration of the contaminant. *Note*: safe use of protective clothing and equipment requires specific skills developed through training and experience.

LEVEL A: (*RED ZONE*): select when the greatest level of skin, respiratory, and eye protection is required. This is the maximum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than the AEGL-2. A NIOSH-certified CBRN full- facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A TECP suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items.

LEVEL B: (RED ZONE): Select when the highest level of respiratory protection is necessary but a lesser level of skin protection is required. This is the minimum protection for workers in danger of exposure to unknown chemical hazards or levels above the IDLH or greater than AEGL-2. It differs from Level A in that it incorporates a nonencapsulating, splash-protective, chemical-resistant splash suit that provides Level A protection against liquids but is not airtight.

A NIOSH-certified CBRN full-facepiece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL C: (YELLOW ZONE): Select when the contaminant and concentration of the contaminant are known and the respiratory protection criteria factors for using APRs or PAPRs are met. This level is appropriate when decontaminating patient/victims. A NIOSH-certified CBRN tight-fitting APR with a canister-type gas mask or CBRN PAPR for air levels greater than AEGL-2. A NIOSH-certified CBRN PAPR with a loose-fitting facepiece, hood, or helmet and a filter or a combination organic vapor, acid gas, and particulate cartridge/filter combination or a continuous flow respirator for air levels greater than AEGL-1. A hooded chemical-resistant suit that provides protection against CBRN agents. Chemical-resistant gloves (outer). Chemical-resistant gloves (inner). Chemical-resistant boots with a steel toe and shank. Escape mask, face shield, coveralls, long underwear, a hard hat worn under the chemical-resistant suit, and chemical-resistant disposable boot-covers worn over the chemical-resistant suit are optional items.

LEVEL D: (GREEN ZONE): Select when the contaminant and concentration of the contaminant are known and the concentration is below the appropriate occupational exposure limit or less than AEGL-1 for the stated duration times. Limited to coveralls or other work clothes, boots, and gloves.

Notes: Take all necessary precautions to prevent any reasonable probability of skin or eye contact. Protective gloves, mandatory: Butyl, toxicological agent, protective gloves (M3, M4, glove set). As a minimum, chemical goggles will be worn. For splash hazards use goggles and face-shield. Full protective clothing will consist of the M3 butyl rubber suit with hood, M2A1 butyl boots; M3 gloves; impregnated underwear; M9 series mask and coveralls (if desired); or the Demilitarization Protective Ensemble (DPE). For general lab work, gloves and lab coat shall be worn with M9 or M17 mask readily available. In addition, when handling contaminated lab animals, a daily clean smock, foot covers; and head covers are required. *Ventilation*: Local Exhaust: Mandatory. Must be filtered or scrubbed. *Special*: Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (lfpm) plus or minus 10% with the velocity at any point not deviating from the average face velocity by more than 20%. Laboratory hoods shall be located so that cross-drafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent HD. Other: recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted. Emergency backup power is necessary. Hoods should be tested semi-annually or after modification or maintenance operations. Operations should be performed with 20 cm inside hoods.

Swatch Test Results for Level A Suits and Chemical Protective Gloves for HD (Mustard gas)

Item	*Breakthrough*
25-mil chemical protective gloves	360 min
Kappler Suit Model 42483	150 min
TYCHEM 10,000 Pkg Style No. 12645	330 min
Trellchem HPS suit	>480 min
Ready 1 Limited Use Suit: Model 91	125 min
First Team XE HazMat suit	385 min
Commander Ultrapro Suit, Style 79102	280 min
Kappler Suit Model 50660	435 min.
TYCHEM Style No. 11645	>480 min
Trellchem TLU suit	>480 min
Chemturion Suit: Model 13	110 min
Chempruf II BETEX Suit	125 min
Commander Brigade: F91	>480 min

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified by NIOSH for CBRN Environments. Do not use chemical cartridge or canister respirators. Less than or equal to 0.003*: Protective mask not required provided that: as an 8-hour TWA (a) Continuous real-time monitoring (with alarm capability is conducted in the work area at the 0.003-milligram per cubic meter level of detection. (b) M9, M17 or M40 mask is available and donned if ceiling concentrations exceed 0.003 milligram per cubic meter. (c) Exposure has been limited to the extent practicable by engineering controls (remote operations, ventilation, and process isolation) or work practices. *If these conditions are not met then the following applies*: full facepiece chemical canister, APRs. (The M9, M17 or M40 series or other certified equivalent masks are acceptable for this purpose in conjunction with the M3 toxicological agent protective (TAP) suit for dermal protection.); *Greater than 0.003 as an 8 hours TWA*: The Demilitarization Protective Ensemble (DPE), 30 mil, may be used with prior approval from the AMC Field Safety Activity. Use time for the 30-mil DPE must be restricted to two hours or less. *Note*: When 30 mil DPE is not available, the M9 or M40 series mask with Level A protective ensemble including impregnated innerwear can be used. However, use time shall be restricted to the extent operationally feasible, and may not exceed 1 hour. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots respectively, to reduce aspiration.

At any detectable concentration: SCBAF:Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved SCBA that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode); or SaF:Pd,Pp:ASCBA (APF = 10,000) (any supplied-air respirator that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, SCBA operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air purifying, full- facepiece respirator with and N100, R100, or P100 filter k-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, SCBA).

Storage: Color code—Blue: Health Hazard/Poison: Store in a secure poison location. Stable at ambient temperatures. Thermal decomposition temperature is 149−177°C. Mustard is a persistent agent depending on pH and moisture, and has been known to remain active for Up to three years in soil. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. During handling, the "buddy" (two-man) system will be used. Containers should be periodically inspected for leaks either visually or using a detector kit, and prior to transferring the containers from storage to work areas. Stringent control over all personnel handling HD must be exercised. Chemical showers, eyewash stations; and personal cleanliness facilities must be provided. Each worker will wash their hands before meals and shower thoroughly with special attention given to hair, face, neck, and hands; using plenty of soap before leaving at the end of the work-day. No smoking, eating, or drinking is permitted at the work site. Decontaminating equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. HD should be stored in containers made of glass for Research, Development, Test and Evaluation (RDTE) quantities or one-ton steel containers for large quantities. Agent shall be double-contained in liquid-tight containers when in storage.

Shipping: UN2810 Toxic liquids, organic, n.o.s., Hazard Class: 6.1; Labels: 6.1-Poisonous materials, Technical Name Required.

Spill Handling:

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 minutes after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the United States Environmental Protection Agency Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (ft/m) 100/30
